The Case Attachments component lets users view a list of all attachments associated with a case.

Mobile device users can expand and collapse the list of attachments when they are looking at the details of their case.

 **Note:**

- You can't attach a file to a case while in Preview mode in Community Builder. When the community is published, you can attach files to cases.
- For users to see case attachments, the Case page layout and case record types for their profile must include the Attachments related list.

- Select the **Case Attachments** component in the page you're configuring.
- In the property editor, configure properties for the component:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.

 **Example:** Sample Case Attachments component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case Banner

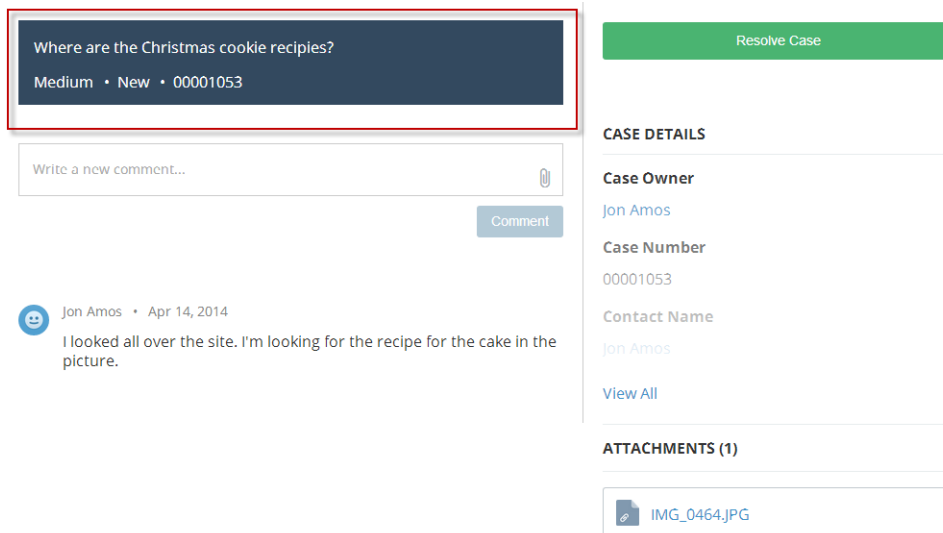

The Case Banner component lets users see a case's status, case ID, and other summary information.

 **Note:** Before Spring '16, this component was named Case Highlights.

- Select the **Case Banner** component in the page you're configuring.
- In the property editor, configure properties for the component:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.

 **Example:** Sample Case Banner component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case Comments

The Case Comments component shows a list of all the comments that a customer and an agent have added to the case.

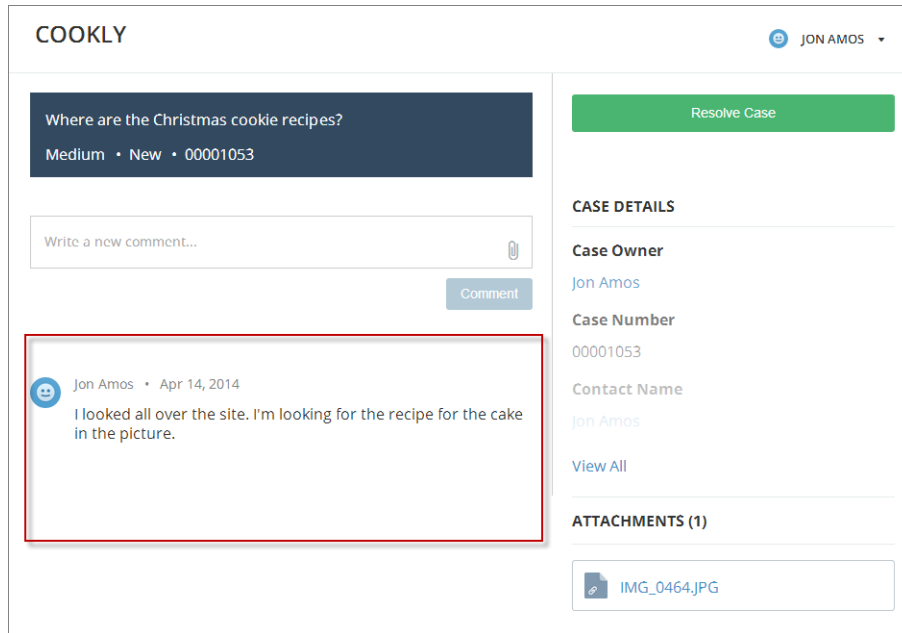

If an attachment has been uploaded with a comment it is shown separately in the Attachments component.

 **Note:** For users to see case comments, the Case page layout and case record types for their profile must include the Case Comments related list.

1. Select the **Case Comments** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.

 **Example:** Sample Case Comments component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case Comments Publisher

Use the Case Comments Publisher component to let customers and agents collaborate using comments on cases. Your customers can open cases, post comments, upload attachments, and check the status of their cases from any of their devices.

 **Note:** Before Spring '16, this component was named Case Publisher.

The component provides a chronological, filterable list of comments your customers and agents have had within the context of a case. It includes case activities, internal and external comments, attachments, and status changes. When authenticated users add a comment to a case, they can add a file to the case as an attachment. So when a customer creates a case using a mobile phone, they can take a picture with their phone's camera and attach it to the case.

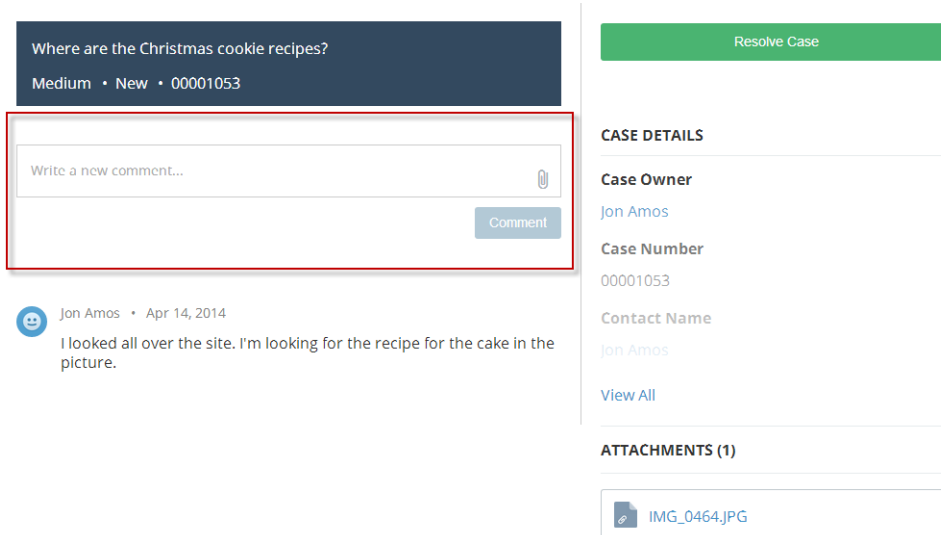

By default, users can attach any supported file type that is 5 MB or less. You can restrict the types of files that users can upload by changing the default values for content types on the Library tab.

1. Select the **Case Comments Publisher** component in the page you're configuring.
2. To configure properties for the component, select the Properties pane:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.
Publisher Placeholder Text	Enter the text that appears in the search bar. The default value is Write a new comment...

Property	Details
Mobile Header Text	Enter the text that appears as the header for mobile users. Mobile and tablet see the text as the header for the comment text area.
Can Attach Files	Lets users attach a file to the comment.
Post Button Label	Enter the text for the button that submits the case or comment.

 **Example:** Sample Case Comments Publisher component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

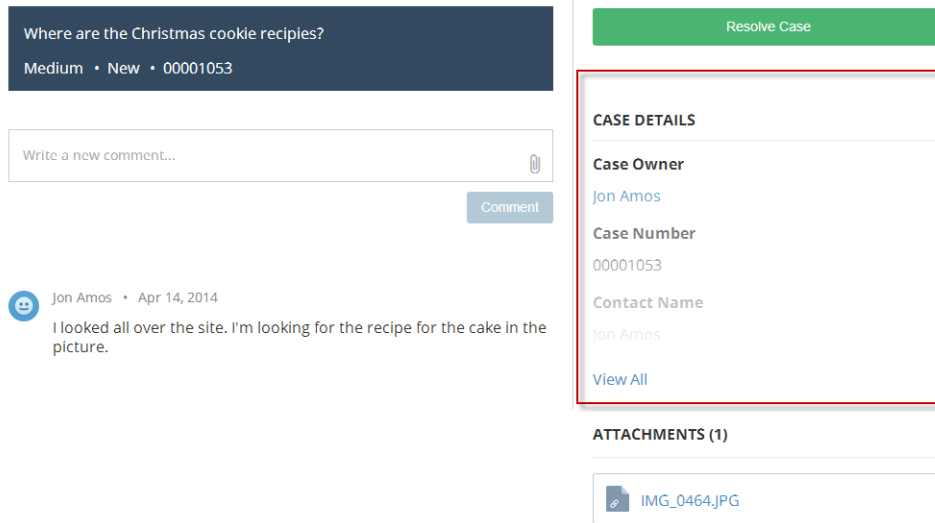

Case Detail

The Case Detail component lets users see all of the details of their case in a collapsible section.

1. Select the **Case Detail** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.

 **Example:** Sample Case Detail component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case Feed

The Case Feed component shows a Chatter feed of all case interactions, including Chatter posts, case emails, questions related to the case, and attachments.

Comments and attachments on posts appear inline below the post for desktop and tablet users, and attachments are also shown separately in the Attachments component.

 **Important:** Make sure to enable the community case feed so users see supported case interactions in their feed. For details, see [Set Up the Community Case Feed](#).

1. Select the Case Feed component in the page that you're configuring.
2. In the property editor, configure properties for the component:

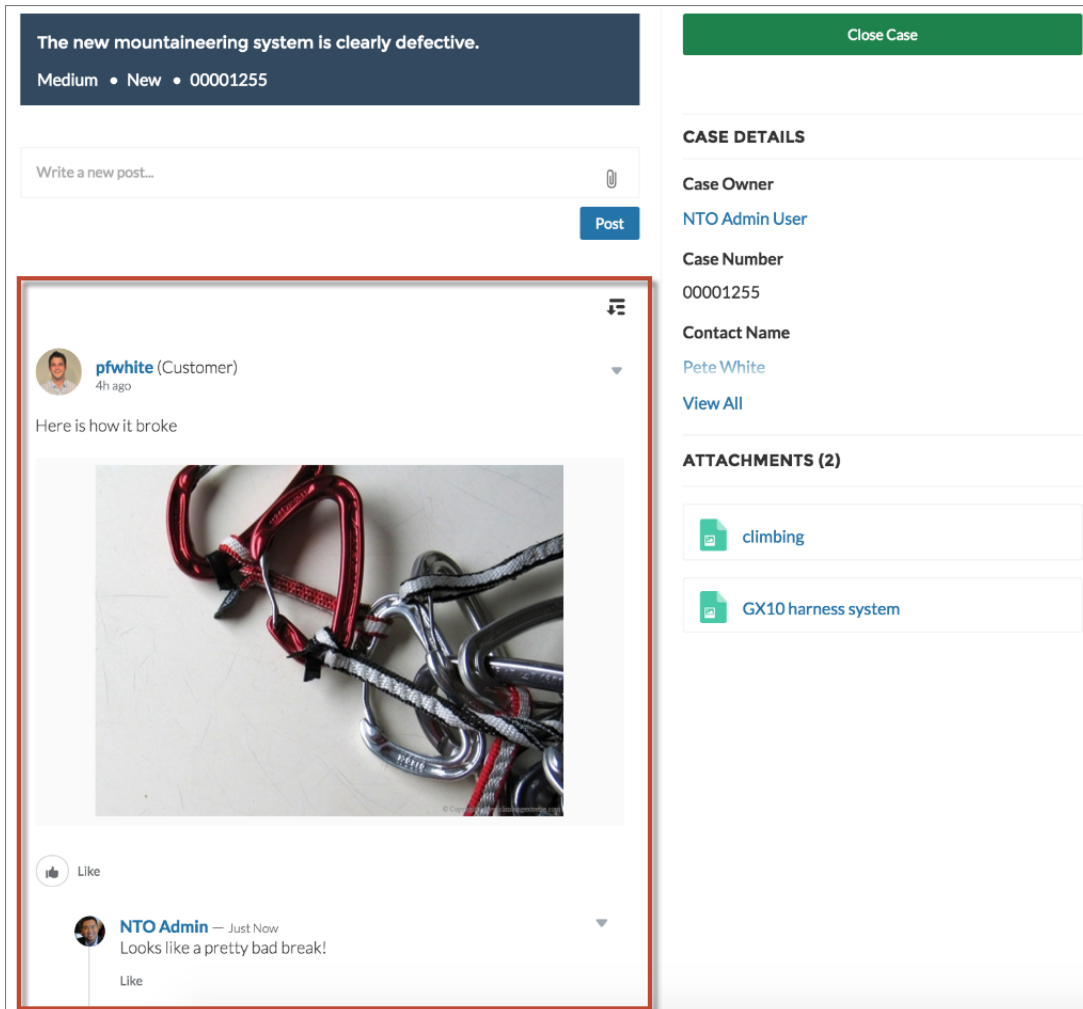

Property

Case ID

Details

Enter this value: `{!recordId}`

 **Example:** Sample Case Feed component:

The screenshot displays a Salesforce Case Feed component. At the top, a dark blue banner contains the case title "The new mountaineering system is clearly defective." and status "Medium • New • 00001255". Below this is a text input field "Write a new post..." with a "Post" button. The feed shows a post from user "pfwhite (Customer)" 4h ago with the text "Here is how it broke" and an image of a broken red climbing carabiner. Below the image is a "Like" button. A response from "NTO Admin" is shown "Just Now" with the text "Looks like a pretty bad break!" and a "Like" button. To the right of the feed is a sidebar with a green "Close Case" button at the top. Below it is the "CASE DETAILS" section, which includes: Case Owner (NTO Admin User), Case Number (00001255), and Contact Name (Pete White) with a "View All" link. The "ATTACHMENTS (2)" section lists two files: "climbing" and "GX10 harness system".

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case Feed Publisher

The Case Feed Publisher component lets customers create Chatter posts on cases and upload attachments from any of their devices.

 **Note:** Before Spring '16, this component was named Case Chatter Publisher.

Attachments are shown in the Attachments component. By default, users can attach any supported file type that is 2 GB or less.

 **Important:**

- Make sure to enable the community case feed so users see supported case interactions in their feed. For details, see [Set Up the Community Case Feed](#).

- If an agent posts on a customer's case within a community built using the Customer Service (Napili) template, the post is only visible to other internal users. To ensure that customers see agent posts, agents should use the Community action in the console.
1. Select the Case Feed Publisher component in the page that you're configuring.
 2. In the property editor, configure properties for the component:

Property	Details
Case ID	Enter this value: <code>{!recordId}</code>
Publisher Placeholder Text	Text that appears in the search bar. The default value is Write a new post...
Mobile Header Text	Text that appears as the header for mobile users. Mobile and tablet users see the text as the header for the post text area.
Can Attach Files	Lets users attach a file to the post.
Post Button Label	Text for the button that submits the post.

 **Example:** Sample Case Feed Publisher component:

The screenshot displays a Salesforce Case Feed Publisher component. At the top, a dark blue header contains the case title "The new mountaineering system is clearly defective." followed by "Medium • New • 00001255". Below this is a text input field with the placeholder "Write a new post..." and a "Post" button. A user profile for "pfwhite (Customer)" is shown, with the text "Here is how it broke" and a photo of climbing gear. On the right, a sidebar contains a "Close Case" button, "CASE DETAILS" (Case Owner: NTO Admin User, Case Number: 00001255, Contact Name: Pete White), and "ATTACHMENTS (2)" (climbing, GX10 harness system).

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Case List

The Case List component displays a list of the user's cases. Only authenticated users can see a list of the cases that they've created.

 **Note:** Before Spring '16, this component was named My Cases.

You can select the fields to display by editing the Cases list view.

 **Note:** The name of the first column in Case List displays as the case title on mobile devices. We recommend using `Subject` as the first column so mobile users can easily scan their cases. To change the column order in the Case List component, edit the case list view that your organization has assigned to it. By default, the Case List component uses the All Open Cases list view from Salesforce.

1. Select the **Case List** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Case Filter Name or ID	Enter the name of the list view that displays cases.  Note: By default, the template uses the AllOpenCases view, which lets users view any open cases that they have permission to see. Configure sharing to ensure that users see only cases that belong to them. Alternatively, you can use another pre-defined list view or create a custom list view.
Header Title	Enter the text for the label that appears at the top of the list of cases. The default for this field is My Cases.
Create Case Label	Enter the text you'd like to display on the button that users can click to create a case. The default text is Create Case.

 **Example:** Sample Case List component:

ACTIVITY		CASES				
MY CASES						Create Case
Case Number	Contact Name	Subject	Status	Priority	Date/Time Opened	Case Owner Alias

Category Filter

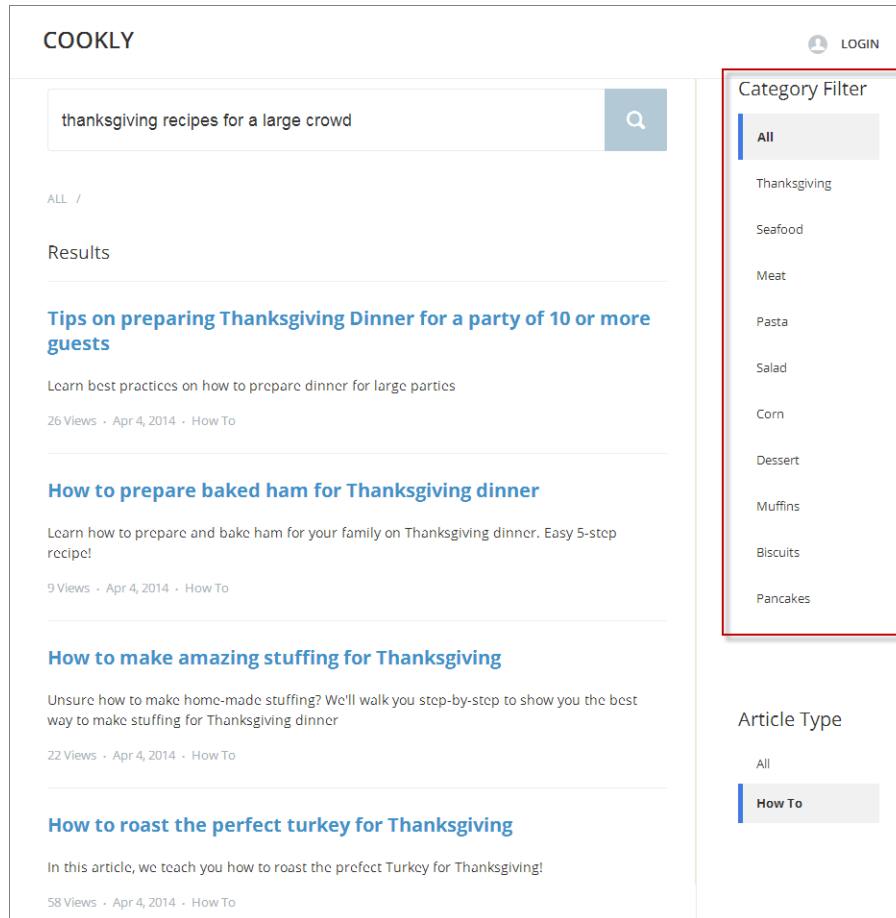

The Category Filter component lets users filter the article list based on selected data categories so that they can see articles from those categories only.

Users can filter the Article View by selecting one or more data categories.

1. Select the **Category Filter** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.

 **Example:** Sample Category Filter component:

The screenshot shows a web page for 'COOKLY' with a search bar containing 'thanksgiving recipes for a large crowd'. Below the search bar, there are search results for Thanksgiving recipes. On the right side, there is a 'Category Filter' sidebar with a list of categories: All, Thanksgiving, Seafood, Meat, Pasta, Salad, Corn, Dessert, Muffins, Biscuits, and Pancakes. Below the categories, there is an 'Article Type' section with 'All' and 'How To' options.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Category Navigation

The Category Navigation component shows a list of child categories for a selected parent category.

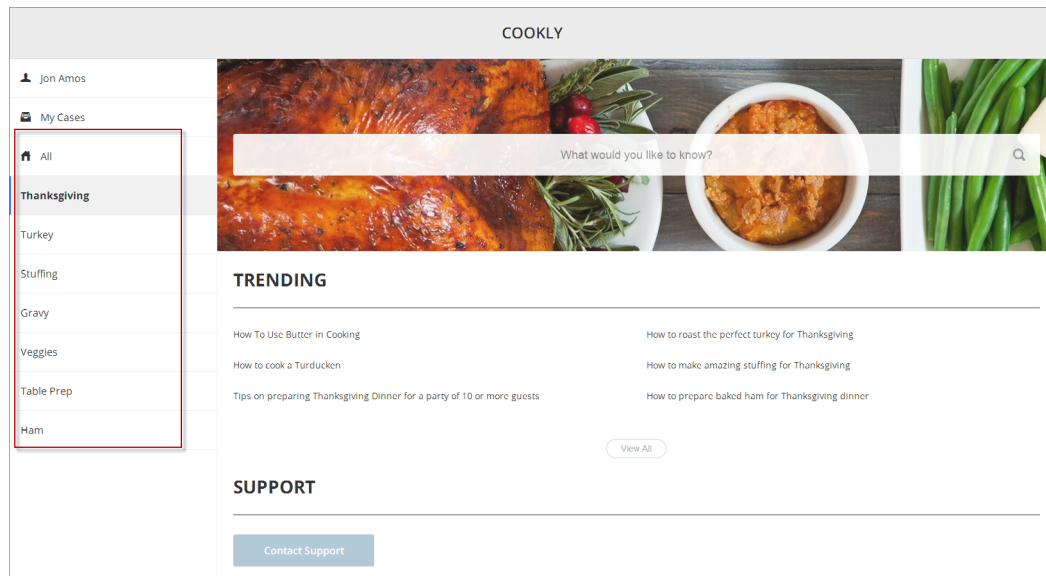

Users can click the child category to view the articles that are associated with it. For long lists of categories, users can view all of the categories and collapse the list to show fewer categories.

1. Select the **Category Navigation** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.

Property	Details
Auto-Collapse	Select the checkbox to have the category navigation component collapse automatically after a category is selected.

 **Example:** Sample Category Navigation component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Contact Support & Ask Buttons

The Contact Support & Ask Buttons component adds two buttons to the page: one that lets users click a button to create a case, and another that allows members ask a question and publish it to the community. When you enable Web-to-Case and set up a guest user case publishing action, guest users aren't required to log in before creating a case. All members must be logged in to ask the community a question.

 **Note:** Guest users can't attach files when creating a case.

1. Select the **Contact Support & Ask Buttons** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Header Label	The text you'd like to display at the top of the component.
Ask Community Label	The text you'd like to display on the button that members can click to ask a question from the community. The default text is <code>Ask a Question</code> .

Property	Details
Contact Support Label	The text you'd like to display on the button that users can click to create a case. The default text is Contact Support.

 **Example:** Sample Contact Support & Ask Buttons component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Contact Support & Ask Buttons

The Contact Support & Ask Buttons component includes two buttons, one to ask a question of the community, and another to contact support by creating a case.

 **Note:** Before Spring '16, this component was named Call to Action.

When you enable Web-to-Case and set up a guest user case publishing action, guest users aren't required to log in before creating a case.

 **Note:** Guest users can't attach files when creating a case.

1. Select the **Contact Support & Ask Buttons** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Header Label	Text that displays at the top of the section that includes both buttons. The default text is Don't see what you're looking for?.
Ask Community Label	Text that appears on the button users click to start discussions in the community. The default text is Ask A Question.
Contact Support Label	Text that displays on the button that users click to contact support by creating a case. The default text is Contact Support.

 **Example:** Sample Contact Support & Ask Buttons component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Create Case Form

The Create Case Form component searches text as it's being entered into a case and displays articles based on the typed text. If users don't see an answer, they can contact support for help. You can also protect your community from spammers by adding a reCAPTCHA widget that guest users must complete before they create a case.

Before Spring '16, this component was named Case Creation.

 **Note:** When you configure the case page layout for your community, specify that some fields are required. Adding required fields to the layout ensures that customers don't accidentally submit cases with empty fields.

1. Select the **Create Case Form** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
General Settings	Click to expand the section with general setting properties.
Attach Files	Lets authenticated users attach a file to the comment in the case. Your organization's settings control the limits for file sizes. If you enable Web-to-Case to let guest users create cases, keep in mind that guest users can't attach files to a case.
Header Title	Text that displays at the top of the page customers use to create a case. The default is Email Customer Support.
Confirmation Message Title	Text that appears as the title of the message confirming that the case has been created. The default is: Your request was submitted successfully.
Confirmation Message Description	Text that appears as the body of the message confirming that the case has been created. For example, You'll hear back from us soon.
Actions in the Publisher	Click to expand the section with action properties.
Signed-In User Case Action	The name of the action that creates cases for authenticated users. Use the action layout editor for the case object in Salesforce setup to specify which fields to include in the layout. The NewCase action is a default in your Salesforce org.
Guest User Case Action	The name of the action that creates cases for unauthenticated users. Use the action layout editor for the case object in Salesforce setup to specify which fields to include in the layout.
Case Deflection	Click to expand the section with case deflection properties.

Property	Details
Use Case Text to Suggest Articles	Uses the text users type in the case title and description fields to suggest articles in the deflection area of the page. Article deflection appears only when you've implemented Salesforce Knowledge in your org.
Number of Articles	Number of articles that display in the component.
Top-Level Category	Top-level data category for template-driven communities using data categories.
Category Group name for article deflection	Data category group name for template-driven communities using data categories.
Deflection Banner Text	Text that displays as the title of the deflection area of the page. The default is Need Answers Fast?.
Deflection Text	Text that displays as the subtitle in the deflection area of the page.
Mobile-Only Deflection Text	Text that displays in the deflection area for users of mobile devices.
reCAPTCHA Settings	Click to expand the section with reCAPTCHA settings.
reCAPTCHA for Guest Case Creation	<p>Adds the reCAPTCHA widget to your page. The reCAPTCHA widget requires guest users to complete a text field successfully before they can create a case.</p> <p> Note: To use Google's reCAPTCHA service, go to the Google reCAPTCHA website, register your domain, and receive a secret and site key pair. For details on which languages are supported in the widget, see the reCAPTCHA website. Google reCAPTCHA is a resource provided by Salesforce to support its users and partners, but is not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.</p>
Secret Key for reCAPTCHA	Enter the key that you received when you registered for the service.
Site Key for reCAPTCHA	<p>Enter the key that you received when you registered for the service.</p> <p> Note: Make sure that you thoroughly test the reCAPTCHA widget in your production organization.</p>

 **Example:** Sample Create Case Form component:

The screenshot shows a community page for 'Backpacking'. At the top, there is a search bar with 'Backpacking' entered and a 'Search' button. A 'LOGIN' button is also visible. Below the search bar, there are navigation links for 'TOPICS' and 'BACKPACKING'. The main content area is divided into two columns. The left column is titled 'EMAIL CUSTOMER SUPPORT' and contains a form with the following fields: 'Subject *', 'Description', a CAPTCHA challenge with the text 'refer' and 'eratt', and a 'SUBMIT' button. The right column is titled 'NEED ANSWERS FAST?' and contains a list of article recommendations with titles and dates: 'Backpacking: Before You Leave Home' (Aug 5, 2014), 'Return Policy for Camping Equipment' (Aug 5, 2014), 'Backpacking for Beginners' (Aug 6, 2014), 'How to setup camping by water' (Aug 6, 2014), 'How to Choose Climbing Ropes' (Aug 6, 2014), and 'How to Choose Snowboard Boots' (Aug 6, 2014).

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Create Record Button

Use the Create Record Button component to allow community members to create records using global actions.

This component relies on the global actions defined in your org by the administrator. If you associate more than one action with this button, it acts like a drop-down list. When a community member selects an action from the list, the Create Record page dynamically loads the appropriate action layout for that action using the Create Record Form component.

1. Add the **Create Record Button** component to a page or select it on the page you're configuring. For example, you could add this to the Home page to make it easy for community members to find.
2. Click **Add Global Action** to add an action to the Global Actions list.
3. Select each action and modify its type and public availability in the Global Action Properties section below.
 - Select the global action type to be associated with each action in the Global Actions list.
 - Select Publicly Accessible to make that action available for guest users in the community.

PROPERTY EDITOR

Global Action Properties

Global Action

- New Group
- Change Shipping Info
- New Case
- New Contact
- New Event
- New Group**
- New Lead
- New Opportunity
- New Task
- New Order
- Your Order Information

 **Example:** Sample Create Record Button component on a community home page.

Create Record Form

The Create Record Form component displays the action layout when a user clicks an action from the Create Record button.

When a community member clicks an action from the Create Record button in your community, they're redirected to the Create Record page, which uses the Create Record Form component to display the fields in the associated global action layout. The page and component automatically pick up the global action layout defined in Setup based on the clicked action and the Action Name property is automatically populated. No additional configuration is required.

 **Example:** Sample Create Record Form component.

The screenshot shows a form titled "NEW CASE". It contains the following fields and controls:

- Subject:** A text input field.
- Contact Name:** A dropdown menu with "Select Contact" as the placeholder.
- Description:** A large text area with a "://" icon at the bottom right.
- Date:** A date picker field with a calendar icon.
- Web Phone:** A text input field.
- Number:** A text input field.
- Business Hours:** A dropdown menu with "Select Business Hours" as the placeholder.
- Confirm:** A blue button at the bottom center.

Custom Lightning Components

Incorporate custom Lightning components in your community design in Community Builder.

To use custom Lightning components in your community:

- Enable Lightning components. To do so, from Setup, enter *Lightning Components* in the Quick Find box, select **Lightning Components**, and then select **Enable Lightning Components**.
- Implement each component from the Developer Console as shown in this example:

```
<aura:component
  implements="forceCommunity:availableForAllPageTypes"
  access="global">
```
- To make the component's properties editable in Community Builder, include a design resource named `componentName.design` with your Lightning component bundle.

 **Note:** For help with developing custom Lightning components, see the [Lightning Components Developer's Guide](#) and the [Lightning Components Cheat Sheet](#).

Custom Lightning components behave just like community template components. Drag and drop the component to the page canvas. To edit its properties, select the component on the page canvas, and then enter changes in the floating component property editor.

Custom components appear in the Components panel along with your template's components.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

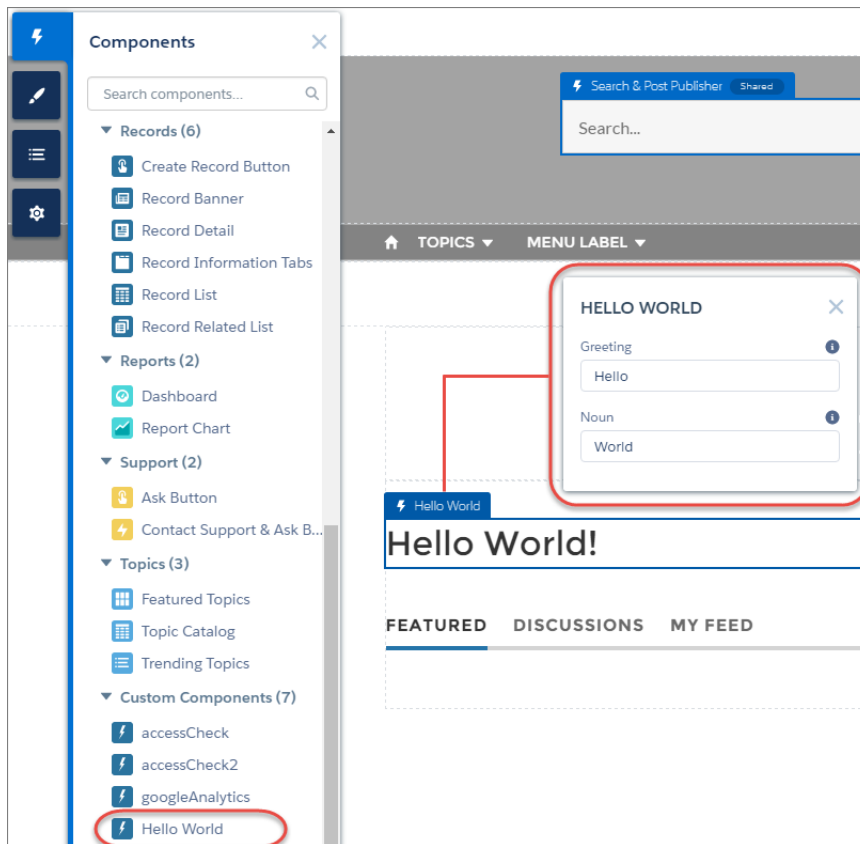

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

 **Example:** A custom component added to the page canvas, with properties open in the floating component property editor:

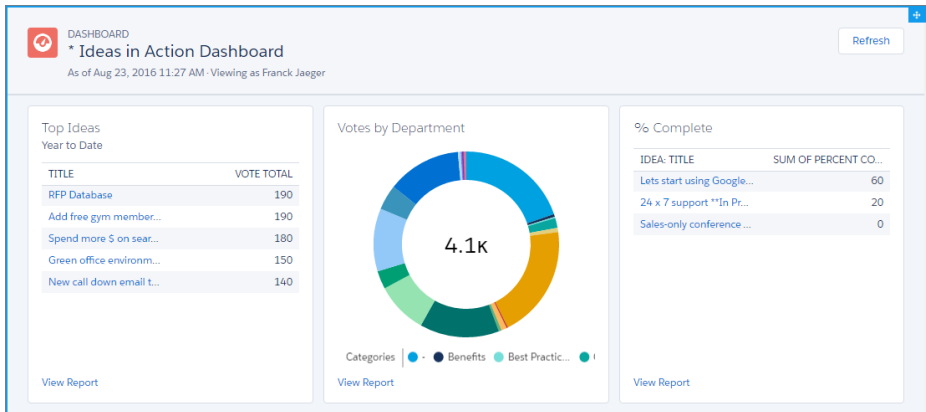

Dashboard

Use the Dashboard component to drag and drop dashboards you set up in your org's public folder to your community's pages.

1. Select the **Dashboard** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Dashboard Name	Select an available dashboard.
Height	Adjust the height of the dashboard. Column width controls the dashboard width.

 **Example:** Sample Dashboard component:

 **Note:** Members can't change the dashboard's running user in the community. This view is read only.

Dashboard List

The Dashboard List component lets users view dashboards in list form.

The dashboard list can be filtered with these criteria:

- Recent
- Created by Me
- Private Dashboards
- All Dashboards

In addition, users have access to dashboard folders. Folders include:

- Created by Me
- Shared with Me
- All Folders

The Dashboard List component doesn't have any editable properties.

 **Note:** The Dashboard List component can only be used on the Dashboard List page.

 **Example:** Sample Dashboard List component:

[insert image]

Expanded Category Navigation

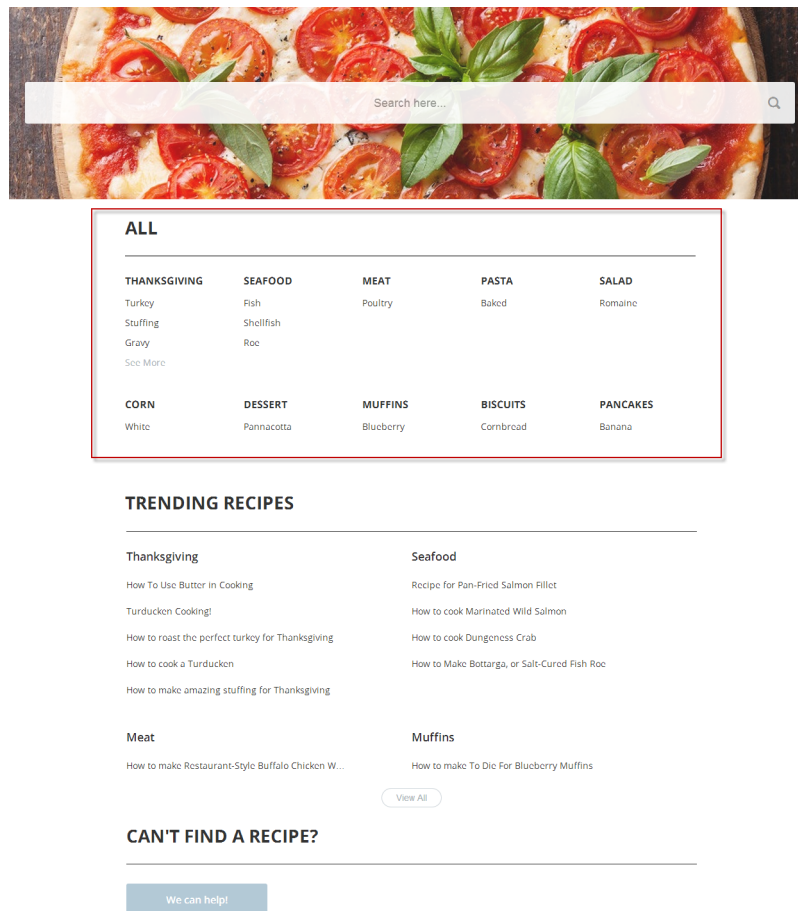

The Expanded Category Navigation component organizes articles based on a hierarchy of categories.

Users can select a top-level category and then view the related categories and subcategories as they're browsing for articles. Then they can click the child category to view the articles that are associated with it. For long lists of categories, users can expand the list to view all of the categories and then collapse it to make it more compact.

1. Select the **Expanded Category Navigation** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.
Title	If you'd like to display another name for the top-level data category, enter the text in this field. For example, if the top-level category name is <i>Desserts</i> , you can change the text to <i>Easy Dessert Recipes</i> . The text you enter in this field appears only as the title of the page. You aren't changing the name of the category in navigation breadcrumbs or anywhere else.
Max Number of Sub-Categories	Specify the to limit the number of child categories to display for each parent category. The default is 3.
Max Number of Categories	Specify the maximum number of parent categories to display in the page. The default is 10, but there is no restriction on the number of parent categories you can display.

 **Example:** Sample Expanded Category Navigation component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Featured Data Categories

The Featured Data Categories component displays a group of data categories, with an image and title showing for each data category within the specified group.

Images help your users select which group of articles they'd like to browse. You can set properties to choose the number of categories displayed on the page.

1. Select the **Featured Data Categories** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property

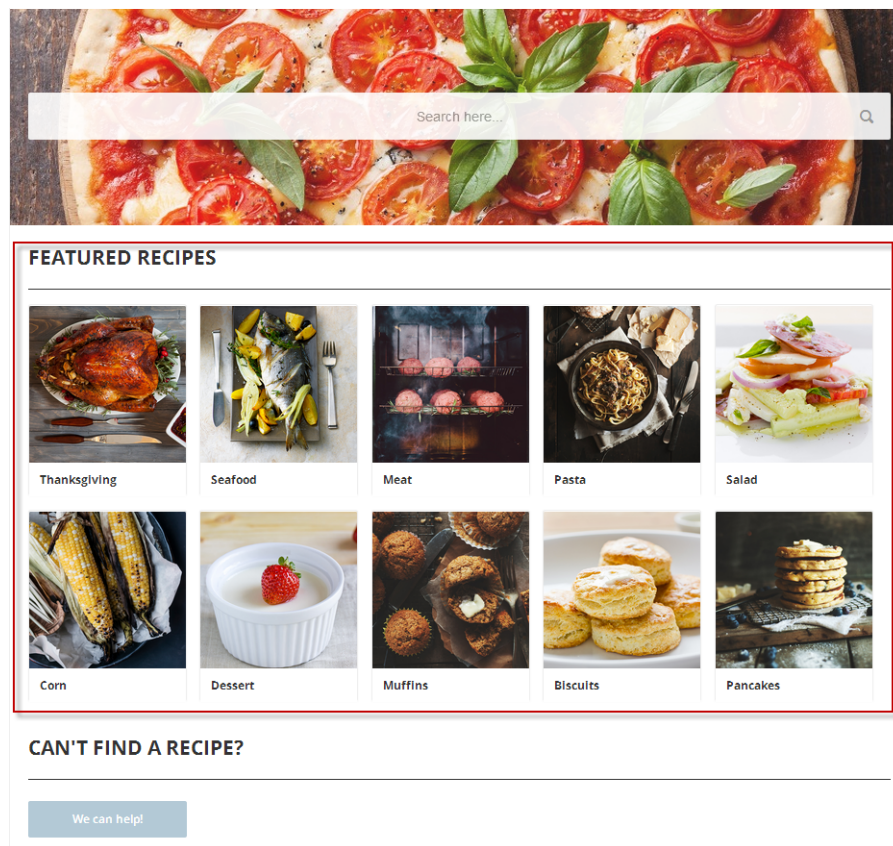

Details

Number of Data
Categories

Type the number of data categories to display from the group. Categories display in the order listed in the data categories group.

Property	Details
Category Image URL	Specify the URL to display the image associated with each data category. To automatically display the image for your data categories, type <code>{!Global.PathPrefix}/{!DataCategory.Name}.jpg</code> in the text box. The recommended size for this image is 220 x 220 pixels.
Title	Enter the title text for the list of featured data categories.

 **Example:** Sample Featured Data Categories component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Featured Search

The Featured Search component lets your users search for articles within a specified data category.

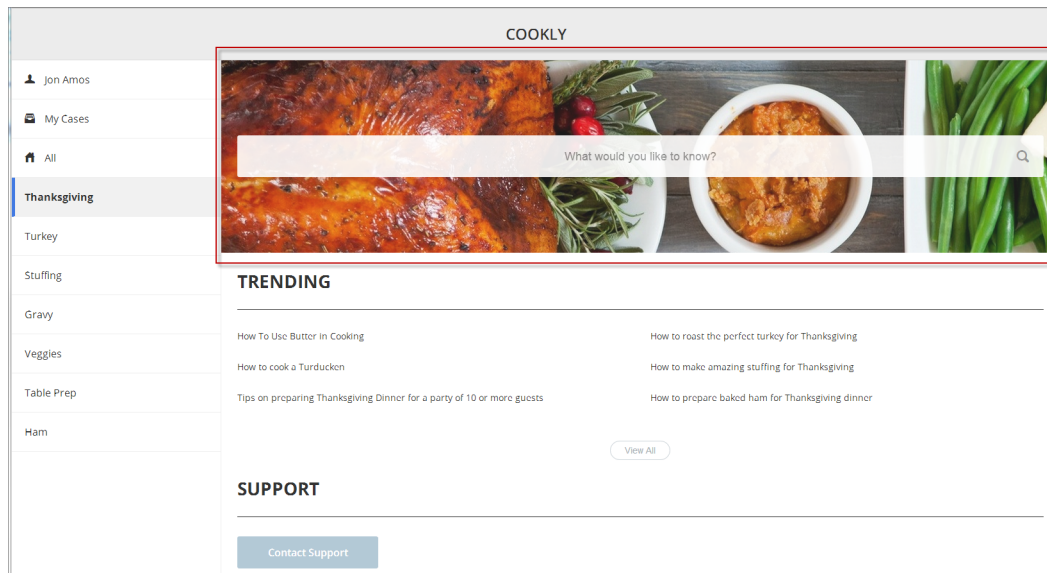

When a user types in the search text box, the system returns articles and search strings based on matches with the characters being typed. You can customize the search to display an image for the data category in which the user is searching.

1. Select the **Featured Search** component in the page you're configuring.

2. In the property editor, configure properties for the component:

Property	Details
Placeholder Text	Enter the text that appears in the search bar. The default text is <code>What would you like to know?</code>
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.
Disable Background Image	Select the checkbox if you don't want to display the background image for the category. The search box becomes smaller and more compact.
Max Number of Auto Query Suggestions	Enter the number of search queries to return per match.
Max Number of Article Title Match Results	Enter the maximum number of articles to return per match.
Category Image URL	Specify the URL to display the image associated with each data category. To display the image for your data categories, type <code>{!Global.PathPrefix}/{!DataCategory.Name}.jpg</code> in the text box. The recommended size for this image is 1220 x 175 pixels.

 **Example:** Sample Featured Search component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

How Incremental Search Works with Koa and Kokua Templates

The search text box returns articles and search strings based on matches with the characters as they are being typed.

Incremental searching gives users immediate results and helps them find the most relevant articles or popular search terms as they type their search string. The user can use the Tab or Arrow keys to display the first suggestion or select on any of the returned results to view that article.

The system queries for public knowledge articles that exist within the channel by which you've made the articles available. So if the user has access to the public knowledge base, only those articles appear in the search. Articles appear in the language that you've selected for the community.

When a user is logged in and clicks the search icon without entering any text, articles and search terms from past searches appear as suggested results.

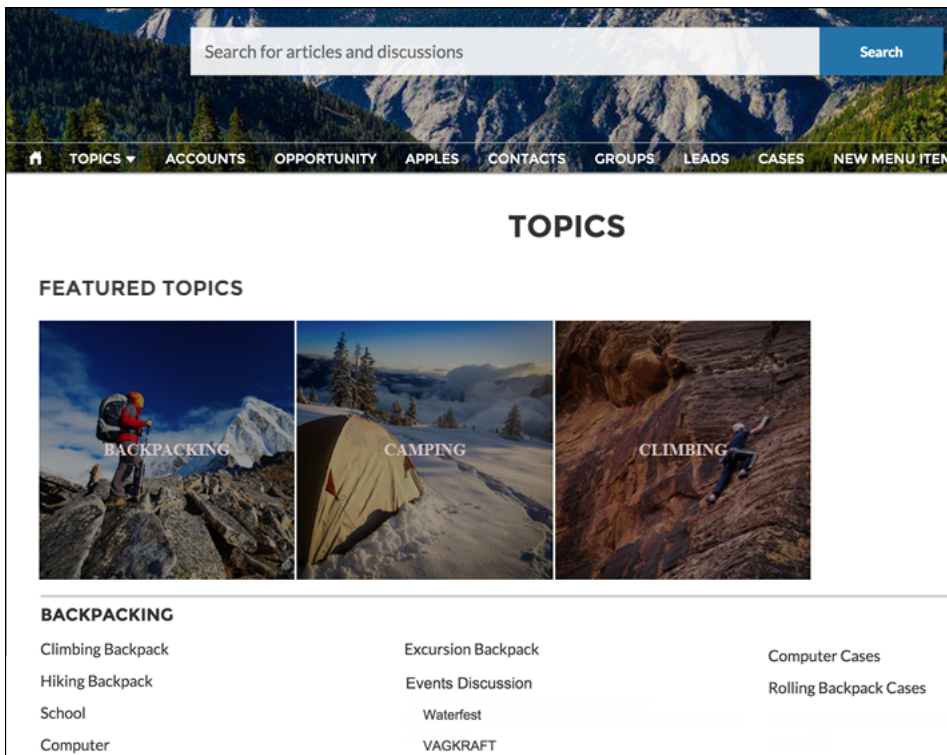

Featured Topics

The Featured Topics component gives you the freedom to display your community's designated featured topics, and the images that represents them, on any community page by simply dragging and dropping.

1. Select the **Featured Topics** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the list of featured topics. The default text is <code>Featured Topics</code> .
Show Title	Check to show the title.

 **Example:** Featured Topics on the Topic Catalog page.

Feed

The Feed component displays a feed of all record or group interactions, including posts, questions, and attachments.

Use the Feed component in the Customer Service (Napili) template to add a feed to a record, a topic, a group, a user profile, or an overall community discussion. The component provides a chronological, filterable list of posts made with the Feed Publisher component. Users who click a post's timestamp are directed to an expanded view, which shows the post and all its related comments.

 **Note:** The Feed component isn't supported for articles.

Comments and attachments on posts appear inline below the post for desktop and tablet users.

1. Select the **Feed** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Feed Type	Select the type of feed you'd like to place on your page.
Record ID	The feed item ID. Typically, this field is automatically populated when the page loads. Leave this field blank if you pick the Community Discussion or My Feed options in Feed Type .
Default Feed Filter	For feed entries you want your community members to see, select the default filter.
Post Style	Choose whether to expand or collapse post comments by default.

 **Example:** Sample Feed component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Feed Compact

Use the Feed Compact component in the Customer Service (Napili) template to add a compact, scannable version of a feed to a record, a topic, a group, a user profile, or an overall community discussion. The component provides a chronological list of question posts made with the Feed Publisher component.

 **Note:** The Feed Compact component displays only question posts, it doesn't support feed filters, nor is it supported for articles.

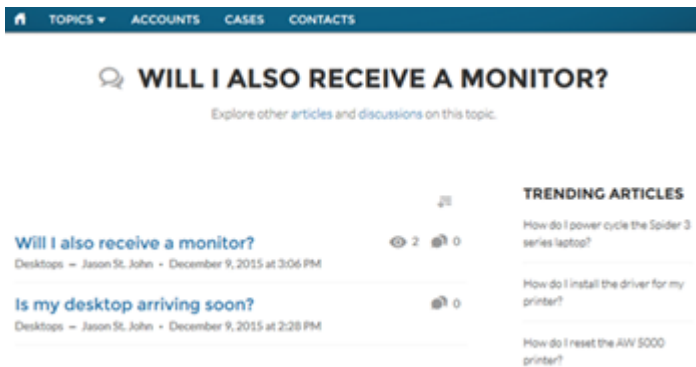

Clicking a post directs users to the expanded post and all its related comments.

1. Select the **Feed Compact** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Show Views	Select to show the number of times an item is viewed  2. A view is counted when an item is liked, commented on, or its detail view is opened. Clear to hide the view count.
Show Likes	Select to show the number of likes for each post. Clear to hide the number of likes.

Property	Details
Show Comments	Select to show the number of comments for each post. Clear to hide the number of comments.
Compact Feed Type	Select the object or context you want to associate this feed with.
Entity Id	The feed item ID. Typically, this field is automatically populated when the page loads. Leave this field blank if you pick the Community Discussion or My Feed options in Compact Feed Type.

Example: Sample Feed Compact component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Feed Post & Comments

The Feed Post & Comments component shows the detailed view of an individual post, comment, or question in the community feed. For questions, it includes the question, all the answers to that question, and an indication if it was escalated to a case.

 **Note:** Before Spring '16, this component was named Feed Item Detail.

Only users who are logged in can post an answer to a question. Users can attach a file to a question or answer post by clicking the paperclip icon. They can choose to **Select a File** from files already uploaded to the community or **Upload a File** from the user's local drive.

Once an answer is posted, users can click  at the top right corner of the post to edit, bookmark, delete, or flag the post. Also, users can edit the topics associated with the post. The editing and flagging features must be enabled for the community. Users in Koa and Kokia communities can only access the Feed Post & Comments component if the community case feed is enabled.

1. Select the **Feed Post & Comments** component in the page you're configuring.

There are no properties to set for this component.

 **Example:** Sample Feed Post & Comments component:

HOW TO GET A REPLACEMENT ZIPPER FOR MY DAYPACK?

Explore other articles and discussions on this topic.

SWalters (Customer) asked a question.
August 5, 2014 at 10:37 AM

How to get a replacement zipper for my daypack?

I broke the zipper on the Daytripper back-pack and I love it! Can I just take it to the store to get it replaced or do I need to ship it back to you?

Feed Publisher

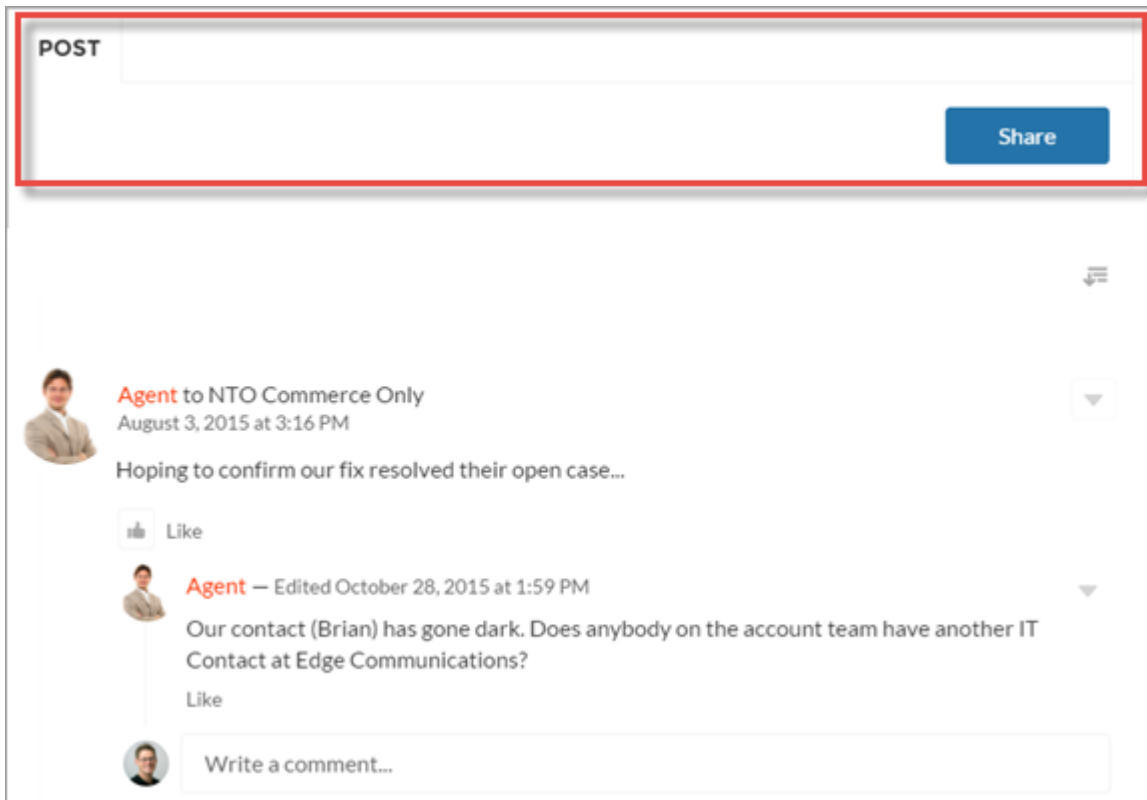

The Feed Publisher component lets customers create rich text posts on records, groups, topics, and profiles, and attach files from any of their devices. It also supports multiple file attachments, inline images, and rich link previews. The Feed Publisher component isn't supported for articles.

When community members create posts using the Feed Publisher, the posts are displayed in the related Feed or Feed Compact component for the page. By default, you can attach any supported file type up to 2 GB per file. For best performance, inline images up to 25 MB per image are recommended. Inline images over 25 MB display at full size, and may be slow to load.

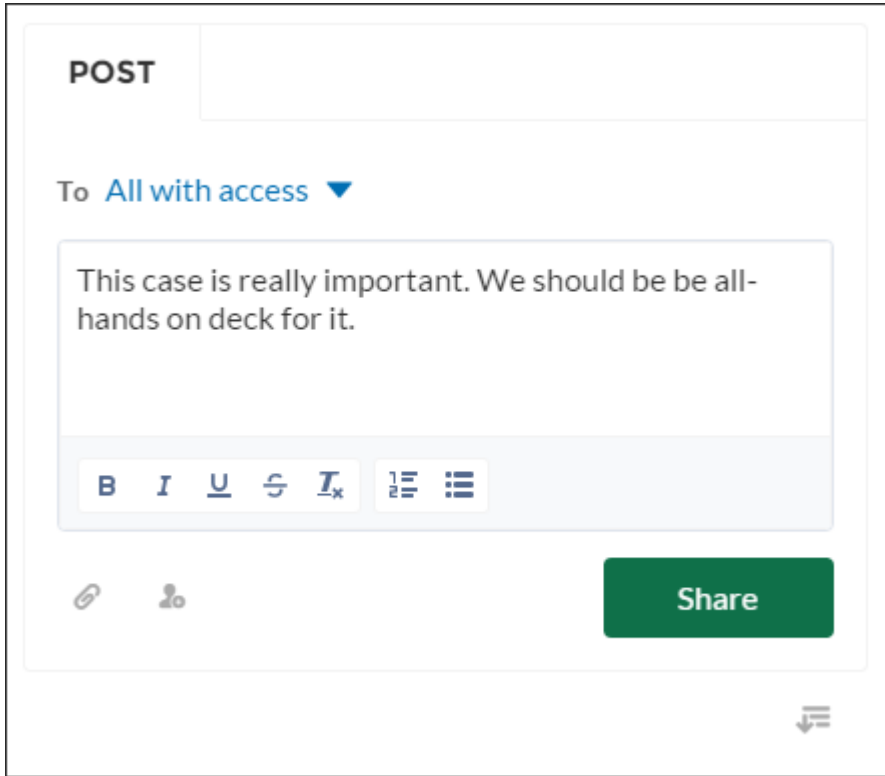

1. Select the **Feed Publisher** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Type	Select the type of feed publisher you'd like to place on your page. To use global publisher actions defined in your Salesforce organization, choose Global. To use an object-specific publisher layout, choose Record. For example, use Record if you want to add the publisher to a custom group detail page and use the publisher actions included in the group publisher layout for your org.
Record ID	The feed item ID. Typically, this field is automatically populated with the record ID when the page loads. Leave this field blank if you pick the Global feed publisher type.
Publisher Layout Design	Choose if you'd like to see the wide or narrow feed publisher layout design.

 **Example:** Sample Feed Publisher component, wide layout

Example: Sample Feed Publisher component, narrow layout

Example: Sample feed post with inline image

Files List

Use the Files List component in the Customer Service (Napili) template to give community members a convenient place to view and manage their files.

Members can upload, sort, and filter files using the files list. Clicking a file opens the file previewer, where members can upload a new version, download, and delete the file. Filters in the left sidebar show different selections of files. The Libraries filter shows files from Salesforce CRM Content libraries, and Files Connect users can see their external libraries under External Sources.

1. Select the **Files List** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Files List	Modify the number of records that display in the window, from 10 to 100. A scrollbar appears to let users scroll to see more records

Example: Sample Files List component, wide layout

Owned by Me	TITLE ↑	OWNER	LAST MODIFIED DATE

Follow Button

The Follow Button component allows users to follow users or topics.

In the Page Editor, you can configure the follow button component on the Profile and the Topic View pages. This component allows a user to follow a topic or another user by clicking this button. When a user views their own profile, the button isn't visible.

1. Select the **Follow Button** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Followed Record ID	The system supplies this value. Don't update this field.

 **Example:** Sample Follow Button component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Global Search Results

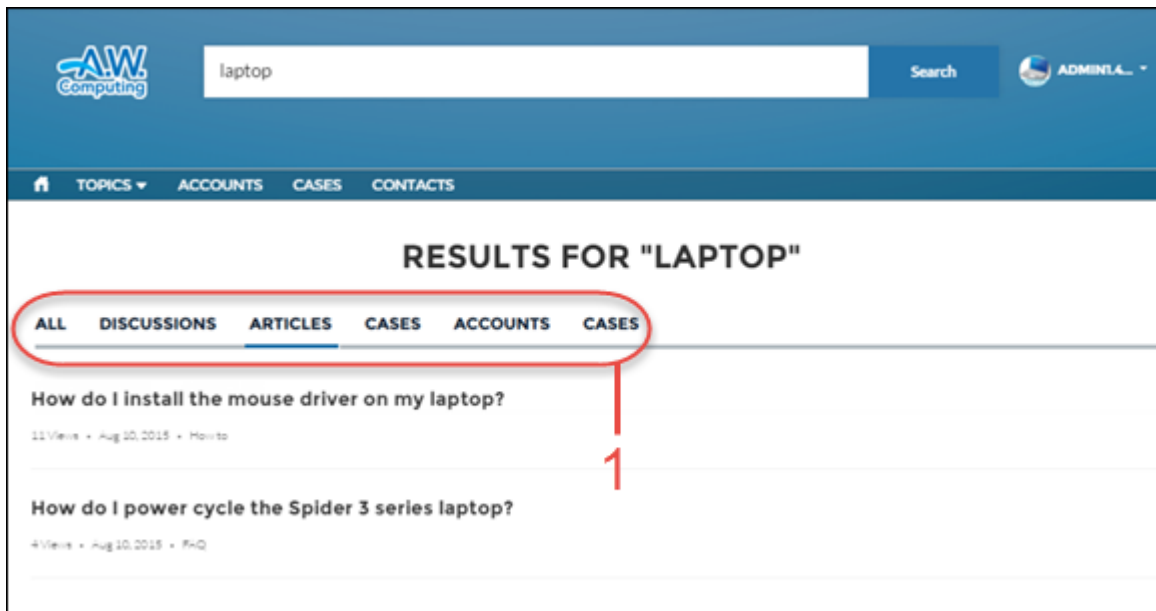

The Global Search Results component displays search results from across the community. The results shown are based on search terms entered in the Search Publisher and can be displayed in one list or in multiple tabs.

1. Select the **Global Search** component.
2. In the property editor, configure properties for the component:

Property	Details
{!searchString}	The system supplies this search term to search across the community.
Show the All results tab.	Check the box to show search results in one list under All.
Search Results Tabs	Add or remove tabs to customize which lists search results are displayed in.

 **Important:** To allow your users to find a custom object's records when they search, in Salesforce setup create a custom tab set to *Default On* or *Default Off*. Creating a custom tab enables the custom object's **Allow Search** setting.

 **Example:** Global Search Results shown in the community:

Group

The Group component displays all the content in a group using a single composite component. It includes the group banner, which includes the member and owner actions, the group feed, description, and related lists (group members and files).

When you add groups to your community navigation menu, clicking the Groups item directs community members to a list of groups. Clicking a group in the group list loads the Group Detail page, which uses this component by default.

Note:

- Add the Add Member action to the group publisher for users to access it from the banner.
- For optimal display, choose a wide column width when using this component on a custom page.

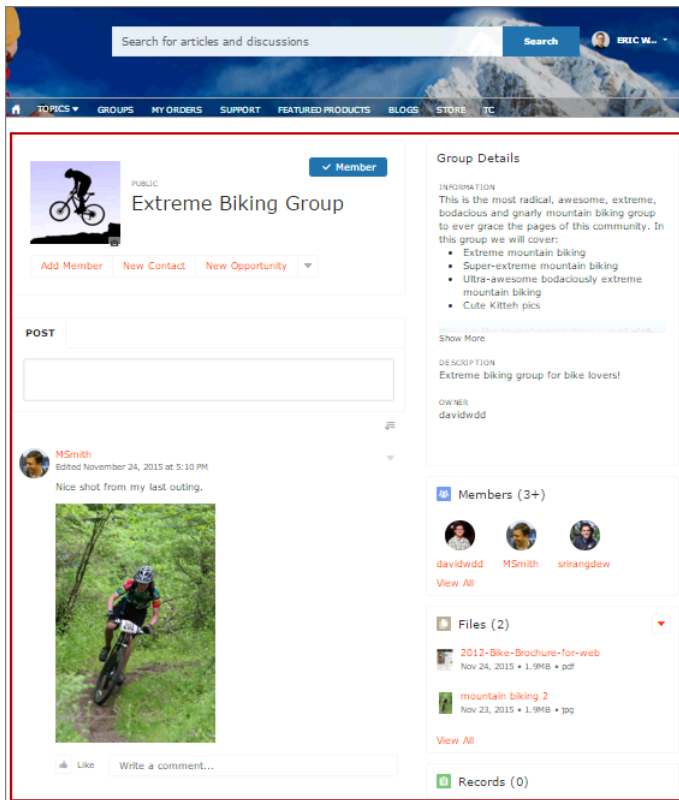

1. Select the **Group** component on the page you're configuring. By default, this component is located on the Group Detail page.

 **Note:** You must have at least one group in your community to view the Group Detail page and modify its components.

2. In the property editor, configure properties for the component:

Property	Details
Group ID	The ID of the group. This value is automatically populated when the group is displayed.
Feed Tab Label	The label used for the group feed tab on mobile devices. The default text is <code>Feed</code> . The label you specify here doesn't affect labels on desktop browsers.
Details Tab Label	The label used for the group details tab on mobile devices. The default text is <code>Details</code> . The label you specify here doesn't affect labels on desktop browsers.
Related Tab Label	The label used for the related lists tab on mobile devices. The default text is <code>Related</code> . The label you specify here doesn't affect labels on desktop browsers.

 **Example:** Sample Group component:

 **Note:** The Group component is optimized to be responsive across all devices. If you want more control over the placement of group content, you can use separate components to create a custom layout. Use the Group Banner, Group Detail, Group Related List, Feed Publisher, and the Feed or Feed Compact components to create a custom group page. However, creating a custom group page does not guarantee optimal display and responsiveness across desktop and mobile devices.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Group Banner

Use the Group Banner component on custom group detail pages for your community. This component displays the group name, the group photo, the Join Group and Leave Group buttons, and other action buttons for group owners, managers, and members.

Use the Group Banner component with the Group Detail, Group Related List, Feed Publisher, and the Feed or Feed Compact components to create a custom group detail page. Creating a custom group detail page does not guarantee optimal display and responsiveness across all desktop and mobile devices. We recommend using the Group component instead, which is a single composite component that displays all of this content.

 **Note:**

- Add the Add Member action to the group publisher for users to access it from the banner.
- For optimal display, choose a wide column width when using this component.

1. Select the **Group Banner** component on the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Group ID	The ID of the group. This value is automatically populated when the group is displayed.

Example: Sample Group Banner component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Group Detail

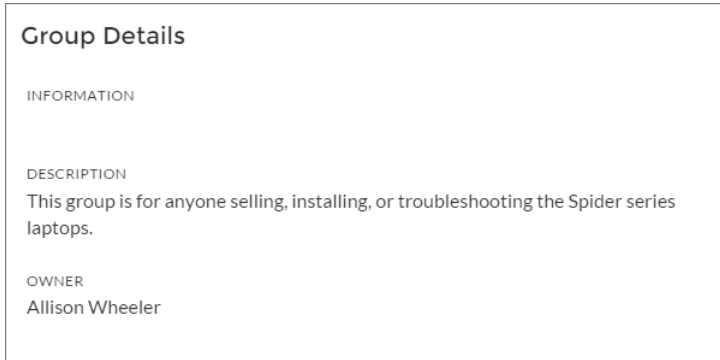

Use the Group Detail component on custom group detail pages for your community. This component displays the content from the group description and information fields along with the name of the group owner.

Use the Group Detail component with the Group Banner, Group Related List, Feed Publisher, and the Feed or Feed Compact components to create a custom group detail page. Creating a custom group detail page does not guarantee optimal display and responsiveness across all desktop and mobile devices. We recommend using the Group component instead, which is a single composite component that displays all of this content.

1. Select the **Group Detail** component on the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Group ID	The ID of the group. This value is automatically populated when the group is displayed.
Header label	The label for the group details section. Affects both the desktop and mobile view.

Example: Sample Group Detail component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Group Related List

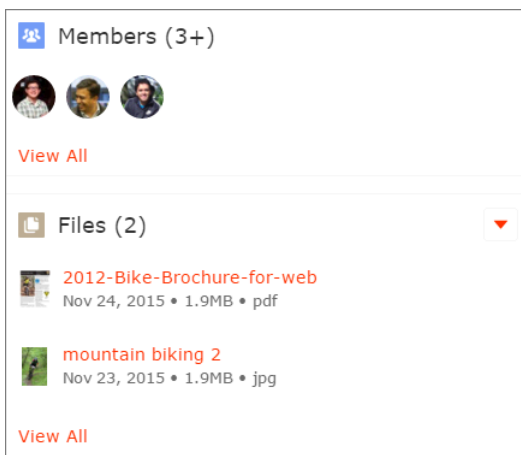

Use the Group Related List component on custom group detail pages for your community. This component displays the group files, members, and records.

Use the Group Related List component with the Group Banner, Group Detail, Feed Publisher, and the Feed or Feed Compact components to create a custom group detail page. Creating a custom group detail page does not guarantee optimal display and responsiveness across all desktop and mobile devices. We recommend using the Group component instead, which is a single composite component that displays all of this content.

1. Select the **Group Related List** component on the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Group ID	The ID of the group. This value is automatically populated when the group is displayed.

Example: Sample Group Related List component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Headline

The Headline component gives you customizable headline text and text banner with inline links to pages that show discussions, topics, and articles. It also displays an icon to the left of the banner that identifies the content as an article or a discussion when either is selected.

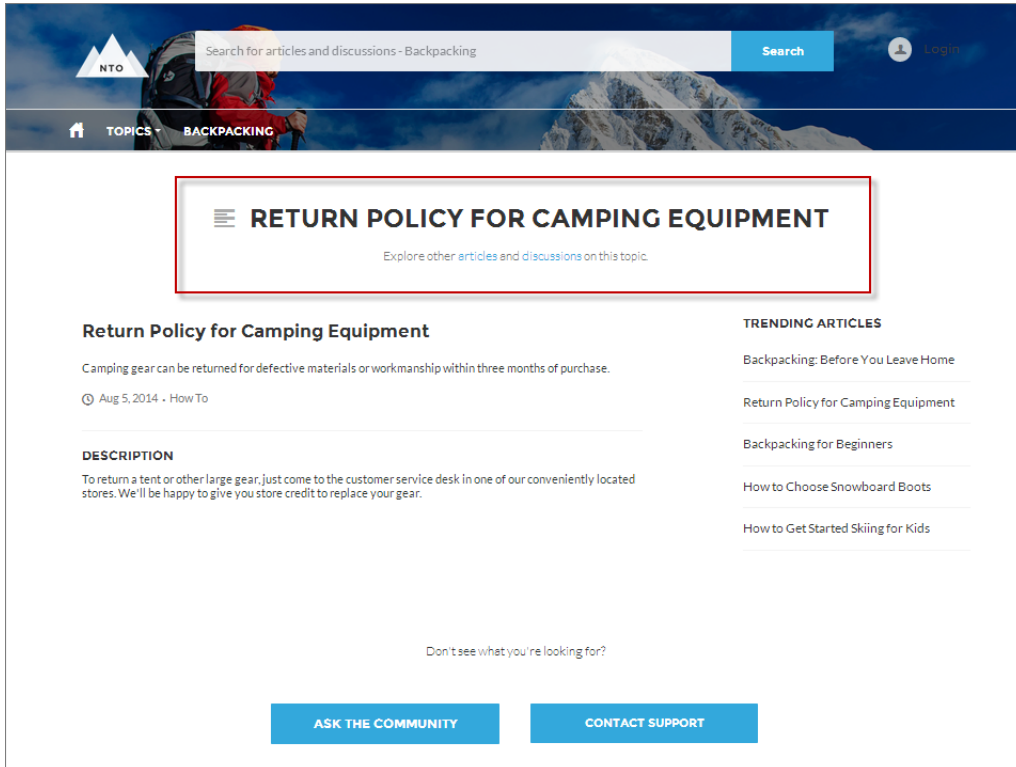

1. Select the **Headline** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter the static text for the page's headline. The default text for the page is <code>Welcome !</code> .
Banner Text	Enter the static text that appears on the home page. The default text is <code>A place where you can easily find solutions and ask questions.</code>
Page Type	Enter the type of content that the page displays in this page. Type either <code>article</code> , <code>topic</code> , or <code>discussion</code> to retrieve the title of the page and display an icon identifying the type of page the user is viewing.
Unique Name or ID	The system retrieves the ID from the URL of the question or article when it's selected.
Banner Text with Articles and Discussions	<p>Enter the static text and link text that lets users select a page that shows articles or discussions. This text and links in this field appear on the page when Salesforce Knowledge is enabled and set up in your organization. You can translate and change the value of each component, but not the position of the component.</p> <pre>Explore other articles and discussions on this topic</pre>
Banner Text with Discussions	<p>Enter the static text and link text that lets users select a page that shows discussions only. This text and link in this field appear on the page when Salesforce Knowledge isn't enabled in your organization. You can translate and change the value of each component, but not the position of the component.</p> <pre>Explore other discussions on this topic</pre>
Show Subtopics	<p>Below the headline, displays links to topics that are children of the current topic. (On mobile devices, these links appear in a Subtopics menu.)</p> <p>Only navigational topics support parent-child relationships.</p>

If you have set up navigational subtopics, change the following properties in the property editor to populate topic and subtopics dynamically on the topic detail page:

Property	Details
Title	Enter <code>{!topicName}</code> to retrieve and display the topic name on the topic detail page.
Page Type	Enter <code>topic</code> as the page type.
Show Subtopics	Select this option to display subtopics.

 **Example:** Sample Headline component:

The screenshot displays a community page for 'Backpacking'. At the top, there is a search bar with the text 'Search for articles and discussions - Backpacking' and a 'Search' button. Below the search bar, there are navigation tabs for 'TOPICS' and 'BACKPACKING'. The main content area features a headline component with the title 'RETURN POLICY FOR CAMPING EQUIPMENT' and a sub-headline 'Explore other articles and discussions on this topic.' Below the headline, there is a section titled 'Return Policy for Camping Equipment' with a brief description and a date 'Aug 5, 2014 - How To'. To the right, there is a 'TRENDING ARTICLES' section with a list of articles: 'Backpacking: Before You Leave Home', 'Return Policy for Camping Equipment', 'Backpacking for Beginners', 'How to Choose Snowboard Boots', and 'How to Get Started Skiing for Kids'. At the bottom, there are two buttons: 'ASK THE COMMUNITY' and 'CONTACT SUPPORT'.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Featured Topics & Feeds

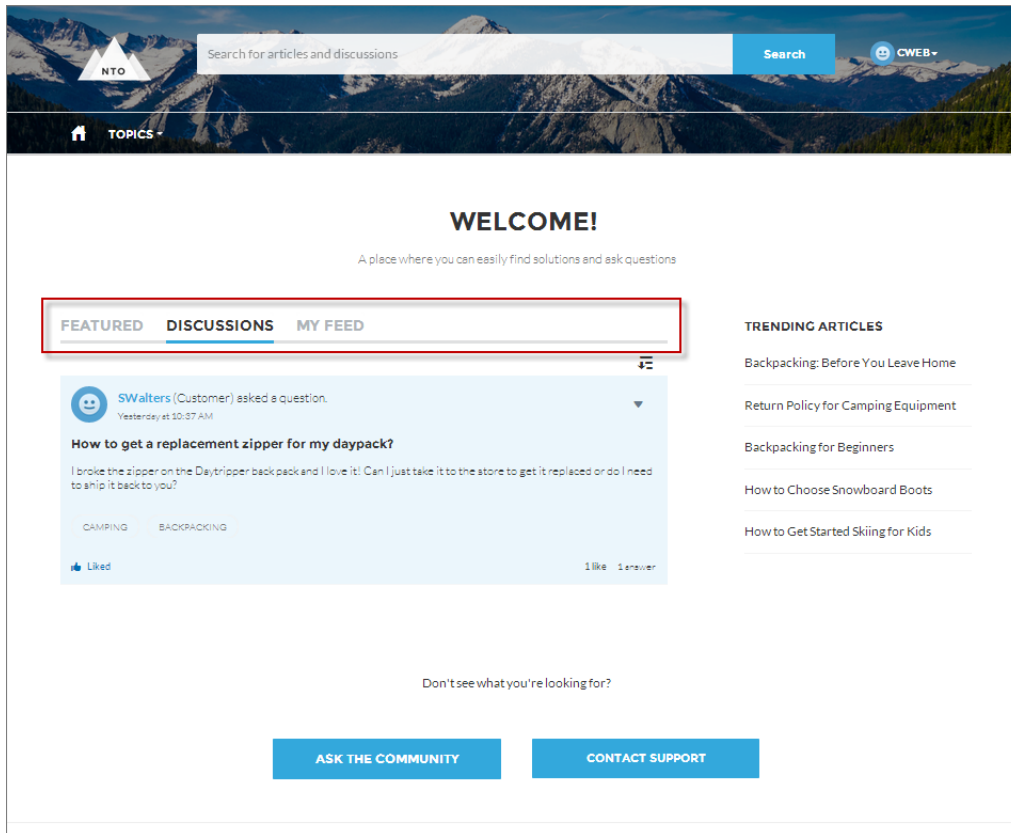

The Featured Topics & Feeds component displays the Featured Topics, Discussions, and My Feed in a tabbed setting. Community members must be logged in to see the My Feed tab.

 **Note:** Before Summer '16, this component was named Home Page Tabs.

1. Select the **Featured Topics & Feeds** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Featured Tab Label	Enter the text you'd like to display on the tab that users select to show topics. The default text is <code>Featured</code> .
Discussions Label	Enter the text you'd like to display on the tab that users select to show discussions. The default text is <code>Discussions</code> .
My Feed Label	Enter the text you'd like to display on the tab that users select to show their feed. The default text is <code>My Feed</code> .
Compact Feed in Discussion Tab	Select to use the compact version of the feed in the Discussions tab. Compact feeds show only question titles and make it easier for users to scan the feed. Compact feeds don't support filters.

 **Example:** Sample Featured Topics & Feeds component:

The screenshot displays a community interface with a search bar at the top and a navigation menu. The navigation menu includes tabs for 'FEATURED', 'DISCUSSIONS', and 'MY FEED', with 'DISCUSSIONS' currently selected. Below the navigation menu, a discussion post is visible, titled 'How to get a replacement zipper for my daypack?' by user 'SWalters (Customer)'. The post content reads: 'I broke the zipper on the Daytripper back pack and I love it! Can I just take it to the store to get it replaced or do I need to ship it back to you?'. The post has 'Like' and 'Answer' buttons. To the right of the discussion is a 'TRENDING ARTICLES' section with several article titles. At the bottom of the page, there are two buttons: 'ASK THE COMMUNITY' and 'CONTACT SUPPORT'.

[Which Components Can I Use with Each Template?](#)

Knowledgeable People

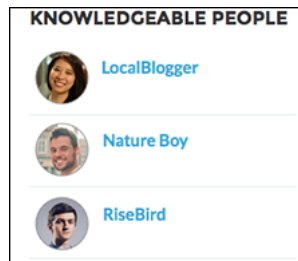

Highlight topic experts so the community can direct questions straight to them. The Knowledgeable People component displays up to five experts, chosen based on factors such as best answers, mentions, or likes on questions and posts.

In the Page Editor, you can configure the Knowledgeable People component on Topic View pages.

1. Select the **Knowledgeable People** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the component. The default text is <code>Knowledgeable People</code> .
Topic ID	The default entry, <code>{!topicId}</code> , displays unique knowledgeable users for each topic. To instead display knowledgeable users based on a specific topic, enter the topic ID.

Example:

For communities created in Spring '15 or earlier, complete these steps to add the Knowledgeable People component:

1. From the community, click  in the global header.
2. Click **Administration** > **Preferences**, and select **Enable knowledgeable people on topics**.
3. Click **Administration** > **Pages**, and go to Site.com Studio.
4. In the Site Pages section, double-click the **main** page.
5. In the Views tab at left, double-click **Customer Service (Napili) Topic View**.
6. Click the Page Elements tab , and search for the Knowledgeable People component.
7. Right-click the component, and place it in the `div.cSecondaryContent` section.

Language Picker

The Language Picker component lets guest users select their preferred language on a page in your community.

You can add the language picker to the header or footer, or to any section of any page; it's not included on any pages by default. Only guest users see the language picker. For authenticated users, the community automatically displays in their profile language. For guest

users, the community displays in the community default language. Customized labels and knowledge articles use the translations added by the community admin in Translation Workbench.

If the guest user wants to view the community in a different language, they can select their preferred language using the language picker. The language picker shows all languages supported in the community. When the user selects a language, the page reloads in that language.

 **Note:**

- The Language pane in Site.com Studio shows the default language and the list of languages supported in the community. If no languages apart from the default language have been set in Site.com Studio, the language picker shows the default language without a drop-down option. To learn more about setting site languages in Site.com Studio, see [Create a Multilingual Site](#).
- To see the list of languages that guest users see, go to the Branding Editor in Community Builder. Make sure you're on a page that contains the language picker. Then click the drop-down icon on the language picker.

1. Select the Language Picker component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Alignment (Left, Center, or Right)	To specify how the language picker is aligned on the page, enter <i>Left</i> , <i>Center</i> , or <i>Right</i> . The default value is <i>Center</i> .

 **Example:** Sample Language Picker component with drop-down language list visible:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Message Notification

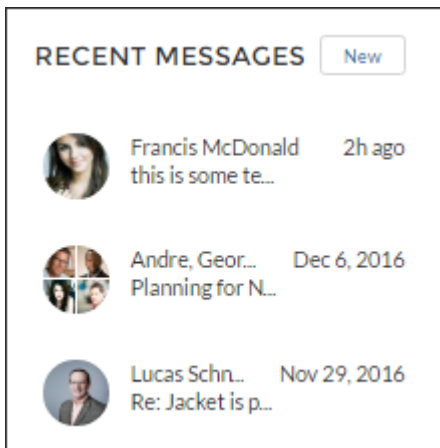

Add the Message Notification component to your community pages to let users view their recent messages from outside the Messages list view. The Message Notification component shows up to three recent messages and allows users to send new messages.

Add the Message Notification component to the community Home page and configure it in the Page Editor.

1. Select the **Message Notification** component.
2. In the property editor, configure properties for the component:

Property	Details
Header Label	Enter a title for the component. The default text is <i>Recent Messages</i> .

 **Example:** Sample Message Notification component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Navigation Bar

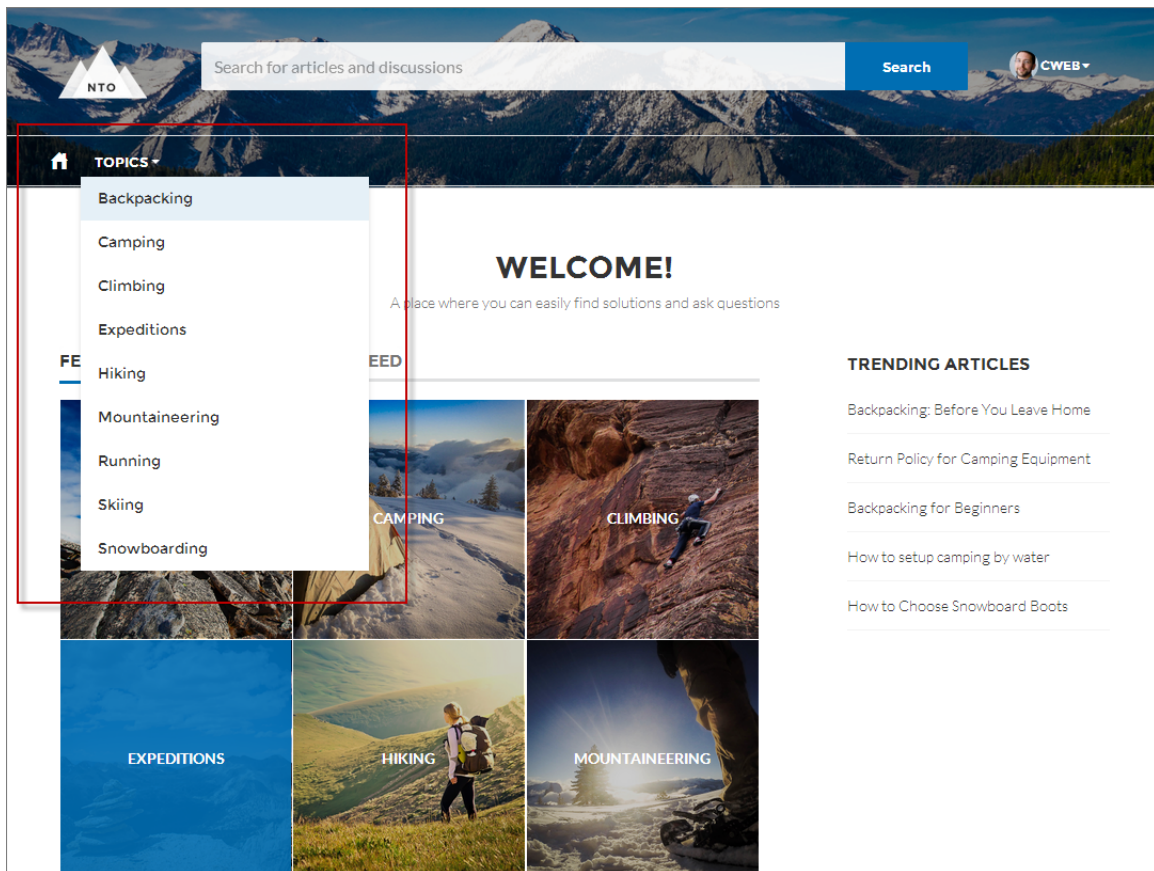

The Navigation Bar component lets users select different topics to browse and provides navigation back to the community home page.

If your Customer Service (Napili) template version is Winter '16 or later, this component is replaced with the [Navigation Menu](#) component.

1. Select the **Navigation Bar** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Topic Menu Label	Enter the text you want to appear as the label for the drop-down list of topics that appears in the navigation bar.

 **Example:** Sample Navigation Bar component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Navigation Menu

The navigation menu component extends your community's navigation beyond navigational topics. Navigation menu items can include Salesforce objects, topics, pages in your community, URLs to external sites, and menu labels. Menu labels are parent headings under which you can nest other menu items.

When setting up the navigation menu, consider the following:

- Menu item labels must be unique within the community.
- You can add up to 20 navigation menu items. Menu items that don't fit on the first line of the navigation menu appear in a **More** overflow menu item.
- If you want to map a navigational topic to a menu item, you must first set it up in Community Management.

To create or modify navigation menu items:

1. Select the **Navigation Menu** component in the page you're configuring.
2. In the property editor, click **Navigation Menu**.
In the menu editor overlay, you can edit or delete existing menu items, or add new ones.

3. To add a menu item:
 - a. Click **Add Menu Item**.
 - b. Enter the name you want to use in the navigation menu for this item.
 - c. Select the type of item you're navigating to.
Options include:
 - Community Page—Links to a page inside your community using a relative URL. For example, `/contactsupport`.
 - External URL—Links to a URL outside of your community. For example, `http://www.salesforce.com`.
 - Menu Label—Adds a parent heading for your navigation menu. Nest items underneath the menu label.
 - Navigational Topic—A drop-down with links to the navigational topics in your community. Navigational topics are set up in Community Management.
 - Salesforce Object—Available objects include accounts, cases, contacts, leads, opportunities, and any custom objects.

 **Tip:** Select this option to create a list view page for the selected object. This option is the easiest way to expose Salesforce record data in your community with minimum configuration.
 - d. Complete the fields based on the type you selected.
 - If you selected Salesforce Object, select the default list view to show.
 - If you selected Community Page, use the drop-down to select the community page you want to link to. The URL field automatically populates the relative URL for the page based on your selection.
 - If you selected External URL, enter the fully qualified URL. To keep navigation within your community, select the `Open link in the same tab` checkbox.
 - Select **Publicly Available** if you want the navigation menu item to show for guest users that aren't members of the community.
4. To move an item, click  and drag the item to where you want it to appear in the menu. Nest other menu items underneath a menu label by dragging them to the right under the menu label.
5. To delete a menu item, hover over or click the item and click .
6. Save your changes.

If your community is already active, you see a Publish Changes button. **When you click this button, your new navigation menu changes are immediately visible to community members.**

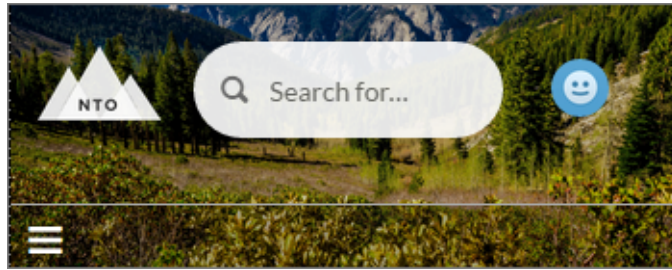

If your community is still in Preview status, you see a Save Changes button. When you click this button, your changes are saved and are visible to your community when you activate it.

 **Example:** Sample Navigation Menu component:

On a mobile device, your community navigation menu collapses to better fit your screen.

Sample Navigation Menu component on a mobile device:

If your community hosts users who speak different languages, you can translate your navigation menu using the Translation Workbench. For information on using the Translation Workbench, see "Translate Terms" in the Salesforce help.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

New Message Button

Drag and drop the New Message Button on a community page to allow community members to start a direct message conversation from that location.

Add the New Message Button component to a community page and configure it in the Page Editor.

1. Select the **New Message Button** component.
2. In the property editor, configure properties for the component:

Property	Details
User ID	The ID of the user sending the message. The system automatically detects and populates this value.
Label	Enter a title for the component. The default text is <i>Send Message</i> .

 **Example:** Sample New Message Button component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Path

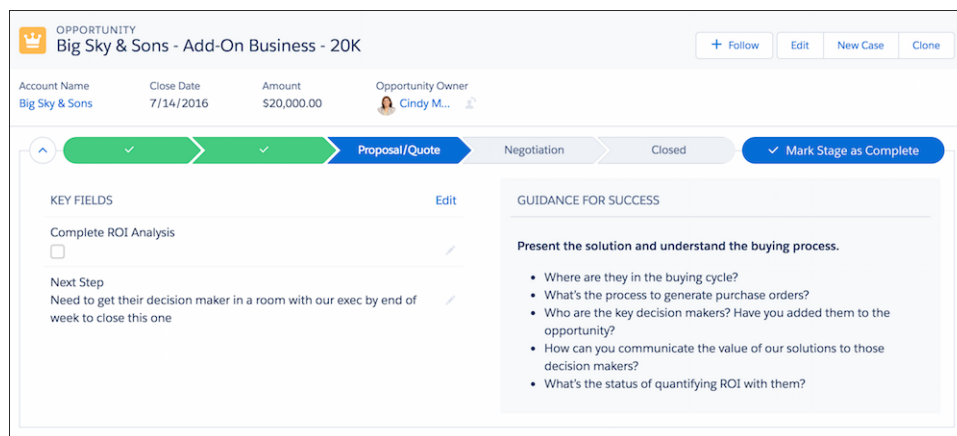

Use this component to guide sales reps through the stages of the sales process and prompt them to enter key field information and record activities. The Path component is used on the Opportunity or Lead record detail pages.

The Path component is intended for a wide-column layout. Add it to columns that are at least 50% wide, though full columns are best.

 **Note:** To see paths on mobile devices, configure a custom path for mobile in your Salesforce org.

1. Set up the path in the Setup menu.
 - a. From Setup, enter **Path** in the **Quick Find** box, then select **Path Settings**.
 - b. Click **Enable**, and then click **New Path** to create a path.
2. Select the **Path** component in the Opportunity Detail or Lead Detail page you're configuring.

 **Example:** Sample Sales Path component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Profile Header

The Profile Header component displays a user's name (or nickname) and profile picture. It also displays a drop-down that lets users navigate to their profile, open a case, access their locale and email notification settings, or log out of the community. External users can also access and manage their account. If the user isn't logged in, a Login button appears in the header.

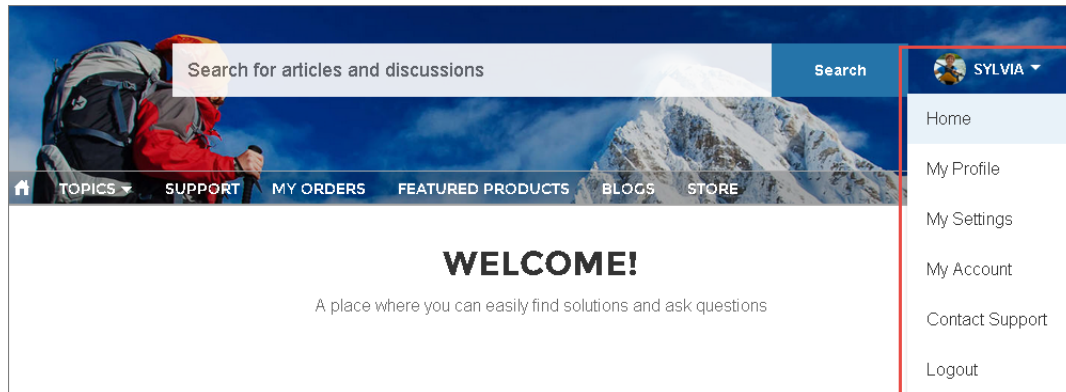

Users can't customize the profile photo functionality in the profile header—they need to edit all profile information from the profile details page.

 **Note:** If nickname display is enabled in the community, this component shows the nickname instead of the user's name. The user's reputation level displays only if reputation is enabled in the community.

1. Select the **Profile Header** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Case Filter Name or ID	<p>The name or ID of the list view that displays the user's cases. This value is used throughout the community to display the user's list of cases.</p> <p> Note: By default, the template uses the AllOpenCases view, which lets users view any open cases that they have permission to see. Configure sharing to ensure that users see only cases that belong to them. Alternatively, you can use another pre-defined list view or create a custom list view.</p>
Include Contact Support	Select this checkbox to include the option to contact an agent from the profile.
Home Label	Enter the text you want to show for the link to the community home page from the user navigation menu. The default text is <i>Home</i> .
View Profile Label	Enter the text you want to show for the link to the profile detail page. The default text is <i>View Profile</i> .
Contact Support Label	Enter the text you want to show for the link to the page where the user can open a case. The default text is <i>Contact Support</i> .
Login Label	Enter the text you want to show for the link to log in to the community. The default text is <i>Login</i> .
Logout Label	Enter the text you want to show for the link to log out from the community. The default text is <i>Log Out</i> .
Community Management	Enter the text you want to show for the link to the Community Management page. The default text is <i>Community Management</i> . This link only appears for users with permissions to manage the community.
Community Setup Label	Enter the text you want to show for the link to the setup page for communities. The default text is <i>Community Setup</i> . This link is shown to users with permissions to create or modify the community's administration settings.
User Settings (Customer Service (Napili) template only)	Enter the text you want to show for the link to access an authenticated user's personal settings for the community. The default text is <i>My Settings</i> .
Show User Settings in Menu (Customer Service (Napili) template only)	Select this checkbox to show user setting in the profile drop-down list.
My Account Label (Customer Service (Napili) template only)	<p>Enter the text you want to show for the link that external users click to view their account record. The Default text is <i>My Account</i>. This feature is available in the Spring '16 version of the Customer Service (Napili) template and later.</p> <p> Note: External community members who access the My Account link see their account details based on the configuration of the Record Detail page.</p>

 **Example:** Sample Profile Header component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Recommendations

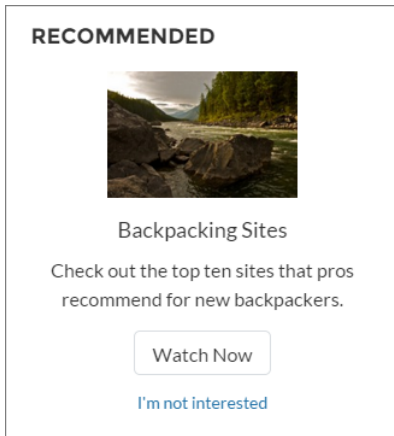

The Recommendations component displays the recommendations for your community.

You can configure the Recommendations component in the Page Editor. The component appears on the community page when a custom recommendation or a system-generated topic recommendation is available.

1. Select the **Recommendations** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the component. The default text is <i>Recommended</i> .
Recommendation Channel	Choose the recommendation channel. The default is <i>Default Channel</i> . To display recommendations that you created in a custom channel, choose that channel. Use these channel values; you can't rename or create other channels.

 **Example:** Sample Recommendations component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Record Banner

The Record Banner component shows the record name, key record highlights, and action buttons that allow users to edit or delete the record.

Before Spring '16, this component was named Record Headline. The Customer Service (Napili) template supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (that uses a preassigned case detail layout) and clicks a contact in the related records. If you haven't created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page. Under the hood, the Record Detail page uses the Record Banner component along with the Record Information Tabs component to display record data.

- You can use the Record Banner component on custom record detail pages that you create. We recommend using it with the Record Information component.
- You can modify what fields display in the Record Banner component by customizing the Highlights Panel layout in the object's page layout.
- Community members with the necessary permissions can use the Edit and Delete buttons to modify or delete the record. These buttons don't display on mobile devices.

 **Note:** For optimal appearance, choose a wide column width when placing this component on your community page.

1. From the Page menu in Community Builder, select Record Detail or your custom record detail page.
2. Select the **Record Banner** component or drag the component from the Page Editor to the page to add it.
3. In the property editor, configure properties for the component:

Property	Details
Record ID	The ID of the record displayed. Typically, this field is automatically populated.

 **Example:** Sample Record Banner component in the Customer Service (Napili) template.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Record Detail

Use this component to share record details in a community built using the Customer Service (Napili) template.

Simply drag the Record Detail component on a record detail or a custom page in the community, and it populates with record information stored in Salesforce. This component is a great way to share information with community members who need it most, like partners.

Users accessing the community on a mobile device have access to actions from the record detail page. For example, a partner user with create and edit access to accounts can create accounts or update an account as needed.

 **Note:** To display the record feed, use one of the feed components with the feed publisher component. To show the related records, use the [Record Related List](#) component. To show a combination of record details, related lists, and the record feed together, we recommend using the composite [Record Information Tabs](#) component.

1. Select the **Record Detail** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Record ID	The record ID. Typically, this field automatically picks up the record ID when the page loads.

 **Example:** Example of a Record Detail component on a community.

Record Information Tabs

The Record Information Tabs component shows detailed record information, lists of related records, and the record feed.

Before Spring '16, this component was called Record Information. The Record Information Tabs component uses the Record Detail Page and the Record Banner component to display record data. Let's dive in and look at it more closely.

The Customer Service (Napili) template supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (that uses a preassigned case detail layout) and clicks a contact in the related records. If you haven't created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page.

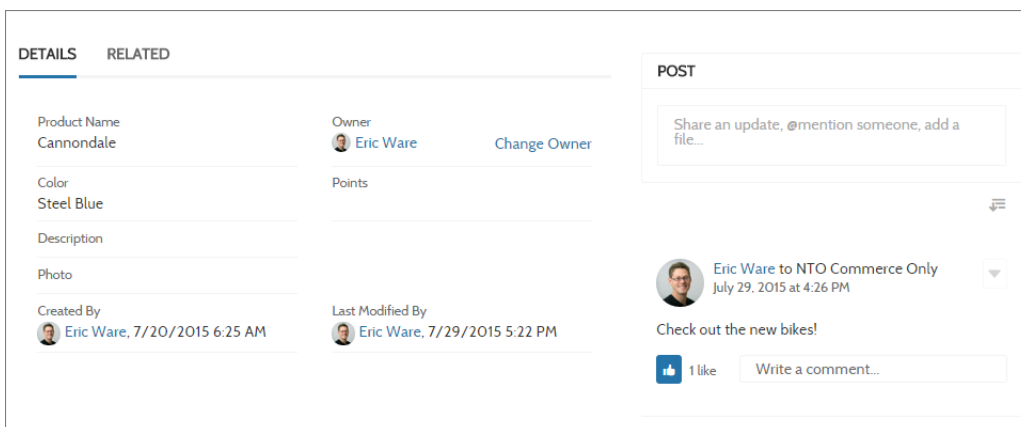

- You can use the Record Information Tabs component on custom record detail pages that you create. We recommend using it with the Record Banner component.
- You can modify what fields display in the Record Information Tabs component by customizing the object's page layout.
- Community members with permissions can create new related records and send emails from the Related tab. They can also expand related record lists to see a longer list. These details are displayed on the generic Record Related List page. These buttons don't display on mobile devices.

 **Note:** Emails are supported in accounts, contacts, leads, opportunities, and campaigns.

1. In the Community Builder Page Editor, select Record Detail or your custom record detail page from the page menu.
2. Select the **Record Information Tabs** component or drag the component from the Page Editor to the page to add it.
3. In the property editor, configure properties for the component:

Property	Details
Record ID	The ID of the record. This value is automatically populated.
Details Tab Label	Label for the tab that shows record details. The default label is Details.
Related Tab Label	Label for the tab that shows lists of related records. The default label is Related.
Discussion Tab Label	Label for the tab that shows the record feed. The default label is Discussions. This label is used on mobile devices only.

 **Example:** Sample Record Information Tabs component in the Customer Service (Napili) template.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Record List

The Record List component shows a list of records on the Record List page. Users can view records, switch between record list views, and create records directly from the list view. If a user doesn't have access to a particular list view, they see the Recently Used list view instead.

 **Note:** Before Spring '16, this component was named Record List View.

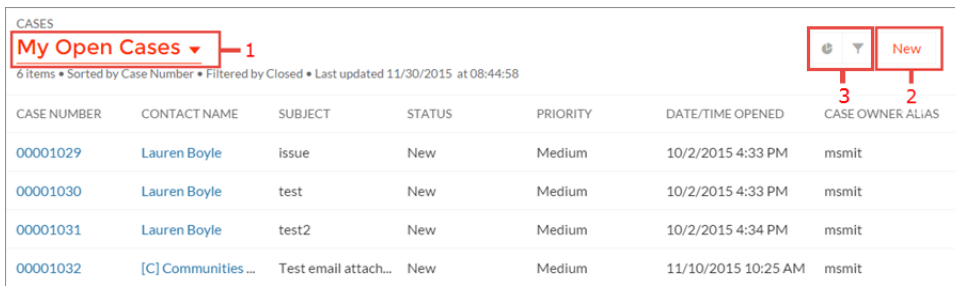

When you create a custom navigation menu item using the Salesforce Object type, it automatically links to a page that displays a list of the records for the selected object. The Customer Service (Napili) template provides an out-of-the-box page to display such a list of records. This generic page is called the Record List page. It's used for all objects in your community that don't have a custom page assigned to them.

- The Record List component supports **accounts, cases, contacts, campaigns, campaign members, groups, leads, opportunities, and custom objects**.
 - You can use the Record List component on any page in your community. We recommend adding it to custom list views that you create. You can also create a navigation menu item to link to that page with its internal page URL.
 - The Record List component is available in two layouts—Full and Compact—so you can choose the one that best meets your needs. The compact layout is ideal for showing short lists of information in a narrow column or when displaying your community on a mobile device. When a page using the full layout is viewed on a mobile device, the page automatically switches to the compact layout.
 - Community members with the necessary permissions can use the New button on the component to create records. This button doesn't display on mobile devices.
 - Community members can click  to filter the list view or remove filters. They can also click  to view related charts. These buttons don't display on mobile devices.
1. Select the **Record List** component on the Record List page.
 2. In the property editor, configure properties for the component:

Property	Details
Number of Records	<p>The number of entries retrieved to show in the list view. The default is 25.</p> <p>When the compact layout is selected, this is the number of records shown. If there are more than 25 records, you click a link to see the full list of records. The maximum number of records for the compact layout is 100.</p> <p>When the full layout is selected, this is the number of records initially shown. As a user scrolls down, more records are displayed. The maximum number of records per page for the full layout is 100.</p>
Layout	<p>Choose from full layout or compact layout. When choosing the layout, consider the following:</p> <ul style="list-style-type: none"> • Compact layout works in any size column. For full layout, use a column width of at least 50% of the page. • If using the full layout, we recommend that you don't place a component below the Record List component on the page. <ul style="list-style-type: none"> – Full layout has a minimum height of 700 pixels. If you place a component below the full layout of the Record List component, the Record List component can overlap with the component below.

Property	Details
	<ul style="list-style-type: none"> Full layout uses infinite scrolling. If you reference an object that contains many records, infinite scrolling can prevent community members from ever seeing the component below the Record List component.
Page's Object Name	The Salesforce object whose records you want to show. The drop-down shows the supported objects: accounts, campaigns, campaign members, cases, contacts, groups, leads, opportunities, and custom objects.
Page's Filter Name	The list view to show for the selected object. The drop-down shows only list views that are valid for the object you select.

 **Example:** Sample Record List component (Full layout):

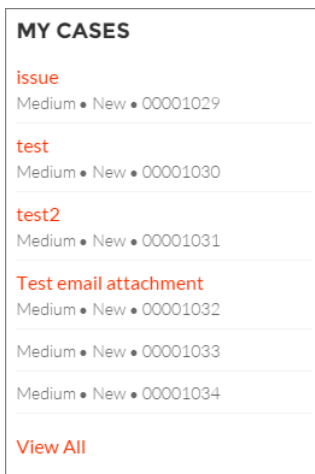

CASE NUMBER	CONTACT NAME	SUBJECT	STATUS	PRIORITY	DATE/TIME OPENED	CASE OWNER ALIAS
00001029	Lauren Boyle	issue	New	Medium	10/2/2015 4:33 PM	mssmit
00001030	Lauren Boyle	test	New	Medium	10/2/2015 4:33 PM	mssmit
00001031	Lauren Boyle	test2	New	Medium	10/2/2015 4:34 PM	mssmit
00001032	[C] Communities ...	Test email attach...	New	Medium	11/10/2015 10:25 AM	mssmit

Community members can:

- Use the menu (1) to change the list view.
- Use the **New** button (2) to create a record. A window pops up where a user can enter and save record details.
- Use the buttons (3) to filter the list view or view related charts. Because external community users can't be assigned the "Create and Customize List Views" permission, they can't filter list views.

Sample Record List component (Compact layout):

MY CASES
issue Medium • New • 00001029
test Medium • New • 00001030
test2 Medium • New • 00001031
Test email attachment Medium • New • 00001032
Medium • New • 00001033
Medium • New • 00001034
View All

Record Related List

The Record Related List component shows a list of records that are related to a record. For example, if you're looking at an account, you can see a related list of contacts for that account. Use the Record Related List component on a record detail page or on a custom page to show a list of related records. Members can create records from the list and from lookups.

When a user expands the list of related records, the Related Record List page is displayed, which uses the Record Related List component under the hood.

1. Select the **Record Related List** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Parent Record ID	The ID of the parent record.
Related List Name	Name of the related list.

Example: Sample Record Related List component:

ACCOUNTS > EDGE COMMUNICATIONS

Contacts New

8 items • Sorted by Last Name

CONTACT NAME	TITLE	EMAIL	PHONE
Michael Chang		michaelcalf@gmail.com	
Sean Forbes	CFO	sean@edge.com	(512) 757-6000
Rose Gonzalez	SVP, Procurement	rose@edge.com	(512) 757-6000

SEE ALSO:

Related Articles List

The Related Articles List component displays the articles related to the article the user is viewing.

In the Page Editor, you can configure the Related Articles List component on the Article Detail page.

1. Select the **Related Articles List** component.
2. In the property editor, configure properties for the component:

Property	Details
Number of Articles	Enter the maximum number of articles to display in the list. You can display up to 10 articles. The default value is 5.
Title	Enter a title for the list of related articles. The default text is <code>Related Articles</code> .
Show Views	Select to show the number of times an article is viewed  2. Clear to hide the view count.

 **Example:** Sample Related Articles List component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Related Questions List

The Related Questions List component displays the questions related to the question the user is viewing.

In the Page Editor, you can configure the Related Questions List component on the Question Detail page. To use this component, your community must have a best answer for at least one question.

1. Select the **Related Questions List** component.
2. In the property editor, configure properties for the component:

Property	Details
Number of Questions	Enter the maximum number of questions to display in the list. You can display up to 10 questions. The default value is 5.
Title	Enter a title for the list of related questions. The default text is <code>Related Questions</code> .
Show Views	Select to show the number of times a question is viewed, liked, or commented on,  2. Clear to hide the view count.

 **Example:** Sample Related Questions List component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Related Topics List

The Related Topics List component displays the topics related to the topic being viewed by the user.

 **Note:** Before Spring '16, this component was named Related Topics.

In the Page Editor, you can configure the Related Topics List component on the Topics View page.

1. Select the **Related Topics List** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the list of related topics. The default text is <code>Related Topics List</code> .
Topic ID	This field populates dynamically with the topic ID.
Show the number of people using the Topic	Shows the number of people who are using the topic.

 **Example:** Sample Related Topics List component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Report Chart

Use the Report Chart component to drag and drop reports you set up in your Salesforce org's public folder to your community's pages. When you click a report, you see the Report Detail page, which shows the Report Summary component. The report summary includes details from the source report in Salesforce.

 **Note:** Only reports with a chart populate in the drop-down list in the report's properties.

1. Select the **Report Chart** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Report Name	Reports with charts, available for use in the community.
Filter By	Setting a filter on the report chart data is supported only for record pages. If you set a filter option, the Report Chart component displays only that filtered data to users.
Refresh Time (Minutes)	The number of minutes between each report refresh.
Show report name	Adds the report name to the community page.
Show refresh button	Shows a refresh button, so users can refresh the chart.

 **Example:** Report Chart component:

Report List

The Report List component lets users view reports in list form.

The report list can be filtered with these criteria:

- Recent
- Created by Me
- Private Reports
- All Reports

In addition, users have access to report folders. Folders include:

- Created by Me

- Shared with Me
- All Folders

The Report List component doesn't have any editable properties.

 **Note:** The Report List component can only be used on the Report List page.

 **Example:** Sample Report List component:

[insert image]

Report Summary

The Report Summary component lets users see a snapshot of the report details from the source report.

Use the Report Summary component on the Report Detail page to see a report's details. Using the component, members can see a report chart, filter data, see the feed, refresh the report, or change its settings. Members with sufficient permissions can also clone, save, export, or subscribe to the report.

1. Select the **Report Summary** component in the Report Detail page.
2. In the property editor, configure properties for the component:

Property	Details
Report Id	This field autopopulates with the record ID of the report.

Reputation Leaderboard

The Reputation Leaderboard component displays a list of community members with the highest reputation points.

In the Page Editor, you can configure the Reputation Leaderboard component on the Home page.

1. Select the **Reputation Leaderboard** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the reputation leaderboard. The default text is <code>Leaderboard</code> .
Number of Users	Enter the maximum number of users to display. You can display up to 10. The default is 5.
Show user rank	Displays the ranks of the users shown in the leaderboard.
Show logged-in user	<ul style="list-style-type: none"> • If the logged-in user doesn't rank on the leaderboard, a row for the user appears at the bottom of the leaderboard. • If the logged-in user ranks on the leaderboard, AND the Show User Rank checkbox is selected, AND Knowledge and Points or Knowledge and Last Active is displayed, the user sees a message about their ranking. For example, "Congratulations! You rank #2."

Property	Details
Show help bubble	Displays a question mark icon at the top of the leaderboard that a user can hover over to get more info.
Exclude internal users	Excludes internal users from the leaderboard.
Help Bubble Text	Enter the message that appears when a user hovers over the question mark icon. The message can be up to 500 characters. The default text is <code>Earn points and climb to new levels when you contribute in the community!</code>
Display Users' :	Determines what information about a user shows in the leaderboard. Options include: <ul style="list-style-type: none"> • Levels and Points—Shows a user's reputation level and total number of reputation points. • Knowledge and Points—Shows a user's total number of reputation points and topics that they're knowledgeable about. • Knowledge and Last Active—Shows topics a user is knowledgeable about and when the user was last active.
Topic Knowledge Label (Up to 20 chars.)	When Knowledge is shown in the leaderboard, this text appears before the topics a user is knowledgeable about. The default text is <code>Knows about</code> . For example, if a user is knowledgeable about backpacks, their leaderboard entry would say "Knows about: Backpacks."

 **Example:** Sample Reputation Leaderboard component:

Level and Points

LEADERBOARD 		
1.	 Eric Ware  Squirrel	646 Points
2.	 Sylvia  Salamander	332 Points
3.	 Sether  Salamander	292 Points

Rich Content Editor

The Rich Content Editor component lets you add formatted custom text to your community pages, along with images and videos.

1. In Community Builder, drag the Rich Content Editor component from the Components panel onto the page canvas.

2. Add and format text (1), and add images (2), a YouTube or Vimeo video (3), source code markup (4), and links (5) directly in the editor.

 **Note:** Images and videos are supported only in Rich Content Editor components that were added after the Spring '16 release.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

 **Example:** Sample YouTube video in the Rich Content Editor component:

Add a Video

Bring your community to life with a [YouTube](#) or [Vimeo](#) video.

YouTube or Vimeo URL

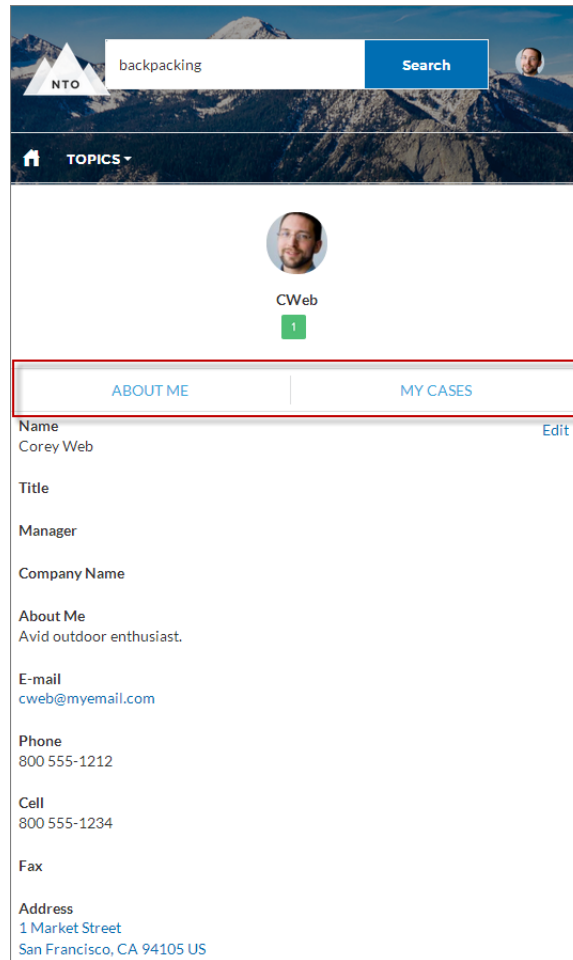

Scroll To

Custom code on the Profile page in the Customer Service (Napili) template lets users scroll to the selected component from a user's profile page. This saves a mobile user from having to scroll to a profile component that isn't visible on his or her device.

1. On the Profile page, right-click the area of custom code below the User Profile Header, and click **Edit**.
2. In the Edit Code page, you can change the labels that let mobile users navigate in their profile.

 **Example:** Sample Scroll To component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Search

The Search component lets users search articles within the context of the page they're viewing.

When a user types in the search text box, the system returns suggested articles and search strings that match the characters typed in the search box.

1. Select the **Search** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Placeholder Text	Enter the text that appears in the search bar. The default value is <i>What would you like to know?</i>

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.
Max Number of Auto Query Suggestions	Select the number of search queries to return per match.
Max Number of Article Title Match Results	Select the number of articles to return per match.

 **Example:** Sample Search component:

COOKLY  JON AMOS

How to cook Marinated Wild Salmon

"A delicious, healthy lemon-garlic marinade for salmon with cilantro and red chili flakes. Marinate at least 6 hours. Broil in the oven or grill 7 to 8 minutes per side."

© Apr 4, 2014 - How To

ADDITIONAL RESOURCES

Directions

1. Season fillets with salt and pepper, onion powder, and red pepper flakes. Set aside in a baking dish.
2. In a medium bowl, mix together olive oil, lemon juice, garlic, balsamic vinegar, sugar, green onions, and cilantro. Pour marinade over salmon; cover, and refrigerate overnight, or at least 6 hours.
3. Preheat oven to 450 degrees F (230 degrees C).
4. Arrange salmon on a broiling sheet. Place in a preheated oven, and bake for 5 minutes. Increase heat to 500 degrees F (260 degrees C), turn filets, and broil 5 minutes more.

Search & Post Publisher

The Search & Post Publisher component lets your users search for articles, discussions, and any object available to your community members and made searchable. It also lets users ask questions or contact support when they can't find the information they're looking for.

Autocomplete search results are based on whether the discussion, article title, or record contains the text entered by the user. The search accounts for partially matching terms and non-adjacent terms. For example, the results for "best backpack" could include a question titled "Which backpack is best for day hikes?" The results for "backpack" could include an article titled "Backpacking Tips." When a user performs a full search by clicking **Search**, the search engine also scans question descriptions and article text for matching terms.

Customize the Search & Post Publisher to meet the needs of your community. Turn on autocomplete search to suggest search results to users, add a footer so that users can contact support if they can't find what they're looking for, and customize the post publisher for when users post questions to the community.

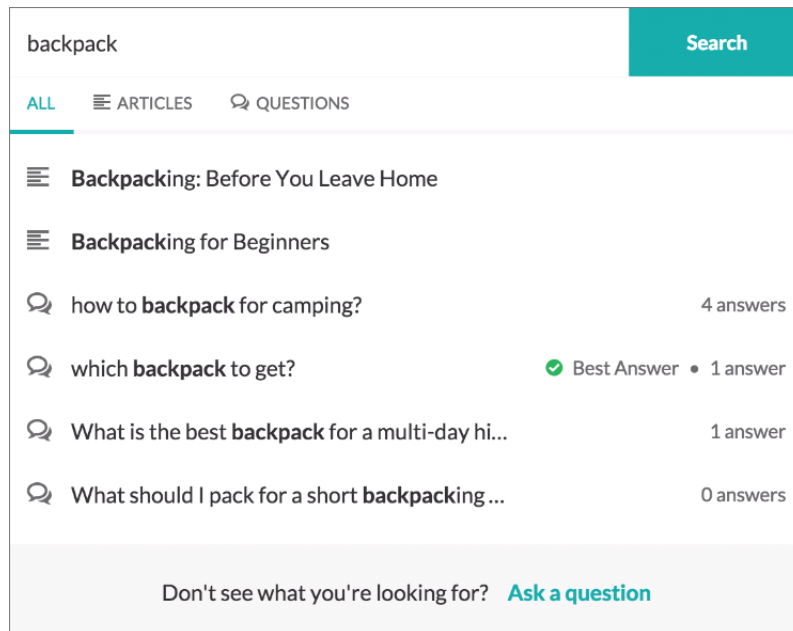

1. Select the **Search & Post Publisher** component in the page you're configuring.

2. In the property editor, configure properties for the component:

Property	Details
Autocomplete Search	Click to expand the section with autocomplete search properties.
Placeholder Text for Search Field	Specify the text that appears in the search box. The default text is Search...
Use autocomplete in searches	Select this option to let users see suggested search results as they enter search terms.
Show autocomplete results in one list	Select this option to display suggested search results in one list as a community member enters search terms. Otherwise, the suggested results are shown in tabs.  Note: This option must be enabled if you want autocomplete search results that can be sorted by relevance.
Maximum Autocomplete Results	Enter the maximum number of suggested results displayed on each tab during a search. The default is 6. An equal number of questions, articles, and objects is displayed in the combined results tab, but if there aren't enough of one type of result, additional results of the other type are displayed to reach the maximum. This functionality is available only in the Winter '16 and later versions of community templates.
Show Discussions results before Articles	By default, articles appear above questions in the combined search results, and the article results tab precedes the question results tab. Select this option to display questions before articles and to switch the tab order. This functionality is available only in the Winter '16 and later versions of community templates.
Autocomplete Results: Sort by Relevance	Click to expand the section that allows you to add searchable Salesforce objects to autocomplete results and have results sort by relevance.
Objects in Autocomplete Results	Click Add to add searchable Salesforce objects to your community's autocomplete results.
Autocomplete Results: Group by Object	Click to expand the section with that allows you to set grouping by object for autocomplete results.
All Results Label	Enter the name of the search results tab that displays results from all the searchable articles, discussions, and objects in the community. The default text is All. This functionality is available only in the Winter '16 and later versions of community templates.
Article Results Label	Enter the name of the search results tab that displays articles only. The default text is Articles. This functionality is available only in the Winter '16 and later versions of community templates.
Discussion Results Label	Enter the name of the search results tab that displays discussions only. The default text is Questions. This functionality is available only in the Winter '16 and later versions of community templates.
Ask Community	Click to expand the section with properties regarding asking the community.
Show footer during search	Select this option to display the footer giving members an option to ask the community a question.

Property	Details
Post to Ask the Community	Enter the text that invites users to post a question to the community or to customer support. The default text is: Don't see what you're looking for?.
Create Your Question Prompt	Enter the text that users click to ask a question. The default text is: Ask a question.
Create Your Sign-In Prompt	Enter the text that directs users to a login page before they ask a question. The default text is: Sign in to ask a question.
Post to Publisher	Click to expand the section with posting properties.
Discussion Publisher Title	Enter the title of the modal window that members use to post questions.
Select Navigational Topic Destination	Enter the text that lets users pick a navigational topic for their question. The default text is: Post to a navigational topic.
Post To Topic	Enter the text that appears before the navigational topic name that the user chooses. For example, if a user posts a question to Coffee, the onscreen text says Post to Coffee.
Topic Required Label	Enter the text that shows that selecting a topic is required.
Allow file attachments	Select this option to let users attach a file to a question.
Contact Support	Click to expand the section with properties regarding contacting support.
Let members contact support	Select this option to let users contact customer support to create a case.
Create Support Case Label	Enter the text to display for the option to create a case. The default text is Contact Support.
Create Private Support Case Label	Enter the text to display for the option to contact support in a private message. The default text is Private.
Case Action Name	Enter the name of the action that creates new cases. Use the action layout editor to specify which fields to include in the layout. You also need to include this action in the Web-to-Case settings. For more information on quick actions and Web-to-Case, see the Salesforce Help.

 **Example:** Sample Search Publisher component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Search Results

The Search Results component lets users view tabbed lists of articles and discussions that are returned from selecting a topic or typing a string in the Search Publisher.

 **Note:** Before Spring '16, this component was named Results List.

1. Select the **Search Results** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Articles Tab Label	Enter the text that appears on the tab that users select to view the list of returned articles. The default text is <code>Articles</code> .
Discussions Tab Label	Enter the text that appears on the tab that users can select to view the list of returned discussions. The default text is <code>Discussions</code> .
Topic ID	The expression in the <code>Topic ID</code> field uses the topic ID that the user selects when filtering by topic.
Search Term	The expression returns results based on the text users enter when typing their search queries.
Active Tab	Specify which tab you want to appear as selected with its contents exposed, when the page loads. The expression retrieves the parameter from the query string in the URL for the page.

Property	Details
	Type <i>articles</i> to display the article search results first or <i>discussions</i> to display the contents of the discussion search results first.
Number of Articles	Specify the maximum number of articles to display in the component.
Show Article Tab	Select this checkbox if you have Salesforce Knowledge enabled and want community members to search for and view articles.

Important: For articles to show up in the Search Results component, they must be associated with a topic.

Example: Sample Search Results component:

The screenshot shows a search results page for the topic 'backpacking'. The page features a search bar at the top with the text 'backpacking' and a 'Search' button. Below the search bar, there is a navigation menu with 'TOPICS' and 'BACKPACKING'. The main content area is titled 'BACKPACKING' and contains a list of articles under the 'ARTICLES' tab. The articles listed are:

- Backpacking for Beginners**: First-time backpacker? Basic tips can go a long way to ensuring you and your group have a great time. 13 Views · Aug 5, 2014 · How To
- Backpacking: Before You Leave Home**: Backpacking requires a fair amount of planning to be successful. Before you leave home, make sure you have the following. 22 Views · Aug 5, 2014 · How To
- Return Policy for Camping Equipment**: Camping gear can be returned for defective materials or workmanship within three months of purchase. 11 Views · Aug 5, 2014 · How To

To the right of the main article list, there is a 'TRENDING ARTICLES' section with the following items:

- Backpacking: Before You Leave Home
- Return Policy for Camping Equipment
- Backpacking for Beginners

At the bottom of the page, there is a message: 'Don't see what you're looking for?' and two buttons: 'ASK THE COMMUNITY' and 'CONTACT SUPPORT'.

Set Case Status Button

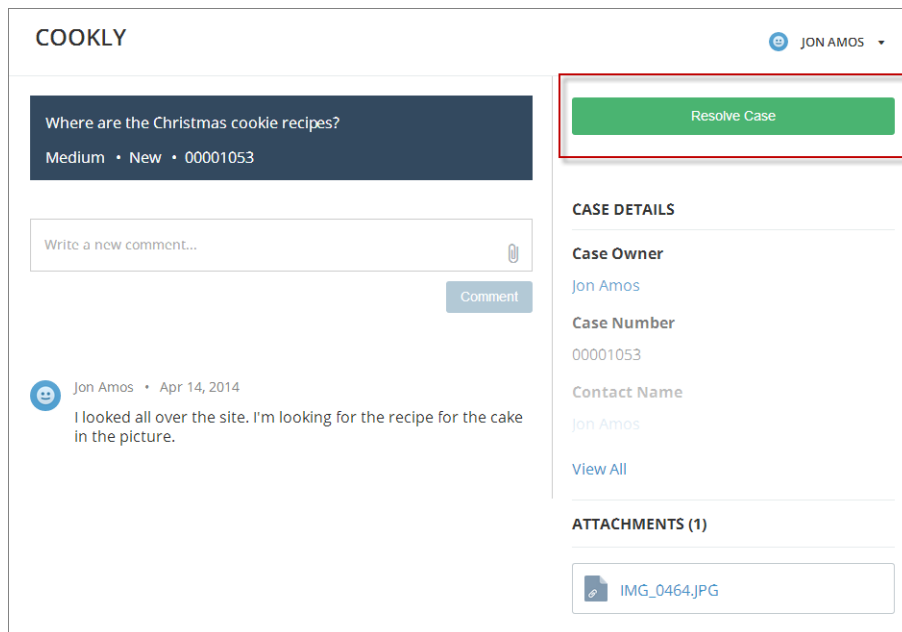

The Set Case Status Button component lets users click a button to mark a case as resolved and close it.

Note: Before Spring '16, this component was named Case Status Button.

1. Select the **Set Case Status Button** component in the page you're configuring.
2. Configure properties for the component in the property editor:

Property	Details
Case ID	Leave the default query string for the unless you plan to customize the component and add your own query string. The system uses the query string in this field to return the Case ID.
Active Status Label	Enter the text that appears on the button when the case is still open. For example, the button can be labeled Close Case or Resolve Case .
Inactive Status Label	Enter the text that appears on the button when the case is closed. For example, the button can be labeled Re-Open Case .

 **Example:** Sample Set Case Status Button component:

The screenshot shows a Salesforce Community page for a user named Jon Amos. The page title is 'COOKLY'. The main content area displays a case titled 'Where are the Christmas cookie recipes?' with a status of 'Medium' and a case number of '00001053'. Below the case title is a comment input field with the placeholder text 'Write a new comment...' and a 'Comment' button. A comment from Jon Amos, dated April 14, 2014, is visible, stating 'I looked all over the site. I'm looking for the recipe for the cake in the picture.' To the right of the main content is a sidebar with 'CASE DETAILS' including 'Case Owner' (Jon Amos), 'Case Number' (00001053), and 'Contact Name' (Jon Amos). Below the case details is an 'ATTACHMENTS (1)' section showing an attachment named 'IMG_0464.JPG'. A green 'Resolve Case' button is highlighted with a red border in the top right corner of the case card.

Tabs

Use the Tabs component in the Customer Service (Napili) to group other components in a set of customizable tabs for structure. Add as many tabs as you need and whatever components you want. You can rename and reorder the tabs, and choose whether to show or hide individual tabs to guest users in the community.

1. Add the **Tabs** component to a page or select it on the page you're configuring.
2. In the property editor, configure the component.
 - To add another tab, click **Add Tab**.

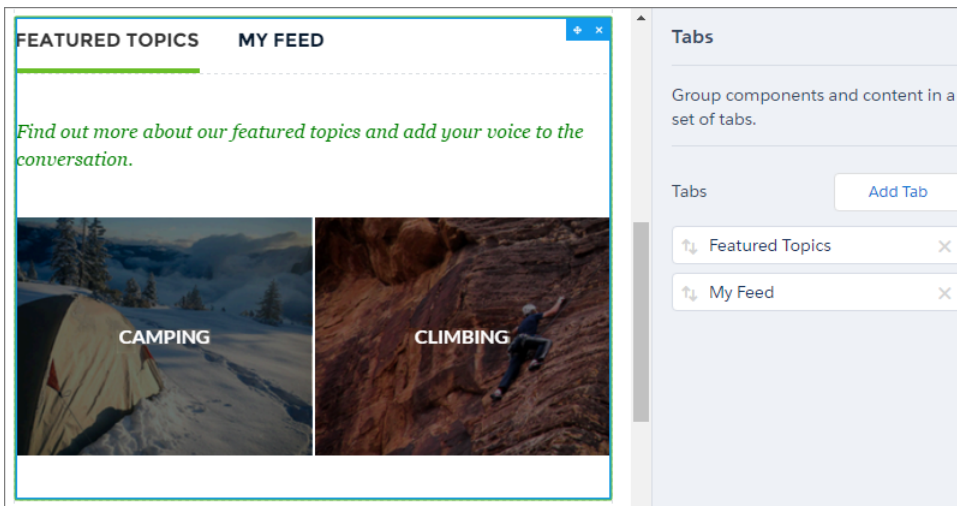

- To rename a tab or set its public availability, select the tab. To make that tab available to guest users in the community, select **Publicly available**. If no tabs are publicly available, the entire Tabs component is hidden from guest users.
- To reorder a tab, drag the tile to the correct position.

3. Add the components you need to each tab.

 **Note:** You can't add a Tabs component to another Tabs component.

 **Example:** Sample Tabs component with two renamed tabs—Featured Topics and My Feed:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Toggle Button

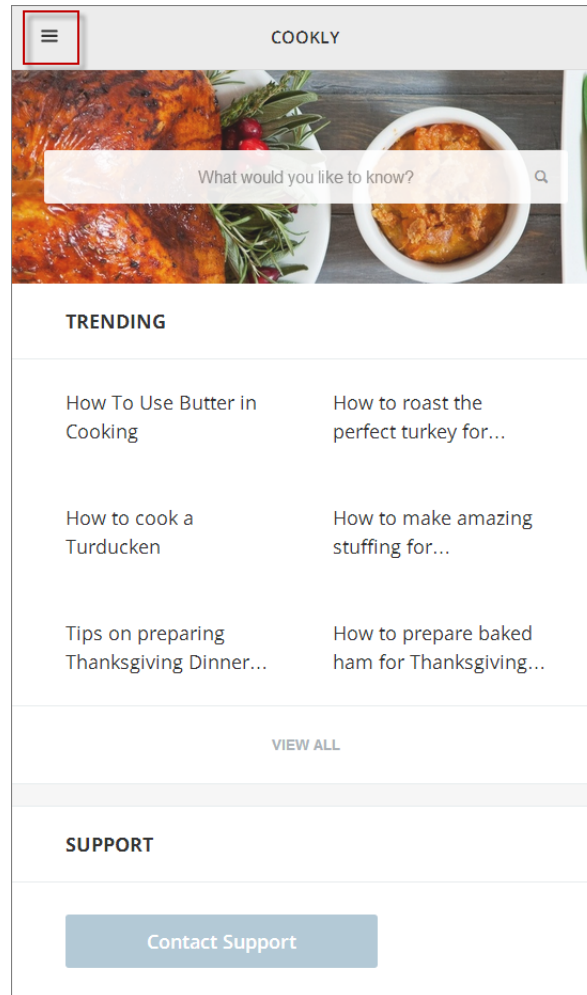

The Toggle Button component lets users display or collapse the left navigation menu for mobile devices and tablets. It doesn't appear in the desktop view.

You can find the **Toggle Button** component in the template header.

1. Select the **Toggle Button** component in the page you're configuring.

There are no properties to set for this component.

 **Example:** Sample Toggle Button component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Topic Catalog

The Topic Catalog component lets community members see a full listing of navigational parent and subtopics you have set up for the community in one convenient location.

The following is the maximum number of navigational topics and subtopics you can have in a Customer Service (Napili) community template.

Level	Maximum Number of Entries
One (parent)	25
Two (subtopic)	10
Three (subtopic)	10

 **Note:** The topic catalog shows only navigational topics and subtopics, and is only visible after you set them up.

1. Edit the Navigation Menu component in your community (typically, on the home page).
2. Select **Add the “More Topics...” link**.

 **Example:** When community members can click `More Topics` link from the Topics list in the navigation menu, they see the topic catalog.

TOPICS

BACKPACKING

Climbing Backpack

Hiking Backpack

Topic Description

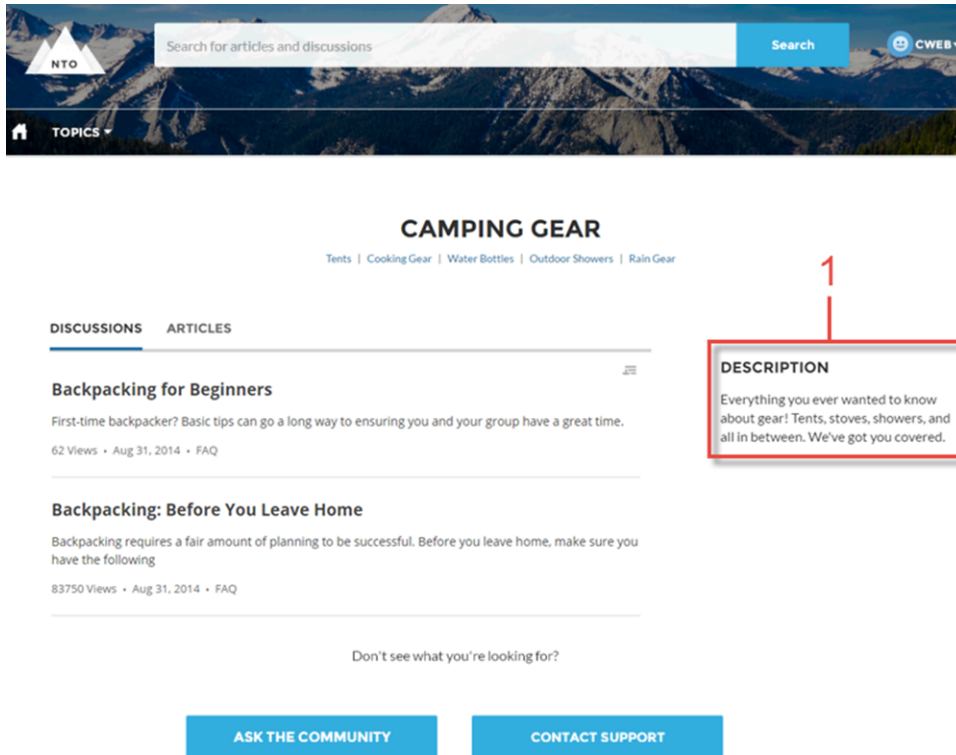

The Topic Description component is used on the Topic Detail page in the Customer Service (Napili) community template. It shows the topic’s description as entered in Community Management.

1. Select the **Topic Description** component in the page you’re configuring.
2. In the property editor, configure properties for the component:

Property	Details
Topic ID	The system supplies this value, and populates the component with the description tied to the topic shown on the topic detail page.

Property	Details
Title	Enter text for the title. The default text is <code>Description</code> .

 **Example:** Sample Topic Description component.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Topic Metrics

The Topic Metrics component lets users see how often community members use a topic.

You can show the number of posts, articles, and followers that a topic has, and how many people have used the topic in the last 60 days. Use the Topic Metrics component on the Topic Detail page.

1. Select the **Topic Metrics** component on the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Show Posts	Enable this setting to show the number of posts tagged with the topic.
Show Articles	Enable this setting to show the number of articles tagged with the topic.

Property	Details
Show Followers	Enable this setting to show the number of people following the topic.
Show how many people used the topic in the last 60 days.	Enable this setting to show how many community members have used the topic in the past 60 days.
Topic ID	This field populates dynamically with the topic ID.

Trending Articles

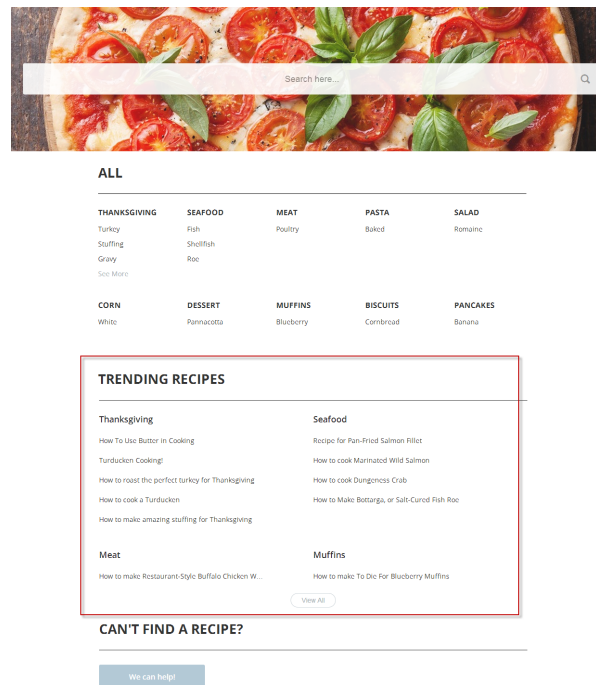

The Trending Articles component displays the most popular articles in your community. You can display them sorted by category or just display the top articles regardless of category.

An article's popularity is based on the number of recent views. You can specify two different display options for this component:

- A two-column list of the top trending articles for the community.
 - Two or more columns of trending articles sorted by data category. When a data category doesn't have any articles that are trending, it doesn't appear in the list.
1. Select the **Trending Articles** component in the page you're configuring.
 2. In the property editor, configure properties for the component:

Property	Details
Category Name	The top-level category that contains the subcategories for articles is automatically set using an expression that uses the top-level category you specified in the template's Custom Properties.
Number of Articles	Enter the maximum number of articles to display in the component. If you are using the two-column view with images, this will be the total number of articles that appear in the component. If you choose to display articles by data category, this will be the number of articles per child category.
Number of Categories	Enter the maximum number of categories to display in the component. This value controls whether the trending articles are organized by category or not: <ul style="list-style-type: none"> • To view a list of trending articles that isn't organized by categories, type <code>0</code> in the field. • To view trending articles organized by data category, specify the number of categories to display. <p> Note: If you specify a parent category that has no children, the component will display the trending articles without categories even if you specify a number in this field.</p>
Title	Enter a title for the component. The default text is <i>Trending</i> .

 **Example:** Sample Trending Articles component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Trending Articles by Topic

The Trending Articles by Topic component displays the most popular articles in your community organized by topic.

 **Note:** Before Spring '16, this component was named Topic Trending Articles.

The topicID attribute is optional. If it's not set, then trending articles scoped by all managed topics appear in the component. An article's popularity is based on the number of recent views.

1. Select the **Trending Articles by Topic** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter the text that is the title for the component. The default text is <i>Trending Articles</i> .
Number of Articles	Enter the maximum number of trending articles to display.
Topic ID	The expression in the field uses the ID from the topic that the user selects to display the list of articles. To display articles from all managed topics, leave this field blank.

 **Example:** Sample Trending Articles by Topic component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Trending Topics

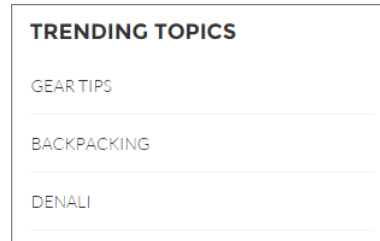

The Trending Topics component displays the popular topics in your community.

In the Page Editor, you can configure the Trending Topics component on the Home page.

1. Select the **Trending Topics** component.
2. In the property editor, configure properties for the component:

Property	Details
Title	Enter a title for the list of trending topics. The default text is <code>Trending Topics</code> .
Number of Topics	Enter the number of trending topics to display. You can display a maximum of five topics at a time.

 **Example:** Sample Trending Topics component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Unanswered Questions

The Unanswered Questions component lets users see the most viewed unanswered questions in a community. The component shows the top unanswered questions based on the view count across the community. As questions are answered, they are removed from view.

 **Note:** Only questions created after the Spring '17 release are displayed in the Unanswered Questions component.

1. Select the **Unanswered Questions** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Title	The title of the component. The default text is <i>Do you have the answer?</i>
Number of Questions	Enter the number of questions to show on the list. The default is 5.
Show views	Show the number of times the question has been viewed by users.

User Profile

The User Profile component shows detailed information for a user, including contact information, profile photo, Chatter statistics, topics the user is knowledgeable about, who the user is following, and the user's followers.

The User Profile component uses a two-column layout by default. Profile details and the profile image are always shown, but you choose if you want to show related lists, Chatter statistics, and Knowledgeable About. You can also customize labels.

The layout of the component also makes it ideal for viewing your community on a mobile device. When viewed on a mobile device or tablet, the component uses a single column layout that includes four tabs: Feed, Cases, Details, and Related. The Cases tab is only visible when a user views their own profile. You can edit all tab labels.

If nickname display is enabled for the community, the nickname is shown in place of the full name when a user views another user's profile. The full name is shown when a user views their own profile.

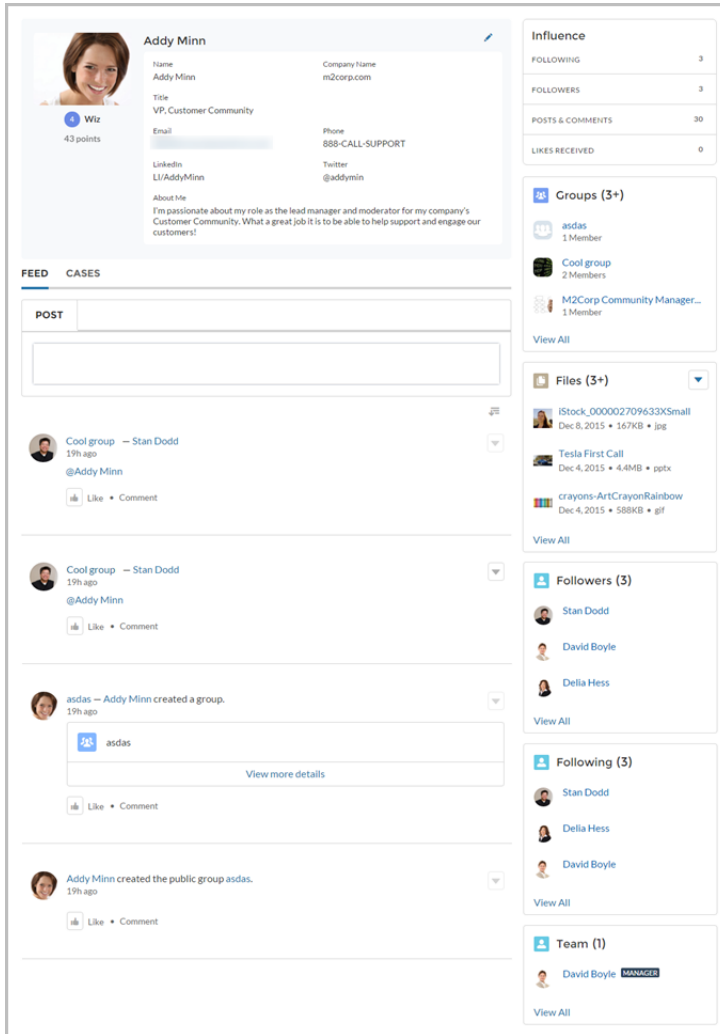

If you prefer to use a different layout or want more granular control over the placement of user profile content, create a custom community page and use the User Profile Summary, User Profile Tabs, User Profile Statistics, User Profile Knowledgeable About, and User Profile Related List components.

1. Select the **User Profile** component in the page you're configuring.
2. Select the Properties pane to view properties for the component:

Property	Details
User ID	The system supplies this value so that authenticated users can view their own information. Don't update this field.
Show Record Activity	Shows posts and comments on records in your feed. For example, if a user comments on a record in the community, and you have access to the record, you see the update in your feed. If disabled, the feed shows only activity, such as questions and answers, from within the community. This option is disabled by default.
Show Influence	Determines if the user's Chatter statistics are shown. Statistics include number of posts and comments, likes received, followers, and people they're following.
Influence Label	Enter a title for the Influence list. The default text is <i>Influence</i> .
Show Knowledgeable About	Determines if the Knowledgeable About list is shown.
Knowledgeable About Label	Enter a title for the Knowledgeable About list. The default text is <i>Knowledgeable About</i> .
Maximum Topics in Knowledgeable About Displayed (up to 10)	Enter the maximum number of topics listed for each user in the Knowledgeable About list, up to a limit of 10.
Show Related Lists	Determines if related lists are shown. Related lists can include Followers, Following, Groups, and Files.
Feed Tab Label	Enter the text you want to display on the tab that users select to view a user's Chatter feed. The default text is <i>Feed</i> .
Cases Tab Label	Enter the text you want to display on the tab that users select to view their cases. This only displays for users on their own profile. The default text is <i>Cases</i> .
Cases Tab Header Label	Enter the text for the label that appears at the top of the list of cases. The default for this field is <i>My Cases</i> .
Case Filter Name or ID	Enter the name of the list view that displays cases.
Create Case Label	Enter the text you'd like to display on the button that users can click to create a case. The default text is <i>Create Case</i> .
Record Details Tab Label (Mobile only)	Determines if a tab appears for the record details. Record details include profile details, Knowledgeable About, and Influence. The tab label is <i>Details</i> . Available only when a community is viewed on a mobile device.
Related Records Tab Label (Mobile only)	Determines if a tab appears for related records, such as Groups, Files, Followers, and Following. The tab label is <i>Related</i> . Available only when a community is viewed on a mobile device.

Example: Sample User Profile component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Profile Detail

The User Profile Detail component shows details about a user including contact information, profile photo, Chatter statistics, and topics the user is knowledgeable about. On other users' profiles, it also shows a Follow button.

 **Note:** Before Spring '16, this component was named User Profile Body.

Chatter statistics for the community include number of posts and comments, likes received, followers, and people the user is following. Knowledgeable About shows top topics that people know about, so the community can quickly see areas of expertise. Topic knowledge is calculated based on factors such as best answers, mentions, or likes on questions and posts.

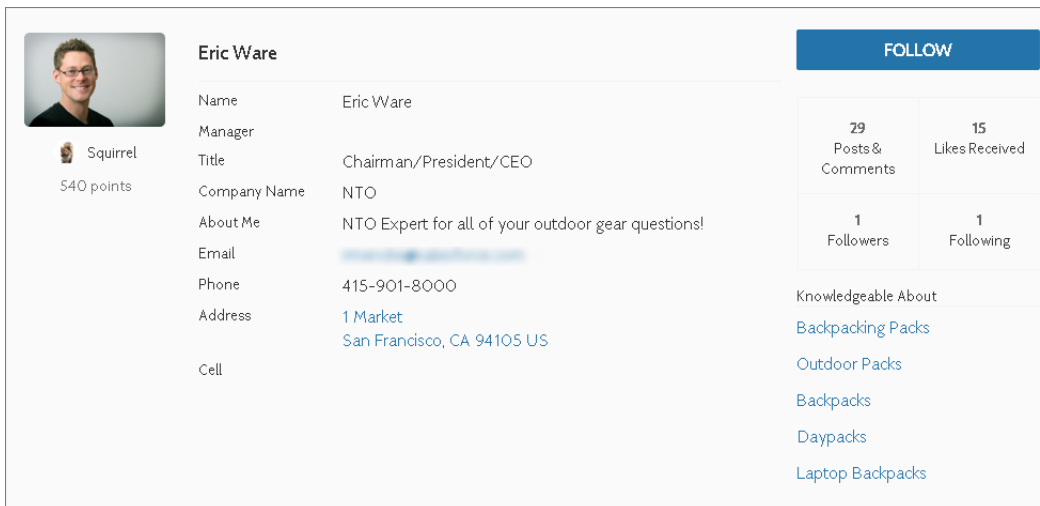

If nickname display is enabled for the community, the nickname is shown in place of the full name when a user views another user's profile. The full name is shown when a user views their own profile.

1. Select the **User Profile Detail** component in the page you're configuring.

2. To view properties for the component, select the Properties pane:

Property	Details
User ID	The system supplies this value so that authenticated users can view their own information. Don't update this field.
Show Knowledgeable About	Determines if the Knowledgeable About list is shown.
Title	Enter a title for the component. The default text is Knowledgeable About.
Maximum Topics Displayed	Enter the maximum number of topics listed for each user, up to a limit of 10.

 **Example:** Sample User Profile Detail component:

Eric Ware

Name: Eric Ware

Manager: Squirrel (540 points)

Knowledgeable About

- Backpacking Packs
- Outdoor Packs
- Backpacks
- Daypacks
- Laptop Backpacks

By default, all the information in a user's profile is visible to all users in the community, including to unlicensed guest users accessing the community. To limit access to members' information, use a custom user profile page layout and hide fields that reveal sensitive information, such as phone, email, title, and manager.

 **Note:** Showing many user fields in a custom layout affects the performance of the profile view. We recommend showing no more than 8 fields.

Similarly, consider modifying the fields for unlicensed guest user profiles to show only the necessary information. For example, you could hide the manager field. For detailed instructions on customizing page layouts, see the Salesforce online help.

User Profile Image

The User Profile Image component displays the user's reputation level, reputation points, and profile photo.

 **Note:** Before Spring '16, this component was named User Profile Header.

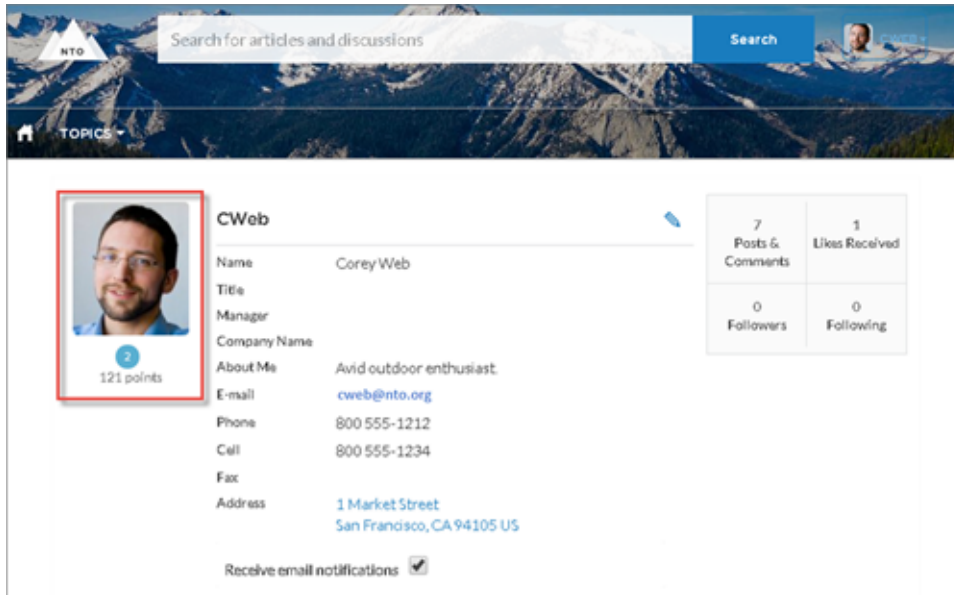

You can find the user profile image component in the Profile page. This component allows users to upload their profile photos in the community.

 **Note:** The user's reputation level and points display only if reputation is enabled in the community.

1. Select the **User Profile Image** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
User ID	The system supplies this value so that authenticated users can view their own information. Don't update this field.

 **Example:** Sample User Profile Image component:

SEE ALSO:

User Profile Knows About

Allow community members to endorse and recognize experts using the widget directly on a member's profile page.

Once you have enabled Knowledgeable People, community members can endorse one another directly on their community's user profile page. The user profile page also displays all the topics the community member is knowledgeable about, and the number of endorsements received for each topic. Community members aren't able to endorse themselves on any topics.

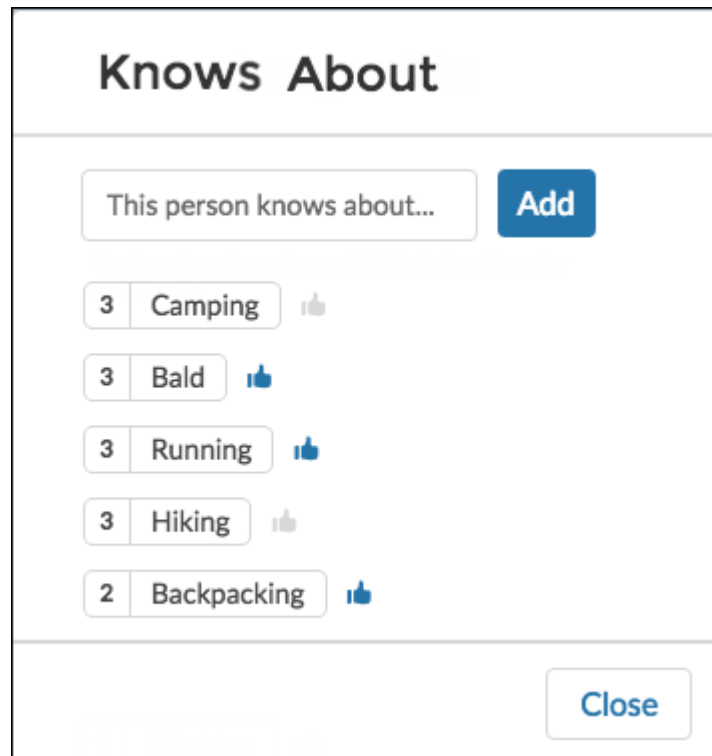

Community members endorse one-another on existing topics, and they can use the widget to enter new topics for endorsements. The widget shows the number of endorsements members have for each topic they know about. Clicking the thumbs up buttons adds or removes endorsements, based on whether the member has been endorsed or not.

 **Note:** Before Summer '16, this component was named Knowledgeable About. The component name for communities built before Summer '16 remains Knowledgeable About.

- Do one of the following:
 - To display the Knows About list within the User Profile component, select that component.
 - To display the list elsewhere on the profile page, drag the User Profile Knows About component to the desired location.
- In the property editor, configure properties for the component:

Property	Details
User ID	The user profile ID. Typically, this field is automatically populated with the record ID when the page loads.
Title	Enter a title for the component. The default text is <code>Knows About</code> .
Maximum Topics Displayed	Enter the maximum number of topics listed for each user, up to a limit of 10.

 Example:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Profile Related List

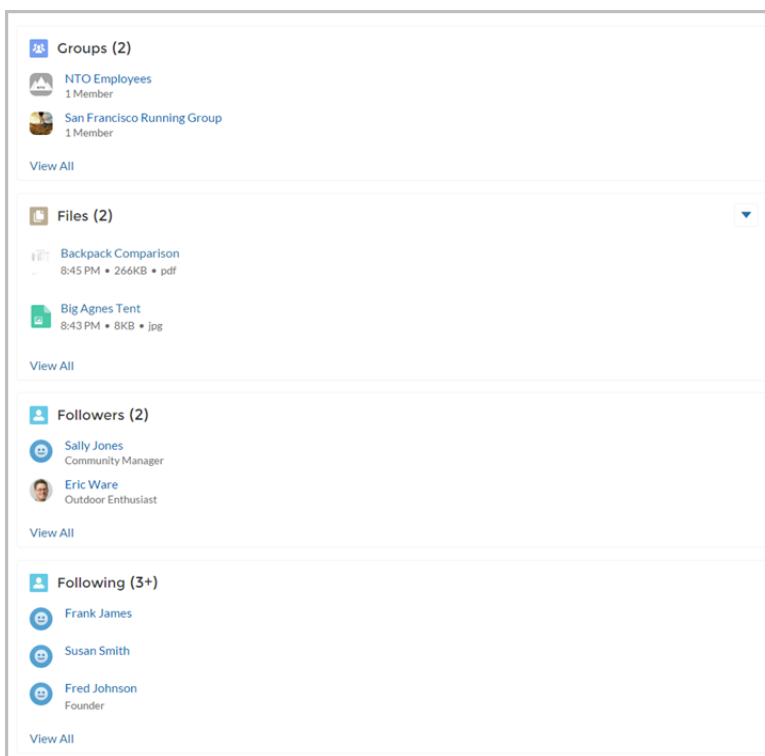

The User Profile Related List component shows lists of a user's files, groups, followers, and who they're following.

Add the User Profile Related List component to the User Profile page to show a user's related lists. Users can view full details for a related list by clicking **View All** at the bottom of the list. On the Files related list, users can click  to upload a file. You can customize which related lists are visible in your community by editing the User Profile page layout.

1. Select the **User Profile Related List** component.
2. In the property editor, configure properties for the component:

Property	Details
User ID	The system supplies this value. Don't update this field.

Example: Sample User Profile Related List component

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Profile Stats

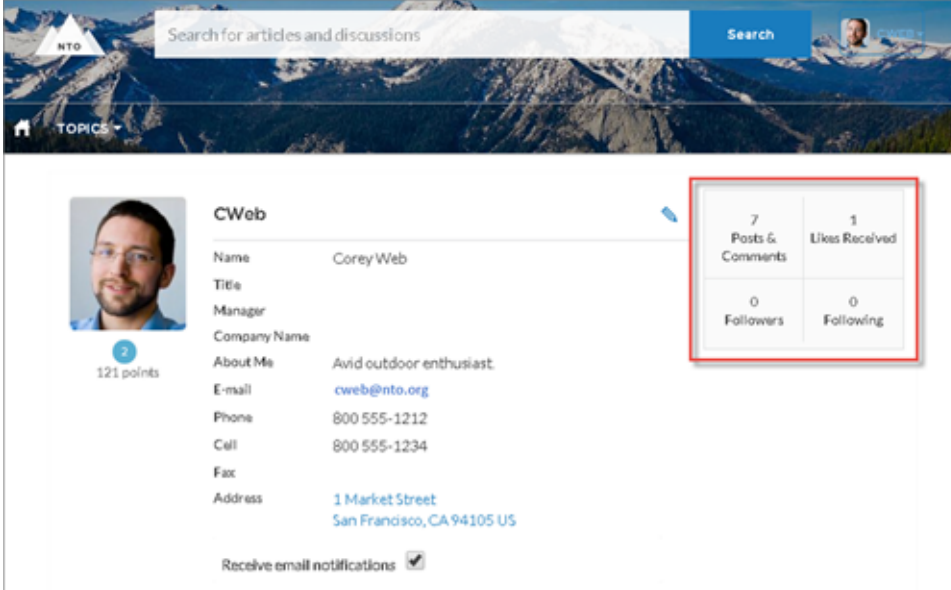

The User Profile Stats component displays the user's Chatter statistics for the community, including number of posts and comments, likes received, followers, and people they're following.

A user's statistics are visible to all members of the community, allowing members to see how active other members of the community are.

1. Select the **User Profile Stats** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
User ID	The system supplies this value. Don't update this field.

 **Example:** Sample User Profile Stats component:

The screenshot shows a user profile for 'CWeb' (Corey Web) with a search bar at the top. The profile includes a profile picture, a '121 points' badge, and a list of contact details: Name (Corey Web), Title, Manager, Company Name, About Me (Avid outdoor enthusiast), E-mail (cweb@nto.org), Phone (800 555-1212), Cell (800 555-1234), Fax, and Address (1 Market Street, San Francisco, CA 94105 US). A 'Receive email notifications' checkbox is checked. A red-bordered box highlights the 'User Profile Stats' component, which displays: 7 Posts & Comments, 1 Likes Received, 0 Followers, and 0 Following.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Profile Summary

The User Profile Summary component displays the user's contact information, title, manager's name, and address. If nickname display is enabled for the community, the nickname is shown in place of the full name when a user views another user's profile. The full name is shown when a user views their own profile.

 **Note:** Before Spring '16, this component was named User Profile Detail.

By default, all the information in a user's profile is visible to all users in the community, including to unlicensed guest users accessing the community. To limit access to members' information, use a custom user profile page layout and hide fields that reveal sensitive information, such as phone, email, title, and manager.

 **Note:** Showing many user fields in a custom layout affects the performance of the profile view. We recommend showing no more than 8 fields.

Similarly, consider modifying the fields for unlicensed guest user profiles to show only the necessary information. For example, you could hide the manager field. For detailed instructions on customizing page layouts, see the Salesforce online help.

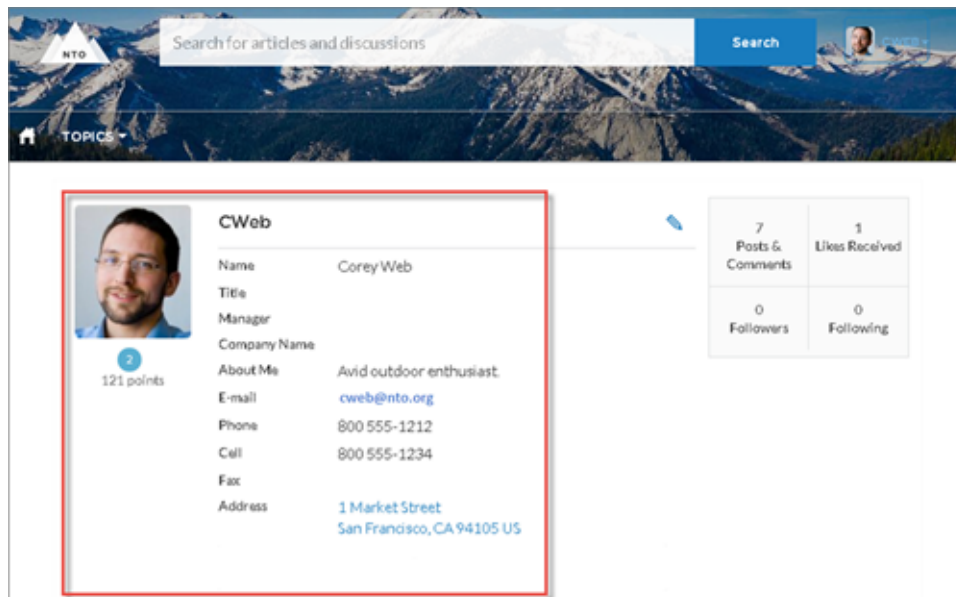

You can add the User Profile Summary component to the Profile page. This component allows users to edit their profile information from the community. When viewing another user's profile, you can click their address to see a Google map of their location.

 **Note:** When viewing a community on a mobile device, the Google map appears below the address.

1. Select the **User Profile Summary** component in the page you're configuring.
2. To view properties for the component, select the Properties pane:

Property	Details
User ID	The system supplies this value so that authenticated users can view their own information. Don't update this field.

 **Example:** Sample User Profile Summary component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Profile Summary & Image

The User Profile Summary & Image component displays a user's photo, contact information, reputation level, title, and manager's name. If nickname display is enabled for the community, the nickname is shown in place of the full name when a user views another user's profile. The full name is shown when a user views their own profile.

 **Note:** Before Spring '16, this component was named User Profile Header Detail.

By default, all the information in a user's profile is visible to all users in the community, including to unlicensed guest users accessing the community. To limit access to members' information, use a custom user profile page layout and hide fields that reveal sensitive information, such as phone, email, title, and manager.

Similarly, consider modifying the fields for unlicensed guest user profiles to show only the necessary information. For example, you could hide the manager field. For detailed instructions on customizing page layouts, see the Salesforce online help.

Users in Koa and Kokua communities access the user profile detail by viewing their own profile or clicking another member's name. In their own profile, users can click the pencil icon to edit their contact information. In another user's profile, users can click **Follow** to see the user's community activity directly in their feed. Clicking another user's address displays a Google map of their location.

 **Note:** When viewing a community on a mobile device, the Google map appears below the address.

 **Important:** To avoid issues, make sure that the User Profile Summary & Image component and the Case List component occupy different regions of the My Cases page. They occupy different regions by default, but it is a good practice to verify in your community.

To check, navigate to the My Cases page in Community Builder, go to the Page Editor, and click . If the two components are listed under one region—for example, Content—drag one to a different region.

1. Select the **User Profile Summary & Image** component in the page you're configuring.
2. To view properties for the component, select the Properties pane.

Property	Details
User ID	The system supplies this value so that authenticated users can view their own information. Don't update this field.

 **Example:** Sample User Profile Summary & Image component:

User Profile Tabs

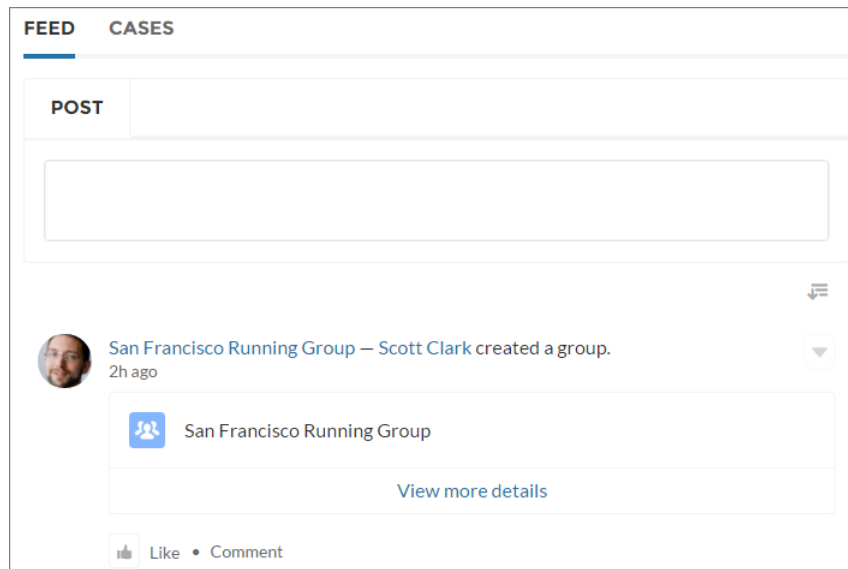

The User Profile Tabs component lets users see their feed and cases on their profile. They can also post to their feed directly from their profile. When viewing another user's profile, they see the user's activity but not their cases.

On desktops and tablets, users see a list view of up to 25 of their most recent cases. They can sort columns in the list and click the case number to view the details of that case. Navigation arrows let them click through the list of cases when there are multiple pages. On mobile devices, the view is optimized and users scroll through a list of cases and select a case to see its details.

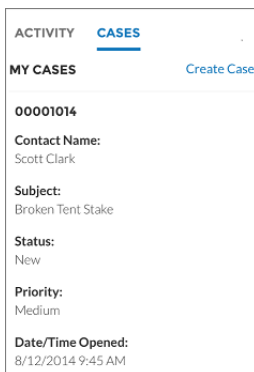

1. Select the **User Profile Tabs** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
User ID	The system supplies this value. Don't update this field.
Feed Tab Label	Enter the text you want to display on the tab that users select to view a user's Chatter feed. The default text is <i>Feed</i> .
Cases Tab Label	Enter the text you want to display on the tab that users select to view their cases. This only displays for users on their own profile. The default text is <i>Cases</i> .
Case Filter Name or ID	Enter the name of the list view that displays cases.  Note: By default, the template uses the AllOpenCases view, which lets users view any open cases that they have permission to see. Configure sharing to ensure that users see only cases that belong to them. Alternatively, you can use another pre-defined list view or create a custom list view.
Header Title	Enter the text for the label that appears at the top of the list of cases. The default for this field is <i>My Cases</i> .
Create Case Label	Enter the text you'd like to display on the button that users can click to create a case. The default text is <i>Create Case</i> .
Show Record Activity	Shows posts and comments on records in your feed. For example, if a user comments on a record in the community, and you have access to the record, you see the update in your feed. If disabled, the feed shows only activity, such as questions and answers, from within the community. This option is disabled by default.

 **Example:** Sample User Profile Tabs component:

Case list viewed on a mobile device:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

User Settings

The User Settings component displays a user's username, email address, language, locale, time zone, profile visibility, and email notification settings. User settings are only available for authenticated users.

On the User Settings component, users can change their language, locale, and time zone so that the community is localized appropriately. A user can also see their username and change their email or password. Users can choose to show their profile details to guest users who aren't logged in to the community. Users can also choose to receive email based on events in the community. If a user doesn't want to receive email about events in the community, he or she can disable email notifications.

1. Select the **User Settings** component in the page you're configuring.
2. In the property editor, configure properties for the component:

Property**Details**

User ID

The system supplies this value. Don't update this field.

 **Example:** Sample User Settings component:

[Which Components Can I Use with Each Template?](#)

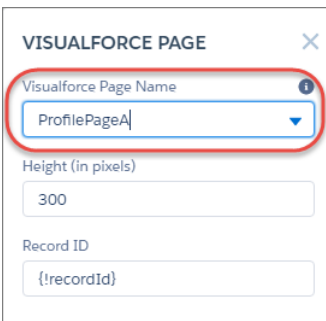

Visualforce Page Component

Use the Visualforce Page component to add existing Visualforce pages to the pages of your Customer Service (Napili)-based community.

1. In Community Builder, drag the Visualforce Page component from the Components panel onto the page.

2. Edit the component to select the Visualforce page to use. If you installed the Salesforce CPQ (Steelbrick) app, those pages are also available for selection here.

3. Adjust the height as you like.
4. Optionally, specify a Record ID if the Visualforce page. Typically, the system populates this value depending on context.

Tip: If the Visualforce page requires the Record ID from an object such as Account, create object pages for Account. Then drag and drop the Visualforce Page component onto the object's detail page. The Record ID field adjusts to the object's ID.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

Login Components

Brand the Login Pages

Use the Community Builder to customize and brand the login pages with your own design. You can change the appearance of the login pages with a background image, color scheme, and font settings. Use Community Builder to set the background. Your preference applies to all login pages, unless you override the settings within an individual page.

1. Select **Go To Community Builder**, if you're not already in it.
2. From the Go To menu, select **Login**.
3. In the left pane, upload an image for the background, and set color and text preferences, as needed.

 **Example:** The Branding Editor settings in Community Builder:

SEE ALSO:

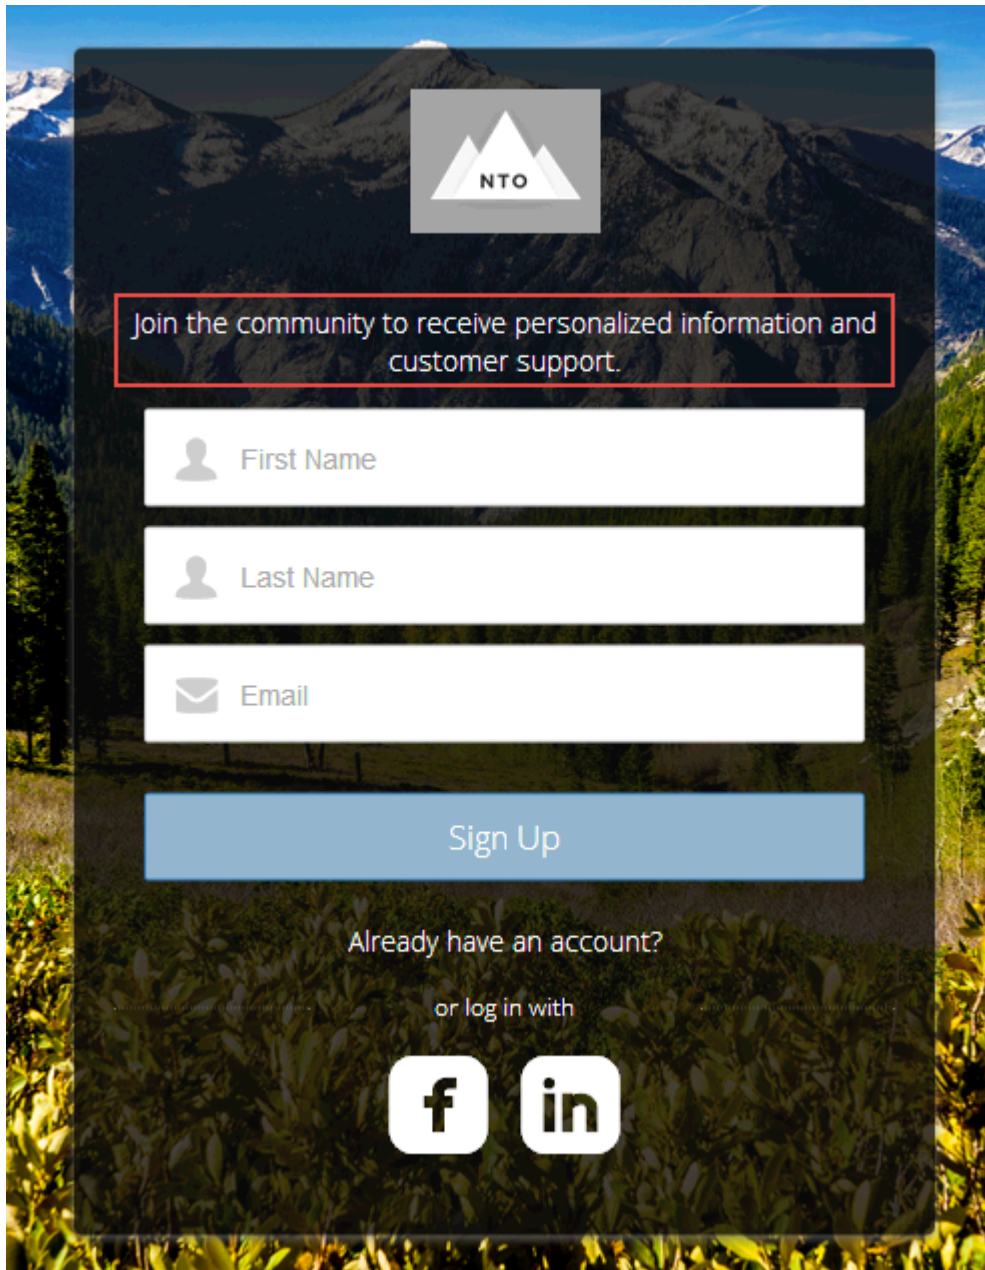

[Which Components Can I Use with Each Template?](#)

Set Up the Content Block

The Content Block component lets you add text to a page so that you can provide instructions and information to users. For example, you can provide instructions for filling out a form or give a group of components a title.

1. In Site.com Studio, select the **Content Heading** or **Content Description** component in the page that you're configuring.
2. Click .
3. Select **Edit HTML**.
4. Enter the text that you want to display on the page.

 **Example:** Sample Content Block component with an introduction to a self-registration form:

Join the community to receive personalized information and customer support.

 First Name

 Last Name

Custom Code

Use Custom Code components to send users to a specific page within your community.

The Custom Code component contains JavaScript navigation. Use this component to give users a link to go to another page. If you're familiar with JavaScript, edit the existing code to provide other functionality. The Custom Code component provides simple navigation but can also be your way of adding JavaScript enhancements to your community.

1. In Site.com Studio, select the **Custom Code** component in the page you're configuring.
2. Click .
3. Select **Edit**.
Edit the JavaScript code to change the navigation or behavior when the user clicks the component.
4. Click **Save and Close**.

 **Example:** Sample Custom Code component as a Cancel button to direct users back to the main login screen if they decide not to reset their password:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Employee Login Link

Use the Employee Login Link component to direct users with accounts in the community's parent org to their login page. When your employees or other users who have accounts in the parent org for the community end up on the community login page, you can redirect them to their own login page with a link. They can then log in with all the settings and permissions of their org account.

1. Select the **Employee Login Link** component in the page that you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Employee Login Link	Enter text that identifies the login option for employees. The label appears as clickable text on the page. The default text is <i>Are you an employee? Login here.</i>

 **Example:** Sample Employee Login Link component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Forgot Password

Use the Forgot Password component to let users request a new password.

Sometimes users forget their existing passwords and need a new one. The Forgot Password component gives users the ability to get one without contacting an administrator. The user enters the email address that's associated with the account, clicks the button, and gets email instructions for resetting the password.

1. Select the **Forgot Password** component in the page that you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Check Email URL	Enter the view or path to the page that notifies the user when the password has been reset and an email has been sent.
Username Label	Enter the text that appears in the field where the user enters a valid username, which can be in the form of an email address if users are identified that way.
Submit Button Label	Enter the text for the button that the user clicks to make the password reset request.

 **Example:** Sample Forgot Password component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Login Form

Let users log in with login fields for a username and password and a button for submitting both.

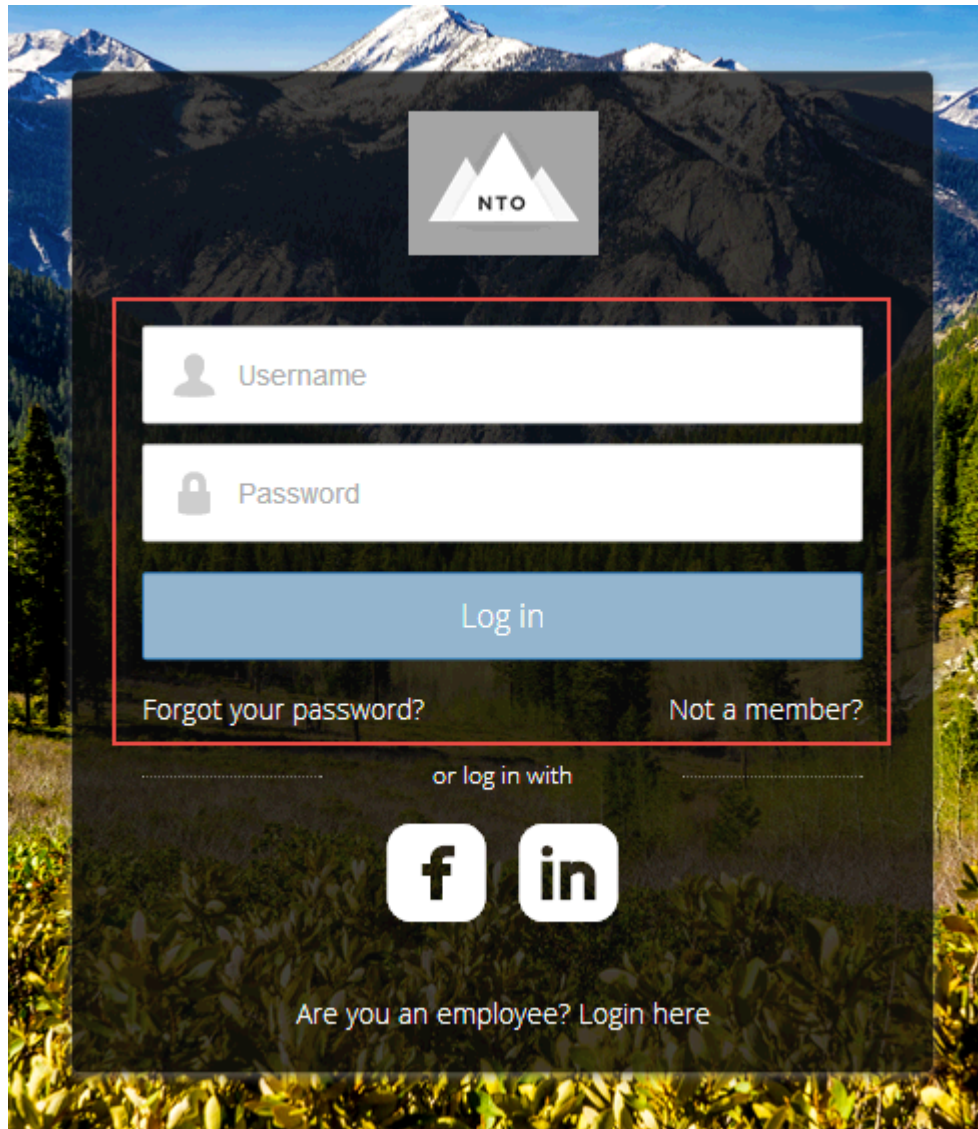

The **Login Form** component is a simple username and password form that lets users with an existing account log in to the community.

 **Note:** If the community administrator deselects the username and password checkbox on the **Administration > Login & Registration** page in Community Management, the Login Form doesn't appear in the published community. For more information, see "Customizing Communities Login" in the Salesforce Help.

1. Select the **Login Form** component in the page that you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Start URL	Enter the path to the page that users see after they log in successfully. This is the home page for the community.
Username Label	Enter the text for the username field label.
Password Label	Enter the text for the password field label.
Login Button Label	Enter the text for the button that the user clicks to submit the login request.
Forgot Password Link Label	Enter the text for the link to the page where users can request a password reset.
Forgot Password URL	Enter the page where users can request a password reset.
Self Register Link Label	Enter the text for the link to the page where users can complete a self-registration form.
Self Register URL	Enter the page where users can complete a self-registration form.

 **Example:** Sample Login Form component:

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Self-Registration

The Self-Registration component lets users set up their accounts so that you don't have to add each one manually. Users put their information into the form fields, and when they click **Sign Up**, an account is created for them. This component has a basic set of fields that you can customize, and you can add more fields.

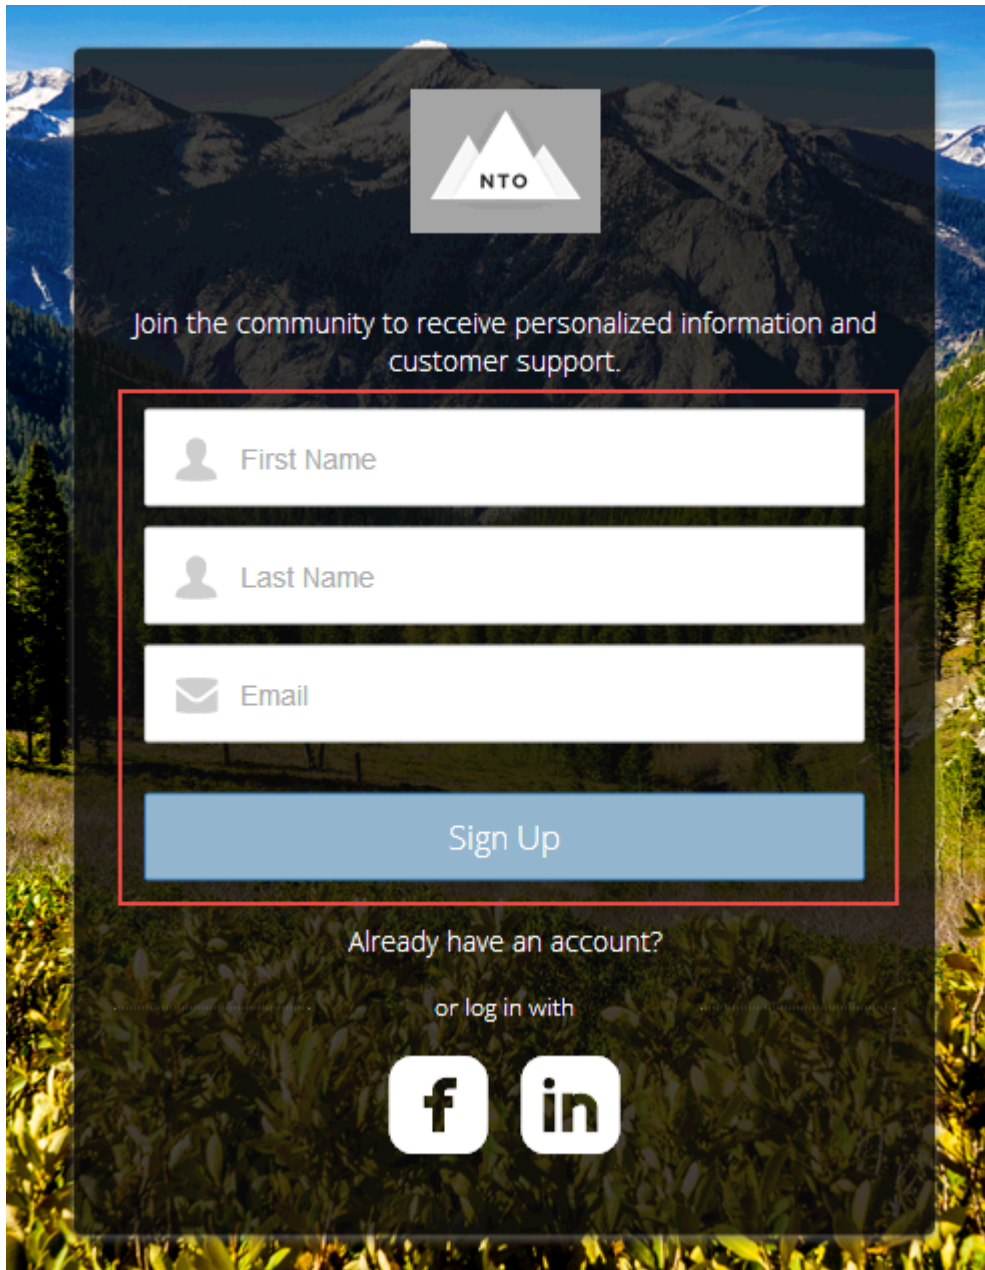

For this component to appear, go to Community Management and select **Administration > Login & Registration > Allow external users to self-register**.

1. Select the **Self Registration** component in the page that you're configuring.

2. In the property editor, configure properties for the component:

Property	Details
Account ID	Enter the variable expression for the account ID to associate with new users.
Start URL	Enter the path to the page that users see after they log in. This page is the home page for the community.
Registration Confirmation URL	Enter the path to the page to display after the user submits the self-registration form.
First Name Label	Enter the label text for the user's first name.
Last Name Label	Enter the label text for the user's last name.
Email Label	Enter the label text for the user's email address.
Password Label	Enter the text for the password field label.
Confirm Password Label	Enter the text for the field in which a user confirms the password. This field usually requests that the user retype the proposed password to make sure that it's correct.
Submit Button Label	Enter the text for the button to submit the form values.
Include Password Field?	Select this option if you want self-registering users to pick their own passwords. Otherwise, password information is provided in the email that they receive after they submit the form.
Extra Fields Field Set Name	Optionally, add fields to the form. If you've created a field set by using our API, enter the variable that's associated with the field set here. For example, you can write code that creates a field set to collect a phone number or other information.

 **Example:** Sample Self-Registration component:

The image shows a self-registration form for a community. At the top, there is a logo consisting of three white triangles forming a mountain shape with the letters "NTO" below them. Below the logo, the text reads "Join the community to receive personalized information and customer support." The form itself is enclosed in a red border and contains three input fields: "First Name" with a person icon, "Last Name" with a person icon, and "Email" with an envelope icon. Below these fields is a blue "Sign Up" button. At the bottom of the form, it says "Already have an account?" followed by "or log in with" and two social media icons: Facebook and LinkedIn.

SEE ALSO:

[Which Components Can I Use with Each Template?](#)

Social Login

The Social Login component provides users with icons that they can click to log in to a third-party account, such as Facebook[®] or LinkedIn[®]. Set these icons for each authentication provider that you configure for the org.

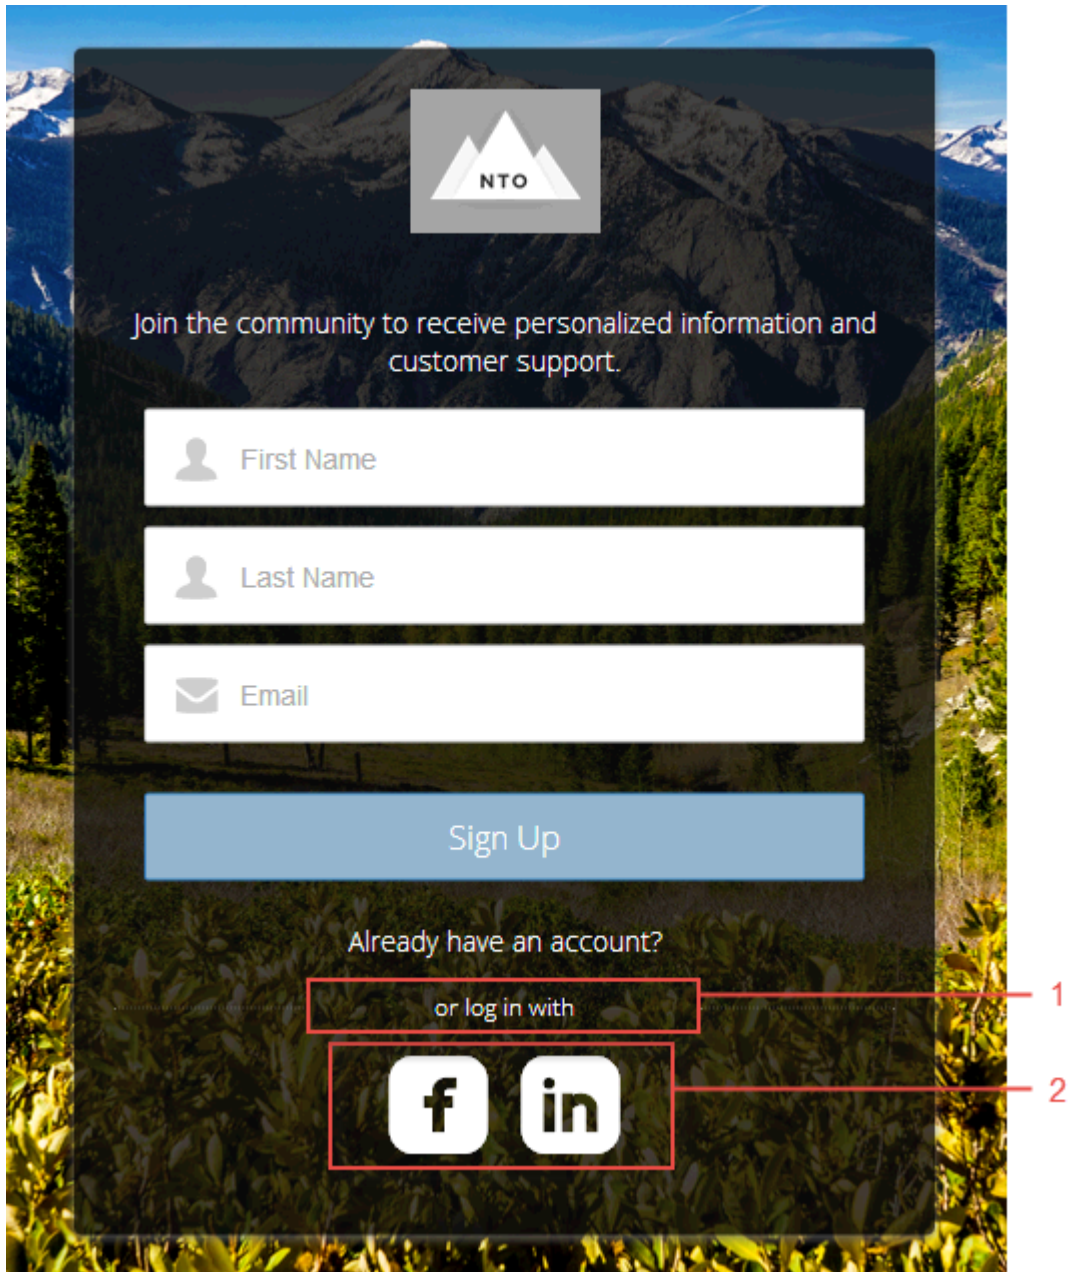

Some users prefer to use an existing account with a service such as Facebook to log in to the community instead of setting up a new account and password. The third-party service is an authentication provider that verifies the identification of the user. Use the Social Login component to add an icon for each supported authentication provider. The user clicks the icon and logs in using the associated account's username and password.

Before you add the Social Login component, set up each authentication provider. For more information, see "Configuring Authentication Providers" in the Salesforce Help.

1. Select the **Social Login** component in the page that you're configuring.
2. In the property editor, configure properties for the component:

Property	Details
Show Header	Select this option to show a text header above the authentication header icons.
Header Text	Enter the text for the header text.

 **Example:** Sample Social Login component with “or log in with” text (1) and authentication provider icons (2):

Community Builder Overview

Community Builder and community templates for self-service let you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder, you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) and customize their design and content.
- [Preview your community](#) and ensure that it appears correctly on different devices.
- [Publish your changes](#) so you can make them available to everyone in your community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Known Limitations

- Community Builder doesn't support branding for communities that weren't created by using one of the preconfigured templates.

[Navigate Community Builder](#)

Community Builder lets you quickly create and style your custom community to match your organization's branding.

[Brand Your Community with Community Builder](#)

Use Community Builder's Branding panel to efficiently apply color and style to your community. Choose a color scheme with the color palette, which provides a wide range of colorized text elements for a personalized design. Match your colors precisely by uploading your own logo to automatically generate a custom color palette.

[Manage Your Community's Settings in Community Builder](#)

Use the Settings area to track which template you're using, view your community's status, and customize your template. If you're using the Customer Service (Napili) template, easily access your navigational and featured topic settings.

[Preview Your Community with Community Builder](#)

Preview how your community appears in a desktop browser window and on mobile devices.

[Publish Your Customizations with Community Builder](#)

Publish your community in Community Builder to make your branding and component customization updates available to everyone in your community.

Navigate Community Builder

Community Builder lets you quickly create and style your custom community to match your organization's branding.

To access Community Builder:

- From the global header menu in Community Workspaces or Community Management, click **Community Workspaces > Go to Builder** or **Community Management > Go to Community Builder**.
- From the All Communities page in Setup, click **Community Workspaces** or **Builder** next to the community name. In Community Workspaces, click Builder.
- From a community, click **Community Builder** in the profile menu.

In Community Builder, you can:

- Drag and drop Lightning components onto your page (1). The Components panel includes custom Lightning components from the AppExchange.
- [Brand the community](#) to match your organization's style (2).
- View all the components on the current page. Select a component to edit its properties. (3)
- [Edit community settings](#) and [accept updates](#) to your community's template (4).
- Use the Communities menu (5) to:
 - Go to the community after it's activated.
 - Open Community Workspaces or Community Management to manage community analytics, login, registration, reputation, topics, and other settings.
 - Return to **Setup**.
- Navigate to the community page that you want to edit using the **Pages** menu and **Page Variation** menu (6). [Manage](#), [create](#), [delete](#), and [set the visibility](#) of pages in Page Properties for each page.
- [See how your community appears on different devices](#) (7).
- [Preview the community](#) in a new browser window (8).
- [Publish your changes](#) to make your updates available to everyone in your community (9).

[Implementation Guide: Using Templates to Build Communities](#)

Brand Your Community with Community Builder

Use Community Builder's Branding panel to efficiently apply color and style to your community. Choose a color scheme with the color palette, which provides a wide range of colorized text elements for a personalized design. Match your colors precisely by uploading your own logo to automatically generate a custom color palette.

Each template includes predefined styles to control the appearance of the pages. These styles give you a head start with your community, and you can easily customize the styles further to suit your needs. After you've created a community, brand and style your pages with Community Builder's Branding panel.

Depending on the template that you select, you can use Community Builder to:

- Apply a color scheme that's appropriate for your template with the color palette.
- Choose colors for text, borders, and button backgrounds.
- Upload your own company logo image to generate a custom color palette based on its main colors.
- Specify font family, style, and weight.
- Change header and page background color, font family, font size, and font color.
- Use custom CSS to apply your own styles.

EDITIONS

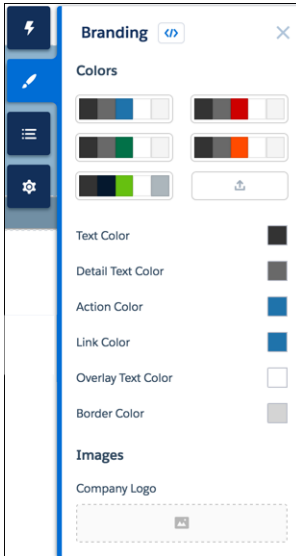

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Set Up Communities"

When you upload your own logo in the Branding panel, Community Builder extracts its colors behind the scenes, and suggests a set of colors based on those colors. To modify a suggested color, click the color swatch and adjust the color by using the slider or by entering hex values.

To brand your community:

1. Select the page that you want to brand in the Pages menu on the top toolbar.
2. Define branding.
Your changes are saved automatically and appear instantly on the page canvas.

Alternatively, click  on the Branding panel to use your own CSS styles. We recommend using CSS sparingly and only when necessary, because future releases of template components might not support all CSS customizations.

[Implementation Guide: Using Templates to Build Communities](#)

Manage Your Community's Settings in Community Builder

Use the Settings area to track which template you're using, view your community's status, and customize your template. If you're using the Customer Service (Napili) template, easily access your navigational and featured topic settings.

To access the Settings area in Community Builder, click  on the left sidebar.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To modify general settings

- "Create and Manage Communities"

- In the General area, settings include:

Community Template

Displays the name and version of the template that your community is using.

Page Access

Specifies the level of access to the page. When you enable public access, guest users can view asset files on public pages by default. Users whose profile settings are more restrictive may not be able to view this page, even if you choose Public.

When you enable public access, the preference **Let guest users view asset files on public pages** in **Administration > Preferences** is automatically enabled.

Community Title

Lets you set the title for your community. The title briefly appears in the browser's title bar before your community's Home page loads.

Published Status

Indicates whether your community is published. If it's published, click the link to open the live community in a separate browser tab.

Guest User Profile

Displays the associated guest user profile. Clicking the link takes you to the Profile page in Salesforce Setup, where you can modify profile settings, such as which permissions the guest user has. For more information about configuring the guest user profile, see "Configure the Guest User Profile for Unauthenticated Users" in the [Using Templates to Build Communities Guide](#).

Set Featured and Navigational Topics (**Customer Service (Napili) template only**)

[Define featured topics](#) and [topics to be used for navigation](#) in Community Workspaces or Community Management.

- In the Theme area, you can [control the layout and appearance](#) of each page in your community.

- In the Languages area, you can access Site.com where you can set the multilingual properties for your community. When set, these properties are used by the Language Picker component, which lets guest users select their preferred language on a page in your community. See “Language Picker” in the [Using Templates to Build Communities Guide](#).
- In the Advanced area, you can [add markup to the page head](#).
- In the Updates area, you can [update your community’s template](#) to the latest version.
- In the Developer area, you can [export customized templates and pages](#).

Update Your Community’s Template

We introduce amazing features and enhancements with every release, so don’t get left behind! Make the most from the latest Community Builder and template features.

Important: As of Spring ’17, we no longer support Koa, Kokua, and Customer Service (Napili) template versions from before Winter ’16 (October 2015). If your community uses a pre-Winter ’16 template and you don’t update it now, members lose access to your site in the Spring ’17 release.

If your community uses a template version that’s later than Winter ’16, sit back and relax. We automatically update your template version to the latest version, so you can start adding the latest features to your community straight away.

The impact of updating a template depends on the version your community is using.

Template Type and Version	What to Expect When Updating to Spring ’17
After Winter ’16 of Koa, Kokua, or Customer Service (Napili)	All updates are automatically applied. Your customizations and branding are preserved along with your data.
Winter ’16 Koa, Kokua, or Customer Service (Napili)	<ul style="list-style-type: none"> • Your customizations are maintained for all pages, except login pages. • Login pages retain branding but lose custom code or component customizations.
Before Winter ’16 Koa, Kokua, or Customer Service (Napili) Before Spring ’16 Aloha template	<p>Most component customizations and properties are overwritten. However:</p> <ul style="list-style-type: none"> • For Koa and Kokua, general settings, such as Category Group Name, Top-Level Category, and Company Name, carry over. • For Customer Service (Napili), topic definitions carry over. <p>Most branding properties defined using the Branding Editor in Community Builder are maintained. However, sometimes your community’s colors are reset to the default value. After you update the template, check the branding properties and update the ones that were reset.</p>

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To update your template

- “Create and Manage Communities”

Template Type and Version	What to Expect When Updating to Spring '17
Salesforce Tabs + Visualforce	Template updates for communities using Salesforce Tabs + Visualforce aren't managed from Community Builder.

For information on component compatibility with older template versions, see "Which Components Can I Use with Each Template?" in the [Using Templates to Build Communities](#) guide.

When a template update is available, a red notification icon appears over the Settings icon in Community Builder.

To update your template (for Winter '16 or earlier versions of templates):

1. In Community Builder, click  > **Updates**.
2. Click **Update** and confirm the update when prompted.
3. Review all community pages and make sure that your branding and styles are as you expect.
4. [Publish your community](#) to apply the template updates.

[Manage Your Community's Settings in Community Builder](#)

[Community Builder Overview](#)

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

 **Note:** Starting with Winter '17, the ability to change templates is no longer supported for communities using the Koa, Kokua, and Customer Service (Napili) templates. The functionality is still available for these templates, but we recommend that you start afresh with a new community instead. If you do change your template from Koa, Kokua, or Customer Service (Napili) to another template type, Salesforce Customer Support will be unable to assist you if any problems arise.

- When you change your template, Salesforce object data carries over, but some branding and component customizations do not. Prepare to redo customizations as necessary.
- Changing the community template updates the navigation options in Community Workspaces or Community Management. To view all available navigation options regardless of template selection, select **Administration Preferences > Show all settings in Community Workspaces or Community Management**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to any other template type. Specifically, `/s` is appended to the community URL. Be sure to update any links to your community with the updated URL.
- In active communities
 - When you switch over to the Koa, Kokuu, or Customer Service (Napili) templates, your template change is saved in a draft version. Use the draft version to further customize your community in Community Builder. Your community is updated only after you publish your changes.
 - When you switch to the Salesforce Tabs + Visualforce template from any other template, your changes immediately reflect in your active community. In this scenario, we recommend that you deactivate your community before you change your template. Once you've made all your changes, reactivate the community.
 - If your template is listed as `None`, it means you're not using a predefined template or you are using a modified version of one of our templates.

To learn more about using the Kokuu, Koa, and Customer Service (Napili) templates, see the [Using Templates to Build Communities](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Preview Your Community with Community Builder

Preview how your community appears in a desktop browser window and on mobile devices.

Community Builder's preview option lets you see how your community will appear when it's live.

- To preview the community in a browser window, click **Preview** on the toolbar.

- In Preview mode, you can see the community in its own browser tab as a customer would see it by clicking the pop-out button.

- Use the options in the  menu to preview how the community looks on different devices:
 - For smartphones, click **Mobile**.
 - For tablets, click **Tablet**.
 - For desktop computer screens, click **Desktop**.

Page Properties and Types in Community Builder

Use the Pages menu and Page Properties to view and edit the properties of the various pages that make up your community.

Edit Community Pages and Components in Community Builder

You can add new components to your community's pages or edit the properties of existing components to customize each page to suit your needs.

Create Custom Pages with Community Builder

Extend your community template by creating custom pages and adding custom record detail, list, and related list pages to get the most from your Salesforce data.

Control Public Access for Each Page in Your Community

Set page-specific access to your community pages, so you can restrict or open up access as you see fit.

Add Markup to the Page <head> to Customize Your Community

Add custom analytics, improve your SEO results, and more by adding custom markup to the page <head> in Community Builder. For example, you can include SEO meta tags that are visible only to search engines or add a *favicon* or web page icon.

Page Variations and Audience Targeting for Pages and Groups

Criteria-based page visibility lets you create different versions of your page and make those variations available to specific audiences and groups.

Custom Theme Layouts and Theme Layout Types

Theme layouts and theme layout types combine to give you granular control of the appearance and structure of each page in your community. Customize the layout's header and footer to match your company's style, configure theme properties, or use a custom search bar and user profile menu. Then use theme layout types to apply a theme layout to individual pages and quickly change layouts from one central location. Whether you're a consulting partner or an ISV, or you simply want to revamp your own community, custom theme layouts make it easy to rebrand.

[Change the Content Layout in Community Builder](#)

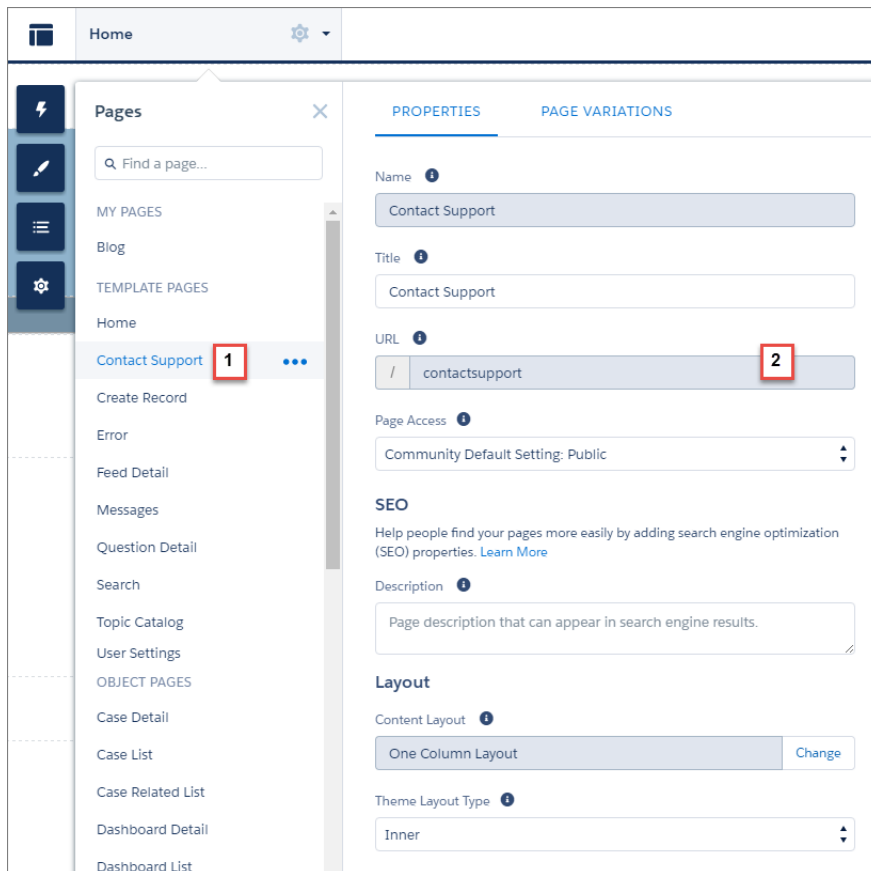

Quickly change the look of your community's pages by switching to a different layout. You can even create your own custom layouts in the Developer Console and import them to use in your community.

[Use Visualforce in Customer Service \(Napili\) Communities](#)

If you have created Visualforce pages, actions, buttons, links, and canvas apps for your Salesforce Tabs + Visualforce template-based communities, you can reuse those elements in Customer Service (Napili)-based communities.

Page Properties and Types in Community Builder

Use the Pages menu and Page Properties to view and edit the properties of the various pages that make up your community.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Page Types (1)

We've grouped your community's pages by type in Pages menu.

My Pages

The standard pages that you create. (The object pages that you create appear under Objects.)

Template Pages

The default pages that come with the community template.

Objects

The pages of the objects in your community, which include the object's record detail, list, and related list pages.

Generic Record Pages

The default record detail, list, and related list pages that come with the Customer Service (Napili) template only. These generic pages are used to display record information for a Salesforce object when custom object pages don't exist.

Login Pages

The default login pages that come with the community template.

Page Properties (2)

The properties available to each page depend on the page type selected.

Name

The name of the page as it appears in Community Builder. Editable only in the standard pages that you create.

Title

The title of the page as it appears in the browser's tab or window title. Used for bookmarking the page and appears in search engine results.

Unavailable for pages in the Template Pages section that set the title dynamically, such as the Article Detail and Topic Detail pages.

By default, detail and list pages in the Objects section set the title dynamically, so although the Title field is available, its value is overridden. However, if you replace the page's default component with a custom Lightning component that doesn't set the page title dynamically, then the title you set here is used.

URL

The URL of the page. Editable only in custom standard pages.

Base URL

Lets you simultaneously change the URLs for all pages—record detail, list, and related list—associated with an object. Promotes consistency by ensuring all object pages share a common URL prefix. Editable only in custom object pages.

Page Access

Specifies the level of access to the page. When you enable public access, guest users can view asset files on public pages by default. Users whose profile settings are more restrictive may not be able to view this page, even if you choose Public.

When you enable public access, the preference **Let guest users view asset files on public pages** in **Administration > Preferences** is automatically enabled.

Description

Used for search engine optimization purposes and appears in search engine results. Available for the Contact Support, Error, Home, and Topic Catalog template pages, and all pages listed under My Pages and Login Pages.

Content Layout

Defines the content regions of your page, such as a two-column layout.

Theme Layout Type

Applies a theme layout type and its associated theme layout to the page.

SEE ALSO:

[Change the Theme Layout of Your Community's Pages](#)

[Change the Content Layout in Community Builder](#)

[Set Up Search Engine Optimization \(SEO\) for Your Community](#)

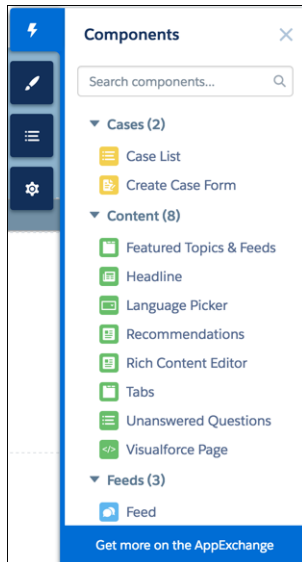

[Lightning Components Developer Guide: Create Custom Content Layout Components for Communities](#)

Edit Community Pages and Components in Community Builder

You can add new components to your community's pages or edit the properties of existing components to customize each page to suit your needs.

If you're adding components to a new custom page, spend some time planning the composition of the page based on its purpose.

1. From the Pages menu in the top toolbar, select the page that you want to edit.
2. Click  to open the Components panel.

The Components panel lists only components that are compatible with the selected page. For example, you can't add the User Profile Detail component to the Home page.

3. Drag the required component from the Components panel onto an editable area of the page. When you drag a component over a content or theme layout region, a label appears to help you identify the region. Components in theme layout regions are shared everywhere that theme layout region is used and we add the label "Shared" to the component name. Components in a content layout region are specific to the page.

4. To edit the properties for a component on the page, select it on the main page canvas or on the Page Structure panel. When you select a component, Community Builder highlights the component with a blue border and displays the component's properties in the floating property editor.
5. Update the component as required.

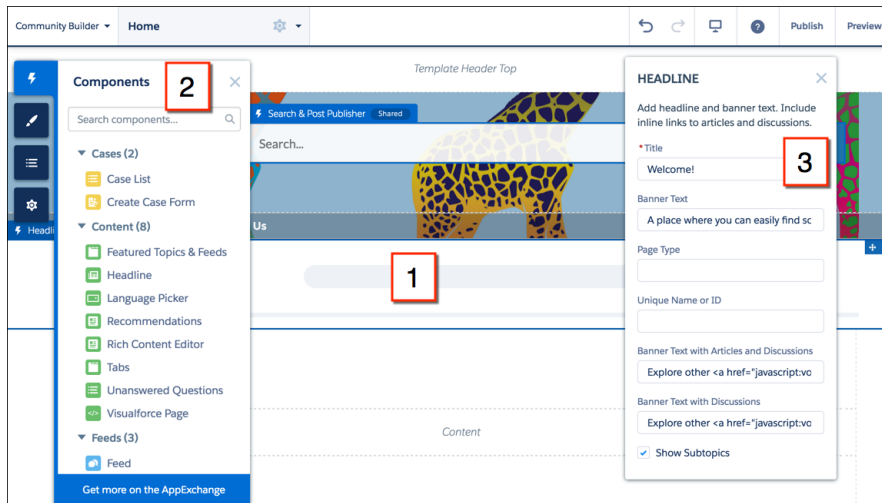

Example: Here's a sample configuration of the Headline component (1) on the Home page with the list of supported Lightning components (2) and properties (3).

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

Tip:

- You can browse a selection of custom Lightning components on the AppExchange and add them to your org directly from Community Builder. Click **Get more on the AppExchange** in the Pages menu. Components that are ready to add to your community's Lightning pages are displayed. When you add a component, it appears in the Components panel of all the template-based communities in your org.
- You can also create custom Lightning components and use them on community pages. For more information on creating custom Lightning components and enabling them for Community Builder, see the [Lightning Components Developer's Guide](#).

Error Messages for Pages Without Data in Community Builder

When you build a template-based community page using Lightning components in Community Builder, you sometimes run into a situation in which a page isn't loading correctly. Find out why you see this error, and how you can fix it. Spoiler alert: Want to see a page? Make sure that the component has underlying data.

Error Messages for Pages Without Data in Community Builder

When you build a template-based community page using Lightning components in Community Builder, you sometimes run into a situation in which a page isn't loading correctly. Find out why you see this error, and how you can fix it. Spoiler alert: Want to see a page? Make sure that the component has underlying data.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

 We can't load this page because it's missing some underlying data. [Learn More](#)

An error occurs on community pages in one of the following three instances:

- The page does not have any components

- The page has one or more components, and one or more do not have any underlying data

You see this error when components rely on dynamic data, and they don't find any underlying data to draw upon. For example, a Group component that doesn't find a group ID, or a record that can't find a record ID, would both give you an error.

Why do I see this error?

In most situations, the page is trying to draw information where information doesn't exist. For example, let's say you make a record detail page for the Account object. If you don't have any accounts set up in Salesforce, you see an error. Or let's say you set up a group detail page, but your new community doesn't have any groups. Once again, you see an error.

Any gotchas?

The Customer Service (Napili) template uses topics to organize content in a community. To see topic detail pages, first set up [Navigational Topics in Community Management](#).

The following default pages in the Customer Service (Napili) template can show this error. Here are some tips on how to fix it.

- Article Detail: Create at least one Salesforce Knowledge article in your org.
- Topic Detail: Create a Navigational Topic.
- Question Detail: Create a Navigational Topic. Use the Ask a Question button to create a question.
- Feed Detail: Use the Post Publisher or Ask a Question button to create a post or question.
- Group Detail: Create a group in the community.

The following default pages in the Koa template can show this error. Here are some tips on how to fix it.

- Home: Associate a Data Category with the template.
- Article Detail: Create at least one Salesforce Knowledge article in your org.
- Article List: Create at least one Salesforce Knowledge article in your org.
- Category Home: Create at least one Data Category in your org.
- Search: Create at least one Salesforce Knowledge Data Category and article in your org.

The following default pages in the Kokua template can show this error. Here are some tips on how to fix it.

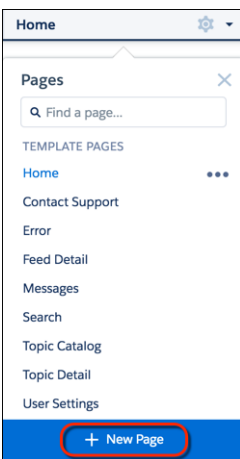

- Home: Associate a Data Category with the template.
- Article Detail: Create at least one Salesforce Knowledge article in your org.
- Article List: Create at least one Salesforce Knowledge article in your org.

- Case Detail: Create at least one case in the community or your org.
- Category Home: Create at least one Data Category in your org.
- Feed Detail: Use the Post Publisher to create a post or question.
- My Cases: Create at least one case in the community or your org.
- Search: Create at least one Salesforce Knowledge Data Category and article in your org.

Create Custom Pages with Community Builder

Extend your community template by creating custom pages and adding custom record detail, list, and related list pages to get the most from your Salesforce data.

1. In Community Builder, open the Pages menu on the top toolbar.
2. Click **New Page** at the bottom of the Pages menu.

3. To create:

- A standard page that's based on a blank layout or a preconfigured page (if available), click **Standard Page**.

If you don't have preconfigured pages, choose a blank layout. Alternatively, if you do have preconfigured pages (because you've exported or imported custom pages), choose one to customize or click **New Blank Page** to select a blank layout.

Click **Next**, give the page a unique name, and specify the static portion of the page's URL.

- A detail, a list, and a related list page associated with one of your Salesforce objects, click **Object Pages** (in Customer Service (Napili) only). Select the object that you want to associate with the page.

EDITIONS

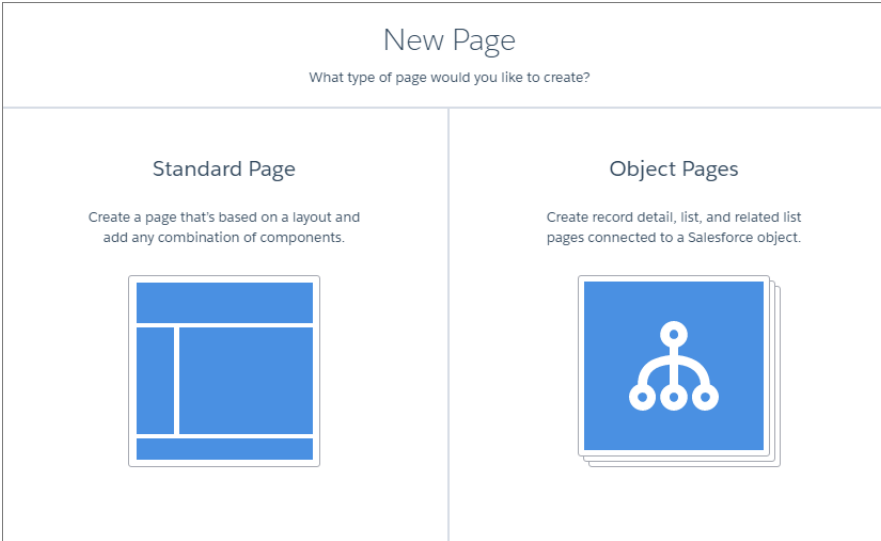

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

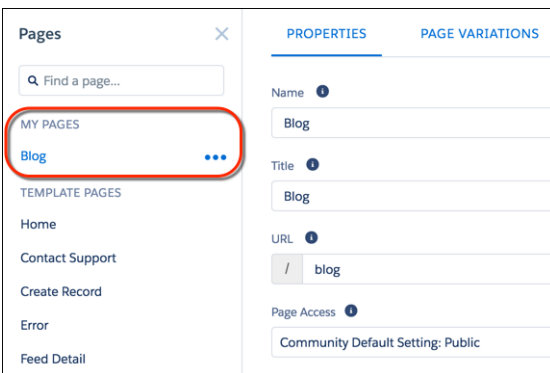

To create pages in Community Builder:

- "Create and Manage Communities"

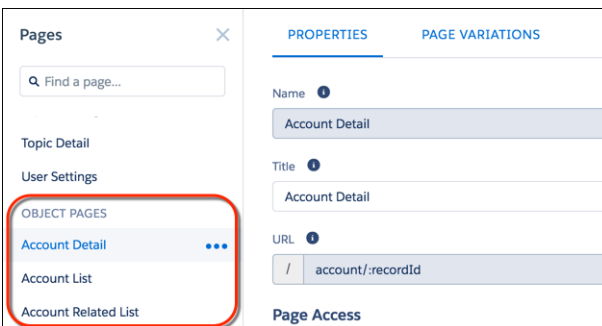

4. Click **Create**.

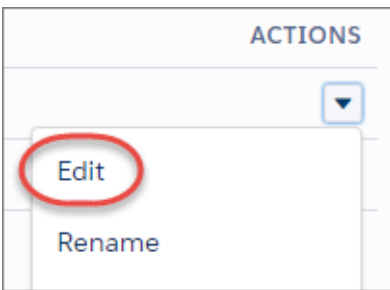

Custom standard pages that are based on a layout appear under My Pages in the Pages menu. Pages that are based on a default template page appear under its Page Variations section.

Custom object pages appear under Object Pages.

5. Open a standard page by selecting it, or open an object page by clicking  > **Edit** in the Page Variations section.

6. Add and configure page components.
7. If you're using the Customer Service (Napili) template, [set the page's visibility](#).
8. Preview and publish your community when you're done.

Tip:

- In Page Properties, you can quickly create alternative versions of the page in the Page Variations tab. For example, you could create three different Question Detail pages to test out various layouts or styles, or to [assign them to different audiences](#). To create a page variation, click **New Page Variation** in the Page Variations tab.

You can also duplicate a page variation by clicking  > **Duplicate**.

- Use the Navigation Menu component to create custom navigation nodes for new pages. For more information about templates and components, see [Using Templates to Build Communities](#).

[Delete a Page in Community Builder](#)

Remove a community page or page variation that you no longer need by deleting it in Page Properties.

Delete a Page in Community Builder

Remove a community page or page variation that you no longer need by deleting it in Page Properties.

Keep in mind that you can't delete:

- The default pages and objects that come with the template
- A page's default page variation
- A custom object page (detail, list, or related list) but you can delete the entire object

To delete a page or page variation:

1. In Community Builder, open the Pages menu.
2. Open Page Properties for the page that you want to delete. Click  beside the page on the top toolbar, or click  beside the page in the Pages dropdown menu.

EDITIONS

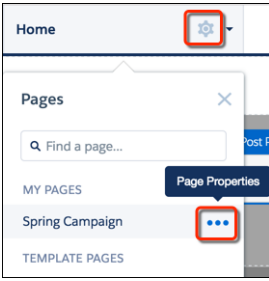

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

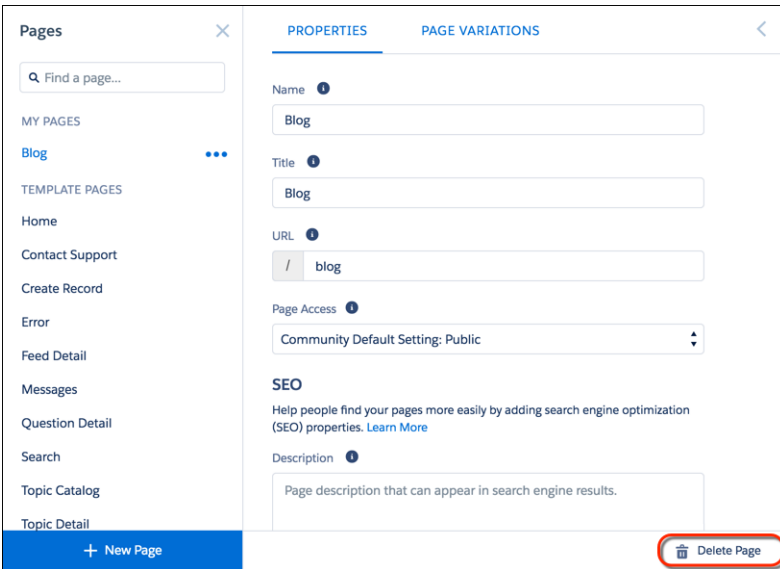

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

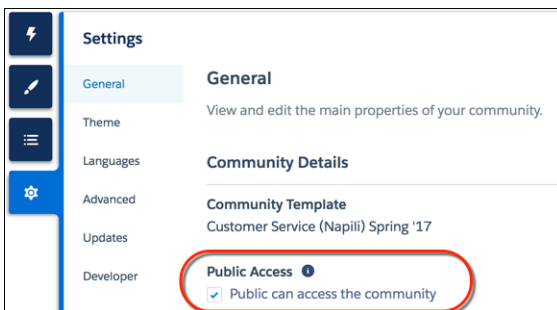

- 3. To delete the page and its page variations (if available), click **Delete Page** on the Properties tab. To delete a page variation, click  > **Delete** on the Page Variations tab.

Control Public Access for Each Page in Your Community

Set page-specific access to your community pages, so you can restrict or open up access as you see fit.

If you want folks to access your community without logging in, enable `Public can access the community` under General Settings in Community Builder.

Alternatively, you can set page-level access in Page Properties.

Community Default Setting

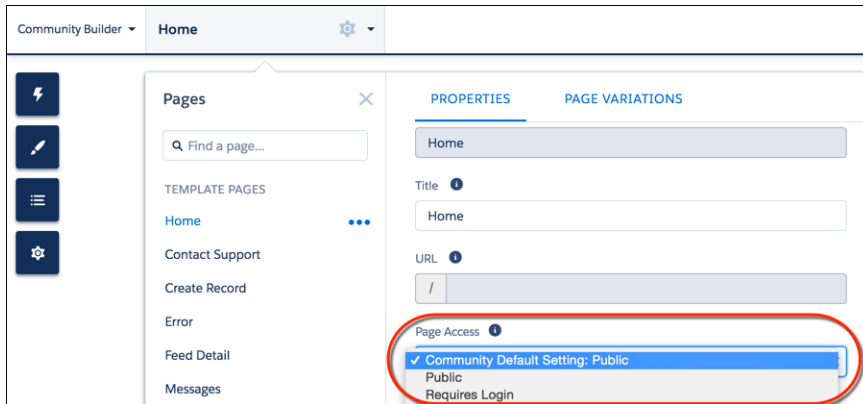

Reflects your choice for Public Access under General Settings. If you allow public access, your community pages are accessible to the public, including unlicensed users by default. If not, members must log in to access the community.

Public

Makes the page public, regardless of the community's default setting.

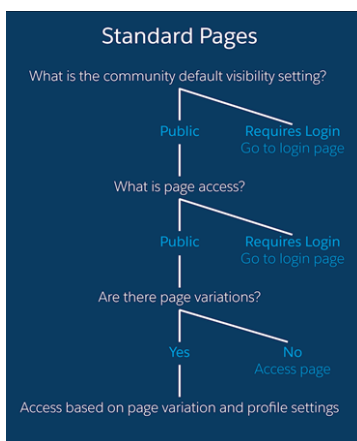

Requires Login

Makes the page private and requires members to log in, regardless of the community's default setting.

How do these settings work with [audience criteria-based page visibility in Community Builder](#)? When a member is trying to access a page, we first check the community's default setting. Is it public or does it require users to log in? After that first check, we look at the page access. Once that's cleared, we finally check the audience criteria-based visibility you set in Page Variations.

How does this logic work for standard pages?

And what's the logic behind pages that show object data?

You can also set privacy settings at the component level for some components, such as the Tabs and the Navigation Menu components. To make a component on a public page visible to guest users, select the **Publicly available** check box in the component's properties.

⚠ Important:

- There are some exceptions to the rule. Some pages are always public, while others are always private. Public pages include login-related pages (Login, Register, Forgot Password, Login Error, Check Password). The Messages page (for direct messages) is always private.
- If public access is enabled in Community Builder at the page or community level, the **Let guest users view asset files on public pages** preference is enabled in **Administration > Preferences** in Community Workspaces or Community Management. This preference lets guest users view asset files shared with the community on publicly accessible pages. It remains enabled as long as any page has public access enabled.
- When you add custom components to your community, they can bypass the object- and field-level security (FLS) you set for the guest user profile. Lightning components don't automatically enforce **CRUD and FLS** when referencing objects or retrieving the objects from an Apex controller. This means that the framework continues to display records and fields for which users don't have CRUD permissions and FLS visibility. You *must* manually enforce CRUD and FLS in your Apex controllers.

Add Markup to the Page <head> to Customize Your Community

Add custom analytics, improve your SEO results, and more by adding custom markup to the page <head> in Community Builder. For example, you can include SEO meta tags that are visible only to search engines or add a *favicon* or web page icon.

For security purposes, we restrict the tags, attributes, and values allowed in the `head` markup of your pages.

Important: Before LockerService is automatically activated for all orgs in the Summer '17 release, make sure that any existing `head` markup contains only the allowed tags, attributes, and values. In Summer '17, invalid `head` markup will be disabled.

Allowed Tags	Allowed Attributes
<base>	href, target
<link>	as, charset, crossorigin, disabled, href, hreflang, id, import, integrity, media, rel, ¹ relList, rev, sheet, sizes, target, title, type ¹ For rel, allowed values are alternate, apple-touch-icon, apple-touch-icon-precomposed, apple-touch-startup-image, author, bookmark, external, help, icon, license, manifest, next, nofollow, noopener, noreferrer, pingback, prefetch, preload, prev, search, shortcut icon, stylesheet, and tag.
<meta>	charset, content, http-equiv, ² name, scheme ² For http-equiv, allowed values are clear-type, content-type, content-language, and default-style.
<title>	None allowed

EDITIONS

Available in: Salesforce Classic and Lightning Experience

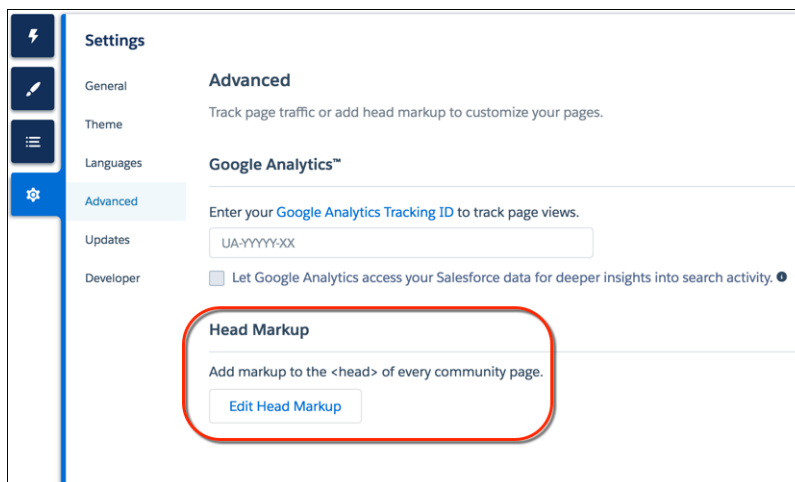

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

1. In Community Builder, click  on the left sidebar and click **Advanced**.

2. Click **Edit Head Markup**.

3. Enter the required HTML.
4. Save your changes.

When you add custom markup, the code is added to the `<head>` of every page.

 **Example:** Here we've added HTML to include a favicon on our community's pages.

Head Markup

For security purposes, we allow only the following tags, attributes, and values:

- `<base>`: href, target
- `<link>`: as, charset, crossorigin, disabled, href, hreflang, id, rel, type
- `<meta>`: charset, content, http-equiv (only values of clearly defined content types)
- `<title>`: No attributes allowed

```

1 <link rel="icon"
2   type="image/png"
3   href="http://example.com/myicon.png">
4 |

```

Page Variations and Audience Targeting for Pages and Groups

Criteria-based page visibility lets you create different versions of your page and make those variations available to specific audiences and groups.

 **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.

Page Variations

Page variations are alternative versions of a page. You can use them to try out different page layouts and styles, or create variations that are aimed at distinct audiences. Every page in your community, including custom pages, must have one default page variation. You can add as many extra variations as you need on the page's Page Variations tab.

You can also duplicate page variations, which really speeds things up when you're creating page variations that have only minor differences.

Assigning specific audience criteria to a page variation lets you target a particular set of members. Criteria include:

- Profile
- Location
- Record type

You can add multiple profiles to a variation if you like, or none.

Here are some considerations when setting location criteria:

- Location based on the user's IP address, which could potentially be located in a neighboring city.
- The location permission is not on by default in Developer Edition orgs. Contact Salesforce if you want to use this feature in that edition.
- Location criteria don't work in countries that don't allow the use of the Google API.

 **Example:** Let's say you have a financial services community and you want your clients and your brokers to see a different Home page based on their profile. You can create two variations of the Home page, each with content targeting a specific audience—clients

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer Editions**

and brokers in this case—and set the visibility of each page to different profiles. All members go to the same URL, but your clients see Home A, whereas your brokers see Home B.

Who Exactly Sees What?

After you create the page variations you need in Page Manager, you can set their visibility. Choose from three visibility options that, when combined with a page's published status, determine whether a page is visible to your community members.

Default: All users unless set by profile

When the page is published, it's visible to all valid community members, except members whose profiles are assigned to a different page variation. Each page must have one default page variation.

By Profile

When the page is published, it's visible only to users with the selected profiles.

None

Even if the page is published, it's not visible to users.

[Manage Audience Targeting for Pages and Groups in Communities](#)

Combine audience criteria to control which page is visible to your community members, creating a custom experience and even custom groups.

Manage Audience Targeting for Pages and Groups in Communities

Combine audience criteria to control which page is visible to your community members, creating a custom experience and even custom groups.

 **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.

To assign audience criteria to a page variation. See [Page Variations and Audience Targeting for Pages and Groups](#) for details and considerations when using audience criteria.

1. In Page Manager, select the page you want to edit.

EDITIONS

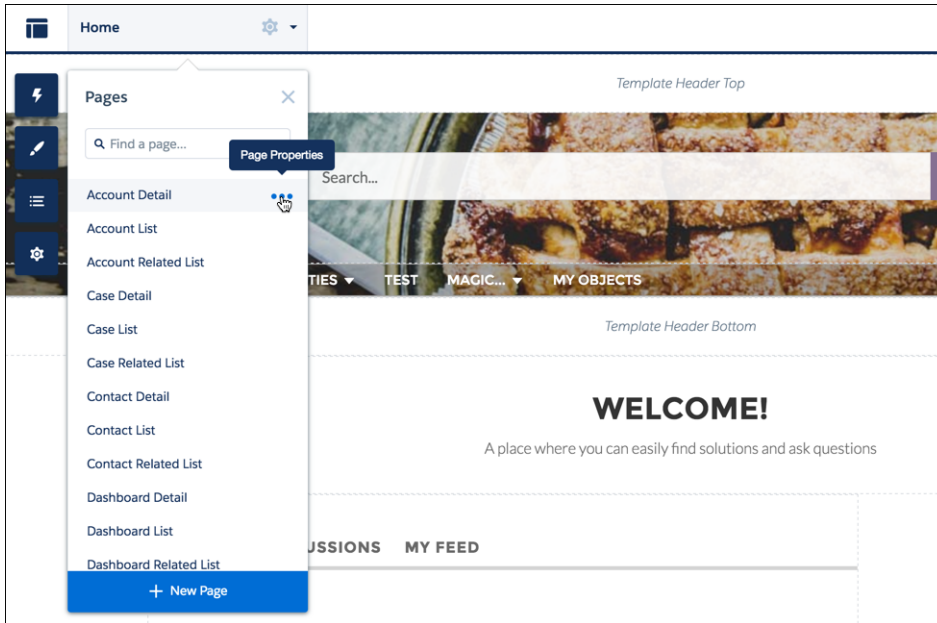

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

2. Hover over the page name to bring up the ellipsis.
3. Click on the ellipsis to bring up the page options.
4. Open the Page Variations tab.
5. Under **Actions**, click  > **Set Audience Criteria**.
6. Select the criteria that you want for your audience.
7. To update the visibility settings of:
 - An unpublished page, click **Save**. The visibility changes don't go live until you publish your community.
 - A published page variation, click **Publish Visibility Changes**. The visibility changes go live immediately, but any other pending changes must be published separately.

To set the visibility of a page variation to Default, click  > **Set Visibility to Default**.

To set the visibility of a page variation to None, remove any assigned profiles or set the visibility of another variation to Default, as appropriate.

Custom Theme Layouts and Theme Layout Types

Theme layouts and theme layout types combine to give you granular control of the appearance and structure of each page in your community. Customize the layout's header and footer to match your company's style, configure theme properties, or use a custom search bar and user profile menu. Then use theme layout types to apply a theme layout to individual pages and quickly change layouts from one central location. Whether you're a consulting partner or an ISV, or you simply want to revamp your own community, custom theme layouts make it easy to rebrand.

 **Note:** This functionality is available in communities based on the Customer Service (Napili) template and Lightning Bolt solutions.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

A theme layout is the top-level layout for the template pages (1) in your community. It includes the common header and footer (2), and often includes navigation, search, and the user profile menu. In contrast, the content layout (3) defines the content regions of your pages, such as a two-column layout.

A theme layout type categorizes the pages in your community that share the same theme layout. You can assign a theme layout to an existing type or create custom types. Then you apply the theme layout type—and thereby the theme layout—in the page's properties. Customer Service (Napili) includes the following theme layouts and types, but you can create custom types or switch layouts as needed.

- Home applies the Customer Service theme layout to all pages, except the login pages.
- Login applies the Login Body Layout theme layout to the login pages.
- Inner isn't applied to any pages. However, the Home and the Inner theme layout types are ideal for applying separate theme layouts when you want your home page to look different from the other pages in your community.

 **Note:** A developer creates custom theme layout components in the Developer Console by implementing the `forceCommunity:themeLayout` interface.

 **Example:** Let's say you create three pages for your upcoming Spring campaign. You want them to use the Large Header theme layout that your developer created. In the **Settings > Theme** area, you add a custom theme layout type called Spring to categorize these pages and assign the Large Header layout to it.

	THEME LAYOUT TYPE ⓘ	THEME LAYOUT ⓘ	
General	Login	Login Body Layout	
Theme	Home	Customer Service	
Languages	Inner	Customer Service	
Advanced	Spring	Large Header	

[New Theme Layout Type](#)

Next, you apply the Spring theme layout type in each page's properties, which instantly applies the Large Header layout to each page.

Everything looks rosy until your VP of marketing decides that the header takes up too much room. That's an easy fix, because you don't have to update the properties of each page to change the theme layout. Instead, with one click in the Theme area, you can switch Spring to the Small Header layout and instantly update all three pages!

Example: Now let's say that the Small Header layout includes two custom properties—Blue Background and Small Logo—which you've enabled and applied to all your campaign pages. However, for one page, you want to apply only the Small Logo property. In this case, you could create a theme layout type called Spring B, assign the Small Header layout to it, and enable Small Logo. Then, you apply the Spring B layout type to the page.

Theme layout types make it easy to reuse the same theme layout in different ways while maintaining as much granular control as you need.

[Change the Theme Layout of Your Community's Pages](#)

[Lightning Components Developer Guide: Create Custom Theme Layout Components for Communities](#)

[Lightning Components Developer Guide: Create Custom Search and Profile Menu Components for Communities](#)

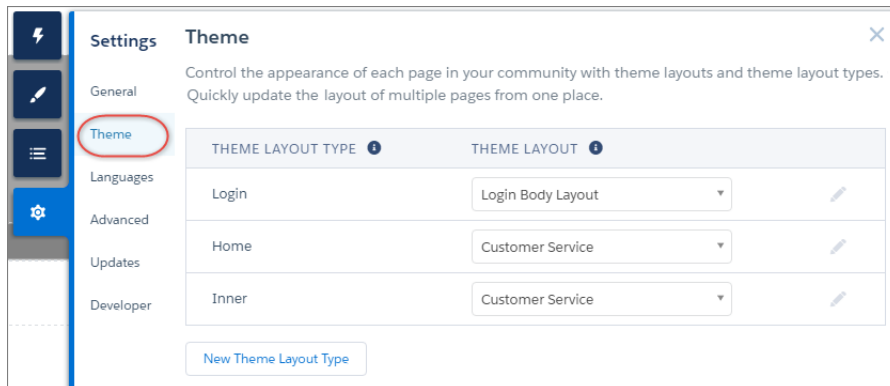

Change the Theme Layout of Your Community's Pages

A theme layout defines the top-level regions of your page, such as the header and footer, navigation, search, and the user profile menu. A theme layout type categorizes the pages in your community that share the same theme layout.

A developer creates custom theme layout components in the Developer Console by implementing the `forceCommunity:themeLayout` interface. The developer can also add properties to a custom theme layout, which you can configure in the Theme area in Community Builder. When the component is available, select the new theme layout to instantly transform the pages it applies to.

 **Note:** This functionality is available in communities based on the Customer Service (Napili) template and Lightning Bolt solutions.

1. In Community Builder, click  on the left sidebar and then click **Theme**.

2. If necessary, create a theme layout type.
3. Assign the theme layout to the theme layout type.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

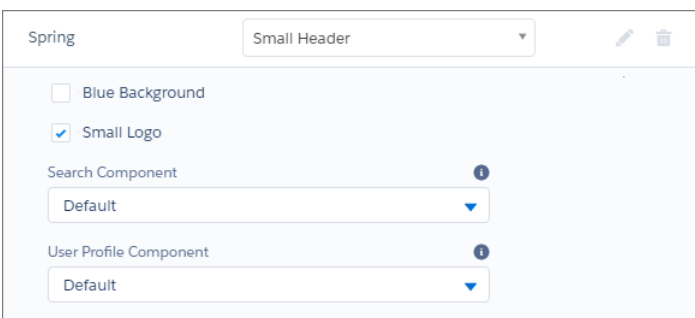

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

4. Update the theme layout's settings, if available. The properties vary depending on how your developer has configured the theme layout.

For example, the default Customer Service theme layout includes the following options for configuring the header region.

Hide the header region and navigation

Hides the default community header, which includes the header image, search box, community menu, and user profile navigation menu, in all the pages of your community. Select this option if you want to replace the header with your own custom version.

Search Component

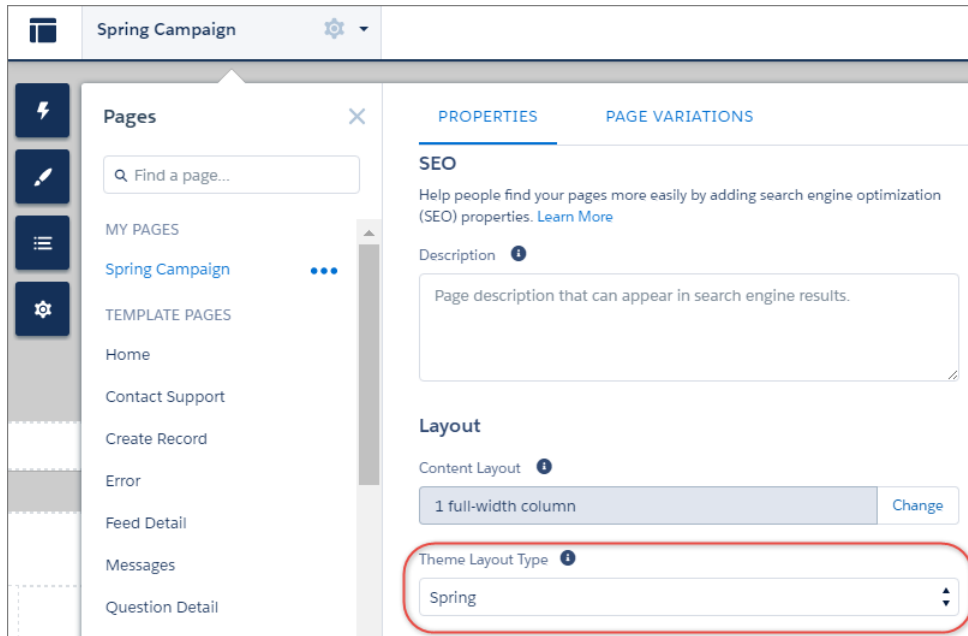

Replaces the default Search and Post component with a custom component, if available.

User Profile Component

Replaces the default Profile Header component with a custom version, if available.

Tip: A developer can create a custom search component using the `forceCommunity:searchInterface` or a custom user profile component using the `forceCommunity:profileMenuInterface` in the Developer Console.

5. Apply the theme layout to a page by selecting the theme layout type in the page's properties.

SEE ALSO:

[Custom Theme Layouts and Theme Layout Types](#)

[Page Properties and Types in Community Builder](#)

[Lightning Components Developer Guide: Create Custom Theme Layout Components for Communities](#)

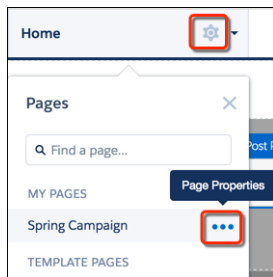

[Lightning Components Developer Guide: Create Custom Search and Profile Menu Components for Communities](#)

Change the Content Layout in Community Builder

Quickly change the look of your community's pages by switching to a different layout. You can even create your own custom layouts in the Developer Console and import them to use in your community.

 **Note:** This functionality is available in the Winter '16 and later versions of the Koa, Kokua, and Customer Service (Napili) templates and the Spring '16 and later versions of the Aloha template.

1. In Community Builder, open the page's properties. Click  beside the page on the top toolbar, or click  beside the page in the Pages dropdown menu.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

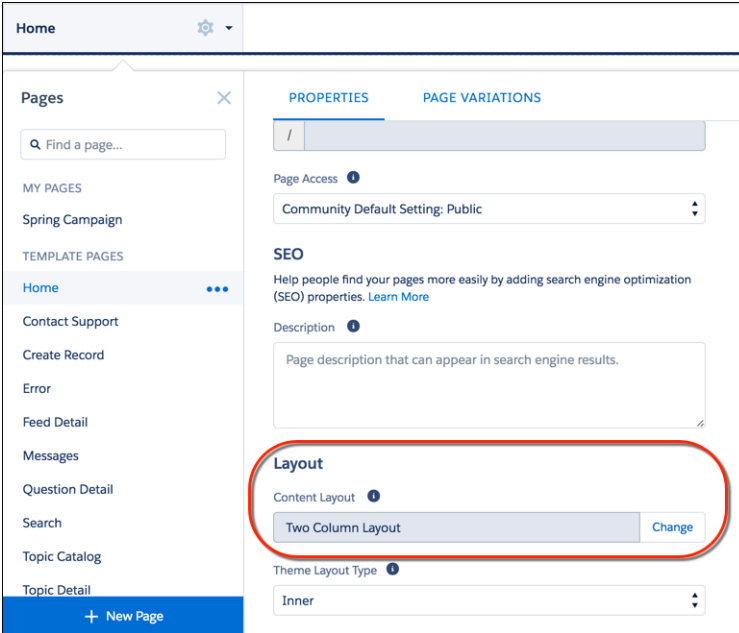

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

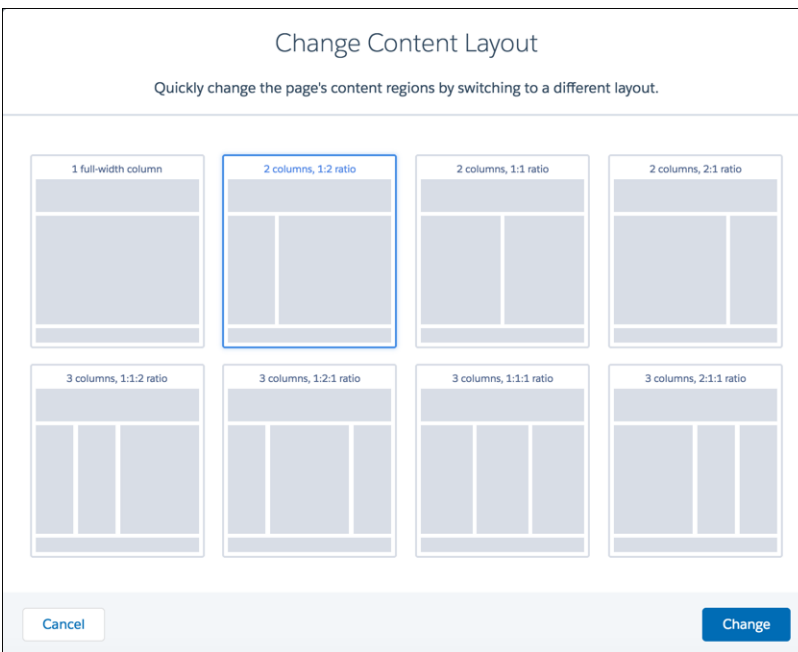

To customize or publish a community:

- "Create and Set Up Communities"

- In Properties, click **Change** in the Layout section.

- Select the new layout. If you've added a custom layout, you see both ready-to-use and custom content layouts displayed together.

- Click **Change**.

If the structure of the new layout is different from the current layout, some regions are not visible. However, the regions are still available and you can switch to a different layout at any time.

 **Note:** If you change the layout of a default template page, the only way to revert to the original layout is to click **Undo**.

Use Visualforce in Customer Service (Napili) Communities

If you have created Visualforce pages, actions, buttons, links, and canvas apps for your Salesforce Tabs + Visualforce template-based communities, you can reuse those elements in Customer Service (Napili)-based communities.

For example, say that you have the Salesforce CPQ (Steelbrick) app installed in your org. You can create a quote detail page and use the Visualforce Page component to display the quote line editor or other pages. If you have configured actions, buttons, and links, associated with standard or custom objects, they work in communities as well. And canvas app overlays let you host third-party applications in your community.

1. Give Visualforce page access to users by profile.
 - a. From Setup, enter *Profiles* in the **Quick Find** box, then select Profiles.
 - b. Click the name of the profile you want to modify.
 - c. On the Profile page, click **Enabled Visualforce Page Access**.
 - d. In the **Enabled Visualforce Page Access** section of the Profile page, click **Edit**.
 - e. In the Available Visualforce Pages list, select the Visualforce pages that you want to make available to this profile and then click **Add**.

- f. Click **Save**.
2. Make the Visualforce page available for your community.
 - a. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
 - b. Click **Edit** for the page you want to make available for your community.
 - c. Select **Available for Salesforce mobile apps and Lightning Pages** and click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

Visualforce Page Component—To add a Visualforce page to your Customer Service (Napili) community, drag and drop the Visualforce Page Component from the Components panel to the page. Select the Visualforce page you want to use in the property editor.

Tip: If the Visualforce page requires the Record ID from an object such as Account, create object pages for Account. Then drag and drop the Visualforce Page component onto the object's detail page. The Record ID field adjusts to the object's ID.

Custom Actions—If you have custom actions with an action type of **Custom Visualforce** associated with a Visualforce page, these actions work in published communities. When users click the action button, the associated Visualforce page displays.

Important: Overrides to standard Visualforce actions such as View, New, Edit, and Delete are not supported in communities. These buttons on record detail pages don't display in communities.

Custom Buttons and Links—If you have custom buttons and links with a content source of Visualforce Page, these buttons and links work in published communities. When users click the button or link, the associated Visualforce page displays.

You can opt to hide the publisher header and publisher Share button in Canvas App Settings.

Best Practices for Using Visualforce in Communities

- Community Branding**—When developing your Visualforce page code, set the `showHeader` attribute to `true`. That way, branding properties you set in **Administration > Branding** in Community Workspaces or Community Management also apply to the Visualforce page component in your Customer Service (Napili) community. To modify the default gray background for Visualforce components, change the **Header Background** property on the Branding page.

- **Mobile**—To enable Visualforce pages to display community branding on mobile, set `standardStylesheets=true` or `showHeader=true` in your Visualforce page code.
- **URLs**—If your Visualforce page contains links to other Visualforce pages, ensure that the Visualforce markup includes `http://` or `https://` at the start of the URL. Also, if your page is locked in a frame, use the `target="_top"` attribute to open the page in the full body of the window. For example,

```
<a href="https://yourVFpageURL.com" target="_top" >Name of Visualforce Page</a>
```

- **JavaScript Sources**—Use JavaScript sources such as `connection.js`, `apex.js`, `debugshell.js`, and `util.js` in Visualforce pages in either of the following ways:

```
<apex:includeScript value="/soap/ajax/36.0/connection.js"/> or  
loadScript("/soap/ajax/36.0/connection.js")
```

- **Images**—Hard-coded image URLs in Visualforce pages are not supported in Community Builder preview. We recommend that you upload images as static resources as follows:

```

```

Share More Salesforce Object Data in Your Community

The Customer Service (Napili) template allows you to share record data for accounts, cases, contacts, tasks, events, and custom objects with minimal configuration. Record data respects user permissions via licenses, profiles, permission sets, and sharing rules.

-  **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.
- Create a [list of records and link to it](#).
- [Display record details in your community](#) with the out-of-the-box Record Detail page or create a custom page.

You can also [add groups to your community](#) in the same way.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

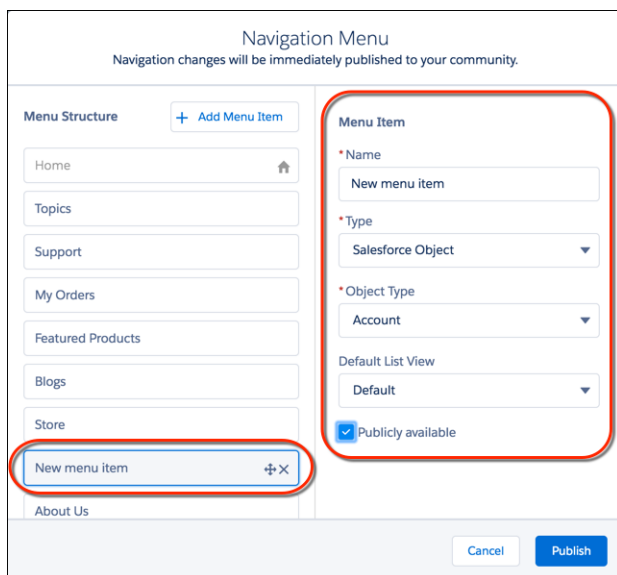

- "Create and Manage Communities"

Share a List of Records in Your Community

Create record list views for accounts, cases, contacts, and custom objects and link to them from the Customer Service (Napili) template navigation menu. Use an out-of-the-box or custom page layout to display the list of records.

 **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.

1. In Community Builder, drag and drop the Navigation Menu component to add it to the appropriate page in the template. We recommend adding it to the Home page.
2. Create a navigation menu item pointing to a supported Salesforce object. Currently, the Customer Service (Napili) template supports accounts, cases, contacts, and custom objects.

3. Publish your changes.

 **Note:** If your community is active, your navigation menu item changes immediately appear to your community members.

That's it! This creates a navigation menu item, which links to a list of the selected object's records. Under the hood, your data is retrieved from Salesforce and displayed using the generic Record List page. This page is available out-of-the-box in the Customer Service (Napili) template and uses the Record Home List View Lightning component to display data in an appropriate layout.

 **Note:** The generic Record List page provides the default list view layout for objects that don't have a predefined or custom list view page assigned. For example, if you create a navigation menu item for another Salesforce object, it uses this same page. If you modify the Record List page, be sure to account for all the affected objects.

 **Example:** A list view page for a custom object called Featured Products.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Creating a navigation menu item is the easiest way to link to a list of records for an object. If you prefer to use a custom list view page for an object, [create a new page](#) for your community using Community Builder. Choose the Standard page type with a single-column layout. Add the Record Home List View component to the page, configure the component properties to point to the object, and then publish the page. To link to the page, create a custom navigation menu item and use the internal page URL.
- Users can access only records they have access to via licenses, profiles, permissions, and sharing rules, same as in Salesforce. Users with the "Create" permission for the object can create records from the list view page. The ability to create records from this page isn't supported on mobile devices.
- You can hide a navigation menu item from guest users to block access to the associated record list view page.
- When users click a record on this page, the record details are displayed using the layout from the generic Record Detail page. If you create a custom record detail page and assign it to the object, we use that page instead.
- Clicking a record in the list view displays the record details, which are displayed using the Record Detail page in the Customer Service (Napili) template.
- The Record List page and the Record Home List View component are not available in the Koa and Kokua templates.

[Navigation Menu](#)

[Record List](#)

Display Record Details in Your Community

Display record details using the generic Record Detail page or create custom record detail pages.

 **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.

The Customer Service (Napili) template supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (with a preassigned case detail layout) and clicks a contact in the related records. If you haven't created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page. Under the hood, the Record Detail page uses the Record Headline and Record Information Lightning components to display record data.

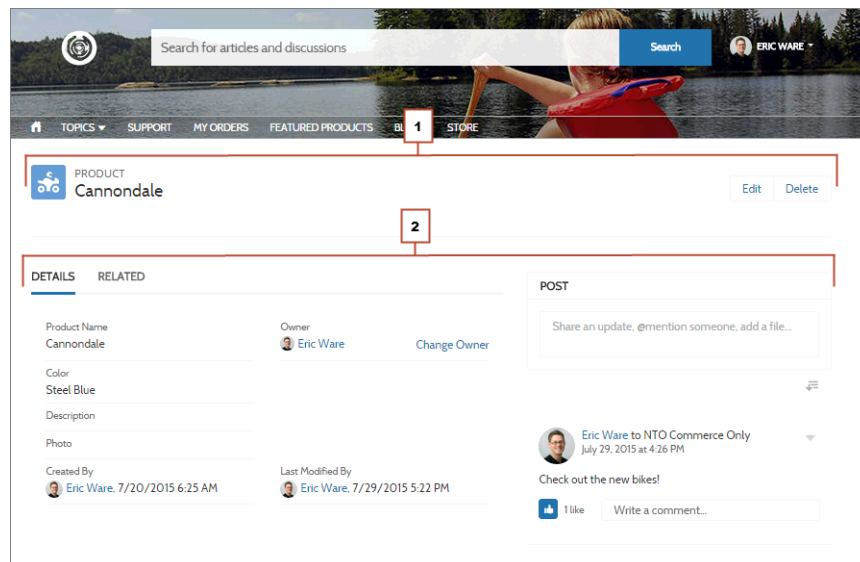

- **Record Headline:** Displays the record name and key record highlights along with buttons to edit and delete the record.
- **Record Information:** Displays all record details including related records and the record feed. It also allows users to create new related records and post to the record feed.

Optionally, you can create custom record detail pages for accounts, contacts, cases, tasks, events, and custom objects.

1. [Create a new Data Detail page](#) in Community Builder and pick a supported object.
2. Add the Record Headline and Record Information components to the page and configure the component properties in the property panel.
3. Publish your changes.

 **Note:** If your community is active, your navigation menu item changes immediately appear to your community members.

 **Example:** The record detail page for a custom object with the Record Headline (1) and Record Information (2) components.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Users accessing the community on a mobile device have access to actions from the record detail page. For example, a partner user with create and edit access to accounts can create accounts or update an account as needed.
- Some objects have preassigned record detail pages to display record data (such as cases). You can check the available pages and assignments for each object in Community Builder in Page Properties.
- Objects without preassigned record detail pages use the generic Record Detail page. If you modify the Record Detail page layout or configuration, be sure to account for all objects that use this page layout.
- Users without the necessary license, profile, and permissions can't access record data.
- Users with the necessary permissions can create records from the related lists, and edit and delete the record from the record headline. These actions aren't supported on mobile devices.
- Page layouts for each object in Salesforce determine what fields display in the Record Information component. The fields in the Highlight Panel layout determines what displays in the Record Headline component. This feature includes support for record types. You can modify the page layout, the Highlight Panel, and record type settings in Salesforce Setup.
- Enable feeds on records in Salesforce to allow users to post on them in communities.
- The Record Detail page, the Record Headline component, and Record Information component are not available in the Koa and Kokua templates.

[Record Banner](#)[Record Information Tabs](#)[Record Related List](#)

Add Groups to Your Community

Want more collaborative communities? Allow community members and guest users to browse and join groups in your Customer Service (Napili) community. Use the out-of-the-box design for groups or create your own customized version of the group detail page using separate components.

 **Note:** This functionality is available in the Winter '16 and later versions of the Customer Service (Napili) template.

1. To enable groups in your community, add groups to the community navigation menu.

This automatically displays a menu item that links to a list of groups in your community. If you make the menu item publicly available, even guest users who aren't logged in to your community can browse through the list of active public groups.

EDITIONS

Available in: **Salesforce Classic** and **Lightning Experience**

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

The screenshot shows the 'Edit Navigation Menu' configuration screen. On the left, a list of menu items includes 'Home' (with a lock icon), 'Topics', and 'GROUPS' (which is selected and highlighted in blue). On the right, the configuration for the 'GROUPS' item is shown, including: Name (GROUPS), Type (Salesforce Object), Object Type (Group), Default List View (Active Groups), and a checked 'Publicly Available' checkbox. At the bottom, there are 'Cancel' and 'Publish Changes' buttons.

2. Publish your community.
3. If you haven't already, customize the group publisher layout to include the Add Member action. This action allows group owners and managers to add members to the group, and isn't shown in the list of actions in the group by default.

When users click on the name of an active group in the community, they're redirected to the group detail page. If it's a private group, they're asked to log in. Only logged-in group members can view private group content.

A few things to keep in mind:

- When you enable groups in your community, the default Group Detail page is used to display group data. This page uses the Group component under the hood for formatting and layout. The Group component is a composite, one-stop component that includes the group banner, group details, related lists, and the group feed. We recommend using this composite component, especially if you want your community pages to be responsive across desktop and mobile device browsers.
- If you prefer to use a different layout or want more granular control over the placement of group content, create a custom community page and use the Group Banner, Group Details, Group Related List, and Feed components. Depending on how you use the individual components, custom pages might not be responsive across all devices.
- Group announcements aren't supported in communities.

Group detail page in Customer Service (Napili) Template

External Data Sources in Your Community

Access your external data and content that are stored outside your Salesforce org from your Customer Service (Napili) template community.

Let your community users access:

- Data that's stored in another Salesforce org, SAP® NetWeaver Gateway, or IBM WebSphere® that your org accesses via Salesforce Connect
- Content that's stored in Google Drive or SharePoint that your org accesses via Files Connect

Note:

- High-data-volume external data sources aren't supported.
- If the external data source has *Identity Type* set to Per User, Customer Service (Napili) template community users can't set up their own authentication settings for external systems. However, you can set up and manage each user's authentication settings for external systems from Lightning Experience or Salesforce Classic.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Example: Let's say you have a partner community for sales, and you store your product order information in a back-office ERP system. You can surface that information to your sales partners, enabling them to view and update orders within the context of all related data regardless of where it's stored.

Or maybe you store your templates for contracts and other agreements in a non-Salesforce environment. Your sales partners can access the latest versions of that content as needed.

Track Community Users with Your Google Analytics Tracking ID

Add your Google Analytics™ tracking ID to track page views in your community. Enable access to your Salesforce data for deeper insights. Then, adjust your community's pages to more accurately reach your customers.

To track using Google Analytics:

1. In Community Builder, click  on the left sidebar and click **Advanced**.
2. Enter your Google Analytics tracking ID.

3. To track user types, user IDs, and search activity, enable **Let Google Analytics access your Salesforce data for deeper insights into search activity**.
4. To enable the service, publish the community.

Your community's analytics data streams directly to the Google Analytics service where you can review and interpret it.

Once you've set up Google Analytics to integrate with your Salesforce community's data, you can either [create your own reports](#) or you can install the preconfigured [Google Analytics for Salesforce Communities package](#). For more information, see the [Google Analytics for Salesforce Communities](#) package write-up.

For developers of custom Lightning components for Communities, we provide the `global forceCommunity:analyticsInteraction` event. Use this event to track events triggered by the custom component.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

Configure Google Analytics™ for Salesforce Communities

Set up Google Analytics to track User IDs, community user types, and search activity so this information can be pulled into meaningful reports.

Google Analytics integrates with your self-service community to track user types, user IDs, pageviews on Salesforce objects, and customer search activity. To correctly capture this information, some initial setup is required.

1. First, let Google Analytics access your data to collect page views. Go to **Settings > Advanced** in Community Builder and enter your Google Analytics ID. For more information about the Google Analytics ID, check the [Google Analytics documentation](#).
2. Then select **Let Google Analytics access your Salesforce data for deeper insights into search activity** to allow Google Analytics to track user types, user IDs, and customer search activity within your community.
3. Create custom dimensions in your Google Analytics account that capture user type and Salesforce object information. From your Google Analytics account, go to **Admin > Property > Custom Definitions > Custom Dimensions**. Click **+New Custom Dimension**. The first dimension you create in your Google Analytics account is automatically sorted as Index 1.
 - a. For Index 1, enter the Name: *User Type* and select **Hit** for the scope.
 - b. For Index 2, enter the Name *Salesforce Object* and select **Hit** for the scope.
4. Create a User-ID view. With the User-ID view, you can analyze how specific segments of traffic with an assigned ID engage with your content. To create a User-ID view, go to **Admin > Property > Tracking Info > User-ID** and follow the instructions.
 - a. For the User-ID view, enter the Name: *User Explorer*.
5. To track how different types of users are interacting with the community, click **Reporting > Audience > User Explorer > User Flow**
6. Once you've set up Google Analytics to integrate with your Salesforce community's data, you can either [create your own reports](#) or you can install preconfigured [Google Analytics for Salesforce Communities package](#). Click [here](#) for more information about the Google Analytics for Salesforce Communities package.

USER PERMISSIONS

Lightning Bolt Solutions: Build Once, Then Distribute and Reuse

Lightning Bolt makes it easy to create and export industry-specific solutions and use them to jump-start new communities, or package and distribute them for others to use. Save time by building once, then reusing. Whether it's for your own org or you're a consulting partner or ISV, you can reduce the time required to build communities and cut development costs.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

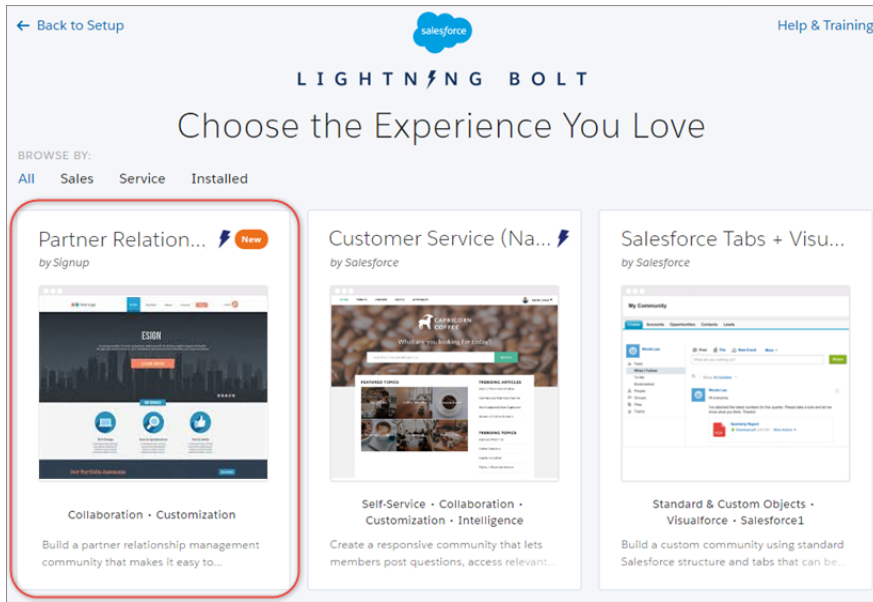

-  **Example:** Let's say you specialize in building partner relationship management (PRM) communities for the manufacturing or tech industries. With Lightning Bolt, you can build and export a PRM-focused solution that's easy to distribute to your customers. After the template is installed on your customer's org, you can further customize it to suit their unique needs. By building the bulk of the solution in your org and then distributing it to your customers' orgs, you can launch their communities in no time.
-  **Example:** Let's say you're an ISV who builds several custom Lightning components and a custom page to create an e-commerce feature for use in Community Builder. Now you can bundle the page and its components into a single package and distribute it to your customers.

What Is a Lightning Bolt Solution?

At its simplest, a Lightning Bolt solution comprises an exported community template that's made up of a theme layout and CSS, along with pages, content layouts, and Lightning components. Bolt solutions seamlessly integrate with Salesforce and incorporate business logic, custom objects, industry best practices, and more.

Use the Customer Service (Napili) template as a base to build your custom solution with standard pages and components, or create custom pages, layouts, and components of your own. After you've finished customizing the template, you can export it from the Developer section in the Settings area.

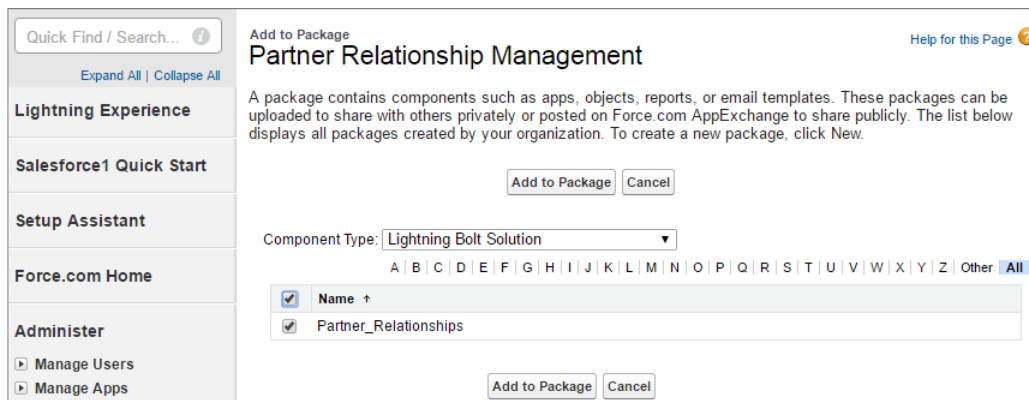

When you export a template, it appears in the Community Creation wizard in your org, where you can use it as a base for building new communities.

Similarly, you can export a single page, which includes the page's content layout and components. After you export a page, it appears in the New Page dialog box in all communities in your org.

What About Packaging and Distribution?

In addition to using exported templates and pages in your own org, you can also package the solutions for distribution to your customers' orgs. After you create and upload a managed package, you can share the link privately with your clients, customers, or partners.

After a template is installed in another org, it appears in the org's Community Creation wizard. Installed pages appear in the New Page dialog box.

[Export and Packaging Considerations for Lightning Bolt Solutions](#)

Before you export a customized template or page as a Lightning Bolt solution, keep the following considerations and limitations in mind.

[Export and Package Customized Lightning Bolt Solutions](#)

Lightning Bolt solutions enable you to customize and export the Customer Service (Napili) template to use as a base for your new communities, or package and distribute it for others to use.

[Export and Package Customized Lightning Bolt Pages](#)

Export pages that you've customized in the Customer Service (Napili) template to use as a base for new pages, or package and distribute them for others to use.

Export and Packaging Considerations for Lightning Bolt Solutions

Before you export a customized template or page as a Lightning Bolt solution, keep the following considerations and limitations in mind.

Note: This functionality is only available in the Customer Service (Napili) template.

Tip: We recommend using managed packages to avoid naming conflicts with other packages in your customer's org or your own.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Single Page Export and Packaging

- The exported page name must be unique.
- When you export a page, the system automatically generates a developer name (`devName`) for it by prepending the community name and removing any non-alphanumeric characters. For example, *My #awesome page* in the Acme community becomes `Acme_My_awesome_page`. Developer names longer than 80 characters are truncated.
- Exported page variations use the naming convention `[Community Name]_[Page Name]_[Variation Name]`.

Original Page Name	Exported Page Name	Exported Page Developer Name
Coffee Fans	Coffee Fans	Acme_Coffee_Fans
West Coast (page variation)	Coffee Fans - West Coast	Acme_Coffee_Fans_West_Coast
East Coast (page variation)	Coffee Fans - East Coast	Acme_Coffee_Fans_East_Coast

- For images in the Rich Content Editor, we export the version used in the editor, which is not necessarily the latest version of the asset file.
- Audience-based visibility criteria aren't included in the export process. Manually reenter this information after importing the page to the community in the destination org.
- When you export a page, its page variations aren't included in the package; you must export them separately.
- You can't export login pages.

Template Export and Packaging

- The exported template name must be unique.
- In the Community Creation wizard, the template author (for example, *by Salesforce*) for exported and imported templates differs.

- When you export a template, your org name is shown within your own org.
- When you import a template, the publisher name of the package is shown.
- If you upgrade a managed template package, existing communities that are based on the upgraded template aren't updated.
- When you export a template, the system generates a developer name (`devName`) for the template by prepending the community name and removing any non-alphanumeric characters. For example, *My Template #2* in the Acme community becomes `My_Template_2`. For the template's pages, the system uses the same naming convention as single exported pages described above. Developer names that are over 80 characters are truncated.
- The following items are not included when you export a template. After you import the template and use it to create a community in the destination org, you must manually reconfigure these items.
 - Custom theme layouts that aren't in use—only theme layouts that are selected in **Settings > Theme** are included
 - Navigation Menu items
 - 🔗 **Note:** If you've created a custom navigation menu component (using `forceCommunity:navigationMenuBase`), the component is included in the package but its navigation settings aren't.
 - Non-default page variations; only default page variations are included. If a page doesn't have a default variation—for example, a page with two variations that are both set to audience-based visibility—the page is excluded entirely.
 - Branding Editor properties and CSS customizations
 - Community Builder settings, including head markup and the Google Tracking ID
 - Community Management settings
 - Localized content for multilingual communities

[Export and Package Customized Lightning Bolt Solutions](#)

[Export and Package Customized Lightning Bolt Pages](#)

[Package and Distribute Your Apps](#)

[ISVforce Guide: Creating and Uploading a Managed Package](#)

Export and Package Customized Lightning Bolt Solutions

Lightning Bolt solutions enable you to customize and export the Customer Service (Napili) template to use as a base for your new communities, or package and distribute it for others to use.

1. In Community Builder, click **Settings > Developer**.
The information that you add on this page appears in the Community Creation wizard and helps users understand the purpose and benefits of your solution.
2. Add a unique name for the solution and select a category.

EDITIONS

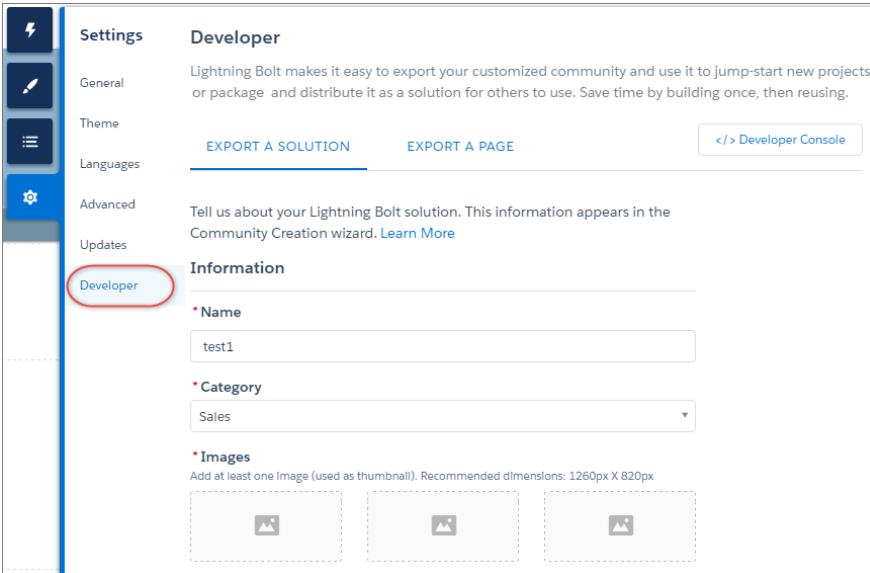

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

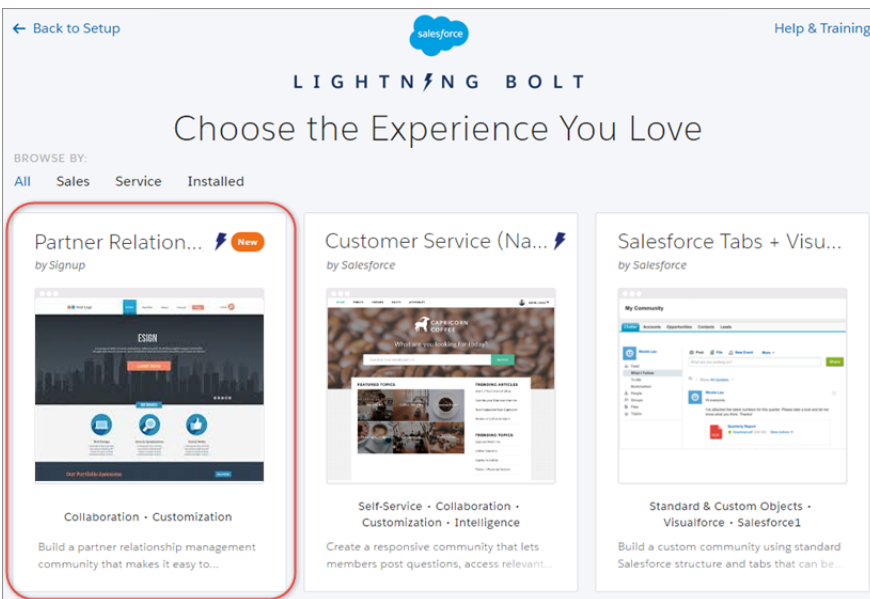

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

3. Add at least one image, which is used as the thumbnail image. The recommended image dimensions are 1260 x 820px. You can add two more images that appear in the detailed description of the solution.
4. Enter a summary that describes the purpose of the solution.
5. Enter at least one key feature.
The feature titles appear under the thumbnail in the Community Creation wizard, and the feature descriptions appear in the solution's detailed description.
6. Click **Export**.
After you export a solution, it appears in the Community Creation wizard in your org, where you can use it as a base for building new communities. Similarly, if you package the solution and install it in another org, it appears in that org's Community Creation wizard.

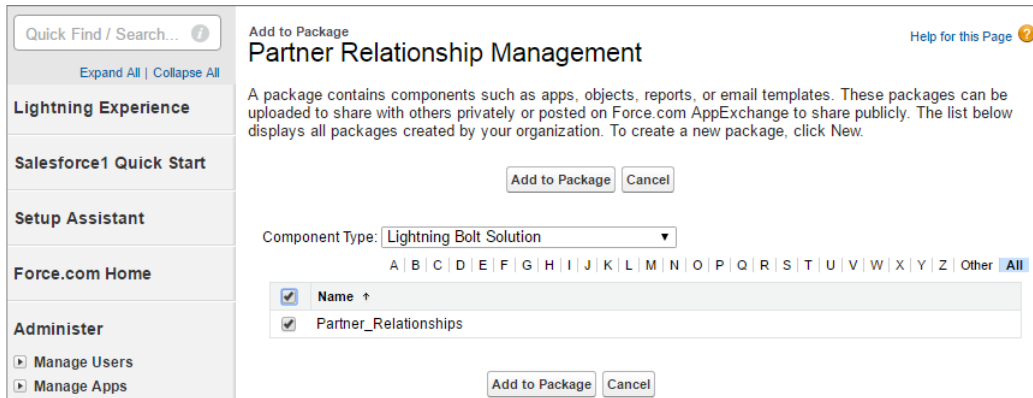

7. If you want to package the exported solution:

a. From Setup, enter *Package* in the **Quick Find** box, and then click **Packages**.

 **Tip:** We recommend using managed packages to avoid naming conflicts with other packages in your customer's org or your own.

b. Select **Lightning Bolt Solution** as the component type.

The screenshot shows the 'Add to Package' interface. On the left is a navigation sidebar with categories like 'Lightning Experience', 'Salesforce1 Quick Start', 'Setup Assistant', 'Force.com Home', and 'Administer'. The main content area is titled 'Partner Relationship Management' and includes a search box, a description of packages, and a list of packages. The 'Component Type' is set to 'Lightning Bolt Solution'. The package list shows 'Partner_Relationships' selected. There are 'Add to Package' and 'Cancel' buttons at the bottom.

c. Upload the package. Then share the link privately with your clients, customers, or partners.

 **Note:** To delete exported and imported solutions, from Setup, enter *Lightning Bolt Solutions* in the **Quick Find** box, and then click **Lightning Bolt Solutions**.

Deleting a solution from your org doesn't affect communities that are already based on it.

Export and Package Customized Lightning Bolt Pages

Export pages that you've customized in the Customer Service (Napili) template to use as a base for new pages, or package and distribute them for others to use.

To export a page and its components:

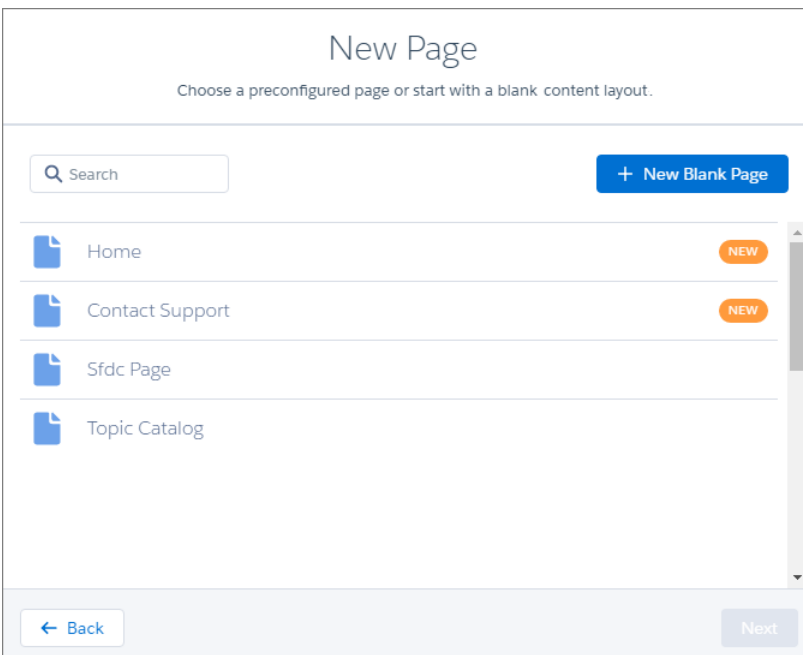

1. In Community Builder, click **Settings** > **Developer** and click **Export a Page**.

2. Select the page to export.

3. Click **Export**.

After you export a page, it appears in the New Page dialog box in all the communities in your org. Similarly, if you package the page and install it in another org, it appears in the New Page dialog box of that org. Newly installed pages are highlighted as New for 30 days.

4. If you want to package an exported page:

- a. From Setup, enter *Package* in the Quick Find box, and then click **Packages**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

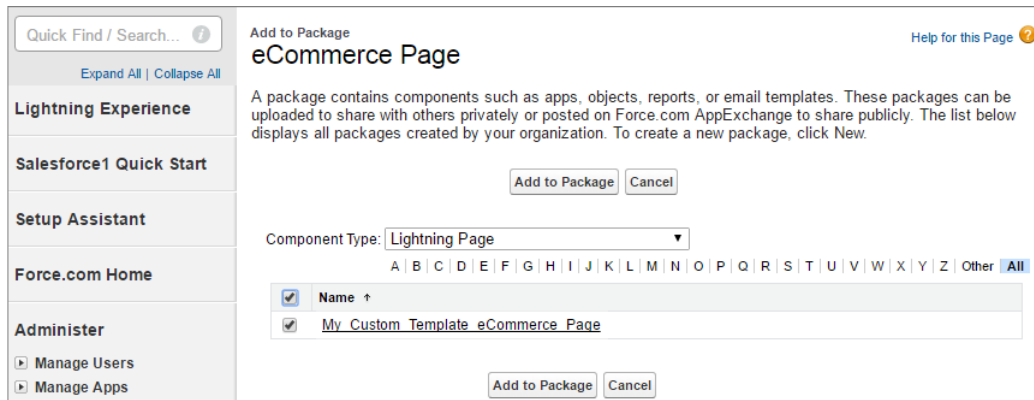

USER PERMISSIONS

To customize or publish a community:

- "Create and Set Up Communities"

 **Tip:** We recommend using managed packages to avoid naming conflicts with other packages in your customer's org or your own.

- b. Select *Lightning Page* as the component type.

Community Management

Community Management is your one-stop shop for administering, managing, and moderating your community.

[Community Managers, Moderators, and Admins Working Together](#)

Communities can thrive when community managers, moderators, and admins understand their unique roles and work together effectively.

[Measure Community Success with Dashboards](#)

Use Dashboards to view your community's analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement, providing you with a high-level view into the health of your community. Dashboards also help you monitor return on investment (ROI) and key performance indicators (KPI).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Insights for Community Engagement](#)

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

[Community Moderation Strategies and Tools](#)

Community moderation allows you to empower members of your community to monitor content and ensure that it's appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

[Organize Communities with Topics](#)

Navigational and featured topics are a fantastic way to organize content in a community. Use topics to structure your community content or highlight key discussions. You can create topics or use the topics that organically emerge from community member posts. You can use topics in the communities built using the Customer Service (Napili) template.

[Customize Recommendations in Communities](#)

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Target specific audiences and use channels to specify locations for the recommendations.

[Reputation Overview](#)

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Community Managers, Moderators, and Admins Working Together

Communities can thrive when community managers, moderators, and admins understand their unique roles and work together effectively.

A community manager and moderator work hand-in-hand. They are partners and support one another in fostering engagement and harmony in the community. Sometimes, they perform some of the same tasks, but each has unique contributions. While the community manager is typically responsible for monitoring adoption and engagement, the moderator is typically responsible for ensuring the community is a healthy environment and that members feel encouraged to be active and helpful to each other.

Community managers, moderators, and admins all work together to protect, engage, and measure community success.

EDITIONS

Prevent spammers, bots, and trolls from attacking the community.

Protect the community from trademark infringement and legal issues.

Ensure community members use appropriate language and adhere to the terms of use.

Welcome new members, add contributors, and connect members with resources.

Help ensure that members questions are answered quickly.

Acknowledge helpful members and thank them.

Review analytics on community health.

Measure return on investment (ROI) and key performance indicators (KPI), such as money saved and cases deflected.

Identify and track community trends.

Identify, encourage, groom, and retain MVPs.

[Manage Your Community](#)

Set up and monitor your community from Community Management or Community Workspaces.

[What's a Community Manager?](#)

Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

[What's a Community Moderator?](#)

Moderators help ensure the success of your community by monitoring user activity and flagged items.

[Access Community Management](#)

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

Manage Your Community

Set up and monitor your community from Community Management or Community Workspaces.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

Important: The options available in Community Management or Community Workspaces are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you don't see the Topics section. Some of the options in the following list might not appear in your community. To display all sections, go to **Administration > Preferences** and enable **Show all settings in Community Management** or **Show all settings in Community Workspaces**.

Home

- View your community's home page dashboard. If your home page still displays a message to install the Salesforce Communities Management package, your administrator hasn't mapped a dashboard yet.
- Preview the community or access your community's settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header or from Community Workspaces.

Engagement

Monitor recent activity and take immediate action without leaving Community Management.

[Insights are set up by the administrator](#). If the Engagement section doesn't appear, the administrator hasn't mapped any Insights for your community.

Dashboards

View dashboards and monitor information about groups, members, feed activity, moderation, topics, and license usage for this community.

[Dashboards are set up by the administrator](#). If the Dashboards section doesn't appear, the administrator hasn't mapped any dashboards for your community.

Moderation

View reports for flagged posts, comments, messages, and files. You can also see a report of all posts that are pending review and set up moderation rules for your community.

[Moderation is set up by the administrator](#).

Topics

Create a navigation menu and showcase popular topics in your community.

[Navigational topics](#) and [featured topics](#) are set up by the administrator or in the case of self-service templates, they are enabled by default. If the Topics section doesn't appear, your community is not using topics.

Recommendations

Recommendations can help drive engagement in a community. They can be set up to encourage users to watch videos, take trainings, and more.

[Recommendations are set up by the administrator](#). If the Recommendations section doesn't appear, the administrator hasn't set up any.

Reputation

Set up reputation levels and points to reward members for activity in the community feed.

[Reputation is set up by the administrator](#). If the Reputation section doesn't appear, the administrator hasn't enabled it.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Workspaces or Community Management:

- "Access Community Management" OR "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community

To access moderation rules and criteria:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community

Administration

On the Administration page, you can update basic setup for the community, including:

- **Members**—Add or remove members based on profiles or permission sets.
- **Tabs**—Select the tabs you want community members to see. Tabs are also used to determine community navigation in Salesforce1. Tab settings aren't used if your community was created with one of the Self-Service templates.
- **Branding**—Select an out-of-box branding theme. This branding is only used if your community uses the Salesforce tabs + Visualforce template.
- **Login & Registration**—Select the default community login page and set up self-registration.
- **Emails**—You can customize email sender information, Chatter email branding, and templates in your community emails.
- **Pages**—Configure page assignments for your community and access the Force.com and Site.com settings for your community.
- **Preferences**—Update important settings such as flagging content, nickname display, public access to Chatter, and file limits.
- **Settings**—Edit your community name, description, and URL. You can also manage the status of your community and update your community template

Lookups in Community Management and Community Workspaces initially return the items you most recently viewed from within the community. If an object you're looking for isn't in the Recently Viewed Documents list, try typing all or part of the object name and searching again.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you can't access the Administration settings in Community Management or Community Workspaces. To add yourself back to the community or make other membership updates, [use the API](#).

[What's a Community Manager?](#)

[What's a Community Moderator?](#)

What's a Community Manager?

Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

Community managers must be employees of your organization; external community members can't be community managers.

A community manager is a member of the community that takes on the extra responsibility of monitoring community engagement. Community managers need access to reports and dashboards that show trends in activity and membership. They also need to be aware if members aren't logging in as frequently as they should be. By monitoring community membership and activity, community managers can figure out how to engage community members and ensure that they participate.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Community managers can set up a point system and reputation levels that reward members with points when they perform certain actions. Once members reach the top of the level's point threshold, they move up a level.

[Assign a Community Manager](#)

To assign a user as a community manager, simply give them the "Manage Communities" permission.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign permission sets:

- “Assign Permission Sets”

What's a Community Moderator?

Moderators help ensure the success of your community by monitoring user activity and flagged items.

In a successful community, members are actively engaged and communicating with one another. A community moderator facilitates knowledge sharing within a community to help members benefit and derive value from their participation. The moderator also helps ensure that all communications and content in the community are appropriate.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management and Community Workspaces. External users who are moderators can moderate within context of the community, such as directly in the community feed. This person should be accustomed to interfacing with customers and can spend time regularly monitoring the community.

A moderator can:

- Review and act on the list of flagged posts and comments in the community
- Review and act on the list of flagged files in the community
- Remove flags directly in the community
- Delete inappropriate posts, comments, messages, and files

A moderator can also help drive the success of a community in many other ways.

- Sharing relevant and useful information in community posts
- Encouraging members to post and comment on each other's posts
- Setting an example by their activity in the community
- Keeping discussions focused, spam-free, and non-controversial
- Redirecting email conversations to communities when it can benefit other community members
- Establishing the community as a reliable source of information and a forum for transparent discussions

You can choose to designate more than one moderator for a community, especially if the community has a large number of members.

 **Note:** Although they share some similar capabilities, a community moderator is different from a [Chatter moderator](#).

Which users can moderate?

There are multiple types of users who can moderate a community when flagging is enabled.

[Assign a Community Moderator](#)

Make one or more people moderators in your community so they can keep an eye on its content.

Which users can moderate?

There are multiple types of users who can moderate a community when flagging is enabled.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management and Community Workspaces. External users who are moderators can moderate within context of the community, such as directly in the community feed. Moderators can continue to flag items even if flagging is disabled for community members, although group owners and group managers can only moderate when flagging is enabled.

Who can moderate items in a community depends on permissions or if the user is a group manager or owner. This table shows who can moderate and what actions they can take in the user interface.

Action	User with "Moderate Communities Feeds"	User with "Moderate Communities Files"	Group Owner or Manager (on items in groups they own or manage)*
Remove flags on a post or comment	✓		✓
Delete a post or comment	✓		✓
Remove flags on a file		✓	✓
Delete a file		✓	✓

*To allow group owners and managers to moderate, the `Allow members to flag content` option must be enabled.

Assign a Community Moderator

Make one or more people moderators in your community so they can keep an eye on its content.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management and Community Workspaces. External users who are moderators can moderate within context of the community, such as directly in the community feed.

You can assign moderators by assigning a permission set that includes one or more of following moderation permissions.

Permission	Allows Users To
Moderate Communities Feeds	Review flagged posts and comments and take action, such as removing flags or deleting the post or comment. Moderator options for feed content are available in the community feed and in Community Management and Community Workspaces.
Moderate Communities Files	Review flagged files they have access to and take action, such as removing flags or deleting the file. Moderator options for

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign permission sets:

- "Assign Permission Sets"

Permission	Allows Users To
	files are available on a file's detail page and in Community Management or Community Workspaces.
Moderate Communities Chatter Messages	Review flagged messages and take action, such as removing a flag or deleting a message. This permission allows users access to only flagged messages in communities they're a member of.
Can Approve Feed Post and Comment	Approve, delete, or edit posts and comments that are pending review.
Moderate Community Users	Freeze external users who are members of the community. Moderators can freeze members on their user profile page or from an Insights report.
Manage Communities	Moderate community content in Community Management or Community Workspaces.
Access Community Management	Access community pages from Community Management and Community Workspaces

You can also add these permissions to a profile. These permissions are valid for all communities the user is a member of, but don't apply in your internal organization.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**, then click **New**.
2. Create a permission set that includes the appropriate permissions.
3. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
4. Find the user you want to be a community moderator and add the permission set to their Permission Set Assignments related list.

After you grant moderator permissions to a user, keep these things in mind:

- The user can now moderate any items they have access to in all communities they're a member of.
- The user can flag items even if *Allow members to flag content* is disabled in a community.
- Moderators can receive an email notification when a post, comment, or file is flagged by selecting the *Flag an item as inappropriate* email notification.

Access to moderator functionality is slightly different depending on user permissions:

- **In the community feed:** Both internal and external users with the "Moderate Communities Feeds" permission can view flag indicators directly in the community feed for posts and comments and decide to either remove the flags or delete the content.
- **In Community Management and Community Workspaces:** Only internal users with the "Manage Communities" or "Create and Set Up Communities" permission can access the **Moderation** area.

Access Community Management

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

If your community has [Community Workspaces](#) enabled, access that instead and navigate to the Moderation workspace.

2. Choose the part of the community you want to manage:

 **Note:** The options available in Community Management and Community Workspaces are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you don't see the Topics section. Some of To display all sections, go to **Administration > Preferences** and enable **Show all settings in Community Management** or **Show all settings in Community Workspaces**.

- Preview the community or access your community's settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header or from Community Workspaces.
- In Engagement, you can view Insights reports and take action on activity in your community.
- In Dashboards, you can view community dashboards and reports.
- In Moderation, you can set up moderation rules and monitor flagged feed items.
- In Topics, you can manage navigational and featured topics.
- In Recommendations, you can set up custom recommendations to appear in your community.
- In Reputation, you can set up reputation levels and points.
- In Administration, you can customize your community properties, such as name, description, URL, status, and template. You can also update your community settings, such as members, tabs, branding, login and registration, and emails.

Measure Community Success with Dashboards

Use Dashboards to view your community's analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement, providing you with a high-level view into the health of your community. Dashboards also help you monitor return on investment (ROI) and key performance indicators (KPI).

[Enable and Map Dashboards for Community Managers](#)

Community managers can use dashboards in each community to measure its success. You can even map a dashboard to the Community Management or Community WorkspacesHome page. You can map custom dashboards or use the ones provided in our AppExchange package.

[Create a Dashboard for Your Community](#)

While you can show any dashboard in your community, we recommend creating them based on the custom report types available for communities.

[View Community Dashboards.](#)

Use dashboards to monitor the health of your community.

[What's the difference between Insights and dashboards?](#)

Insights let you take immediate action on recent activity in your community, and dashboards let you see trends.

Enable and Map Dashboards for Community Managers

Community managers can use dashboards in each community to measure its success. You can even map a dashboard to the Community Management or Community WorkspacesHome page. You can map custom dashboards or use the ones provided in our AppExchange package.

You can choose to map any dashboard you have access to, but ensure that your community managers have access as well.

All dashboards in display as Lightning dashboards, regardless of what types of dashboard you're using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard. Remember that although dashboards render in the Lightning view, Salesforce Communities isn't fully supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you're using a [supported browser](#).

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

If the Salesforce Communities Management package is installed in your organization, each of the pages has a default mapping to a dashboard from the package. You can overwrite these values as needed.

To map or update your dashboards:

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **DashboardsSettings**.
3. For each of the pages, select the dashboard you want to show to community managers. To change the name of the dashboard page, click inside the dashboard label.
The dashboard you map to Home displays on your Community Management or Community WorkspacesHome page.

Create a Dashboard for Your Community

While you can show any dashboard in your community, we recommend creating them based on the custom report types available for communities.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

All dashboards in display as Lightning dashboards, regardless of what types of dashboard you're using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard. Remember that although dashboards render in the Lightning view, Salesforce Communities isn't fully supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you're using a [supported browser](#).

Open [Community Workspaces](#) or [Community Management](#).

1. Create custom report types based on the Networks object.

Only reports that are based on the Networks object show community-specific information in Community Management and Community Workspaces.

 **Note:** You can create reports based on other objects and expose them in Community Management or Community Workspaces. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Feed Revisions
 - Network Members
 - Network Membership Daily Metrics
 - Network Moderations
 - Network Public Usage Daily Metrics
 - Network Unique Contributor Daily Metrics

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share dashboards:

- "Manage Dashboards in Public Folders"

- Recommendation Metric
- Topic Assignments
- Topics
- Unpublished Feed Entities

2. Use the custom report type to create a report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

3. Create a dashboard with components. Select the report as your source type.

- Add a component for each report you want to include in your dashboard.
- Find your report on the Data Sources tab and add it to the component.

In order for a Salesforce Classic dashboard to optimally render in the Lightning view used in Community Management and Community Workspaces, make sure that your dashboard meets the following requirements:

- Includes only up to 20 reports arranged within three columns
- Doesn't include unsupported charts, such as funnel, scatter, table, multi-metric, pie, and gauge

For a list of dashboard features not supported in the Lightning view, see [Reports and Dashboards: Lightning Experience Limitations](#).

Note: Metrics are supported in the Lightning view, but they display as large tiles. We recommended that you don't include metrics in your dashboards.

4. Share the folder that you save your dashboard in with your community managers.

5. From [Community Management](#) or [Community Workspaces](#), click **DashboardsSettings** to map your dashboard.

When a community manager accesses [Community Management](#) or [Community Workspaces](#), the dashboard appears under Dashboards. If you mapped a dashboard to the Home page, the dashboard appears there.

Dashboards in [Community Management](#) and [Community Workspaces](#) are automatically refreshed every 24 hours. To see the latest data, click **Refresh**. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard hasn't been refreshed in 24 hours, it's refreshed automatically when you access it. All role-based external users in your community can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 1,000 times daily per org. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

Remember that you can customize your dashboards at any time. To edit your dashboard, go to the **Dashboards > Settings** page in [Community Management](#) or [Community Workspaces](#). Click into the **Label** field to edit the page name and select the down arrow to the right of the **Dashboard** field to map to a different dashboard. Click **Edit dashboard** to open the dashboard in your internal Salesforce org. If you're using a dashboard that was created in Lightning Experience, the edit link won't work.

Insights for Community Engagement

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

Example: With an Insights report set up to track new members, community managers can quickly navigate to a new member’s profile to send them a welcome message.

 **Tip:** Let us do the setup work for you! Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Insight reports provided in the package are 100% customizable. You can change the default Insights page names, report folder mappings, and even the Insights report columns and filters at any time. So don't be afraid to customize or change what you get in the package. You won't hurt our feelings.

[Enable and Map Insights for Community Managers](#)

Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

[Create Your Own Insights for Your Community](#)

Create your own Insights to display in Community Management or Community Workspaces. We recommend that you create your Insights reports based on custom report types available for communities.

[Create Custom Actions for Community Insights](#)

Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer's posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

[View and Customize Insights for Your Community](#)

Use Insights in to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.

Enable and Map Insights for Community Managers

Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management or Community Workspaces. On the Insights page, links are automatically created for report fields such as `Created By` or `Group Name`. For posts, comments, and messages, you can even see the contents directly on the page.

Tip: Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

When you install the package, report folders are automatically installed in your internal org. If you have no previous Insights mapped, the package automatically maps them for you. You can change the default mappings at any time.

To map or update Insights for your community:

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **EngagementSettings**.
3. Provide a name for each Insights page and then select the report folder you want to map to the page.

You can map up to 10 Insights pages.

Make sure that you have shared the mapped report folder with your community managers or they won't be able to view the Insights reports.

4. Click **Save**.

Insights pages are visible to community managers when they expand the Engagement section in Community Management or Community Workspaces.

Go check out your changes. Click Engagement and then click each Insights page name. Use the drop-down menu to verify the reports mapped to each page.

If you installed the Salesforce Communities Management package, moderation-related Insights reports are also mapped to pages in the Moderation section of Community Management or Community Workspaces. Unlike the page names in the Engagement section, the page names in the Moderation section can't be renamed or unmapped.

Create Your Own Insights for Your Community

Create your own Insights to display in Community Management or Community Workspaces. We recommend that you create your Insights reports based on custom report types available for communities.

 **Tip:** Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

1. Create custom report types based on the Networks object.

Only reports that are based on the Networks object show community-specific information in Community Management and Community Workspaces.

 **Note:** You can create reports based on other objects and expose them in Community Management or Community Workspaces. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Feed Revisions
 - Network Members
 - Network Membership Daily Metrics
 - Network Moderations
 - Network Public Usage Daily Metrics
 - Network Unique Contributor Daily Metrics
 - Recommendation Metric
 - Topic Assignments
 - Topics
 - Unpublished Feed Entities

2. Use the custom report type to create an Insights report.

Insights reports are just like any other report, except they must also meet the following requirements:

- The report must be a tabular report.
- The report can't include pagination.
- We recommended that your report only return 2,000 rows or less because only the first 2,000 rows are displayed in Community Management or Community Workspaces.
- To view "Approve" and "Delete" comment actions, you must add the FeedCommentID column to your Insights report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share report folders:

- "Manage Reports in Public Folders"

3. Save the report to a new report folder that you can map to in Community Management or Community Workspaces.

We recommend that you create a separate report folder for each of your Insights pages. For example, create one report folder called *Insights Members* and another called *Insights Moderation*.

Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management or Community Workspaces.

4. Share your Insights report folder with your community managers.
5. In [Community Management or Community Workspaces](#), click **Engagement > Settings** to map Insights pages to your report folder.

When a community manager accesses Community Management or Community Workspaces, the Insights reports appear in the drop-down menu on the mapped Engagement page.

 **Note:** Some Insights are not available in Developer Edition or sandbox orgs.

- [Create Custom Actions for Community Insights](#)

Create Custom Actions for Community Insights

Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer's posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

When you click an Insights action in the report, behind the scenes a Visualforce page drives the action. The Visualforce page links to standard or custom objects using standard controllers or standard list controllers.

Here are the high-level steps of how to create a custom Insights action:

1. Create a Visualforce page.

There are a few options you can use:

- Use a standard controller

Choose this option to create a Visualforce page that contains the same functionality and logic used in standard Salesforce pages. For example, if you use the standard Accounts controller, clicking a **Save** button in a Visualforce page results in the same behavior as clicking **Save** on a standard Account edit page.
- Use a standard list controller

Choose this option to create a Visualforce page that can display or act on a set of records. Examples of existing Salesforce pages that work with a set of records include: list pages, related lists, and mass action pages.
- Use a controller extension that uses Apex

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and set version settings for Visualforce pages:

- "Customize Application"

To edit custom Visualforce controllers:

- "Author Apex"

Choose this option if you want to expose new functionality, customize the navigation through an application, use callouts or Web services, or if you need finer control for how information is accessed for your page.

All options work with standard objects and custom objects.

For detailed information about these options, see the Visualforce Developer Guide.

2. Add your custom action to the Insights report.

Actions are displayed based on the data returned in the report. Make sure that you have a report that is currently returning the data your action needs.

- a. Open [Community Workspaces](#) or [Community Management](#).
- b. Navigate to the Insights report that you want to apply your new custom action to.
- c. On the report, click  and then add your custom action from the picklist.

3. Ensure that your users have the correct permissions to complete your custom action.

Depending on how you set up your custom action, after the action is executed, the user either stays on the Insights page or is redirected to a page in your internal org. Unlike our standard Insights actions, users don't receive the standard success or failure message for custom actions.

Example: Here's an example of a custom action to delete all activity from a community member. This custom action is great for cleaning up the community after a spam attack.

Create a custom controller extension using an Apex class and use it in your Visualforce page. The following `DeleteAllActivityControllerExtension` class is an example of a custom controller extension.

```
public with sharing class DeleteAllActivityControllerExtension {

    private List<Id> ids;
    private String returnUrl;
    private Database.DeleteResult[] deleteResult = null;
    private Map<String, String> resultMap;
    private String success = 'success';
    private String failure = 'failure';

    public DeleteAllActivityControllerExtension(ApexPages.StandardController controller)
    {
        resultMap = new Map<String, String>();
        /* The IDs you select on the Insights page are stored in a comma separated
string of IDs.
        This string is passed in a parameter called "idsList" */
        String idsList = ApexPages.currentPage().getParameters().get('idsList');
        //The return URL to the Insights page is passed in a parameter called "returnURL"

        returnUrl = ApexPages.currentPage().getParameters().get('returnURL');
        ids = idsList.split(',');
    }

    public PageReference deleteAllActivity() {
        deleteFeedPosts();
        deleteFeedComments();
        //Include these two lines of code to be redirected to the Insights page after
you click the action.
        PageReference retPage = new PageReference(returnUrl);
    }
}
```

```

        retPage.setRedirect(true);
        Integer failureCount = calculateFailureCount();
        Integer successCount = ids.size() - failureCount;
        retPage.getParameters().put(success, String.valueOf(successCount));
        retPage.getParameters().put(failure, String.valueOf(failureCount));
        return retPage;
    }

    private void deleteFeedPosts() {
        List<FeedItem> feedItems = [Select Id, CreatedById FROM FeedItem WHERE
        CreatedById IN :ids];
        deleteResult = Database.delete(feedItems, false);
        //Update the resultMap with failures to calculate the failureCount
        if(deleteResult != null) {
            for(Integer i=0;i < deleteResult.size();i++) {
                if (!deleteResult.get(i).isSuccess()) {
                    for(Database.Error error : deleteResult.get(i).getErrors()) {
                        resultMap.put(string.valueOf(feedItems.get(i).CreatedById),
        failure);
                    }
                }
            }
        }
    }

    private void deleteFeedComments() {
        List<FeedComment> feedComments = [Select Id, CreatedById FROM FeedComment WHERE
        CreatedById IN :ids];
        deleteResult = Database.delete(feedComments, false);
        //Update the resultMap with failures to calculate the failureCount
        if(deleteResult != null) {
            for(Integer i=0;i < deleteResult.size();i++) {
                if (!deleteResult.get(i).isSuccess()) {
                    for(Database.Error error : deleteResult.get(i).getErrors()) {
                        resultMap.put(string.valueOf(feedComments.get(i).CreatedById),
        failure);
                    }
                }
            }
        }
    }

    private Integer calculateFailureCount() {
        Integer failureCount = 0;
        for (String result : resultMap.values()) {
            if (failure == result) {
                failureCount++;
            }
        }
        return failureCount;
    }
}

```

This code creates a **Delete All Activity** button in your Insights report. This button deletes all posts and comments for any selected members. If you wanted to delete all private messages and files too, you could expand the code.

 **Note:**

- This code example doesn't include any permission checks. This custom action only works for admins.
- The IDs for the items you selected on the Insights report are passed to the Visualforce page using the `idsList` parameter.

The following Visualforce markup shows how the custom controller extension can be used in a page:

```
<apex:page standardController="User"  
extensions="DeleteAllActivityControllerExtension" action="{!deleteAllActivity}"  
>
```

View and Customize Insights for Your Community

Use Insights in to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.

Each Insights page includes multiple Insights reports. You can access these reports using the drop-down menu on the page. On the Insights page, links are automatically created for report fields such as **Created By** or **Group Name**. For posts, comments, and messages, you can even see the contents directly on the page.

Insights are powerful tool that you can use to perform mass-actions. For example, if a spammer attacks your community, you can select all the offending posts and click **Delete Post**.

Important: Some Insights actions require special permissions. If you can't perform an action, let your admin know.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click Engagement or Moderation.

Note: Your admin maps Insights pages. If the Engagement section isn't visible or the Moderation section doesn't include any Insights pages, your admin hasn't mapped them yet.

Pages with mapped report folders appear when you expand the sections.

3. Click the Insights page you want to view.
 - To access other Insights reports, use the drop-down menu.

- Take action! Only the first two actions are displayed on the page. To see more actions, click next to the displayed actions. You can select up to 100 rows at a time.
- To filter the report by relative and custom date ranges, use the drop-down date filter. Select one of the following relative date ranges: All Time, This Week, This Month, Last Month, Today, Yesterday, Last 7 Days, and Last 30 Days. You can also enter your own custom date range.
- To sort the report by a specific column, click the column heading. An arrow on the column indicates whether the report is sorted by ascending or descending order.
- To edit or customize the report, click to open the report in your internal org. From there you can customize the report to fit your community needs, such as adding or removing columns and updating the report filters.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

- To edit the actions assigned to a page, click to open the Edit Insights Actions page.

Actions that appear on the Insights report are displayed based on the data returned in the report. For example, if the report returns data about a user, the **Freeze Member** and **Unfreeze Member** actions are displayed. If the report stops returning data, actions aren't removed. However, when you go to update the actions, we let you know that some are no longer appropriate.

Community Moderation Strategies and Tools

Community moderation allows you to empower members of your community to monitor content and ensure that it's appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

Moderation is crucial for a community to thrive. You need active moderators who are willing to spend time ensuring that the members and content in your community are appropriate and helpful. You also need to empower members to speak up when they view something as inappropriate or offensive.

With Communities moderation, you can:

- Designate specific users as moderators so that they can closely monitor the community
- Allow members to flag posts, comments, files, and messages that are inappropriate or spam
- Allow moderators to review and act on flagged items, such as deleting a post, comment, or file
- Allow group owners and managers to moderate within their groups
- Create rules and criteria to automatically block, flag, replace keywords in member-generated content, such as posts or comments
- Create rules to review and approve content from specific members
- Track flagging and moderation activity within your community

To [limit the size and types of files allowed in your community](#), go to the **Administration Preferences** page.

To report on moderation activity in your communities, you can use the preconfigured Audit Trail Insights report provided in Salesforce Communities Management package. You can also query the flagged content or activity using the API, or create a custom report type using `Networks` as the primary object. For more information about the Salesforce Communities Management package, see [Report on Communities with the AppExchange Packages for Community Management](#).

 **Note:** Changes to a feed item's status are not included in the Audit Trail Insights report.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your members to flag content.

If your org is using Transaction Security, community moderation offers some of the same functionality. Transaction Security and communities moderation can be used at the same time.

[Track Community Activity with the Moderation Overview Page](#)

Moderation Insights are arranged in clickable tiles in the Moderation Overview page of Community Management and Community Workspaces. View the entire picture of your community's moderation activity at a glance and take action on day-to-day moderation tasks.

EDITIONS

Available in: **Enterprise, Performance, Unlimited, and Developer Editions**

[Enable Members to Flag Items in Your Community](#)

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

[Community Moderation Criteria](#)

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

[Community Moderation Rules](#)

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

[Review and Approve Posts and Comments in Your Community](#)

Premoderation rules to review and approve content ensure that non-compliant and inappropriate content isn't immediately visible to everyone in your community. Posts and comments pending review aren't displayed in the community feed; only the author and community moderators can see pending posts and comments in the feed. An author can see a pending comment on a pending post only if the author posted both. After you set up the rules, moderators can approve content directly in the community feed, in Community Workspaces, or in Community Management.

[Moderate Flagged Posts and Comments in Your Community](#)

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

[Moderate Flagged Files in Your Community](#)

Community moderators can review a list of files that members of the community have flagged as inappropriate or spam and take action. Group owners or group managers can view flags and take action on files in their groups.

[Moderate Flagged Direct Messages in Your Community](#)

Community members can flag messages in communities built using the Customer Service (Napili) template. Community moderators can review and act on a list of direct messages that members of the community have flagged as inappropriate or spam.

[Moderate Flagged Private Messages in Your Community](#)

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

[Set Up Apex Triggers for Flagging Items](#)

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

[Communities Moderation Limits](#)

Community moderation limits ensure that your community performs optimally.

[Assign a Community Manager](#)

Track Community Activity with the Moderation Overview Page

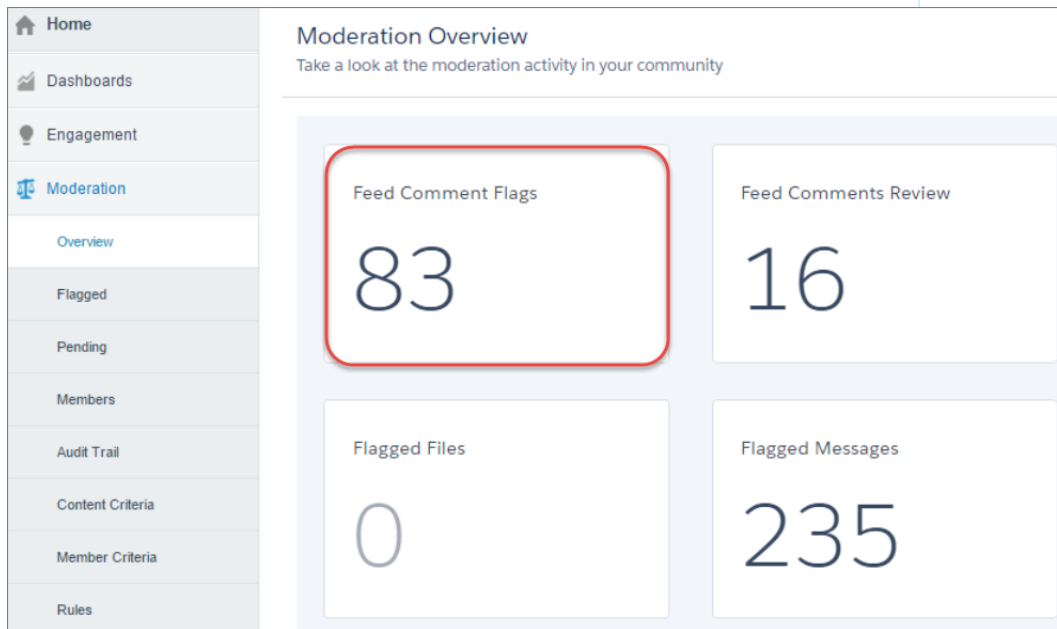

Moderation Insights are arranged in clickable tiles in the Moderation Overview page of Community Management and Community Workspaces. View the entire picture of your community's moderation activity at a glance and take action on day-to-day moderation tasks.

 **Example:** To view all feed comment flags, click **Feed Comment Flags** and go directly to the Feed Comments Flags Insight report. You can approve or delete flagged comments in bulk, directly from the Insight report.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** per Editions

 **Tip:** Let us do the setup work for you! Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Insight reports provided in the package are 100% customizable. You can change the default Insights page names, report folder mappings, and even the Insights report columns and filters at any time. So don't be afraid to customize or change what you get in the package. You won't hurt our feelings.

Enable Members to Flag Items in Your Community

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

Community moderation must be enabled for your organization before you can allow members to flag content in the user interface. If you don't see the option to allow flagged content, contact your administrator.

This setting isn't required to flag or moderate items using the API.

Once an item is flagged, your community moderator can review it and take action. Remember that moderators can continue to flag items even if flagging is disabled for community members.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration > Preferences**, then select `Allow members to flag content`.
3. Click **Save**.

With this setting enabled in a community:

- Members can flag posts, comments, and files using the `Flag as inappropriate` option.
- Members can flag messages from within the community on their My Messages page in Chatter. If a member has turned on email notification for messages, they can also flag the message directly from their email. Members can only flag messages that are sent from communities they are members of.

 **Note:** Messages can't be flagged in partner or customer portals, your internal organization, or from Salesforce1.

- Group owners and managers can moderate groups they own or manage.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your members to flag content.

SEE ALSO:

[Assign a Community Moderator](#)

Community Moderation Criteria

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

Plan Your Use-Cases

Before creating your member criteria, think about what you want to do.

- Do you want to protect your community from bots and spammers? Most spammers attack shortly after they've joined. Set up member criteria based on a user's creation date.
- Do you want to review members' first posts? Set up member criteria that targets users without community contributions.
- Do you want to moderate your internal users' activity in your community? Set up member criteria to include only your internal users.
- Do you want to be notified when a partner contributes for the first time? Set up member criteria to include only your partner users that don't have community contributions.

Before creating content criteria, think about what you want to moderate.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable users in your community to flag items:

- "Create and Set Up Communities"

AND

Is a member of the community

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Do you want to moderate profanities and slang? Set up separate keyword lists for each group of related words.
- Do you want to replace competitor product names with asterisks? Create a keyword list just for your competitor products.
- Do you want to monitor content for HIPAA compliance? Create a keyword list that alerts of possible HIPAA violations.

Create Content Criteria to Moderate Your Community

Create and modify content criteria that define offensive language or inappropriate content that you don't want in your community. Content criteria are used in rules to moderate member-generated content, such as posts and comments.

Create Member Criteria to Moderate Your Community

Create and modify member criteria to use in community moderation rules. Target specific groups of members based on their user profile, user type, user creation date, or whether they've posted or previously commented in the community. Use member criteria in your rules to help pin-point specific use-cases, like reviewing posts only from your customer users who were created in the last 7 days.

Create Content Criteria to Moderate Your Community

Create and modify content criteria that define offensive language or inappropriate content that you don't want in your community. Content criteria are used in rules to moderate member-generated content, such as posts and comments.

You can also use the Metadata API or Tooling API to set up keyword lists.

Some things to keep in mind:

- Your org can have up to 30 keyword list criteria. This limit is per org, not per community.
- A keyword list can have up to 2,000 keywords.
- Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BadWord*, it's matched when a user types *BADWORD* or *badword*.

Set up content criteria to use in your moderation rules:

1. Open [Community Workspaces](#) or [Community Management](#).
2. If you're using Community Workspaces, access Moderation by clicking **Moderation > Content Criteria > New**. If you're using Community Management, access Moderation by clicking **ModerationContent Criteria**.
3. Enter a name, unique name, and description for your criteria.
4. Click **Save**.
5. Update the keywords in your criteria.

To add keywords, click **Add**.

- Keywords can only be up to 100 characters and can include letters, numbers, spaces, and special characters.
- Wildcard characters aren't supported.
- Separate keywords with commas or line breaks.
- When adding keywords, you can copy and paste up to 32,000 characters at a time.

 **Tip:** To cover different variations of the same word, you can use special characters and spaces. For example:

bad-word

b@dword

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete criteria:

- "Manage Communities"
OR "Create and Set Up Communities"
- AND
- Is a member of the community

b a d w o r d

To delete keywords, select the keywords you want to remove, then click **Delete**.

A message indicates how many keywords were added or failed to add, and the number of duplicates that were ignored. If your entire entry failed to save, review the keyword requirements and then submit again. Don't worry about adding duplicates because they're ignored.

To delete criteria, click **Del** from the Content Criteria page. If criteria is being used by a rule, you can't delete it.

Create Member Criteria to Moderate Your Community

Create and modify member criteria to use in community moderation rules. Target specific groups of members based on their user profile, user type, user creation date, or whether they've posted or previously commented in the community. Use member criteria in your rules to help pin-point specific use-cases, like reviewing posts only from your customer users who were created in the last 7 days.

Some things to keep in mind:

- Your org can have up to 100 member criteria. This limit is per org, not per community.
- Each member criteria can include up to 100 user conditions.

You can create criteria that includes only user types and user profiles, or just filters. Or if you want it all, your criteria can include user types, user profiles, and filters. Let's get started.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **ModerationMember Criteria**, then click **New**.
3. Enter a name, unique name, and description for your criteria.
4. Select the types of user types or user profiles to include in your criteria.

You can select any combination of types and profiles. Members are included when they belong to *any* one of your selections.

If you delete a profile in your internal org, the profile is also removed from your member criteria.

5. Select to filter your members by:

- **None**—Select this option if you don't want to filter the criteria using the other options. None is the default selection.
- **User creation date**—Select this option to include only users that were created within a specific time frame. Enter the number of days since the user was created.

Note: A user's creation date might not be the same date they became a member of the community. For example, you can have an internal user that was created 120 days ago who became a member of the community 5 days ago. For users that self-register, their creation date is the date they become a member of the community.

- **Members without community contributions**—Select this option to include only members that haven't posted or commented in the community. Posts that are pending review don't count as community contributions until they are approved.

If you selected user types or user profiles, and you also select filter conditions, members are included only if they belong to one of the selected user types or profiles *and* the filter condition.

6. Click **Save** to apply your changes.

Example: Let's look at the following conditions:

User Types: Partner

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete criteria:

- "Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community

User Profiles: Customer Community Plus Login User, Customer Community Plus User, and Customer Community User

Filter By: User creation date is set to 7 days since the user was created

This member criteria applies to:

- Partner users created in the last 7 days
- Customer Community Plus Login User created in the last 7 days
- Customer Community Plus User created in the last 7 days
- Customer Community User created in the last 7 days

You can use this member criteria in a rule to:

- Review and approve their posts
- Be notified of their contributions
- Flag all their contributions

To delete criteria, click **Del** from the Member Criteria page. If criteria is being used by a rule, you can't delete it.

Community Moderation Rules

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

[Customize Preconfigured Moderation Rules](#)

If your community was created after Spring '17, your community comes populated with preconfigured moderation rules that block, flag, freeze, replace or review banned keywords. Simply activate the rules and they are ready to go. You can customize both the rules and the list of banned keywords.

[Create Content Rules to Moderate Your Community](#)

Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

[Create Rate Limit Rules to Moderate Your Community](#)

Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

[How and when do community moderation rules execute?](#)

Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.

[Enable Record Feed Moderation](#)

Run moderation rules on comments or posts on any record feed that is visible from within a community. Record feed moderation ensures that member posts or comments stay within the guidelines of the community.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Customize Preconfigured Moderation Rules

If your community was created after Spring '17, your community comes populated with preconfigured moderation rules that block, flag, freeze, replace or review banned keywords. Simply activate the rules and they are ready to go. You can customize both the rules and the list of banned keywords.

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
 - Each content rule can have up to 3 keyword criteria and 10 member criteria.
 - Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last the rules that flag content. If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content.
 - Moderation rules apply only to feed posts, comments, and polls. Moderation rules do not apply to topics that are created.
1. Open [Community Workspaces](#) or [Community Management](#).
 2. Click **Moderation** > **Rules** > **Moderation Rule**, then click **Edit** next to the rule that you want to modify.
 3. If the rule meets your requirements, simply click **Activate**. Or you can customize the following fields:
 - **Name**—Change the name of your rule.
 - **Unique Name**—Enter a unique name for your rule. The unique name used by the API.
 - **Description**—Optionally, change the description.
 - **Activate Rule**—Select to activate rule.
 - **Applies To**—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles. All feed types, such as polls and links, are supported.
 - **Moderation Action**—Change what you want to happen when the criteria is matched.
 - **Block** prevents the content from being published.
 - **Review** allows users with the “Can Approve Feed Post and Comment” permission to approve the content before it's published.
 - **Replace** publishes the content with the keywords replaced as asterisks. For example, *BadWord* becomes *******.
 - **Flag** publishes the content and then automatically flags the content as inappropriate.
 - **Message for Member**—Change the existing pop-up message that your member sees when their content is blocked. If you don't specify a message, the member sees the standard message: “You can't use %BLOCKED_KEYWORD% or other inappropriate words in this community. Review your content and try again.” The %BLOCKED_KEYWORD% variable displays up to 5 blocked words. You can also use this variable in your own custom message.
 - **Tip:** For international communities, you can translate this message. From Setup, enter *Translate* in the Quick Find box, then select **Translate**. To provide a translation for the message, select the Moderation Rule setup component and expand the community the rule belongs to.
 - **Member Criteria**—Specify member criteria to enforce this rule. Ask yourself, who should this rule apply to?
 - **Content Criteria**—Specify the content criteria to enforce this rule. Ask yourself, what specific keywords should this rule apply to? A list of banned keywords has been created for you and is preselected for the rule. You can add or remove terms from the list by clicking **Content Criteria** and clicking **Banned Keywords**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

USER PERMISSIONS

To view, create, edit, and delete rules:

- “Manage Communities”
OR “Create and Set Up Communities”
AND
Is a member of the community

4. Click **Save**.

A few things to bear in mind:

- If you activate a content rule without specifying member criteria, the rule applies to all members.
- If you activate a content rule without specifying content criteria, the rule either:
 - Prevents members from creating posts and comments entirely
 - Sends all posts for review
 - Flags all posts and comments
- If you select member criteria and content criteria, the rule applies only when both criteria are met.
- Specifying criteria is optional. However, we recommend that you include criteria in your rules to target specific members and content.

Create Content Rules to Moderate Your Community

Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

If your community uses the Customer Service (Napili) template, moderation rules apply to questions and group posts created by your community members. If your community uses Salesforce Tabs + Visualforce, moderation rules can also run on publisher actions.

You can also use the Metadata API or Tooling API to set up content rules.

Some things to keep in mind:

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Each content rule can have up to 3 keyword criteria and 10 member criteria.
- Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content. If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content.

 **Tip:** Before creating a rule, we recommend that you create criteria to use in the rule.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **ModerationRules**, then click **New** and select **Content Rule**.
3. Complete the following fields:
 - **Name**—Enter a name for your rule.
 - **Unique Name**—Enter a unique name for your rule. The unique name used by the API.
 - **Description**—Optionally, enter a description.
 - **Activate Rule**—If selected, the rule is activated.
 - **Applies To**—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles. All feed types, such as polls and links, are supported.
 - **Moderation Action**—Specify what you want to happen when the criteria is matched.
 - **Block** prevents the content from being published.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete rules:

- “Manage Communities” OR “Create and Set Up Communities”
- AND
- Is a member of the community

- **Review** allows users with the “Can Approve Feed Post and Comment” permission to approve the content before it’s published.
 - **Replace** publishes the content with the keywords replaced as asterisks. For example, *BadWord* becomes *******.
 - **Flag** publishes the content and then automatically flags the content as inappropriate.
- **Message for Member**—Specify the message that your member sees when their content is blocked. If you don’t specify a message, the member sees the standard message: “You can’t use %BLOCKED_KEYWORD% or other inappropriate words in this community. Review your content and try again.” The %BLOCKED_KEYWORD% variable displays up to 5 blocked words. You can also use this variable in your own custom message.

Tip: For international communities, you can translate this message. From Setup, enter *Translate* in the Quick Find box, then select **Translate**. To provide a translation for the message, select the Moderation Rule setup component and expand the community the rule belongs to.

- **Member Criteria**—Specify member criteria to enforce this rule. Ask yourself, who should this rule apply to?
- **Content Criteria**—Specify the content criteria to enforce this rule. Ask yourself, what specific keywords should this rule apply to?

Important: Keep the following things in mind:

- If you activate a content rule without specifying member criteria, the rule applies to all members.
- If you activate a content rule without specifying content criteria, the rule either:
 - Prevents members from creating posts and comments entirely
 - Sends all posts for review
 - Flags all posts and comments

Yikes! Be careful.
- If you select member criteria and content criteria, the rule applies only when both criteria are met.
- Specifying criteria is optional. However, we recommend that you include criteria in your rules to target specific members and content.

4. Click **Save**.

[Create Member Criteria to Moderate Your Community](#)

Create Rate Limit Rules to Moderate Your Community

Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

Each rate rule controls two actions: notification and freeze. You can set up your rate rule for both actions or just one. You can apply the rule to: posts, comments, files, and private messages. In communities that use the Customer Service (Napili) template, this includes questions and answers.

Some things to keep in mind:

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Each rate rule can have up to 10 member criteria.

 **Tip:** Before creating a rule, we recommend that you create member criteria to use in the rule.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **ModerationModerationRules**, then click **New** and select **Rate Rule**.
3. Complete the following fields:

- **Name**—Enter a name for your rule.
- **Unique Name**—Enter a unique name for your rule. The unique name used by the API.
- **Description**—Optionally, enter a description.
- **Activate Rule**—If selected, the rule is activated.
- **Applies To**—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles.
- **Member Criteria**—Specify the member criteria to enforce this rule. Ask yourself, who do I want this rule to apply to?

Spammers are typically new members. We recommend creating member criteria that only includes customer users that were created in the last 7 days.

 **Note:**

- Rate rules don't apply to internal users. You can use member criteria that includes internal users, but the rules don't apply to them.
- If you activate a rate rule without specifying member criteria, the rule applies to all external users.

- **Content Creation Time Frame**—Select the time frame you want to use.
- **Notify Moderators**—Enter a number. Moderators are sent an email when a member creates this much content in your set time frame.
- **Freeze Members**—Enter a number. Members are frozen when they create this much content in your set time frame.

 **Important:** When members are frozen, they're frozen in all communities that they're a member of.

Emails are sent to users with the "Moderate Community Users" permission. Make sure that you assign your moderators this permission. Emails are sent even if a user has turned off Chatter emails.

4. Click **Save** to apply your changes.

- AND
- Is a member of the community

 **Example:** Let's use the following rate rule as an example.

Applies To: Posts and private messages

Member Criteria: Customer users created in the past 7 days

Content Creation Time Frame: 3 minutes

Notify Moderators: 6

Freeze Members: 10

With this rate rule, here's what happens when a member reaches your limits.

In the span of 3 minutes, a member creates...	Is the moderator notified?	Is the member frozen?
4 posts and 2 private messages	✓	✗
6 posts	✓	✗
6 comments	✗	✗
8 posts and 2 private messages	✓	✓
10 posts	✓	✓
10 comments	✗	✗

A rate rule with these values protects the community from spammers and bots but also allows you to help your new members. Maybe a non-threatening member posted a question over and over hoping to get it answered faster. Rate rules do more than protect—they let you help members in need.

Here's a rule set up just for private messages.

Applies To: Private messages

Member Criteria: Customer users created in the past 3 days

Content Creation Time Frame: 15 minutes

Notify Moderators: 1

Freeze Members: 3

This rate rule protects the community from spammers that attack via private messages.

My rate rule didn't do anything. What's going on?

Give it time. Rate limit rules might not seem exact, but they are. Trust us. For example, say you set up a rate rule to freeze members when they create content 10 times in 3 minutes. It's possible for a member to create 9 items towards the end of the first 3-minute time frame. In this case, the member isn't frozen until they post another 10 items in the second 3-minute time frame.

Check the member criteria you're using. For example, let's say you have a rate rule that uses member criteria to filter for members without community contributions. After a member's first post or comment, the rule doesn't apply to the member anymore, so the member doesn't reach the freeze limit you set.

[Create Member Criteria to Moderate Your Community](#)

How and when do community moderation rules execute?

Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.

If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content. On the server, Salesforce executes community rules within the standard order of execution.

Rules that block content execute during system validation. Rules that block content ignore changes made by `before` triggers. For example, if a `before` trigger changes a feed post, a moderation rule that blocks content isn't aware of the changed content and executes on the original content.

Rules to review and approve content execute before database saves. These rules execute before rules that replace content.

Rules that replace content execute before database saves.

Rules that flag content execute after workflow rules.

[Apex Developer Guide: Triggers and Order of Execution](#)

Enable Record Feed Moderation

Run moderation rules on comments or posts on any record feed that is visible from within a community. Record feed moderation ensures that member posts or comments stay within the guidelines of the community.

Members can post or comment on any record types that have a feed. The moderation rules configured for your community catch any posts or comments that don't meet the rules' criteria. Flags on a record feed are only visible from within the community that flags them. You can also turn off moderation rules for internal users so that their feed activity isn't flagged.

1. Enter **Communities Settings** in the Quick Find / Search bar.
2. Click the box next to **Moderation applies to all feed posts regardless of where they are visible**.
3. Click **Save**.

Review and Approve Posts and Comments in Your Community

Premoderation rules to review and approve content ensure that non-compliant and inappropriate content isn't immediately visible to everyone in your community. Posts and comments pending review aren't displayed in the community feed; only the author and community moderators can see pending posts and comments in the feed. An author can see a pending comment on a pending post only if the author posted both. After you set up the rules, moderators can approve content directly in the community feed, in Community Workspaces, or in Community Management.

To set up a moderation rule to review and approve posts and comments, go to **ModerationRules** and create a content rule that uses the **Review** action. Here are some ways that you can use rules to review content:

Self-Service Community

Does your community allow members to self-register? You can set up a rule to review and approve questions from all your self-registering users. Use member criteria that includes only your guest user profile and filters for members who were created in the past seven days.

Have spammers ever attacked your community? Use member criteria that includes only your guest user profile and filters for members that have never contributed to the community.

Partner Community

Want to ensure that your partners aren't discussing a recent acquisition or other sensitive transactions? You can set up a rule to review posts and comments that include keywords such as "acquisition" or "merger."

Employee Community

Does your community require HIPAA compliance? Set up your rules to review posts and comments from all your employees.

 **Note:** Users must have Manage Communities or Create and Set Up Communities permissions to create moderation rules.

Pending Review is displayed in the header of the post or comment until it's approved. Remember that while a post or comment is pending approval, the author can still edit or delete it, however they can't comment on it. An author can see a pending comment on a pending post only if the author posted both. To prevent the author from editing the post or comment, you can disable feed post editing for certain users.

There are two ways to review and approve posts and comments in your community:

- Use a preconfigured Insights report in Community Workspaces or Community Management.
Use the Pending Insights report provided in the Salesforce Communities Management package. This report lets you see all the posts and comments that are pending review in your community. The Insights report displays the contents of posts and comments so you can quickly assess whether that content is spam or harmless. You can then approve or delete the item directly from the report. You can also perform mass-action and approve multiple items at once.

To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the AppExchange Packages for Community Management](#).

- Approve posts and comments directly in the community feed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To approve, delete, or edit posts and comments that are pending review:

 **Note:** An author can see a pending comment on a pending post only if the author posted both.

- "Can Approve Feed Post and Comment"

To approve, delete, or edit posts and comments that are pending review in Community Workspaces or Community Management:

- "Can Approve Feed Post and Comment"

AND

"Access Community Management" OR
"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

In the community feed, users with the “Can Approve Feed Post and Comment” permission see an extra action in the post or comment drop-down menu. If the item is inappropriate, they can delete it. If it has a typo, they can edit it.

After the item is approved, the author receives an email letting them know the item is approved and providing a link to it. Email notifications, such as @mentions notifications, are sent only after the item is approved.

SEE ALSO:

[Create Content Rules to Moderate Your Community](#)

[Feed Post and Comments Editing Overview](#)

Moderate Flagged Posts and Comments in Your Community

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

Flagged posts and comments have a small orange flag next to the post or comment date. The number next to the flag indicates how many people have flagged the item. The moderator can review each item and decide whether to take action.

A few things to keep in mind:

- Moderators can only view and act on items they have access to.
- Within a group in a community, group owners or managers can moderate items in their groups, including viewing or removing flags and deleting posts, comments, or files if necessary.
- If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged posts and comments:

- View flagged posts and comments from the [Moderation Overview Home App](#).
- Use a preconfigured Insights report in Community Workspaces or Community Management. Use the Flagged Posts and Flagged Comments reports provided in the Salesforce Communities Management package. These reports let you quickly manage your community’s flagged posts and comments. You can see the content of the post or comment and then remove the flag or delete it. You can also select multiple items at once.

To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the AppExchange Packages for Community Management](#).

- Use the flagged feed in Chatter.

If you’re using a Salesforce Tabs + Visualforce community, you can see a list of flagged posts and comments using the Chatter menu in your community. The `Allow members to flag content` preference must be enabled to see the Flagged feed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view flagged items, remove flags, and delete posts or comments:

- “Moderate Communities Feeds”

To moderate posts and comments in Community Workspaces or Community Management:

- “Access Community Management”
OR “Moderate Communities Feeds”

AND

“Manage Communities”
OR “Create and Set Up Communities”

AND

Is a member of the community whose Community Management page they’re trying to access.

- Moderate using a custom list. You can expose a list of flagged posts and comments using the Chatter REST API or ConnectApi in Apex.
 - Click on a link to the post or comment from the notification email.
 - Moderate directly within context of the community by removing flags or deleting content in the feed.
-  **Tip:** To receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on your Email Settings page.

SEE ALSO:

[Chatter REST API Developer Guide](#)

[Apex Developer Guide](#)

Moderate Flagged Files in Your Community

Community moderators can review a list of files that members of the community have flagged as inappropriate or spam and take action. Group owners or group managers can view flags and take action on files in their groups.

Members of your community may post files that aren't appropriate because they contain sensitive information or offensive content. Other members of the community can flag these files for review. Flagged files have a small orange flag. The number next to the flag indicates how many people have flagged the item.

A few things to keep in mind:

- Moderators can only view and act on items they have access to.
- Within a group in a community, group owners and managers can review and remove flags on files in the groups they own and manage if `Allow members to flag content` is enabled for their community.
- If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged files:

- Access the Flagged Files Insight report directly from the Community Management Moderation Overview page.
- Use a preconfigured Insights report in Community Management or Community Workspaces. Use the Flagged Files report provided in the Salesforce Communities Management package. This report lets you see the name of the flagged file, who created it, who flagged it, and how many flags the file has. You can click a link to open the file and review the content. Then you can remove the flag or delete the file. You can also select multiple items at once.
To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the AppExchange Packages for Community Management](#).
- Moderate using a custom list. You can expose a list of flagged files using the Chatter REST API or ConnectApi in Apex.
- Moderate directly within context of the community by removing flags or deleting content on the file detail page.

 **Tip:** To receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on your Email Settings page.

To [limit the size and types of files allowed in your community](#), go to the **Administration Preferences** page.

"Access Community Management" OR
"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community

Moderate Flagged Direct Messages in Your Community

Community members can flag messages in communities built using the Customer Service (Napili) template. Community moderators can review and act on a list of direct messages that members of the community have flagged as inappropriate or spam.

 **Note:** Private messages and direct messages are separate features. Direct messages are newer and offer a richer feature set for private communication in communities. Direct messages are based on Chatter and offer a rich text editor that supports inline images and attachments. With direct messages, you can start a message right from a feed post.

The “Moderate Communities Chatter Messages” permission allows moderators to see the contents of flagged direct messages, remove flags, and delete flagged messages.

1. If you haven’t already, install the [Salesforce Communities Management \(for Communities with Chatter\)](#) package from the AppExchange.
2. Open [Community Workspaces](#) or [Community Management](#).
3. In Community Management, go to **Moderation > Flagged** and select **Direct Messages** from the dropdown menu to filter the flagged items.
4. Review and act on the flagged messages.

 **Tip:** If you want to receive an email each time a message in your community is flagged, select the **Flags an item as inappropriate** option on the Email Settings page. To receive emails, you must have the “Moderate Communities Chatter Messages” and “Manage Chatter Messages and Direct Messages” permissions. To set your email preferences, go to your profile page within a community, click the drop-down button () in the upper-right corner and select **My Settings**, then click **Email Settings**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view and moderate flagged direct messages in Community Management or Community Workspaces:

- “Moderate Communities Chatter Messages”

AND

“Manage Chatter Messages and Direct Messages”

AND

“Moderate Communities Feeds”

AND

“Access Community Management” OR
“Manage Communities”
OR “Create and Set Up Communities”

AND

Is a member of the community

To make all posts available to moderation, including direct messages, in Communities Settings under Community Moderation Rule Settings:

- Moderation applies to all feed posts regardless of where they are visible

Moderate Flagged Private Messages in Your Community

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

The “Moderate Communities Chatter Messages” permission allows users to see the contents of messages, remove flags, and delete messages only in communities they’re a member of. With this permission, only flagged messages can be deleted. The “Modify All Data” permission allows moderators to remove flags or delete a message in the SOAP API.

Ensure that your moderators are assigned the “Moderate Communities Chatter Messages” permission, *not* the “Manage Chatter Messages” permission. The “Manage Chatter Messages” permission allows users to see *all* the messages in your entire Salesforce org. Avoid security and privacy concerns; double-check that your moderators and managers have the right permission.

 **Important:** Keep these limitations in mind:

- Community members can’t flag messages sent from communities that they aren’t a member of or that haven’t turned on flagging for their users.
- Users can’t flag messages in your internal organization, in Salesforce1, or in partner and customer portals.

There are a few ways to monitor and manage flagged messages in your communities:

- Access the Flagged Files Insight report directly from the Community Management Moderation Overview page.
- Use a preconfigured Insights report in Community Management or Community Workspaces. Use the Flagged Private Messages report provided in the Salesforce Communities Management package. This report lets you track trends and stay on top of message spamming attacks in your community. You can view who sent the message, the contents of the message, when it was sent, and who flagged the message. You can use this report to unflag messages and delete messages.

To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the AppExchange Packages for Community Management](#).

- Create your own report. First, create a custom report type using `Networks` as the primary object and `Network Audits` as the secondary object. Then create a report using your new custom report type and add a field filter for `Audited Object Type` set to equal `Chatter Message`. Use the API to delete flagged messages.
- Directly query the flagged messages from the API and then delete them.

 **Tip:** If you want to receive an email each time a message in your community is flagged, select the **Flags an item as inappropriate** option on the Email Settings page. To receive emails, you must have the “Moderate Communities Chatter Messages” and “Moderate

EDITIONS

[Guidelines for Deleting Your Users’ Chatter Messages](#)

[Report on Communities with the AppExchange Packages for Community Management](#)

[SOAP API Developer Guide: ChatterMessage](#)

[Apex Developer Guide: Moderate Chatter Private Messages with Triggers](#)

Set Up Apex Triggers for Flagging Items

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

 **Tip:** Did you know you can do this in the UI? Most communities don’t need custom moderation triggers. You can create moderation rules and criteria directly in Community Workspaces or Community Management. For more information, see [Community Moderation Rules](#).

Using triggers to automatically flag items allows you to moderate your community behind the scenes. These flags are **only** visible to moderators. You can view flags in Community Workspaces or Community Management, query for them in the API, or use custom report types to create reports on flagged items, people whose items are flagged most, and more.

Consider the following when creating triggers:

- Create Apex after insert triggers on either FeedItem, FeedComment, ChatterMessage, or ContentDocument.
- Define criteria that when met creates a NetworkModeration (flag) record, with the FeedComment, FeedItem, ChatterMessage, or ContentDocument as the parent.

 **Example:** This trigger automatically flags posts in your community that contain *BadWord*.

```
trigger autoflagBadWordOnPost on FeedItem (after insert) {

    List<NetworkModeration> flags = new List<NetworkModeration>();

    for (FeedItem rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope)) {
            continue;
        }

        if (rec.body.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(EntityId = rec.id, Visibility
= 'ModeratorsOnly');
            flags.add(nm);
        }
    }

    if (!flags.isEmpty()) {
        insert(flags);
    }
}
```

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create triggers:

- “Modify All Data”

```

    }
}

```

A similar trigger on comments would look like this.

```

trigger autoflagBadWordOnComment on FeedComment (after insert) {
    List<NetworkModeration> flags = new List<NetworkModeration>();

    for (FeedComment rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope)) {
            continue;
        }

        if (rec.commentBody.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(EntityId = rec.id, Visibility
= 'ModeratorsOnly');
            flags.add(nm);
        }
    }

    if (!flags.isEmpty()){
        insert(flags);
    }
}

```

Communities Moderation Limits

Community moderation limits ensure that your community performs optimally.

Criteria Limits

- Your org can have up to 30 keyword list criteria. This limit is per org, not per community.
- Your org can have up to 100 member criteria. This limit is per org, not per community.

Rule Limits

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Moderation rules apply only to feed posts, comments, and polls. Moderation rules do not apply to topics that are created.

Audit Limits

Changes to a feed item's status are not included in the Audit Trail Insights report.

SEE ALSO:

[Communities Limits](#)

Organize Communities with Topics

Navigational and featured topics are a fantastic way to organize content in a community. Use topics to structure your community content or highlight key discussions. You can create topics or use the topics that organically emerge from community member posts. You can use topics in the communities built using the Customer Service (Napili) template.

In Community Workspaces or Community Management, choose navigational topics and subtopics to provide a consistent map of your community. Use featured topics to highlight current, popular conversations. In the community itself, member-created topics let users organize information for each other, creating a personalized experience that boosts community engagement.

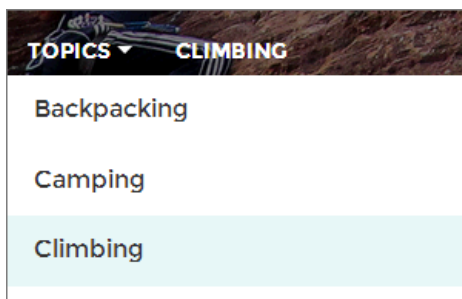

In a self-service community, the Customer Service (Napili) template specifies the layout and design of navigational, featured, and member-created topics.

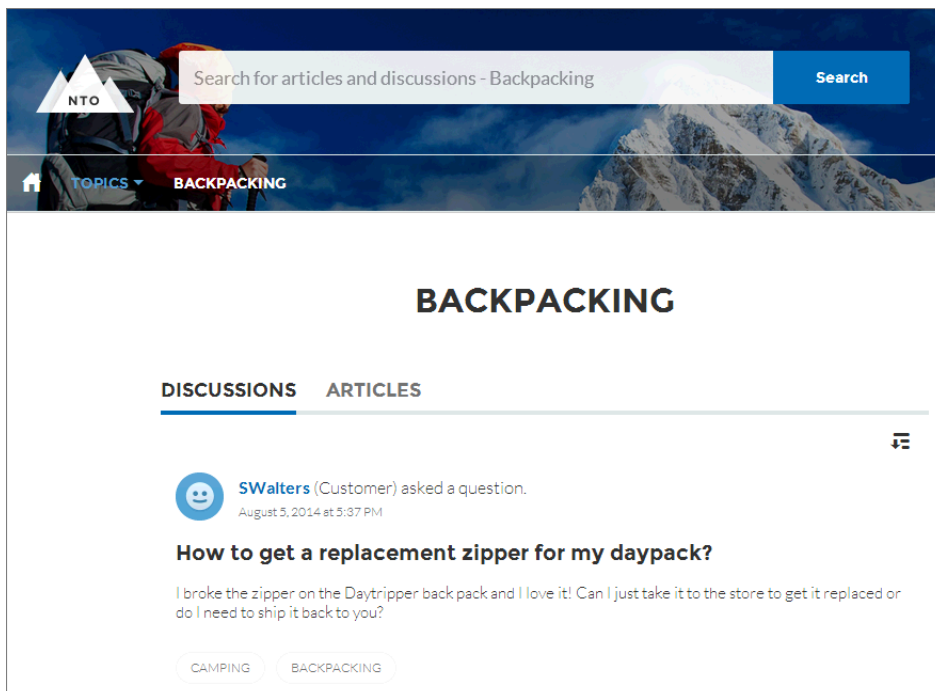

Tip: To add navigational and featured topics to other types of communities, Apex developers can use the `ConnectApi.ManagedTopics` class in a Visualforce page.

Navigational Topics

On every page of a self-service community, navigational topics are available from the Topics menu at upper left. Community members can also see all the community's navigational topics and subtopics in one place in the topic catalog.

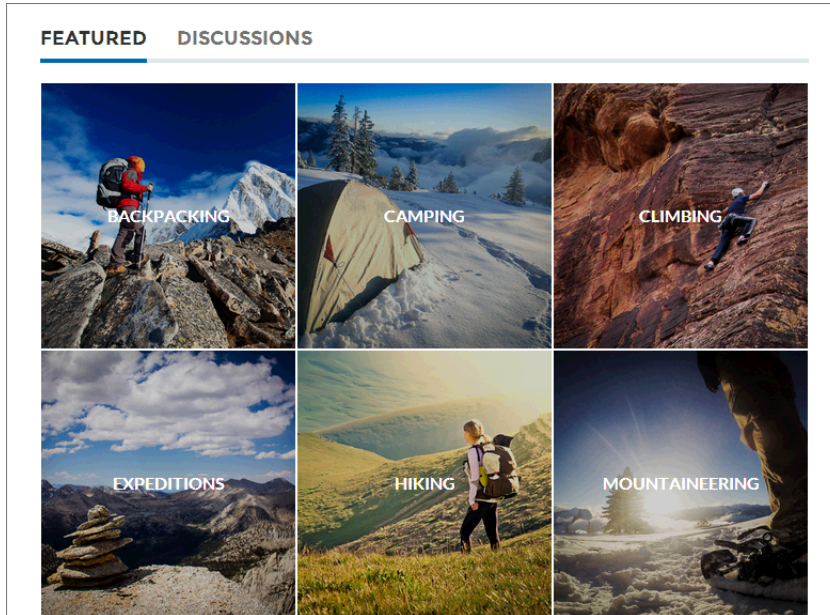

When visitors choose a navigational topic, the banner image you selected for it appears at the top of the page.

Featured Topics

Featured topics are accessible from the body of your community home page. Thumbnail images you select for featured topics uniquely identify them. (These unique thumbnails appear only on the home page; at the top of all featured topic pages, the default banner image specified in Community Builder appears.)

Member-Created Topics

When posting questions, community members create topics by using hashtags in body text, or typing in the topic suggestions box. (In Setup, the “Assign Topics” and “Create Topics” permissions must be enabled for community users.)

Post To **Backpacking** ▾
✕

What's the best backpack for a solo expedition?

I'm doing a solo hike of the Pacific Crest Trail next July. Any recommended packs for a #PCT trek like this?

Topics help get your questions seen by the right people

ASK

If any suggested topics are poor matches for the post, members can simply click to delete them.

Tip: Member-created topics can be accessed via search, or highlighted as featured topics.

Topic Metrics

Community members can check how often a topic has been used in the past 60 days and how many followers it has. Find metrics on a topic's detail page. With this information at their fingertips, community members know how current and popular a topic is. Admins can also use these metrics to highlight certain topics in their communities or consolidate similar topics based on usage.

[Manage Topics in Communities](#)

As the number of topics in a community grows, curate them to improve usability. Whether you've enabled Community Workspaces or are working in Community Management, you can create, merge, rename, and delete topics in one convenient location.

[Set Up Featured Topics](#)

Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

[Set Up Navigational Topics](#)

Structure your community's content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren't enabled, administrators can add articles to each topic using the Chatter REST API.)

[See Your Community's Topics and Subtopics in One Place](#)

You've gone through the exhaustive task of adding topics and various levels of subtopics to your community's content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community's topic catalog.

[Add Topics to Articles or Remove Them](#)

Easily add multiple topics of any type to specific articles, or quickly remove them as community needs change.

[Translate Topics Names and Descriptions for Communities with International Audiences](#)

Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.

Manage Topics in Communities

USER PERMISSIONS

To access Community Workspaces or Community Management page:	"Manage Communities" OR "Create and Set Up Communities"
To create topics:	"Create Topics"
To merge topics:	"Merge Topics"
To delete topics:	"Delete Topics"
To rename topics:	"Edit Topics"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

As the number of topics in a community grows, curate them to improve usability. Whether you've enabled Community Workspaces or are working in Community Management, you can create, merge, rename, and delete topics in one convenient location.

1. Open [Community Workspaces](#) or [Community Management](#).
2. If you're using Community Workspaces, access Topics by clicking **Content Targeting > Topics > Topic Management**. If you're using Community Management, access Topics by clicking **Topics > Topic Management**.

3. Do one of the following:

- To create a topic (often with a plan to merge existing ones into it), click **New**. Add a name and a topic description, which will boost SEO.
- To combine existing topics, click **Merge**.

Merging a topic automatically redirects existing hashtags in posts. If you merge a navigational or featured topic, the topic type, image, and any subtopic relationships are discarded.

- To rename or delete an existing topic, or add a description to it, click .

If you don't see a topic you want to rename or delete, either search for it or click **Show More** below the topic list.

 **Tip:** For communities with a global audience, you can [translate names and descriptions](#) of navigational and featured topics. From Setup, search for and select *Translate*. Then select the *Managed Topic* setup component, and expand a community to see its master topic names.

To set up featured topics:

- "Edit Topics"

Set Up Navigational Topics

Structure your community's content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren't enabled, administrators can add articles to each topic using the Chatter REST API.)

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**, and enable topics for all the article types you want to include.

 **Note:** Enabling topics disables public tags on articles. Personal tags aren't affected.

2. Open [Community Workspaces](#) or [Community Management](#).
3. If you're using Community Workspaces, access Topics by clicking **Content Targeting > Topics > Navigational Topics**. If you're using Community Management, access Topics by clicking **Topics > Navigational Topics**.
4. In the text box at right, enter a topic name, and click **Add**. Want to add subtopics? After you add a topic, choose your topic from the drop down menu (under Show the subtopics of). To add a subtopic, add another topic and click **Add**. You can add up to two levels of subtopics for each parent topic.
5. If your organization uses data categories, hover over the navigational topic name, and click . Select a Data Category Group, then select the categories you want to add to the topic, and click **Add Articles & Close Window**.

 **Important:** This process adds only current articles to a topic. To add new articles, return to Community Management or Community Workspaces and repeat the step above.

6. Hover over a topic name, and click . Then click **Upload banner image** and select an image that appears across the top of the topic page.

(Banner images are scaled to 1400 x 180 pixels. To prevent distortion, create image files with those dimensions.)

7. Repeat steps 4-6 to create several navigational topics for your community. Then click **Save**.
8. Use subtopics to further categorize your content. Associate articles for each set of subtopics for a more granular organization.
The following is the maximum number of navigational topics and subtopics you can have in a Customer Service (Napili) community template.

Level	Maximum Number of Entries
One (parent)	25
Two (subtopic)	10
Three (subtopic)	10

 **Tip:** To quickly edit existing navigational topics, simply hover over a topic name, and do any of following:

- To move a topic up or down, click the arrows at left.

[See Your Community's Topics and Subtopics in One Place](#)

See Your Community's Topics and Subtopics in One Place

You've gone through the exhaustive task of adding topics and various levels of subtopics to your community's content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community's topic catalog.

The topic catalog shows the hierarchy of navigational topics you've created for the community. It's only visible after you set up navigational topics, and it's accessed from the navigation menu.

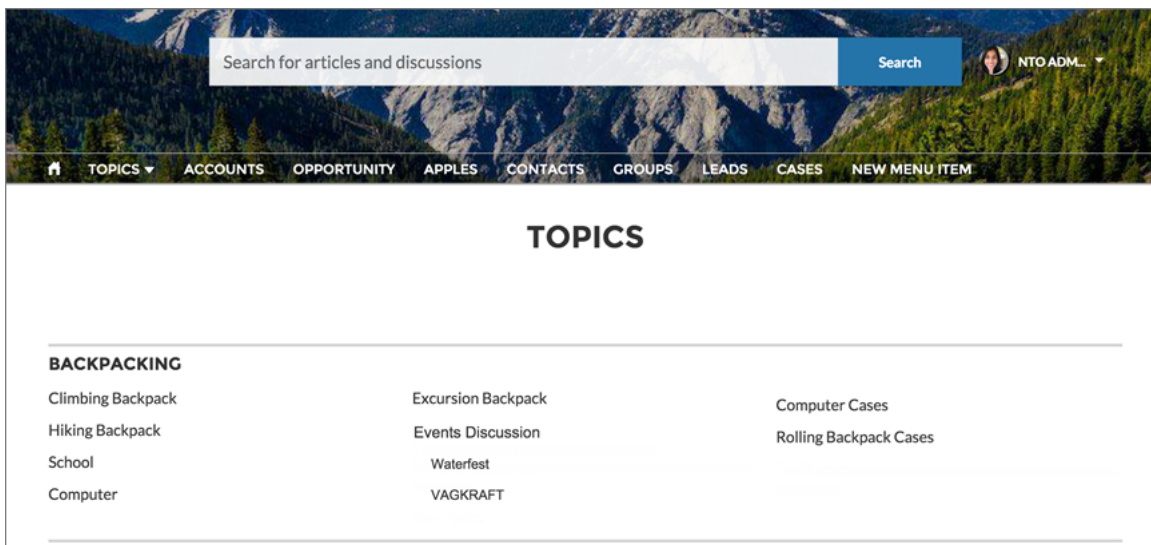

How is the topic catalog useful to your community members?

- New and returning users look at all the organized topics in one place, getting a lay of the land before diving deeper into a specific topic.
- Any community user can use the topic catalog as a jumping point to go from topic to topic.

To set up the topic catalog, select the **Add the "More Topics..." link** when editing the navigation menu on the home page.

You can also see an article or discussion's placement in the topic hierarchy using breadcrumbs. To show breadcrumbs on your community's pages, drag and drop the Breadcrumb component on the page in Community Builder.

 **Example:**

SEE ALSO:

[Set Up Navigational Topics](#)

Add Topics to Articles or Remove Them

Easily add multiple topics of any type to specific articles, or quickly remove them as community needs change.

1. Open [Community Workspaces](#) or [Community Management](#).
2. If you're using Community Workspaces, access Topics by clicking **Content Targeting** > **TopicsArticle Management**. If you're using Community Management, access Topics by clicking **TopicsArticle Management**.
3. Use the search bar to look for articles. Filter your search by selecting a data category group, followed by a specific category.
4. Click an article, and then type to assign topics, or click existing ones to remove them.

 **Note:** To automatically add the translated version of a topic to translated articles, the translated topics and articles must already be uploaded in the system. Otherwise, the translated article is tagged with the English topic.

Translate Topics Names and Descriptions for Communities with International Audiences

Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.

1. From Setup, enter *Translate* in the **Quick Find** box, then select **Translate**.
2. Select the *Language* you're translating into.
3. For *Setup Component*, select **Managed Topic**.
4. For *Aspect*, select **Field Label** to change the topic name, and **Description** to change the topic description.
5. In the *Community Name* column, expand a community to see its master topic names.
6. To enter language-specific names for navigational and featured topics, double-click in the *Topic Name Translation* column.

Consider the following when you're using the Translation Workbench:

- There is no Metadata API support for translated topic names or descriptions.
- While topic name uniqueness is guaranteed in English, the translator must ensure the uniqueness of topic names in the translated language.
- Modifying topic names from Community Workspaces or Community Management only changes the English community. All translated topic name and description changes must be made using the Translation Workbench.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Workspaces or Community Management page:

- "Manage Communities"
- OR
- "Create and Set Up Communities"

To add or remove topics:

- "Create Topics"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To translate topics:

- "View Setup and Configuration"

AND

Be designated as a translator

- If a translated topic name is entered when the community is in English mode, the translated name can appear twice in the translated community.
- When topics names are translated with the Translation Workbench, hashtags in the translated communities also change. For example, #help shows as #aiuto in Italian. If the community member then reverts to English from Italian, clicking the #aiuto hashtag gives an error message rather than showing the topic detail page of #help.

 **Note:** To automatically add the translated version of a topic to translated articles, the translated topics and articles must already be uploaded in the system. Otherwise, the translated article is tagged with the English topic.

Customize Recommendations in Communities

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Target specific audiences and use channels to specify locations for the recommendations.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Open Recommendations.
 - In Community Workspaces, select **Content Targeting > Recommendations**.
 - In Community Management, select **Recommendations > Recommendations**.
3. Select **Default Channel** or one of the custom channels.

A channel is a way to group recommendations together so you can determine where they show up in the community.

Default Channel

Recommendations in the default channel appear in predefined locations, such as directly in the feed in the Salesforce1 mobile browser app and on the Home and Question Detail pages in communities using the Summer '15 or later version of the Customer Service (Napili) template.

Custom Channel

You choose the pages where you want these recommendations to appear. In Community Builder, add the Recommendations component to the page where you want the recommendation to appear. Use the property editor to specify the custom channel with the recommendation.

Using a custom channel, you could surface a recommendation to review specific knowledge articles on a product description page to guide customers to more information.

If you want to change the channel of a recommendation, delete the recommendation and recreate it in a different channel.

4. Click **New**.
5. Complete the following fields:
 - **Name**—Enter a name for the recommendation. This name doesn't appear in the community.
 - **Image**—Click **Upload Image** to include an image with your recommendation.
 - **Title**—Optionally, enter header text that appears above the image.
 - **Description**—Enter detailed text that suggests what users can do.
 - **Button text**—Enter a label for the button in the recommendation.
 - **https://**—Enter the URL that the button opens.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Workspaces or Community Management:

- "Manage Communities"
- OR
- "Create and Set Up Communities"

The URL can contain context variables to pass information about the user who clicked the recommendation and the context in which it was clicked. For example, include a `{!userId}` context variable in your URL, `https://www.example.com/doSurvey?userId={!userId}`. When a user clicks the button in the recommendation, Salesforce sends the ID of that user to your server in the HTTP request.

Recommendations support these context variables.

Context Variable	Description
<code>{!actionLinkId}</code>	The ID of the recommendation link that the user clicked.
<code>{!actionLinkGroupId}</code>	The ID of the recommendation link group containing the recommendation that the user clicked.
<code>{!communityId}</code>	The ID of the community in which the user clicked the recommendation. The value for your internal Salesforce org is the empty key, <code>"000000000000000000"</code> .
<code>{!orgId}</code>	The ID of the org in which the user clicked the recommendation.
<code>{!userId}</code>	The ID of the user that clicked the recommendation.

- **Audience**—Select an audience for the recommendation. If you don't select an audience, all members of the community see the recommendation.

 **Tip:** To create an audience that appears in this drop-down list, in Community Workspaces, select **Content Targeting > Recommendations > Audiences**. In Community Management, select **Recommendations > Audiences**. Click **New**.

- **Enabled**—If checked, this recommendation is active and appears in communities.

When disabled, recommendations that exist in feeds in the Salesforce1 mobile browser app are not removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

6. Click **Save**.

 **Tip:** To remove a recommendation, click the recommendation name. At the bottom of the recommendation details, click **Delete**.

[Create Targeted Audiences for Your Community Recommendations](#)

Create audiences of new community members or use the API to manage customized lists of audience members to organize and target recommendations.

SEE ALSO:

[Update Your Community's Template](#)

Create Targeted Audiences for Your Community Recommendations

Create audiences of new community members or use the API to manage customized lists of audience members to organize and target recommendations.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Open Audiences.
 - In Community Workspaces, select **Content Targeting > Recommendations > Audiences**.
 - In Community Management, select **Recommendations > Audiences**.
3. Click **New**.
4. Complete the following fields.
 - **Name**—Enter a name for the audience in Community Management or Community Workspaces.
 - **Audience Type**
 - Select **New Members** to create an audience based on how long users have been community members.
Enter the number of days since registration for audience members.
 - Select **Custom List** to create an audience based on any criteria you want.

 **Note:** You can't manage audience membership for custom lists through the UI. Add and remove members through the API.

5. Click **Save**.

Audiences you create appear in the Audience drop-down list when you create a recommendation.

 **Tip:** To remove an audience, click the audience name. At the bottom of the audience details, click **Delete**. If you remove an audience that is associated with a recommendation, the recommendation is disabled and the audience is set to the default (All community members).

Reputation Overview

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Your reputation level appears on your profile page and when any user hovers over your name. It's visible to other community members so that they know how influential you are. When you start out in the community, you are at the lowest level. As you become more active in the community, you gain points and your reputation level increases. Increases in reputation levels are posted to your feed. In other words, as people see you participating and sharing your knowledge, your credibility and influence grows.

These are the default actions that increase your reputation level. You increase your reputation by:

Update the default reputation levels to meet your community's needs and help motivate your members.

[Set Up Reputation Points](#)

Set up a point system to reward users for participating in the community.

[How is my community reputation calculated?](#)

The reputation level on your profile is calculated based on your total points.

Enable Reputation in Your Community

Enable reputation in your community so that members are recognized and rewarded for participating.

A powerful tool for a community manager is the ability to recognize individual members for their participation. Community managers know that recognition and a little friendly competition usually lead to more active members. Enabling reputation turns on a default point system and set of reputation levels in the community. A community manager can personalize labels and point values from the Community Management page.

Members start to accrue points by performing the actions that have assigned point values. Once the member exceeds the top of the level's point threshold, they move up a level. They, and other members of the community, see their reputation level on their profile and when hovering over their name. Total points also show on member's profiles.

 **Note:** When you enable Reputation, Chatter influence is removed from the Contribution section on the profile page.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration Preferences**.
3. Select **Enable setup and display of reputation levels**, then click **Save**.

After you enabled reputation, a default point system and set of reputation levels is available on the Community Management page. The default reputation points are as follows:

If your selected community template doesn't have Chatter enabled, the Reputation section doesn't appear in Community Management. To show the Reputation section, go to **Administration Preferences** and select **Show all settings in Community Management**.

SEE ALSO:

[Set Up Reputation Levels](#)

[Set Up Reputation Points](#)

[How is my community reputation calculated?](#)

Set Up Reputation Levels

Update the default reputation levels to meet your community's needs and help motivate your members.

When reputation is enabled for a community, 10 default levels are added. You can add or remove levels, give each level a name, and update the point range and image for each level.

 **Note:** A community must have at least three reputation levels and can have up to 50.

1. Open [Community Workspaces](#) or [Community Management](#).
2. If you're using Community Workspaces, access Reputation by clicking **Administration** > **Reputation Levels**. If you're using Community Management, access Reputation by clicking **Reputation** > **Reputation Levels**.

From here you can:

- Upload your own image for each reputation level. Click the default image to browse to an image file and upload a new image.

 **Note:** You can't revert to the default reputation level images from the Salesforce user interface. Use the Salesforce Chatter REST API to do this.

- Give each level a name, such as "Beginner," "Intermediate," and "Expert." If you don't assign a name, the default is used. For example, "Level 1," "Level 2," "Level 3."
- Edit the point range for a level.

When you update the higher value of a level's point range, the lower value for the next level is automatically adjusted when you save.

- Add more levels by clicking **Add a level**, located underneath the list of levels.
- Remove a level by clicking  next to the level.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To update reputation levels:

- "Manage Communities"
- AND
- Is a member of the community

3. Click **Save** to apply your changes.

You can now update the point system for the community. The point system determines how many points a user gets when they perform certain actions or when others recognize their contributions by commenting, liking, or sharing their posts. Reputation level increases are posted to member feeds.

You can [translate](#) reputation level names so that international community members can view their reputation levels in the appropriate language. In Translation Workbench, select the `Reputation Level` setup component and then expand the node next to your community.

Questions and answers in the community feed are not to be confused with the Chatter Answers functionality.

 **Note:** In organizations with reputation enabled prior to the Winter '15 release, actions associated with questions and answers will be available at the time of the release and their default point values will be set to 0. Existing user reputation points will not be affected by the release, and users won't accrue points from these actions until you configure point values for them.

1. Open [Community Workspaces](#) or [Community Management](#).
2. If you're using Community Workspaces, access Reputation by clicking **Administration > Reputation Points**. If you're using Community Management, access Reputation by clicking **Reputation Reputation Points**.
3. Update the points for each action. If you don't want users to accrue points for a certain action, set the Points to 0.
4. Click **Save**.

Point totals show up on profile pages beneath the photo. Point totals are visible to anyone in the community.

 **Tip:** You can directly update reputation points for a community member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

SEE ALSO:

[Set Up Reputation Levels](#)

How is my community reputation calculated?

The reputation level on your profile is calculated based on your total points.

Points are accrued when you perform activities that your community manager has assigned point values. You could also potentially gain points if your posts or comments draw reaction from other community members. For example, your community manager may have decided that writing a post earns you 5 points. If someone else shares your post, your community manager may decide that you should earn 10 points because your post is influencing others to contribute.

 **Note:** Only active users accrue points. For example, if an active user likes the post of an inactive user, the active user gets 1 point, but the inactive user does not get points.

Default point values are as follows. Keep in mind that your community manager may have customized these values. For more information, contact your community manager.

[Google Analytics™ for Salesforce Communities Package](#)

The Google Analytics for Salesforce Communities package contains pre-configured reports that track search activity within a community.

Report on Communities with the AppExchange Packages for Community Management

The Salesforce Communities Management packages give community managers an essential starter set of dashboards and reports to keep tabs on activity and engagement directly in Community Management or Community Workspaces.

Use the Salesforce Communities Management package to:

- Take advantage of the newest features using preconfigured reports (use the latest package version)
- View the latest metrics and rapidly spot trends
- Determine how fast your community is growing
- Find out who your most engaged members are
- Discover which discussions people and groups are most excited about
- Identify areas in your community that need attention
- Take immediate action on recent activity with Insights reports

 **Note:** To use the preconfigured Insights reports, your community must use Chatter.

During installation, dashboard and report folders are automatically installed in your internal org.

You'll also have the option to give your community managers access to the package contents so you don't have to share the dashboard and report folders with them later. If you have no previous Insights or dashboards mapped in Community Management or Community Workspaces, they are automatically mapped for you during installation.

After the package is installed, you can access your new dashboards and reports alongside all your other Salesforce dashboards and reports. When you view the dashboards in Community Management or Community Workspaces, community-specific data is displayed.

[What's New?](#)

The new streamlined Community Workspaces centralizes all your community needs, whether you're moderating, building, or administering your community. You can also access quick links to frequently visited pages, catch up on release notes, and dive into Help & Training. Search reports have become even more powerful. Now search reports show which search terms produced no results in the community and which ones did. Admins can also see the average number of results per search term and which searches were confined to a specific subset of records.

[Install the Package](#)

Any internal user with the necessary permissions can install the Salesforce Communities Management package, as long as Salesforce Communities is enabled in your Salesforce org.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To install AppExchange packages:

- "Download AppExchange Packages"

[Upgrade Considerations](#)

During upgrades, your customizations are preserved. We don't overwrite anything you've tweaked. However, we can't port over your customizations to new versions of the components. You must recreate your customizations in the new package components. If we update existing components, we recommend that you recreate any customizations you've made and then delete the older component versions.

[Install the Upgrade](#)

If you have a previously installed version of the package, you can upgrade when a newer package becomes available.

[Post-Upgrade Checklist](#)

Upgrading can sometimes be tricky. We give you lots of amazing components each release, but we don't have the power to automatically remove components when we create a better version. Make sure you review the Unsupported Components list. If you haven't made any customizations to our reports and dashboards, we recommend that you delete all the unsupported components.

[Insights Vs. Dashboards—What's the Difference](#)

Use Insights to view, monitor, and act on your community's activity. Insights give you a super-focused look at a specific area while helping you with day-to-day community management. Insights can help you prioritize your work and give you instant access to what matters most.

[Community Management Insights](#)

The Salesforce Communities Management package provides a set of Insights reports that let you monitor recent activity and drill down to the source of that activity to take further action.

[Community Management Dashboards Descriptions](#)

The Salesforce Communities Management package provides a set of dashboards, each with its own source reports, and a set of custom report types. The available reports depend on whether you install the package for communities that have Chatter, or the package for communities that don't.

[Salesforce Org Dashboard and Report Descriptions](#)

You must view the Chatter and Licenses dashboards and reports from your internal Salesforce org.

[Custom Report Type Descriptions](#)

The reports in this package are based on a set of communities-focused custom report types, which you can customize to enhance reporting capabilities with more fields.

[The Power of Customization](#)

The dashboard and reports provided in the package are a great start, but they may not be exactly what your community needs. With a few simple steps, you can customize the provided dashboards and reports to suit your needs. To customize a report, open the **Reports** tab and click the report name you want to modify, then click **Customize**.

[Unsupported Components](#)

The following list identifies which reports are no longer supported in this release.

Editions**

Enable Community Workspaces

To enable Community Workspaces, in Setup, enter **Communities** in the Quick Find box and click **Communities Settings**. Under Community Management Settings, select **Enable Community Workspaces**. Community Workspaces are enabled by default in all orgs created after Spring '17.

Not ready to move to Community Workspaces yet? You don't have to do a thing. Your settings stay the same unless you enable Community Workspaces. Want to check out [Community Workspaces](#) on page 3362? Feel free to give it a try. You can easily revert to Community Management by deselecting **Enable Community Workspaces**.

 **Note:** Internet Explorer® version 11 does not support Community Workspaces.

What's Different?

Community Workspaces offers a streamlined area to access all the tools that you need for building, managing, and tracking your community. Even though it looks different, everything you use is still there. Some things have been moved around a bit.

- Engagement reports have been moved into the Dashboard workspace. Reporting dashboards and your Home dashboards are also located in the Dashboard workspace.
- Recommendations and Topics are in the new Content Targeting workspace.
- Moderation pages have been organized into separate areas within the Moderation workspace. You can access moderation Insights from the Home tab and create and customize moderation rules, member criteria, and content criteria from the Rules tab.
- Want to jump to another workspace from the workspace you are in? It's easy! Click the icon in the upper-left corner and a navigation dropdown menu appears. You can also switch between communities without leaving Community Workspaces.

 **Note:** We encourage you to switch Community Workspaces, as future updates are based on the Community Workspaces framework.

[Salesforce Community Management Package with Chatter](#)

The Community Management package delivers the insights, dashboards, reports, and moderation controls community managers need, to drive adoption, monitor engagement, and build a vibrant community.

[Salesforce Community Management Package Without Chatter](#)

The Community Management package delivers the dashboards and reports community managers use, to drive adoption, monitor engagement, and build a vibrant community.

Salesforce Community Management Package with Chatter

The Community Management package delivers the insights, dashboards, reports, and moderation controls community managers need, to drive adoption, monitor engagement, and build a vibrant community.

Version 9.0 features include:

New custom report types:

- Network Moderation Flagged Direct Messages 1.0
- Related Questions CTR 1.0
- Community Searches 2.0

New reports to track question click-through-rates, flagged Direct Messages, and search results.

A new Community Search Dashboard 2.0, that provides even more information about your community's search behavior.

[Unsupported old reports and dashboards](#)—if you're upgrading, remove these components manually.

Salesforce Community Management Package Without Chatter

The Community Management package delivers the dashboards and reports community managers use, to drive adoption, monitor engagement, and build a vibrant community.

Version 7.0 features:

New reports to track search results

New dashboards:

- New Community Search Dashboard 2.0, that provides information about your community's search behavior.
- [Unsupported old reports and dashboards](#)—if you're upgrading, remove these components manually

Install the Package

Any internal user with the necessary permissions can install the Salesforce Communities Management package, as long as Salesforce Communities is enabled in your Salesforce org.

If you're upgrading from a previous version of this package, review the [Upgrade Considerations](#) and then follow the steps in [Install the Upgrade](#). Be sure to check the unsupported components list and delete them from your organization.

 **Note:** To install the version of the package for Communities with Chatter, Chatter must be enabled. There are no prerequisites to install the version of the package for communities without Chatter.

1. Select **AppExchange** from the Force.com Apps drop-down list. You can also click [here](#).
2. Search the AppExchange site for [Salesforce Communities Management \(for Communities with Chatter\)](#) or [Salesforce Communities Management \(for Communities without Chatter\)](#).
3. Click **Get It Now** on the application information page. If prompted, log in to the AppExchange.
4. Click **Install in Production**.
5. Review the terms and conditions, select **I have read and agreed to the terms and conditions**, then click **Confirm and Install**.

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

6. Click **Install for Specific Profiles** to grant access to the users who will be working with the reports and dashboards.
7. Review the list of API access that the package components have been granted access to, then click **Next**.
8. Click **Install**.

 **Example:** Report folder mapping in the Dashboard workspace of Community Workspaces.

If this is your first time installing the package, or you don't have any current mappings for your Community Management or Community Workspaces, the package automatically maps the Insights report folders and dashboards for you.

 **Note:** If you have an earlier version of the package installed, we recommend that you uninstall it before reinstalling the new version. If you've customized any of your reports, you can upgrade the package without uninstalling your current version. Click [here](#) for more information about what to consider when upgrading.

The Installed Package Detail page confirms when installation is complete. In your Salesforce org, look in the Reports tab for the following folders.

Folder Name	Description	Package with Chatter	Package without Chatter
Communities Dashboards	Provides the License Usage 1.0 and Community Search Dashboard 2.0 dashboards.		
	 Note: Don't map these dashboards in Community Management; view them in your internal org.		

Folder Name	Description	Package with Chatter	Package without Chatter
Lighting Communities Dashboards	Provides the dashboards that map to Dashboards in Community Management and Community Workspaces, including your home page.  Note: Installing the package doesn't auto-map a dashboard for your home page, you must map one yourself.		
Communities Reports	Provides the reports used in your Community Management dashboards. These reports are used in the dashboards in Dashboards > Reporting if you are using Community Workspaces.		
Community Management Home Reports	Provides the reports used in your Community Management home dashboard. These reports are in Dashboards > Home if you are using Community Workspaces.		
Insights Adoption 2.0 Insights Activity 2.0 Insights Files 2.0 Insights Groups 2.0 Insights Self-Service 2.0 Insights Topics 2.0	Each folder includes reports for the mapped Insights pages in Community Management Engagement or in Dashboards > Engagement if you are using Community Workspaces.		
Moderation Audit Trail Moderation Flagged Moderation Pending Moderation Users	Each folder includes reports for the mapped Insights pages in Community Management Moderation or in Moderation > Moderate if you are using Community Workspaces.		
Misc Communities Reports	Provides reports that are feature-dependent , such as reports that require Chatter messages, direct messages, or the community case feed.		
Chatter Dashboards Chatter Reports	Provides reports and dashboards to track Chatter usage in your internal Salesforce org.  Note: These folders don't map to anything in Community Management or Community Workspaces	 	

 **Note:** If you are installing the package for Communities without Chatter, you also still have a Community Management Home Dashboards folder.

Upgrade Considerations

During upgrades, your customizations are preserved. We don't overwrite anything you've tweaked. However, we can't port over your customizations to new versions of the components. You must recreate your customizations in the new package components. If we update existing components, we recommend that you recreate any customizations you've made and then delete the older component versions.

Has it been a few releases since you've upgraded?

If so, we recommend that you start with a clean slate. First, remove any mappings you have in Community Management, and then [uninstall](#) on page 1144 the package entirely. Once you've done that, you can reinstall the latest-and-greatest version of the package.

 **Important:** If you've customized the components we provide, don't use this approach. Install the upgrade normally, and then recreate your customizations in the newer versions. Then you can safely delete your old versions.

 **Note:** Versioning is handled at the component level: dashboards, reports, and custom report types. If a component is updated, its version is updated. For a list of new components, see [What's New?](#) Because of the way we map Insights reports in Community Management, we also version the Insights folders. If we make major changes to Engagement or Moderation, we provide an updated version of each Insights folder within that page.

Install the Upgrade

If you have a previously installed version of the package, you can upgrade when a newer package becomes available.

Upgrading doesn't overwrite the original custom report types, dashboards, or reports.

 **Important:** Customizations are not ported to the new package. If we updated components that you've customized, you must recreate your customizations in the new component versions. Recreate your customizations before continuing to the next step.

1. Review the [upgrade considerations](#).
2. [Install the Package](#). Installing an upgrade is just like a clean install. After you install the package, click **Reports** in your internal Salesforce org to check out your new folders and components. Dashboard and report names are suffixed with version numbers so you can easily identify the new items.
3. Review [What's New?](#) to see if we updated any components that you've customized. You can also look for this symbol  in the document to identify new components.
4. In Community Management or the Dashboard workspace, review and update your dashboard and Insights mappings. Click **Dashboards > Settings or Engagement > Settings**.

We recommend that you verify your dashboard mappings are using the latest version of all the dashboards.

5. If applicable, delete any reports, dashboards, or custom report types that were updated or are now [unsupported](#) to avoid confusion and ensure your community managers always use the latest and greatest.

For more information, see [What's New?](#) and [Unsupported Components](#).

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

Post-Upgrade Checklist

Upgrading can sometimes be tricky. We give you lots of amazing components each release, but we don't have the power to automatically remove components when we create a better version. Make sure you review the Unsupported Components list. If you haven't made any customizations to our reports and dashboards, we recommend that you delete all the unsupported components.

If you're upgrading to the Communities Management (for Communities with Chatter) 9.0 package, complete these steps:

- Delete all the reports in the original Insights folders and also delete those original folders. Then in Community Management, update your mapping to use the Insights 2.0 folders. For example, you can delete the **Insights Adoption** folder and all of its contents, but keep the **Insights Adoption 2.0** folder. Keep in mind that if you made any customizations to the Insights reports, they don't port over to the updated versions, and you'll lose those customizations if you delete those reports.
- Make sure the License Usage 1.0 dashboard is **not** mapped in Community Management. View this dashboard only in your internal Salesforce org, not in Community Management.
- If you still see version numbers on your Communities Dashboards and Communities Reports folders, remove them from the folder names and merge all the reports into one folder. Your reports and dashboards aren't affected by renaming the folders. Review the [list of report and dashboard folders](#) that should be included in your org.

Insights Vs. Dashboards—What's the Difference

Use Insights to view, monitor, and act on your community's activity. Insights give you a super-focused look at a specific area while helping you with day-to-day community management. Insights can help you prioritize your work and give you instant access to what matters most.

You can visit the Adoption page under **Insights**, or under **Dashboards > Engagement** if you are using Community Workspaces, to take action on activity from your new members. For example, you can view a report about new members that have received the most likes on their posts and comments. This Insights report helps you identify and engage with your active new members.

Use Dashboards to view your community's analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement in your community. They help you monitor return on investment (ROI) and key performance indicators (KPI).

You can visit the **Dashboards > Activity** page to track total posts and comments including overall contribution trends in your community.

Community Management Insights

The Salesforce Communities Management package provides a set of Insights reports that let you monitor recent activity and drill down to the source of that activity to take further action.

Important: Insights are only available in the Communities Management AppExchange package with Chatter.

When you view Insights in Community Management or Community Workspaces, reports automatically display data specific to the community you're managing. Insights reports are arranged into two sections, Engagement and Moderation. You can switch between reports by using the drop-down menus on the Engagement or Moderation pages.

Tip: Insights let you know how the report is filtered.

You can edit this label to be more descriptive.

1. Use the tables in this document to identify the custom report type for your Insights report.
2. In your internal Salesforce org, from Setup enter *Report Types* in the Quick Find box, and then select **Report Types**.
3. Click the name of the custom report type you want to edit, then click **Edit Layout**.
4. To change a label, select the field you want to update and click **Edit Properties** and then save your work.

5. Verify your changes in Community Management or Community Workspaces.

Adoption Insights

Use the Adoption Insights page to monitor member activity.

With Adoption Insights, you can:

- Identify and welcome your new members
- Drive adoption and engagement in your community
- Re-engage with your community's top contributors

Report Name	Description	Custom Report Type
Active Members	Members who logged in to your community in the last 7 days with Chatter activity, such as a post or like.	Network Member Activity 1.0
Active Members With No Picture	Members without a user profile picture who logged in to your community in the last 7 days.	Chatter Activity 1.0

Report Name	Description	Custom Report Type
Contributors Inactive For 7+ Days 2.0	Members with the most posts and comments who are now inactive. These members haven't logged in to the community in the last 7 days, but have logged in once during the last 30 days. This report includes only members with more than 5 posts or 5 comments.  Important: Adjust the report filters to fit your community.	Network Member Activity 1.0
Influencers Inactive For 7+ Days 2.0	Members with the most likes and comments received who are now inactive. These members haven't posted in the last 7 days, but have logged in to the community in the last 30 days. This report includes only members with at least 5 likes or 5 received comments.  Important: Adjust the report filters to fit your community.	Network Member Activity 1.0
Influencers With No Picture	Members with the most likes and comments received, who have no user profile picture. This report includes only members with at least 5 likes or 5 received comments.  Important: Adjust the report filters to fit your community.	Chatter Activity 1.0
New Contributors With No Picture	Members without a user profile picture, who registered in the last 7 days and also posted or commented recently.	Chatter Activity 1.0
New Members	New members who registered in the last 7 days with Chatter activity, such as a post or like.	Network Member Activity 1.0
Recent Contributors 2.0	New members active in Chatter groups or user profiles in the last 7 days, sorted by most recent activity.	Network Members 3.0
Recent Contributors With No Picture	New members without a user profile picture, active in Chatter groups or user profiles in the last 7 days, sorted by most recent activity.	Network Members 3.0
Recent Logins Successful	External users with the most recent successful logins to the community during the last 7 days. This report only includes direct logins to the community. If a user logs into an org and then switches to a community, their login activity isn't included.	Network Login History 5.0

Activity Insights

Use the Activity Insights page to track posts and comments in groups.

With Activity Insights, you can:

- Moderate recent discussions, including identifying posts with no comments
- Monitor your community's hot discussions
- Moderate group activity from new members

Report Name	Description	Custom Report Type
New Discussions 2.0	New group discussions created in the last 7 days, sorted by the newest post.	Network Groups Activity 3.0
New Members' Comments 2.0	Group comments created in the last 7 days by a member who registered in the last 30 days. This report is sorted by the highest number of likes.	Network Groups Activity 3.0
New Members' Posts 2.0	Group posts created in the last 7 days by a member who registered in the last 30 days.	Network Groups Activity 3.0
Recent Discussions	Group discussions created in the last 30 days.	Network Groups Activity 3.0

Files Insights

Use the Files Insights page to monitor file uploads and downloads, including files receiving lots of comments. With Files Insights, you can monitor files by community engagement and file type.

Report Name	Description	Custom Report Type
Files With Activity	Files with comments, likes, or downloads.	File and Content Report
New Image Files 2.0	Image files uploaded in the last 7 days, sorted by the most recent upload.	File and Content Report
New Office Files 3.0	Office files uploaded in the last 7 days, sorted by the most recent upload.	File and Content Report
New Video Files 2.0	Video files uploaded in the last 7 days, sorted by the most recent upload.	File and Content Report
Recent Files (All) 2.0	Files uploaded in the last 7 days, sorted by the most recent upload.	File and Content Report

Groups Insights

Use the Groups Insights page to help manage your groups.

With Groups Insights, you can:

- Moderate newly created groups
- Manage groups with deactivated or inactive owners
- Manage groups that will soon be archived

Report Name	Description	Custom Report Type
Best Answers From Groups 1.0	Best Answers created in last 7 days from Groups, sorted by the most recent answers.	Network Group Q&A Activity 1.0
Groups Recently Archived 2.0	Groups that were automatically archived in the last 15 days, sorted by the most recent contribution date. The report doesn't include groups manually archived by a user.	Network Group Membership 3.0

Report Name	Description	Custom Report Type
Groups Soon To Be Archived 2.0	Groups that are scheduled to be archived in the next 15 days, sorted by the soonest archive date.	Network Group Membership 3.0
Groups With Deactivated Owners 2.0	Groups with owners that are deactivated. These groups are active and haven't been archived.	Network Group Membership 3.0
Groups With Inactive Owners 2.0	Groups with owners who didn't log in to the community in the last 30 days. These groups are active and haven't been archived.	Network Group Membership 3.0
New Groups	Groups added in the last 7 days.	Network Group Membership 3.0
Questions From Groups 1.0	Questions created in the last 7 days from groups, sorted by most recent.	Network Groups Q & A Activity 1.0
Questions With New Answers From Groups	Questions with answers created in last 7 days from groups, sorted by most recent answer.	Network Groups Q & A Activity 1.0
Questions Without Answers From Groups 1.0	Questions created in the last 7 days without answers from groups, sorted by most recent question.	Network Groups Q & A Activity 1.0
Questions With Answers From New Groups 1.0	Questions created in the last 7 days with answers from new groups, sorted by most recent question.	Network Groups Q & A Activity 1.0
Questions From New Groups 1.0	Questions created in the last 7 days from groups, sorted by most recent question.	Network Groups Q & A Activity 1.0

Moderation Insights

Use the Moderation Insights page to track flagged posts, files, messages, and content flagged by moderation rules.

With Moderation Insights, you can:

- Monitor content blocked, flagged, or replaced by rules
- Monitor spammers or new members
- Monitor types of flagged messages including notes from customer
- Monitor private messages from new members (for details, see the [Misc Communities Reports](#) section)

Report Name	Description	Custom Report Type
🚩 Flagged Comments 3.0	Comments flagged in the last 7 days.	Network Moderation Flagged Comments 2.0
🚩 Flagged Files 3.0	Files flagged in the last 7 days.	Network Moderation Flagged Files 2.0
🚩 Flagged Private Messages 3.0	Chatter messages flagged in the last 7 days.	Network Moderation Flagged Messages 2.0
🚩 Flagged Direct Messages 1.0	Direct Messages flagged in the last 7 days.	Network Moderation Flagged Direct Messages 1.0
🚩 Flagged Posts 3.0	Posts flagged in the last 7 days.	Network Moderation Flagged Posts 2.0

Report Name	Description	Custom Report Type
Frozen Members 2.0	Members frozen in the last 7 days.	Network Frozen Members 2.0
Posts Pending Approval	Feed posts pending approval.	Network Posts Pending Approval 2.0
Moderation Audit 2.0	All moderation audits in the last 7 days. This includes flagging by users, moderation rules, and moderator actions.	Network Activity Audit 1.0

Self-Service Insights

Use the Self-Service Insights page to track questions and answers in user profiles, including questions escalated to cases.

With Self-Service Insights, you can monitor and act on:

- Recently-created questions
- Questions and answers from new members to help drive adoption
- Questions escalated to cases (for details, see the [Misc Communities Reports](#) on page 3728 section)

 **Note:** This Insights page supports communities using the Napili template.

Report Name	Description	Custom Report Type
Best Answers 2.0	Questions with a best answer added in the last 7 days.	Network User Activity 3.0
Best Answers From External Members 2.0	Questions with a best answer from an external user added in the last 7 days.	Network User Activity 3.0
Questions 2.0	Questions added in the last 7 days.	Network User Activity 3.0
Questions From New Members 2.0	Questions added in the last 7 days by new members. A member is considered new if they joined the community less than 30 days ago.	Network User Activity 3.0
Questions With Answers From New Mem 2.0	Questions with answers from new members in the last 7 days. A member is considered new if they joined the community less than 30 days ago. This report is sorted by the most recent question.	Network User Activity 3.0
Questions With New Answers 2.0	Questions with a new answer that has been added in the last 7 days. This report is sorted by the most recent answer.	Network User Activity 3.0
Questions Without A Best Answer 2.0	Questions with answers in the last 7 days that still don't have a best answer.	Network User Activity 3.0
Questions Without Answers 2.0	Questions added in the last 7 days that haven't been answered.	Network User Activity 3.0

Topics Insights

Use the Topics Insights page to keep an eye on recent topics.

With Topics Insights, you can:

- Manage topic assignments
- Monitor new topics

Report Name	Description	Custom Report Type
Topics Added 2.0	Topics created in the last 7 days.	Network Topics 3.0
Topics Assigned 2.0	Topics assigned in the last 7 days.	Network Topic Assignments 3.0
Topics Most Talked About 2.0	Topics created in the last 7 days with the highest "Talked About" score.	Network Topics 3.0

Community Management Dashboards Descriptions

The Salesforce Communities Management package provides a set of dashboards, each with its own source reports, and a set of custom report types. The available reports depend on whether you install the package for communities that have Chatter, or the package for communities that don't.

After installing the package, when you view the dashboards from Community Management or Community Workspaces, reports automatically display data specific to the community you're accessing the report from. To view data from across all your communities, view the dashboard in your internal Salesforce org.

 **Important:** For the package without Chatter, you only get: two home dashboards and the Overview, Members, and Licenses Usage dashboards.

 **Note:**

- Trending metrics are calculated daily and the calculation starts the day after a release. Trending metrics work only in active Salesforce orgs. To collect trending metrics in non-active orgs, contact Salesforce.
- Filtering is not supported on standard report types.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Home Dashboard and Reports](#)

When you access Community Management, your home dashboard is the first thing you see. It ensures that you stay up to date and is customizable to fit your community needs.

[Overview Dashboard and Reports](#)

Use the Overview dashboard to track membership growth, login trends, and members' post and comment activity in Chatter.

[Activity Dashboard and Reports](#)

Use the Activity dashboard to track engagement and activity levels, based on members' Chatter activity.

[Chatter Edits Reports](#)

Use these reports to track Chatter edits in your community.

[Community Search Dashboard and Reports](#)

Use the Community Search Dashboard to track search activity in the community.

[Files Dashboard and Reports](#)

Use the Content dashboard to track content uploads, downloads, engagement, and content creators.

[Custom Recommendations Dashboard and Reports](#)

Use the Custom Recommendations dashboard to see how your community's custom recommendations are doing.

[Groups Dashboard and Reports](#)

Use the Groups dashboard to monitor feed and member activity in Chatter groups.

[Members Dashboard and Reports](#)

Use the Members dashboard to track community membership, new members added, and external member logins over time.

[Moderation Dashboard and Reports](#)

Use the Moderation dashboard to track community moderators' and members' flagging activity.

[Q&A Dashboard and Reports](#)

Use the Q & A dashboard to track recent activity for questions, answers, and best answers posted in groups

[Self-Service Dashboard and Reports](#)

The Self-Service dashboard tracks activity in the self-service template.

[Topics Dashboard and Reports](#)

Use the Topics dashboard to track your community topics.

[Misc Communities Reports](#)

The reports provided in this folder are feature-dependent or require special user permissions. You can add these reports to Insights folders or dashboards in Community Management or Community Workspaces. These reports are provided in the **Misc Communities Reports** folder.

Home Dashboard and Reports

When you access Community Management, your home dashboard is the first thing you see. It ensures that you stay up to date and is customizable to fit your community needs.

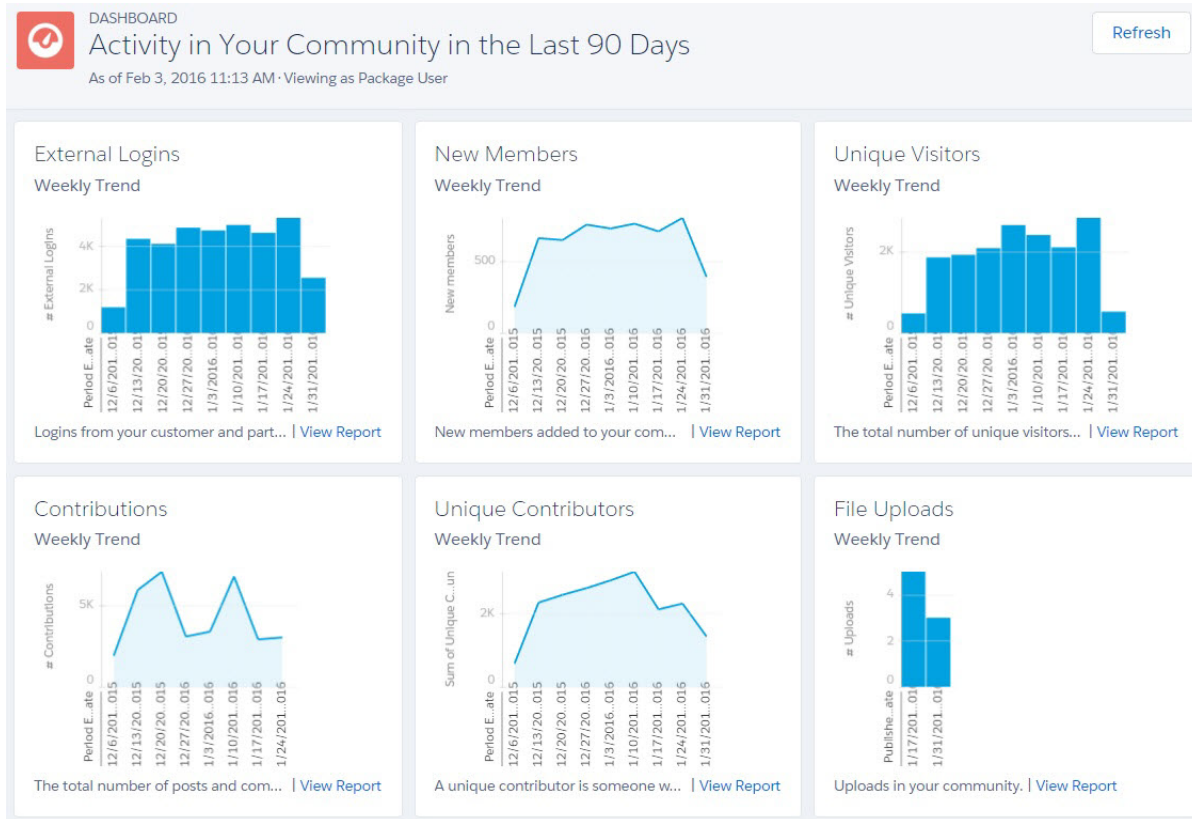

We provide dashboards for short-term and long-term data, with options for communities with or without Chatter and self-service communities.

The Sample Community Dashboard automatically maps to your home page. To change the mapping of the dashboard, go to **Dashboards > Settings** in Community Management. If you've enabled Community Workspaces, the Home dashboard is in the Dashboards workspace.

Tip: If you want your home dashboard to include metrics and reports about your community's cases, see [Misc Communities Reports](#). You can also [Create a Dashboard for Your Community](#).

Overview Dashboard and Reports

Use the Overview dashboard to track membership growth, login trends, and members' post and comment activity in Chatter.

With this dashboard, you can see:

- How contributions are trending
- How group membership is trending
- How topics and assignments are trending
- How question and answers are trending
- How files are trending

Important: For information about the reports provided in the Overview dashboard for the package without Chatter, refer to what's installed in your org.

MO - Flags L90D	Trending report of flagged content in your community in the last 90 days.	Network Moderation 2.0	✓
New Members (Last 90 Days Trend)	Newly joined members in the last 90 days.	Network Membership Daily Metrics 2.0	✓
O - External Logins L90D	External logins by community member type in the last 90 days.	Network Membership Daily Metrics 2.0	✓

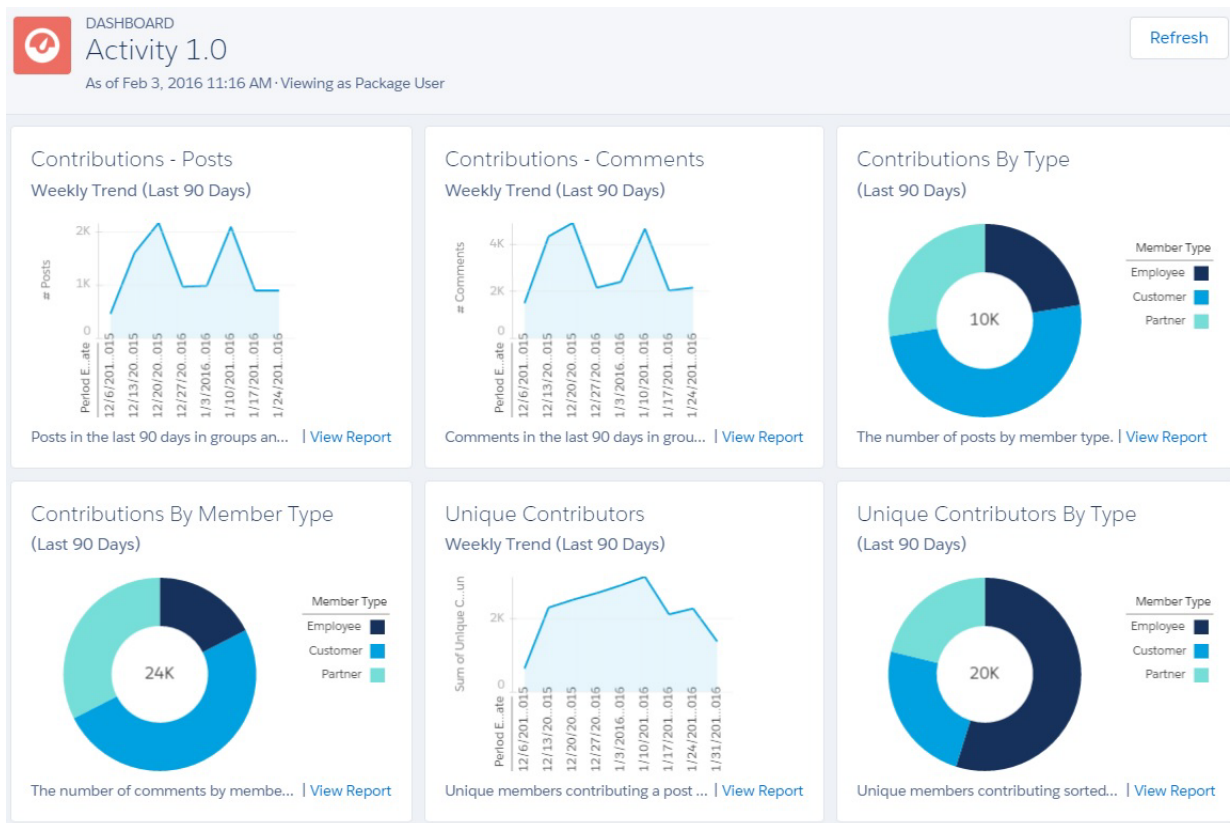

Report Name	Description	Custom Report Type	On Dashboard?
T - Topics Assigned L90D	Topics assigned in the last 90 days.	Network Topic Assignments 3.0	<input checked="" type="checkbox"/>
T - Topics Created L90D	Topics added in the last 90 days.	Network Topics 2.0	<input checked="" type="checkbox"/>

Activity Dashboard and Reports

Use the Activity dashboard to track engagement and activity levels, based on members' Chatter activity.

With this dashboard, you can answer:

- How many posts and comments are there?
- How many members are contributing and are there any members that aren't contributing?
- Which posts are the most commented on or liked?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
A - # Comments	Total number of comments in groups and user profiles.	Network Activity Daily Metrics 2.0	
A - # Comments L30D	Total number of comments in groups and user profiles in the last 30 days.	Network Activity Daily Metrics 2.0	
A - # Comments Per Post	The average number of comments per post.	Network Activity Daily Metrics 2.0	
A - # Comments Per Post L30D	The average number of comments per post in the last 30 days.	Network Activity Daily Metrics 2.0	
A - # Members Contributing L30D	Members who have contributed to Chatter in the last 30 days.	Network Members 2.0	
A - # Members Who Never Contributed	Members who have never contributed to Chatter.	Network Members 2.0	
A - # Posts	Total number of posts in groups and user profiles.	Network Activity Daily Metrics 2.0	
A - # Posts L30D	Total number of posts in groups and user profiles in the last 30 days.	Network Activity Daily Metrics 2.0	
A - Contributions By Member Type L90D	Trending report on posts and comments in the last 90 days in groups and user profiles, sorted by member type.	Network Activity Daily Metrics 2.0	
A - Contributions L90D	Trending report on posts and comments in the last 90 days in groups and user profiles.	Network Activity Daily Metrics 2.0	
A - Unique Contributors By Type L90D	Unique members contributing a post or comment in the last 90 days.	Network Unique Contributor Daily Metrics 2.0	
Daily Unique Contributors (Last 90 Days)	Unique members contributing a post or comment on a given day in the last 90 days.	Network Unique Contributor Daily Metrics 2.0	

Chatter Edits Reports

Use these reports to track Chatter edits in your community.

These reports aren't associated with a dashboard, but you can find them in the Communities Reports folder.

 **Important:** These reports are *only* available in the package with Chatter.

 **Tip:** If you want to report on Chatter edits in your internal Salesforce org, use the reports in the **Chatter Reports** folder.

Report Name	Description	Custom Report Type
CH - # Chatter Edits	Number of Chatter edits made in the community.	Network Chatter Edits 1.0

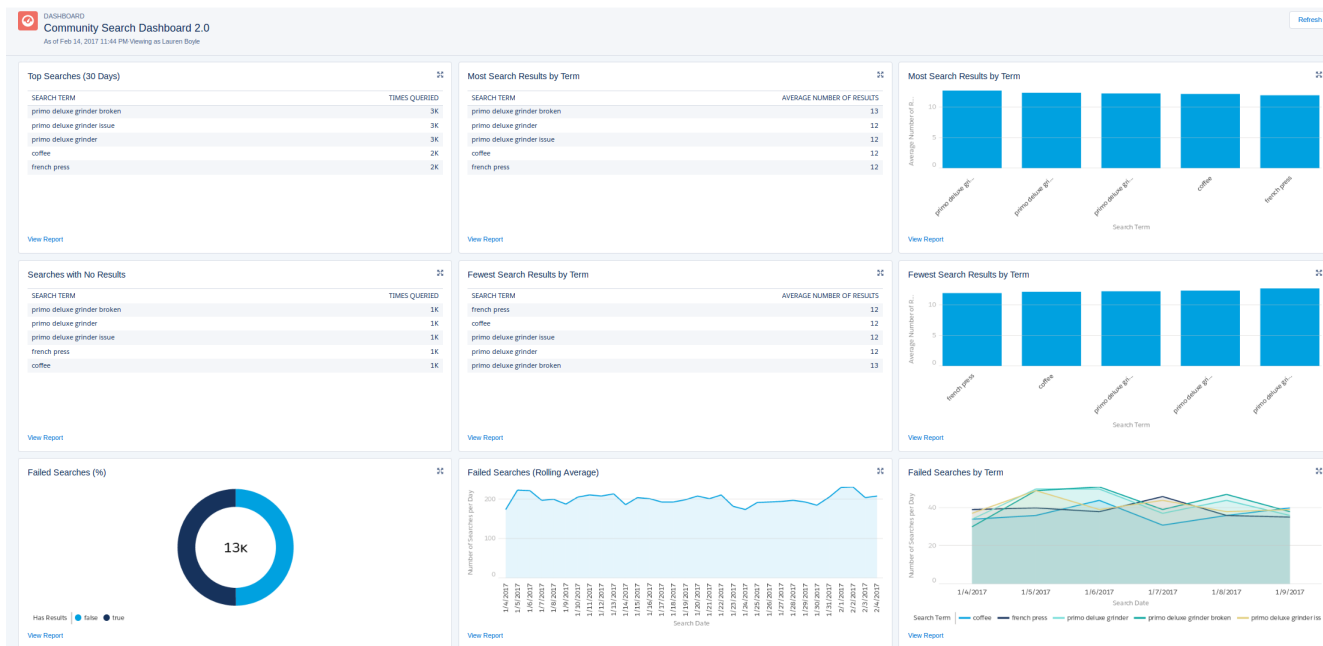

Report Name	Description	Custom Report Type
CH - Chatter Edits By Feed Type	Distribution of community Chatter edits by feed type: posts or comments.	Network Chatter Edits 1.0
CH - Chatter Edits By Member Type	Distribution of community Chatter edits by member type: internal, partner, or customer.	Network Chatter Edits 1.0
CH - Daily Chatter Edits L30D	Daily trend of Chatter edits in the community.	Network Chatter Edits 1.0

Community Search Dashboard and Reports

Use the Community Search Dashboard to track search activity in the community.

With the Community Search Dashboard, you can track:

- Which terms are being search for by community members?
- How many members are searching for a term on a specific day?
- How many community users are logged in when they enter a search term?
- What type of community member is searching for a term?

Important: This dashboard and its reports are available *only* in communities using the Customer Service (Napili) template and Search reports can only run in production environments.

Report Name	Description	Custom Report Type	On Dashboard?
Autocomplete Click-Through % (Last 30 Days)	What percentage of autocomplete search results had a successful click?	Community Searches 2.0	<input checked="" type="checkbox"/>

Report Name	Description	Custom Report Type	On Dashboard?
 Autocomplete Search Usage (30 Days)	Are users clicking on suggested search results?	Community Searches 2.0	
 Logged-In vs Guest Search (Last 30 Days) 2.0  Note: This report has been enhanced in the current package.	How many community users are logged in when they enter a search term?	Community Searches 2.0	
 Most Autocomplete Clicks (30 Days)	Which search terms led to the most clicks of suggested search results?	Community Searches 2.0	
 Number of Results Per Term (30 Days)	How many search results are returned per search term?	Community Searches 2.0	
 Search Frequency by Term (Last 30 Days) 2.0  Note: This report has been enhanced in the current package.	Which terms are being searched for by community members?	Community Searches 2.0	
 Searches by Member Type (Last 30 Days) 2.0  Note: This report has been enhanced in the current package.	What type of community member is searching for a term?	Community Searches 2.0	
Search Result Outcomes (30 days)	How many searches had results?	Community Searches 2.0	
 Searches w/ No Results, by Day (30 Days)	Which search terms had zero results on any given day?	Community Searches 2.0	
 Searches w/ No Results by Type (30 Days)	What type of community member is searching for a term, and did it have results?	Community Searches 2.0	
 Searches with Zero Results (30 Days)	How many search results are returned per search term?	Community Searches 2.0	

Files Dashboard and Reports

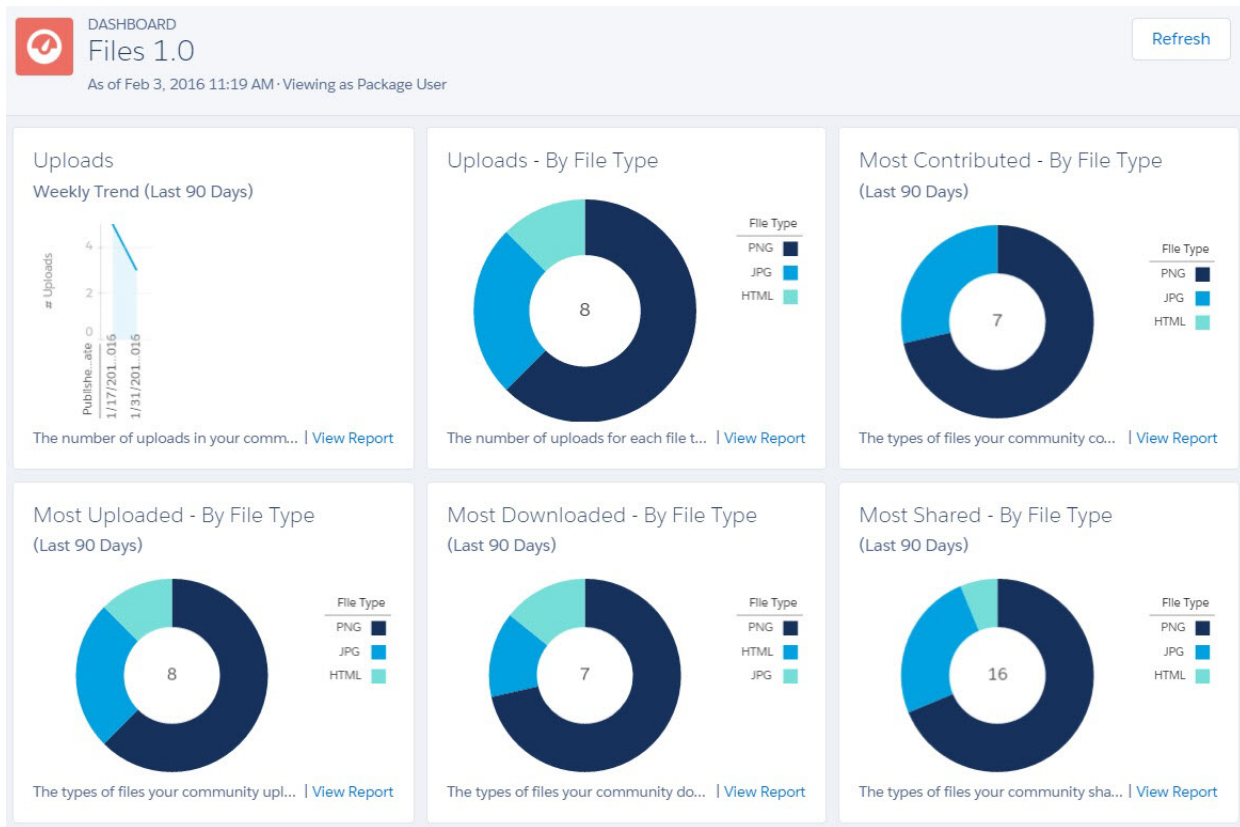

Use the Content dashboard to track content uploads, downloads, engagement, and content creators.

With this dashboard, you can answer:

- How many file uploads and downloads are there?
- Are there any file trends?

- What type of files are being distributed the most or least?
- How is file engagement?
- Which members are driving file engagement?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
C - # File Contributions	The total number of file contributions, defined as posts and comments.	File and Content Report	
C - # File Downloads	The total number of files downloaded.	File and Content Report	
C - # File Likes	The total number of file likes.	File and Content Report	
C - # File Shares	The total number of files shares.	File and Content Report	
C - # File Uploads	The total number of files uploaded.	File and Content Report	

Report Name	Description	Custom Report Type	On Dashboard?
C - File Activity By File Type L90D	Reports on the types of files uploaded and downloaded in your community.	File and Content Report	
C - File Activity L90D	Reports on the number of uploads and downloads in your community in the last 90 days.		
C - File Sharing Monthly	Monthly trending report on the number of file shares in your community.	File and Content Report	
C - File Uploads Distribution By Type	Distribution of files uploaded by file type.	File and Content Report	
C - New Files Trending By Contributions	Files uploaded in the last 30 days with the most posts and comments.	File and Content Report	
C - New Files Trending By Downloads	Files uploaded in the last 30 days with the most downloads.	File and Content Report	
C - New Files Trending By Likes	Files uploaded in the last 30 days with the most likes.	File and Content Report	
C - Top 10 Users - Most File Contrib L30D	<p>Top 10 users who received the largest number of posts and comments on their files in the last 30 days.</p> <p> Note: This report is not included on the Content dashboard. If you want to use it, edit the dashboard and remove an existing report to add it.</p>	File and Content Report	
C - Top 10 Users - Most File Likes L30D	<p>Top 10 users who received the largest number of likes on their files in the last 30 days.</p> <p> Note: This report is not included on the Content dashboard. If you want to use it, edit the dashboard and remove an existing report to add it.</p>	File and Content Report	
C - Top 10 Users - Most File Uploads	Top 10 users who uploaded the largest number of files.	File and Content Report	

Custom Recommendations Dashboard and Reports

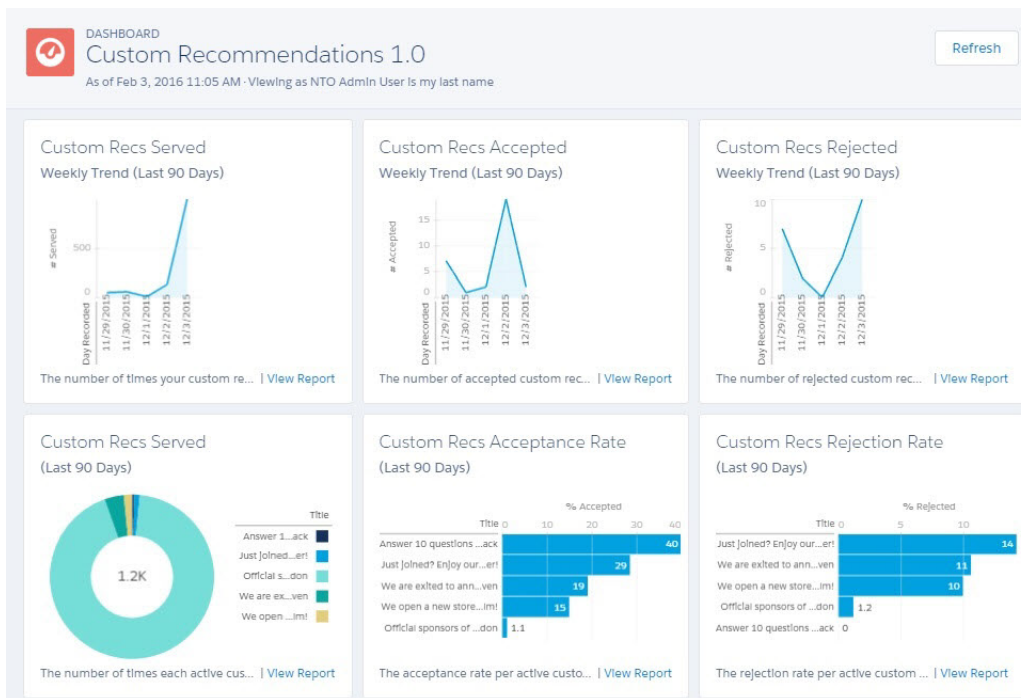

Use the Custom Recommendations dashboard to see how your community's custom recommendations are doing.

You can see how often your recommendations are viewed, clicked, or dismissed. You can view data for individual recommendations or across channels.

With this dashboard you can answer:

- Which recommendations are being clicked the most?
- Which recommendations are being rejected the most?
- Are my custom channels helping my recommendations?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Recommendations FAQ

Frequently asked questions about recommendations.

Recommendations FAQ

Frequently asked questions about recommendations.

What does it mean when a recommendation is served?

A recommendation is served when it's displayed on a page, including when the page refreshes.

What does it mean when a recommendation is accepted?

A recommendation is accepted when a member clicks the button text, such as "Buy Now."

What does it mean when a recommendation is rejected?

A recommendation is rejected when a member clicks "I'm not interested."

How is the acceptance rate calculated?

The acceptance rate equals the total number of times a member clicks the recommendation, divided by the total number times the recommendation was served (displayed) in your community. For example, if a custom recommendation is clicked by 100 members and it was served 1,000 times, the acceptance rate is 10%.

How is the rejection rate calculated?

The rejection rate equals the total number of times a member dismisses the recommendation, divided by the total number of times the recommendation was served (displayed) in your community. For example, if a custom recommendation is dismissed 100 times and it was served 1,000 times, the rejection rate is 10%.

What are channels?

Channels group recommendations together so you can determine where they show up in your community.

Report Name	Description	Custom Report Type	On Dashboard?
R - Channel Recommendations Details	Details for your custom recommendation channels. This includes information about your channels being served the most, accepted the most, or rejected the most.	Network Custom Recommendations 1.0	
R - Channel Recommendations L90D	Custom recommendation channel trends by acceptance rate, rejection rate, and number of times it was served (displayed) in the last 90 days.	Network Custom Recommendations 1.0	
R - Custom Recommendations Details	Details for your custom recommendations. This includes information about your recommendations being served the most, accepted the most, or rejected the most.	Network Custom Recommendations 1.0	
R - Custom Recommendations L90D	Top custom recommendations over time. This includes details about how many of your custom recommendations were served, accepted (clicked), or rejected (dismissed) in the last 90 days.	Network Custom Recommendations 1.0	

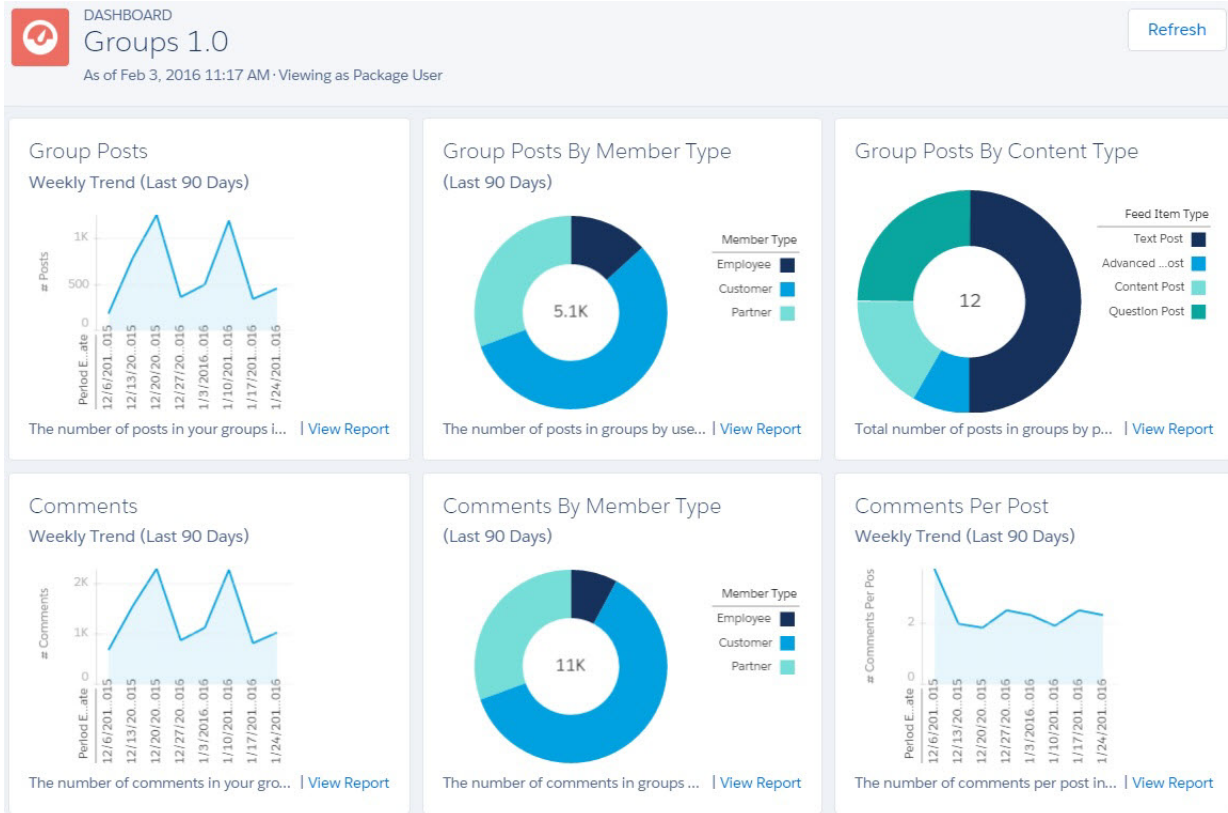

Groups Dashboard and Reports

Use the Groups dashboard to monitor feed and member activity in Chatter groups.

With this dashboard, you can answer:

- Which groups are most active?
- Which groups are growing the fastest?
- Who are the top contributors?
- How many posts and comments are there in groups?

 **Important:** This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
G - # Group Comments	Total number of comments in active groups.	Network Group Activity 3.0	
G - # Group Comments L30D	Total number of comments in active groups, in the last 30 days.	Network Group Activity 3.0	
G - # Group Comments Per Post	Total number of comments per post in groups, in the last 30 days.	Network Activity Daily Metrics 2.0	
G - # Group Comments Per Post L30D	Total number of comments per post in groups.	Network Activity Daily Metrics 2.0	
G - # Group Members	Total number of active members across all non-archived groups.	Network Group Members 2.0	
G - # Group Members Added L30D	Total number of active members added in the last 30 days across all non-archived groups.	Network Group Members 2.0	
G - # Group Posts	Total number of posts in active groups.	Network Group Activity 3.0	
G - # Group Posts L30D	Total number of posts in active groups, in the last 30 days.	Network Group Activity 3.0	

Report Name	Description	Custom Report Type	On Dashboard?
G - # Groups	Total number of groups.	Network Group Membership 2.0	
G - # Groups Added L30D	Total number of active groups created in the last 30 days.	Network Group Membership 2.0	
G - Active Groups L90D	Reports on groups with activity, such as posts and comments, in the last 90 days.	Network Group Activity 3.0	
G - Group Activity L90D	Trend on the number of posts and comments in your groups in the last 90 days.	Network Activity Daily Metrics 2.0	
G - Group Activity By User Type L90D	Reports on the number of contributions in groups by user type, such as partner, customer, or employee in the last 90 days.	Network Activity Daily Metrics 2.0	
G - Top 10 Groups By Contributions	Top groups by contributions.	Network Group Activity 3.0	
G - Top 10 Groups By Members	Top groups by members. Excludes members of archived groups and inactive users.	Network Group Activity 3.0	
Group Posts By Type	Posts in groups by post type.	Network Group Activity 3.0	

Members Dashboard and Reports

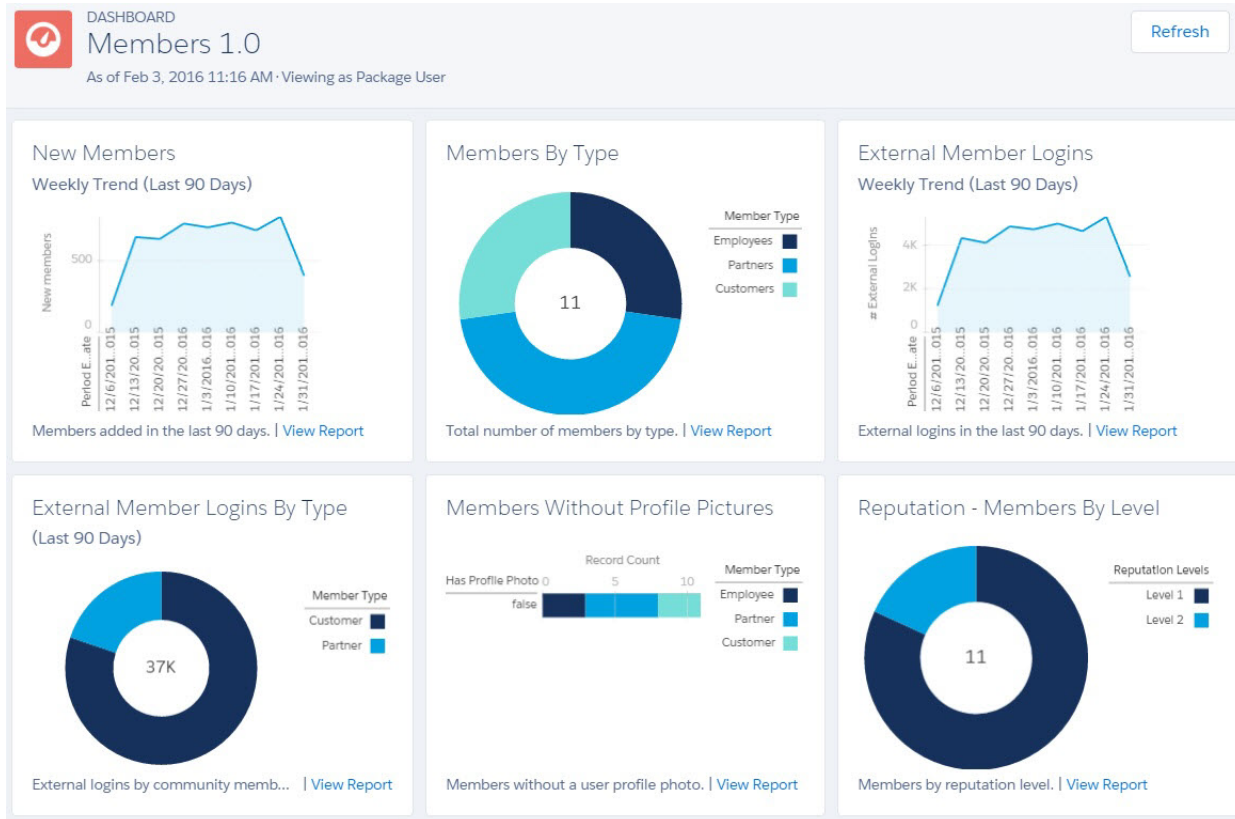

Use the Members dashboard to track community membership, new members added, and external member logins over time.

With this dashboard, you can answer:

- How many members are there and how many are new?
- Which members are logging in the most?
- Which new members are logging in the most?

 **Tip:** If your community is not using the reputation feature, you can remove the reports and metrics associated with the feature.

 **Important:** For information about the reports provided in the Members dashboard for the package without Chatter, refer to what's installed in your org.

Report Name	Description	Custom Report Type	On Dashboard?
M - # Member Logins L30D	Total number of members who logged in during the last 30 days.	Network Login History 5.0	
M - # Members	Total number of active members.	Network Members 2.0	
M - # Members Added L30D	Total number of active members added to the community in the last 30 days.	Network Members 2.0	
M - Members By Reputation Level	Total number of members by reputation level. To use this report, you must update the Reputation Level field and map it to your reputation levels and points.	Network Members 2.0	✓
M - Members With No Profile Photo	Reports on members without a user profile photo.	Network Members 2.0	✓
M - Top 10 Members By Reputation Points	Top 10 members with the highest reputation points.	Network Members 2.0	✓
Members by Type	Total number of members by type.	Network Members 2.0	✓

Report Name	Description	Custom Report Type	On Dashboard?
New Members (Last 90 Days Trend)	New members in the last 90 days.	Network Membership Daily Metrics 2.0	✓
O - External Logins L90D	External logins by community member type in the last 90 days.	Network Membership Daily Metrics 2.0	✓

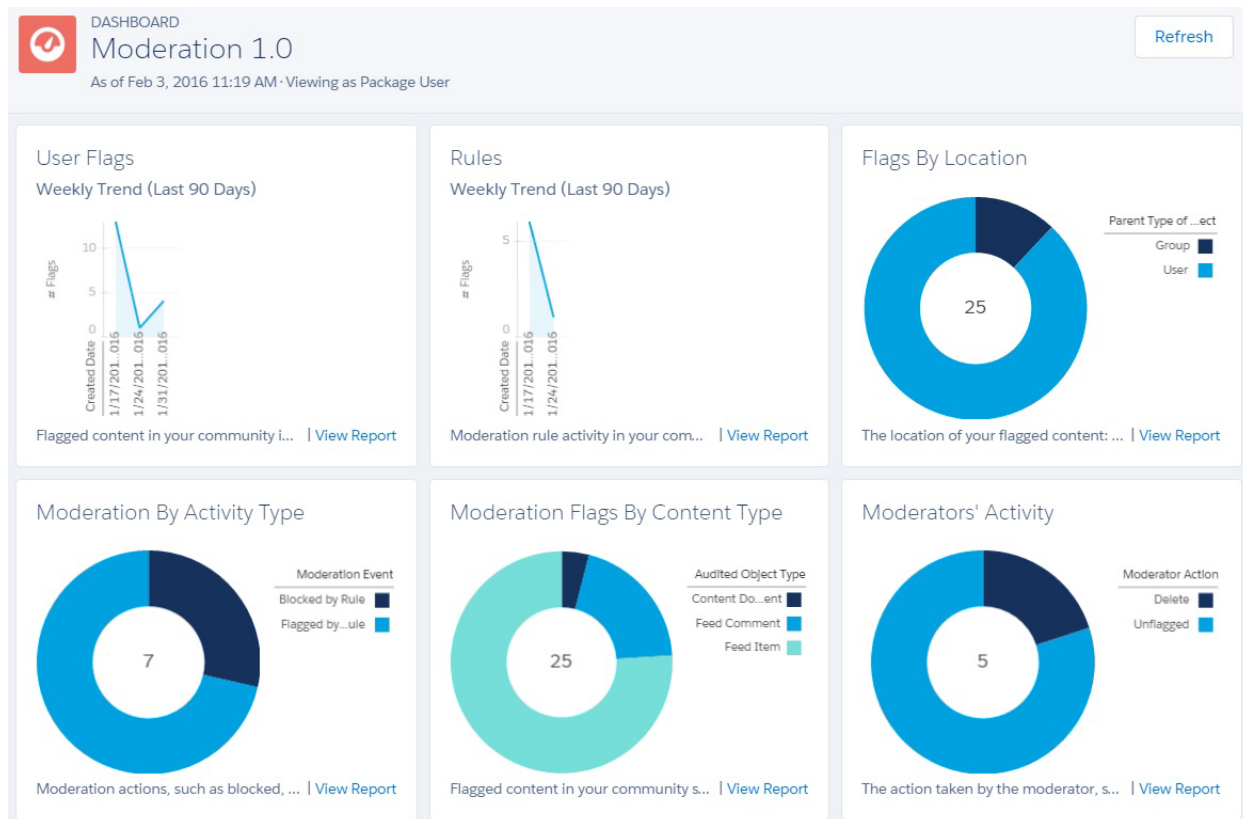

Moderation Dashboard and Reports

Use the Moderation dashboard to track community moderators' and members' flagging activity.

With this dashboard, you can answer:

- How many flags are there?
- Who is flagging content?
- Who is removing flags?
- How many private messages are being sent?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
MO - # Flagged Items Deleted	Total number of flagged items deleted by moderators.	Network Moderation 2.0	
MO - # Flags	Total number of flagged items.	Network Moderation 2.0	
MO - # Flags L30D	Total number of flagged items in the last 30 days.	Network Moderation 2.0	
MO - # Flags Removed	Total number of flags removed by moderators or users unflagging content.	Network Moderation 2.0	
MO - # Messages Sent	Total number of private messages sent in the community.	Network Private Messages 2.0	
MO - # Messages Sent L30D	Total number of private messages sent in the last 30 days in the community	Network Private Messages 2.0	
MO - Flags L90D	Trending report of flagged content in your community in the last 90 days.	Network Moderation 2.0	
MO - Flagged Item Location	Reports on the location of your flagged content, in user profiles or in groups.	Network Moderation 2.0	
MO - Flagged Item Type	Flagged content in your community sorted by object type, such as files, posts, comments, and private messages.	Network Moderation 2.0	
MO - Moderator Action	Reports on the action taken by the moderator, such as removing the flag on a post or deleting the flagged post.	Network Moderation 2.0	
MO - Rule Action	Reports on moderation actions, such as blocked, flagged, or replace.	Network Moderation 2.0	
MO - Rule Activity L90D	Trending report on moderation rule activity in your community in the last 90 days.	Network Moderation 2.0	
MO - Top 10 Message Senders L30D	Top 10 members sending the most private messages in the last 30 days.	Network Private Messages 2.0	

Q&A Dashboard and Reports

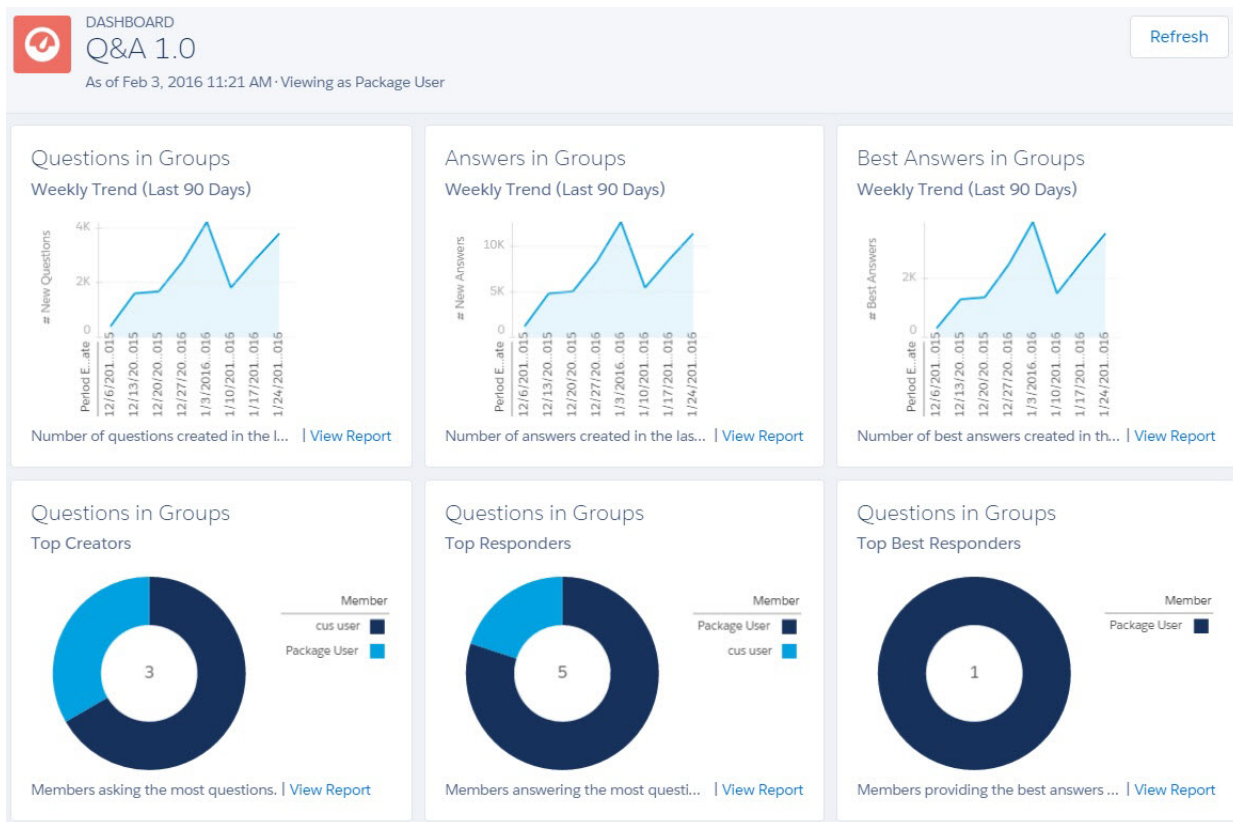

Use the Q & A dashboard to track recent activity for questions, answers, and best answers posted in groups

To track the same activity in user profiles, use the [Self-Service Dashboard](#). With this dashboard you can answer:

- How many questions and answers are there per month?
- How many unanswered questions are there?
- How many questions without best answers are there?
- Who are the top question creators and question responders?

- How are questions and answers trending?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
Q - # Answers in Groups	Total number of answers in groups.	Network Group Activity 2.0	
Q - # Answers in Groups L30D	Total number of answers in groups in the last 30 days.	Network Group Activity 2.0	
Q - # Best Answers in Groups	Total number of best answers in groups.	Network Group Activity 2.0	
Q - # Questions in Groups	Total number of questions posted in groups.	Network Group Activity 2.0	
Q - # Questions in Groups L30D	Total number of questions posted in groups in the last 30 days.	Network Group Activity 2.0	
Q - # Unanswered Questions in Groups	Total number of unanswered questions in groups.	Network Group Activity 2.0	

Report Name	Description	Custom Report Type	On Dashboard?
Q - % Of Qs With Best Answers in Groups	Percentage of answered questions that have best answers in groups.	Network Group Activity 2.0	
Q - Answered Questions Groups L90D	Answered questions in groups in the last 90 days.	Network Group Activity 2.0	
Q - Answers in Groups L90D	Trend of answers in groups in the last 90 days.	Network Activity Daily Metrics 2.0	
Q - Best Answers in Groups L90D	Trend of best answers in groups in the last 90 days.	Network Activity Daily Metrics 2.0	
Q - Questions in Groups L90D	Trend of questions in groups in the last 90 days.	Network Activity Daily Metrics 2.0	
Q - Top 10 Best Q Responders in Groups	Top 10 users responding to questions with the best answers.	Network Group Activity 2.0	
Q - Top 10 Question Creators in Groups	Top 10 users with the most questions	Network Group Activity 2.0	
Q - Top 10 Question Responders in Groups	Top 10 users responding to questions	Network Group Activity 2.0	
Q - Unanswered Questions Groups L90D	Unanswered questions in groups in the last 90 days.	Network Group Activity 2.0	

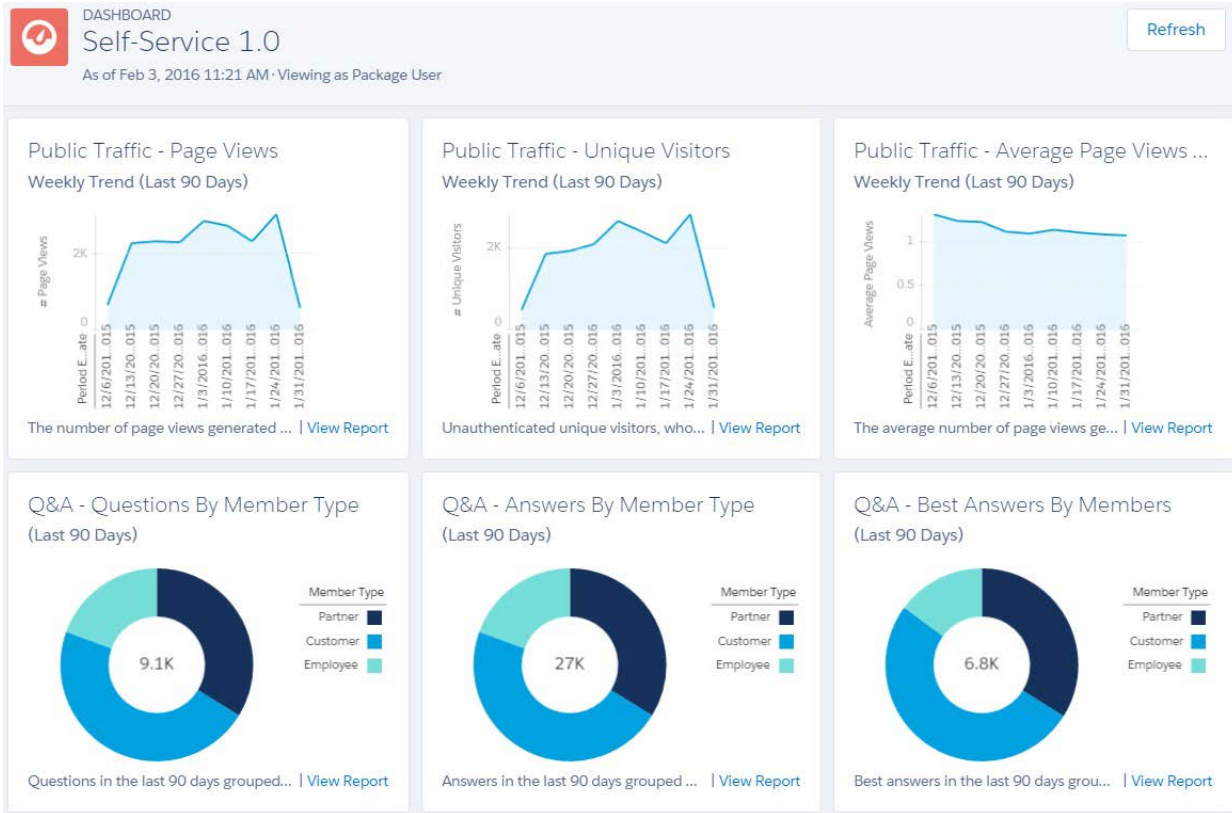

Self-Service Dashboard and Reports

The Self-Service dashboard tracks activity in the self-service template.

You can track recent activity for questions and answers posted on user profiles. To track the same activity in groups, use the [Q&A Dashboard and Reports](#). With this dashboard you can answer:

- How many questions, unanswered questions, and answers there are in users profiles?
- How many daily page views and unauthenticated unique visitors does my community have?
- Who is creating and responding to questions?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
S - # Answers in User Profiles	Total number of answers in user profiles.	Network User Activity 2.0	
S - # Answers in User Profiles L30D	Total number of answers in the last 30 days in user profiles.	Network User Activity 2.0	
S - # Average Page Views per UV	Average number of page views per unique visitor.	Network Public Usage Daily Metrics 2.0	
S - # Best Answers in User Profiles	Total number of best answers in user profiles.	Network User Activity 2.0	
S - # Page Views L30D	Total number of page views in the last 30 days.	Network Public Usage Daily Metrics 2.0	
S - # Questions in User Profiles	Total number of questions posted in user profiles.	Network User Activity 2.0	
S - # Questions in User Profiles L30D	Total number of questions posted in the last 30 days in user profiles.	Network User Activity 2.0	

Report Name	Description	Custom Report Type	On Dashboard?
S - # Unanswered Qs in User Profiles	Total number of unanswered questions in user profiles.	Network User Activity 2.0	
S - % Of Qs With Best Answer in User Profile	Percentage of answered questions that have best answers in user profiles.	Network User Activity 2.0	
S - Answers By User Type L90D	Answers in the last 90 days grouped by user type, such as partner, customer, or employee.	Network Activity Daily Metrics 2.0	
S - Answers in User Profiles L90D	Answers in the last 90 days.	Network Activity Daily Metrics 2.0	
S - Avg Page Views By Visitors L90D	Reports on the average page views generated by visitors for the last 90 days.	Network Public Usage Daily Metrics 2.0	
S - Best Answers By User Type L90D	Best answers in the last 90 days grouped by user type, such as partner, customer, or employee.	Network Activity Daily Metrics 2.0	
S - Best Answers in User Profiles L90D	Best answers in the last 90 days.	Network Activity Daily Metrics 2.0	
S - Page Views L90D	<p>Reports on the number of page views generated by guest users for the last 90 days in your self-service community.</p> <p> Note: The number of page views might not match other analytics tools, as all tools use different methods for counting page views.</p>	Network Public Usage Daily Metrics 2.0	
S - Questions By User Type L90D	Questions in the last 90 days grouped by user type, such as partner, customer, or employee.	Network Activity Daily Metrics 2.0	
S - Questions in User Profiles L90D	Questions in the last 90 days.	Network Activity Daily Metrics 2.0	
S - Top 10 Best Q Respd in User Profiles	Top 10 users responding to questions with the best answer.	Network User Activity 2.0	
S - Top 10 Q Creators in User Profiles	Top 10 users with the most questions.	Network User Activity 2.0	
S - Top 10 Q Responders in User Profiles	Top 10 users responding to questions.	Network User Activity 2.0	
S - Unique Visitors L90D	Reports on unauthenticated unique visitors, who visited the site at least once that week, in the last 90 days in your self-service community. This includes visitors accessing the login and logout pages.	Network Public Usage Daily Metrics 2.0	

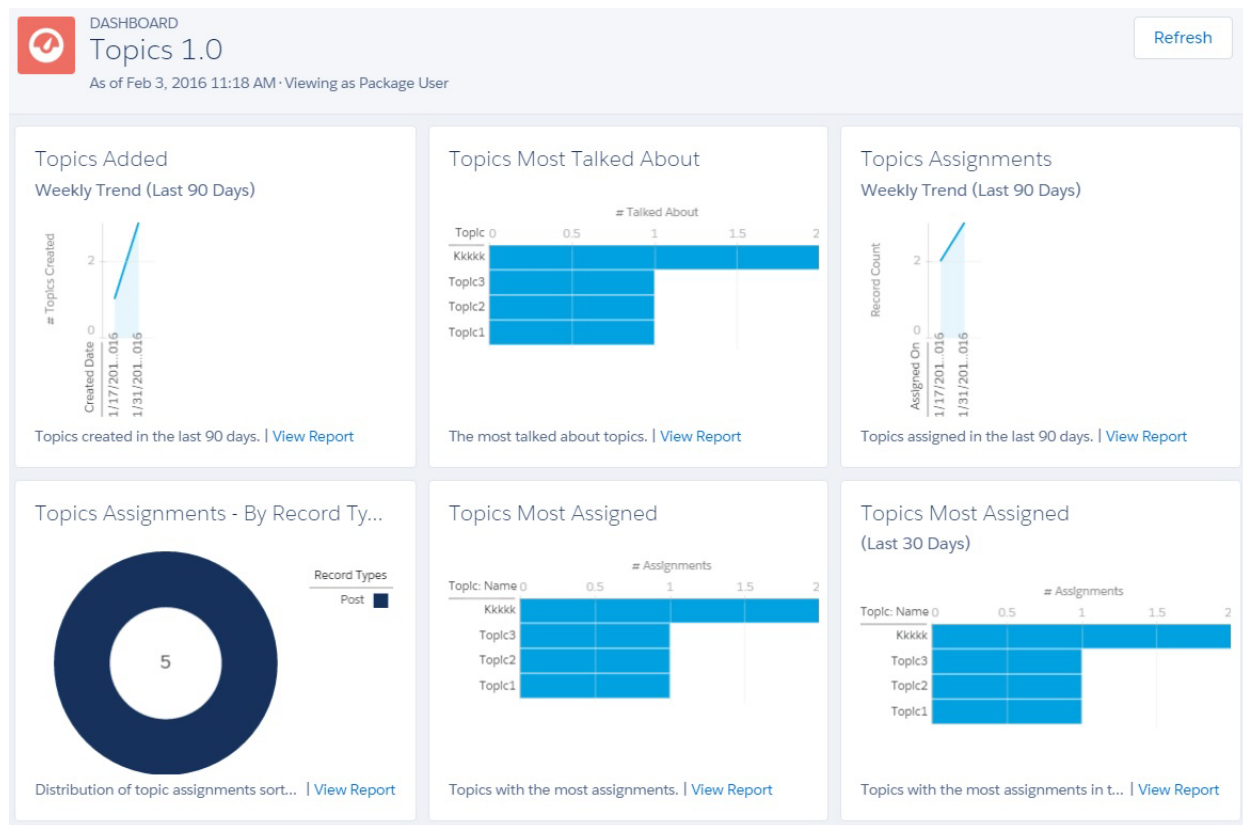

Topics Dashboard and Reports

Use the Topics dashboard to track your community topics.

With this dashboard, you can see:

- How are topics trending?
- How many topics are getting assigned?
- Who's assigning topics?
- Which topics are being talked about?

Important: This dashboard and its reports are *only* available in the package with Chatter.

Report Name	Description	Custom Report Type	On Dashboard?
T - # Topics	Total number of topics.	Network Topics 2.0	
T - # Topics Added L30D	Total number of topics added in the last 30 days.	Network Topics 2.0	
T - # Topics Assigned	Total number of topics assigned.	Network Topic Assignments 3.0	
T - # Topics Assigned L30D	Total number of topics assigned in the last 30 days.	Network Topic Assignments 3.0	

Report Name	Description	Custom Report Type	On Dashboard?
T - Top 10 Topic Assigners	Top 10 users with the largest number of topics assigned.	Network Topic Assignments 3.0	
T - Top 10 Topic Assigners L30D	Top 10 users with the largest number of topics assigned in the last 30 days.	Network Topic Assignments 3.0	
T - Top 10 Topics By Assignment	Top 10 topics with the most assignments.	Network Topic Assignments 3.0	
T - Top 10 Topics By Assignment L30D	Top 10 topics with the most assignments in the last 30 days.	Network Topic Assignments 3.0	
T - Top 10 Trending Topics	Top 10 topics with the largest number of "Talking About" indicators.	Network Topics 2.0	
T - Topics Assignments By Record Type	Distribution of topic assignments sorted by the Record Types field (unmapped record types show as Other). Note: You can create values for the Record Types field to map custom objects or other types that are not predefined.	Network Topic Assignments 3.0	
T - Topics Assigned L90D	Reports on the number of topics assigned in the last 90 days.	Network Topic Assignments 3.0	
T - Topics Created L90D	Trending report on the number of topics created in the last 90 days.	Network Topics 2.0	

Misc Communities Reports

The reports provided in this folder are feature-dependent or require special user permissions. You can add these reports to Insights folders or dashboards in Community Management or Community Workspaces. These reports are provided in the **Misc Communities Reports** folder.

Report Name	Description	Requires	Custom Report Type
Cases	Total number of questions that escalated to cases in the last 30 days. Tip: You can use this report on your Home Dashboards .	Org preference - Enable Question-to-Case in Communities	Network Cases 1.0
Escalated To Case	Questions that have been escalated to cases. Tip: We recommend that you add this report to the Insights Self-Service folder so you can view this report in Community Management or Community Workspaces.	Org preference - Enable Question-to-Case in Communities	Network Cases 1.0

Report Name	Description	Requires	Custom Report Type
Escalated To Case Closed	<p>Questions that have been escalated to cases and closed in the last 7 days.</p> <p> Tip: We recommend that you add this report to the Insights Self-Service folder so you can view this report in Community Management or Community Workspaces.</p>	Org preference - Enable Question-to-Case in Communities	Network Cases 1.0
Messages From New Members	<p>Private messages sent by external users in the last 7 days. This report only includes messages sent by external users who registered in the last 7 days.</p> <p> Tip: We recommend that you add this report to the Moderation Audit Trail folder so you can view this report in Community Management or Community Workspaces.</p>	<p>Org preference - Enable Private Messages</p> <p>User permission - "Manage Chatter Messages"</p> <p> Important: You need this user permission to see the report in your org.</p>	Network Private Messages 3.0
Questions Escalated - Monthly Trend	<p>Monthly trending report on questions escalated to cases in your community.</p> <p> Tip: You can use this report on your Community Management Home dashboard or in Community Workspaces under Dashboards > Home.</p>	Org preference - Enable Question-to-Case in Communities	Network Cases 1.0
Questions Escalated - Weekly Trend	<p>Weekly trending report on the number of questions escalated to cases in your community in the last 90 days.</p> <p> Tip: You can use this report on your Community Management Home dashboard or in Community Workspaces under Dashboards > Home.</p>	Org preference - Enable Question-to-Case in Communities	Network Cases 1.0
 Related Questions CTR	<p>The click-through rate for the Related Questions (RQ) widget, which is the ratio of the number of times a user clicked on the RQ widget compared to the number of times the widget was shown</p>	Related Questions CTR 1.0	

Salesforce Org Dashboard and Report Descriptions

You must view the Chatter and Licenses dashboards and reports from your internal Salesforce org.

[Chatter Dashboard and Report](#)

Use the Chatter dashboards and reports to track Chatter usage in your internal Salesforce org.

[License Usage Dashboard and Reports](#)

Use the Licenses Usage 1.0 dashboard to track usage of login-based and named-user licenses so you can optimize license usage and plan for growth.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Chatter Dashboard and Report

Use the Chatter dashboards and reports to track Chatter usage in your internal Salesforce org.

Internal Salesforce Org

You must view these dashboards and reports from your internal Salesforce org. If you previously installed the [Salesforce Chatter Dashboards package](#), you must uninstall that package and use the reports and dashboards provided here instead. You can find these reports and dashboards in the **Chatter Reports** and **Chatter Dashboards** folders.

 **Important:** These dashboard and reports are *only* available in the package with Chatter.

 **Warning:** If you customize these Chatter reports and remove the Networks filter, they will report on Chatter usage across your entire Salesforce org, including usage from your internal org and your communities. If you view these Chatter dashboards or reports from within Community Management or Community Workspaces, only community-specific data is displayed. To create a report that returns data only from your internal org, use the Network: Name less than ! filter.

For detailed information about the Chatter dashboards, reports, and custom report types, see [Get Started with Chatter Dashboards](#). The following components are provided in the Chatter Dashboards package:

- Chatter Overview dashboard and reports
- Chatter Adoption by Department dashboard and reports
- Chatter Files dashboard and reports
- Chatter Groups dashboard and reports
- Chatter Management dashboard and reports
- Chatter Q&A dashboard and reports
- Chatter Topics dashboard and reports
- Chatter User dashboard and reports
- Chatter Custom Report Types
- Chatter Edits reports

License Usage Dashboard and Reports

Use the Licenses Usage 1.0 dashboard to track usage of login-based and named-user licenses so you can optimize license usage and plan for growth.

With this dashboard, you can see:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- If you need to adjust your allocated license usage
- Monthly and daily tracking of your license usage
- Predict and stop possible overages based on monthly trends

The reports in this dashboard only track community licenses. To track portal licenses, clone the reports and update the license filter.

You can find these reports and dashboards in the **Communities Reports** and **Communities Dashboards** folders.

Important: View this dashboard only from your internal Salesforce org’s Dashboards tab. Viewing this dashboard in Community Management or Community Workspaces displays incorrect data as the license metrics become community- specific and not org-wide. For this reason, we recommend that you don’t map this dashboard in Community Management or Community Workspaces

License Usage 1.0

Find a dashboard... Edit Clone Refresh As of Today at 5:35 AM

Customer Community Members

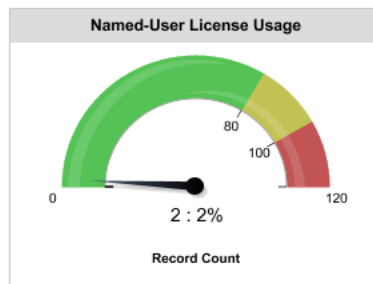

Licenses Purchased: **0**
 The number of Customer Community member-based licenses you've purchased.

Customer Community license usage. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # User Licenses Allocated and then adjust your 80% and 120% limits.

Customer Community Plus Members

Licenses Purchased: **500**
 The number of Customer Community Plus member-based licenses you've purchased.

Customer Community Plus license usage. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # User Licenses Allocated and then adjust your 80% and 120% limits.

Partner Community Members

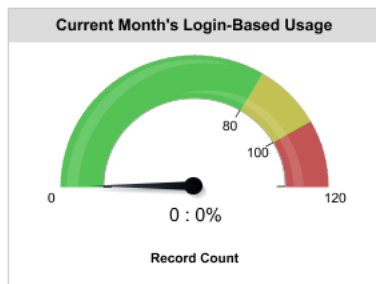

Licenses Purchased: **2K**
 The number of Partner Community member-based licenses you've purchased.

Partner Community license usage. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # User Licenses Allocated and then adjust your 80% and 120% limits.

Customer Community Logins

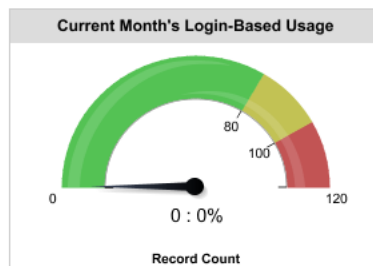

Monthly Logins Purchased: **0**
 The number of Customer Community monthly logins you've purchased.

The current month's usage of logins across all communities. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # Monthly Logins Allocated and then adjust your 80% and 120% limits.

Customer Community Plus Logins

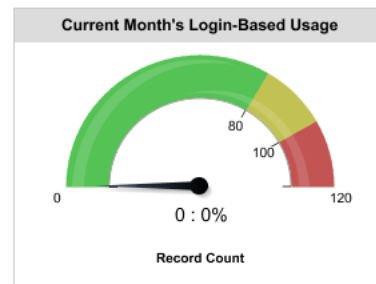

Monthly Logins Purchased: **0**
 The number of Customer Community Plus monthly logins you've purchased.

The current month's usage of logins across all communities. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # Monthly Logins Allocated and then adjust your 80% and 120% limits.

Partner Community Logins

Monthly Logins Purchased: **0**
 The number of Partner Community monthly logins you've purchased.

The current month's usage of logins across all communities. TIP: Adjust this report's gauge thresholds. Replace 100 with the value listed for the # Monthly Logins Allocated and then adjust your 80% and 120% limits.

 **Note:** Customize gauge reports to provide relevant ranges based on your actual number of licenses. To edit the dashboard click **Edit Attributes** on the report you want to customize. For Breakpoint 2 (set by default to 100), enter your number of allocated licenses. For Breakpoint 1 (set by default to 80), enter 80% of your allocated licenses. For Maximum (set by default to 120), enter 120% of your allocated licenses. You can also change the breakpoints to any percentage you want. For example, if you have 50 licenses, you would change 80 to 40, 100 to 50, and 120 to 60.

Custom Report Type Descriptions

The reports in this package are based on a set of communities-focused custom report types, which you can customize to enhance reporting capabilities with more fields.

 **Tip:** Items in custom report types that reference a user or member, such as Created By, contain the following user lookup fields: LastLoginDate, Department, Country, Role, and Profile. You can specify these additional fields to display in your report by editing the custom report type from Setup. Open the custom report type details, click **Edit Layout**, and then click **Add fields related via lookup**.

The Network Members object includes member lookup fields. With access to this detail, you can repurpose member reports to report on other things such as accounts. For example, you can make a copy of a member report and then add the User, Account field through the Network Members lookup fields. This approach allows you to use the Top 10 Members By Contribution report to create a new report called Top 10 Accounts by Contributor report. You can customize reports to provide data on the top active and inactive accounts based on the number of logins over a specific time range.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Note:** Currently, you can't report on the number of accounts by type. Also, the following custom report types don't track internal users who log in to a community from their internal Salesforce org.

Custom Report Type Name	Description	Package with Chatter	Package without Chatter
Chatter Activity 1.0	Provides information on Chatter user activity such as, posts, comments, and likes. The user metrics are calculated against the user activity on groups and user profiles in your organization.		
Chatter Activity Daily Metrics 1.0	Provides daily trending metrics on posts and comments created in groups and user profiles in your organization.		
Chatter Edits 1.0	Provides information on Chatter edits.		
Chatter Group Members 1.0	Provides information on groups and their members, such as the date a member joined the group.		

Custom Report Type Name	Description	Package with Chatter	Package without Chatter
Chatter Groups Activity 1.0	Provides information on group activity, such as posts, comments, and likes, and group contributors. Use this custom report type to report on overall group activity, by member type and by feed item type (for example: post or question poll).	✓	
Chatter Knowledgeable Users 1.0	Provides information on knowledgeable users in your organization.	✓	
Chatter Topic Assignments 1.0	Provides information on topic assignments. Use this custom report type to report on the number of assignments, your top assigners, and assignments by object types. You can also use it to find topics with the most assignments.	✓	
Chatter Topics 1.0	Provides information on trending topics, topic assigners, and more.	✓	
Chatter Unique Contributor Daily Metrics 1.0	Provides information on daily unique visitors across groups and user profiles in your organization.	✓	
Chatter User Activity 1.0	Provides information on user profiles such as posts, comments, and likes, and profile contributors. Use this custom report type to report on overall user profile activity, by member type and by feed item type (for example, post or question poll).	✓	
✦ Community Searches 2.0	Provides information about community's search behavior.	✓	✓
File and Content Report	Use this standard report type to track file adoption and engagement for Chatter in your internal Salesforce org or in communities. You can also track file properties (such as file version and size), file uploads, downloads, shares, links, link views, and who uploaded the content.	✓	
Network Activity Audit 1.0	Provides information about flagging and moderation activity in a community.	✓	
Network Activity Daily Metrics 2.0	Provides daily trending metrics on posts and comments created in groups and user profiles by member type (internal, customer, and partner).	✓	
Network Cases 1.0	Provides information about cases in your Salesforce org.	✓	
Network Chatter Edits 1.0	Provides information on Chatter edits in the community.	✓	
Network Comments Pending Approval 1.0	Provides information about your community's feed comments that are pending approval.	✓	
Network Custom Recommendations 1.0	Provides information about the custom recommendations and channels in your community including; details about the acceptance rate, rejection rate, and number of times a recommendation was served.	✓	✓

Custom Report Type Name	Description	Package with Chatter	Package without Chatter
Network Group Membership 3.0	Provides information on groups and their members, such as the date a member joined the group and the member type (internal, customer, or partner).	✓	
Network Groups Activity 3.0	Provides information on group activity (posts, comments, and likes) and group contributors. Use this custom report type to report on overall group activity, by member type and by feed item type (for example: post or question poll).	✓	
Network Groups Q & A Activity 1.0	Provides information about your community groups' question and answer activities.	✓	
Network Login History 5.0	Provides detailed metrics about the external users (partners or customers) logging into a community. This custom report type doesn't include logins for internal users accessing the community from their internal Salesforce org. (The Network Tenant Usage Entitlement custom report type is no longer supported in this package. Lookup Network > Network Members > Login History from the Network Login History 5.0 custom report type to get a detailed report of usage)	✓	✓
Network Member Activity 1.0	Provides high-level metrics about community member adoption and engagement.	✓	
Network Members 3.0	Provides information on community members. The Network Members entity exposes all user record fields.	✓	✓
Network Membership Daily Metrics 2.0	Provides daily trending metrics for all members including new members in the community, across all member types (internal, partner, and customer). Also provides daily trending metrics on external (partner and customer) member logins.	✓	✓
Network Frozen Members 2.0	Provides information about all your community's frozen members.	✓	
✦ Network Moderation Flagged Direct Messages 1.0	Provides information about all of your community's direct messages which have been flagged by the users.	✓	
Network Moderation Flagged Comments 2.0	Provides information about all your community's feed comments which are flagged by the users.	✓	
Network Moderation Flagged Files 2.0	Provides information about all your community's files which are flagged by the users.	✓	
Network Moderation Flagged Messages 2.0	Provides information about all your community's Chatter messages which are flagged by the users.	✓	
 Note: This report has been enhanced for this version			

Custom Report Type Name	Description	Package with Chatter	Package without Chatter
Network Moderation Flagged Posts 2.0	Provides information about all your community's feed posts which are flagged by the users.	✓	
Network Posts Pending Approval 2.0	Provides information about all your community's feeds posts which are pending approval.	✓	
Network Private Messages 3.0	Provides information on private messages sent in a community, including who sent them.	✓	
Network Public Usage Daily Metrics 2.0	Provides daily trending metrics on the number of public page views (such as guest user access). Force.com and Site.com page views are tracked. You can also use this custom report type to track page views on a community template such as Napili.	✓	✓
Network Topic Assignments 3.0	Provides information on topic assignments in a community. Use this custom report type to report on the number of assignments, your top assigners, and assignments by object types. You can also use it to find topics with the most assignments.	✓	
Network Topics 3.0	Provides information on trending topics, topic assignments, topic assigners, and more.	✓	
Network Unique Contributor Daily Metrics 2.0	Provides information on daily unique visitors across groups and user profiles, by member type (internal, customer, and partner).	✓	
Network User Activity 3.0	Provides information on user profile activity (such as posts, comments, and likes) and profile contributors. Use this custom report type to report on overall user profile activity, by member type and by feed item type (for example, post or question poll).	✓	
Network User Licenses 1.0	<p>Provides information about community user license usage.</p> <p>The Usage Entitlement is a license bucket that includes Customer Community Logins, Customer Community Members, Partner Community Logins, and Partner Community Members (tracking both community and portal licenses assigned to the community). The Customer Community Members and Partner Community Members bucket fields track name-based users per community. The Customer Community Logins and Partner Community Logins bucket fields track login-based users across communities.</p> <p>The Amount Used field indicates how many licenses were used that week. The Amount Allowed field indicates how many licenses the customer purchased (either named-users or logins per month).</p>	✓	✓

Custom Report Type Name	Description	Package with Chatter	Package without Chatter
✦ Related Questions CTR 1.0	Provides information about the number of times a user clicks on the Related Questions widget compared to the number of times it is shown.		

The Power of Customization

The dashboard and reports provided in the package are a great start, but they may not be exactly what your community needs. With a few simple steps, you can customize the provided dashboards and reports to suit your needs. To customize a report, open the **Reports** tab and click the report name you want to modify, then click **Customize**.

Customize the Date Filter

For reports that specify a date filter, you can customize these reports to provide any date range.

Add or Remove Columns from Reports

If a report includes a column that isn't useful to you, remove it. If you want more data displayed, add another column. To add a column, double-click the additional field from the Fields pane, and reorder the columns if you want to. To remove a column, click the column and select **Remove Column**.

Change the Grouping of a Report

You can change the report grouping to better fit your community or internal Salesforce org.

Add More Filter Logic

You can add more filters to a report. For example, you can filter a report to only show external users or a subset of groups.

Report on New Data

You can also report on new data by adding custom lookup fields to the custom report types.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Customize the Date Filter

For reports that specify a date filter, you can customize these reports to provide any date range.

You can also change the **Date Field** to report on other objects in the report. Try customizing the G- # Group Members Added L30D report.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

For more information, see [Filter Your Report Data](#), [Build Effective Filters](#), and [Understanding Relative Date Values for Filter Criteria](#).

Add or Remove Columns from Reports

If a report includes a column that isn't useful to you, remove it. If you want more data displayed, add another column. To add a column, double-click the additional field from the Fields pane, and reorder the columns if you want to. To remove a column, click the column and select **Remove Column**.

For more information, see Report Fields in Salesforce Help.

Change the Grouping of a Report

You can change the report grouping to better fit your community or internal Salesforce org.

For example, if a report is grouped by department, you can group by country instead. Try customizing the CH D - Group Membership By Dept report.

1. In the Fields pane, drag the new field you want to group by into the Preview pane area that says **Drop a field here to create a grouping**.
2. In the Preview pane, click the old grouping field and select **Remove Group**.
3. On your new grouping field, click the dropdown and select **Sort Group By** and select the relevant data you want to sort by.

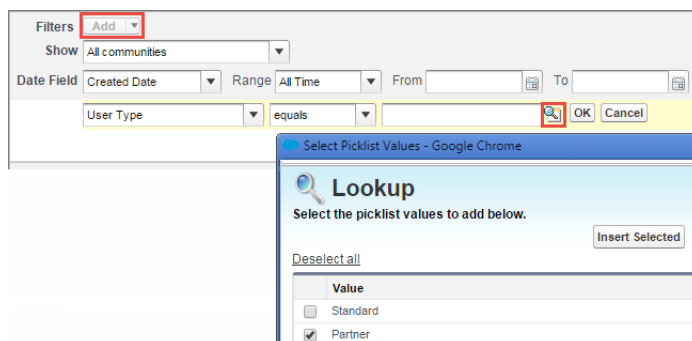

For more information, see [Group Your Report Data](#).

Add More Filter Logic

You can add more filters to a report. For example, you can filter a report to only show external users or a subset of groups.

To add a filter, click **Add** and then specify the field.

Adding a User Type filter:

Added Group filter:

2. Group Name contains "North"
3. Group Name contains "Mobile"

For more information, see [Add Filter Logic](#) and [Filter Your Report Data](#) in Salesforce Help.

Report on New Data

You can also report on new data by adding custom lookup fields to the custom report types.

This type of customization is useful if you want to expose more user fields or custom fields that you've added to contacts. See the [Custom Report Type Descriptions](#) section for more information.

From the **Community Management Home Dashboards** folder—all dashboards; you can remove this folder if you installed the package with Chatter²³

From the **Community Management Home Reports** folder:

²² If you still want to use the Members (Last 30 Days Trend) and Members (Last 90 Days Trend) reports, you can re-create them. Keep in mind, to get the Member Count field, you need to create a custom report type with Networks as the primary object and Network Members as the secondary object. Then create a report using this custom report type and add the Member: fullname field. This report returns a snapshot of data, not trending data.

²³ In the package with Chatter, all dashboards in this folder are no longer supported. In the package without Chatter, this folder and its dashboards still remain.

- Questions Escalated - Daily Trend

Set Up Report Management for External Users—Create and Edit Reports

Community partner and customer users can create and edit reports in their own personal folder or in a privately shared folder if they have sufficient permissions. You can grant partner and customer users permissions to create and edit reports through their profiles or by using permission sets. After you grant the required permissions, they can use the drag-and-drop Report Builder tool.

Important: If your organization existed before the Summer '13 release, you must first turn on enhanced sharing for reports and dashboards before granting external users permissions. See [Analytics Folder Sharing](#).

To create, customize, and delete reports, external users must use the Report Builder tool.

Data visibility is based on two main things: the user role the partner or customer belongs to and your organization's sharing rules. Your organization's field-level security is respected, meaning that if a field is not visible for external users, a partner or customer user won't see it in Report Builder.

1. To allow external users to create and edit reports, turn on the "Create and Customize Reports," "Report Builder," and "Edit My Reports" permissions through custom profiles or permission sets. If you want external users to export report data, also assign them "Export Reports" permission.

In Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets** or **Profiles**. Assign the following permissions:

External User Permissions Needed to Create and Edit Reports

To create, customize, and delete reports in a personal folder:	"Create and Customize Reports"
	AND
	"Report Builder"

To create, customize and delete their own reports in a privately shared folder with Viewer access:	"Edit My Reports"
	AND
	"Report Builder"

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create permission sets or enable custom permissions in profiles:

- "Manage Profiles and Permission Sets"

To assign a permission set to a user:

- "Assign Permission Sets"

To share a report folder with external users:

- "Manager" folder access or "Manage Reports in Public Folders"

³⁰ This entire folder and its contents are unsupported.

External User Permissions Needed to Create and Edit Reports

To export report data:

“Export Reports”

You can give permission to create and edit reports to all role-based external users with licenses such as Customer Community Plus and Partner Community. You can also give permission to all legacy role-based portal licenses such as Customer Portal and Gold Partner.

Note:

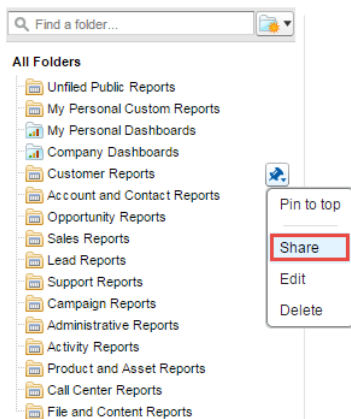

- These permissions aren't available to high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
- External users with legacy portal licenses can create and edit reports in communities, but not in portals.

2. If you want your external users to create or edit reports in a privately shared folder, grant them “Viewer” access on the folder.

On the **Reports** tab in the Folders view, click next to the folder you want to share, then select **Share**.

Note: Partner and customer users can't create, edit, or view reports in the Unfiled Public Reports folder.

Depending on what objects, fields, and categories your external users have access to, they might see custom report types in the UI when creating a report. Custom report types are visible if a user has read access on any fields or objects included in the custom report type.

[Communities Report and Dashboard Limitations](#)

Track Community Activity with Custom Reports

Create custom reports to track usage, moderation, and other community activity.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

To monitor the health of your community, you can create custom report types and then create a report using that custom report type. If you want your community managers to see your report in Community Management, you can create or edit a dashboard to include your report and then map the updated dashboard in Community Management. To change the mapping of a dashboard, click **Dashboards > Settings**.

 **Note:** Only reports that are based on the Networks object show community-specific information on the Community Management page. Using reports based on the Networks object, means you can create one custom report and use it across all your communities.

Use the following table to get started with reporting for communities:

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
Chatter Usage	Networks > Chatter Messages	Create reports on the private message activity in your community. ¹
Chatter Usage	Networks > Feed Revisions	Create reports on posts and comments that your members have edited.
Chatter Usage	Networks > Groups	Create reports on the groups in your community.
Moderation	Networks > Network Audits	Create reports on all moderation activity and history in your community. To report on moderation activity in private Chatter messages, filter the report by <code>Audited Object Type</code> (on the Network Audits object) to equal <code>Chatter Message</code> .
Moderation	Networks > Network Members > Network Activity Audit — Moderators	Create reports on members in your community who either flagged items or moderated a flagged item.
Moderation	Networks > Network Members > Network Activity Audit — User	Create reports on the members in your community whose items were flagged, blocked, or replaced.
Moderation	Networks > Network Members > User Login	Create reports on frozen members in your community.
Moderation	Networks > Network Moderations > Content Documents Networks > Network Moderations > Feed Posts Networks > Network Moderations > Feed Comments Networks > Network Moderations > Private Messages	Create reports on content that is currently flagged in your community. These reports allow you to see the actual contents of the flagged item. For example, you can see the contents of a flagged private message to easily determine if the message is spam.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
Moderation	Networks > Unpublished Feed Entities > Feed Posts	Create report on posts that are pending review and approval.
Public Activity	Networks > Network Public Usage Daily Metrics	Create reports on the daily public community page views and unique visitors.
Recommendations	Networks > Recommendation Metric	Create reports on custom recommendation usage in your community.
Topic Activity	Networks > Topics	Create reports on the topic activity in your community.
Topic Activity	Networks > Topic Assignments	Create reports on the topic assignments in your community.
User Activity	Networks > Network Activity Daily Metrics	Create reports on the daily number of posts and comments by member type.
User Activity	Networks > Network Members > Login History	Create reports on community login activity. This report only includes direct logins to the community. If a user logs in to an org and then switches to a community, their login activity isn't included.
User Activity	Networks > Network Membership Daily Metrics	Create reports on the daily count of total active members, new members added, and external member logins by member type.
User Activity	Networks > Network Unique Contributor Daily Metrics	Create reports on the unique daily contributors in your community. A member is counted as a contributor if they posted or commented on a group or a user profile.
User Profile Photos	Networks > Network Members	To report on user profiles with or without photos, filter the report by <code>Has Profile Photo</code> (on the Network Members object) to equal <code>True</code> or <code>False</code> .

¹To report on Chatter Messages, you must have the "Moderate Communities Chatter Messages" permission.

 **Note:** You can create reports based on other objects and expose them in Community Management or Community Workspaces. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.

Google Analytics™ for Salesforce Communities

Does your company use Google Analytics to track site analytics? Now you can use it to track search activity in self-service communities and track deflection from cases. Using Google Analytics, you can dive deeply into your community's search behavior and pull that information into meaningful reports.

Google Analytics integrates with your self-service community to track user types, user IDs, pageviews on Salesforce objects, and customer search activity.

The Package includes:

- Search dimensions that can be rearranged for different drilldown configurations.
- Options for tracking user flow
- Reports that can be customized at multiple levels
- Preconfigured reports:
 - Contact Support Page Activity

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

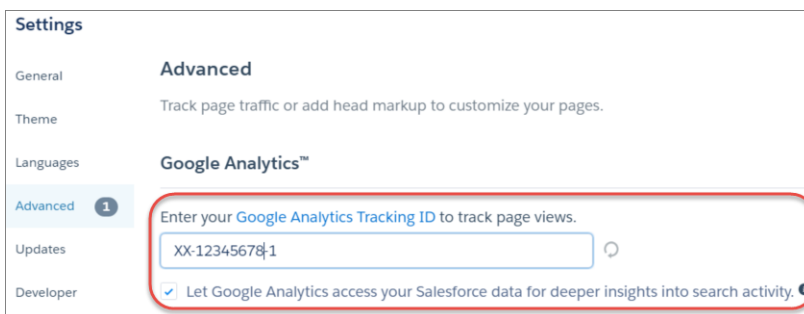

- Page Views by New and Returning Users
- Page Views by Salesforce Object
- Page Views by User Type
- Search Activity
- Preconfigured dashboards:
 - Contact Support Activity
 - Search Activity
 - Page Views

Enable Google Analytics™ for Your Community

Let Google Analytics access your Salesforce data to track community user types, user IDs, page views on Salesforce objects, and customer search activity.

1. First, let Google Analytics access your data to collect page views. Go to **Settings > Advanced** in Community Builder and enter your Google Analytics ID. For more information about the Google Analytics ID, check the [Google Analytics documentation](#).
2. Then select **Let Google Analytics access your Salesforce data for deeper insights into search activity** to allow Google Analytics to track user types, user IDs, and customer search activity within your community.

 **Example:** Google Analytics in Builder.

When you publish your community to enable the service, your community's search data streams directly to Google Analytics and appears in your Google Analytics reports.

Set Up Google Analytics™ for Salesforce Communities

Set up Google Analytics to correctly capture usage and page view metrics for Salesforce communities.

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

[Enable Google Analytics™ for your community](#) to integrate your Salesforce data with Google Analytics before you set up Google Analytics.

USER PERMISSIONS

To customize or publish a community

- "Create and Set Up Communities"

1. Create custom dimensions in your Google Analytics account that capture user type and Salesforce object information. From your Google Analytics account, go to **Admin > Property > Custom Definitions > Custom Dimensions**. Click **+New Custom Dimension**. The first dimension you create in your Google Analytics account is automatically sorted as Index 1.
 - a. For Index 1, enter the Name: *User Type* and select **Hit** for the scope.
 - b. For Index 2, enter the Name *Salesforce Object* and select **Hit** for the scope.
2. Create a User-ID view. With the User-ID view, you can analyze how specific segments of traffic with an assigned ID engage with your content. To create a User-ID view, go to **Admin > Property > Tracking Info > User-ID** and follow the instructions.
 - a. For the User-ID view, enter the Name: *User Explorer*.

Example: Custom Dimensions

+ NEW CUSTOM DIMENSION				
Custom Dimension Name	Index	Scope	Last Changed	State
User Type	1	Hit	Jan 26, 2017	Active
Salesforce Object	2	Hit	Jan 26, 2017	Active

Once you've set up Google Analytics to integrate with your Salesforce community, you can [create your own reports](#) or [install the preconfigured Google Analytics for Salesforce Communities package](#) on page 3752. Click [here](#) to access the package.

 **Note:** Index 1 must be labeled User Type and Index 2 must be labeled Salesforce Object. If these indexes are not aligned with the appropriate labels, incoming data from Salesforce will properly filter into your reports. If you have an existing Google Analytics account with indexes 1 and 2 under different labels, create a separate account to link to Salesforce.

Install Google Analytics™ for Salesforce Communities

Install preconfigured reports that integrate Salesforce community data with Google Analytics.

1. Make sure you've signed in to your Google Analytics account.
2. Click [here](#) or search for Google Analytics for Salesforce Communities in the [Google Analytics Solutions Gallery](#).
3. Click the dropdown next to **Select a View** and select **User Explorer** under the account that you are adding the package to.
4. Click **Create**.
5. View your reports from **Customization > Custom Reports** in your Google Analytics account.

Contact Support Page Activity Report

The Contact Support Page Activity report tracks case deflection. This report can help you maximize your self-service offerings by tracking which articles resolved support issues and which subjects resulted in new customer support cases.

Page Views by New and Returning Users Report

The Page Views by New and Returning Users report tracks which page views are from new users and how many are from returning users.

Page Views by Salesforce Object Report

The Page Views by Salesforce Object report tracks how many times an object page is viewed.

Page Views by User Type Report

The Page Views by User Type report tracks how often each type of user is viewing a page.

Search Activity Report

The Search Activity report tracks which actions users take after entering a term in the search box.

Contact Support Page Activity Report

The Contact Support Page Activity report tracks case deflection. This report can help you maximize your self-service offerings by tracking which articles resolved support issues and which subjects resulted in new customer support cases.

When a customer goes to the Contact Support page, they typically have a specific issue that they need help with right away. The customer has the option of entering their question into a search box and either selecting a recommended article or opening up a customer support case. The Contact Support Page Activity report tracks which cases are created and how many times a customer selected an article instead. You can drill into the report to:

- Track how many cases have been deflected from customer support
- See which articles were clicked the most
- See which subjects lead to a new support case

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Page Views by New and Returning Users Report

The Page Views by New and Returning Users report tracks which page views are from new users and how many are from returning users.

You can drill into the report to:

- Track how active different types of user are within your community
- See which pages are being viewed
- Get detailed information about the pages, such as page title and URL

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Page Views by Salesforce Object Report

The Page Views by Salesforce Object report tracks how many times an object page is viewed.

You can drill into the report to:

- Track how often an object page has been viewed
- Get more information about the page, such as page title and URL

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Note: Only overridden pages for objects are captured as different objects. Standard pages like the Home page and Contact Support Page are captured in the “Standard” Bucket.

Page Views by User Type Report

The Page Views by User Type report tracks how often each type of user is viewing a page.

You can drill into the report to:

- Select the user type you want to report on
- Get more information about the page, such as page title and URL

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

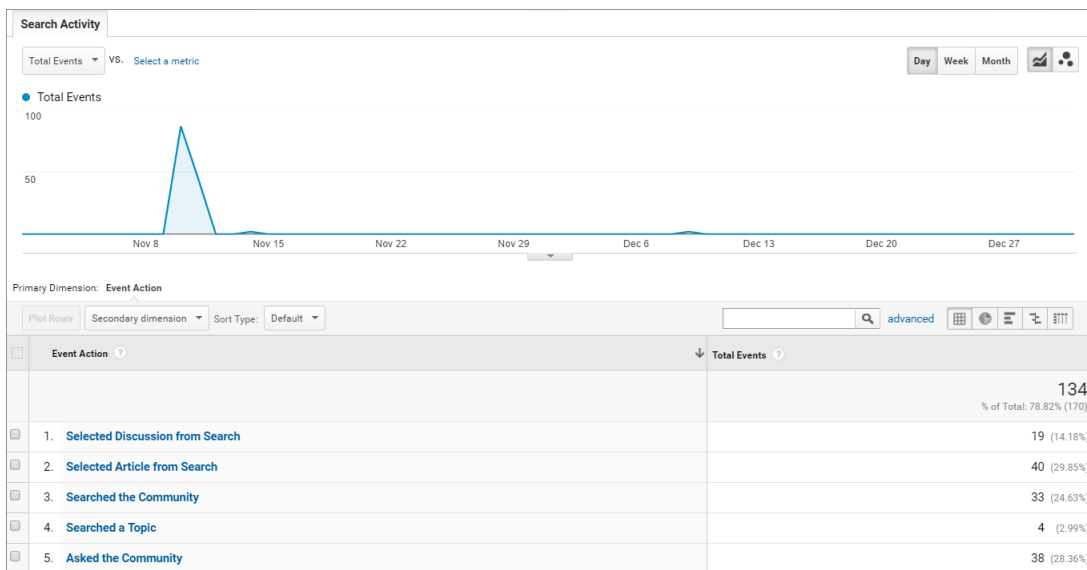

Search Activity Report

The Search Activity report tracks which actions users take after entering a term in the search box.

When a customer enters a term in the search box, recommended articles and similar questions are displayed to them as they type. From there, they can click an article or related question. Customers have the option of searching the entire community or narrowing their search down to a particular topic. They also have the option of asking the community a new question.

The Search Activity report tracks which action the customer takes from the page that they begin their search on. You can drill into the report to:

- Identify which search terms are being used with each action
- Track how many times a search term is being used

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Google Analytics™ for Salesforce Communities Dashboard

The Google Analytics for Salesforce Communities package contains three dashboards that visually display the key metrics tracked in the package.

When you access Google Analytics, your Google Analytics for Salesforce Communities dashboards are under **Reporting > Dashboards > Private**. The Google Analytics for Salesforce Communities package contains three dashboards:

 **Note:** The names of the dashboards can be customized. All other labels are not customizable.

[Search Activity Dashboard](#)

The Search Activity dashboard represents the search activity within the community.

[Contact Support Page Activity Dashboard](#)

The Contact Support Page Activity dashboard represents the activity on the Contact Support page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Page Views Dashboard

The Page Views dashboard represents the page views in your community.

Search Activity Dashboard

The Search Activity dashboard represents the search activity within the community.

You can get the following information from this dashboard:

- Which actions were taken most frequently
- How Internal, Partner, Customer, and Guest users searched the community
- A list of search terms used to create questions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Contact Support Page Activity Dashboard

The Contact Support Page Activity dashboard represents the activity on the Contact Support page.

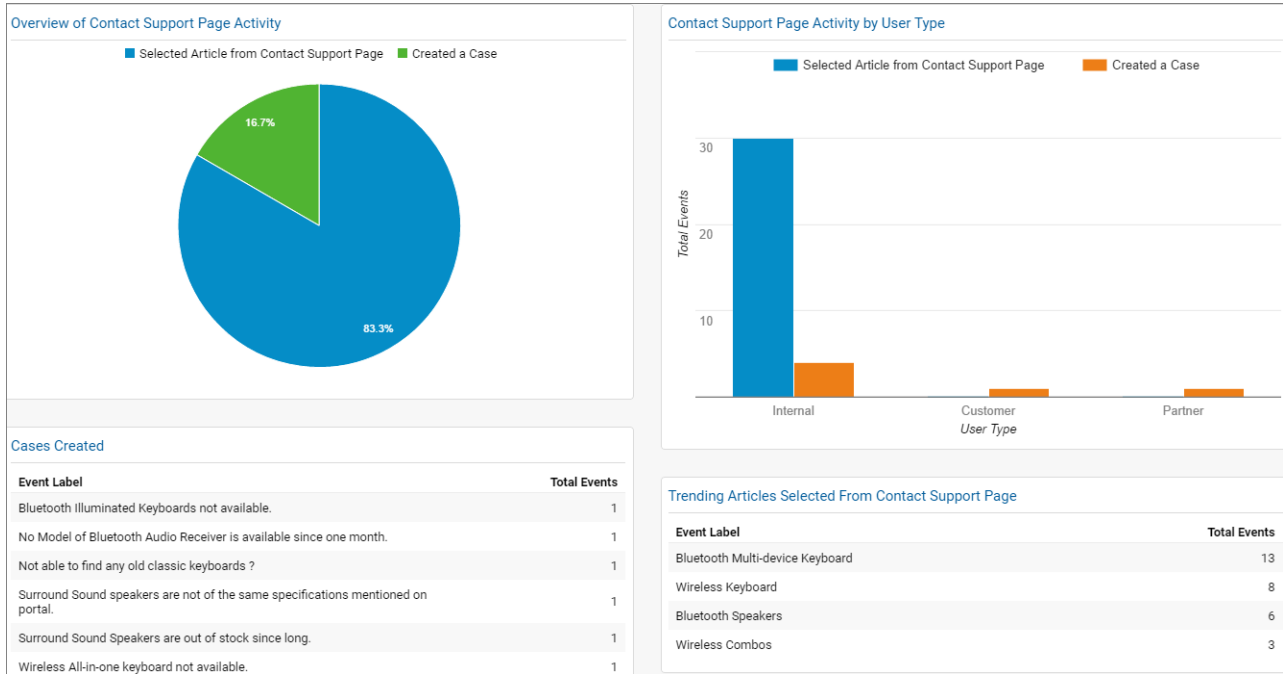

You can get the following information from this dashboard:

- How frequently a user selected an article or created a case from the Contact Support page
- Which types of users selected an article or created a case from the Contact Support page
- Which subjects lead to support cases
- Which articles were most frequently viewed

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Note: User Types refer to Internal, Partner, Customer, and Guest users.

Page Views Dashboard

The Page Views dashboard represents the page views in your community.

Track page views:

- By Salesforce object
- By User Type
- By location
- By new versus returning users

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Tracking User Flow

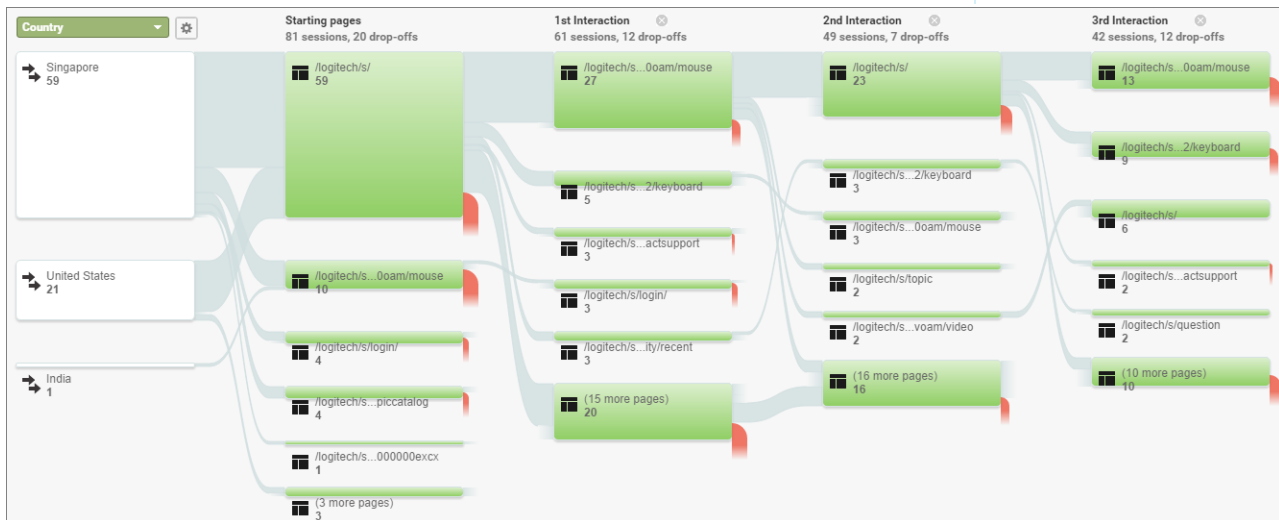

The User Flow tracks how different types of users are interacting with the community.

User Flow is a graph that tracks a user's navigation throughout the community. It provides insights into traffic patterns on your site. Traffic patterns provide valuable information a community's effectiveness and the path a user is likely to take when resolving an issue. Go to **Reporting > Audience > User Explorer > User Flow** to view.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Manage Partner Relationships in Communities

Communities is a powerful tool for partner relationship management. Collaborate with your business partners in a community. Invite partners to a community, share records with them, to drive, track, and support channel sales

 **Note:** If you have an existing partner portal, you can also continue to use the portal to collaborate with partners. However, we strongly recommend you migrate your partners to a community. Partner portal licenses can be reused in a partner community.

A community allows your partner users to log in to Salesforce through a separate website and access data you've made available only to them. In a partner community, you can:

- Extend Salesforce to securely expose CRM data with partners.
- Recruit, onboard, and educate partners (training and certifications).
- Manage your channel sales with programs, tiers, business plans, and partner scorecards.
- Manage lead distribution, deal registration, and quoting for channel sales.
- Streamline channel marketing with marketing development funds (MDF), marketing campaigns, and co-branded email communications.
- Provide a rich, personalized and mobile-ready experience to drive partner productivity
- Manage, track, and forecast partner sales **alongside** your direct sales in your Salesforce org.

With communities, you can publicly share information that you want all partners to see in a single location. You can also share data privately with specific partner users in the same community and restrict access with the security built into Salesforce. For example, you can pass leads to specific partners. You can also set up multiple communities if your community requirements vary across partners.

 **Example:** Here are a few industry examples of how a company can use a community to drive partner sales:

- A technology company can work with resellers to pass leads, register deals, and market products together
- A manufacturer can work with its distributors, wholesalers, and retailers in communities.
- An insurance company can work with independent brokers to track leads and sell insurance products.

[Migrating from Portals to Communities](#)

Enable Partner Functionality in Your Org

Buy partner licenses to enable functionality that lets you set up partner accounts and create partner users in your org.

When you buy partner licenses, the following functionality is enabled in your org:

- The default [Partner User profile](#). You can clone it to create custom partner profiles or extend data access via permission sets.
- Three standard [partner roles](#): Partner User, Partner Manager, Partner Executive. When you create partner accounts, you can associate one of these roles with the partner users.
- A [sharing rule group and category](#) targeted at partner users.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- The **Manage External Account** and **Enable as Partner** buttons on accounts.
- A **Manage External User** and **Enable Partner User** button on contacts.

 **Note:** If you have previously purchased partner portal licenses, you already have these features in your org.

Templates Supported for Partner Communities

The choice of template for creating a partner community depends on your company's branding requirements and the development effort you can invest in for the design of your community.

Use the [Lightning Partner Management](#) solution to use a highly customizable template that uses slick Lightning components, just like Customer Service (Napili). It comes prepackaged with custom objects, record types, and pages to set up a partner community with leads and marketing management. It also has a rich look and feel that is responsive across devices, including mobile devices.

If you want a quick migration from portals to communities or prefer the Salesforce Classic look and feel, use the Salesforce Tabs + Visualforce template. This option allows heavy rebranding, but you'll need developers with Visualforce skills,

Still confused? [Compare the features available in all community templates.](#)

What's Your Partner Community Strategy?

The type of partner community you create depends on your business, your channel sales program, and the tiers within it. For example, the strategy for a hardware manufacturer with a few partners is different from that of an insurance company with a large agent network.

Try to get early answers to these questions to plan your community strategy:

- How many Partner Community licenses do I need?
 -  **Note:** If you don't need access to all sales objects, such as opportunities, leads, and campaigns, you can also use Customer Community Plus licenses for partners.
- Can I invite all my partners to the same community or do I need multiple communities?
- Do I need a custom partner profile or all the roles?
- What data do I want to share with my partners network?
- What level of data visibility and privacy do I need for my community?

For more ideas on planning your community strategy, check out [this Trailhead module for Communities.](#)

Migrate from a Partner Portal to a Community

Salesforce recommends that you migrate from partner portals to communities. Portal licenses are supported in communities so you don't require separate community licenses.

 **Note:** Starting from Summer '13, partner portals are no longer available for new Salesforce orgs. Existing organizations using partner portals can continue to use their partner portals or migrate to communities. If you don't have a partner portal, but want to share records and information with your partners, try Salesforce Communities. Contact Salesforce for more information.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Why Migrate from Portals to Communities?

Communities offer all the functionality available in portals and customer portals, plus more features including:

- A [responsive, mobile-ready, prepackaged Lightning Partner Management solution](#)
- Build personalized, rich experiences with your company's branding
- Chatter collaboration with groups, file sharing, and feeds
- Access to reports and dashboards plus the ability to create custom reports for your community
- Single sign-on and login support for multiple authentication providers
- Content moderation, direct messages, and much more
- Single location where you can design, moderate, and manage your community

Plus, we're working round the clock to bring you more features in every release.

See the [Migrating from Portals to Communities](#) guide for more information on how to migrate your portal users and data over to a community.

If You Continue to Use Partner Portals

All the information about setting up partner accounts, users, portals, and tracking partner sales is available in the [Salesforce Partner Portal Guide](#).

Prep Your Org for a Partner Community

To set field-level security:	“Manage Profiles and Permission Sets” AND “Customize Application”
To set sharing rules:	“Manage Sharing”

You’ve bought your partner licenses and have partner functionality enabled in your org. You’re ready to collaborate with your partners and start closing deals together! Before you actually create a partner community, work with your channel manager to create partner accounts and users, assign partner roles, and manage permissions.

At the very outset, [set up the channel manager role](#) and assign it to the internal users in your org who manage channel sales and work with partner organizations.

Channel managers with the necessary permissions can perform the next steps.

1. Each partner account is [automatically assigned three partner roles](#).

Tip: We strongly recommend that you [reduce the number of roles to one](#) role: Partner User. To avoid role proliferation, it’s better to use one role and [grant super user access](#) to users who need access to other users’ data.

2. In Setup, type *Sharing Settings* in the Quick Find/Search box and edit the organization-wide defaults. Set the Default External Access setting to **Private** for all the objects you want to share with your partners.
3. Clone and customize the [Partner User profile](#) per your community’s needs and, if necessary, grant extra permissions with a permission set.
4. [Create a partner account](#) for each partner organization you work with. Partner accounts store details about partner users and their sales data.
5. Also, plan how you want to use [sharing rules to share data with partners](#).
6. Add users from each partner company as contacts on the respective partner account.
7. Convert the contacts on the partner account to [partner users](#) and assign a partner license, profile, and role.
8. Optionally, [enable](#) and [grant super user access](#) to partner users if you want them to view data owned by other users in their role hierarchy.
9. If you work with many partner users or don’t want to deal with user management for a partner organization, consider [delegating user administration](#).

With that, you’re ready to set up a community and assign partner users to it.

SEE ALSO:

[Default Organization-Wide Sharing Settings](#)

[Controlling Who Community or Portal Users Can See](#)

Set Up the Channel Manager Role

Channel managers are internal users who manage your partner accounts and partner users. Before setting up a partner community, identify an internal user to play the channel manager role.

Channel Manager Role

Ideally, channel managers should create all the partner accounts for the partner organizations they manage. All partner users associated with a partner account automatically fall below the channel manager in the partner role hierarchy. So all the data owned by those partner users rolls up and is visible to the channel manager.

Channel Manager Profile

Profiles determine the permissions users have, page layouts they see, the tabs and record types available to them, and other settings. Create a custom profile for channel managers or use a permission set to grant permissions to a standard profile. A few tips on what you might want to include:

Grant the “Manage Partners” permission

When this permission is enabled, channel managers can create partner accounts and partner users.

Make the following objects available to channel managers

Leads, Accounts, Contacts, Opportunities, Documents, Campaigns, Products, and any other object you plan to share with partner users in your community.

Assign record types

Assign record types to channel manager profiles. For example, the Lightning Partner Management solution includes two lead record types: one to track sales leads and the other to register deals. Make sure that your channel manager has access to both.

Make the **Partner Account** field visible to channel managers on leads, accounts, and opportunities

Channel managers can create list views or reports for tracking partner user activity.

Assign page layouts

Assign the appropriate page layouts to your channel manager profiles.

Make the **Last Transfer Date** field visible to channel managers on leads

Channel managers can create lists views or reports for tracking partner user activity.

More Tips

- Create a public sharing group for channel managers. You can use this group for filtering and controlling access to documents.
- Create a lead queue for channel managers. You can use this queue for lead assignment rules.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Create Partner Accounts

Add each company with which you partner to Salesforce as a business account. We recommend that channel managers create partner accounts so they can view all partner data.

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using a partner community or a partner portal. A channel manager who owns a partner account can access all the data associated with the partner account and the associated partner users.

 **Note:** The partner user role is a subordinate of the account owner's role. All data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a partner user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.

1. Create a new business account.
2. Click **Manage External Account** and then, click **Enable as Partner**.
3. In the confirmation dialog, select **Yes, I want to enable this account as a Partner Account**.
4. Click **Confirm**.

-  **Note:**
- If your organization has person accounts, they cannot be used as partner accounts. Only business accounts can be used as partner accounts.
 - Partner accounts can't be deleted, but can be [disabled](#).

Once you create a partner account, you can add users to the account as contact records and then convert them to partner users. Partner users are Salesforce users with access to CRM objects, such as opportunities, leads, and campaigns. Partner users can access and modify the Salesforce data you share with them by logging into a community.

Disable Partner Accounts

You can't delete partner accounts, but you can disable them. Disabling a partner account disables partner users associated with the account. We recommend disabling a partner account only if the account was accidentally enabled for community access.

If you choose to disable a partner account:

- Up to 15 active and inactive external users associated with the account are permanently disabled. You also remove them from all communities, groups, teams, permission sets, and sharing rules they're associated with.
 - If there are more than 15 active or inactive external users associated with an account, you can't disable it. Disable the users before disabling the account.
 - Roles and groups associated with the account are permanently deleted and not moved to the Recycle Bin.
1. Go to the Account detail page for the account you want to disable.
 2. Click **Manage External Account**, then click **Disable Partner Account**.
 3. Click **OK** to confirm.

If you decide to re-enable the account in the future, you can re-enable individual contacts as partner community users. Re-enabling a contact for a partner community creates a partner user record that is not associated with the previous partner user and role. You can't restore deleted roles and groups.

Create Partner Users

After you create a partner account, add users to the account as contact records and then convert them to partner users. Partner users are Salesforce users with access to CRM objects such as opportunities, leads, and campaigns. Partner users can access Salesforce data when they're invited a community.

 **Tip:** Before creating partner users, configure your community so your partner users don't log in to your community before it is ready.

1. View the partner account contact you want to convert to a partner user.
2. On the contact detail page, click **Manage External User** and choose **Enable Partner User**.
3. Edit the user record for this partner and assign a partner license, role, and profile.

 **Tip:** You can use a Customer Community Plus license if the user doesn't require access to CRM objects, such as opportunities, leads, and campaigns.

4. Click **Save**.

After you create a partner user, you can edit the partner account and the partner user independently. Changes made to one are not reflected in the other.

 **Tip:** To check or troubleshoot issues with the partner use account, on the contact detail page, click **Manage External User** and choose **Log in to Portal as User**. A new browser window opens and you are logged in to the community as a community user.

Consider the following when creating partner users:

- The available profiles for the partner user are limited to the Partner User profile or profiles that have been cloned from it.
- The **Role** drop-down is read-only the first time you enable a contact as a partner or customer user for an account. The next time you enable a contact on this account as a customer or partner user, you can select a **Role** for the user.
- Unlike a standard user, the partner user role is automatically assigned based on the account name.
- The partner user role is a subordinate of the account owner's role. All data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a partner user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.
- Partner users and contacts cannot be deleted. If you no longer want a partner user to have access to their community, deactivate the partner user.
- If you have enabled a user as a delegated administrator, note the following requirement. Before the user can create an external user, you must add at least one partner profile to the Assignable Profiles related list and assign the user the "Manage External Users" permission.

Partner User Profile

When you buy Partner Community licenses, the Partner User profile is automatically created in your org. The Partner User profile can't be modified, but you can clone it or create permission sets to specify what partner users can do.

 **Note:** The Partner User profile is also available in your org if your organization has bought Partner Portal or Customer Community Plus licenses.

The profile you assign to partner users defines what data they can access within a community. For example, you can control whether users can view, create, or edit cases and custom object records using profiles and permission sets. You can also clone the Partner User profile and create custom profiles with varying permissions.

For each cloned profile, ensure that the "API Only User" permission is not selected. Users associated with this permission selected aren't able to log in to their communities.

When you enable the first external user on a partner account, a user role hierarchy is created for that account. This role hierarchy rolls up to the account owner (typically, the channel manager). The three roles in this hierarchy are Partner User, Partner Manager, or Partner Executive. When you create contacts on the partner account and convert them to external users, assign one of these roles to them.

The Partner User role rolls up to the Partner Manager role, which rolls up to the Partner Executive role. The Partner Executive role rolls up to the Channel Manager role. Partner users at a given role level are able to view and edit all data owned by or shared with users below them in the hierarchy, regardless of your org's sharing model.

The role names include the partner account name. For example, if the partner account name is Acme, the three roles created for the account are called Acme Partner User, Acme Partner Manager, and Acme Partner Executive. If the ownership of a partner account is changed to another channel manager, the partner user role is moved to that location in the role hierarchy.

 **Tip:** We recommend that you [reduce the number of roles to one](#). Grant [super user access](#) to partner users if you want them to see other partner users' data.

You can delete partner roles, in which case the roles are renamed to maintain the hierarchy. For example, if the Manager role is deleted from a three-role hierarchy of Executive, Manager, and User, then the Executive role is renamed to Manager but its object ID remains the same. When you create a partner role, it is automatically placed at the bottom of this hierarchy. You can delete multiple roles in bulk

for better performance. For example, if most of your users are assigned the User role, you can delete the Executive and Manager roles. For more information on deleting partner roles, see the SOAP API Developer's Guide.

[Portal Roles Limit](#)

[Set the Default Number of Community Roles](#)

Sharing Data with Partner Users

Sharing groups and a sharing rule category are available by default in your org to share Salesforce data with partner users in a community.

 **Tip:** Org-wide defaults and field-level security also control data access for partners in communities. Set the Default External Access setting to **Private** for all the objects you want to expose to partner users in your community.

After you buy partner licenses for your org, the following groups and sharing rule category are created:

Group or Category	Description
All Partner Portal Users group	Contains all partner users in your organization
All Internal Users group	Contains all Salesforce users in your organization
Roles and Internal Subordinates sharing rule category	Allows you to create sharing rules in which you can choose specific Salesforce users in your organization by role, including users in roles below the selected role. Partner roles are excluded.

Use these groups and the sharing rule category to easily create sharing rules that grant all community, portal, or Salesforce users access to specific data. You can also create sharing rules to share records between community users and internal Salesforce users, but not between partner users associated with different partner accounts.

 **Note:** Customer Community licenses support sharing sets, but not sharing rules. And sharing sets don't support objects that are associated with multiple other objects of the same type, for example, the Contacts to Multiple Accounts feature. To use such features, your community members must have the Customer Community Plus or Partner Community license.

Grant Super User Access to a Partner User

Super user access allows partner users to view data owned by other partners or users below them in their role hierarchy. For example, you can allow managers in your partner accounts to view the data owned by their direct reports.

A few things to consider before you grant super user access to users:

- Enable Partner Super User Access in your Communities Settings before granting access to individual partner users.
- Partner super user access applies to cases, leads, custom objects, and opportunities only.
- Partner super users can access all the data owned by other users below them in the partner account hierarchy, regardless of sharing rules and even when the org-wide default setting is set to Private.

For example, consider two partner super users with the same role under the same account. User A owns a few opportunities, and User B has manual share to another opportunity. This gives User A access to all opportunities owned by User B, and User B can access all of User A's opportunities.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Partner Super User Access:

- "Customize Application"

Partner Super Users with Role	Can Access Data Owned By
Partner Executive	<ul style="list-style-type: none"> – All partner users and partner super users in the same role – Manager and User roles below them in the hierarchy
Partner Manager	<ul style="list-style-type: none"> – All partner users and partner super users in the same role – User roles below them in the hierarchy
Partner User	All partner users and partner super users in the same role (User roles only)

- Use this information to grant super user access to users with Partner Community licenses.
1. View the contact record for the user on the partner account.
 2. Click **Manage External Account**, then choose **Enable Super User Access**.
 3. Click **OK**.

This grants super user access to the user with a Partner Community license. You can also grant super user access to users with [Customer Community Plus licenses](#).

SEE ALSO:

Enable Leads for Partner Users

If you are using the Salesforce Tabs + Visualforce template, enable leads for partner users in your community so that they can access and create leads in your communities.

When you enable leads for partner users in your community, you can assign leads to those members. Additionally, partner users can edit leads, create leads, import leads, and also mass update leads in a list view.

1. Open [Community Workspaces](#) or [Community Management](#).
2. Click **Administration Tabs**, and add the **Leads** tab to the list of available tabs in your community.
3. In Setup, set tab visibility and object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a permission set, use the following settings for leads:
 - In the Tab Settings, select Available and Visible.
 - In the Object Settings, select “Read,” “Create,” and “Edit.”
 - b. If using a profile, such as the Partner User profile, set the leads tab setting to `Default On` and enable the “Read,” “Create,” and “Edit” object permissions for leads.
4. Optionally, you can assign extra permissions that enable advanced features for your partners. If you plan to apply these permissions to only some of your partner users, we recommend creating separate permissions sets.

 **Note:** Partner users with legacy portal licenses can use these advanced features in communities, but not in portals.

Feature	Partner User Permission Needed
To import leads using the Import Leads link on the Leads tab in your community.	“Import Leads”
If your partner user is importing leads, it might also make sense to allow them to import accounts and contacts using the Import My Organization’s Accounts & Contacts link on the Accounts and Contacts tabs in your community.	AND Optionally, “Import Personal Contacts”
To change the status of multiple leads via the Change Status button.	“Manage Leads”
To change the owner of multiple leads via the Change Owner button.	“Transfer Leads”

Delegate External User Administration

If your partner organizations have a large number of users, you can delegate user administration to external users.

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

External users who are delegated administrators can:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions

USER PERMISSIONS

To enable leads for partner users:

- “Manage Profiles and Permission Sets”

USER PERMISSIONS

To manage external users:

- “Manage External Users”

To create, edit, and delete profiles:

- “Manage Profiles and Permission Sets”

- Create and edit external user records
- Reset passwords for external users
- Deactivate existing external users

You can grant delegated external user administration rights to users with Partner Community, Customer Community Plus, Gold Partner, Enterprise Administration, and Customer Portal Manager licenses.

You can't edit standard profiles. You can add Delegated External User Administrator to a permission set that you assign to a standard profile.

1. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles** and click a custom profile.
2. Click **Edit**.
3. Select **Delegated External User Administrator**.
4. Click **Save**.
5. Click **Edit** in the Delegated External User Profiles related list.
6. Select the profiles you want users with this profile to be able to administer.
7. Click **Save**.

Consider the following when setting up delegated external user administration.

- You can also grant delegated administration rights using permission sets.
- On the profile you're granting delegated administration rights to:
 - Add the "Create" and "Edit" permissions on contacts so that delegated administrators can create and update contacts related to their account.
 - Set the Accounts and Contacts tab settings to Default On so that delegated administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- Make sure accounts and contacts are available in your community.
- Optionally, set field-level security and page layouts so that delegated external user administrators can access only the account and contact fields you specify.

Create a Partner Community with the Lightning Partner Management Solution

Quickly set up a custom, branded space where you can invite your partners and work on driving channel sales together. This prepackaged solution is optimized for channel managers and partners to collaborate on and track sales data. A simplified setup, combined with rich branding and a responsive UI, lets you quickly build an exclusive online experience, so you can invite your channel partners and track and monitor your sales together from a single location.

Prerequisites

Prior to installing the solution, make sure your org:

- Includes Partner Community or Partner Portal licenses
- Has Communities enabled

What You Get Out of the Box

The Lightning Partner Management solution contains prepackaged pages, components, business logic, and other features that support channel management (sales + marketing) processes.

Channel managers and partners can create and share leads, opportunities, accounts, and contacts together. In addition, partner communities provides:

- Partner account management
- Partner recruitment, onboarding, and support
- Lead distribution
- Deal registration
- Content library
- Partner analytics
- Marketing development fund management

For detailed information on installing and configuring the Lightning Partner Management solution, see the [Salesforce Lightning Partner Management](#) guide.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To install and customize the Lightning Partner Management solution:

- “Customize Application”
- “Create and Set Up Communities”
- “Download AppExchange Packages”

Assign Cases to a Partner User

Assign cases to partner users so they can view, modify, and update case information.

Before you assign cases to partners, configure cases for partners. You can only assign cases that you have access to.

1. On the case detail page, click **[Change]** next to the **Case Owner** field.
2. Select **Partner User** from the Owner drop-down list and enter the name of the partner user.
3. Optionally, select the **Send Notification Email** checkbox to send an email to the new owner.
4. Click **Save**.

The partner user can view and edit the case from their community.

Note:

- Case comments added by partner community users are public and visible to any user that can view the case.
- You can create case assignment and escalation rules that automatically assign cases to partner users based on criteria that you define.

Assign Leads to Partner Users

You can assign leads to partners or allow partners to drive their own lead queue.

You can:

- Assign each lead to an individual partner user.
- Assign leads to a lead queue and allow partner users to claim leads from the queue.
- Use lead assignment rules to automatically assign leads to partner users or queues based on certain properties of those leads.

Note: User actions in a community don't trigger assignment rules.

Assigning a lead to a partner user or partner lead queue is just like assigning a lead to any other user or queue. Leads assigned directly to a user or a queue that is not part of the lead pool are shown on the community's Leads page or tab. The partner user can see leads by selecting the appropriate list view. Until a partner user has reviewed a lead, it displays in bold, and is in the My Unread Leads list view.

If a lead is assigned to a queue that is in the lead pool, the lead displays in the Available Leads list.

Tip: Assign partner leads to someone with a Partner Manager or Partner Executive role in the partner account. The manager can then manage lead assignment for the partner users in that account.

USER PERMISSIONS

To assign leads to partner users:

- "Edit" on leads

Assign Tasks and Events to Partner Users

If you have added a calendar to your community, you can add events to it. Partner users with the “Edit Events” permission can create and edit their own events. Also, with the appropriate field-level security settings, partner users can view and create activities related to leads or opportunities.

 **Note:** Calendars, events, and activities are only available in the Salesforce Tabs + Visualforce template.

Partner users can add tasks to leads or opportunities as reminders of particular tasks they should perform. Administrators and channel managers can view the activity history for a particular lead or opportunity, or use reports to track activities assigned to partner users. A partner user can only add tasks for or see calendars shared by:

- Other partner users assigned to the same account.
- The channel manager for their account.

 **Note:** The following event and calendar features are not supported in communities: spell check, event updates, enhanced list views, drag-and-drop scheduling, calendar sharing, and hover details.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign events to partner users:

Access Your Communities from Salesforce

Internal Salesforce users who are also community members can easily access communities using the global header. The global header is not available by default; the org administrator must enable it for community members.

 **Note:** Orgs that enabled Communities before Winter '14 see the new global header by default when they turn on Communities.

The menu on the left side lets you switch between communities and your internal org. Switching between your internal org and your communities doesn't disrupt your workflow. We automatically return you to the page where you were last working, so you can pick up right where you left off. Also, you can work in multiple communities at once from separate browser tabs.

- The dropdown shows all the active communities that you're a member of.
- If you have the "Create and Set Up Communities" permission, you also see communities in preview that you're a member of.
- Internal users who aren't members of any community only see the company name.
- External users see the dropdown menu only if they belong to more than one active community.
- If an external user who is only a member of one active community is given the URL for a community in preview, they don't see the dropdown menu in the community.

 **Important:** If your org is setting up a My Domain that hasn't finished deployment of the new custom domain, switching from a community to your internal org directs you to the Salesforce login page instead. This can happen when you've logged in using a My Domain URL that has been registered but not yet deployed. Once your domain is deployed, selecting your organization in the dropdown directs you to the internal organization as expected.

The *YOUR NAME* menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features.

 **Important:** The global header isn't supported in Lightning Experience, so to create, manage, or access communities from the Global Header, switch back to Salesforce Classic. If your org is using Lightning Experience, users with the appropriate permissions must switch to Salesforce Classic to access the global header.

SEE ALSO:

[Set Up and Manage Salesforce Communities](#)

Share Personal Contact Information Within Communities

Users can specify which information from their profile is visible to external users, such as customers and partners, and guests viewing publicly accessible pages that don't require login.

When interacting with other community members, it's important to balance being visible and accessible with protecting your personal contact information. You may not want to show your job title, phone numbers, and other contact details outside of your internal organization. Your customers and partners may not want other customers and partners viewing all their contact information.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Use either the user interface or API to control visibility. You can choose to expose fields to employees only, members of the community from outside your company, or guest users who aren't required to log in. Some fields are always visible to everyone accessing the community. Some fields allow up to three levels of visibility, while others allow fewer.

- **Employees**—Only members from the internal organization can view.
- **External**—Members from the internal organization and external members, such as customers and partners, can view. External users are users with Community, Customer Portal, or partner portal licenses.
- **Public**—Anyone can view, including guest users viewing publicly accessible pages that don't require login. Guest users can access public pages in communities via the Guest User license associated with each site or community.

In the API, setting a field to `true` on the User object makes it visible to the type of user indicated in the field name (external or guest users).

Consider these tips about the visibility of your contact information.

- Your chosen settings apply to every community you're a member of.
- When a user is restricted from viewing a contact information field, there are differences in what's displayed in the user interface versus the API.
 - In the user interface, the restricted field is hidden from your profile everywhere that it usually displays in a community. If your organization displays your profile information on custom Visualforce pages, the field still displays, but with the value `#N/A`.
 - In the API, a field set to `false` returns the value `#N/A`.
- Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company's internal organization.

Default Visibility Settings for Contact Information

This table summarizes the default visibility settings for contact information and your options for restricting visibility.

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
First Name	Public	Go to <i>Your Name</i> > Edit Contact Info , then click About	Everyone see these fields unless your administrator enables nickname display or creates a custom page that displays this information. If your administrator has enabled nickname display, your nickname displays in place of your first and last names in most locations.	N/A
Last Name				
Nickname				
About Me				

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
Title	External	Go to <i>Your Name</i> > Edit Contact Info , then click About	Employees, external, or public	<p><code>UserPreferencesShowTitleToExternalUsers</code> <code>UserPreferencesShowTitleToGuestUsers</code></p> <p> Note: When the guest user preference is set to <code>true</code>, the job title field is visible to external members even if the external member preference is set to <code>false</code>.</p>
Profile photo	External. Users without access see the stock photo.	On your profile page, click Update under your photo (or Add Photo if you haven't added a photo yet), then select Show in communities with publicly accessible pages	External or public	<code>UserPreferencesShowProfilePicToGuestUsers</code>
City Country Email Fax Mobile Phone State Street Address Work Phone Zip/Postal Code	Employees	Go to <i>Your Name</i> > Edit Contact Info , then click Contact	Employees, external, or public	<p> Note: For each pair of preferences controlling the visibility of a field, when the guest user preference is set to <code>true</code>, the field is visible to external members even if the external member preference is set to <code>false</code>.</p> <p><code>UserPreferencesShowCityToExternalUsers</code> <code>UserPreferencesShowCityToGuestUsers</code> <code>UserPreferencesShowCountryToExternalUsers</code> <code>UserPreferencesShowCountryToGuestUsers</code> <code>UserPreferencesShowEmailToExternalUsers</code> <code>UserPreferencesShowEmailToGuestUsers</code> <code>UserPreferencesShowFaxToExternalUsers</code> <code>UserPreferencesShowFaxToGuestUsers</code> <code>UserPreferencesShowManagerToExternalUsers</code> <code>UserPreferencesShowManagerToGuestUsers</code> <code>UserPreferencesShowMobilePhoneToExternalUsers</code> <code>UserPreferencesShowMobilePhoneToGuestUsers</code> <code>UserPreferencesShowPostalCodeToExternalUsers</code> <code>UserPreferencesShowPostalCodeToGuestUsers</code> <code>UserPreferencesShowStateToExternalUsers</code></p>

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
				<code>UserPreferencesShowStateToGuestUsers</code>
				<code>UserPreferencesShowStreetAddressToExternalUsers</code>
				<code>UserPreferencesShowStreetAddressToGuestUsers</code>
				<code>UserPreferencesShowWorkPhoneToExternalUsers</code>
				<code>UserPreferencesShowWorkPhoneToGuestUsers</code>

Search Behavior in Communities

Search capabilities in communities can make or break a member's experience. Search in communities is different depending on whether your community is using a Community Builder-based template or a Salesforce Tabs + Visualforce template. In general, searches within a community return results specific to that community.

 **Note:** To be searchable in communities, objects must be [searchable in Lightning Experience](#) and supported in community templates.

For all communities:

Search behavior in communities is different from searches in the internal org:

- In general, searches within a community return matches from within the community. To find items from a different community, members must leave the current community and search from within the other community.
- In community search results, members can see what they have access to through their profiles and permission sets. In addition, they can also view data that is explicitly shared with them in the community context. This can include internal company content and records not explicitly shared with the rest of the community. For example, if the user's profile allows access to accounts, but the accounts tab isn't exposed in the community, the member can still view account data in their search results.
- For user searches performed by external users of a community, global search and enhanced lookup search (with the **All Fields** option selected) query the following limited set of fields:
 - Name
 - Username
 - User ID
 - Body
 - Email
 - Phone
 - Custom fields

For example, say an external community member searches for a user, John Doe, by his alias `john.doe`. If that term isn't contained in any of the searchable fields in the user object, John Doe's record isn't included in search results.

- Search results include all the records and files that a community member has access to. This includes records not explicitly exposed in the community or records and files they have access to in the internal Salesforce organization. In file searches, users can see:
 - Files they own
 - Files shared with them directly

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer Editions**

- Files they have access to in a library
- Files that are posted to a record they have access to
- Files that are posted to groups or shared with that community
- The admin must enable search result filters for an object in the internal org for it to be searchable in a community. To make custom objects searchable, the object must be associated to a tab in the internal org.

For communities using the Koa and Kokua templates:

- The Featured Search component lets community members search for articles within a specific data category.
- The Article List component shows the search results based on the search term entered in Featured Search.

For communities using the Customer Service (Napili) template:

- The Search Publisher component lets community members enter search terms in the community.
- The Search Results component shows a list of search results limited to articles and discussions.
 -  **Note:** Only articles that have a topic associated to them in Topic Management populate in the Search Results component.
- The Global Search Results component lets members see search results in one tab (All), or in separate tabs for cases, accounts, contacts, and any other object exposed in the community (including custom objects) to which they have access.
 -  **Note:** Admins must associate a tab to a custom object to make it searchable in global search.
- The Search & Post Publisher component gives admins the option to set up autocomplete search results. These suggested search results populate based on objects made searchable in the community, and included in autocomplete search.

For communities using Salesforce Tabs + Visualforce:

- If Chatter is enabled in your org, global search and contextual feed search are enabled by default in all communities.
 - With global search, members can search for records, files, people, groups, topics, and feed posts and comments.
 - Feed search () is helpful when members want to look for information in a specific feed context. Groups, user profiles, records, and the community feed support feed search.
- If Chatter isn't enabled, sidebar search is enabled in all communities.
 - Sidebar search doesn't support searches for items specific to Chatter, such as feeds, groups, files, topics, and user profiles.

Manage Your Community Email Notifications

Use email notifications to keep up with important updates in communities.

You can choose to receive email notifications whenever someone posts on your profile, comments after you on a post you've commented on, posts to a group you belong to, and more. Email notification preferences are set by community.

To set your email preferences, go to your profile page within a community, click the drop-down button () in the upper-right corner and select **My Settings**, then click **Email Settings**. You can turn individual notifications on or off.

Your chosen settings apply to the current community. If you don't belong to any groups yet, you won't see the option to set groups on this page until after you join your first group. You can also set your group email preferences using the **Email Me...** drop-down on each group's page. You can choose to receive a daily or weekly digest email or an email every time someone posts. This option is visible if you're a group member.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Your email options are similar to the Chatter email settings in your internal organization under your personal settings (*Your Name* > **My Settings** > **Email Settings** for Chatter Free users). Within communities, however, note the following differences.

- The default notification frequency for new groups you join can't be set via the user interface. It can be set only via Salesforce APIs (SOAP API and REST API).
- Personal digests aren't currently available.
- If your community has Chatter messages enabled, you're notified of file shares in a message. If Chatter messages aren't enabled, you are notified of file shares by email.
- If flagging is enabled in the community, the `Flags an item as inappropriate` option appears for all members of the community, but only sends notifications if:
 - You're a group owner or manager and a member flags a post, comment, or file in your group.
 - You're a moderator and a member flags a post, comment, or file you have access to. Depending on the type of notification you want to receive, you also need following permissions:

Email Notifications About	Required Permission
Flagged posts and comments	"Moderate Communities Feeds"
Flagged files	"Moderate Communities Files"
Flagged Chatter messages	"Moderate Communities Feeds" and "Moderate Communities Chatter Messages"
Flagged direct messages	"Moderate Communities Chatter Messages"

If the **Flag as Inappropriate** link doesn't work in your email, try flagging the message from the UI.

Who Can See What in Communities

Communities contain various types of users who require varying levels of access. What users see depends on their user type and which tabs the administrator selects when creating the community. The behavior outlined below also doesn't take into account updates to your sharing model or user sharing.

	Administrator or Salesforce user with "Create and Set Up Communities" permission	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
Administer communities in Salesforce	Can create, customize tabs and branding, add or remove members, and activate or	Not available	Not available

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Salesforce Chatter

Connect, engage, and motivate users to collaborate and work efficiently across the organization regardless of their role or location.

Salesforce Chatter lets users collaborate on sales opportunities, service cases, campaigns, and projects with embedded apps and custom actions. Salesforce organizations created after June 22, 2010 have Chatter already enabled for all users by default. However, if you only want certain parts of your organization to use Chatter, you can do a profile-based rollout of Chatter instead. With a profile-based rollout, only the users that have been assigned the required user profile or permission sets have access to Chatter. Profile-based rollout of Chatter is useful for larger companies and companies or government agencies with regulatory constraints. It allows them to plan a controlled rollout and deploy Chatter on a department-by-department basis.

We recommend rolling out Chatter for all users in your organization, unless your company doesn't want all users to have full access to Chatter. Chatter is secure and works in accordance with all the security and permission settings in your Salesforce organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To enable Chatter:

- "Customize Application"

[Profile-Based Chatter Rollout Overview](#)

Profile-based rollout of Chatter enables Chatter for a subset of users instead of all users in the organization.

[Encryption for Chatter \(Pilot\)](#)

In the Spring '17 release, we're running a public pilot for Shield Platform Encryption for Chatter. Encryption for Chatter enables you to encrypt sensitive data when it's stored, and not just when it's transmitted over a network. Encryption for Chatter isn't ready for production, but you can safely try it out in a *dedicated* sandbox environment.

[Chatter Settings](#)

Chatter is enabled by default in Salesforce and the Salesforce1 app. Configure various Chatter features and customize the Chatter experience for your users on the Chatter Settings page in Setup.

[Publisher Actions and Layouts](#)

Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

[Feed Tracking](#)

Feed tracking tracks changes to objects and fields and posts them as updates in Chatter. Users who follow a record, see the feed updates in their Chatter feed.

[Chatter Email Settings and Branding](#)

Chatter email settings let you control whether users receive email notifications about new posts, comments, and other changes. You can also change the format of the emails, like add your company's logo and sender information.

[Chatter Post Actions and Layouts](#)

Actions on posts and comments appear in the drop-down menu on a post or comment. Users can edit, bookmark, mute, and delete posts, add topics, and create tasks from posts.

[Group Layouts](#)

The group layout lets you customize which fields, buttons, actions, and lists appear in Chatter groups. Changes to the group layout affect all groups in your organization, but they only show up on the group pages in Salesforce1. Changes to the group publisher show up in the full Salesforce site and the Salesforce1 app.

[Topics on Objects](#)

Topics on objects is one of the most powerful ways to crowdsource your company's key themes and issues.

[Customize Chatter Influence](#)

Customize activity thresholds for posts, comments, and likes to improve the Chatter influence calculation.

[Guidelines for Deleting Your Users' Chatter Messages](#)

Salesforce administrators with the "Manage Chatter Messages" permission can access all users' private messages via the SOAP API. You can view and delete any message (such as for compliance purposes).

[Report on Chatter with the Dashboards Package](#)

The Salesforce Chatter Dashboards package packs a punch! You get multiple dashboards, over 100 reports, and even custom report types that you can use to monitor and manage Chatter adoption and engagement in your organization.

[Chatter User Licenses](#)

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Profile-Based Chatter Rollout Overview

Profile-based rollout of Chatter enables Chatter for a subset of users instead of all users in the organization.

Profile-based rollout of Chatter makes Chatter available for a part of your organization, but not for all users. Once profile-based rollout of Chatter is enabled for your organization, you can turn on Chatter for the users with the required user profile or permission sets. All other users in your organization don't have access to Chatter.

 **Example:** Let's say you assign a profile or permission set that excludes Chatter access to a subset of users. These users still have access to Salesforce objects, but they don't see the record feed and they can't make posts.

[Get Ready for Profile-Based Rollout of Chatter](#)

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

[Control Chatter Access Through User Profiles](#)

Modify existing custom user profiles to allow or deny access to Chatter.

[Control Chatter Access Through Permission Sets](#)

Handle Chatter access by modifying existing or creating new permission sets.

[Profile-Based Rollout Considerations](#)

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Get Ready for Profile-Based Rollout of Chatter

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

From a high-level perspective, a profile-based rollout of Chatter consists of these steps:

 **Note:** Before you begin, disable Chatter for your entire organization (go to Chatter settings and deselect **Enable**).

1. Salesforce enables the profile-based rollout of Chatter feature for your organization.
2. You determine who gets access to Chatter.
3. You review and modify existing custom user profiles and permissions sets.
4. Verify that the Enable Chatter permission in a custom user profile or permission set has the desired setting.
5. To allow or restrict Chatter access, assign the associated profile or permission set to users.
6. You turn on Chatter for your organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

 **Note:** Perform step 6 as a separate, final step. If step 6 is combined with another step or performed out of order, unpredictable and undesirable results can occur.

SEE ALSO:

[Profile-Based Chatter Rollout Overview](#)

[Control Chatter Access Through User Profiles](#)

[Control Chatter Access Through Permission Sets](#)

Control Chatter Access Through User Profiles

Modify existing custom user profiles to allow or deny access to Chatter.

When Salesforce turns on profile-based rollout of Chatter for your organization, the Enable Chatter permission is added to all of your existing user profiles and permissions sets. This permission is automatically enabled for all standard profiles. It is also automatically enabled for all custom profiles, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages and Direct Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

Modify your existing custom profiles with the desired permissions to control access to Chatter and create new custom profiles, if required.

1. Log in as a Salesforce administrator.
2. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.

3. For each of your existing custom user profiles:
 - a. Click **Edit**.
 - b. In the Administrative Permissions section, select or deselect **Enable Chatter**, depending on whether you want users with this profile to have Chatter access or not.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Group, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

USER PERMISSIONS

To enable Chatter:

- “Customize Application”

Administrative Permissions	
API Enabled	<input type="checkbox"/>
Api Only User	<input type="checkbox"/>
Author Apex	<input type="checkbox"/>
Bulk API Hard Delete	<input type="checkbox"/>
Manage Data Categories	<input type="checkbox"/>
Manage Data Integrations	<input type="checkbox"/>
Manage Dynamic Dashboards	<input type="checkbox"/>
Manage Email Client Configurations	<input type="checkbox"/>
Edit My Dashboards	<input type="checkbox"/>
Edit My Reports	<input type="checkbox"/>
Edit Read Only Fields	<input type="checkbox"/>
Enable Chatter	<input checked="" type="checkbox"/>
Invite Customers To Chatter	<input type="checkbox"/>
IP Restrict Requests	<input type="checkbox"/>
Manage Analytic Snapshots	<input type="checkbox"/>
Reset User Passwords and Unlock Users	<input type="checkbox"/>
Schedule Dashboards	<input type="checkbox"/>
Schedule Reports	<input type="checkbox"/>
Send Outbound Messages	<input type="checkbox"/>
Transfer Record	<input type="checkbox"/>
Use Identity Features	<input type="checkbox"/>
Use Team Reassignment	<input type="checkbox"/>

The Enable Chatter permission is only available if profile-based rollout of Chatter is enabled for your organization.

- c. Save your changes.
 4. If applicable, create new custom user profiles with the desired permissions and assign them to users.
-  **Note:** Selecting the Enable Chatter permission in a person's user profile doesn't automatically turn on Chatter for that person. People can't use Chatter until actually you turn [on Chatter](#) for your organization.

SEE ALSO:

- [Get Ready for Profile-Based Rollout of Chatter](#)
- [Control Chatter Access Through Permission Sets](#)
- [Chatter Settings](#)
- [Profile-Based Rollout Considerations](#)

Control Chatter Access Through Permission Sets

Handle Chatter access by modifying existing or creating new permission sets.

When you enable or disable Chatter through permission sets, consider that:

- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person's user profile and permission set.

For your existing permission sets, verify that they include the correct and required Chatter permissions for the desired subset of users.

1. Navigate to Permission Sets.
2. For each existing user-level permission set:
 - a. In the System section, click **System Permissions**.
 - b. Click **Edit** and select **Enable Chatter**. This permission is available only after profile-based rollout of Chatter is enabled for your org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

USER PERMISSIONS

To enable Chatter:

- "Customize Application"

System Permissions		Edit
▼ System		
Permission Name	Enabled	Description
Access Custom Mobile Apps	<input type="checkbox"/>	Allow user to run custom mobile apps.
API Enabled	<input type="checkbox"/>	Access any Salesforce.com API.
Api Only User	<input type="checkbox"/>	Access Salesforce.com only through a Salesforce.com API.
Assign Topics	<input type="checkbox"/>	Assign existing topics to feed items. Remove topics from feed items.
Author Apex	<input type="checkbox"/>	Create Apex classes and triggers.
Bulk API Hard Delete	<input type="checkbox"/>	Delete records in the Bulk API without storing them in the Recycle Bin.
Chatter Internal User	<input type="checkbox"/>	Use all Chatter features.
Connect Organization to Environment Hub	<input type="checkbox"/>	Allows a user to connect this organization to an Environment Hub.
Edit Tasks	<input type="checkbox"/>	Create, edit, and delete tasks.

Profile-Based Rollout Considerations

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

- The Enable Chatter option isn't available unless profile-based rollout of Chatter has been enabled for the organization.
- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person's user profile and permission set.
- Selecting the Enable Chatter permission in a person's user profile or permission set doesn't automatically turn on Chatter for the organization. Turn on Chatter for your organization after you modified user profiles and permission sets.
- Standard Salesforce user profiles have Chatter enabled by default. You can't disable Chatter for these standard profiles.
- Don't deselect Enable Chatter permission on a cloned Chatter External user profile. The user sees an error message and can't log in.
- Don't deselect the Enable Chatter permission on a cloned Chatter Free or Chatter Moderator profile. You get an error message and can't save the profile.
- Enabling profile-based rollout of Chatter and Chatter for an organization also enables a set of dependent Chatter user permissions. If Chatter is disabled for the organization, these permissions are also disabled at the same time. However, if Chatter is then enabled again, these permissions aren't automatically re-enabled and the administrator must enable them explicitly.
- When profile-based rollout of Chatter is enabled for an organization, Chatter is automatically enabled for standard profiles. For all custom profiles and permission sets, Chatter is automatically enabled, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
 - “Create and Share Links to Chatter Files” (ChatterFileLink)
 - “Invite Customers To Chatter” (ChatterInviteExternalUsers)
 - “Manage Chatter Messages and Direct Messages” (ManageChatterMessages)
 - “Moderate Chatter” (ModerateChatter)
 - “Moderate Chatter Feeds” (ModerateNetworkFeeds)
 - “Use Case Feed” (ViewCaseInteraction)
 - “View All Data” (ViewAllData)
- In organizations that have Work.com enabled, users with access to Chatter can’t thank users who don’t have access to Chatter.
 - If your organization already has Chatter enabled and switches to profile-based rollout of Chatter, manually enable Chatter in all existing custom profiles and permission sets. Otherwise, users that are assigned these custom profiles and permission sets lose access to Chatter.
 - When profile-based rollout of Chatter is enabled, users who can’t use Chatter because of their profile or permissions also can’t use global search. Advanced search is available to these users.

Encryption for Chatter (Pilot)

In the Spring ‘17 release, we’re running a public pilot for Shield Platform Encryption for Chatter. Encryption for Chatter enables you to encrypt sensitive data when it’s stored, and not just when it’s transmitted over a network. Encryption for Chatter isn’t ready for production, but you can safely try it out in a *dedicated* sandbox environment.

-  **Note:** We provide encryption for Chatter to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Pilot programs are subject to change, and we can’t guarantee acceptance. Encryption for Chatter isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can’t guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for encryption for Chatter in the [Chatter Product group in the Success Community](#).

Encryption applies to all Chatter feeds. It lets your company comply confidently with privacy policies, regulatory requirements, and contractual obligations for handling Chatter data.

Encrypted fields include:

- Feed posts
- Questions and answers
- Link names
- Comments
- Poll questions, but not poll choices

Encrypted fields work normally throughout the Salesforce user interface, business processes, and APIs. (There are some exceptions; for example, encrypted fields can’t be filtered.) When you encrypt a field, existing values aren’t encrypted immediately. Values are encrypted only after you interact with them, for example, you add or edit field content.

EDITIONS

Available in: Salesforce Classic, Lightning Experience, and Salesforce1

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions. Requires purchasing Salesforce Shield.

Available in: **Developer** Edition at no charge for orgs created in Summer ‘15 and later.

 **Important:** Historic Chatter feeds can't be mass-encrypted.

Enabling encryption for Chatter disables Spam IQ and exposes Chatter to the global limitations that come with encryption.

SEE ALSO:

[Which Fields Can I Encrypt?](#)

[Encrypt Data in Chatter \(Pilot\)](#)

Chatter Settings

Chatter is enabled by default in Salesforce and the Salesforce1 app. Configure various Chatter features and customize the Chatter experience for your users on the Chatter Settings page in Setup.

- To access the Chatter Settings page, enter *Chatter* in the Quick Find box and select *Chatter Settings*.
- To disable Chatter for your entire organization, deselect **Enable** in the Chatter Settings section.

[Chatter Group Settings](#)

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates, and ask questions.

[Enable Emoticons in the Feed](#)

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

[Customer Invitations](#)

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

[Coworker Invitations](#)

Allow Salesforce users to invite coworkers who don't have Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

[Enable Actions in the Publisher](#)

To add global actions to the publisher, you must first enable the Actions in the Publisher feature in Chatter Settings. Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

[Feed Post and Comments Editing Overview](#)

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

SEE ALSO:

[Salesforce Chatter](#)

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com** Editions

Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates, and ask questions.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

[Chatter Group Archiving](#)

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

[Enable Records in Chatter Groups](#)

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

[Enable Unlisted Chatter Groups](#)

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

[Unlisted Group Limitations](#)

Consider the limitations of unlisted groups before you decide to enable them in your organization.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Archived groups count toward your organization's group limits (30,000), but not toward a user's group membership limits (300).

There are more group archiving settings on the group settings page. That's where group owners and managers can archive, activate, or edit the automatic archiving settings. To change the archiving settings for multiple groups at once, use the Salesforce API.

If your organization doesn't want to use group archiving, disable this feature in Setup. Enter *Chatter* in the **Quick Find** box, select **Chatter Settings**, and deselect **Allow Group Archiving** in the Groups section.

 **Note:** To allow group owners and managers to archive, activate, or disable automatic archiving in the Salesforce1 apps and in the Lightning Experience, customize the group layout and add the necessary fields.

SEE ALSO:

[Group Layouts](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

The Add Record action on the group publisher lets users add account, contact, lead, opportunity, contract, campaign, case, and custom object records to groups. The Add Record action isn't available by default, so you must configure the group publisher to include this action.

[Walk Through It: Allow Users to Add Records to Chatter Groups](#)

We recommend that you also customize object layouts to include the Groups related list on record detail pages. Customize the layout of all the standard and custom objects in your organization that support group-record relationships. The Groups related list shows users the list of groups associated with the record.

[Walk Through It: Add the Groups Related List to Records](#)

If you don't want to users to add records to groups, enter *Chatter* in the *Quick Find* box in Setup, then select *Chatter Settings*, and deselect **Allow records in groups in the Groups** section. Disabling the feature hides the Group Records list on the group detail page and the **Add Record** action in the group publisher.

SEE ALSO:

[Customize the Chatter Group Layout and Publisher](#)

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results. By default, unlisted groups aren't enabled for your organization. Review the limitations of unlisted groups, before you enable this feature in your organization.

1. From Setup, enter *Chatter* in the *Quick Find* box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Enable Unlisted Groups**.
A message displays with important information about enabling unlisted groups in your organization.
4. In the highlighted message, select the checkbox next to **I want to enable unlisted groups and understand that I may need to update Apex/Visualforce code in my organization**.
5. Click **Save**.

Any user can create an unlisted group. Unlike private groups, users with the "View All Data" or "Modify All Data permission" can't view or update unlisted groups unless they're members. To allow

USER PERMISSIONS

To enable permission for profiles:

- "Customize Application"

non-members to view and modify unlisted groups, assign the “Manage Unlisted Groups” permission to them via their profile or a permission set.

SEE ALSO:

[Unlisted Group Limitations](#)

[Unlisted Groups Overview](#)

Unlisted Group Limitations

Consider the limitations of unlisted groups before you decide to enable them in your organization.

For Administrators

- Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.
- Users with the “Modify All Data” permission can’t delete feed content from unlisted groups, unless they are group members.
- Users with the “Data Export” permission can export all Chatter data and view the exported posts and comments from any group, regardless of whether they have the “Manage Unlisted Groups” permission.
- You can’t grant the “Manage Unlisted Groups” permission to users with these profiles Chatter External, High Volume Portal, or High Volume Customer Portal.
- Unlisted groups count toward a user’s group limit, but they don’t appear in the Groups list on a user’s profile page unless the person who’s viewing the list is a member of those groups or has permission to manage unlisted groups. When unlisted groups are hidden, the count that’s shown next to the Groups list might not be accurate, depending on the permissions of the person viewing the list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

For Developers

Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account. This limitation has implications for pages that are written in Apex.

- Visualforce pages that display groups might expose unlisted groups to users who aren’t members.
- Because system mode disregards the user’s permissions, all users who are accessing a Visualforce page that’s showing an unlisted group can act as an owner of that group.
- AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren’t members.

To limit and manage access to the unlisted groups in your organization:

- Explicitly filter out unlisted groups from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit unlisted group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of unlisted groups. In Setup, enter *Group Triggers* in the Quick Find box, then select **Group Triggers** to add triggers.

SEE ALSO:

[Enable Unlisted Chatter Groups](#)

[Unlisted Groups Overview](#)

Enable Emoticons in the Feed

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

Emoticons aren't supported in Salesforce1.

1. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
2. In the Emoticons in Feed section, select **Allow Emoticons**.

Salesforce supports these character combinations in posts and comments.

Character Combinations	Emoticon
<ul style="list-style-type: none"> • :) • :-) 	 (smile)
<ul style="list-style-type: none"> • :P • :-P • :p • :-p 	 (tongue)
<ul style="list-style-type: none"> • :(• :-( (frown)
<ul style="list-style-type: none"> • >:(• >:-( (angry)
<ul style="list-style-type: none"> • :((• :!(• :!-( (crying)

USER PERMISSIONS

To enable emoticons:

- "Customize Application"

Customer Invitations

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

Customer invitations don't support custom domains created using My Domain, single sign-on, and IP restrictions. To allow customer invitations with these features enabled, we recommend one of the following approaches:

- Customize the single sign-on page for your organization with an extra link redirecting users to `https://yourDomain.my.salesforce.com/`.
- Enable single sign-on for your customers.

Customer invitations are enabled by default. To disable customer invitations, enter *Chatter* in the **Quick Find** box in Setup, select *Chatter Settings*, and deselect **Allow Customer Invitations** in the Chatter Settings section. Disabling this feature doesn't delete existing customers or groups that allow customers.

SEE ALSO:

[Coworker Invitations](#)

[Can I connect multiple Salesforce organizations using Chatter?](#)

Coworker Invitations

Allow Salesforce users to invite coworkers who don't have Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

Coworker invitations are automatically enabled for new Salesforce organizations. The email domain of the first Salesforce user that is added to the organization is used as the company domain in the **Company Email Domains** field. Invitations aren't turned on if the user's domain is a free public email provider such as yahoo.com or gmail.com.

You can add up to 200 domains. Enter the domains that are used in email addresses for your company. We recommend that you don't enter public email domains such as hotmail.com, yahoo.com, or gmail.com. If invited, anyone with an email address in these domains can join and see user profiles, feeds, and Chatter groups.

To disable coworker invitations, go to Setup and enter *Chatter* in the **Quick Find** box. Select *Chatter Settings*, and deselect **Allow Coworker Invitations** in the Coworker Invitations section. If you deselect this feature, users can't accept outstanding invitations. Similarly, if you remove an email domain, users can't accept outstanding invitations from that domain.

Feed Post and Comments Editing Overview

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

A Chatter Settings option and two user permissions control the feed post editing feature.

The *Allow users to edit posts and comments* option in Chatter Settings enables or disables the Edit Feed Post feature for your organization. This option is enabled by default in existing and new organizations. All users that are assigned a standard profile can edit their own posts and comments immediately, except for Chatter Free, Chatter External, and Customer Portal users. For users that are assigned custom profiles, administrators must specifically enable the permissions in the users' custom profiles or permission sets.

The “Edit My Own Posts” permission allows users to edit their own posts. This permission is available and automatically enabled on standard profiles, except Chatter External, Chatter Free, and Customer Portal User profiles. To allow Chatter External, Chatter Free, or Custom Portal users to edit their own posts, clone the profiles and enable the “Edit My Own Posts” permission in the cloned profiles. Assign the cloned profiles to the users.

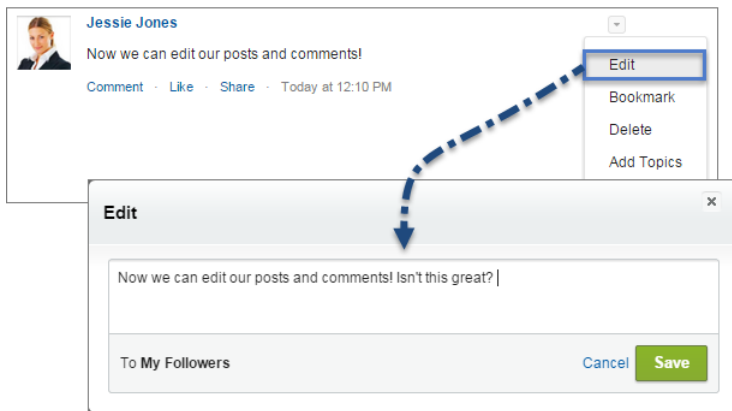

The “Edit Posts on Records I Own” permission allows users to edit posts and comments on records they own, including other people's posts and comments. For example, a group owner or manager can edit all posts on the group's feed. A manager for a particular record type can edit all posts on the record. This permission is available on standard and custom profiles, but it is disabled by default.

This table summarizes the permissions and their default settings.

User Permission	Description	Available in	Default Setting
Edit My Own Posts	Allows users to edit their own posts	Standard profiles, except <ul style="list-style-type: none"> • Chatter External User • Chatter Free User • High Volume Customer Portal User • Partner Community User Profile 	Enabled in all new and existing organizations
		Custom profiles	Disabled in all new and existing organizations
Edit Posts on Records I Own	Allows record owners to modify their own posts and	Custom profiles	Disabled in all new and existing organizations.

User Permission	Description	Available in	Default Setting
	posts other users made on groups and record detail pages.		However, Chatter moderators, community moderators, and users with “Modify All Data” permission can always edit all posts and comments.

The *Allow users to edit posts and comments* option in Chatter Settings is enabled by default. For users that have the required permissions, the Edit option is available from the drop-down menu on posts, comments, questions, and answers. It opens a separate Edit window, where users can modify the text.

After users saved their edited version of the post, it shows an Edited time stamp to indicate that the original post was modified.

If users edit a post or comment and mention new people or groups, those people and groups receive email notifications. People and groups who were mentioned in the original post or comment don't receive a new email notification. Email notifications for edited posts or comments show the Edited time stamp.

For community users, feed post editing is only available, if the community was created using Salesforce Tabs + Visualforce or the Customer Service (Napili) template. The Edit option isn't available on system-generated posts like feed tracked record updates.

[Enable Feed Post Editing in User Profiles or Permission Sets](#)

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

[Disable Feed Post Editing for All Users](#)

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

Enable Feed Post Editing in User Profiles or Permission Sets

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

Here's how you enable the permissions in a permission set.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click an existing permission set or create one.
3. In the System Permissions section, click **Edit**.
4. Select the edit feed post permissions you want to enable.
 - Select *Edit My Own Posts* to allow users that are assigned this custom profile to edit their own posts and comments.
 - Select *Edit Posts on Records I Own* to allow users that are assigned this custom profile to edit posts and comments on records they own, including posts and comments made by other users.
5. Click **Save**.
6. Assign the permission set to the users who need the permissions.

Example:  [Walk Through It: Assign a Permission Set](#)

USER PERMISSIONS

To create custom profiles

- “Manage Profiles and Permission Sets”

Disable Feed Post Editing for All Users

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. In the Post and Comment Modification section, deselect *Allow users to edit posts and comments*.

Post and Comment Modification

The author of the post or comment, the record owner, a Chatter moderator, and a moderator in this community have permission to modify the text.

Allow users to edit posts and comments

4. Click **Save**.

The feed post editing feature is disabled for your entire organization. Users can no longer edit posts and comments.

USER PERMISSIONS

To enable or disable features in Chatter Settings:

- “Customize Application”

Publisher Actions and Layouts

Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

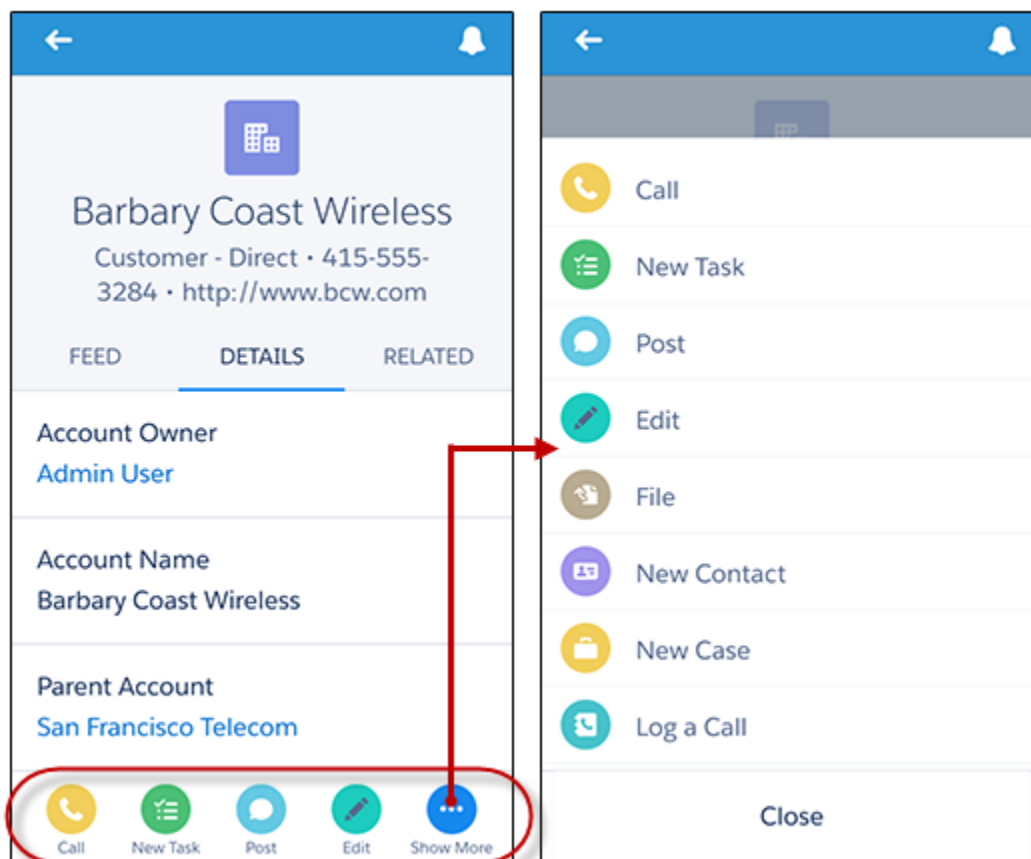

Actions are all about productivity. Actions let users accomplish things with fewer clicks, fewer fields, and ultimately less time spent. Actions are especially useful in Salesforce1, because it makes it easy to create and edit records with a simple, mobile-optimized interface. By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, and Question.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com** Editions

In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

There are several categories of actions, like standard actions, nonstandard actions, default actions, mobile smart actions, custom actions, and productivity actions.

- **Standard actions:** Standard actions are actions that are automatically added to the publisher when Chatter is enabled—such as Post, File, Link, and Poll. You can customize the order in which these actions appear in the publisher, but you can't edit their properties.
- **Nonstandard actions:** Nonstandard actions are actions that you create and customize yourself.
- **Default actions:** Default actions are predefined actions provided by Salesforce. Add them to the publisher layout to make them available to your users.
- **Mobile smart actions:** Mobile smart actions are a set of preconfigured actions, just like default actions. In Salesforce1, mobile smart actions let users create records directly in the feed.
- **Custom actions:** Custom actions are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5000 characters.
- **Productivity actions:** Productivity actions are predefined by Salesforce and are attached to account, contact, event, lead, user, and user profile objects. You can't edit or delete productivity actions.

To customize the publisher with more actions or change the order of the actions, first enable actions in the publisher on the Chatter Settings page in Setup.

[Create Global Publisher Layouts](#)

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic and Lightning Experience, these layouts customize the actions on global pages (like the Home page) and on the Chatter page. Lightning Experience also uses these layouts to populate the Global Actions menu. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

[Add Actions to Global Publisher Layouts](#)

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Create Global Publisher Layouts

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic and Lightning Experience, these layouts customize the actions on global pages (like the Home page) and on the Chatter page. Lightning Experience also uses these layouts to populate the Global Actions menu. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. To create a new global publisher layout, click **New**.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down list.
4. Enter a name for the new global publisher layout.
5. Click **Save**.

SEE ALSO:

[Assign Global Publisher Layouts to User Profiles](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Database.com,** and **Developer** Editions

USER PERMISSIONS

To create actions:

- "Customize Application"

To customize action layouts and page layouts:

- "Customize Application"

To view page layouts:

- "View Setup"

Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list.

 [Walk Through It: Customizing Global Publisher Layouts](#)

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in Salesforce Classic.

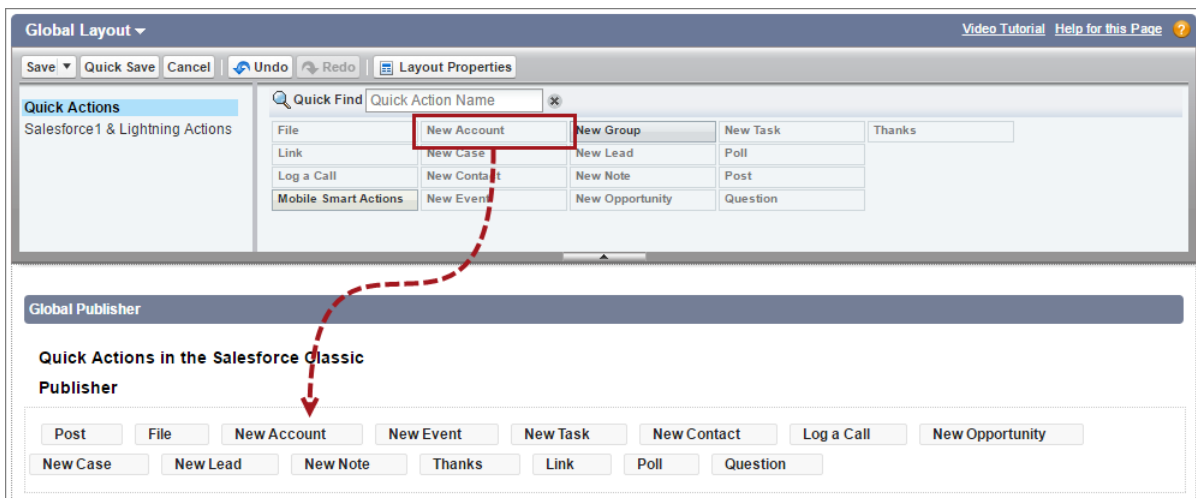

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 & Lightning Actions category in the palette. On object page layouts, the Salesforce1 & Lightning Actions category contains all available types of actions for the object, including quick actions, productivity actions, Lightning component actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

1. From Setup, enter *Publisher Layouts* in the **Quick Find** box, then select **Publisher Layouts**.
2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.
3. Click **Save** when you're done, or click **Quick Save** to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

 **Example:** Let's add the **New Account** action to the publisher on the Home and Chatter pages in Salesforce Classic, so users can create an account directly from the publisher. Drag the **New Account** action to the Quick Actions in the Salesforce Classic Publisher section and save your changes.

Go to the Chatter tab in Salesforce Classic. Now the **New Account** action shows up in the publisher.

EDITIONS

Feed Tracking

Feed tracking tracks changes to objects and fields and posts them as updates in Chatter. Users who follow a record, see the feed updates in their Chatter feed.

Feed tracking is available for objects and fields. You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

Sharing rules and field-level security determine visibility of record changes in Chatter feeds. To see changes to that record in their feeds, users must have access to the record.

These objects and fields are tracked by default:

- Account: Account Name, Account Owner
- Case: Case Owner, Priority, Status
- ChatterGroup: Allow Customers, Description, Group Access, Information Body, Information Title, Name, Owner Name
- Contact: Account Name, Contact Owner, Name
- Lead: Lead Owner, Lead Status, Name
- Opportunity: Amount, Close Date, Opportunity Name, Opportunity Owner, Stage
- Topic: Description
- User: About Me, Address, Email, Manager, Phone, Title

Tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the tracking field audit history is still available.

[Customize Chatter Feed Tracking](#)

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

[Enable Feed Updates for Related Records](#)

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

- "View Setup and Configuration"

Customize Chatter Feed Tracking

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

1. From Setup, enter *Feed Tracking* in the *Quick Find* box, then select **Feed Tracking**.
2. Select an object.
3. Select **Enable Feed Tracking**.

You must have the required user permissions to see this checkbox.

4. Select up to 20 fields to track.

You can't select fields for external objects or article types. The following standard field types can't be tracked:

- Auto-number, formula, and roll-up summary fields
- Encrypted and read-only system fields
- The *Expected Revenue* field on opportunities
- The *Solution Title* and *Solution Details* fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled

5. If you have actions in the publisher enabled, you see the *All Related Objects* option. Select this checkbox to show feed items when related objects are created.
6. Save your changes.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

Salesforce Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To customize fields tracked in feeds:

- "Customize Application"

To view the field tracking setup page:

- "View Setup and Configuration"

Enable Feed Updates for Related Records

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.
2. Click the object for which you want to enable feed updates for related records.
3. Click **All Related Objects**.
If you don't see this option, make sure that actions in the publisher are enabled. The All Related Objects option is available only on these objects:
 - Account
 - Campaign
 - Case
 - Contact
 - Custom objects
 - Group
 - Lead
 - Opportunity
4. Save your changes.

Example: If you enable feed updates for related records on accounts, the account feed includes:

- Feed updates for all activity on the account
- Updates for related tasks, events, and contacts

Chatter Email Settings and Branding

Chatter email settings let you control whether users receive email notifications about new posts, comments, and other changes. You can also change the format of the emails, like add your company's logo and sender information.

If Chatter is enabled, email notifications are enabled by default. However, your users can configure their own email settings. They control whether they want to receive emails, for which changes, and how often. It is important that you teach your users how they can control the amount of email they receive. Too many email notifications are a pain point for many Chatter users and a common barrier to adoption.

Configure the general Chatter email settings and branding from Setup. Enter *Email Settings* in the **Quick Find** box, then select **Email Settings**. This table describes the settings.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Setting	Description
General Settings	
Allow Emails	Enables or disables email notifications for your entire company. If you deselect this option, all email notifications are disabled and your users don't receive any notifications.
Allow Email Replies	If selected, users can reply to email notifications about messages and comments via email instead of navigating to the comment or message in Chatter.
Allow Posts via Email	If selected, users can post to groups using email.
Allow Attachments via Email	If selected, users can include attachments in posts to groups using email.
Show Salesforce1 mobile app download badges	Show App Store and Google Play download badges for Salesforce1 in all Chatter email notifications from your internal org. Badges don't appear in email notifications from communities. A recipient's language setting affects whether badges appear: if a badge isn't translated in the set language, it doesn't appear in the email. The option to show badges is selected by default.
Allow API-only Chatter Digests	 Note: This setting appears only if API-only Chatter Digests are enabled for your company. To enable this feature, contact Salesforce. If selected, daily and weekly scheduled digests are disabled for your entire company. You must call the API to receive digests for your users.
Sender	
From Name	The name that appears as the sender's name in the email notification. For example, add your company's name.
Email Address	The email address of the sender. For example, add your company's email address.
Branding	
Logo	A logo that appears in the email notification. Upload a different logo to replace the default Chatter logo.
Footer Text	The text that appears in the footer of the notification email. We strongly recommend including your company's physical address to comply with applicable anti-spam laws.

[Customize Branding for Email Notifications](#)

Customize your company's Chatter email notifications to show sender information, footer text, and a footer logo that is personalized for your organization.

Customize Branding for Email Notifications

Customize your company's Chatter email notifications to show sender information, footer text, and a footer logo that is personalized for your organization.

1. From Setup, enter *Email Settings* in the **Quick Find** box, then select **Email Settings**.
2. Enter custom values for the email sender's name and address to replace the default values.

 **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

3. Customize what displays in the footer of Chatter emails.

 **Note:**

- All Chatter emails display the Chatter logo and Salesforce information unless you replace them with your organization's own logo and information.
- If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

- a. Choose a logo to replace the default Chatter logo.

The logo must be an existing document in the Documents tab and must be marked **Externally Available Image**. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

- b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

4. Click **Save**.

SEE ALSO:

[Chatter Email Settings and Branding](#)

Chatter Post Actions and Layouts

Actions on posts and comments appear in the drop-down menu on a post or comment. Users can edit, bookmark, mute, and delete posts, add topics, and create tasks from posts.

The standard Bookmark, Delete, Mute, and Add Topic actions on posts are available by default and you can't modify them. However, you can add more actions like the Edit and Create New Task actions.

[Enable Create New Tasks on Posts](#)

Enhance the feed with an action that lets users create tasks directly from a post.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To customize Chatter email settings:

- "Customize Application"

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Enable Create New Tasks on Posts

Enhance the feed with an action that lets users create tasks directly from a post.

[Actions in the Publisher](#) and [feed tracking](#) for task objects must be enabled.

1. From Setup, enter *Feed Item* in the **Quick Find** box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. In the Feed Item Layout, click **Quick Actions**.
4. Select the **Create New Task** action and drag it to the Actions in the Publisher section.

If you don't see the Create New Task action, verify that the [Actions in the Publisher](#) feature is enabled in the Chatter Settings in Setup.

5. Save your changes.

The Create New Task action displays on the drop-down menu on text and content posts. When a user creates a task from a post, the task shows up in the My Task list on the user's Home page. The Create New Task action on posts

- Is available on text and content posts, but not on system-generated posts like tracked feed updates
- Can be partly customized. You can't change the fields, but you can change the layout of the fields.
- Generates an update that displays in the user's feed

SEE ALSO:

[Set Up Actions with Chatter Enabled](#)

Group Layouts

The group layout lets you customize which fields, buttons, actions, a lists appear in Chatter groups. Changes to the group layout affect all groups in your organization, but they only show up on the group pages in Salesforce1. Changes to the group publisher show up in the full Salesforce site and the Salesforce1 app.

Changes you make to the group layout and the publisher affect all groups in your organization. You can't customize the layout for an individual group.

[Customize the Chatter Group Layout and Publisher](#)

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

[Add Actions to the Group Publisher](#)

Customize the group publisher with quick actions and Salesforce1 actions.

Customize the Chatter Group Layout and Publisher

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

1. From Setup, enter *Group Layouts* in the Quick Find box, then select **Group Layouts**.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. From the palette on the top of the page, drag and drop fields, buttons, and other user interface elements to the different sections to add them to the group layout. Drag and drop them back to the palette to remove them from the layout. To make sure this works in Salesforce1 and Lightning Experience, be sure the following are in your group layout:
 - Post
 - Announcement
 - File
 - Poll
 - Edit Group
 - New Group Member
 - Manage Notifications
 - Delete Group
 - Leave Group

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

4. Click **Save** to save the layout.

Example: To allow group owners and managers to archive and activate groups from Salesforce1 and Lightning Experience, drag the Archive field to the Group Detail section.

EDITIONS

- [Add Actions to Global Publisher Layouts](#)

Add Actions to the Group Publisher

Customize the group publisher with quick actions and Salesforce1 actions.

By default, Chatter groups display standard actions that are part of the global publisher layout, like Post, File, Link, and Poll. Override the global publisher layout with a customized group publisher layout.

1. From Setup, enter *Groups* in the *Quick Find* box, then select *Group Layouts*.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. Click **override the global publisher layout** in the Quick Actions in the Salesforce Classic Publisher section or **override the predefined actions** in the Actions in the Salesforce1 and Lightning Experience Actions section. Drag and drop actions between the palette and the publisher layout to add, remove, and reorder actions.

Changes to the Quick Actions in the Publisher section appear in the full Salesforce site. Changes to the Actions in the Salesforce1 Action Bar section appear in Salesforce1 and Lightning Experience. In groups that allow customers, the publisher only shows standard actions.

Example: Add the Announcement, Add Record, and Add Member actions to the group publisher.

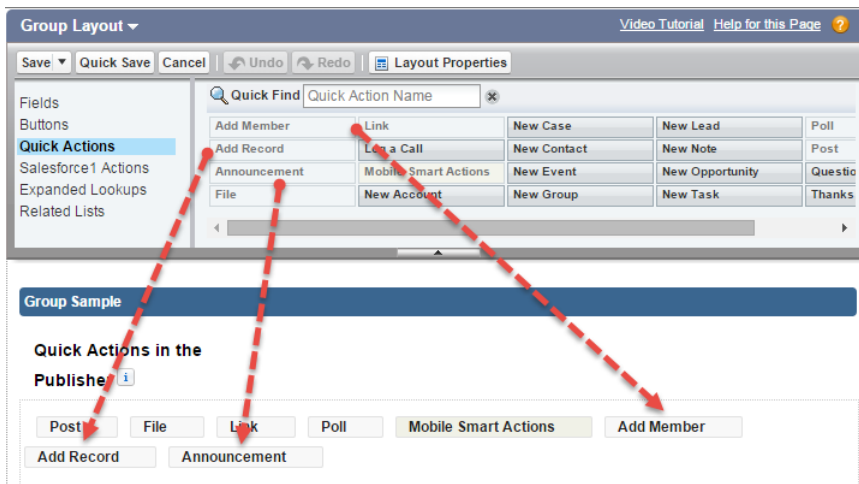

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

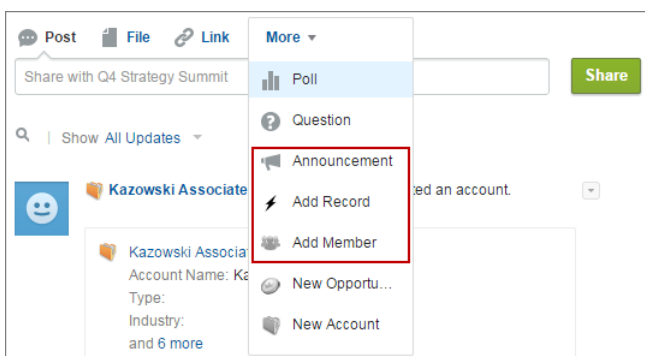

USER PERMISSIONS

To customize Chatter group layouts:

- “Customize Application”

Now users can select these actions directly from the publisher.

Topics on Objects

Topics on objects is one of the most powerful ways to crowdsource your company's key themes and issues.

Your employees can attach topics to object records based on what they're seeing in the field and from working with customers, giving your business insight into the voice of your customer. And because topics can cross objects, they can provide connections across people, conversations, and records.

Users can also add topics to posts. Topics on posts help users organize posts and increase their visibility. Topics are great for discussing a particular issue, theme, or subject, that isn't limited to a particular group of people. For example, if your company has created a year-long goal around volunteering with local schools, create a topic to allow your entire company to share posts, photos, and updates related to the company goal. Groups, on the other hand, are good for conversation with a specific gathering of people. Collaboration within a group can cover any number of subjects, but always involves the same key team members. For example, if your company is planning a holiday party, a private group for the party committee lets them plan the event without the rest of the company learning the details in advance.

EDITIONS

Available in: Salesforce Classic

Available in all editions

[Enable and Configure Topics for Objects](#)

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

[Delete Topics](#)

People with appropriate permissions can delete topics directly from topic detail pages.

[Topics Privacy](#)

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

Enable and Configure Topics for Objects

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

 **Note:** Topics are only supported on English Knowledge articles.

 **Warning:** When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Select an object.
3. At the right, select **Enable Topics**.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click **Save** to save changes for all objects.

Now, users with access to the enabled objects and appropriate topics permissions can:

- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

Additionally, if your organization uses Chatter, users can click any topic assigned to a record to go directly to a topic page. There, they'll find other records on the topic, people who are knowledgeable about the topic, and other related information.

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To enable topics for objects:

- "Customize Application"

Delete Topics

People with appropriate permissions can delete topics directly from topic detail pages.

Because topic names and descriptions are not private, administrators might want to delete topics for compliance reasons or to remove inappropriate content. When deleting topics, consider these points.

- Topics are permanently deleted. They aren't sent to the Recycle Bin.
- Deleted topics are removed from search results, the topics list, all posts and records, Recently Talked About topics, Related Topics, and your users' favorites. Deleted topics are removed from Trending Topics after the next calculation.
- Users can reintroduce a topic after it's been deleted.

To delete a topic:

1. Navigate to the topic detail page.
2. In the upper-right, click , and choose **Delete**.

Topics Privacy

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

This table explains where you can see all topics and where you can't see topics used solely in private groups or on records.

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Topics list	✓	
Topic search results	✓	
Topic reports	✓	
Knowledgeable User reports		✓
Related Topics on the topic detail page	✓	

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To delete standard topics:

- "Modify All Data"
- OR
- "Delete Topics"

To delete topics also used as navigational or featured items in a community:

- "Create and Set Up Communities"
- OR
- "Manage Communities"

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Recently Talked About topics on group detail pages	✓	
Recently Talked About topics on profiles		✓
Trending Topics on the Chatter page		✓
Topic suggestions when adding topics to a post		✓
People talking number in the topics list and in topic suggestions when adding topics to a post		✓

 **Note:** You can't use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn't created, and the link won't work.

Customize Chatter Influence

Customize activity thresholds for posts, comments, and likes to improve the Chatter influence calculation.

Chatter activity statistics include how many posts and comments users made, how many comments they received, and how many people liked their posts and comments.

1. From Setup, enter *Influence* in the *Quick Find* box, then select **Influence**.
2. Change the minimum activity thresholds.
All minimum activity thresholds default to zero. If you set higher thresholds, users who don't meet all three minimums are considered observers who aren't counted when calculating influence rank. Users who do meet all three minimums but have relatively low activity are also considered observers, but they're counted when calculating influence.
3. Click **Save**.
Chatter influence is recalculated when you save these values.

 **Warning:** Use caution when setting new thresholds because users' influence levels can change immediately.

Guidelines for Deleting Your Users' Chatter Messages

Salesforce administrators with the "Manage Chatter Messages" permission can access all users' private messages via the SOAP API. You can view and delete any message (such as for compliance purposes).

When you delete private Chatter messages, consider these guidelines.

- Messages are hard deleted. They aren't sent to the recycle bin.
- Deleted messages aren't included in message search results.
- Deleting a message that resulted from sharing a file with someone does not delete the file itself.
- If all messages in a conversation are deleted, the conversation isn't shown in My Messages and can't be retrieved via the Chatter REST API.
- If replies via email are enabled and a user replies to a deleted message, Chatter returns an error notification and doesn't process the reply message.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions for users with a Salesforce license, and **Database.com** Edition for users with a Database.com Admin license

Report on Chatter with the Dashboards Package

The Salesforce Chatter Dashboards package packs a punch! You get multiple dashboards, over 100 reports, and even custom report types that you can use to monitor and manage Chatter adoption and engagement in your organization.

Use the Salesforce Chatter Dashboards package to:

- View overall Chatter adoption with detailed metrics and monthly trends
- Monitor group adoption with membership and engagement metrics, such as the number of posts, comments, likes, and the top contributors
- Monitor content creation and user engagement, such as the top files, trending content, and the top contributors
- View topic taxonomy and monitor topic assignments, including the most assigned topics and the top assigners
- Create customized reports using out-of-the-box groupings such as department, country, role, or profile

You can install the [Salesforce Chatter Dashboards](#) from AppExchange.

 **Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see [Get Started with Chatter Dashboards](#).

Once the package is installed, you can access your new dashboards, reports, and custom report types alongside all your other Salesforce dashboards and reports.

As newer versions of the package become available, you can upgrade your package by reinstalling the package. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

Dashboard	Description
Overview	See the overall state of Chatter at a glance.
Adoption by Department	Get an overview of department metrics for groups, user profiles, and topic adoption.
Files	Track file uploads, downloads, engagement, and content creators.
Groups	Monitor feed and member activity in Chatter groups.
Management	Track unanswered questions and posts, group growth rates, and the overall health of your groups.

EDITIONS

Available in: **Professional, Enterprise, Unlimited, Developer, and Performance** Editions

Dashboard	Description
Q&A	Track recent activity for questions, answers, and best answers posted in groups.
Topics	Track your Chatter topics activity.
User	Track recent activity for questions, answers, and best answers in user profiles.

 **Note:** The reports in this package return data for all Chatter. If your organization is using a community, we recommend that you install the [Salesforce Communities Management \(for Communities with Chatter\)](#) package instead. This package allows you to report on Chatter usage in your internal organization and Chatter usage in your community.

Chatter User Licenses

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Chatter External

This license is for users who are outside of your company's email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they're invited to. They have no access to Chatter objects or data.

Chatter Free

The Chatter Free license is for users who don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can't access any Salesforce objects or data. Chatter Free users can also be Chatter moderators.

Chatter Free users don't see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.

Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects

EDITIONS

Available in: Salesforce Classic

Chatter External and Chatter Free licenses are available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Chatter Only (also known as Chatter Plus) licenses are available in: **Professional, Enterprise Unlimited, and Performance** Editions

- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see [Chatter Plus Frequently Asked Questions](#)

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Chatter Desktop client	✓	✓	✓
Use the Salesforce1 mobile app (Downloadable apps require the "API Enabled" profile permission)	✓ Downloadable app users can't access Groups or People list views.	✓	✓
Feeds	✓	✓	✓
File sharing	✓	✓	✓

Using and approving workflows			

Chatter Administration FAQs

Can I connect multiple Salesforce organizations using Chatter?

Chatter is available only on a per-organization basis. Only users within the same Salesforce organization can communicate with each other using Chatter. However, you can add people outside of your company's email domains to use Chatter in your organization as a customer in groups you own or manage.

Can portal users use Chatter?

Chatter is not available to portal users in partner portals or Customer Portals. Chatter is available to customer users and partner users in Communities.

Can I take control of the Chatter Expert user?

As an administrator, you can either deactivate or take over the Chatter Expert user and provide posts to your company. By default, the Chatter Expert posts when a new user chooses to start one of the groups suggested by Chatter on the Groups you can join page.

 **Note:** This applies only to organizations created after Summer '11.

To deactivate the Chatter Expert:

1. Click **People > Find People**.
2. Search for Chatter Expert.
3. Click **Manage User > Deactivate User**.

To take control of the Chatter Expert so that you can send and receive posts:

1. Click **People > Find People**.
2. Search for Chatter Expert.

3. Change the email address to your own.

Can I Stop a User From Creating Chatter Groups?

If there are users that shouldn't be able to create groups, you can prevent them from doing so.

The ability to create groups (public, private, or unlisted) is controlled by the permission "Create and Own New Chatter Groups." The permission is enabled by default and administrators can disable it on the appropriate users' profiles.

After an administrator disables this permission, a user can no longer create or be assigned as owner of new Chatter groups. If the user was already the owner of any groups, that ownership is not revoked.

[Edit Profiles in the Original Profile Interface](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Can I change the location of Chatter feeds using the page layout editor?

Currently, you can't change the location of Chatter feeds. However, users can click the  **Hide Chatter** link in a Chatter feed to hide the feed, and the  **Show Chatter** link to show the feed.

Can I prevent certain words from being used in Chatter posts?

No, not using the standard Chatter interface. However, there are third-party apps like [Chatter Blacklist](#). This app lets you create a "blacklist" of words, phrases, or custom expressions (for example, credit card numbers) that are prohibited in Chatter posts and comments. These words can prevent a post, be substituted with approved words or phrases, or be recorded for audit purposes.

Salesforce Support doesn't provide troubleshooting for third-party applications/packages unless specifically stated in the provider information of the application.

Do Chatter posts and files count toward my storage use?

Chatter feed posts, tracked changes, and comments don't count toward your data storage. However, any files and photos you upload are counted against file storage. Files uploaded on the Files tab are also counted against file storage.

Salesforce Files

Customize page layouts to include the Files related list, so users see a list of files associated with a record.

[Add the Files Related List to Page Layouts](#)

Customize page layouts to include the Files related list, so users can add files to a record and see a list of files associated with the record.

[Prevent Users from Attaching Salesforce Files](#)

Use permission sets to prevent users from attaching Salesforce Files to posts, records, and other objects.

Add the Files Related List to Page Layouts

Customize page layouts to include the Files related list, so users can add files to a record and see a list of files associated with the record.

Use files instead of attachments to make the files available outside of the context of the individual record. The file owner or admin still decides sharing settings for the file.

1. From Setup, enter *Object Manager* in the **Quick Find** box, then select the name of the object you want to add the Files related list to (such as Opportunity).
2. Click **Page Layouts**.
3. Click the page layout you want to customize.
4. In the list of available items in the left pane, click **Related Lists**.
5. Drag **Files** to the Related Lists section.
6. Click **Save**.

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Prevent Users from Attaching Salesforce Files

Use permission sets to prevent users from attaching Salesforce Files to posts, records, and other objects.

Disable or enable the user permission in Setup. Enter *User Profiles* in the **Quick Find** box, then select **Profiles**. Click **Edit** next to the user profile you want. In the Administrative Permissions section, enable or disable the Select Files from Salesforce checkbox. Click **Save**.

Another option is to apply the permission in a permission set. Users who have this permission disabled are still able to upload files from their local drive. To apply the permission in a permission set, from Setup enter *Permission Sets* in the **QuickFind** box, then select **Permission Sets**. Edit the permission set and apply the Select Files from Salesforce permission.

EDITIONS

Available in: All Editions

Permission sets available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Salesforce Files Sync

With Salesforce Files sync, users can sync files between their devices and Salesforce.

[Enable Salesforce Files Sync](#)

Enable Salesforce Files Sync to allow users to sync files between their devices and Salesforce.

[Grant Users Access to Salesforce Files Sync](#)

After enabling Salesforce Files Sync, grant your users access by either creating and assigning a permission set or by granting permission on profiles.

[Install Salesforce Files Sync](#)

The Salesforce Files Sync client syncs files between user's computers and Salesforce. Users can also access synced files from Salesforce 1.

[Configure File Upload and Download Security Settings](#)

To provide more security, control the way some file types are handled during upload and download.

Monitor Salesforce Files Sync access and usage with the Salesforce Files Sync administrator tools.

[Regenerate a Content or File Preview](#)

If content or a file doesn't have a preview or the preview quality is poor, try to regenerate the preview.

Enable Salesforce Files Sync

Enable Salesforce Files Sync to allow users to sync files between their devices and Salesforce.

1. From Setup, enter *Salesforce Files* in the **Quick Find** box.
2. Under **Settings**, select **General Settings**.
3. At the bottom of the Salesforce Files Sync Settings page, click **Edit**.
4. Select **Enable Files Sync**.
5. Click **Save**.

Salesforce Files Sync is now enabled for your organization.

Next, grant users access to Salesforce Files Sync.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Salesforce Files Sync:

- "Customize Application"

Grant Users Access to Salesforce Files Sync

After enabling Salesforce Files Sync, grant your users access by either creating and assigning a permission set or by granting permission on profiles.

[Grant Access to Salesforce Files Sync Using a Permission Set](#)

Permission sets are an easy way to enable Salesforce Files Sync for users.

[Enable Salesforce Files Sync for Profiles](#)

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

USER PERMISSIONS

To enable Salesforce Files Sync for users:

- "Customize Application"

Grant Access to Salesforce Files Sync Using a Permission Set

Permission sets are an easy way to enable Salesforce Files Sync for users.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. Fill out the required fields.

Label

The unique label for the permission set. For example, you might call this permission set "Salesforce Files Sync Enabled".

API Name

The unique name used by the Force.com API.

Description

A description of this permission set. For example, "Enables Salesforce Files Sync for assigned users. Salesforce Files Sync allows users to automatically sync files across devices."

4. Select a user license option.

USER PERMISSIONS

To create a permission set:

- "Customize Application"

 **Note:** If you plan to assign this permission set to users with both Salesforce and Chatter Only licenses, select — *None* —.

5. Click **Save**.
The overview page for your new permission set appears.
6. Under System, click **System Permissions**.
7. At the top of the System Permissions list, click **Edit**.
8. Select **Sync Files**.
9. Click **Save**.

Assign the permission set to users who should have access to Salesforce Files Sync.

SEE ALSO:

[Permission Set Licenses](#)

Enable Salesforce Files Sync for Profiles

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select the profile that will have the Salesforce Files Sync permission.
3. On the profile detail page, click **Edit**.
4. Under Administrative Permissions, select **Sync Files**.
5. Click **Save**.

SEE ALSO:

[Profiles](#)

USER PERMISSIONS

To enable Salesforce Files Sync for profiles:

- “Customize Application”

Install Salesforce Files Sync

The Salesforce Files Sync client syncs files between user's computers and Salesforce. Users can also access synced files from Salesforce 1.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Users can download Salesforce Files Sync from Chatter.

1. From your personal settings, enter *Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click the **Download** button.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

Configure File Upload and Download Security Settings

To provide more security, control the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the **Quick Find** box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that can pose a security risk, select **Don't allow HTML uploads as attachments or document records**.

This setting blocks the upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

Warning: Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
 - HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
 - After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.
4. Set download behavior for each file type:
 - a. **Download** (recommended): The file, regardless of file type, is always downloaded.
 - b. **Execute in Browser:** The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
 - c. **Hybrid:** Salesforce Files are downloaded. Attachments and documents execute in the browser.
 5. Click **Save**.

Tips and Best Practices for Administering Salesforce Files Sync

Monitor Salesforce Files Sync access and usage with the Salesforce Files Sync administrator tools.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To configure file upload and download settings:

- "Customize Application"

View When and How Users Access Salesforce Files Sync

Once Salesforce Files Sync has been enabled for users, review how often users access the application from their desktop, or how they share files.

- The Login History page lists logins to the Salesforce Files Sync desktop application under the Application column as “Salesforce Files”. To view these logins, export your organization’s login history to a CSV file or create a custom list view with the Application column displayed prominently.
- View an individual user’s login history on their User detail page in the Login History related list.

Revoke Access to Salesforce Files Sync

Things happen—users have their laptops stolen, people leave the company. Revoke access to Salesforce Files Sync to prevent data from falling into the wrong hands.

- On mobile devices, synced files are included in the Salesforce1 application. If mobile security has been compromised, revoke the user’s access to the Salesforce1 application.
- On desktop and laptop computers, Salesforce Files Sync stores synced files in the “Salesforce Files Sync” folder. When you disable the “Sync Files” permission for an individual user, the files no longer sync with Salesforce. However, previously synced files remain in the Salesforce Files Sync folder on the user’s computer.

To make disabling Salesforce Files Sync for individual users easier, we recommend [enabling Salesforce Files Sync using a permission set](#) on the user record rather than [enabling the feature for profiles](#).

SEE ALSO:

[Monitor Login History](#)

Regenerate a Content or File Preview

If content or a file doesn’t have a preview or the preview quality is poor, try to regenerate the preview.

The file is added to a queue while the regeneration is in progress. The existing preview is deleted immediately and users don’t a preview while the file is in the queue.

You can’t regenerate a preview for encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB.

1. From Setup, enter *Regenerate Previews* in the Quick Find box, then select **Regenerate Previews**.
2. Specify either the Content Document ID or the Content Version ID.
If you specify the Content Document ID but don’t specify the Version Number, the latest version is used.

To see whether the preview regenerated successfully, navigate to the file’s detail page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer**

USER PERMISSIONS

To regenerate a preview:

- “Customize Application”

Salesforce Files Connect

With Files Connect, Salesforce users can access, share, and search external data from systems like Google Drive, SharePoint, or Box.

[The Files Connect Setup Process](#)

The setup process for Files Connect differs for cloud-based and on-premises external data sources.

[Enable Salesforce Files Connect for Your Organization](#)

Let users search and share files from external systems like Google Drive and SharePoint.

[Let Users and Administrators Access Files Connect Data Sources](#)

After you enable Files Connect, give users and administrators permission to access specific external data sources from Salesforce.

[Create an Authentication Provider for Box](#)

To use Box as an external data source, you must create an authentication provider for it in Salesforce.

[Define an External Data Source for Box](#)

Let users access their Box content from Files home, feed posts, and search.

[Create an Authentication Provider for Google Drive](#)

To use Google Drive as an external data source, you must create an authentication provider for it in Salesforce. The process begins with creating a related project in the Google Developers console.

[Define an External Data Source for Google Drive](#)

Let Chatter users access their Google Drive content from the Files tab, feed posts, and search. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

[Create an Authentication Provider for SharePoint Online Using Azure \(Preferred Method\)](#)

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in a Microsoft Azure web application.

[Create an Authentication Provider for SharePoint Online or OneDrive for Business Using Office 365 \(Alternate Method\)](#)

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in an Office 365 app.

[Define an External Data Source for SharePoint Online or OneDrive for Business](#)

With Files Connect and Chatter, Salesforce can access content from Microsoft's cloud-based systems.

[Set Up a Secure Agent for SharePoint 2010 or 2013](#)

A Secure Agent provides secure communication between Salesforce and on-premises data in SharePoint 2010 or 2013. The Files Connect on-premises solution is available only to customers who already own the license.

[Ensure Access with Secure Agent Clusters](#)

Secure Agent clusters provide failover protection, ensuring that Salesforce users can always access on-premises external data sources like SharePoint 2010 or 2013.

[Define an External Data Source for SharePoint 2010 or 2013](#)

Let Salesforce access data in your on-premises system. Files Connect and Chatter make it possible. The Files Connect on-premises solution is available only to customers who already own the license.

[Include a Files Connect Data Source in Global Search](#)

Combine searches for Salesforce data with external data from Google Drive, SharePoint, OneDrive for Business, or Box. Via the API, developers can automate the process with supported SOQL or SOSL queries.

[Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries](#)

After you create an external object for a SharePoint data source, some special steps are needed to search or query any custom properties it contains.

[Define a Simple URL External Data Source](#)

If Chatter is enabled for your organization, Salesforce can access data hosted on another Web domain for use in the Files tab and feed.

The Files Connect Setup Process

The setup process for Files Connect differs for cloud-based and on-premises external data sources.

Tip: For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

First, enable Files Connect, and let users access related external data sources

1. [Enable Salesforce Files Connect for Your Organization](#).
2. [Let Users and Administrators Access Files Connect Data Sources](#).

For cloud-based data sources, create an authentication provider, and then define the source

If you use Google Drive:

1. [Create an Authentication Provider for Google Drive](#).
2. [Define an External Data Source for Google Drive](#).

If you use Microsoft's cloud systems:

1. [Create an Authentication Provider for SharePoint Online Using Azure \(Preferred Method\)](#).
2. [Define an External Data Source for SharePoint Online or OneDrive for Business](#).

If you use Box:

1. [Create an Authentication Provider for Box](#)
2. [Define an External Data Source for Box](#)

For on-premises data sources, set up a Secure Agent, and then define the source

Note: This process is available only to customers who have the paid permission set license, "Files Connect for on-premises external data sources." This license is no longer available for purchase.

1. [Set Up a Secure Agent for SharePoint 2010 or 2013](#) on a Linux or Windows server to securely connect Salesforce to data stored behind your firewall.
2. [Define an External Data Source for SharePoint 2010 or 2013](#).

Include the external data in global search

To let users access external data in global Salesforce searches, you'll need to [create an external object and give users access to its fields](#). This is an optional step, but highly recommended to best integrate external data with Salesforce.

For per-user data sources, have users authenticate in Salesforce

If you specified per-user authentication for a data source and exposed it through profiles or permission sets, ask authorized users to [provide their data source credentials](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Start accessing, sharing, and searching external files!

Now users can [access and share external files](#) via the Files tab and feed, and [search for them](#) right alongside their Salesforce content.

Enable Salesforce Files Connect for Your Organization

Let users search and share files from external systems like Google Drive and SharePoint.

1. From Setup, enter *Files Connect* in the **Quick Find** box, then select **Files Connect** under **Settings**.
 2. Click **Edit**, and then select **Enable Files Connect**.
 3. For File Sharing, select one of the following:
 - **Copy** stores a copy of external files in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system.
 - **Reference** points to external files stored outside Salesforce. No file previews are available, and file downloads require user access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup).
-  **Tip:** Choose the Copy mode if your organization shares files with external customers or partners. Choose the Reference mode to reflect access restrictions from the external system in Salesforce.

Regardless of sharing mode, files in Salesforce don't reflect file revisions in external systems. However, Reference mode points to the latest versions in those systems.

[The Files Connect Setup Process](#)

[Let Users and Administrators Access Files Connect Data Sources](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Salesforce Files Connect:

- "Customize Application"

Let Users and Administrators Access Files Connect Data Sources

After you enable Files Connect, give users and administrators permission to access specific external data sources from Salesforce.

 **Tip:** Though you can provide access to data sources via permission sets or profiles, permission sets let you more quickly adjust access for several types of users. Regardless of which method you choose, be sure to give administrators access so they can configure data sources.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets** or enter *Profiles* in the **Quick Find** box, then select **Profiles**.

2. Create a new permission set or profile, or click an existing one.
If you use a permission set, User License must be set to the default option, "None."

3. For a permission set, click **System Permissions**, then click **Edit**.
For a profile, click **Edit**, and scroll down to the Administrative Permissions section.

4. Do either of the following, and then click **Save**.

- To access cloud-based data sources like SharePoint Online, select **Files Connect Cloud**.
- To access on-premises data sources like SharePoint 2010 or 2013, select **Files Connect On-premises**.

 **Note:** The on-premises permission is available with a paid permission set license, "Files Connect for on-premises external data sources." To enable Files Connect on-premises for a user:

- a. [Assign the Files Connect license to the user](#).
- b. Create a permission set and add the "Files Connect On-premises" permission to it.
- c. Assign the permission set to the user.

5. For a permission set, click **Manage Assignments** in the toolbar at the top of the page. Then click **Add Assignments**, select users for the permission set, and click **Assign**.

 **Important:** Include any administrators who need to configure external data sources.

6. If you haven't already, define the external data sources for your organization:

- [Define an External Data Source for SharePoint Online or OneDrive for Business](#)
- [Define an External Data Source for SharePoint 2010 or 2013](#)
- [Define an External Data Source for Google Drive](#)
- [Define an External Data Source for Box](#)

 **Note:** If you select an identity type of Named Principal for the data source, skip the steps below. But if you select Per User, read on.

7. In Setup, return to the detail page for the permission set or profile. Then do either of the following:

- For a permission set, in the Apps section, click **External Data Source Access**.
- For a profile, go to the Enabled External Data Source Access related list.

8. Click **Edit**, add specific data sources to the Enabled External Data Sources list, and click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set permissions:

- "Customize Application"

To use Files Connect for on-premises external data sources:

- "API Enabled"

(Users enter their credentials when they first access external data sources, or from their personal settings on the Authentication Settings for External Systems page.)

SEE ALSO:

- [The Files Connect Setup Process](#)
- [Enable Salesforce Files Connect for Your Organization](#)
- [Permission Sets](#)
- [Profiles](#)

Create an Authentication Provider for Box

To use Box as an external data source, you must create an authentication provider for it in Salesforce.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

Create an Authentication Provider in Salesforce

1. In Setup, enter *Auth. Providers* in the **Quick Find** box, then select **Auth. Providers**.
2. Click **New**.
3. For **Provider Type**, select **OpenID Connect**, and then set the following options:
 - **Name**—Enter the name you want to appear in Salesforce.
 - **URL Suffix**—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the Name entry.
 - **Consumer Key**—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
 - **Consumer Secret**—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
 - **Authorize Endpoint URL**—Enter `https://account.box.com/api/oauth2/authorize`
 - **Token Endpoint URL**—Enter `https://api.box.com/oauth2/token`
 - **User Info Endpoint URL**—Leave empty.
 - **Default Scopes**—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the **Callback URL** entry to a text file. (You'll use this when creating the Box application.)
5. [Create a Box application](#). Then return to step 6.
6. When you have created the Box application, edit the Salesforce Auth Provider and replace the following values with those from the Box app.
 - **Consumer . Key**: the Box `client_id`.
 - **Consumer . Secret**: the Box `client_secret`.
7. Click **Save**. Your Box authentication provider is now ready to be used.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
- AND
- "Manage Auth. Providers"

Create a Box Application

1. Using the credentials of your Box admin account, log in to <https://app.box.com/developers/services>.
2. Click **Create a Box Application**.
3. Enter a project name, select Box content, and click **Create Application**.
4. Click **Configure your application**.
5. In the **redirect_uri** field, paste the Salesforce callback URL specified in the [OAuth2 specification](#).
6. Copy the **client_id** and **client_secret** values to a text file. Enter these values at step 6 of Create an Authentication Provider in Salesforce.

Define an External Data Source for Box

Let users access their Box content from Files home, feed posts, and search.

1. From Setup in Salesforce Classic, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Box
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)
Authentication Protocol	The protocol used to access Box. Select OAuth 2.0 .
Authentication Provider	Enter the Box Authentication Provider .
Scope	Leave blank.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To define an external data source:

- “Customize Application”

Field	Description
Start Authentication Flow on Save	Select to immediately test the settings above.

Create an Authentication Provider for Google Drive

To use Google Drive as an external data source, you must create an authentication provider for it in Salesforce. The process begins with creating a related project in the Google Developers console.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

Create a Project in the Google Developers Console

- Using the credentials of your Google App for Work admin account, log in to <https://console.cloud.google.com>.
- In the title bar, expand **Go to Project** and click **Create Project**.
- Enter a project name, and click **Create**.
- In the project dashboard, click the menu icon in the top left, then click **API Manager**.
- In the API manager, go to the Google APIs tab and search for *Google Drive API*.
- Click **Google Drive API** in the search results, then click **Enable API**.
- Click **Credentials**, located in the left-hand menu.
- In the OAuth Consent Screen tab, enter a valid email address and product name. Then click **Save**.
- In the Credentials tab, click **Add credentials** and select `OAuth client ID`.
- Select `Web application` and click **Create**.
- Copy the client ID and client secret values to a text file. You'll use these values when creating an authentication provider in Salesforce.

Create an Authentication Provider in Salesforce

- In Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
- Click **New**.
- For `Provider Type`, select **OpenID Connect**, and then set the following options:
 - `Name`—Enter the name you want to appear in Salesforce.
 - `URL Suffix`—Enter the suffix at the end of the URL path. For example, in the path, `https://login.salesforce.com/services/authcallback/00Dx0000000001/MyGoogleProvider`, the suffix is "MyGoogleProvider"
 - `Consumer Key`—Enter the client ID you copied when creating the Google project.
 - `Consumer Secret`—Enter the client secret you copied when creating the Google project.
 - `Authorize Endpoint URL`—Enter `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create authentication providers:

- "Customize Application" AND "Manage Auth. Providers"

- **Token Endpoint URL**—Enter `https://accounts.google.com/o/oauth2/token`
 - **Default Scopes**—Enter `openid email profile https://www.googleapis.com/auth/drive`
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the **Callback URL** entry to a text file. (You'll use this when editing the Google project.)

Edit the Project in the Google Developer Console

1. In the API Manager, click **Credentials**, located in the left-hand menu.
2. Click on the previously created Web application.
3. In the Authorized Redirect URIs section, add the Callback URL you copied when creating the authentication provider in Salesforce.
4. Click **Save**.

Define an External Data Source for Google Drive

Let Chatter users access their Google Drive content from the Files tab, feed posts, and search. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Google Drive
Identity Type	<p>The identity type used to authenticate to the external data source.</p> <p>Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source..)</p> <p>Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.</p>

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
Authentication Protocol	The protocol used to access Google Drive. Select OAuth 2.0 .
Authentication Provider	Enter the Google Drive authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test the settings above.

Create an Authentication Provider for SharePoint Online Using Azure (Preferred Method)

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in a Microsoft Azure web application.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

To fully configure an authentication provider, complete these steps.

1. [Create an Authentication Provider Using Placeholder Values](#)
2. [Register a Web Application in the Azure Management Console](#)

 **Note:** If you do not have access to the Azure Management Console, or you need to authenticate to OneDrive for Business, follow these instructions to register your app in Office 365: [Create an Authentication Provider for SharePoint Online or OneDrive for Business Using Office 365 \(Alternate Method\)](#).

3. [Configure the Authentication Provider in Salesforce](#)

Create an Authentication Provider Using Placeholder Values

The authentication provider provides the redirect URI you need to register your app.

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For *Provider Type*, select **OpenID Connect**, and then set the following options.
 - *Name*—Enter the name you want to appear in Salesforce.
 - *URL Suffix*—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the *Name* entry.
 - *Consumer Key*—Enter a placeholder value.
 - *Consumer Secret*—Enter a placeholder value.
 - *Authorize Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Token Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Default Scopes*—Leave empty.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
- AND
- "Manage Auth. Providers"

4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the `Callback URL` entry to a text file.

Register a Web Application in the Azure Management Console

1. Log in to Azure at `https://manage.windowsazure.com/`. (If you have any trouble, connect to Azure with your browser in “incognito” mode.)
2. In the left navigation panel, select **Active Directory**.
3. Select your active directory.
4. On the Active Directory page, select **Applications** from the header menu.
5. Click **Add** in the footer menu.
6. Choose **Add an application my organization is developing**.
7. Enter a name for your app, and choose **Web Application and/or Web API**. Click the arrow.
8. On the **App Properties** screen, enter:
 - `Sign-on URL`—Enter a URL. (You can change this value later.)
 - `App ID URI`—Enter a unique URI. (You can change this value later.)
9. Click the checkmark to complete.
10. Once the app is created, click **Configure** from the header menu.
11. Copy the `Client ID` to a text file—you need this ID to configure the auth provider in Salesforce.
12. Create a key with a duration of 1 year or 2 years. (You’ll see the key value after you save.)
13. Update `Reply URL` with the callback URL that you copied from your Salesforce Authentication Provider.
14. Remove any existing application permissions.
15. Click **Add application** and add Office 365 Sharepoint Online.
16. Click **Delegated Permissions**, and then click the arrow to add the delegated permissions you want.
17. Click **Save** from the footer menu.
18. Copy the displayed key value to your text file.

Configure the Authentication Provider in Salesforce

In Salesforce, replace the original placeholder values with the correct ones from the Azure app.

1. In Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **Edit** next to the authentication provider you created previously.
3. Change the following values.
 - `Consumer Key`—Enter the Client Id you copied to a text file.
 - `Consumer Secret`—Enter the key you copied to a text file.
 - `Authorize Endpoint URL`—Enter the URL as follows:
`https://login.microsoftonline.com/common/oauth2/authorize?prompt=consent&resource=https%3A%2F%2FYOUR_TENANT.sharepoint.com%2F`
 - `Token Endpoint URL`—Enter the URL as follows:
`https://login.microsoftonline.com/common/oauth2/token`

- **SharePoint Online example**

```
https://login.microsoftonline.com/common/oauth2/authorize?prompt=consent&resource=https%3A%2F%2Fcontenthubblitz.sharepoint.com%2F
```

4. Click **Save**. Your authentication provider is now ready for use.

SEE ALSO:

[The Files Connect Setup Process](#)

Create an Authentication Provider for SharePoint Online or OneDrive for Business Using Office 365 (Alternate Method)

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in an Office 365 app.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

To fully configure an authentication provider, complete these steps.

1. [Create an Authentication Provider Using Placeholder Values](#)
2. [Register an Office 365 App](#)

 **Note:** If you have access to the Azure Management Console, you can register your provider using Azure: [Create an Authentication Provider for SharePoint Online Using Azure \(Preferred Method\)](#) on page 3842

3. [Edit the Authentication Provider in Salesforce](#)

Create an Authentication Provider Using Placeholder Values

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For *Provider Type*, select **Microsoft Access Control Service**, and then set the following options.
 - *Name*—Enter the name you want to appear in Salesforce.
 - *URL Suffix*—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the *Name* entry.
 - *Consumer Key*—Enter a placeholder value.
 - *Consumer Secret*—Enter a placeholder value.
 - *Authorize Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Token Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Default Scopes*—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the *Callback URL* entry to a text file. (You use this when registering an Office 365 app.)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
- AND
- "Manage Auth. Providers"

Register an Office 365 App

1. Log in to your Office365 account as an administrator, and go to one of the following URLs.

SharePoint Online

`https://your company name.sharepoint.com/site collection path/_layouts/15/appregnew.aspx`

OneDrive for Business

`https://your company name-my.sharepoint.com/_layouts/15/appregnew.aspx`

2. Set the following options.
 - `Client Id`—Click **Generate**, and copy the generated value to a text file.
 - `Client Secret`—Click **Generate**, and copy the generated value to a text file.
 - `Title`—Enter a name for the app.
 - `App Domain`—Enter the domain name of your Salesforce org.
 - `Redirect URL`—Enter the Callback URL you copied when creating the Authentication Provider in Salesforce.

3. Click **Create**.

Now you configure the newly created app to access SharePoint resources.

4. Go to one of the following URLs.

SharePoint Online

`https://your company name.sharepoint.com/site collection path/_layouts/15/appinv.aspx`

OneDrive for Business

`https://your company name-my.sharepoint.com/_layouts/15/appinv.aspx`

5. Set the following options.
 - `App Id`—Enter the Client Id you copied to a text file, then click **Lookup**.
 - `Title`—Keep the default value.
 - `App Domain`—Keep the default value.
 - `Redirect URL`—Keep the default value.
 - `Permission Request XML`—Enter a string with this format.

SharePoint Online

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="[SCOPE]" Right="[PLACEHOLDER]"/>
</AppPermissionRequests>
```

OneDrive for Business

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="http://sharepoint/content/tenant"
  Right="[PLACEHOLDER]"/>
  <AppPermissionRequest Scope="http://sharepoint/social/tenant" Right="Read"/>
</AppPermissionRequests>
```

6. For SharePoint Online, replace [SCOPE] with one of these values.

! **Important:** Office 365 recognizes only these scope URLs; copy them exactly, without changes.

- `http://sharepoint/content/sitecollection/web` to let users access a single site (but not its subsites).
- `http://sharepoint/content/sitecollection` to let users access a single site collection (including all subsites).
- `http://sharepoint/content/tenant` to let users access all site collections.

7. Replace [PLACEHOLDER] with one of these values:

- Read
- Write
- Manage
- Full Control

For details about the differences between permission levels above, see the [Microsoft website](#).

8. Click **Create**.

Edit the Authentication Provider in Salesforce

In Salesforce, replace the original placeholder values with the correct ones from the Office 365 app.

1. In Setup, enter *Auth. Providers* in the Quick Find box, then select **Auth. Providers**.

2. Click **Edit** next to the authentication provider you created previously.

3. Change the following values:

- **Consumer Key**—Enter the Client Id you copied to a text file.
- **Consumer Secret**—Enter the Client Secret you copied to a text file.
- **Authorize Endpoint URL**—Enter the URL of the OAuthAuthorize.aspx page in Office 365. The URL format is as follows.

SharePoint Online

```
https://your company name.sharepoint.com/site collection
path/_layouts/15/OauthAuthorize.aspx
```

OneDrive for Business

```
https://your company name-my.sharepoint.com/_layouts/15/OauthAuthorize.aspx
```

- **Token Endpoint URL**— Enter a URL in the following format.

SharePoint Online

```
https://accounts.accesscontrol.windows.net/your company
nameonmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/your
company namesharepoint.com@your company name.onmicrosoft.com
```

OneDrive for Business

```
https://accounts.accesscontrol.windows.net/your company
nameonmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/your
company name-my.sharepoint.com@your company name.onmicrosoft.com
```

4. Click **Save**. Your authentication provider is now ready for use.

Define an External Data Source for SharePoint Online or OneDrive for Business

With Files Connect and Chatter, Salesforce can access content from Microsoft's cloud-based systems.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint Online or Files Connect: Microsoft OneDrive for Business .
Site URL	<p>The URL of your SharePoint site, site collection, or web app.</p> <p> Important: The URL must begin with <i>https</i>. It should look like this: <code>https://salesforce.sharepoint.com/HRSite</code></p> <p>(Don't copy the URL seen in the browser when accessing SharePoint. It should not look like this: <code>https://salesforce.sharepoint.com/HRSite/SitePages/Home.aspx</code>)</p>
Exclude Other Site Collections	Accesses only the site collection specified by the URL, ignoring any other site collections. This should always be enabled if any users are currently allowed to access the root site collection.
Identity Type	<p>The identity type used to authenticate to the external data source.</p> <p>Select Per User to require separate credentials for each user who accesses the data source.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
	(Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.) Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol used to access SharePoint Online. Select OAuth 2.0 .
Authentication Provider	Enter the SharePoint Online authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test your settings or to create an external object for this external data source.

[The Files Connect Setup Process](#)

Set Up a Secure Agent for SharePoint 2010 or 2013

A Secure Agent provides secure communication between Salesforce and on-premises data in SharePoint 2010 or 2013. The Files Connect on-premises solution is available only to customers who already own the license.

 **Note:** The Secure Agent setup process is available only to customers who have the paid permission set license, "Files Connect for on-premises external data sources." This license is no longer available for purchase.

To fully configure a Secure Agent, complete these steps:

1. [Create a Connected App for the Secure Agent](#)
2. [Create a Profile and User Specific to the Secure Agent](#)
3. [Create the Agent in Salesforce, and Download the Installer to Your Server](#)
4. Install and Run the Agent on a [Windows Server](#) or a [Linux Server](#)
5. [Install Secure Agent Plug-ins for Your On-premises Data Source](#)
6. [Update Previously Installed Plug-ins](#)
7. [Import Any Required Certificates](#)
8. [Track and Troubleshoot Secure Agent Activity](#)

 **Tip:** For a visual walk-through, see this [video tutorial of Secure Agent setup](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To set up a Secure Agent:

- "Customize Application"

Create a Connected App for the Secure Agent

1. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the Connected Apps section, click **New**.
3. In the Basic Information section, enter the following settings:
 - *Connected App Name*—Enter a distinctive name like “Secure Agent App.”
 - *API Name*—Leave the default value.
 - *Contact Email*—Enter your administrator’s address.
4. In the API section, select **Enable OAuth Settings**, and enter the following settings:
 - *Callback URL*—Enter `https://login.salesforce.com` for a production instance, or `https://test.salesforce.com` for a sandbox.
 - *Use Digital Signatures*—*Deselect* this option.
 - *Selected OAuth Scopes*—Add “Access and manage your data (api)” and “Perform requests on your behalf at any time (refresh_token, offline_access).”
5. Click **Save**.
6. In Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
7. Next to the new app, click **Edit**, and then enter the following settings:
 - *Permitted Users*—Select “Admin approved users are pre-authorized.”
 - *IP Relaxation*—Select “Relax IP restrictions.”
8. Click **Save**.

Create a Profile and User Specific to the Secure Agent

1. In Setup, enter *Profiles* in the *Quick Find* box, then select **Profiles**.
2. Next to the Standard User profile, click **Clone**.
3. For *Profile Name*, enter a distinctive name like “Secure Agent profile.”
4. Click **Save**.
5. Next to the new profile, click **Edit**.
6. In the Connected App Access section, select the connected app you created for the agent.
7. In the Administrative Permissions section, select **Modify Secure Agents**.
8. Click **Save**.
9. In Setup, enter *Users* in the *Quick Find* box, then select **Users**.
10. Click **New User**.
11. For *Profile*, select the profile you created for the agent. Then complete the remaining required fields, and click **Save**.

 **Important:** Be sure to *deselect* “Generate new password and notify user immediately.”

Create the Agent in Salesforce, and Download the Installer to Your Server

1. In Setup, enter *Secure Agents* in the *Quick Find* box, then select **Secure Agents**.

2. Click **New Secure Agent**.
3. Enter a **Label** for the user interface and **Name** for the API.
 -  **Note:** Choose the label carefully, because you can't change it. Salesforce relies on a consistent label to remain connected to the agent.
4. For **Proxy User**, enter the user you created for the Secure Agent.
5. Click **Save**.
6. On the details page, click **Download Installer**, and then choose **Linux Agent** or **Windows Agent**.
7. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**, and click the name of the connected app you created. Then, in the API section, copy the Consumer Key value to a text file.
8. To your server, copy the text file and the downloaded installer file (sfdc-agent.zip for Windows, or sfdc-agent.run for Linux).
 -  **Important:** Make sure the server can access both Salesforce and your on-premises data source, and has Java 6.x or 7.x installed.

Install and Run the Agent on a Windows Server

1. Extract the files in sfdc-agent.zip. Then double-click SecureAgentInstaller.exe
2. Click **Next**, and enter an installation folder. Click **Next** again, and finish initial installation.
3. When the configuration window appears, enter proxy settings used to connect to Salesforce.
 -  **Tip:** To change proxy settings after installation (due to a new password for example), enter the `agent:proxyconfig` command in the agent interface.
4. For Login Server Type, choose **Production** or **Sandbox**.
 -  **Tip:** To later change this and following configuration settings, you must uninstall and reinstall the agent.
5. For Oauth Client Key, enter the Consumer Key value you copied to the text file.
6. For Encryption Settings, select one of the following:
 - **Generate** to randomly generate a 1,024-bit public/private key pair. See the [Re-use existing certificate](#) setting if you need another key size. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.
 - **Re-use existing keystore** to reuse a key pair from a previous agent installation. The keystore is in this location: `[agent installation folder]\etc\auth.jks`.
 -  **Note:** If you select an existing keystore, skip to step 10.
 - **Re-use existing certificate** to select your own certificate and private key. This option enables you to use a different key size. Contact Salesforce for more information.
7. In Salesforce, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
8. Click **Edit** next to the connect app, and select **Use Digital Signatures**.
9. Click **Choose File**, and select the *.509 certificate. Then click **Save**.
10. Return to the agent installer, and click **Next** to complete the installation.
11. Click **Install Agent as Service** to start the "Salesforce Secure Agent" service on your server.

 **Tip:** To access services in Windows, choose **Start > Administrative Tools > Services**.

Install and Run the Agent on a Linux Server

1. Run the installer using one of these commands:

- Production instance:

```
./sfdc-agent.run
```

- Sandbox instance:

```
./sfdc-agent.run -l https://test.salesforce.com
```

- Production instance with your own public/private key pair:

```
./sfdc-agent.run -l https://login.salesforce.com -p [private key filename].PKCS8 -f [public key filename].X509
```

- Production instance with a keystore generated during a previous installation:

```
./sfdc-agent.run -l https://login.salesforce.com -j [path to *.jks file]
```

You'll find the *.jks file here: `[agent installation folder]/etc/auth.jks`

2. Follow the on-screen instructions to enter an installation folder and proxy settings.

 **Tip:** To change proxy settings after installation, enter the `agent:proxyconfig` command in the agent interface.

3. When the installer prompts you for an OAuth Client Key, enter the Consumer Key value you copied to the text file.

 **Note:** If you specified a keystore generated during a previous installation, skip to step 8.

4. If prompted, generate a random 1,024-bit public/private key pair. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.

 **Note:** Contact Salesforce if you need to use a different key size.

5. In Salesforce, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.

6. Click **Edit** next to the connect app, and select **Use Digital Signatures**.

7. Click **Choose File**, and select the *.509 certificate. Then click **Save**.

8. Return to the agent installer, and press Enter to complete the installation.

9. Start the agent with this command: `[agent installation folder]/bin/start`

Install Secure Agent Plug-ins for Your On-premises Data Source

To connect a Secure Agent to an external data source in Salesforce, you need to install the necessary plug-ins.

1. In Setup, enter *Secure Agents* in the *Quick Find* box, then select **Secure Agents**.

2. Click an agent name to access its details page.

3. In the Secure Agent Plugins list, click **New**.

For SharePoint 2010 or 2013, you'll need to install the following plug-ins:

- Files Connect SharePoint
- Files Connect Remote Connector Service
- Secure Transport Client Service

4. To install a plug-in, select it from the Type menu, enter a distinctive name, and click **Save**. Repeat the process for each required plug-in.

Update Previously Installed Plug-ins

When plug-in updates are available, administrators receive weekly email notifications.

1. In Setup, enter *Secure Agents* in the **Quick Find** box, then select **Secure Agents**.
2. In the Secure Agent Plugins list, if the Update Available column states "Yes," click **Edit** for that plug-in.
3. Select **Update to the recommended version on save**, and click **Save**.

Import Any Required Certificates

In the agent interface, you can press the TAB key to access a variety of commands. If your SharePoint server requires a self-signed certificate, or a certificated signed by an unofficial authority, you must use the `rsc:importcert` command. Then enter the path to import the self-signed certificate, or the root certificate of the authority, into the Secure Agent trust store.

The `rsc:listcert` command lists all certificates currently in the trust store, while `rsc:deletecert` deletes the specified certificate from the store.

Track and Troubleshoot Secure Agent Activity

Download log files to precisely monitor agent events.

1. In Setup, enter *Secure Agents* in the **Quick Find** box, then select **Secure Agents**.
2. Click the name of a previously created Secure Agent to open its detail page.
3. Click either of the following:
 - **Download Logs** to download a compressed .zip file containing text logs.
 - **Download Diagnostics** to see the current agent state, including the list of installed plug-ins and Java virtual machine status.

Ensure Access with Secure Agent Clusters

Secure Agent clusters provide failover protection, ensuring that Salesforce users can always access on-premises external data sources like SharePoint 2010 or 2013.

 **Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” This license is no longer available for purchase.

Create the Secure Agent Cluster

1. Create multiple Secure Agents on different servers by repeating this process: [Set Up a Secure Agent](#).
2. From Setup, enter *Secure Agent Clusters* in the **Quick Find** box, then select **Secure Agent Clusters**.
3. Click **New Secure Agent Cluster**.
4. Enter a **Label** for the user interface and **Name** for the API.
5. To add available agents to the cluster, select them, and click **Add**.

Change the priority order in which agents are used by moving them up or down in the Selected Secure Agents list. The accessible agent with highest priority is used first.

6. Click **Save**.

Check Cluster Status

1. From Setup, enter *Secure Agent Clusters* in the **Quick Find** box, then select **Secure Agents Clusters**.
2. Click a cluster name to access its details page.
3. Note the overall status for the cluster. Green indicates that all agents are accessible, yellow that some are, and red that none are.
4. Note the status of individual agents and these additional details:
 - The **Priority** column shows the order in which agents are used. To change priority, click **Edit**, and move agents up or down in the Selected Secure Agents list.
 - The **Active** column indicates which agent is currently in use.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise**, **Performance**, **Unlimited**, and **Developer Editions**

USER PERMISSIONS

To set up Secure Agent clusters:

- “Customize Application”

Define an External Data Source for SharePoint 2010 or 2013

Let Salesforce access data in your on-premises system. Files Connect and Chatter make it possible. The Files Connect on-premises solution is available only to customers who already own the license.

 **Note:** This setup process is available only to customers who have the paid permission set license, “Files Connect for on-premises external data sources.” This license is no longer available for purchase.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint
Secure Agent	A service running on a Linux or Windows server on your intranet that lets you securely connect Salesforce to your on-premises SharePoint server. See Set Up a Secure Agent for SharePoint 2010 or 2013 .
Site URL	The URL of your SharePoint site, site collection, or web app.  Important: The URL must begin with <i>https</i> and end with the site name. (Don't copy the URL seen in the browser when accessing SharePoint.)
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To define an external data source:

- “Customize Application”

Field	Description
	Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol required to access SharePoint. Select Password Authentication . (This option supports HTTP Basic and NTLM authentication.)
Administration Username	The username Salesforce uses to test the connection to SharePoint. You don't need to enter a SharePoint administrator's username. However, ensure that the credentials you use have adequate privileges to access the data source, perform searches, and return information.
Administration Password	The password Salesforce uses to test the connection to SharePoint.

Note: Salesforce users can't access SharePoint 2010 if anonymous access is enabled for the web application.

[The Files Connect Setup Process](#)

Include a Files Connect Data Source in Global Search

Combine searches for Salesforce data with external data from Google Drive, SharePoint, OneDrive for Business, or Box. Via the API, developers can automate the process with supported SOQL or SOSL queries.

To include external data in global searches or API queries, first create a related external object. External objects behave similarly to custom objects, but map to data stored outside Salesforce in an external system like SharePoint. Each external object maps to a data table, and the object fields map to accessible table columns.

 **Tip:** External objects support lookup relationships similar to custom objects, letting you integrate external data into related lists and other areas throughout Salesforce. For details, see [External Object Relationships](#).

To fully configure global search, complete these steps:

1. [Choose the Layout for Global Search Results](#)
2. [Create an External Object from an External Data Source](#)
3. [Give Users Access to the External Object Fields](#)
4. [Create a Custom Tab for the External Object \(Lightning Experience Only\)](#)

To automate search with SOQL or SOSL, review the supported queries for your data source:

- [SOQL and SOSL Support for SharePoint and OneDrive External Objects](#)
- [SOQL and SOSL Support for Google Drive External Objects](#)

Choose the Layout for Global Search Results

By default, Files Connect external objects use the standard search results layout for Chatter and the Files tab. If you want to display customized search layouts for these objects, complete these quick steps.

1. From Setup, enter *Files Connect Settings* in the **Quick Find** box, then select **Files Connect Settings**.
2. Select **Use External Object Search Layout**.

Create an External Object from an External Data Source

1. Define an external data source that supports search:
 - [SharePoint Online or OneDrive for Business](#)
 - [SharePoint 2010 or 2013](#)
 - [Google Drive](#)
 - [Box](#)
2. In Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
3. Click the data source name to access the details page.
4. Click **Validate and Sync**.

 **Note:** Note: If the **Validate and Sync** button is disabled, edit the [Authentication Settings for External Systems](#) on page 5722 to enable the **Start Authentication Flow on Save** checkbox.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an external object and provide access to its fields:

- “Customize Application”

5. Select the table named "items_[data source]." Then click **Sync** to create an external object that maps to the entire source. Now you deploy the object to make the data it contains available to users.
6. Choose **Build > Develop > External Objects**.
7. Click **Edit** next to the new external object.
8. At the bottom of the page, click **Deployed**, and then click **Save**.

Give Users Access to the External Object Fields

1. In Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Click [a permission set in which you enabled Files Connect](#).
3. In the Apps section, click **Object Settings**.
4. Click the name of the external object.
5. Click **Edit**, and enable the necessary Read permissions (for the object itself, and all fields you want to reveal in Salesforce).
6. Click **Save**.

Create a Custom Tab for the External Object (Lightning Experience Only)

1. In Setup, enter *Tabs* in the search bar, then select **Tabs**.
2. Click **New** in the *Custom Object Tabs* section.
3. In Step 1 of the setup wizard, enter the name of the custom object you created from your external data source.
4. In Step 2, choose the availability and visibility of the tab to profiles. The tab does not need to be visible, but it does need to be accessible—choose either **Default On** or **Tab Hidden**.
5. Complete Step 3 and click **Save**.

SOQL and SOSL Support for SharePoint and OneDrive External Objects

SharePoint and OneDrive external objects support these standard fields and any custom fields you enable.

 **Note:** Queries on specific fields return only documents that the external data source indexed.

Field Name	Queryable	Sortable
Author	Yes	Yes
Comment	No	Yes
ContentLength	Yes	Yes
CreationDate	Yes	Yes
DisplayUrl	No	Yes
DownloadUrl	No	No
ExternalId	Yes	Yes

Field Name	Queryable	Sortable
IsFolder	Yes	Yes
	 Note: Not supported for SharePoint 2010 or 2013.	
MimeType	Yes	Yes
Name	Yes	Yes
UpdateDate	Yes	Yes
UpdatedBy	Yes	Yes

 **Note:** You can also use `ParentId__c` as query criteria to retrieve the list of documents in a folder. However, that field isn't displayed in query results unless your query specifies a `ParentId__c` value.

SOQL and SOSL Support for Google Drive External Objects

Files Connect supports all standard Google Drive properties, but not custom properties. The following properties have different field names in Salesforce external objects:

Google Property	Salesforce Field
alternateLink	DisplayUrl
createDate	CreationDate
description	Comment
downloadURL	contentStreamUri
editable	readOnly
fileSize	ContentLength
id	ExternalId
lastModifyingUserName	UpdatedBy
mimeType	MimeType
modifiedDate	UpdateDate
ownerNames	Author
originalFilename	contentStreamFileName
title	Name

This subset of fields supports SOQL and SOSL queries. (None are sortable, reflecting limitations in the Google Drive API.)

- CreationDate
- lastViewedByMeDate

- `MimeType`
- `Name`

 **Note:** Google Drive queries on the `Name` field support only one wildcard, `%`. Searches using this wildcard match only name prefixes. For example, the title "HelloWorld" would be returned with the query `Name LIKE "Hello%"` but not `Name LIKE "%World"`.

- `sharedWithMe`

 **Note:** Queries on the `sharedWithMe` field with a value of "false" are not supported, protecting confidential data.

- `starred`
- `UpdateDate`

SEE ALSO:

[The Files Connect Setup Process](#)

[Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries](#)

Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries

After you create an external object for a SharePoint data source, some special steps are needed to search or query any custom properties it contains.

Configuring Custom Properties in SharePoint

External objects in Salesforce let you select and filter on these custom properties from SharePoint:

- Custom columns defined in a Custom Content Type
- Metadata from Microsoft Word, Excel, and other Office documents

To search on these custom properties in Salesforce, a corresponding Managed Property must be created by a Sharepoint administrator.

- To display these properties in external object fields, or use them in SOQL or SOSL `SELECT` queries, set the corresponding Managed Property to `Retrievable`. (In Sharepoint 2010, this option is labeled, "Allow this property to be used in scopes.")
- To filter on these properties in external objects, or use them as query criteria in a SOQL or SOSL `WHERE` clause, set the corresponding Managed Property to `Queryable`.

Querying Resulting Fields in Salesforce

In the examples below, `CustomProperty` stands for the Custom column name defined in the Custom Content Type, or the Office document metadata name. `ManagedCustomProperty` stands for the corresponding Managed Property name.

SharePoint 2010

Use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. Two corresponding fields must exist for the external object in Salesforce: one for selecting, the other for filtering.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an external object and provide access to its fields:

- "Customize Application"

Here's a SOQL example:

```
SELECT CustomProperty FROM items_sp2010_x WHERE ManagedCustomProperty=...
```

SharePoint 2013 and Online

In most cases, `ManagedCustomProperty` can be used for both the `SELECT` and `WHERE` clause.

Here's a SOQL example:

```
SELECT ManagedCustomProperty FROM items_sp2013_x WHERE ManagedCustomProperty=...
```

However, for file types SharePoint doesn't index for search, such as .jpg, .png, and .pdf files, you must use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. As a workaround, you can define an alias on the Managed Property in SharePoint and format queries like this:

```
SELECT Alias FROM items_sp2013/Online WHERE Alias=...
```

Tip: Normally, custom properties aren't displayed on external object detail pages—defining an alias also addresses this issue.

Boolean Custom Properties

When using boolean (Yes/No) custom properties with a corresponding Managed Property set to the Text type, the corresponding external object field must be set to the Text type as well. In filters, the values "0" and "1" equal false and true, respectively. For example:

```
WHERE customBooleanWithTextManagedProperty="1"
```

"0" and "1" are also displayed as results, however, so boolean custom properties should use a Managed Property type of YesNo. Set the corresponding external object field to Checkbox to query it with standard `true` or `false` values. For example:

```
WHERE customBooleanWithYesNoManagedProperty=true
```

Metadata in Microsoft Office Documents

The Sharepoint Search service returns all metadata from Office documents as strings, so corresponding external object fields must be set to the Text type.

Dates are returned in the format, MM/DD/YYYY hh:mm:ss AM/PM, (for example, "3/31/2015 9:59:00 PM"). To query on fields using the Date type, the external object must include a corresponding Date field for filtering, and a Text field for selecting.

Limitations for Specific SharePoint Property Types in Salesforce

All versions

- Number, Currency, and Choice multiple properties can't be selected for file types SharePoint doesn't index for search. By default, this includes image, video, and .pdf files, although .pdf files are natively indexed starting with SharePoint 2013.

SharePoint 2010

- Number, Choice multiple, and Currency properties can't be selected.
- Date properties can be selected but results are unlikely to be formatted in UTC (Coordinated Universal Time), so values may reflect a different time zone than expected.

SharePoint 2013

- Multiple Line of Text, URL, Date, and Choice Dropdown properties aren't queryable.
- Choice Dropdown, Choice multiple, URL, and Date properties can't be selected.

SharePoint Online

- Multiple Line of Text, URL, and Date properties aren't queryable.
- Choice multiple and URL properties can't be selected.

[Include a Files Connect Data Source in Global Search](#)

Define a Simple URL External Data Source

If Chatter is enabled for your organization, Salesforce can access data hosted on another Web domain for use in the Files tab and feed.

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Simple URL .
URL	The URL of the server hosting data outside of Salesforce, which must begin with <i>http://</i> or <i>https://</i> .
Default External Repository	Used for SharePoint® Online®. If metadata is not accessible, use this field to create tables and default table fields.
Large Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .
Small Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
Identity Type	The identity type used to authenticate to the external data source. Select Anonymous , which doesn't require users to provide credentials when accessing the data source.
Authentication Protocol	The protocol required to access the data source. Select No Authentication .

 **Note:** Simple URL data sources can't be included in global search, so the "Validate and Sync" option isn't supported.

 **Note:** SOQL queries can't be performed on the external objects created from Simple URL data sources.

Chatter Desktop

Control access to Chatter Desktop and install and configure the Chatter Desktop Managed Version.

[Control Access to Chatter Desktop](#)

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

[Install Chatter Desktop Managed Version](#)

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

[Configure Chatter Desktop Managed Version](#)

Control Chatter Desktop settings by deploying an XML-based configuration file to each user's machine. The configuration in the file overrides the user's settings.

[Enable and Assign Permissions to Use Code Snippets](#)

Use code snippets to enter syntax-highlighted code samples through the publisher in Lightning Experience and self-service communities based on the Customer Service (Napili) template. To make code snippets available, enable them and assign the permission to use them. There are two ways to enable and assign code snippet permission: through a user profile (step 1) or through a permission set (step 2).

Control Access to Chatter Desktop

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

1. From Setup, enter *Chatter Desktop Settings* in the *Quick Find* box, then select **Chatter Desktop Settings**.
2. Select **Enable Chatter Desktop** to allow users to access Chatter data from Chatter Desktop.
Deselect this option to block access to the Chatter Desktop self-installation page and prevent all instances of Chatter Desktop from accessing Chatter data.
3. Select **Allow Chatter Desktop Managed Installations Only** to prevent non-administrators from installing Chatter Desktop.
For example, select this option if your IT department plans to deploy Chatter Desktop to your organization.
4. Save your changes.

SEE ALSO:

[Salesforce Chatter](#)

[Install Chatter Desktop Managed Version](#)

[Configure Chatter Desktop Managed Version](#)

Install Chatter Desktop Managed Version

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

! **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

The managed version of Chatter Desktop is ideal for enterprises deploying Chatter Desktop to users who don't have administrator privileges on their machines. The managed version:

- Doesn't automatically install AIR—your IT department must obtain a redistribution agreement from Adobe Systems Incorporated and deploy the required version of AIR before deploying Chatter Desktop
- Requires your IT department to accept the Chatter Desktop managed version end user license agreement on behalf of the users to which Chatter Desktop is deployed
- Doesn't automatically post to Chatter the first time Chatter Desktop launches
- Doesn't regularly check Salesforce for new versions

To install the managed version:

1. Deploy Adobe® Integrated Runtime (AIR®) version 2.6 or later (the latest version is recommended) to the machines on which you plan to deploy Chatter Desktop.

AIR is Adobe's cross-platform runtime environment for desktop applications, and is a prerequisite for Chatter Desktop.

 **Tip:** Visit these links before deploying AIR:

- AIR® overview:
http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html
- Information on obtaining an AIR® redistribution license from Adobe Systems Incorporated:
http://www.adobe.com/products/air/runtime_distribution1.html
- Installation information:
http://help.adobe.com/en_US/air/redirect/WS485a42d56cd19641-70d979a8124ef20a34b-8000.html
- Administration information:
http://help.adobe.com/en_US/air/admin/WS485a42d56cd1964167ea49bd124ef17d52a-8000.html

2. From Setup, enter *Chatter Desktop Settings* in the **Quick Find** box, then select **Chatter Desktop Settings**.

3. Click the link to download the managed version.

 **Important:** Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

SEE ALSO:

[Control Access to Chatter Desktop](#)

[Configure Chatter Desktop Managed Version](#)

Configure Chatter Desktop Managed Version

Control Chatter Desktop settings by deploying an XML-based configuration file to each user's machine. The configuration in the file overrides the user's settings.

1. Create a file named `.chatterdesktop`, add a `chatterdesktop` parent element with two child elements, `config` and `servers`.
2. Inside the `config` element, create the child elements listed in this table and add an `default` and an `editable` attribute. Both attributes can have the value `true` or `false`.
To make a child element the default setting, set the element's `default` attribute to `true`. To allow users to change a default setting through the user interface, set the element's `editable` attribute to `true`.

Child Element	Description
<code>launchOnStartup</code>	Launches the application on startup.
<code>minimizeOnClose</code>	Minimizes the application on close.
<code>notifications</code>	Enables popup notifications.
<code>criticalAlerts</code>	Enables alerts for new feed posts and comments by highlighting the taskbar icon (Windows) or causing the dock icon to bounce (Mac OS).
<code>bringToFront</code>	Brings Chatter Desktop to the foreground for new feed posts and comments.
<code>alwaysOnTop</code>	Enables Chatter Desktop to always display in the foreground.
<code>chatWindowToFront</code>	Enables the chat window to display in the foreground when a new chat is received (Mac only).
<code>chatSoundEnabled</code>	Enables sounds for new chats received.
<code>playSoundForEveryMessage</code>	Enables sounds for all chats received.

 **Note:** If the `default` attribute is set to `true` for `chatSoundEnabled` and `false` for `playSoundForEveryMessage`, a sound plays only for new chats received. If both are set to `true`, a sound plays for every chat received. If both are set to `false`, chat sounds are disabled.

3. If your organization uses instances of Salesforce other than Production and Sandbox, specify the servers that host those instances in separate `server` elements inside the `servers` element.

Inside each `server` element, include the following attributes:

- `label`—The name of the connection as you want it to appear in the user interface.
- `serverUrl`—The URL you use to log in to the instance. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

- `defaultServer`—Set to TRUE to make this server the default instance to which Chatter Desktop connects.
4. Test the `.chatterdesktop` configuration file.
 - a. Copy the `.chatterdesktop` configuration file to the user directory on your machine. The user directories are:
 - Windows—`c:\Documents and Settings\` (Windows XP) or `C:\Users\` (Windows 7)
 - Mac OS—`/Users/`
 - Linux—`/home/`
 - b. Launch Chatter Desktop and verify that it functions correctly. See [Chatter Desktop Troubleshooting Tips](#) if there are problems.
 5. Copy the `.chatterdesktop` file to the user directory on every machine running Chatter Desktop in your organization.

 **Example:** The following is a sample configuration file:

```
<chatterdesktop>
  <config>
    <launchOnStartup default="false"
      editable="false"/>
    <minimizeOnClose default="false"
      editable="true"/>
    <notifications default="true"
      editable="true"/>
    <criticalAlerts default="false"
      editable="true"/>
    <bringToForeground default="false"
      editable="true"/>
    <alwaysOnTop default="false"
      editable="false"/>
    <chatWindowToForeground default="false"
      editable="false"/>
    <chatSoundEnabled default="true"
      editable="true"/>
    <playSoundForEveryMessage default="true"
      editable="true"/>

  </config>

  <servers>
    <server label="Europe"
      serverUrl="https://emea.salesforce.com"
      defaultServer="true"/>
    <server label="Production"
      serverUrl="https://login.salesforce.com"
      defaultServer="false"/>
  </servers>
</chatterdesktop>
```

```
</servers>  
</chatterdesktop>
```

Enable and Assign Permissions to Use Code Snippets

Use code snippets to enter syntax-highlighted code samples through the publisher in Lightning Experience and self-service communities based on the Customer Service (Napili) template. To make code snippets available, enable them and assign the permission to use them. There are two ways to enable and assign code snippet permission: through a user profile (step 1) or through a permission set (step 2).

1. Enable code snippets through a user profile:
 - a. In Setup, expand **Manage Users** (**Users** in Lightning Experience), click **Profiles**, then click **Clone** next to **Standard User**.
 - b. Give the clone a **Profile Name**, and click **Save**.
 - c. On the clone page, click **Edit**.
 - d. Scroll to the **General User Permissions** section, select **Allow Inclusion of Code Snippets from UI**, and click **Save**.
 - e. Under **Manage Users**, click **Users**.
 - f. Edit each user you want to have code snippet permission, and assign them the cloned user profile.
2. Enable code snippets through a permission set:
 - a. In Setup, expand **Manage Users** (**Users** in Lightning Experience), click **Permission Sets**, then click **New**.
 - b. In the **Label** field, enter a name for the permission set.
 - c. Optionally, pick a type of user license for this permission set; pick **None** if you don't want to limit this permission set to a particular type.
 - d. Click **Save**.
 - e. On the new permission set page, under **System**, click **System Permissions**, then click **Edit**.
 - f. Select **Allow Inclusion of Code Snippets from UI**, and click **Save**.
 - g. Click **Manage Assignments**, then **Add Assignments**.
 - h. Assign the new permission set, then click **Done**.

Salesforce CRM Content

Store, share, and manage your files in content libraries.

To edit or delete libraries:	<p>"Manage Salesforce CRM Content"</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Set up Salesforce CRM Content to enable the use of content libraries in your org. Salesforce CRM Content is only available in Salesforce Classic, but files from content libraries are available in Lightning Experience if Salesforce CRM Content is enabled for your org.

Tip: For more detailed information about setting up Salesforce CRM Content, refer to the [Salesforce CRM Content Implementation Guide](#).

You can also enable Salesforce CRM Content in the Salesforce Mobile Classic app by adding the Content tab to the desired mobile configuration data sets.

To set up Salesforce CRM Content for your organization:

1. Enable Salesforce CRM Content from Setup by entering *Salesforce CRM Content* in the Quick Find box, selecting **Salesforce CRM Content**, and then selecting *Enable Salesforce CRM Content*.
2. Give users access to Salesforce CRM Content by assigning feature licenses in one of the following ways:

- To assign feature licenses to users automatically, from Setup, enter *Salesforce CRM Content* in the Quick Find box, select **Salesforce CRM Content**, and then select *Autoassign feature licenses to existing and new users*.
 - To assign feature licenses to users manually, from Setup, enter *Users* in the Quick Find box, then select **Users** and click **Edit** next to the user's name. Select the *Salesforce CRM Content User* checkbox and click **Save**.
3. Verify that the Salesforce CRM Content users have the Salesforce CRM Content user permissions enabled. The user permissions include "Manage Salesforce CRM Content," "Create Libraries," "Manage Content Permissions," "Manage Content Properties," "Manage record types and layouts for Files", and "Deliver Uploaded Files and Personal Content."
 -  **Note:** Users with the "Deliver Uploaded Files and Personal Content" user permission can create content deliveries from personal libraries. This user permission does not affect the ability to deliver content from shared libraries.
 4. Optionally, create a public group with a set of Salesforce CRM Content users. You can save time later by assigning the group to a library rather than assigning several users to the same library individually.
 5. Optionally, create one or more library permissions. Library permissions are the groups of privileges that determine user access within a library. Every user must be assigned a library permission before he or she can use a library. All new organizations contain three library permissions: library administrator, author, and viewer.
 6. Use the New Library Wizard to create a library, add members to the library, and assign library permissions to the members.
 7. Categorize and define your content:
 - a. Create content fields. These are custom fields that you assign to page layouts. The default fields are *Description*, *Tags*, and *Title*. If you want to create a field named, for example, *Reviewed By*, your custom content field would be a picklist with the names of possible reviewers.
 - b. Create a custom page layout or modify the default page layout. Page layouts are the containers for custom fields; they determine which fields are available during the publishing process and how the fields display on the content details page. You can create multiple page layouts and record types and assign a content field to any or all page layouts. For example, if sales and marketing users need to record different information about their content, you can create Sales and Marketing page layouts and record types. If you create a *Related Campaign* lookup field and add it to the Marketing page layout and record type only, users who select the Sales record type during the upload process will not have the option to choose a campaign.
 8. Optionally, enable the Add Google Doc to Salesforce service so library members can contribute Google docs to Salesforce CRM Content.

Implementation Tips

- Before creating libraries, review the files you plan to store in Salesforce CRM Content to determine how many libraries you need and what content belongs in each library. Users are given access to content based on library.
- If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.
- To enable Salesforce CRM Content functionality for leads, accounts, contacts, opportunities, cases, products, or custom objects, add the Related Content related list to the appropriate page layout.
- To send web-formatted content to colleagues, leads, or contacts and associate it with Salesforce records, add the Content Deliveries related list to the page layout for leads, accounts, contacts, opportunities, cases, campaigns, or custom objects.
- To allow users to publish, edit, and search in any of the Salesforce-supported languages, from Setup, enter *Salesforce CRM Content* in the Quick Find box, select **Salesforce CRM Content**, and then click **Enable multilanguage search and contribute**.
- To associate Google docs with a library, the Add Google Doc to Salesforce service must be activated for your organization.

- Salesforce CRM Content is available via the Customer Portal and partner portal.
- All Salesforce CRM Content items display as primary tabs in the Salesforce Console.

Best Practices

- If you are using the Related Content related list on Salesforce objects, align your custom content fields with the standard and custom fields on the object to increase the accuracy of a “Find Content” search. Clicking the **Find Content** button on the related list matches content to the fields on the record and displays search results containing the related content.
- To ensure that content is classified consistently, define consistent tag names with your contributors. For example, by establishing tag names at the outset, you can avoid having tags such as “channel” and “channels” in the same library.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
- To highlight valuable content and make it easier to find, mark it as “featured” on the content details page. Featured content receives a higher priority than similar content in search results, and appears on the Libraries tab for easy access. To feature content, users must have the `Feature Content` option checked in their library permission.
- If your organization uses Google Docs, encourage library members to add their Google docs to a library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

Customize Content Fields

Categorize and define your content

To create, modify, and delete Salesforce CRM Content custom fields for categorizing and defining your content, go to the object management settings for content. If you're using Lightning Experience, go to the Object Manager, select **Content Version**, then scroll to the fields area. If you're using Salesforce Classic, enter *Salesforce Files* in the **Quick Find** box, then select **Fields**. The data assigned to these fields during upload is available on the content details page for the life of the file. After creating custom content fields, you must assign them to a page layout. The page layout determines which fields appear when a user uploads or revises files in Salesforce CRM Content.

To create a custom content field:

1. Click **New**.
2. Choose the type of field to create, and click **Next**.
3. For relationship fields, associate an object with the field and click **Next**.
4. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
5. Choose the page layout that should display the field as an editable field.

Click **Edit** or **Del** in the Content Custom Fields & Relationships related list to edit or delete a custom content field. You cannot edit or delete the standard content fields. Deleted custom fields and their data are stored until your org permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data.

USER PERMISSIONS

To create, edit, or delete custom fields:

- "Manage Salesforce CRM Content"
- OR
- "Manage Content Properties"

Create Libraries

Store, share, and manage your files in content libraries so you can decide who has access to files in each library and what permissions they have. Each org can have up to 2,000 libraries.

Step 1: Create a New Library

1. Click **New** in the My Libraries section of the Libraries tab home page.
2. Enter a unique library name.
3. If you want, add a description.
4. Click **Save and Add Members** or, if you want to add members later, click the **Save and Close** button.

Step 2: Add Library Members

1. On the **Libraries** tab, click the library name if the library isn't already open.
2. In the **Members** section, click **Add Members**.
3. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.
4. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

 **Tip:** If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.

5. Click **Add** to add the members to the library.
6. Click **Next**.

Step 3: Assigning Library Permissions to Members

Select a library permission for each user or public group and click **Save**. For more information, see [Manage Library Permissions](#) on page 3874.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create libraries:

- "Manage Salesforce CRM Content"
- OR
- "Create Libraries"

To add members to a library:

- "Manage Salesforce CRM Content"
- OR

Manage Library checked in your library permission definition

To assign library permissions to members:

- "Manage Salesforce CRM Content"
- OR

Manage Library checked in your library permission definition

Manage Library Permissions

To manage library permissions, from Setup, enter *Content Permissions* in the Quick Find box, then select **Content Permissions**. A library permission is a group of privileges assigned to each Salesforce CRM Content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

 **Note:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has three library permissions: Library Administrator, Author, and Viewer.

To [create a custom library permission](#), click the **Add Library Permissions** button. To [edit a library permission](#), click **Edit** next to the library permission name. To [delete a library permission](#), click **Del** next to the library permission name.

 **Note:** Library permissions do not apply to personal libraries. All Salesforce CRM Content users can save files in their personal libraries.

SEE ALSO:

[Create Libraries](#)

Create Library Permissions

To create a library permission in Salesforce CRM Content, from Setup, enter *Content Permissions* in the Quick Find box, then select **Content Permissions**. Next, click **Add Library Permissions**.

 **Tip:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has Viewer, Author, and Library Administrator library permissions. If not, consider creating them. These three library permissions provide the different levels of library access required for most organizations. For the "Viewer" library permission, select the *View Comments* and *Add Comments* library privileges. For the "Author" library permission, select the *Add Content*, *Add Content on Behalf of Others*, *Archive Content*, *Add Comment*, and *Tag Content* library privileges. For the "Library Administrator" permission, select the *Manage Library* privilege.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, the description for a "Marketing Reviewer" permission would read, "Reviews all content used in outbound marketing campaigns" or "Can view and comment on documents."
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

Library Privilege	Description
Manage Library	Perform any action in the library. This privilege is required to edit a library's name and

USER PERMISSIONS

To create, edit, or delete library permissions:

- "Manage Salesforce CRM Content"
- OR
- "Manage Content Permissions"

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create library permissions:

- "Manage Salesforce CRM Content"
- OR
- "Manage Content Permissions"

Library Privilege	Description
	description, add or remove library members, or delete a library. Manage Library is a super permission which provides all the following permission options listed except Deliver Content. Creating a library requires the “Manage Salesforce CRM Content” app permission or “Create Libraries” system permission.
Add Content	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
Add Content on Behalf of Others	Choose an author when publishing content in the library.
Archive Content	Archive and restore any content in the library.
Delete Content	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
Feature Content	Identify any content in the library as “featured.”
View Comments	Read comments posted to any content in the library.
Add Comments	Post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.
Modify Comments	Edit or delete comments made to any content in the library.
Tag Content	Add tags when publishing content or editing content details in the library.
Deliver Content	Create a content delivery using any files in the library.
Attach or Share Content	Make content from this library accessible in Chatter. Within Chatter, select a file from the library and attach it to a post or share it.
Organize File and Content Folder	Create, rename, and delete folders in libraries in Lightning Experience.

4. Click **Save**.

Editing Library Permissions

To edit a Salesforce CRM Content library permission, from Setup, enter *Content Permissions* in the **Quick Find** box, then select **Content Permissions**. Then click **Edit** next to the appropriate permission.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, the description for a “Marketing Reviewer” permission would read, “Reviews all content used in outbound marketing campaigns” or “Can view and comment on documents.”
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

Library Privilege	Description
Manage Library	Perform any action in the library. This privilege is required to edit a library’s name and description, add or remove library members, or delete a library. Manage Library is a super permission which provides all the following permission options listed except Delete Content . Creating a library requires the “Manage Salesforce CRM Content” app permission or “Create Libraries” system permission.
Add Content	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
Add Content on Behalf of Others	Choose an author when publishing content in the library.
Archive Content	Archive and restore any content in the library.
Delete Content	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
Feature Content	Identify any content in the library as “featured.”
View Comments	Read comments posted to any content in the library.
Add Comments	Post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.

USER PERMISSIONS

To delete library permissions:

- "Manage Salesforce CRM Content"
- OR
- "Manage Content Permissions"

Assigning Library Tagging Rules

In Salesforce CRM Content, tags are descriptive labels that help classify and organize content. Contributors can assign tags to their files, content packs, Google docs, or Web links, thus enabling all library members to browse for content by tag. The tagging rule in a library determines how contributors can tag content; for example, the restricted-tagging rule does not allow contributors to create new tags. Library tagging rules are optional. By default, library contributors can enter any tag.

To assign a tagging rule to a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Tagging Rules** and choose one of the following options:

Library Tagging Rule	Description
Open Tagging	This rule places no restrictions on tagging. Contributors can enter any tag when publishing or editing content. While a tag is typed, Salesforce CRM Content autosuggests tags based on the contributor's recently used tags and the Popular Tags list.
Guided Tagging	This rule also enables contributors to enter any tag when publishing or editing content, but contributors are also offered a list of suggested tags. If you select Guided Tagging, the next step prompts you to enter the suggested tags that you want to recommend to library contributors.
Restricted Tagging	This rule requires contributors to choose from the list of suggested tags. If you select Restricted Tagging, the next step prompts you to enter the list of suggested tags.

3. If you chose **Guided Tagging** or **Restricted Tagging**, click the link for auto-populating the `Suggested Tags` field and then edit, add, or remove tags as needed. If you do not auto-populate the `Suggested Tags` field, any new tags you enter in the field are added to the existing list of suggested tags in the library.
4. Click **Save**.

Notes on Library Tagging Rules

- `Open Tagging` is the default tagging rule.
- If you publish, share, or move content to a library that uses restricted tags, you will receive an error if your content contains unsupported tags.
- When you share content from one library to another, the most restrictive tagging rule applies. For example:
 - When content is shared between a restricted-tagging library and a guided- or restricted-tagging library, you can only choose tags that are common to both libraries.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign a tagging rule to a library:

- "Manage Salesforce CRM Content"

OR

Manage Libraries checked in your library permission definition

- When content is shared between an open tagging library and a restricted-tagging library, you can only choose tags suggested in the restricted-tagging library.
- If a restricted tagging rule is applied after content has already been published in the library and the existing content contains tags that are no longer permitted by the rule, the tags remain assigned to the content until it is edited or revised. For example, if the `Q3Forecast` document has a `market indicators` tag and `market indicators` is not a suggested tag according to the new restricted-tagging rule, `market indicators` is removed from `Q3Forecast` only when a user publishes a new version of the file or edits the file's tags on the content details page.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

SEE ALSO:

[Create Libraries](#)

Restrict Record Types in a Library

Library administrators can choose which record types are available in a library. They can also set the default record type for publishing content to the library.

To restrict the record types allowed in a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Record Types**.
3. Optionally, change the default record type for the library.
4. Select the `Restrict the record types available in the library` checkbox.
5. Select one or both of the following options:
 - `Allow content with any record type to be linked to this library`—Select this option if you want to enable content published in other libraries to be shared to the library where you have restricted record types. The content in other libraries can be shared regardless of the record types used.
 - `Do not apply record type restrictions to existing content`—Select this option if you do not want to receive warnings regarding existing content in the library. You will not be alerted if existing content uses record types that you exclude from the library. This option refers to notifications only; existing content is not affected by restricted record types.
6. For each record type that you want to allow in the library, move it from the Available Record Types list to the Selected Record Types list.
7. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Record types available in: both Salesforce Classic and Lightning Experience

Record types available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To restrict record types:

- "Manage record types and layouts for Files"
- OR
- "Manage Salesforce CRM Content"

Notes on Restricting Record Types

- If the library already contains published content, selecting the `Restrict the record types available in the library` option automatically moves all the record types used by the published content to the Selected Record Types list.
- Deselecting the `Restrict the record types available in the library` option automatically moves any record types in the Selected Record Types list to the Available record Types list.
- When changing a file's managing library, the file's record type must be permitted in the new managing library.
- When sharing a file with a library, the file's record type must be permitted in the shared library unless the `Allow content with any record type to be linked to this library` option is selected for the shared library.
- When the default record type for a user's profile differs from the default record type for a library, the user profile default takes priority when a user with that profile shares a file with the library. *General* is used as the default record type when no default is set for the user profile.
- When there are no record types in common between a user profile and a library, the default record type for a library is available to users with that user profile who are sharing files with the library.

Content Settings

Customize content settings and enable content previews.

[Customize Content Settings](#)

[Allow Content Previews in Link Posts](#)

Salesforce provides rich media support for over 400 URL domains. When you attach a link to a post, supported links are converted into embedded videos, images, and rich article previews.

[Set Up Content Deliveries](#)

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

[Content Delivery Fields](#)

Customize Content Settings

From Setup, enter *Salesforce CRM Content* in the **Quick Find** box, then select **Salesforce CRM Content** to modify the defaults for your Salesforce CRM Content organization:

Enable Salesforce CRM Content

If this option is checked, Salesforce CRM Content is enabled for your organization.

Autoassign feature licenses to existing and new users

If this option is checked, Salesforce automatically attempts to assign Salesforce CRM Content feature licenses to all existing users. If there aren't enough licenses available, no licenses are assigned. Contact Salesforce to request additional feature licenses. When a new user is created, a Salesforce CRM Content feature license is automatically assigned as long as licenses are available. A feature license corresponds to the `Salesforce CRM Content User` checkbox on the user detail page.

Enable multilanguage search and contribute

If this option is checked, a `Language` drop-down list is available when users publish, edit, or search for content. The `Language` drop-down list contains all languages that Salesforce supports.

If a user does not choose a language when publishing content, that content is associated with the user's personal language by default. If the user's personal language setting is different from the organization's language, content published by that user is associated with the user's language, not the organization's language.

Enable content pack creation

If this option is checked, the **Create New > Content Pack** option displays on the Libraries tab and users can create content packs from any documents or files in their Salesforce CRM Content private or public libraries.

If this option is not checked after users in your organization have already created content packs, those packs are not deleted and users can continue to modify metadata such as description, title, and custom fields. However, once content pack creation is no longer enabled, users cannot customize or modify existing packs. Specifically, the **Clone & Customize** button and the **Edit > Edit Content Pack** option on the content details page are unavailable.

Enable enhanced document viewer

If this option is checked, an enhanced set of navigation and customization options are available for the document viewer. The document viewer allows users to preview a document without downloading, whether the document be a content delivery sent to a lead, prospect, or colleague, a document viewed internally in Salesforce CRM Content, or a file in Salesforce Files. The document viewer has three modes: the Preview tab on the content details page (preview mode), the content delivery URL (delivery mode), and full screen mode, which displays when you click the full-screen option on the content details page or in a content delivery. In Chatter, users can preview files in feeds, on file lists, and on the Files tab. The `Enhanced document viewer` setting provides the following capabilities to users who are viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**. The right-click menu is not available in preview mode.
- You can jump directly to a page by entering the page number and clicking Enter. This option is not available in full-screen mode.
- From the right-click menu you can choose the **Fit Width** option to expand the width of the document or the **Fit Full Page** option to view the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose the **Full Screen** option to view the document in full screen mode or the **Exit** option to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To modify Salesforce CRM Content settings:

- "Manage Salesforce CRM Content"

- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available in preview mode or for PowerPoint documents in any mode.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Navigating with keyboard-arrow keys is not available in preview mode.

Enable Office 2007 previews in Content—Pilot

If this option is checked, Microsoft Office 2007 files, including PowerPoint, Word, and Excel can be previewed in their entirety in Salesforce CRM Content and Chatter. In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

You can also preview files in Chatter feeds, from the Files tab, from a file detail page, and from group and profile file lists.

Note: If this option is unchecked after Office 2007 previews have been generated, those previews will no longer be available.

Show Salesforce Files in Salesforce CRM Content

If this option is enabled, searches in Salesforce CRM Content include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Files, Shared with Company, My Groups, and My Libraries**.

If this option is not checked, searches in Salesforce CRM Content don't include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Libraries, Private Library**, and any shared libraries the user is a member of.

SEE ALSO:

[Customize Salesforce CRM Content](#)

[Allow Content Previews in Link Posts](#)

Allow Content Previews in Link Posts

Salesforce provides rich media support for over 400 URL domains. When you attach a link to a post, supported links are converted into embedded videos, images, and rich article previews.

You must enable Chatter before you can enable link previews.

The rich media content is provided by Embed.ly, a third-party service. We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Also all our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Allow Rich Link Previews**.
4. Click **Save**.

Post with links to rich media content are rendered as a preview, including thumbnails, descriptions, and video players for video URLs. If a post doesn't render a link as a rich preview in the feed, the URL domain for that link either isn't supported or Embed.ly was unable to return the preview content for the URL.

Rich media previews are enabled by default. If you disable rich media previews, users can only preview videos from the YouTube community.

 **Note:** For a look-up list of supported URL domains, see ["URL Domains for Rich Link Previews in Feeds."](#)

[Customize Content Settings](#)

Set Up Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only. By default, a content delivery shows the most recent version of the file being delivered.

Create content deliveries from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

1. From Setup, enter *Content Deliveries* in the **Quick Find** box, then select **Content Deliveries** and enable **Enable Creation of Content Deliveries for**

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

USER PERMISSIONS

To enable Chatter:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To enable or disable content deliveries:

- "Customize Application"

Salesforce Files If you don't have access to the Content Deliveries feature, contact Salesforce Customer Support to activate it.

2. Choose a default option for content-delivery passwords. Because content-delivery URLs can be sent to leads, customers, or any unauthenticated user, Salesforce recommends requiring password protection if your users will send confidential documents via content delivery. The options below allow you to select an organization-wide default for content-delivery password protection.
 - **Password protection is optional and defaults to OFF**—If this option is selected, users can choose to require a password when they create a content delivery, but the `Require Password to Access Content` field on the create-delivery wizard is not checked by default.
 - **Password protection is optional and defaults to ON**—If this option is selected, the `Require Password to Access Content` field on the create delivery wizard is checked by default. Users can uncheck the option if they do not want to require a password.
 - **Password protection is required**—If this option is selected, a password is generated each time a content delivery is created. Users cannot opt out of the password requirement.

 **Note:**

- If you choose to require a password, users who create a content delivery will receive a password when the delivery is generated; users must send the password and the delivery URL to delivery recipients. Delivery recipients are prompted for the password when they click the content delivery URL.
- Content delivery passwords display with the content-delivery URL when the delivery is created. You can also access the password on the delivery detail page for the life of the content delivery.

When content delivery is enabled, all users should add the Content Deliveries related list to their page layouts for leads, business accounts, contacts, opportunities, cases, campaigns, or custom objects. All Salesforce CRM Content users will see a **Deliver Content** option on each content details page.

Implementation Tips

- To ensure quality of service, the total number of content-delivery views allowed within a 24-hour period is limited to 20,000. Also, the amount of bandwidth allocated to content deliveries is limited to 10 GB within a 24-hour period. If a recipient tries to view a delivery when a rate limit has been exceeded, a notification displays that asks the viewer to try again later. Salesforce may be able to increase rate limits on an exception basis. For more information, contact your sales representative.
- When you create a content delivery, Salesforce copies the original file and creates a new version of that file specifically for online viewing. Note the following information concerning supported file types:
 - Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files are supported for online views.
 - Adobe® PDF files are supported for online views, but copy-protected PDFs are not.
 - JPG, BMP, GIF, and PNG are supported for online views.
 - Any document over 25 MB is not supported for online views.

You can create a content delivery with any file type, but if the file type is not supported for online viewing, your recipient can only download the document in its original file format.

- Always preview your content delivery before sending the URL to recipients. In some cases, formatting in the original file, such as colors and non-standard fonts, may not display properly in the online version. If you are not happy with the quality of the online version, the content delivery wizard gives you the option of making your content available for download in its original file format.
- Content deliveries require Adobe Flash version 9.0.115. If a recipient does not have Flash installed, a download option displays.
- Customer Portal and partner portal users cannot create content deliveries.
- Only the creator of a content delivery can delete the delivery record or edit details such as the expiration date.

- Each time a content delivery's URL is clicked, Salesforce records the click as one view and distinguishes between internal and external views. An internal view is a view by a Salesforce user, for example, clicking the delivery URL on the delivery detail page or the View option on the Content Deliveries related list is an internal view. The Content Deliveries related list provides a count of all views for each delivery. Open the delivery details page to see information about a specific view.
-  **Note:** For password-protected content deliveries, a view is recorded when the recipient clicks on the delivery URL regardless of whether he or she enters the password and views the delivery.
- Salesforce CRM Content users can deliver content from shared libraries or a personal library.

Best Practices

- After creating a content delivery, always preview it before sending the URL to your recipients to ensure that the formatting in the original file displays properly in the online version. For example, colors and non-standard fonts may not display properly in the preview player. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or as a PDF file only. Your recipients will be able to download the file, and you can track whether the file was downloaded on the delivery detail page.
- Animation and timings in PowerPoint files are not supported in the content delivery's online version. Hyperlinks in all file types are also unsupported. See the [implementation tips](#) for a complete list of supported file types.
- If you are a Salesforce CRM Content user and want recipients of your content delivery to always see the latest version of a file rather than the version available on the delivery-creation date, open the delivery detail page and click **Edit**. Select the `Content Delivery Opens Latest Version` checkbox.
- If you select `Notify Me of First View or Download`, you will receive an email when the content delivery is viewed for the first time.

Storage Implications

In Salesforce CRM Content, file storage is consumed when content is published to shared libraries or saved to a private library. Creating content deliveries does not have an additional affect on storage limits, but users who frequently upload files to their personal libraries for the purpose of content delivery should consider their organization's file-storage limits. Administrators can use reporting to identify which users are consuming the most storage and which files are largest in size.

For non-Salesforce CRM Content users, file storage is consumed each time a content delivery is created. Once uploaded to Salesforce, a file cannot be reused for multiple content deliveries. Creating multiple content deliveries with the same file requires uploading the file each time. Deleting a content delivery deletes the source file in Salesforce, thus increasing file-storage space.

[Set Up Salesforce CRM Content](#)

[Content Delivery Fields](#)

Content Delivery Fields

The following table provides a description of the fields (in alphabetical order) that make up a content delivery. These fields are located on the create-delivery wizard, the Content Deliveries related list, or the delivery details page.

Field	Description
Allow Recipient to View in the Browser	If checked, the content delivery can be viewed online in a custom Web page. On the delivery details page, this field is labeled <code>Allow View in the Browser</code> .
Allow Recipient to Download as PDF	If checked, the content delivery converts Microsoft® Word, Excel, and PowerPoint files into PDF files and gives the recipient the option of downloading the PDF. If the file you uploaded was not a PDF, Word, Excel, or PowerPoint file, this option does not appear in the create-delivery wizard. On the delivery details page, this field is labeled <code>Allow Download as PDF</code> .
Allow Download in Original Format	If checked, the content delivery allows recipients to download the original file. In the create-delivery wizard, this field is called <code>Allow Recipient to Download as [file type]</code> where <code>[file type]</code> is the original file's file type, such as .ppt, .pdf, or .doc.
Author	For Salesforce CRM Content files, the user who published the file. (Read only)
Content Delivery Name	The name assigned to the content delivery. By default, the <code>Content Delivery Name</code> includes the file name and the creation date.
Content Delivery Opens Latest Version	For Salesforce CRM Content files, this flag indicates that the recipient of a content delivery sees the most current version of a file. For example, if a file is updated between the delivery-creation date and today's date, a recipient who views the delivery today sees the newest version.
Content Delivery Expires	A flag that indicates whether access to the content delivery will expire on the expiration date. In the create-delivery wizard, this flag corresponds to the checkbox next to the <code>Remove access to content on field</code> .

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Created By	The user who created the content delivery, including creation date and time. (Read only)
Description	For Salesforce CRM Content files, the description provided when the file was published. (Read only)
Expiration Date	The date on which the content delivery can no longer be viewed. In the create-delivery wizard, this is the date entered in the <code>Remove Access to Content on</code> field.
File Downloaded	A flag that indicates whether a file in the content delivery was downloaded. For example, if a content delivery includes options to view the content in the browser, download the content in its original file format, and download the content as a PDF file, this flag is checked if the recipient downloads the original file or the PDF file. (Read only)
Internal View	A flag that indicates whether a Salesforce user viewed the content delivery. A view is considered internal if the user opens the delivery URL from within Salesforce, for example by clicking View on the Content Deliveries related list or clicking the delivery URL on the delivery detail page. If the user copies the URL and pastes it into his or her browser, the view is considered external. (Read only)
Last Modified By	The user who last modified the content delivery, including modification date and time. (Read only)
Last Viewed	The date and time on which the content delivery was last viewed. A view is one click of the content-delivery URL. (Read only)
Notify Me of First View or Download	If checked, the user who created the content delivery receives an email notification the first time the content delivery URL is clicked.
Owner Name	The user who owns the content delivery. (Read only)
Related To	The record that the content delivery is associated with, such as an account, opportunity, or custom object. Users with sharing access to the record can click it to view more details.
Require Password to Access Content	If checked, the recipient must enter the provided password before viewing the content delivery. The password appears when the content delivery is generated and for the life of the delivery on the delivery detail page.
Title	For Salesforce CRM Content files, the title of the file included in the content delivery. (Read only)

Field	Description
View Count	Total number of views for the content delivery, including internal and external. (Read only)

[Set Up Content Deliveries](#)

Set Up Salesforce CRM Content for Salesforce Mobile Classic

Note the following about how Salesforce CRM Content is implemented in Salesforce Mobile Classic:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Mobile Classic is only supported on iPhone devices.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Mobile Classic is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Mobile Classic configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.
3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Mobile Classic app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like `LAST 90 DAYS` or `LAST 180 DAYS` to ensure that recently updated content records are synchronized.
- **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.

EDITIONS

Salesforce Mobile Classic setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions for orgs created prior to Winter '17

Mobile app available for an extra cost in: **Professional** and **Enterprise** Editions for orgs created prior to May 1, 2016

Mobile app not available for orgs created in Winter '17 or later

USER PERMISSIONS

To view Salesforce Mobile Classic configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Mobile Classic data sets:

- "Manage Mobile Configurations"

- **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
 - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under `Set Max Record Limit` and entering the maximum number of content records this configuration can transfer to mobile devices. Use the `Order By` and `Sort` drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
 7. Click **Done**.

- [Integrate Gmail with Salesforce.](#)
- [Use Google Talk in Salesforce](#)

Get Started with Salesforce and Google Apps

-  **Note:** Not all Google Apps features are available in Lightning Experience. The features that are available may not look the same as they do in Salesforce Classic.

Google Apps is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. If your organization has a Google Apps account, Salesforce administrators can enable Google Docs, Gmail, and a host of Google-related AppExchange apps—customized for use within Salesforce.

Step 1: Creating a Google Apps Account

Create a Google Apps account for your organization using one of the following methods:

- From Setup, enter *Google Apps* in the **Quick Find** box, select **Google Apps Settings**, and click **Sign Up** to launch the account-creation page on the Google website. You are prompted to register your organization's domain name or purchase a new domain name from Google. A domain is the portion of a website's URL that follows the "www." Follow Google's steps to configure your new or existing domain and set up your Google Apps account.
 - If your organization purchased the Salesforce and Google Apps Supported feature, from Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup** to create a new Google Apps Premier Edition account or upgrade your existing Standard Edition account to Premier Edition. For details, see [Get Started With Salesforce and Google Apps Supported](#).
-  **Note:** Google Apps in Salesforce supports Google Apps business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.

Step 2: Configuring Google Apps Domain Settings

- On the Google Apps Settings page in Salesforce, click **Edit**.
- Choose a user for the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
- Enter the **Google Apps Domain** that you registered with Google. For example, if your company's URL is `http://www.acme.com` and you created a Google Apps account for the `acme.com` domain, enter `acme.com` in the **Google Apps Domain** field.
- Click **Save**.

Step 3: Activating Google Apps Services

- In the **Activate Google Apps Services** section on the Google Apps Settings page, locate the Google Apps service(s) that you want to activate.
- Click **Edit** or **Install** to activate a service. In the Action column, **Edit** corresponds to Google Apps services that are already integrated in Salesforce, and **Install** corresponds to uninstalled Force.com AppExchange apps. Integrated Google Apps services include:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view and modify Google Apps domain settings:

- "Customize Application"

To activate or deactivate Google Apps services:

- "Customize Application"

To install or uninstall Force.com AppExchange packages:

- "Download AppExchange packages"

To export a list of users to Google to create Google Apps accounts:

- "Customize Application"

- [Add Google Docs to Salesforce](#)
- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)
- [Google Talk Sidebar Component](#)

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

For descriptions of the Google-related AppExchange apps, visit <http://sites.force.com/appexchange>.

Step 4: Creating Google Apps Users

Activating Google Apps services in Salesforce makes the services visible to all users in your organization, but a user cannot access a service unless he or she has a Google Apps account on your organization's domain. The Google Apps administrator registered with Google can create these additional accounts. For more information, see [Create Google Apps Accounts](#).

SEE ALSO:

[Get Started With Salesforce and Google Apps Supported](#)

[Set Up Google Apps in Salesforce](#)

[Activate Google Docs in Salesforce](#)

[Gmail™ in Salesforce](#)

Get Started With Salesforce and Google Apps Supported

The Salesforce and Google Apps Supported feature includes a Google Apps Premier Edition account for your organization. In Salesforce, you can create that account or upgrade from an existing Google Apps Standard Edition account to Google Apps Premier Edition.

After you create a new Google Apps Premier Edition account or upgrade your existing Google Apps Standard Edition account in Salesforce, the Premier Setup page displays your organization's domain name, the number of Google Apps Premier Edition licenses available to your organization, and, if applicable, the status of your upgrade.

Creating a New Google Apps Premier Edition Account

If your organization does not have a Google Apps account, complete the following steps to register a Google Apps Premier Edition account and enable Salesforce and Google Apps:

1. From Setup, enter *Premier Setup* in the Quick Find box, then select **Premier Setup**.
2. Complete the fields in Column A:

Field	Description
Domain Name	Enter the domain that you want to register as your organization's Google Apps account. For example, if your company's URL is <code>http://www.acme.com</code> , enter <code>acme.com</code> as your Domain Name.
User Name	This value is used to create the Google Apps administrator for your organization's account. For example, if your Google Apps administrator will be <code>jsmith@acme.com</code> , enter <code>jsmith</code> . After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
First Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Last Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Email Address	This email address receives a confirmation notice when your Google Apps Premier

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create a Google Apps Premier Edition account in Salesforce:

- "Customize Application"
- OR
- Google Apps Administrative Contact

To upgrade Google Apps Standard Edition to Google Apps Premier Edition in Salesforce:

- "Customize Application"
- OR
- Google Apps Administrative Contact

Field	Description
	Edition account is created. Google does not store this value for any other purpose.
Password	The Google Apps administrator can log in to Google Apps with this password.
Confirm Password	The Google Apps administrator can log in to Google Apps with this password.

3. Click **Create New Premier Account**.
4. To enable Salesforce and Google Apps, from Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.
5. Choose a user for the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
6. Verify that the **Google Apps Domain** field contains the domain name you registered with Google.
7. Activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).
8. Create users for your organization's Google Apps account. For more information, see [Create Google Apps Accounts](#).

 **Note:** The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

Upgrading to a Google Apps Premier Edition Account

Complete the following steps to upgrade your organization's existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

1. From Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup**.
2. Complete the fields in Column B:

Field	Description
Domain Name	The domain that you want to register as your organization's Google Apps Premier Edition account. If you already enabled Salesforce and Google Apps, this field is prepopulated with your organization's domain name.
Google Apps Token	The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization's Google Apps administrator can access this information on the Google website. For more information, click Retrieve Google Apps Token in Column B.

3. Click **Upgrade Existing Account to Premier**.
 4. To enable Salesforce and Google Apps, from Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.
 5. As needed, edit the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
 6. Verify that the *Google Apps Domain* field contains the domain name you registered with Google.
 7. As necessary, activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).
 8. As necessary, create users for your organization's Google Apps account. For more information, see [Create Google Apps Accounts](#).
-  **Note:** The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

SEE ALSO:

[Get Started with Salesforce and Google Apps](#)

Set Up Google Apps in Salesforce

 **Note:** Not all Google Apps features are available in Lightning Experience. Those that are available may not look the same as they do in Salesforce Classic.

From Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings** to edit your Google Apps domain settings, activate or deactivate Google Apps services in Salesforce, or install or uninstall Google-related Force.com AppExchange packages..

 **Important:** You cannot use Salesforce and Google Apps until a Google Apps account has been created for your organization and your Google Apps domain settings are configured in Salesforce. For instructions on creating an account and configuring your domain settings, see [Get Started with Salesforce and Google Apps](#) on page 3890.

Editing Google Apps Domain Settings

Domain settings consist of two values: the user chosen to administer your organization's Google Apps account and the domain your organization registered with Google. Both fields are required to enable Google Apps in Salesforce. To edit your domain settings:

1. In the Configure Google Apps Domain section, click **Edit**.
2. Optionally, choose a new user for the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Optionally, modify the *Google Apps Domain* that is registered with Google for your organization's Google Apps account. Your *Google Apps Domain* is typically your company's domain; for example, acme.com.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit Google Apps domain settings and activate or deactivate services:

- "Customize Application"

To install or uninstall AppExchange packages:

- "Download AppExchange packages"

Modifying Google Apps Services

This section lists Google Apps services that are integrated with Salesforce and also provides links to several Google-related Force.com AppExchange apps that can be easily installed from AppExchange.

To activate or deactivate an integrated service, click **Edit** next to the service name. These services include:

- [Add Google Docs to Salesforce](#)
- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)
- [Google Talk Sidebar Component](#)

Important: Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

To install or uninstall an AppExchange app, click **Install** or **Uninstall** next to the appropriate name. To view all Google-related AppExchange offerings, visit <http://sites.force.com/appexchange>.

Implementation Tips

- For detailed information about Google Apps, refer to [Google's online help](#).
- Google Apps in Salesforce is available for Google business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.
- After creating a Google Apps account for your organization, create Google Apps accounts for your Salesforce users. From Setup, enter *Users* in the **Quick Find** box, select **Users**, and then click **Export to Google Apps**.
- Notify users of their Google Apps usernames and passwords.
- Notify users about the changes they will see in Salesforce when Google Apps services are activated.
- To view all the Google apps available on Force.com AppExchange, visit <http://sites.force.com/appexchange>.
- By default, Google Apps users on your organization's domain can share Google docs with Google Apps accounts outside your domain. The control panel for your Google Apps account contains sharing settings that enable you to restrict document sharing to within your domain.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- Customer Portal and partner portal users with access to the **Contribute** tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- Customer Portal and partner portal users cannot access Gmail Buttons and Links.
- If your organization purchased the Salesforce for Google Apps Supported feature, see [Get Started With Salesforce and Google Apps Supported](#) on page 3892.

Best Practices

- Test your Google Apps integration using a sandbox or Developer Edition organization.
- Manage Google Apps users as you would Salesforce users. For example, if you deactivate a Salesforce user, also deactivate his or her Google Apps account in the control panel for your organization's Google Apps account. For information about administering your organization's Google Apps account, refer to [Google's online help](#).
- To locate a Google doc quickly in Salesforce, search for the doc using search.

SEE ALSO:

[Get Started with Salesforce and Google Apps](#)

Create Google Apps Accounts

After [creating a Google Apps account for your organization](#) and [enabling Google Apps in Salesforce](#), you can create Google Apps accounts for individual users. To access the Google Apps services that are enabled in Salesforce, each user needs a Google Apps account on the domain your organization registered with Google. An account includes a username and password that allow the user to log in to all Google Apps services.

 **Note:** If your organization purchased Salesforce and Google Apps Supported, the number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased.

To export a list of users to Google and create Google Apps accounts for each user:

1. From Setup, enter `users` in the `Quick Find` box, then select **Users**.
2. In the View drop-down list, choose a list of users.
3. Click **Export to Google Apps** to export all the users in the list. To export certain users only, select those users in the Action column.

 **Note:** If Google Apps is not enabled for your organization, the **Export to Google Apps** button does not display. To enable Google Apps in Salesforce, see [Get Started with Salesforce and Google Apps](#) on page 3890.

4. On the Export Users to Google Apps page, click the export file link that is labeled as Step 1. The name of the link depends on the list view you chose to export; for example, if you were viewing the All Users list, the link on the Export Users to Google Apps page is **All Users Export File**.
5. In the CSV spreadsheet that displays when click you the export link, provide a temporary password for each user. You can modify the `username`, `last name`, and `first name` fields for any user as needed. Google creates account names by adding your domain to the usernames in the spreadsheet; for example, if your domain is `acme.com` and the spreadsheet contains `john.doe` and `jane.doe` usernames, the Google Apps usernames are `john.doe@acme.com` and `jane.doe@acme.com`.
6. Save the spreadsheet to your computer.
7. Click the **Google Apps Bulk User Import Tool** link to launch the Bulk Account Update page for your organization's Google Apps account. If prompted, log in with your Google Apps administrator username. Only the user who is registered with Google as the administrator of your organization's account can create additional Google Apps accounts on your organization's domain.
8. Follow Google's instructions to import the data in the spreadsheet. The Google Apps administrator receives a confirmation report, and the user for each successfully created account receives a notification email at his or her new Gmail account..

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

Export users to Google:

- "Customize Application"

Create Google Apps accounts:

- Google Apps administrator

9. Notify users of their usernames and passwords. They will need this information to use any Google Apps service that is enabled in Salesforce.

SEE ALSO:

[Get Started with Salesforce and Google Apps](#)

Activate Google Docs in Salesforce

 **Note:** Google Docs appear in Lightning Experience, but they switch to Salesforce Classic when clicked. The Add Google Doc button isn't available in Lightning Experience.

 **Important:** After you activate a Google Apps service in Salesforce, it's visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see [Get Started with Salesforce and Google Apps](#).

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators.

To activate or deactivate the Add Google Docs to Salesforce service:

1. From Setup, enter *Google Apps Settings* in the Quick Find box, then select **Google Apps Settings**.
2. Click **Edit** next to the Add Google Docs to Salesforce option in the Activate Google Apps Services list.
3. Select **Activate**.
4. Read and indicate whether you agree to the Terms of Use.
5. Click **Save**.

When the Add Google Docs to Salesforce service is enabled, the following changes allow users to create, edit, or view Google docs and associate them with Salesforce records:

- The Notes & Attachments related list on accounts, assets, contacts, contracts, leads, opportunities, products, and custom objects is renamed to Google Docs, Notes, & Attachments.
- The Attachments related list on cases, solutions, and campaigns is renamed to Google Docs & Attachments.
- If Salesforce CRM Content is enabled, the Libraries tab has an **Add Google Doc** drop-down list.

Users can also install the **Add Google Doc to Salesforce** browser button, which allows them to associate a Google doc to several Salesforce records or a Salesforce CRM Content library without being logged in to Salesforce.

Implementation Tips

- For information about Google Docs, refer to [Google's online help](#).
- By default, Google Docs users on your domain can share their Google docs with Google Apps accounts outside your domain. The control panel in your Google Apps account contains sharing settings that enable you to restrict document sharing to users within your organization's domain.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

Activating the Add Google Docs to Salesforce service:

- "Customize Application"

- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- The Add Google Docs to Salesforce service cannot be disabled for your organization if Google docs are referenced in Apex.
- Google docs count against data storage. For each Google doc associated with a record or library in Salesforce, two Kb of storage is used.

[Get Started with Salesforce and Google Apps](#)

Gmail™ in Salesforce

Integrate Gmail with Salesforce.

Gmail to Salesforce available in: both Salesforce Classic and Lightning Experience

Gmail Buttons and Links available in: Salesforce Classic

Available in: **All** Editions except **Database.com**

USER PERMISSIONS

Activating Gmail in Salesforce:

- "Customize Application"

 **Note:** If **Send Through Gmail** is turned on in Setup, the **Compose Gmail** button in Activity History on leads and contacts is available in Lightning Experience.

1. From Setup, enter *email* in the **Quick Find** box.
2. Select **Send Through External Email Services**.
3. Enable **Send Through Gmail**.

 **Important:** After you activate a Google Apps service in Salesforce, it's visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see [Get Started with Salesforce and Google Apps](#).

Integrate Gmail with Salesforce in two ways

- Gmail to Salesforce
- Gmail Buttons and Links

Gmail to Salesforce

Gmail to Salesforce lets you log emails automatically. It also lets you log chats you send from your Gmail account as activities on leads, contacts, opportunities, and other records that support activity history. It's important to know that after you activate Gmail to Salesforce, you can't deactivate it.

To activate Gmail to Salesforce:

1. From Setup, enter *Email to Salesforce* in the **Quick Find** box, then select **Email to Salesforce**. Confirm that it's activated.
2. From Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.

3. Set a Google Apps Administrative Contact and Google Apps Domain, then save your changes.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History on leads and contacts. When you select a Gmail link or **Compose Gmail**, Salesforce automatically logs you in to your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

To activate Gmail Buttons and Links:

1. From Setup, enter *Google Apps* in the *Quick Find* box, then select **Google Apps Settings**.
2. In the Activate Google Apps Services list, click **Edit** next to Gmail Buttons and Links.
3. To activate Gmail Buttons and Links, select **Active**.
4. To add **Gmail** links next to all email fields (except email fields on pages under Setup), select **Gmail Links**.
5. To add **Compose Gmail** buttons in Activity History on leads and contacts, select **Gmail Buttons**.
6. Read and indicate whether you agree to the Terms of Use.
7. Click **Save**.

Implementation Notes

If enable Gmail Buttons and Links without Gmail to Salesforce, you can still use the Gmail links on contacts and leads. But keep in mind that Salesforce doesn't log emails you send from your Gmail account. Salesforce also doesn't automatically populate the **BCC** field on the **Compose Mail** window with an Email to Salesforce address.

Learn Wave Analytics with Trailhead

Trailhead is the fun and free way to learn Salesforce. Now you can get acquainted with Wave Analytics through Trailhead, using a special Wave-enabled Developer Edition org.

For the Wave Analytics trails, you can't use an old Developer Edition org. You must sign up for the special Developer Edition that comes with a limited Analytics Cloud Wave Platform license and contains sample data required for the Wave trails.

You'll find the sign up for the special Developer Edition org in these trails:

- Explore with Wave Analytics: http://trailhead.salesforce.com/trail/wave_analytics_explorer
- Build and Administer Wave Analytics: https://trailhead.salesforce.com/trails/wave_analytics_enable_and_produce
- Accelerating Analytics with Wave Apps: http://trailhead.salesforce.com/trail/wave_analytics_apps

Pin Apps to Your Analytics Home

Wave apps are where you run your dashboards, and you can pin your favorite apps to your personal Analytics home page.

The first time you click the Wave Analytics tab, you'll see tiles for your three most recently used Wave apps. If you've unpinning all your apps, you're prompted to add apps to the home page.

Click **Pin Apps** to select the apps that you want to access regularly. Or to unpin an app, click it to remove the pin.

Apps appear on your Wave Analytics home in the order that you pinned them.

 **Note:** If you don't have any apps yet, go to [Create an App](#).

Run Apps

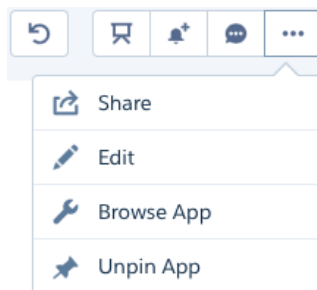

Start your Wave app to run and present its dashboards.

Click an app, either one that's pinned on your Wave Analytics home page or one listed under the Browse tab. Clicking an app opens it in presentation mode, displaying the first dashboard on your navigation list.

To open the navigation panel, click the navigation icon (). The panel lists the available dashboards. Click the icon again to close the panel.

When the navigation panel is open, click a dashboard to start it. Dashboards let you explore live, interactive views of your data. Go ahead and click the widgets, toggles, and charts. When you want to return the dashboard to its initial state, click the refresh icon ().

In addition, from the running app you can:

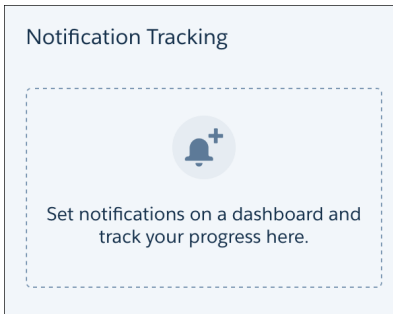

- [Present full screen](#)
- [Set and manage notifications](#)
- [Annotate the dashboard](#)
- [Share the dashboard](#)
- [Open the dashboard in the dashboard designer in order to edit it](#) (if you have permission and access)

- [Browse the contents of the app](#)
- [Unpin the app from the home page](#) (if you have permission and access).

Track Notifications

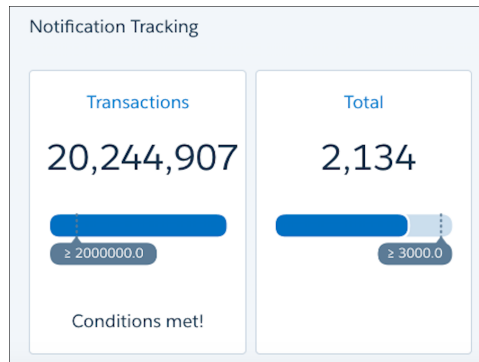

The lower part of the Analytics home page tracks the progress on the notifications that you've set.

Click an app on your Wave Analytics home page and navigate to a dashboard with KPIs. The KPI numbers are actually dashboard widgets that you can use to set notifications. Hover over the number, locate the dropdown menu, and select **Set Notification**.

To learn how to set notifications, see [Set Smart Notifications for Your Most Important Business Metrics](#).

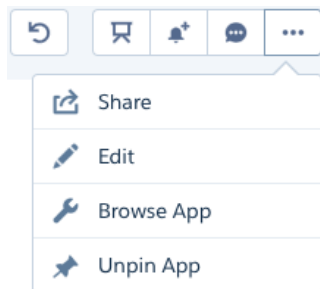

All your active notifications appear on your Analytics home page. The notifications tracking gauges are designed to show the progress toward the conditions set in your notification.

Browse Your Wave Assets

To view or search organized lists of apps, dashboards, and lenses, click **Browse All** on the home page.

You can also view the contents of a running app by selecting **Browse App** from its menu.

Wave's Browse tab gives you options to view all assets, sort by asset, and search. Lists of assets are arranged in most recently used order. Click **Show More** next to an asset to see the full list.

Click the list view icon () to view assets with their descriptions and additional information. Click the tile view icon () to go back to tiles with thumbnail images of dashboards and lenses.

In list view, relevant timestamps are provided, depending on the asset. For lenses and dashboards, Modified is the last time the asset was edited, and Refresh is the last time the asset's dataset was updated. If a dashboard contains components that reference more than one dataset, the Refresh timestamp will reflect the most recently updated dataset.

Explore with Wave Assets

Introduce yourself to the Wave Analytics way of data exploration.

[Exploring and Visualizing Your Data Interactively](#)

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

[Collections of Data in Wave Analytics](#)

Wave collects and organizes your data in datasets, lenses, dashboards, and apps. These collections, also known as “Wave assets,” represent levels of data refinement—from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.

[Data Exploration Concepts](#)

As you learn how to explore and visualize your data, it’s helpful to review key concepts such as visualization, measure, and dimension.

[What Is a Dashboard?](#)

A Wave dashboard is a collection of widgets that work together to tell a data story from multiple angles. Depending on what you want the dashboard to show or how to behave, you can add different widgets, such as key performance indicators, charts, tables, filters, and images.

[Key Elements of a Wave Dashboard](#)

A dashboard isn’t just for reading. It’s for carrying on a conversation based on one or more datasets that matter to your company. Don’t just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around, and explore!

[Explore Your Data](#)

[Build Wave Dashboards](#)

[Put It All Together with Wave Apps](#)

Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

- View—View the data set.
- Explore—Get to know the boundaries and shape of your data. Play with different views, zoom in and zoom out, and see what you get with different charting options.
- Refine—Narrow your view to the most important data. Decide the level of detail and categorization that’s easiest for your colleagues to understand. Choose the most appropriate chart visualization.
- Save—Save your work.
- Share—Share your view with others. For a more packaged presentation, use your visualization to build a dashboard.

Collections of Data in Wave Analytics

Wave collects and organizes your data in datasets, lenses, dashboards, and apps. These collections, also known as “Wave assets,” represent levels of data refinement—from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.

- A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.
- A *lens* is a particular view into a dataset’s data. It’s where you do exploratory analysis and visualization.
- A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.
- An *app* is a purpose-built set of analytics and answers about a specific area of your business. With apps, you can provide pathways through your data, plus powerful tools for spontaneous, deep explorations. After creating dashboards, lenses, and datasets, organize apps to present dashboards in relevant order, and then share apps with appropriate groups.

Data Exploration Concepts

As you learn how to explore and visualize your data, it’s helpful to review key concepts such as visualization, measure, and dimension.

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate. Measures have names (revenue) and values (\$1,000,000). When you’re viewing a chart visualization in Wave Analytics, it’s important to remember:

- The chart either shows a slice of your data based on the number of or amount of something, or it shows tabular data.

- A measure is typically *aggregated* in some way, which means that it's displayed with some math already applied to it. For example, when you first view a dataset, you often see a simple aggregation such as the count of the number of rows. You typically aggregate by a different method—sum, average, maximum, and so on—as you explore and change or add measures, but you always specify how you want to aggregate at the time when you select the measure.
- You can identify measures by their position (the far left items in the top left corner of a lens) and by the text that indicates the aggregation method (such as Sum of Revenue).

 **Warning:** If you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum for a numeric field (36,028,797,018,963,967), the value overflows and Wave Analytics returns an incorrect result.

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. Like measures, dimensions also have names (region) and values (northeast). Time is usually considered a dimension rather than a measure.

What Is a Dashboard?

A Wave dashboard is a collection of widgets that work together to tell a data story from multiple angles. Depending on what you want the dashboard to show or how to behave, you can add different widgets, such as key performance indicators, charts, tables, filters, and images.

When you share Wave Analytics data via a dashboard, you're setting up your audience members to do some exploring of their own, without turning them loose on the whole data set.

One use of a dashboard is to provide a focus for your audience. A dataset can contain vast amounts of data. Some of that data is relevant to specific questions that your audience has; some of that data is irrelevant noise. Data that's critical to one set of questions is sometimes noise in relation to another set of questions.

Keep in mind that even though we call it a dashboard, we're actually doing much more with this interface than we do with a traditional dashboard in a car. This dashboard doesn't just tell us what's changed; it invites us to dig deeper into the underlying data. It's like using the speedometer in a car to tell us not just how fast we're going but how our speed has changed at various points in our trip, how traffic conditions ahead of us are changing, and how those changes affect our arrival time.

[Key Elements of a Wave Dashboard](#)

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around, and explore!

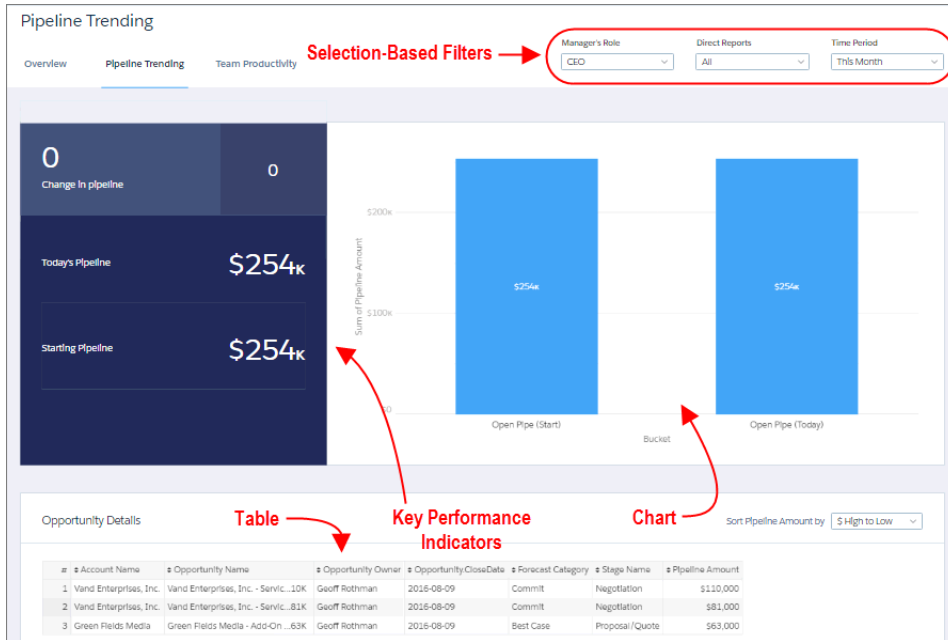

SEE ALSO:

[Build a Dashboard with the Wave Dashboard Designer](#)

[Build a Dashboard with the Classic Designer](#)

Key Elements of a Wave Dashboard

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around, and explore!

You read a Salesforce Wave dashboard interactively by clicking its displayed elements. Every element is a picture of a live, filtered query.

Selection-Based Filters

A selection-based filter lets you apply whatever filters you wish while viewing the dashboard. For example, set the minimum and maximum values in a range widget to make the dashboard show the amounts that fall within that range. These types of filters are often tied to each other so that you can progressively drill deeper. For example, use one filter to look at sales of a product. Then use the next to filter sales by region. Finally, use another to filter sales by account. The dashboard shows the results based on all three filters. There are different types of selection-based filter widgets: date, list, range, and toggle.

Key Performance Indicators

Some information is best measured by a single number, also known a key performance indicator. Some number elements can be filtered based on selections in charts and filters. For example, in a bar chart that shows individual salespeople’s pipelines, click a bar to focus on a particular person’s pipeline. Notice that the number changes from showing the total value for all salespeople to show the value for the selected person.

Charts

A rich variety of charts shows you data from multiple angles. Many parts of a chart are interactive. For example, click a bar in a bar chart and watch what happens. Clicking a bar filters the query that the bar chart represents. Your revision changes other values in this chart, values in other charts, and number displays.

Tables

A table provides the record-level details. For example, a chart can show you a performance summary for each region, but the table can show you the opportunity-specific details. You can sort tables to show the top and bottom records. You can also create calculated columns in tables to compute values based on existing data.

Work with Wave

Personalize your own Wave experience and collaborate with Wave Analytics apps with features such as notifications, annotations, presentation mode, and downloading filtered data from Wave. In addition, custom menus in lenses and dashboards allow you to take action in Salesforce directly from Wave.

Set Smart Notifications for Your Most Important Business Metrics

With notifications, Wave works for you, when and where you choose. Attach notification criteria to number widgets in dashboards, and select when to run the queries. You can see notifications in Wave, Lightning Experience, and email. Notifications are available in dashboards built in the Wave dashboard designer.

Collaborate with Dashboard Annotations

Annotate dashboard widgets with comments posted in the dashboard and in Chatter. With annotations, you can hold conversations about your data and how it's visualized, with the dashboard right there for reference.

Present Live, Interactive Dashboards

Conduct meetings directly from Wave by presenting dashboards in running apps. With dashboards instead of slides with static images, you have real-time access to your data, and you can showcase dynamic visualizations.

Download Images and Filtered Data

Download filtered data from lens explorations and dashboard widgets. Download formats include image (.png), Microsoft® Excel® (.xls), and comma-separated values (.csv) files. This feature downloads the results of a displayed query (or step).

Incorporate Visualizations through Chatter Posts and Sharing Links

Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that's presented.

Take Control of Your Salesforce Experience with Wave Custom Actions Menus

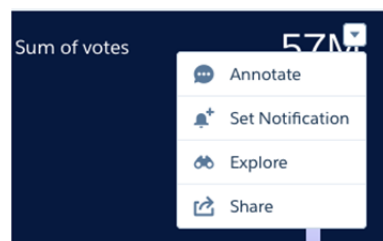

Wave custom actions menus in charts and tables let you take advantage of Salesforce actions—such as posting to Chatter, creating an event or opportunity, or updating a record—and go directly to Salesforce records.

Set Smart Notifications for Your Most Important Business Metrics

With notifications, Wave works for you, when and where you choose. Attach notification criteria to number widgets in dashboards, and select when to run the queries. You can see notifications in Wave, Lightning Experience, and email. Notifications are available in dashboards built in the Wave dashboard designer.

To set up a Wave notification, follow these steps.

1. Locate the number widget on your dashboard that shows the KPI you want to be notified about. Optionally, you can use the dashboard's filters to narrow the query against your data and create a personalized KPI.
2. Select **Set Notification** from the drop-down list.

3. In the New Notification panel, set the value that you want to know about as soon as your widget query returns it.

For example, say that you want to know when your team has reached 75% of quota. You'd click **Set Notification** on the Quota Attainment number widget. In the New Notification panel, you'd select **Equals or is greater than** from the drop-down list and enter 75 for the threshold value.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To set notifications on Wave Analytics dashboard widgets:

- "Use Wave Analytics"

- Select the frequency and time when you want the query to run.

- Test your notification on the spot with **Save and Run**, or simply save it. No administrator setup is required.

When the conditions you've set for the KPI are met, you're notified in the app and via email. In Wave and Lightning Experience, the bell icon (🔔) informs you of notifications.

In Wave, the drop-down list from the bell includes the option to manage Wave notifications. You can also manage notifications on the dashboard. The bell icon with the plus (🔔+) opens the list of notifications and shows numbers in blue (1) on widgets that have notifications attached. In the All Notifications panel, each notification has a drop-down action list for editing and deleting the notification.

Take note of these considerations for Wave notifications.

- You can set up to five notifications per user.
- Notifications are available only for dashboards designed in the Wave dashboard designer.
- Notifications are available only from number widgets.

- For queries with groupings, all results are evaluated for the notification criteria, not just the first row (which is the value shown in the widget).

Collaborate with Dashboard Annotations

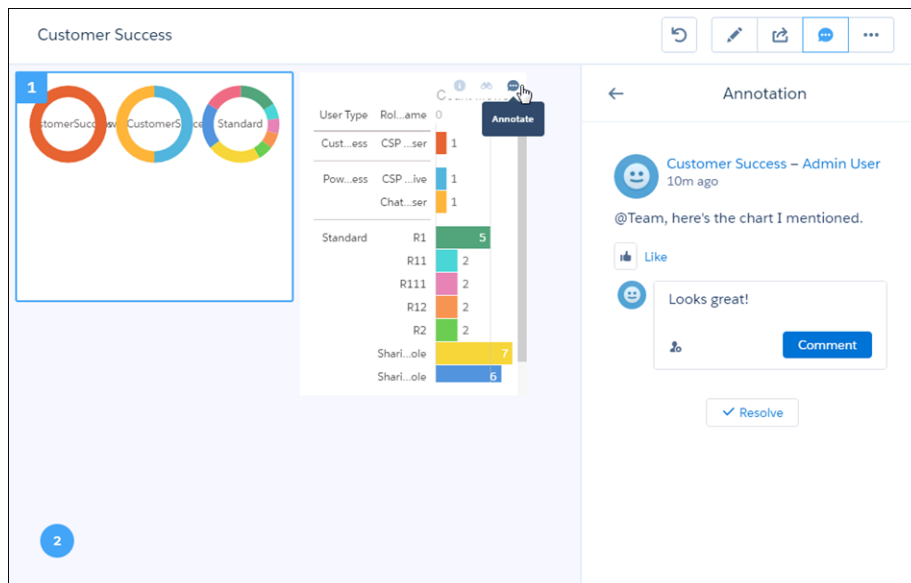

Annotate dashboard widgets with comments posted in the dashboard and in Chatter. With annotations, you can hold conversations about your data and how it's visualized, with the dashboard right there for reference.

 **Note:** Annotations are supported only in dashboards built using the Wave dashboard designer.

To create annotations, select Annotate from the drop-down list on a widget, or click the speech bubble icon () in the dashboard control bar. Widgets with annotations show a blue square with the number of open annotations.

Wave saves both open and resolved annotations. And if you delete a widget, its open annotations are saved as detached annotations. You can access detached annotations from the blue circle at the bottom of the dashboard.

Click an annotation in a blue square or circle to open it for comments.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To annotate Wave Analytics dashboard widgets:

- "Use Wave Analytics"

Although you can @mention anyone in your org, the security you have set up controls access to the dashboard.

Wave dashboard annotations are natively integrated with Chatter, and comments on dashboards also appear as Chatter posts. The

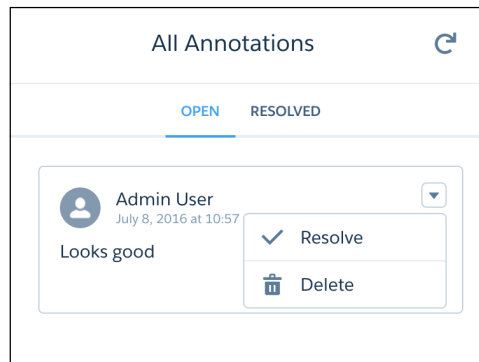

Annotation panel includes the option to post a screenshot of the current state of the dashboard.

On an open annotation, you can refresh the feed or close the annotation.

In the dashboard panel, each annotation has a drop-down action list for resolving or deleting the annotation.

You receive all posts on a dashboard if you click its [+ Follow](#) button. When you see annotations in Chatter, click the dashboard image to navigate directly to the annotation on the dashboard in Wave.

SEE ALSO:

[Enable Annotations on Dashboard Widgets](#)

Present Live, Interactive Dashboards

Conduct meetings directly from Wave by presenting dashboards in running apps. With dashboards instead of slides with static images, you have real-time access to your data, and you can showcase dynamic visualizations.

Start a presentation by clicking an app on the home page, or if you are browsing the app, click the **Present** button. The presentation starts running inside the Wave window with the first dashboard on the navigation list.

Click  to run the presentation in the full screen.

During the presentation, you can use all the Wave dashboard functionality, such as filtering, faceting, and linking to other dashboards. In addition, the presentation has a control bar.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To present from Wave Analytics:

- "Use Wave Analytics"

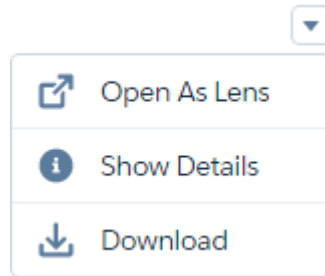

You can share, download, access the dashboard designer, set notifications, and collaborate in a dashboard's feed with annotations.

To move to another dashboard, click  to open the navigation panel and select the next dashboard to present. Click  again to close the navigation panel.

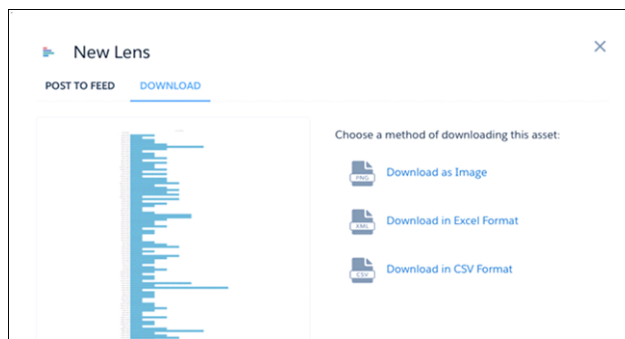

Download Images and Filtered Data

Download filtered data from lens explorations and dashboard widgets. Download formats include image (.png), Microsoft® Excel® (.xlsx), and comma-separated values (.csv) files. This feature downloads the results of a displayed query (or step).

Select **Download** from the drop-down menu on a dashboard widget.

Or, from a lens, select **Share** and then **Download**.

When downloading filtered data, the number of rows is limited by the query. The default limit per query is 10,000 rows of data. To set a different value, use the SAQL `limit` statement.

SEE ALSO:

[Enable Downloading from Wave Analytics](#)

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To download screenshots and data in tabular format through the Wave Analytics user interface:

- “Download Wave Analytics Data”

Incorporate Visualizations through Chatter Posts and Sharing Links

Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that’s presented.

1. Click **Share**.

2. Click the tab for the sharing method that you want: **Post to Feed**, which posts to Chatter an image and link to the lens, dashboard, or app; or **Get URL**, which is a unique URL to the asset.
 - a. If you’re posting to Chatter, select **User** or **Group** feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the **x**. Note that posted images are public.
 - b. If you’re getting the unique URL, copy the link, and then paste it wherever you want to share it.
3. If applicable, click **Give Access** to set the level of sharing access.
4. Click **Done**.

Note: To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

Take Control of Your Salesforce Experience with Wave Custom Actions Menus

Wave custom actions menus in charts and tables let you take advantage of Salesforce actions—such as posting to Chatter, creating an event or opportunity, or updating a record—and go directly to Salesforce records.

With custom actions menus, you can use quick actions that have been added to Salesforce objects—directly from Wave dashboards and lenses. You can also open records from Salesforce or elsewhere on the Web through the menus.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To use custom actions menus:

- “Use Wave Analytics”

Opportunity Name
 Equals Opportunity for Pearson1363 Filter

#	Opportunity Name	Amount	ValidFromDate
1	Opportunity for Pearson1363		0Z 20
2	Opportunity for Pearson1363	\$	0Z 20
3	Opportunity for Pearson1363	\$	0Z 30

- Open Record
- Log a Call
- New Task
- New Event
- Post
- File
- New Case
- New Note
- Link
- Poll
- Question

You can access actions menus from the following parts of charts and tables in Wave:

- Value labels on charts (such as "Opportunity for Pearson" in the image above).

- Legend value labels in table cells.

- Values in table cells.

Hover over the labels to see if an actions menu is available. Click the value, cell, or legend displays the menu, to see the menu’s contents and select from the available actions or open a record.

Developers or administrators edit the [Extended Metadata \(XMD\)](#) file for a dataset to create menus. To learn more, see [Enable Actions and Links with Custom Actions Menus in Lenses and Dashboards](#)

Wave Platform Setup

Set up your organization to use the Salesforce Wave Analytics platform by enabling Wave and creating and assigning permission sets.

The information here describes how to set up your organization to use the Wave platform. Read [Prebuilt Wave Apps](#) to get started with and set up Sales Wave Analytics, Service Wave, and other apps.

Each Analytics Cloud - Wave Analytics Platform license is a single-user license that provides access to the Salesforce Wave Analytics cloud. It includes single Analytics Cloud - Sales Wave Analytics App and Analytics Cloud - Service Wave Analytics App single-user licenses. The table shows data storage limits for each license. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

License	Limit
Analytics Cloud - Wave Analytics Platform	100 million rows

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

License	Limit
Analytics Cloud - Sales Wave Analytics App	25 million rows when used without Analytics Cloud - Wave AnalyticsPlatform license. Use of Sales Wave app license does not increase data limit for platform license
Analytics Cloud - Service Wave Analytics App	25 million rows when used without Analytics Cloud - Wave AnalyticsPlatform license. Use of Service Wave app license does not increase data limit for platform license
Analytics Cloud - Additional Data Rows	100 million rows

Important:

- Wave Analytics license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.
- If you purchased a Wave Analytics Platform license before October 20, 2015 with Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses: Read [Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015](#). If you're migrating users from Builder or Explorer licenses to the new Analytics Cloud - Wave Analytics Platform license: See [Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#) before you start the setup process for those users.
- If you disable Wave Analytics, user permissions are removed from each defined permission set. If you re-enable Wave Analytics later, you must define the permission sets again.

Wave Platform Setup Process

Follow these basic steps to set up your organization to use the Wave Analytics platform.

1. Enable Wave for your organization.
2. Define the main Wave user types in your organization.
3. Create permission sets to group related user permissions according to the needs of each user type.
4. Assign a permission set to an individual user, which also *auto-assigns* the Analytics Cloud - Wave Analytics Platform permission set license to that user.

Note: For efficiency, you can assign a permission set to groups of users. You can also assign multiple permission sets to a user.

Walk Through It: [create, edit, and assign a permission set.](#)

You can assign a Wave permission set license along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
- Salesforce Platform One

For best results, follow the steps for setting up the Wave Analytics platform in the order shown here.

1. [Learn About Wave Analytics Cloud Permission Set Licenses and User Permissions](#)
Wave Analytics permission set licenses enable the permissions to explore data with and manage the Salesforce Wave Analytics platform. They also let Salesforce Community users view Wave dashboards.
2. [Identify Wave Analytics Platform User Types](#)
Identifying types of Wave platform users helps assure that the setup process meets your team’s analytics needs.
3. [Enable Wave Analytics and Create Permission Sets](#)
After Salesforce provisions you with the Wave Analytics platform license, enable Wave and create permissions.
4. [Assign Wave Analytics Permission Sets to Users](#)
Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to Wave functionality.
5. [Complete Setting up the Wave Analytics Platform](#)
Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

[Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#)

Learn About Wave Analytics Cloud Permission Set Licenses and User Permissions

Wave Analytics permission set licenses enable the permissions to explore data with and manage the Salesforce Wave Analytics platform. They also let Salesforce Community users view Wave dashboards.

- Each Wave platform user needs an Analytics Cloud - Wave Analytics Platform permission set license to use the Wave platform. Creating a permission set and assigning it to a user *auto-assigns* the Wave platform permission set license to that user. You can also manually assign permission set licenses to users.
- Community users need an Analytics Cloud - Wave Community Users permission set license to view Wave apps shared via dashboards embedded in Visualforce pages.

The Analytics Cloud - Wave Analytics Platform permission set license enables the following permissions.

User Permission	What It Enables
"Use Wave Analytics"	Accessing Wave Analytics. Viewing and exploring datasets. Viewing and sharing lenses and dashboards.
"Create and Edit Wave Analytics Dashboards"	Creating, editing, and deleting Wave Analytics dashboards.
"Create Wave Analytics Apps"	Creating, editing, deleting, and sharing Wave Analytics applications.
"Upload External Data to Wave Analytics"	Uploading external data to Wave Analytics to create a dataset. Monitoring dataflow and system jobs in the data monitor.
"Edit Wave Analytics Dataflows"	Editing, starting, stopping, and rescheduling the dataflow. Creating, editing, and running dataset recipes. Monitoring dataflow and system jobs in the data monitor. Use discretion when assigning this user permission because it enables access to all Salesforce object data to which the Integration User has access. See Salesforce Data Access in Wave Analytics .
"Manage Wave Analytics"	Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.

“Download Wave Analytics Data”

Downloading screenshots and data in tabular format through the Wave Analytics user interface.

 **Note:** When you create permission sets for Wave users, selecting any Wave Analytics permission automatically enables the “Use Wave Analytics” permission as well. Also, the type of access granted on an app controls the actions that can be performed on its datasets, lenses, and dashboards. For example, if a user has the “Use Wave Analytics” permission, the user must also have Viewer access on an app to view its datasets, lenses, and dashboards.

The Analytics Cloud - Wave Community Users permission set license enables the “View Wave Analytics on Communities Pages” permission. That permission enables external users to view Wave dashboards embedded in VisualForce pages in their communities. See [Enable Wave Analytics for Communities](#) on page 3927.

Identify Wave Analytics Platform User Types

Identifying types of Wave platform users helps assure that the setup process meets your team’s analytics needs.

The Wave Analytics Platform license includes the permissions that enable users in your organization to import, work with, and explore data using the Wave platform. The license also includes permissions that let administrators manage Wave. To set up Wave in the most useful way, think through the different ways people access Wave features and categorize them into user types. Here are a few examples.

Most people on your team fall into two basic categories:

- Users, who view Wave dashboards, lenses, and datasets and occasionally import data to Wave.
- Administrators or managers, who access to the full range of Wave functionality to create apps, dashboards, lenses, and datasets, edit data, and otherwise customize the Wave experience.

Accordingly, when you set up the Wave platform, creating two basic permission sets can meet the needs of most of your organization:

- A “view” permission set that contains the permissions needed by most basic-level users when they access Wave.
- A “manage” permission set that’s reserved for a select few administrators and managers and contains permissions to use all Wave features

You can set up Wave Analytics however you want, defining other user types and permissions sets based on the needs of users in your organization. For example, you can create a “superuser” permission set for users who create and share apps and dashboards. Or, a “data wizard” permission set would enable other users to work closely with datasets.

We focus on two main types of people on your team -- users and administrators -- in the example permission sets we describe in our detailed setup instructions.

Enable Wave Analytics and Create Permission Sets

After Salesforce provisions you with the Wave Analytics platform license, enable Wave and create permissions.

Enable the Wave Platform

To use the Wave platform, first enable it for your organization.

1. In the Salesforce Setup menu, under Administer, click **Analytics Cloud | Getting Started**.
2. Click **Enable Analytics**.

Create Permission Sets

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

The next step in the setup process is to create permission sets made up of Wave user permissions. We show you how to create two permission sets:

- *Manage Wave* permission set, for users who create and administer Wave.
- *View Wave* permission set, for users who explore app dashboards and datasets.

 **Note:**

- Customers who purchased Wave before October 20, 2015: See [Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015](#) before following the instructions here.
 - The Manage Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Builder license (purchased before October 20, 2015). If you have a Builder license or you're migrating to the current Wave Analytics platform license, follow these steps to create a permission set with the same functionality.
 - The View Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Explorer license (purchased before October 20, 2015). If you have an Explorer license or you're migrating to the current Wave Analytics platform license, follow these steps to create a permission set with the same functionality.
1. In the Setup menu, under administer, click **Manage Users | Permission Sets** and then click **New**.
 2. Enter `Manage Wave Analytics` or `View Wave Analytics` in the Label field, as appropriate. This automatically creates the API name as well. You can change it if you like, but it can't include spaces, end with an underscore, or have two consecutive underscores.
 3. Select the permission set license to associate with this permission set by using the License drop-down option. In this case, select the Analytics Cloud – Wave Analytics Platform permission set license.

Enter permission set information

Label	Manage Wave Analytics
API Name	Manage_Wave_Analytics
Description	Permission set for Wave admins

Session Activation Required [i](#)

Select the type of users who will use this permission set

Who will use this permission set?

-Choose '--None--' if you plan to assign this permission set to multiple users with different user and permission set licenses.
 -Choose a specific user license if you want users with only one license type to use this permission set.
 -Choose a specific permission set license if you want this permission set license auto-assigned with the permission set.

Not sure what a permission set license is? [Learn more here.](#)

License	<div style="border: 1px solid #ccc; padding: 5px; width: fit-content;"> Permission Set Licenses Analytics Cloud - Wave Analytics Platform Analytics Cloud Explorer Field Service Dispatcher Field Service Mobile Field Service Scheduling Field Service Standard Identity Connect Orders Platform Sales Analytics Apps Sales Console User Service Analytics Apps </div>
---------	--

If you select a specific permission set license, any user assigned to the permission set is *auto-assigned* the permission set license. If you leave the default of --None--, you must *manually* assign the permission set license to users before you can add them to the new permission set.

4. Click **Save**. The Permission Set Overview page shows the new permission set. Now add user permissions to the set.
5. Click **System Permissions** to open the list of user permissions enabled by the Wave platform license. Then click **Edit**.
6. Do one of the following.
 - If you're creating the Manage Wave Analytics permission set, select "Manage Wave Analytics" user permissions and click **Save**. You've successfully created a permission set that enables access to all Wave features. You don't have to select any of the other individual permissions. Assign this permission set sparingly because it provides access to all Wave features, many of which are inappropriate for most analytics users.
 - If you're creating the View Wave Analytics permission set, select "Use Wave Analytics Cloud" and "Upload External Data to Wave Analytics" user permissions and click **Save**. You've successfully created a permission set that enables a user to view the Wave datasets, lenses, and dashboards that they have permission to view, and to upload data files from outside Salesforce.
7. You can now assign your new permission set to users, which is covered in [Assign Permission Sets to Users](#).

Repeat these steps for every user in your organization who requires access to Wave.

Assign Wave Analytics Permission Sets to Users

Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to Wave functionality.

Walk Through It: [assign a permission set](#)

1. In the Setup menu, under administer, click **Manage Users | Permission Sets**.
2. Click the permission set you want to assign to users. If you've followed the instructions in [Enable Wave Analytics and Create Service Wave Permission Sets](#) on page 3922, select either the Manage Wave Analytics or View Wave Analytics permission sets.
3. Click **Manage Assignments** and click **Add Assignments**.
4. Select the users who need access to Wave, and click **Done**. When you assign the permission set to users, Salesforce *auto-assigns* the Analytics Cloud - Wave Analytics Platform *permission set license* to those users.

Assign the Manage Wave Analytics permission set sparingly, since it provides access to all Wave features. Assign it only to users who administer or manage the Wave platform.

USER PERMISSIONS

To assign a permission set to users:

- "Assign Permission Sets"

Complete Setting up the Wave Analytics Platform

Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

[Enable Preview Thumbnails for All Lenses and Dashboards](#)

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

[Enable Wave Analytics for Communities](#)

Securely share Wave Analytics apps with community partner and customer users.

[Enable Downloading from Wave Analytics](#)

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

[Grant Users Access to the Wave Dashboard Designer and Classic Designer](#)

To grant users access to either dashboard designer, assign each of them the "Create and Edit Wave Analytics Dashboards" user permission. For users to access the Wave dashboard designer, the **Enable Wave Dashboard Designer** setup option must also be enabled, which it is by default.

[Enable Annotations on Dashboard Widgets](#)

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.

[Enable the Wave REST API](#)

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

[Connected App for Wave Analytics on Mobile](#)

Install the Salesforce Wave Analytics App Package to allow your mobile clients to easily connect to your org. This package contains the Connected App component that gives you control over who's logging in and how your mobile clients share images and links.

[Wave Analytics Security Implementation Guide](#)

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

[Salesforce Data Access in Wave Analytics](#)

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

[Set Up a Whitelist of Trusted Sites for Embedded Wave Dashboards](#)

Specify your trusted sites in the Wave Analytics whitelist, you can include embedded Wave dashboards in websites and apps outside of Salesforce servers.

Enable Preview Thumbnails for All Lenses and Dashboards

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

If no security predicate is defined for a dataset, then preview thumbnails always appear. If a security predicate is defined, then preview thumbnails don't show unless this setting is enabled. With the setting enabled, preview thumbnails appear for all assets.

! **Important:** Even if row-level security applies to the dataset used by a lens or dashboard, the preview thumbnail could expose data from restricted rows. Row-level security restrictions take effect only after you've clicked through to the lens or dashboard.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
2. Select **Show preview thumbnails for lenses and dashboards with row level-security enabled**.
3. Click **Save**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

Enable Wave Analytics for Communities

Securely share Wave Analytics apps with community partner and customer users.

 **Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

To set up Wave Analytics for sharing with Communities, complete the following steps.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**. Select **Enable Wave Analytics for Communities**.
2. Assign your community members the Analytics Cloud - Wave Community Users permission set license.
3. Create a permission set that includes the "View Wave Analytics on Communities Pages" permission and assign it to your community members.

Enable Downloading from Wave Analytics

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

To set up users to download data from Wave, complete the following steps.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, and then select **Permission Sets** under Manage Users.
2. Select the Analytics Cloud Permission Set where you want to add the permission, and then select **System Permissions**.
3. Select **Download Wave Analytics Data**.
4. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available for an extra cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in: **Developer Edition**

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

To view Wave dashboards and lenses:

- "View Wave Analytics on Communities Pages"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

Grant Users Access to the Wave Dashboard Designer and Classic Designer

To grant users access to either dashboard designer, assign each of them the “Create and Edit Wave Analytics Dashboards” user permission. For users to access the Wave dashboard designer, the **Enable Wave Dashboard Designer** setup option must also be enabled, which it is by default.

If Wave dashboard designer is disabled, complete the following tasks to enable it.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
2. Select **Enable Wave Dashboard Designer**, and then click **Save**.
3. For each user that builds dashboards, assign the “Create and Edit Wave Analytics Dashboards” user permission to them.
Each user has a choice whether to use the classic designer or Wave dashboard designer for each dashboard.

SEE ALSO:

[Build a Dashboard with the Wave Dashboard Designer](#)

Enable Annotations on Dashboard Widgets

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.

 **Note:** Annotations are supported only in dashboards built with the Wave dashboard designer.

To enable annotations, complete the following steps.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, and then select **Feed Tracking** under Chatter.
2. Scroll down and select **Wave Asset**.
3. Select **Enable Feed Tracking**.
4. Click **Save**.

SEE ALSO:

[Collaborate with Dashboard Annotations](#)

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the Wave dashboard designer or classic designer:

- “Create and Edit Wave Analytics Dashboards”

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- “Manage Wave Analytics”

Enable the Wave REST API

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
2. Select **Enable the Wave API for all Wave users**.
3. Click **Save**.

Connected App for Wave Analytics on Mobile

Install the Salesforce Wave Analytics App Package to allow your mobile clients to easily connect to your org. This package contains the Connected App component that gives you control over who's logging in and how your mobile clients share images and links.

1. While logged in as an admin, navigate to <https://login.salesforce.com/packaging/installPackage.apexp?p0=04tB0000000DKTA>.
2. Select **Install for All Users**.
If you install the Connected App only for certain roles, then only those clients are subject to your policies.
3. After clicking **Done**, click the Salesforce Wave Analytics App Package and then **View Components**.
4. Select iOS or Android. To configure policies and other settings, click **Edit**. When you are finished, save your changes.
For more information about Connected App settings, see [Edit a Connected App](#).
5. If you want to disable sharing options for mobile users, click **New** in the Custom Attributes section.

All sharing options are enabled by default. To disable an option, add its attribute key and enter "false" for the attribute value. See the table for the supported attribute keys.

Attribute Key	Mobile clients can share	Mobile Device
SHARE_IMAGE_AIRDROP	Images via AirDrop	iOS
SHARE_IMAGE_CAMERAROLL	Images from Camera Roll	iOS
SHARE_IMAGE_OPEN	The image that's currently open on the mobile device	iOS

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To install and configure Connected App:

- "Manage Wave Analytics"

Attribute Key	Mobile clients can share	Mobile Device
SHARE_IMAGE_S1	Images in Salesforce1	iOS
SHARE_IMAGE_EMAIL	Images through email	iOS
SHARE_LINK_NFC	Links via Near Field Communication (NFC)	Android
SHARE_LINK_BLUETOOTH	Links over Bluetooth	Android
SHARE_LINK_AIRDROP	Links via AirDrop	iOS
SHARE_LINK_CLIPBOARD	The link that's currently in the clipboard of the mobile device	iOS and Android
SHARE_LINK_S1	Links in Salesforce1	iOS and Android
SHARE_LINK_EMAIL	Links through email	iOS and Android
SPOTLIGHT_SEARCH	Mobile clients can see Wave Analytics assets in Spotlight search results	iOS

 **Note:** To apply custom attributes to connected users, you can revoke them and ask them to reconnect.

- To view and control how mobile clients connect to your Wave-enabled org, from Setup, enter *Connected Apps* in the *Quick Find* box, then select **Connect Apps OAuth Usage**.

You can block user sessions, revoke individual users, and drill in to user details. For more information, see [Monitoring Usage for a Connected App](#).

 **Note:** For certificate-based authentication, users must set their desktop browsers to allow cookies.

For additional security, use Mobile Device Management (MDM) with the option to show only authorized hosts. The "OnlyShowAuthorizedHosts" key allows you to hide the "Add New Account" plus sign in the mobile app. For more information, see [Using MDM with Salesforce Mobile SDK Apps](#).

Wave Analytics Security Implementation Guide

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

- The administrator can implement object-level and field-level security to control access to Salesforce data. For example, the administrator can restrict access to prevent the dataflow from loading sensitive Salesforce data into datasets. This document describes how Wave Analytics uses object-level and field-level security on Salesforce data and how to configure permissions on Salesforce objects and fields.
 - Dataset owners can implement row-level security on each dataset that they create to restrict access to its records. If a dataset does not have row-level security, users who have access to the dataset can view all records. This document describes how to configure row-level security on datasets and provides some sample implementations based on datasets created from Salesforce data and external data.
 - App owners, administrators, and users granted manager access to an app control access to datasets, lenses, and dashboards within apps. This document describes the different levels of access for apps and how to share datasets, lenses, dashboards in an app with other users.
- Note:** Wave Analytics doesn't synchronize with sharing that's configured in Salesforce. Instead, you configure security separately in Wave Analytics. Wave Analytics provides a robust row-level security feature that enables you to model many different types of access controls on datasets.

For complete information about implementing Wave Analytics security, see [Wave Analytics Security Implementation Guide](#).

Salesforce Data Access in Wave Analytics

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Wave Analytics uses the permissions of the Integration User to extract data from Salesforce objects and fields when a dataflow job runs. Because the Integration User has View All Data access, consider restricting access to particular objects and fields that contain sensitive data. If the dataflow is configured to extract data from an object or field on which the Integration User does not have permission, the dataflow job fails.

When you query a dataset that has row-level security based on the User object, Wave Analytics uses the permissions of the Security User to access the User object and its fields. The Security User must have at least read permission on each User object field included in a predicate. A predicate is a filter condition that defines row-level security for a dataset. By default, the Security User has read permission on all standard fields of the User object. If the predicate is based on a custom field, then grant the Security User read access on the field. If the Security User does not have read access on all User object fields included in a predicate expression, an error appears when you try to query the dataset using that predicate.

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow's access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow's access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

When configuring permissions for the Integration User or Security User, make changes to a cloned version of the user profile.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and then select the user profile.
For the Integration User, select the Analytics Cloud Integration User profile. For the Security User, select the Analytics Cloud Security User profile.
2. Click **Clone** to clone the user profile.
3. Name and save the cloned user profile.
4. Click **Object Settings**.
5. Click the name of the Salesforce object.
6. Click **Edit**.
 - a. To enable permission on the object, select **Read** in the Object Permissions section.
 - b. To enable permission on a field of the object, select **Read** for the field in the Field Permissions section.

 **Note:** You can't change the permissions on standard fields of the User object.
7. Save the object settings.
8. Assign the cloned user profile to the Integration User or Security User.
 - a. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
 - b. Select the user to which you want to assign the user profile.
 - c. Click **Edit**.
 - d. In the Profile field, select the user profile.
 - e. Click **Save**.
9. Verify that the Integration User or Security User has the right permissions on fields of the objects.

USER PERMISSIONS

To clone a user profile:

- "Manage Profiles and Permission Sets"

To edit object permissions:

- "Manage Profiles and Permission Sets"
- AND
- "Customize Application"

Set Up a Whitelist of Trusted Sites for Embedded Wave Dashboards

Specify your trusted sites in the Wave Analytics whitelist, you can include embedded Wave dashboards in websites and apps outside of Salesforce servers.

To set up a Wave Analytics whitelist, complete the following steps.

1. From Setup, enter *whitelist* in the **Quick Find** box, and then select **Whitelist** under Wave Analytics.
2. On the Whitelist for Embedding Wave Dashboards page, click **New**.
3. On the Whitelisted Site Edit page, enter the information for the site you want to add to the Wave whitelist.
4. Click **Save**.

Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015

If you purchased Wave Analytics Builder or Explorer licenses before October 20, 2015, you can continue to use your licenses to set up the Wave platform for users in your organization or you can migrate to the new single-user Wave Analytics platform license.

-  **Note:** This information applies only to customers who purchased Wave Analytics licenses before October 20, 2015, and continue to use the Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses after that without migrating to the new Analytics Cloud Wave Platform license. If you purchased Wave on or after October 20, 2015, go to [Wave Platform Setup](#).
-  **Important:** If you're migrating from the previous Analytics Cloud Builder or Analytics Cloud Explorer platform licenses to the single-user Wave Analytics platform license, read [Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#).

The Analytics Cloud Wave Platform License

Analytics Cloud Wave Platform license purchased before October 20, 2015, enable you to turn on Wave Analytics for your organization. Each previous Wave Platform license is contractually limited to a maximum of 400 users. If you need more than 400 users, you can purchase additional Wave Platform licenses.

Each previous Wave Platform license enables you to:

- Store up to 250,000,000 rows in your final registered datasets.
- Run up to 50 concurrent queries in Wave Analytics.

The Analytics Cloud Permission Set Licenses

Each user needs an Analytics Cloud permission set license to use the product. The permission set license defines what user permissions can be assigned to the user. The administrator assigns permission set licenses to users.

As part of Wave Analytics platform licenses sold before October 20, 2015, Salesforce provides the following permission set licenses:

- Analytics Cloud Builder permission set license enables users to access all Wave Analytics features.
- Analytics Cloud Explorer permission set license enables users to upload external data to Wave Analytics and explore data.

Here are Wave Analytics user permissions included with each permission set license.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

User Permission	Included in Explorer or Builder Permission Set License?	What It Enables
"Create and Edit Wave Analytics Dashboards"	Builder only	Creating and editing Wave Analytics dashboards.
"Create Wave Analytics Apps"	Builder only	Creating and sharing Wave Analytics applications.
"Edit Wave Analytics Dataflows"	Builder only	Downloading, uploading, starting, stopping, and rescheduling the dataflow. Viewing dataflow and system jobs in the data monitor.
"Manage Wave Analytics"	Builder only	Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.
"Upload External Data to Wave Analytics"	Builder and Explorer	Uploading external data to Wave Analytics to create a dataset. Viewing dataflow and system jobs in the data monitor.
"Use Wave Analytics"	Builder and Explorer	Using Wave Analytics, and viewing the datasets, lenses, and dashboards that the user has permission to view. Automatically enabled when you select any other Wave permission.

 **Note:** When you create permission sets for Wave users, selecting any of the other Wave Analytics permissions automatically enables the "Wave Analytics" permission.

You can assign previous Wave Analytics permission set licenses along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
- Salesforce Platform One

SEE ALSO:

[Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#)

Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses

To complete migration from previous Analytics Cloud Builder and Analytics Cloud Explorer licenses purchased before October 20, 2015, to the new Analytics Cloud - Wave Analytics Platform license, you may need to set up Wave users in your organization with new permission sets.

When Salesforce provisions your organization with the new Analytics Cloud - Wave Analytics Platform license, you may have to set up some users with the new license.

- **Builder license users.** Users who access Wave with the Analytics Cloud Builder permission set license should be able to continue to use the Wave Analytics platform without any additional setup. The Builder license is simply renamed *Analytics Cloud - Wave Analytics Platform*, and you'll see that permission set license in Salesforce Setup.
- **Explorer license users.** During the new license provisioning process, Salesforce may remove the Analytics Cloud Explorer license from your org. If that's the case, you'll see the new Analytics Cloud - Wave Platform license instead of the Explorer license and you have to set up users with that license. If the Explorer permission set license is still visible, you do not have to repeat the setup process for Explorer users.

If users in your organization require you to set them up with the new Analytics Cloud - Wave Platform license—even if they used Wave with a previous license—follow the steps in [Wave Platform Setup](#) on page 3919. You need to assign them the new permission set license, create one or more new permission sets, and assign the permission sets to users.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

Update the Sales Wave Analytics Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Analytics Quota dataset so the app includes quotas data for your team.

When you create Sales Wave Analytics, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave Analytics, you need to update the Quota dataset by completing the following steps. You can also watch the video [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow \(Lightning Experience\)](#), which covers the steps described here.

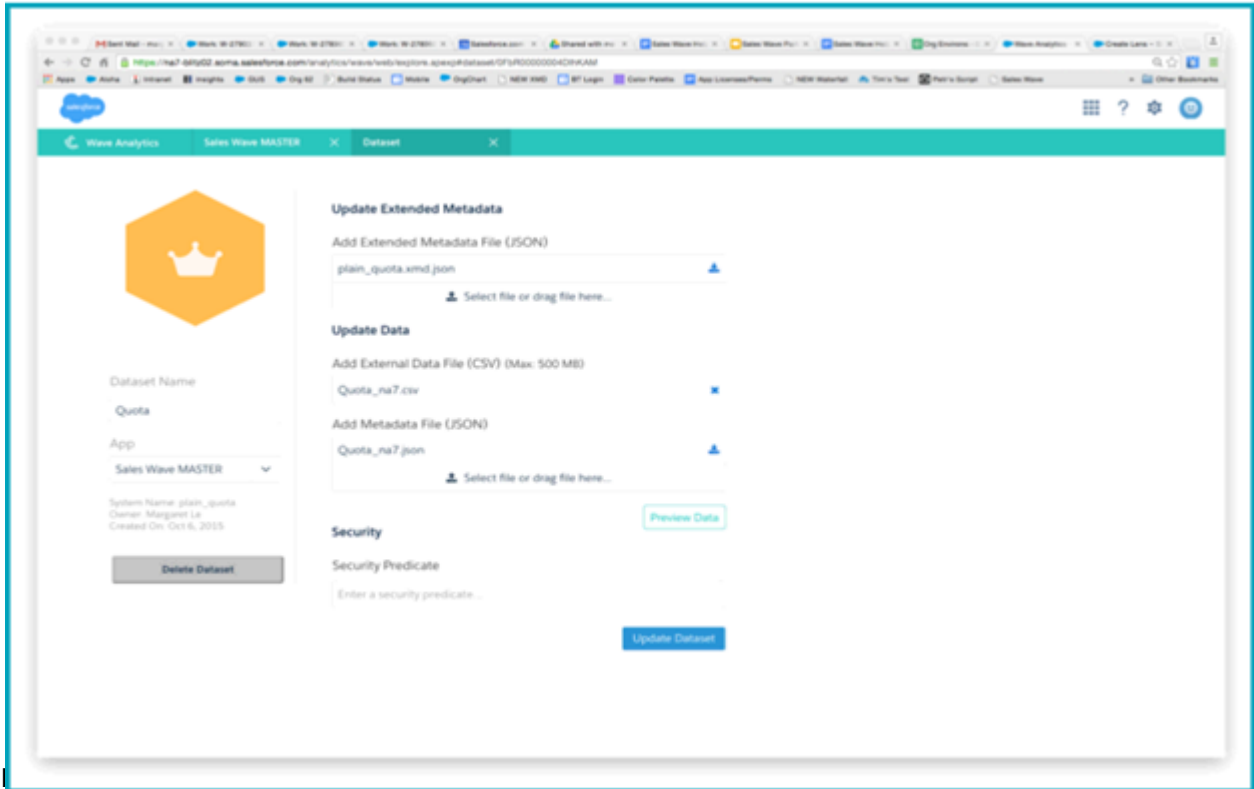

- **Note:** When you work with .CSV files you want to import to Sales Wave Analytics, create and open them using only a UTF-8-compliant text editor. Opening them in Microsoft Excel or other spreadsheet software reformats .CSV files and makes them unusable in Sales Wave Analytics
- **Note:** If your business doesn't track quotas at the user level, you can skip this step. Complete the step only if you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level.
- **Important:** When you create the .CSV file, be sure it contains the following fields, in this order, with exactly these names. Field names are case-sensitive:
 1. StartDate (in yyyy-mm-dd format)
 2. QuotaAmount
 3. OwnerName
 4. Username

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

1. Create a .CSV file to include the fields just described, that is StartDate (in yyyy-mm-dd format, QuotaAmount, OwnerName, Username.. For an example, see [Sales Wave Analytics Example .CSV File](#).
2. Save the file to a location that you can easily remember.
3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.
4. Hover over the dataset, then click **Edit**.
5. Salesforce displays the dataset editing screen for the Quota dataset. From the Update Data section, select **Select file or drag file**

6. In the dialog box that opens, navigate to the .CSV file you created in Step 1, and double-click it.
7. Click **Update Dataset**.
8. If your fiscal period is different than calendar period, that is if it starts another date besides January 1, you also need to update the Quota Metadata file.
 - a. Copy the JSON from [Sales Wave Analytics App Quota Dataset JSON File](#) and paste it into a text editor of your choice.
 - b. Change the value of "fiscalMonthOffset" from 4 to a number that represents the month your fiscal period starts. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December.
 - c. Save the file to your desktop and upload it to Sales Wave Analytics by dragging it to **Select file or drag file here...** in the Add Metadata File (JSON) section of the dataset editing screen.
 - d. Click **Update Dataset**.
9. After uploading your quota data, re-run the dataflow to update the dashboards.
 - a. Click the Gear menu at the upper right of the Sales Wave screen and select Data Monitor.

- b. Select Dataflow view from the menu at the top left of the Data Monitor screen.

- c. Find your app; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name, and click

it. The dataflow assures that Sales Wave has your company’s latest sales data. You can learn more about dataflows from [Schedule the Sales Wave App Daily Dataflow](#).

[Sales Wave Analytics Example .CSV File](#)

Here’s an example of the .CSV file you create to update the Sales Wave Analytics Quota (Target) dataset.

[Sales Wave Analytics App Quota Dataset JSON File](#)

Use this file to update the Sales Wave Analytics Quota dataset with your fiscal year start date if it’s *not* January 1.

Sales Wave Analytics Example .CSV File

Here's an example of the .CSV file you create to update the Sales Wave Analytics Quota (Target) dataset.

 **Note:** This file is for example purposes only. Create a unique .CSV file with quota data for members of your team including the following fields:

- QuotaAmount
- StartDate
- OwnerName
- Username

Create the file using a UTF-8 compliant text editor, and do not open the file with Microsoft Excel or another spreadsheet application. Field names are case-sensitive and must appear in your file exactly as shown here.

See [Update the Sales Wave Analytics Quota \(Target\) Dataset](#) on page 4295.

 **Example:**

```
QuotaAmount,StartDate,OwnerName,Username
5000000,2014-01-01,Priya Anand,user9.kthjbnrxfifo@yourDomain.com
5000000,2014-02-01,Priya Anand,user9.kthjbnrxfifo@yourDomain.com

```

Sales Wave Analytics App Quota Dataset JSON File

Use this file to update the Sales Wave Analytics Quota dataset with your fiscal year start date if it's *not* January 1.

Copy the contents of this file into an editor of your choice and change the "fiscalMonthOffset" value (shown in **bold**) to the month your fiscal period begins. In metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December. In the code below, the number is set to "4", which stands for May. Use the number that represents the month your

fiscal period begins. Then save the file and upload it to Sales Wave Analytics following the instructions in [Update the Sales Wave Analytics Quota \(Target\) Dataset](#).

```
{

        }
      ]
    }
  ]
}
```

Data Integration

You can integrate Salesforce data and external data into Wave Analytics to enable users to explore and visualize the data with explorer and designer. *External data* is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

When you load data into Wave Analytics, you load it into datasets. A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form.

You can use the following methods to create datasets in Wave Analytics.

	Dataflow JSON	Dataset Builder	Upload User Interface	External Data API	Wave Connector Interface
Data source	Salesforce objects; existing datasets	Salesforce objects	External data	External data	Microsoft Excel
Can join external and Salesforce data?	Yes	No	No	No	No
Graphical user interface?	No (JSON)	Yes	Yes	No (programmatic access)	Yes
Can create multiple datasets at once?	Yes	No	No	No	No
Supports incremental extraction?	Yes	No	No	Yes	No
Data refresh method	Automatic	Automatic	Manual	Manual	Manual
Can filter records?	Yes	No	No	No	No
Can generate new columns when creating datasets?	Yes (delta and dimension columns)	No	No	No	No
Can override metadata?	Yes	No	Yes	Yes	No

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

[Create Datasets with a Dataflow](#)

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

[Transformations for Wave Dataflows](#)

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

[Create a Dataset with the Dataset Builder](#)

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

[Optimize Your Dataflows with Replication](#)

Replication decouples the extract of Salesforce data from your dataflows, letting you run it on a separate schedule. By scheduling these extracts ahead of time, your dataflow has less to do and runs faster. To lighten the load even more, replication extracts Salesforce data incrementally by default, meaning that only data that's changed gets extracted.

[Wave Connector for Excel Data](#)

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

[Create a Dataset with External Data](#)

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

[Edit a Dataset](#)

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

[Delete a Dataset](#)

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org's limit for rows across registered datasets.

[Prepare Datasets with Recipes](#)

A dataset recipe is a user-interface tool that lets you take data from your existing datasets and replications, prepare it, and output the results to a new dataset. Use a recipe to combine data from multiple datasets or replications, bucket the data, add formula fields, and cleanse the data by transforming field values. You can remove fields and filter rows that you don't need, before you create the target dataset.

[Row-Level Security for Datasets](#)

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn't be accessible by everyone.

[Predicate Expression Syntax for Datasets](#)

You must use valid syntax when defining the predicate expression.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Wave Analytics applies one of the following types to each dataset field:

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. To increase query performance, Wave Analytics indexes all dimension fields in datasets.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

For each dataset that you create, you can apply row-level security to restrict access to records in the dataset.

Attention: Before you create a dataset, verify that the source data contains at least one value in each column. Columns with all null values won't be created in datasets and can't be referenced in dataflows, lenses, or dashboards. Consider providing a default value for null values, like "n/a" or "empty."

[Numeric-Value Handling in Datasets](#)

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number "3,200.99" with a scale of "2" as "320099". The user interface converts the stored value back to decimal notation to display the number as "3200.99."

[Null Measure Handling in Datasets](#)

When you create or update a dataset, through your dataflow or a CSV upload for example, blank measure values in your data need to be replaced with concrete values. Wave uses the default values specified in your dataflow or CSV metadata file to replace blank values. When null measure handling is enabled, you can specify these defaults using the special "null" value. When no default value is specified, Wave replaces blanks with null values.

[Enable Null Measure Handling](#)

Null measure handling lets you specify "null" default values in your dataflows and CSV uploads. When no default value is specified, Wave replaces blanks with null values in your datasets.

[Date Handling in Datasets](#)

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

[Dataflow JSON](#)

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

[Dataset Builder](#)

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

[Wave Connector for Excel Data](#)

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

[Upload External Data from the User Interface](#)

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

[External Data API](#)

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

Numeric-Value Handling in Datasets

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number “3,200.99” with a scale of “2” as “320099”. The user interface converts the stored value back to decimal notation to display the number as “3200.99.”

The maximum numeric value that can be stored in a dataset is 36,028,797,018,963,967 and the minimum numeric value is -36,028,797,018,963,968.

 **Warning:** If a numeric value is not within this range, you might receive unexpected results. For example, if you try to load the value 3.7E-16 with a scale of 16 into a dataset, Wave Analytics tries to store the value as 3700000000000000. However, because this value exceeds the maximum, Wave Analytics fails to load the entire record. In addition, if you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum, the value overflows and Wave Analytics returns an incorrect result.

Null Measure Handling in Datasets

When you create or update a dataset, through your dataflow or a CSV upload for example, blank measure values in your data need to be replaced with concrete values. Wave uses the default values specified in your dataflow or CSV metadata file to replace blank values. When null measure handling is enabled, you can specify these defaults using the special “null” value. When no default value is specified, Wave replaces blanks with null values.

 **Note:** Null measure handling is enabled in orgs created after the Spring ‘17 release and can’t be disabled. To enable this feature in other orgs, see [Enable Null Measure Handling](#) on page 3945.

Null measure handling is important because it affects the results of certain calculations. Without null measure handling, Wave replaces blanks in your data with zeros, and you can’t specify nulls as default values in your dataflows. Consider this example of data with customer satisfaction scores, where some customers have not responded.

Source Data	Dataset with Zeros for Blanks	Dataset with Nulls for Blanks																																																
<table border="1"><thead><tr><th>Customer</th><th>CSAT</th></tr></thead><tbody><tr><td>Customer 1</td><td>3</td></tr><tr><td>Customer 2</td><td></td></tr><tr><td>Customer 3</td><td>4</td></tr><tr><td>Customer 4</td><td></td></tr><tr><td>Customer 5</td><td>5</td></tr><tr><td>Average CSAT</td><td>4</td></tr><tr><td>Min CSAT</td><td>3</td></tr></tbody></table>	Customer	CSAT	Customer 1	3	Customer 2		Customer 3	4	Customer 4		Customer 5	5	Average CSAT	4	Min CSAT	3	<table border="1"><thead><tr><th>Customer</th><th>CSAT</th></tr></thead><tbody><tr><td>Customer 1</td><td>3</td></tr><tr><td>Customer 2</td><td>0</td></tr><tr><td>Customer 3</td><td>4</td></tr><tr><td>Customer 4</td><td>0</td></tr><tr><td>Customer 5</td><td>5</td></tr><tr><td>Average CSAT</td><td>2.4</td></tr><tr><td>Min CSAT</td><td>0</td></tr></tbody></table>	Customer	CSAT	Customer 1	3	Customer 2	0	Customer 3	4	Customer 4	0	Customer 5	5	Average CSAT	2.4	Min CSAT	0	<table border="1"><thead><tr><th>Customer</th><th>CSAT</th></tr></thead><tbody><tr><td>Customer 1</td><td>3</td></tr><tr><td>Customer 2</td><td>null</td></tr><tr><td>Customer 3</td><td>4</td></tr><tr><td>Customer 4</td><td>null</td></tr><tr><td>Customer 5</td><td>5</td></tr><tr><td>Average CSAT</td><td>4</td></tr><tr><td>Min CSAT</td><td>3</td></tr></tbody></table>	Customer	CSAT	Customer 1	3	Customer 2	null	Customer 3	4	Customer 4	null	Customer 5	5	Average CSAT	4	Min CSAT	3
Customer	CSAT																																																	
Customer 1	3																																																	
Customer 2																																																		
Customer 3	4																																																	
Customer 4																																																		
Customer 5	5																																																	
Average CSAT	4																																																	
Min CSAT	3																																																	
Customer	CSAT																																																	
Customer 1	3																																																	
Customer 2	0																																																	
Customer 3	4																																																	
Customer 4	0																																																	
Customer 5	5																																																	
Average CSAT	2.4																																																	
Min CSAT	0																																																	
Customer	CSAT																																																	
Customer 1	3																																																	
Customer 2	null																																																	
Customer 3	4																																																	
Customer 4	null																																																	
Customer 5	5																																																	
Average CSAT	4																																																	
Min CSAT	3																																																	

Calculated values such as average and minimum are correct in the source data, but when blank values are replaced with zeros, the resulting calculations are incorrect. Here the zeros are included in the calculation. When the calculations are made using null measures, the average and minimum calculations are correct.

Null measure handling allows the use null values in these dataflow transformations.

append	Wave can append datasets with different measure fields. For example, if one dataset has an Amount field that is not present in a second dataset, the new dataset created after the append has an Amount field containing nulls in rows from the second dataset. Without null measure handling, appending datasets is not possible when measure fields are different.
--------	--

augment	When the key in the left dataset is null or has no match in the right dataset, Wave appends columns from the right dataset and inserts nulls for dimensions and measures. Without null measure handling, Wave inserts zeros for measures.
computeExpression	<p>The <code>defaultValue</code> attribute for a computed field accepts a value of null. For example:</p> <pre data-bbox="375 380 1437 827"> "SQLNode": { "action": "computeExpression", "parameters": { "source": "extractOpp", "mergeWithSource": true, "computedFields": [{ "name": "Amount2", "type": "Numeric", "precision": 18, "defaultValue": "null", "scale": 5, "sqlExpression": "Amount+Amount" }] } } </pre>
computeRelative	<p>The <code>defaultValue</code> attribute for a computed field accepts a value of null. When a value can't be calculated, such as when <code>previous()</code> or <code>next()</code> has no value, Wave uses this default. For example:</p> <pre data-bbox="375 947 1437 1577"> "computeTrending": { "action": "computeRelative", "parameters": { "partitionBy": ["OpportunityId"], "orderBy": [{ "name": "CreatedDate", "direction": "asc" }], "computedFields": [{ "name": "AmountPrev", "defaultValue": "null", "expression": { "sourceField": "Amount", "offset": "previous()", "default": "null" } }] } } </pre>
dim2mea	<p>The <code>measureDefault</code> parameter accepts a value of null. Wave uses this value when it can't convert a dimension to a valid numeric value. When no default is specified, Wave uses a value of null. For example:</p> <pre data-bbox="375 1696 1437 1890"> "Create_Measure_From_Dimension": { "action": "dim2mea", "parameters": { "dimension": "StageVal__c", "measure": "StageValue", "measureDefault": "null", } } </pre>

	<pre> "source": "Extract_Opportunities" } } } </pre>
sfdcDigest	<p>The <code>defaultValue</code> attribute for a field accepts a value of null. When no default is specified, wave uses a value of null. For example:</p> <pre> Sample Sfdc-digest :{ "Extract_Opportunities": { "action": "sfdcDigest", "parameters": { "object": "Opportunity", "fields": [{ "name": "Amount", "defaultValue": "null", "precision":18 "scale":2 }] } } } </pre>
Update	Wave can update non-null values with nulls.

 **Note:** The `delta` transformation is not supported when null measure handling is enabled and dataflows containing delta transformations fail. Use `computeRelative` and `computeExpression` transformations instead in your dataflows, to calculate changes in measure values over time. For an example, see [Enable Null Measure Handling](#) on page 3945.

Enable Null Measure Handling

Null measure handling lets you specify “null” default values in your dataflows and CSV uploads. When no default value is specified, Wave replaces blanks with null values in your datasets.

 **Note:** Null measure handling is enabled in orgs created after the Spring ‘17 release and can’t be disabled.

To enable this feature in other orgs, first contact Salesforce Customer Support to evaluate your org and determine what additional steps you might need to take.

Additional steps may be necessary because null measure handling can’t retroactively change zeros to nulls, if those zeros have previously replaced blank values. This behavior can result in datasets containing a mixture of zeros coming explicitly from the source data, zeros replacing blank values, and nulls. Aggregate calculations in such datasets are incorrect.

When Salesforce makes null measure handling available in your org, you can enable it from Setup. Enter *Wave Analytics* in the Quick Find box, then click **Settings**. Select **Enable null measure handling in Wave Analytics**, and then click **Save**.

Customer Support may recommend that you take one or more of these steps, after enabling null measure handling.

1. Update your existing dataflow definition files to use null instead of 0 in `defaultValue` attributes for measure fields in these transformations.

<code>computeExpression</code>	<code>defaultValue: "null"</code>
<code>computeRelative</code>	<code>defaultValue: "null"</code>

USER PERMISSIONS

To enable null measure handling:

- “Customize Application”

dim2mea	measureDefault: "null"
sfdcDigest	defaultValue: "null"

2. Create new instances of long-lived datasets used as a source for dataflows, using a `defaultValue` of null for measure fields. Long-lived datasets are typically reference datasets that are not updated through a dataflow and used to augment data in other datasets. For example, you might use a geolocation dataset to augment lead information based on zip codes.
3. If you have incrementally built datasets in which the source data is no longer available, use a custom dataflow to manually convert 0 values to null. Incrementally built datasets are datasets that are created over time by appending rows, such as logs.
4. Reimplement `delta` transformations in your dataflows, using `computeRelative` and `computeExpression` transformations. The `delta` transformation is not supported when null measure handling is enabled and dataflows containing delta transformations fail.

In this example, the `delta` transformation on the left calculates the difference between an opportunity amount and its previous amount. The `computeRelative` and `computeExpression` transformations on the right respectively calculate the previous amount and its difference to the current amount.

delta Transformation	computeRelative and computeExpression Transformations
<pre> "Calculate_Delta": { "action": "delta", "parameters": { "dimension": "OpportunityId", "epoch": "CreatedDate_day_epoch", "inputMeasure": "Amount", "outputMeasure": "DeltaAmount", "source": "Extract_Opportunity_History" } }, </pre>	<pre> "Compute_Previous": { "action": "computeRelative", "parameters": { "partitionBy": ["OpportunityId"], "orderBy": [{ "name": "CreatedDate", "direction": "asc" }] }, "computedFields": [{ "name": "PrevAmount", "expression": { "sourceField": "Amount", "offset": "previous()", "default": "current()" } }], "source": "Extract_Opportunity_History" }, "Compute_Delta": { "action": "computeExpression", "parameters": { "computedFields": [</pre>

delta Transformation	computeRelative and computeExpression Transformations
	<pre> { "name": "DeltaAmount", "type": "Numeric", "precision": 18, "defaultValue": 0, "scale": 2, "saqlExpression": "Amount - PrevAmount" }], "source": "Compute_Previous" } }, </pre>

SEE ALSO:

[computeRelative Transformation](#)

[computeExpression Transformation](#)

Date Handling in Datasets

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

Wave Analytics generates the following date fields.

Field Name	Field Type	Description
<date field name>_Second	Text	Number of seconds. If the date contains no seconds, value is '0.'
<date field name>_Minute	Text	Number of minutes. If the date contains no minutes, value is '0.'
<date field name>_Hour	Text	Number of hours. If the date contains no hours, value is '0.'
<date field name>_Day	Text	Day of the month.
<date field name>_Week	Text	Week number in calendar year.
<date field name>_Month	Text	Month number in calendar year.
<date field name>_Quarter	Text	Quarter number in calendar year.
<date field name>_Year	Text	Calendar year.

Field Name	Field Type	Description
<date field name>_Week_Fiscal	Text	Week number in fiscal year.
<date field name>_Month_Fiscal	Text	Month number in fiscal year.
<date field name>_Quarter_Fiscal	Text	Quarter number in fiscal year.
<date field name>_Year_Fiscal	Text	Fiscal year.
<date field name>_sec_epoch	Numeric	Number of seconds that have elapsed since January 1, 1970 (midnight UTC).
<date field name>_day_epoch	Numeric	Number of days that have elapsed since January 1, 1970 (midnight UTC).

You can set metadata attributes to control how dates are loaded into datasets and to enable Wave Analytics to generate fiscal date fields. You set the metadata attributes in the [sfdcDigest transformation parameters](#) for Salesforce data or in the [metadata file](#) for external data.

Important: Before loading dates from an external data file, ensure that you review the date format requirements [here](#). Also, ensure that the column names in the external data file do not conflict with the generated date field names. For example, if you load a CSV with column `Create_Date`, Wave Analytics generates the `Create_Date_Year` field in the dataset. If the CSV also had a field named `Create_Date_Year`, Wave Analytics would throw an error because the names conflict.

Fiscal Periods in Wave Analytics

If the calendar and fiscal year differ, you can enable Wave Analytics to generate the fiscal date fields in the dataset in addition to calendar date fields. To enable Wave Analytics to generate fiscal date fields, set the `fiscalMonthOffset` attribute to a value other than '0'. You set this attribute for each date column for which you want to generate fiscal date fields. If you set the offset to '0' or you do not specify a value, Wave Analytics does not generate any fiscal date fields.

Additionally, to configure the fiscal periods, set the following metadata attributes for each date column:

fiscalMonthOffset

In addition to enabling the generation of fiscal date fields, this attribute also determines the first month of the fiscal year. You specify the difference between the first month of the fiscal year and first month of the calendar year (January) in `fiscalMonthOffset`. For example, if your fiscal year begins in April, set `fiscalMonthOffset` to '3'.

isYearEndFiscalYear

Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year. The `isYearEndFiscalYear` attribute indicates whether the fiscal year is the year in which the fiscal year ends or begins.

To see how this works, let's look at a couple of examples. If `isYearEndFiscalYear` = true (or you do not specify this attribute), then the fiscal year is the year in which the fiscal year ends. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2016 because the fiscal year ends in 2016.

If `isYearEndFiscalYear = false`, then the fiscal year is the year in which the fiscal year begins. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2015 because the fiscal year begins in 2015.

Week Numbering in Wave Analytics

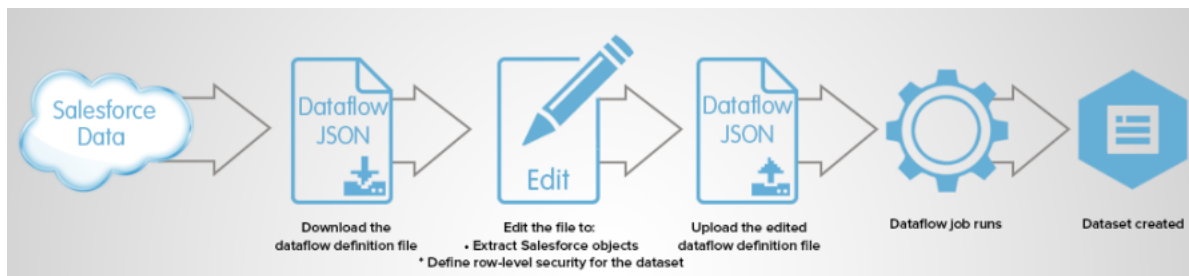

For each date loaded into a dataset, Wave Analytics generates the corresponding week number for the calendar year and, if applicable, fiscal year. Similar to the SOQL function `WEEK_IN_YEAR`, week 1 in Wave Analytics is January 1 - January 7. (This is different from the UTC `week()` calculation.)

If needed, you can configure the week to start on a particular day of the week by setting the `firstDayOfWeek` attribute. For example, if January 1 is a Saturday and you configure the week to start on a Monday, then week 1 is January 1 - 2. Week 2 starts on Monday, January 3. Week 3 starts January 10, the following Monday. Notice that week 1 can be a short week to ensure that the subsequent weeks start on the specified day of the week.

Dataflow JSON

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

Wave Analytics provides a default dataflow that contains some sample transformation logic. This dataflow is just a sample that you must configure before running it.

To configure the dataflow, you add transformations to the dataflow definition file. A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. You can add transformations to determine what data to extract, how to transform datasets, and which datasets to register to make available for queries.

After you configure the dataflow, you upload the new dataflow definition file to Wave Analytics.

By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule. The dataflow runs on a daily schedule to capture the latest changes to Salesforce data and changes in the dataflow logic.

You can also stop, reschedule, and monitor dataflow jobs.

SEE ALSO:

[Create Datasets with a Dataflow](#)

Dataset Builder

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

After you select the data to include in the dataset, the dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs.

SEE ALSO:

[Create a Dataset with the Dataset Builder](#)

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

[Install the Wave Connector Excel App](#)

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

Upload External Data from the User Interface

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

When Wave Analytics loads any data into a dataset, it also adds metadata about each column of data. For example, metadata can include the field type, precision, scale, and default value.

For external data, Wave Analytics infers metadata about each column of data in the external data file unless you specify different metadata attributes in a metadata file. A *metadata file* is a JSON file that describes the structure of an external data file. For example, you can use a metadata file to explicitly set the field type and default value for a specific column of external data. If no metadata file is provided when you upload external data, Wave Analytics treats every column as a dimension and sets the field type to 'Text.' This impacts the type of queries that can be placed on the dataset because you can't perform mathematical calculations on dataset columns with a Text field type. You can only perform mathematical calculations on dataset columns with a Numeric field type.

After you create a dataset based on an external data file, you can edit the dataset to apply a new metadata file. This enables you to change the metadata attributes of each column.

 **Note:** Wave temporarily stores the uploaded CSV and metadata files for processing only. After a dataset is created, Wave purges the files.

SEE ALSO:

[Create a Dataset with External Data](#)

External Data API

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

For more information about the External Data API, see the [Wave Analytics External Data API Developer Guide](#).

Create Datasets with a Dataflow

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

1. Design the Dataflow

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

2. Configure the Dataflow

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

3. Start and Stop a Dataflow

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

4. Monitor a Dataflow Job

Use the monitor in the data manager to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

5. Reschedule and Unschedule a Dataflow

After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.

Design the Dataflow

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

To illustrate some key design decisions, let's consider an example. In this example, the goal is to create a dataset called "Won Opportunities." The dataset will contain opportunity details, including the account name for each opportunity.

To create this dataset, you design the following dataflow:

The dataflow extracts opportunity data from the Opportunity object and extracts the account name from the Account object. For each extracted object, the dataflow creates a new dataset.

The dataflow then transforms the datasets created from the extracted data. First, the dataflow joins the opportunity and account data into a new dataset. Next, the dataflow filters the records based on the opportunity stage so that the dataset contains only won opportunities. Each time the dataflow transforms a dataset, it creates a new dataset.

Finally, because you want users to be able to query won opportunities only, you configure the dataflow to register the final dataset only. However, if you wanted, you could register any dataset created by the dataflow and register as many datasets as you like.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

Configure the Dataflow

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. The dataflow definition file must be saved with UTF-8 encoding.

Before you can configure a dataflow to process external data, you must [upload the external data to Wave Analytics](#).

1. In Wave Analytics, click the gear icon () and then click **Data Manager**. The data manager opens on the Monitor tab, with the Jobs view selected by default.
2. Select **Dataflow View**.
3. To download the dataflow definition file, click **Download** in the actions list (1).

EDITIONS

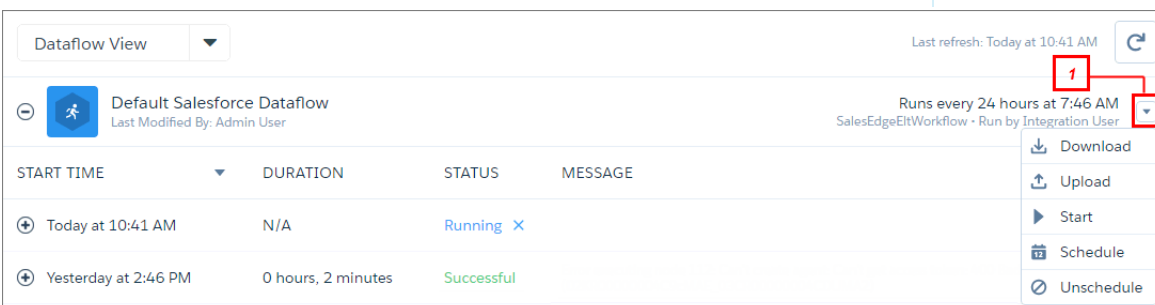

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To edit the dataflow definition file:

- "Edit Wave Analytics Dataflows"

4. Make a backup copy of the dataflow definition file before you modify it. Wave Analytics doesn't retain previous versions of the file. If you make a mistake, you can upload the previous version to roll back your changes.

5. Add each transformation as a node in the dataflow definition file.

For example, based on the design in the [previous step](#), you can add the following transformation nodes:

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_AccountDetails": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" }
      ]
    }
  },
  "Transform_Augment_OpportunitiesWithAccountDetails": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "AccountId" ],
      "relationship": "OpptyAcct",
      "right": "Extract_AccountDetails",
      "right_key": [ "Id" ],
      "right_select": [
        "Name"
      ]
    }
  },
  "Transform_Filter_Opportunities": {
    "action": "filter",
    "parameters": {
      "filter": "StageName:EQ:Closed Won",
      "source": "Transform_Augment_OpportunitiesWithAccountDetails"
    }
  },
  "Register_Dataset_WonOpportunities": {
    "action": "sfcdregister",
    "parameters": {
      "alias": "WonOpportunities",
      "name": "WonOpportunities",
    }
  }
}
```

```

    "source": "Transform_Filter_Opportunities"
  }
}

```

Note: The JSON keys and values are case-sensitive. Each bolded key in the example JSON is the node name for a transformation. Each node contains an action value, which identifies the transformation type. The order in which you add the transformations to the dataflow definition file doesn't matter. Wave Analytics determines the order in which to process the transformations by traversing the dataflow to determine the dependencies among them.

Important: Node names must be unique in a dataflow definition file, and can't contain space or tab characters. Consider that node names are **not** treated as case sensitive, so names such as "Extract_Opportunities" and "extract_opportunities" are not unique in the same definition file.

- Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.

An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.

- Save the dataflow definition file with UTF-8 encoding, and then close the file.

- In the Dataflow view of the Monitor tab, click **Upload** from the action list (1) to upload the updated dataflow definition file.

Note: Uploading the dataflow definition file does not affect any running dataflow jobs and does not automatically start the dataflow job.

You can now start the dataflow on demand or wait for it to run on the schedule. Users cannot query the registered datasets until the dataflow runs.

If you have enabled replication, you can create multiple dataflows, in addition to the default dataflow, and configure them in the same way. Look out for the **Create** button in the Monitor tab of the data manager after you enable replication. See [Optimize Your Dataflows with Replication](#).

The screenshot displays the Wave Analytics Dataflow View. At the top, there's a teal header with the Wave Analytics logo. Below the header, there's a 'Dataflow View' dropdown menu, a 'Last refresh: Today at 11:09 AM' indicator, and a 'Create' button circled in red. The main area lists three dataflows: 'Default Salesforce Dataflow', 'Marketing Dataflow', and 'Product Support Dataflow'. Each entry includes a status icon (a green checkmark), the name, and the last modified user. To the right of each entry, there's a schedule indicator (e.g., 'Runs every 24 hours at 6:00 AM') and a dropdown menu. The dropdown menu for the 'Marketing Dataflow' is open, showing options: 'Download', 'Upload', 'Start', 'Schedule', 'Unschedule', and 'Delete'. The 'Upload' option is circled in red.

Note: Your org can have up to 10 dataflows. This includes the default dataflow, and Wave app dataflows such as Sales Wave and Service Wave. Keep in mind that each dataflow run counts towards your limit of 24 dataflow runs per day.

Start and Stop a Dataflow

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

 **Note:** By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule.

1. In Wave Analytics, click the gear icon () and then click **Data Manager**. The data manager opens on the Monitor tab, with the Jobs view selected by default.
2. Select **Dataflow View**.

EDITIONS

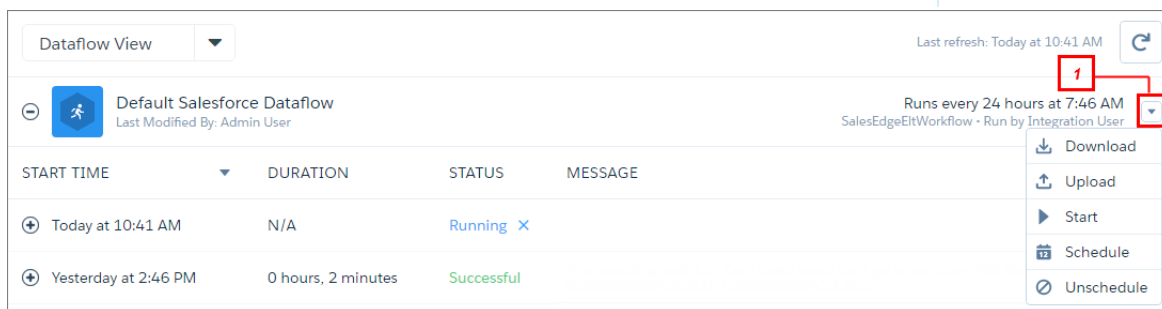

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To start a dataflow job:

- "Edit Wave Analytics Dataflows"

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a refresh button. Below this, the 'Default Salesforce Dataflow' is listed, with a note that it 'Runs every 24 hours at 7:46 AM' and is 'Run by Integration User'. A table below shows the job history:

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running	
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

To the right of the table is an actions menu with options: Download, Upload, Start, Schedule, and Unschedule. A red box labeled '1' highlights the 'Start' button.

3. Click **Start** in the actions list (1) to start the dataflow job. The dataflow job is added to the job queue. The **Start** button is grayed out while the dataflow job runs.
4. After the job completes, Wave Analytics sends an email notification to the user who created the dataflow. The email notification indicates whether the job completed successfully. It also shows job details like start time, end time, duration, and number of processed rows. If the job failed, the notification shows the reason for the failure.

 **Note:** If the dataflow creator is not an active user, the notification is sent to the user who last modified the dataflow schedule or definition file.

5. To stop a dataflow job that is currently running, click  next to the job status. If you click **Start** to restart a stopped dataflow, the job starts over—the dataflow job does not resume from the point at which it was stopped.

You can monitor the dataflow job in the data monitor to determine when dataflow completes. After the dataflow completes successfully, refresh the Home page to view the registered datasets.

Monitor a Dataflow Job

Use the monitor in the data manager to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

The Dataflow view of the monitor shows the status, start time, and duration of the last 10 dataflow jobs and retains the last 7 days of history. To help you troubleshoot a failed job, you can view error messages about the job, view the run-time details about every transformation that is processed, and download error logs where available.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the data monitor:

- “Edit Wave Analytics Dataflows”, “Upload External Data to Wave Analytics”, or “Manage Wave Analytics”

To download an error log:

- “Edit Wave Analytics Dataflows” and “View All Data”

The screenshot shows the 'Dataflow View' of a 'Default Salesforce Dataflow'. The job status is 'Warning' with a message: 'The job completed successfully, but some rows failed. Download the error log from the data monitor to view the failed rows.' A detailed view of the job's nodes is expanded, showing the following data:

NODE NAME	START TIME	DURATION	STATUS	NODE TYPE	INPUT ROWS
salesData	Today at 1:00 AM	22 seconds	Successful	sfdcDigest	706
Derived_Fields	Today at 1:00 AM	0 seconds	Warning	computeExpression	706
optimize-Register_Catego...	Today at 1:00 AM	0 seconds	Successful	optimizer	N/A
Register_CategorizedSales	Today at 1:00 AM	3 seconds	Successful	sfdcRegister	N/A

1. In Wave Analytics, click the gear icon () and then click **Data Manager**. The data manager opens on the Monitor tab, with the Jobs view selected by default.

2. Select **Dataflow View** (1).
3. Click  to see the latest status of a job.

Each job can have one of the following statuses:

Status	Description
Running	The job is running.
Failed	The job failed.
Successful	The job completed successfully.
Warning	The job completed successfully, but some rows failed.

4. If the dataflow job fails, expand the job node (2) and review the run-time details for every transformation that was processed.
5. If an error log is available for a node, click the download log button (3) to download a CSV file containing the failed rows.

 **Note:** Error logs display the data from rows that have failed to load. To maintain data security and prevent unauthorized access to this data, only users with the "View All Data" permission can download error logs.

6. If there's a problem with the dataflow logic, edit the dataflow definition file, upload it, and then run the dataflow again.

Reschedule and Unschedule a Dataflow

After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.

1. In Wave Analytics, click the gear icon () and then click **Data Manager**.
The data manager opens on the Monitor tab, with the Jobs view selected by default.
2. Select **Dataflow View**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To schedule or unschedule a dataflow job:

- "Edit Wave Analytics Dataflows"

The screenshot shows the 'Dataflow View' for a 'Default Salesforce Dataflow'. The table below shows the run history:

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running	
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

The actions menu on the right includes: Download, Upload, Start, Schedule, and Unschedule. A red box highlights the 'Schedule' option.

- Click **Schedule** in the actions list (1) to reschedule the dataflow job. The default daily schedule and start time appears.
- To continue running it once per day, select the time that you'd like to start the dataflow job.
- To run it on an hourly basis, select **Hour(s)** and then specify the interval details. Minute offset is the number of minutes past the hour to run the dataflow.

Dataflow Schedule

The 'Dataflow Schedule' dialog shows the following configuration:

- Run every: 1 Hour(s)
- Minute offset: 0:10

A blue 'Save' button is located at the bottom right of the dialog.

Hourly scheduled dataflows run relative to a fixed base time (00:00 UTC). For example, if you schedule a dataflow to run every 6 hours with a 15-minute offset, the dataflow is scheduled to run at 00:15 UTC, 06:15 UTC, 12:15 UTC, and 18:15 UTC, each day. The first dataflow run occurs at the next scheduled time. So, if you change the schedule at 04:00 UTC, the dataflow runs at the next scheduled time (06:15 UTC), and then every 6 hours thereafter. To keep things simple, the scheduler specifies the time of the first dataflow run (in your time zone), after you save the schedule.

- Click **Save**. The Dataflow Schedule pop-up box specifies the next time, in your local time zone, that the dataflow runs.
- Click **Done**.
- To stop a dataflow from running on a schedule, select **Unschedule** in the action list (1).

Transformations for Wave Dataflows

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

For example, you can use transformations to join data from two related datasets and then register the resulting dataset to make it available for queries.

[append Transformation](#)

The append transformation combines records from multiple datasets into a single dataset.

[augment Transformation](#)

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

[computeExpression Transformation](#)

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren't extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.

[computeRelative Transformation](#)

You can use the computeRelative transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

[delta Transformation](#)

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

[dim2mea Transformation](#)

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

[edgemart Transformation](#)

The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the augment transformation together to join an existing dataset with a new dataset.

[filter Transformation](#)

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

[flatten Transformation](#)

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

[sfdcDigest Transformation](#)

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

[sfdcRegister Transformation](#)

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

[sliceDataset Transformation](#)

The sliceDataset transformation removes fields from a dataset in your dataflow, leaving you with a subset of fields for use in a new dataset or in other transformations. This allows you to create multiple datasets, each with different sets of fields from a single dataset.

[update Transformation](#)

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

[Overriding Metadata Generated by a Transformation](#)

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

SEE ALSO:

[Create Datasets with a Dataflow](#)

append Transformation

The append transformation combines records from multiple datasets into a single dataset.

Consider the following rules when using this transformation.

- This transformation does not remove duplicate records.
- All input datasets must have the same structure—the corresponding columns must be in the same order and have the same name and field type.

 **Example:** Let's look at an example. Each month, you create a dataset that contains the month's sales targets. Now, you want a holistic view of sales targets for all months. To do that, you create the following dataflow definition file to merge the existing datasets into a single dataset.

```
{
  "Extract_SalesTargets_2014Jan": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Jan" }
  },
  "Extract_SalesTargets_2014Feb": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Feb" }
  },
  "Extract_SalesTargets_2014Mar": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Mar" }
  },
  "Append_SalesTargets_2014Quarter1": {
    "action": "append",
    "parameters": {
      "sources": [
        "Extract_SalesTargets_2014Jan",
```

```

        "Extract_SalesTargets_2014Feb",
        "Extract_SalesTargets_2014Mar"
    ]
}
},
"Register_AllSalesTargets": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "AllSalesTargets",
    "name": "AllSalesTargets",
    "source": "Append_SalesTargets_2014Quarter1"
  }
}
}
}

```

After you create the single dataset, you can use date filters to analyze the sales targets by month, quarter, or year.

[append Parameters](#)

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

append Parameters

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
sources	Yes	Nodes in the dataflow definition file that identify the datasets that you want to merge.

SEE ALSO:

[append Transformation](#)

augment Transformation

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

When you create the transformation, you identify each input dataset as the left or right dataset and specify the relationship between them. Wave Analytics combines all the columns of the left dataset with only the specified columns from the right dataset. (Keep in mind that each dataset can't have more than 5,000 columns.) Wave Analytics adds the relationship to column names from the right dataset, which is useful when the left and right datasets have columns with the same names.

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. To match related records, the augment transformation uses a match condition. You specify the match condition based on a key from each dataset. For example:

```
"left_key": [ "Id" ], "right_key": [ "Prod_ID" ]
```

A key can be a single-column key or a composite key. For a match condition based on a composite key, the keys for both datasets must have the same number of columns, specified in the same order.

Tip: To augment more than two datasets, augment two datasets at a time. For example, to augment three datasets, augment the first two datasets, and then augment the resulting dataset with the third dataset.

Example: Let's look at an example of the augment transformation. In this example, you want to extract data from the Opportunity and Accounts objects, and then match the data based on the account ID field.

You create the following dataflow definition file.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" }
      ]
    }
  },
  "Augment_OpportunitiesWithAccountDetails": {
```

```

    "action": "augment",
    "parameters": {
      "operation": "LookupSingleValue",
      "left": "Extract_Opportunity",
      "left_key": [
        "AccountId"
      ],
      "relationship": "OpptyAcct",
      "right": "Extract_AccountDetails",
      "right_key": [
        "Id"
      ],
      "right_select": [ "Name" ]
    }
  },
  "Register_OpportunityDetails": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunity_Account",
      "name": "Opportunity_Account",
      "source": "Augment_OpportunitiesWithAccountDetails" }
  }
}

```

After you run the dataflow, Wave Analytics creates and registers the Opportunity_Account dataset. It also adds the relationship as a prefix to all columns from the right dataset.

[Special Cases for Matching Records with the augment Transformation](#)

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

[augment Parameters](#)

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

Special Cases for Matching Records with the augment Transformation

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

Let's look at some examples that illustrate some special cases.

Handling Null Keys

When a record in the left dataset contains a null key, Wave Analytics doesn't perform a lookup to match the record. Instead, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
<i>null</i>	Bench	<i>null</i>	Custom	800
		Prod3	Standard	700

Wave Analytics doesn't match the last record because the product ID is null. Instead, Wave Analytics inserts a null for the `Price.Pricebook` dimension and '0' for the `Price.UnitPrice` measure. Here's the resulting dataset after the augment.

```
[ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 ],
[ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 ],
[ "id":null, "Name":"Bench", "Price.Pricebook":null, "Price.UnitPrice":0 ]
```

Handling Empty Keys

Wave Analytics matches empty-value left keys and empty-value right keys.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
""	Bench	""	Custom	800
		<i>null</i>	Standard	700

Wave Analytics matches the last record in the Product dataset with the third record in the Price dataset because they both have empty values (""). Here's the resulting dataset after the augment.

```
{ "id": "Prod1", "Name": "Table", "Price.Pricebook": "Standard", "Price.UnitPrice": 1000 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": "Standard", "Price.UnitPrice": 450 },
{ "id": "", "Name": "Bench", "Price.Pricebook": "Custom", "Price.UnitPrice": 800 }
```

Handling Non-Unique Keys

Although it's recommended, the left key doesn't have to be unique. If multiple records have the same left key, Wave Analytics creates the same values for the appended columns.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod2	Chair	Prod3	Standard	700

Wave Analytics matches the records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

```
{ "id": "Prod1", "Name": "Table", "Price.Pricebook": "Standard", "Price.UnitPrice": 1000 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": "Standard", "Price.UnitPrice": 450 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": "Standard", "Price.UnitPrice": 450 }
```

Handling No Match

If left key doesn't have a match in the right dataset, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod4	Standard	1000
Prod2	Chair	Prod5	Standard	450
Prod3	Bench			

Because no keys match, Wave Analytics doesn't match any records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

```
{ "id": "Prod1", "Name": "Table", "Price.Pricebook": null, "Price.UnitPrice": 0 },
{ "id": "Prod2", "Name": "Chair", "Price.Pricebook": null, "Price.UnitPrice": 0 },
{ "id": "Prod3", "Name": "Bench", "Price.Pricebook": null, "Price.UnitPrice": 0 }
```

Handling Multiple Matches

If the left dataset has a one-to-many relationship with the right dataset, Wave Analytics might find multiple matches for a left record. What Wave Analytics does with multiple matches depends on the specified augment operation. You can specify one of the following operations to handle the multiple-match case:

LookupSingleValue

The augment transformation returns results from a single row. Wave Analytics randomly selects one row from the list of matched rows.

 **Note:** Each time you run the dataflow, Wave Analytics can return different results depending on the returned row.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupSingleValue`, and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Although there are multiple rows for Prod3 in the Price dataset, Wave Analytics randomly chooses one matching row and returns values based on that row. Here's the resulting dataset after the augment if Wave Analytics chooses the first Prod3 row.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.UnitPrice":800 }
```

LookupMultiValue

Wave Analytics returns results from all matched rows.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupMultiValue`, and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Because the lookup returns multiple rows for Prod3, the dimension `Price.Pricebook` field in the resulting dataset becomes a multi-value field, showing all dimension values. The measure field `Price.UnitPrice` contains 1500, which is the sum of 800 and 700. Here's the resulting dataset after the augment.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.Pricebook":"Standard", "Price.UnitPrice":1500 }
```

[augment Transformation](#)

augment Parameters

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
operation	No	<p>Indicates what the transformation does if it matches multiple rows in the right dataset with a row in the left. Valid values:</p> <ul style="list-style-type: none"> <code>LookupSingleValue</code>. Returns values from one of the matched rows. If you don't specify the <code>operation</code> parameter, the transformation uses this operation. <code>LookupMultiValue</code>. Returns values from all matched rows. <p>For more information about each operation, see Special Cases for Matching Records with the augment Transformation.</p>
left	Yes	Node in the dataflow definition file that identifies the left dataset. This is one of two input sources for this transformation.
left_key	Yes	<p>Key column in the left dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order. For a composite key, use the following syntax:</p> <pre>["Key Column1", "Key Column2", ..., "Key ColumnN"]</pre> <p> Note: The left or right key can't be a multi-value field.</p>

Parameter	Required?	Value
right	Yes	Node in the dataflow definition file that identifies the right dataset. This is one of two input sources for this transformation.
relationship	Yes	Relationship between the left and right datasets. The dataflow adds the relationship to the beginning of the right column names in the output dataset to make the column names unique and descriptive.
right_select	Yes	An array of column names from the right dataset that you want to include in the output dataset. The dataflow adds the relationship as a prefix to the column name to determine the name of the right column in the output dataset.
right_key	Yes	Key column in the right dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order.

[augment Transformation](#)

computeExpression Transformation

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren't extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.

 **Note:** The computeExpression and computeRelative transformations are similar, but they have a key difference. The computeExpression transformation performs calculations based on other fields within the same row. The computeRelative transformation performs calculations based on the previous and next values of the same field in other rows.

Consider the following guidelines when creating a computeExpression transformation:

- You can include only the following SAQL operators and functions in the expression:
 - [Arithmetic operators](#)
 - [Case operator](#)
 - [String operator](#)
 - [Date functions](#)
- The values of the derived field must match its specified type. For example, set the type of the derived field to `TEXT` if the values are strings.

- Wave calculates the values of derived fields in the order in which they are listed in the JSON. Thus, if you create a derived field based on other derived fields in the same computeExpression transformation, the input derived fields must be listed first. For example, Derived_A must be listed before Derived_B in the following computeExpression transformation JSON snippet:

```
"CreateDerivedFields": {
  "action": "computeExpression",
  "parameters": {
    "source": "sourceNode",
    "mergeWithSource": false,
    "computedFields": [
      {
        "name": "Derived_A",
        "type": "Text",
        "label": "Derived Field A",
        "sqlExpression": "\"hello \""},
      {
        "name": "Derived_B",
        "type": "Text",
        "label": "Derived Field B Dependent on Field A",
        "sqlExpression": "Derived_A + \"world\""
      }
    ]
  }
}
```

- You can choose whether the resulting dataset includes only the derived fields, or includes the input and derived fields.

 **Example:** Let's look at an example. You want to create a dataset based on Salesforce opportunity data. You create a dataflow that extracts the Id and Amount fields from the Opportunity object. In addition, you also want to add the following derived fields to the dataset: ModifiedId, SalesTax, FinalPrice, and ValueCategory. For the derived fields, you will:

- Append "SFDC" to each opportunity Id to get a new modified Id.
- Calculate the sales tax based on an 8% tax rate.
- Calculate the final price by adding the amount and sales tax.
- Categorize opportunities into low-, medium-, and high-value buckets based on the calculated final price.

You create the following dataflow definition.

```
{
  "salesData": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        {"name": "Amount"},
        {"name": "Id"}
      ]
    }
  },
  "Derived_Fields": {
    "action": "computeExpression",
    "parameters": {
      "source": "salesData",
      "mergeWithSource": true,
      "computedFields": [
        {
          "name": "ModifiedId",
          "type": "Text",
          "sqlExpression": "\"SFDC\" + Id",
        }
      ]
    }
  }
}
```

```

    {
      "name": "SalesTax",
      "type": "Numeric",
      "precision": 18,
      "defaultValue": "0",
      "scale": 5,
      "sqlExpression": "Amount * 0.08"},
    {
      "name": "FinalPrice",
      "type": "Numeric",
      "precision": 18,
      "defaultValue": "0",
      "scale": 5,
      "sqlExpression": "Amount + SalesTax"},
    {
      "name": "ValueCategory",
      "type": "Text",
      "sqlExpression": "case when FinalPrice < 1000 then \"Low\" when
FinalPrice >= 1000 and FinalPrice < 2000 then \"Medium\" else \"High\" end"}
  ]
},
"Register_CategorizedSales": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "Categorized_Sales",
    "name": "Categorized_Sales",
    "source": "Derived_Fields" }
}
}

```

[computeExpression Parameters](#)

When you define a `computeExpression` transformation, you set the action attribute to `computeExpression`. You also specify the parameters for the input source and the expression used to generate the values.

computeExpression Parameters

When you define a `computeExpression` transformation, you set the action attribute to `computeExpression`. You also specify the parameters for the input source and the expression used to generate the values.

You can specify parameters in the following sections of the `computeExpression` node: `parameters` and `computedFields`.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
source	Yes	Node in the dataflow definition file that identifies the input source for this transformation.

Parameter	Required?	Value
mergeWithSource	No	Indicates whether the input fields are included with the derived fields in the resulting dataset. When true, the resulting dataset contains all input fields from the source and the newly generated derived fields. When false, the resulting dataset contains the derived fields only. Default is true.
computedFields	Yes	Attributes and expression used to generate derived fields in the dataset. See computedFields .

computedFields

The following table describes the attributes in the `computedFields` section. It also describes optional attributes that you can provide to override the field metadata to make the data appear differently in a dataset. For example, Wave can replace null values in a field with a default value.

Parameter	Required?	Value
name	Yes	API name of the generated field.  Note: The API names must be unique. Otherwise, the dataflow fails to run.
type	Yes	Wave Analytics field type associated with the field. Valid types are Text, Numeric, or Date. Example: <pre>"type": "Text"</pre>
label	No	The display name of the generated field that appears in the Wave user interface. Can be up to 255 characters. Defaults to input field name if not specified.
saqlExpression	Yes	SAQL expression used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation.

Parameter	Required?	Value
		Example: <pre>"sqlExpression": "toDate (birth_day, \ \"yyyy-M-d\") "</pre>
format	Yes (for Date fields only)	Format of the derived date field. For information about formats, see the External Data Format Reference .
precision	Yes (for Numeric fields only)	The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive. Example: <pre>"precision": 10</pre>
scale	Yes (for Numeric fields only)	The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: <pre>"scale": 2</pre>
defaultValue	No	For text and numeric fields that can be null. Default value that replaces a null value for the specified field.

SEE ALSO:

[computeExpression Transformation](#)

computeRelative Transformation

You can use the computeRelative transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

Note: The computeExpression and computeRelative transformations are similar, but the computeExpression transformation performs calculations based on fields within the same row. The computeRelative transformation performs calculations based on the same field in other rows—particularly the current, first, previous, or next rows.

When you define a `computeRelative` transformation, you specify a source transformation as the input, partition the records, and sort the records within each partition. For example, you can use `sfdcDigest` to extract opportunity history records, and then use `computeRelative` to calculate changes in each opportunity over time. You can partition opportunity records by opportunity ID, and then chronologically sort records within each partition to correctly identify the previous and next values.

Example: Let's look at an example. To perform trending analysis on the sales pipeline, create a dataflow that contains the following transformations.

sfdcDigest transformation

Extracts the following data from the `OpportunityHistory` object.

OpportunityHistory Object				
OpportunityId	CreatedDate	StageName	Amount	CloseDate
00630000003JrH6AAK	2005-11-23T20:24:09.000Z	Closed Won	36938	11/15/2005

00630000003JsMcAAK	2005-10-17T23:30:20.000Z	Negotiation/Review	18750	10/31/2005
00630000003OG95AAG	2005-10-28T17:45:30.000Z	Present/Demo/Quote	52000	11/30/2005

computeRelative transformation

Performs the following tasks:

- Partitions the extracted records by opportunity ID.
- Within each partition, sorts the extracted records by `CreatedDate` in ascending order. Sorting by `CreatedDate` ensures that the changes that occur for each opportunity are listed in chronological order.
- Adds the following derived fields to the final dataset.

OpportunityCreatedDate

Determines the date that the opportunity was first created. You can use this date with the actual close date to determine the number of days required to close the sale. The goal is to shorten the sales cycle to recognize revenue.

ValidToDate

Determines the date to which the state of the opportunity is valid. You can use this field to determine the time period for which the opportunity details are valid in each record.

AmountPrev

Determines the previous amount of the opportunity. You can use this field to determine if the values of opportunities are increasing or decreasing, which can affect whether you hit your sales targets.

CloseDatePrev

Determines the previous expected close date for the opportunity. You can use this field to analyze how the expected close date changes over the sales cycle of the opportunity. If the expected close date keeps getting pushed out, identify the issues that are causing the longer sales cycle.

sfdcRegister transformation

Registers the final dataset that contains the extracted fields from the `sfdcDigest` transformation and the derived fields from `computeRelative` transformation.

You create the following dataflow definition.

```
{
  "extractOppHistory": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [
        {"name": "OpportunityId"},
        {"name": "CreatedDate"},
        {"name": "StageName"},
        {"name": "Amount"},
        {"name": "CloseDate"}
      ]
    }
  },
  "computeTrending": {
    "action": "computeRelative",
    "parameters": {
      "partitionBy": ["OpportunityId"],
      "orderBy": [
        {
          "name": "CreatedDate",
          "direction": "asc"
        }
      ]
    },
    "computedFields": [
      {
        "name": "OpportunityCreatedDate",
        "expression": {
          "sourceField": "CreatedDate",
          "offset": "first()",
          "default": "current()"
        }
      },
      {
        "name": "ValidToDate",
        "expression": {
          "sourceField": "CreatedDate",
          "offset": "next()",
          "default": "3000-01-01T00:00:00.000Z"
        }
      },
      {
        "name": "AmountPrev",
        "expression": {
          "sourceField": "Amount",
          "offset": "previous()",
          "default": "0"
        }
      },
      {
        "name": "CloseDatePrev",
        "expression": {
          "sourceField": "CloseDate",

```

```

        "offset": "previous()",
        "default": "01/01/1970"
    }
}
],
"source": "extractOppHistory"
}
},
"Register_OppportunityHistory_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "SalesPipelineTrending",
    "name": "Sales Pipeline Trending",
    "source": "computeTrending"
  }
}
}
}

```

The dataflow runs and creates the following dataset.

Sales Pipeline Trending Dataset								
OpportunityId	CreatedDate	StageName	Amount	CloseDate	OpportunityCreatedDate	ValidToDate	AmountPrev	CloseDatePrev
00630000003JrH6AAK	2005-10-17T22:28:33.000Z	Present/Demo/Quote	429000	11/15/2005	2005-10-17T22:28:33.000Z	2005-11-03T21:53:36.000Z	0	1/1/1970
00630000003JrH6AAK	2005-11-03T21:53:36.000Z	Negotiation/Review	201480	11/15/2005	2005-10-17T22:28:33.000Z	2005-11-23T20:24:09.000Z	429000	11/15/2005
00630000003JrH6AAK	2005-11-23T20:24:09.000Z	Closed Won	369380	11/15/2005	2005-10-17T22:28:33.000Z	3000-01-01T00:00:00.000Z	201480	11/15/2005
00630000003JsMcAAK	2005-10-17T23:30:20.000Z	Negotiation/Review	187500	10/31/2005	2005-10-17T23:30:20.000Z	2005-10-28T18:12:06.000Z	0	1/1/1970
00630000003JsMcAAK	2005-10-28T18:12:06.000Z	Negotiation/Review	187500	11/15/2005	2005-10-17T23:30:20.000Z	3000-01-01T00:00:00.000Z	187500	10/31/2005
00630000003OG95AAG	2005-10-28T17:45:30.000Z	Present/Demo/Quote	520000	11/30/2005	2005-10-28T17:45:30.000Z	3000-01-01T00:00:00.000Z	0	1/1/1970
00630000003SYADAA4	2005-11-08T18:47:18.000Z	Present/Demo/Quote	42000	12/3/2005	2005-11-08T18:47:18.000Z	3000-01-01T00:00:00.000Z	0	1/1/1970
00630000003SZAZAA4	2005-11-08T19:44:27.000Z	Present/Demo/Quote	1411200	12/16/2005	2005-11-08T19:44:27.000Z	3000-01-01T00:00:00.000Z	0	1/1/1970
00630000003Yx9BAAS	2005-11-23T01:06:57.000Z	Present/Demo/Quote	715000	11/30/2005	2005-11-23T01:06:57.000Z	2005-11-23T01:07:46.000Z	0	1/1/1970
00630000003Yx9BAAS	2005-11-23T01:07:46.000Z	Present/Demo/Quote	71280	11/30/2005	2005-11-23T01:06:57.000Z	2005-11-25T18:03:46.000Z	715000	11/30/2005
00630000003Yx9BAAS	2005-11-25T18:03:46.000Z	Closed Won	58320	11/23/2005	2005-11-23T01:06:57.000Z	3000-01-01T00:00:00.000Z	71280	11/30/2005

Notice that Wave partitions the records by opportunity ID and then sorts the records in ascending order based on the CreatedDate field within each partition. Wave can now use the previous and next rows within each partition to determine changes in field values in the dataset.

[computeRelative Parameters](#)

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

computeRelative Parameters

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

You can specify parameters in the following sections of the computeRelative node.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
source	Yes	Node in the dataflow definition file that identifies the input source for this transformation.
partitionBy	Yes	API name of the field used to partition the records in the dataset. Specify one partition-by field only.
orderBy	Yes	Field used to sort the records within each partition and the sort order: ascending (asc) or descending (desc). Specify one sort field only. Example: <pre>"orderBy": [{ "name": "CreatedDate", "direction": "asc" }]</pre>
computedFields	Yes	A list of definitions for derived fields. Example: <pre>"computedFields": [{ "name": "OpportunityCreatedDate", "expression": { "sourceField": "CreatedDate", "offset": "first()", "default": "current()" } }, { "name": "AmountPrev", "expression": { "sourceField": "Amount", "offset": "previous()", "default": "0" } }]</pre> See computedFields .

computedFields

The following table describes the attributes in the `computedFields` section.

Parameter	Required?	Value
name	Yes	API name of the derived field to add to the dataset. The name must be unique in the dataset.

Parameter	Required?	Value
		 Note: If the name is not unique, the dataflow fails to run.
expression	Yes	Expression attributes used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation. Example: <pre>"expression": { "sourceField": "CloseDate", "offset": "previous()", "default": "01/01/1970" }</pre> See expression .

expression

The following table describes the attributes in the `expression` section.

Parameter	Required?	Value
sourceField	Yes	API name of the input field from the source node that's used in the expression.
offset	Yes	The function used in the expression. You can use the following functions: <p>current() Gets the value from the current record. Example: <pre>"offset": "current()"</pre></p> <p>first() Gets the value from the first record in the partition, like the first <code>CreateDate</code> for an opportunity. Example: <pre>"offset": "first()"</pre></p> <p>next() Gets the value from the next record. Example: <pre>"offset": "next()"</pre></p> <p>previous() Gets the value from the previous record. Example: <pre>"offset": "previous()"</pre></p>

Parameter	Required?	Value
		<p> Note: Derived fields are computed in the order that they're defined. The calculation of a derived field can be based on the value from another derived field as long as it has already been defined. For example, <code>next ()</code> can't access the value of a derived field in the next row.</p> <p> Tip: To get the correct results when using the <code>previous ()</code> and <code>next ()</code> functions, the <code>computeRelative</code> transformation requires you to sort the records.</p>
default	Yes (for numeric fields only)	<p>The default value if one can't be calculated. For example, you can specify a default value when no previous or next value exists. You can insert a constant value or <code>current ()</code> as a default value.</p> <p>Examples:</p> <pre>"default": "3000-01-01T00:00:00.000Z"</pre> <pre>"default": "current ()"</pre>

delta Transformation

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

The delta transformation calculates each delta value by comparing the value in each record with the value in the previous record. Because records might not be sorted, the delta transformation orders the records before computing the delta values. To do this, the transformation sorts the data by the specified dimension, and then by the specified epoch date column.

 **Note:** When Wave Analytics processes dates, it creates the following epoch date columns for each date processed:

Epoch Time Column	Description
<date_column_name>_sec_epoch	For example, if the date column is <code>CloseDate</code> , the generated epoch second column is <code>CloseDate_sec_epoch</code> . This column provides the number of seconds that have elapsed since January 1, 1970 (midnight UTC/GMT).
<date_column_name>_day_epoch	For example, if the date column is <code>CloseDate</code> , the generated epoch day column is <code>CloseDate_day_epoch</code> . This column provides the number of days that have elapsed since January 1, 1970 (midnight UTC/GMT).

 **Example:** Let's look at an example. You want to create an `OppHistoryDelta` dataset that contains opportunity history from the `OpportunityHistory` object and also calculates the deltas for opportunity amounts.

The `OpportunityHistory` object contains the following data.

OpportunityId	CloseDate	StageName	Amount
1	1/1/2014	New	100
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200
1	3/1/2014	ClosedWon	100

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [
        { "name": "OpportunityId" },
        { "name": "CloseDate" },
        { "name": "StageName" },
        { "name": "Amount" }
      ]
    }
  },
  "Calculate_Delta": {
    "action": "delta",
    "parameters": {
      "dimension": "OpportunityId",
      "epoch": "CloseDate_day_epoch",
      "inputMeasure": "Amount",
      "outputMeasure": "DeltaAmount",
      "source": "Extract_Opportunities"
    }
  },
  "Register_Dataset": {
    "action": "sfcdregister",
    "parameters": {
      "alias": "OppHistoryDelta",
      "name": "OppHistoryDelta",
      "source": "Calculate_Delta"
    }
  }
}
```

To calculate the delta values for each opportunity amount, the delta transformation sorts the records by the dimension (OpportunityId) first, and then by time (CloseDate_day_epoch) as shown here.

OpportunityID	CloseDate	StageName	Amount
1	1/1/2014	New	100
1	3/1/2014	ClosedWon	100

OpportunityID	CloseDate	StageName	Amount
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200

After the records are sorted, for each dimension (OpportunityId), the transformation compares the previous value to the next value to determine the delta for each record. The transformation creates the following dataset.

OpportunityId	CloseDate	StageName	Amount	DeltaAmount
1	1/1/2014	New	100	0
1	3/1/2014	ClosedWon	100	0
2	1/1/2014	New	100	0
2	2/1/2014	ClosedWon	200	100

For the first record of each dimension, the transformation inserts '0' for the delta value.

Note: If an opportunity contains multiple changes on the same day, you must sort the records on a shorter time interval. In this case, sort on CloseDate_sec_epoch column. Otherwise, records might not be sorted correctly, which means delta values will be incorrect.

delta Parameters

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

delta Parameters

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	Yes	Dimension column in the dataset used to sort records when calculating the delta values.
epoch	Yes	Epoch date column in the dataset used to sort records within each dimension when calculating delta values.
inputMeasure	Yes	Measure column on which you want to calculate the delta.
outputMeasure	Yes	Name of the output column that contains the delta value.

Parameter	Required?	Value
source	Yes	Node in the dataflow definition file that contains the dataset to which you want to add the delta column.

SEE ALSO:

[delta Transformation](#)

dim2mea Transformation

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

If the transformation cannot create a measure from a dimension, the transformation populates the measure with the specified default value. If no default value is provided, the transformation inserts '0.'

Example: Let's look at an example. Your Opportunity object contains a custom text field called StageVal__c, which contains the opportunity amount at a particular stage. Because this is a text field, Wave Analytics loads this data as a dimension. However, you'd like to create a measure from this dimension to enable users to perform calculations on stage amount.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "StageVal__c" }
      ]
    }
  },
  "Create_Measure_From_Dimension": {
    "action": "dim2mea",
    "parameters": {
      "dimension": "StageVal__c",
      "measure": "StageValue",
      "measureDefault": "0",
      "measureType": "long",
      "source": "Extract_Opportunities"
    }
  },
  "Register_The_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
```

```

        "alias": "OpportunitiesWithConvertedMeasure",
        "name": "OpportunitiesWithConvertedMeasure",
        "source": "Create_Measure_From_Dimension"
    }
}
}

```

[dim2mea Parameters](#)

When you define a `dim2mea` transformation, you set the action attribute to `dim2mea` and specify the parameters.

dim2mea Parameters

When you define a `dim2mea` transformation, you set the action attribute to `dim2mea` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	Yes	Dimension column in the dataset from which you want to create the measure.
measure	Yes	Name of the output measure. This column name must be unique within the dataset. Do not use the same name as the dimension because the transformation preserves the dimension in the dataset.
measureDefault	Yes	Default value for the measure if the transformation is unable to create a measure from a dimension.
measureType	Yes	Type of measure. Valid value: "long"
source	Yes	Node in the dataflow definition file that contains the dataset to which you want to add the measure.

SEE ALSO:

[dim2mea Transformation](#)

edgemart Transformation

The `edgemart` transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the `augment` transformation together to join an existing dataset with a new dataset.

Example: Let's look at an example. You would like to compare the final sales amount against the opportunity amount to determine if heavy discounts were offered to close deals. You previously created and registered the FinalSales dataset. The FinalSales dataset contains the final sale amount of each opportunity that was closed and won.

Table 59: FinalSales Dataset

OppID	UpdateDate	StageName	SaleAmount
1	1/1/2014	ClosedWon	100,000
2	11/1/2013	ClosedWon	150,000
3	2/1/2014	ClosedWon	200,000

You would now like to create a dataset that contains opportunity information from the Opportunity object. Then, you would like to join the data from the existing FinalSales dataset with the Opportunity dataset.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" }
      ]
    }
  },
  "Extract_Final_Sales_Data": {
    "action": "edgemart",
    "parameters": { "alias": "FinalSales" }
  },
  "Combine_Opportunities_FinalSales": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "Id" ],
      "relationship": "Opportunity",
      "right": "Extract_Final_Sales_Data",
      "right_key": [ "OppID" ],
      "right_select": [ "SaleAmount" ]
    }
  },
  "Register_Opportunity_FinalSales_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OpportunityVersusFinalSales",
      "name": "OpportunityVersusFinalSales",
      "source": "Combine_Opportunities_FinalSales"
    }
  }
}
```

[edgemart Parameters](#)

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

edgemart Parameters

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

The following table describes the input parameter:

Parameter	Required?	Value
alias	Yes	API name of the dataset from which you want to extract data. To determine the API name of a dataset, edit the dataset and view the system name.

SEE ALSO:

[edgemart Transformation](#)

filter Transformation

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

 **Example:** Let's look at an example. You would like to create a dataset that contains only opportunities that were Closed Won. First, you extract all opportunities from the Opportunity object. Next, you filter the records so that you only include opportunities with a Closed Won stage name.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Filter_Opportunities": {
    "action": "filter",
    "parameters": {
      "filter": "StageName:EQ:Closed Won",
      "source": "Extract_Opportunities"
    }
  }
},
```

```

"Register_My_Won_Oppportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "MyWonOppportunities",
    "name": "MyWonOppportunities",
    "source": "Filter_Oppportunities"
  }
}

```

filter Parameters

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

filter Expression Syntax

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

filter Parameters

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
filter	Yes	Filter expression that specifies which records to include in the new dataset. See filter Expression Syntax .
source	Yes	Node in the dataflow definition file that contains the dataset that you want to filter.

SEE ALSO:

[filter Transformation](#)

filter Expression Syntax

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

 **Note:** String comparisons in a filter expression are case-sensitive.

You can use the following types of filter expressions:

Filter Expression Syntax	Description
dim:EQ:value	True if the dimension and value are equal. Example: <code>"filter": "StageName:EQ:Closed Won"</code>
dim:R:val0:val1	True if the left dimension falls within the specified range between val0 and val1.

Filter Expression Syntax	Description
	Example: <code>"filter": "EmployeeId:R:100:1000"</code>
<code>dim:R:val</code>	True if the dimension is greater than or equal to the value based on binary sort order. For example, this is true when the dimension is 'City' and the value is 'Anderson' because 'City' > 'Anderson'). Example: <code>"filter": "LastName:R:Li"</code>
<code>dim:R::val</code>	True if the dimension is less than or equal to the value based on binary sort order. Example: <code>"filter": "LastName:R::Levy"</code>
<code>dim:N:val</code>	True if the dimension and value are not equal. Example: <code>"filter": "RoleName:N:Manager"</code>
<code>dim:EQ:val1 val2</code>	True if the dimension equals values val1 or val2. This filter expression uses the logical OR operator (). You can compare the dimension value against more than two values. For example, to compare against three values, use the following syntax: <code>dim1:EQ:val1 val2 val3.</code> Example: <code>"filter": "Lead Status:EQ:Open Contacted"</code>
<code>dim1:EQ:val1,dim2:EQ:val2</code>	True if dimension dim1 equals value val1 and dimension dim2 equals value val2. This filter expression uses the logical AND operator (,). You can compare more than two dimensions. For example, to compare three dimensions, use the following syntax: <code>dim1:EQ:val1,dim2:EQ:val2,dim3:EQ:val3.</code> Example: <code>"filter": "Lead Status:EQ:Qualified,Rating:EQ:Hot"</code>

SEE ALSO:

[filter Transformation](#)

flatten Transformation

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

When you configure the flatten transformation to flatten a hierarchy, you specify the field that contains every node in the hierarchy and the field that contains their corresponding parent based on the hierarchy. The flatten transformation generates one record for each hierarchy node, which we refer to as the "self ID." Each record contains two generated columns that store the hierarchy for each self ID node. One column contains a comma-separated list of all ancestors for each node in the hierarchy. The other column contains the hierarchy path.

See the Roles and RolePath columns in the following flattened dataset to see how ancestors are stored.

Role ID (Self ID)	Role Name	Parent Role ID	Roles	RolePath
1	Salesperson 1	10	10, 20, 30	\10\20\30
2	Salesperson 2	10	10, 20, 30	\10\20\30
3	Salesperson 3	11	11, 20, 30	\11\20\30
10	Regional Manager 1	20	20, 30	\20\30
11	Regional Manager 2	20	20, 30	\20\30
20	Vice President 1	30	30	\30
21	Vice President 2	30	30	\30
30	CEO	Not applicable	Not applicable	Not applicable

You can also configure the flatten transformation to include the self ID node in the generated hierarchy columns. The following dataset shows the self ID in bold.

Role ID (Self ID)	Role Name	Parent Role ID	Roles	RolePath
1	Salesperson 1	10	1 , 10, 20, 30	\ 1 \10\20\30
2	Salesperson 2	10	2 ,10, 20, 30	\ 2 \10\20\30
3	Salesperson 3	11	3 ,11, 20, 30	\ 3 \11\20\30
10	Regional Manager 1	20	10 ,20, 30	\ 10 \20\30
11	Regional Manager 2	20	11 ,20, 30	\ 11 \20\30
20	Vice President 1	30	20 ,30	\ 20 \30
21	Vice President 2	30	21 ,30	\ 21 \30
30	CEO	Not applicable	30	30

 **Example:** Let's look at an example. You want to create a dataset that contains all opportunities. For each opportunity, you want to include user and role information about the opportunity owner. Also, to implement row-level security based on the role hierarchy, each opportunity record must also contain a list of all ancestors above each opportunity owner based on the role hierarchy. To generate the list of ancestors, use the flatten transformation to flatten the role hierarchy.

You create the following dataflow definition file:

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
```

```

        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Department" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "ParentRoleId" }
      ]
    }
  },
  "Flatten_UserRole": {
    "action": "flatten",
    "parameters": {
      "source": "Extract_UserRole",
      "self_field": "Id",
      "parent_field": "ParentRoleId",
      "multi_field": "Roles",
      "path_field": "RolePath",
      "include_self_field": false
    }
  },
  "Augment_User_FlattenUserRole": {
    "action": "augment",
    "parameters": {
      "left": "Extract_User",
      "left_key": [ "UserRoleId" ],
      "relationship": "Role",
      "right": "Flatten_UserRole",
      "right_key": [ "Id" ],
      "right_select": [
        "Id",
        "Name",

```

```

        "Roles",
        "RolePath"
    ]
}
},
"Augment_Opportunity_UserWithRoles": {
    "action": "augment",
    "parameters": {
        "left": "Extract_Opportunity",
        "left_key": [ "OwnerId" ],
        "right": "Augment_User_FlattenUserRole",
        "relationship": "Owner",
        "right_select": [
            "Name",
            "Department",
            "Role.Id",
            "Role.Name",
            "Role.Roles",
            "Role.RolePath"
        ],
        "right_key": [ "Id" ]
    }
},
"Register_OpportunityWithRoles_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
        "alias": "OppRoles",
        "name": "OppRoles",
        "source": "Augment_Opportunity_UserWithRoles",
        "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
    }
}
}
}

```

To flatten the Salesforce role hierarchy, the flatten transformation uses the following input fields from the UserRole object.

Id

Id identifies each node in the Salesforce role hierarchy.

ParentRoleId

ParentRoleId identifies the parent as defined in the role hierarchy.

After traversing through each parent-child relationship in the UserRole object, the flatten transformation generates one record for each role ID. Each record contains all ancestor roles for each role in the hierarchy. The flatten transformation generates two output columns—Roles and RolePath—to store all ancestor roles for each role.

[flatten Parameters](#)

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

flatten Parameters

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
include_self_id	No	Indicates whether to include the self ID node in the generated multi_field and path_field columns. Valid values are <code>false</code> (default) and <code>true</code> .
self_field	Yes	Name of the input field that identifies each node in the hierarchy.
parent_field	Yes	Name of the input field that identifies the direct parent of each node in the hierarchy. For example, the Regional Manager 1 role is the parent of the Salesperson 1 role in a role hierarchy.
multi_field	Yes	Name of the multi-value output field that contains a list of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the list of ancestors for each node in the hierarchy. For example, for Salesperson 1 role, the hierarchy of ancestors is: <code>Sales Manager 1, Regional Manager 1, Vice President 1, CEO</code> .
path_field	Yes	A string representation of the multi-field field, separated by backslashes. This output field contains the hierarchical path of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the ancestry path for each node in the hierarchy. For example, for a salesperson role in a role hierarchy, the value is: <code>Sales Manager 1\Regional Manager 1\Vice President 1\CEO</code> .
source	Yes	Node in the dataflow definition file that contains the hierarchical data that you want to flatten. This node is the input source for this transformation and it must contain the input fields mapped to self_field and parent_field.

Note: By default, the multi_field and path_field fields are created as system fields, which aren't visible in the user interface. To make the fields appear in the user interface, set the `ISSystemField` metadata attribute to `false` for each field in the flatten transformation. For more information about metadata attributes, see [Overriding Metadata Generated by a Transformation](#).

SEE ALSO:

[flatten Transformation](#)

sfdcDigest Transformation

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

When you upload the dataflow definition file, Wave Analytics validates access to Salesforce objects and fields based on the user profile of the user who uploads the file. If the user profile does not have read access to a field or object, the upload fails.

At run time, Wave Analytics runs the dataflow as the Integration User. Wave Analytics validates access to Salesforce objects and fields based on the user profile of the Integration User. For example, if the dataflow tries to extract data from a custom field on which the Integration User does not have read access, the dataflow job fails.

 **Note:** The Integration User is a preconfigured user that is created when Wave Analytics is enabled in your organization. If you or the Integration User need permission on a Salesforce object or field, ask the administrator to grant access.

For more information about preconfigured users in Wave Analytics, see the *Wave Analytics Security Implementation Guide*.

 **Example:** Let's look at an example. You would like to create a dataset that contains all opportunities from the Opportunity object.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        { "name": "OpportunitySupportTeamMembers__c" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

Considerations When Using the sfdcDigest Transformation

- Consider dataset storage limits when extracting data. For example, a dataset can contain a maximum of 5,000 fields, so be selective when choosing fields. See [Wave Analytics Limits](#).
- The sfdcDigest transformation runs a SOQL query to extract data from a Salesforce object, and so is subject to SOQL limits. If the query exceeds any of these limits, it may return no results or cause the dataflow job to fail. For example, The length of the SOQL query cannot exceed 20,000 characters. To reduce the SOQL query length, consider breaking up the extract into two or more sfdcDigest transformations and then use the augment transformation to combine the results. For example, you might create one sfdcDigest transformation to extract half of the fields and create another sfdcDigest transformation to extract the remaining fields. See [SOQL and SOSL Limits](#).

[Filtering Records Extracted from a Salesforce Object](#)

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

[Overriding Salesforce Field Metadata](#)

You can override the field metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

[Unsupported Salesforce Objects and Fields in Wave](#)

The `sfdcDigest` transformation can't extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

[sfdcDigest Parameters](#)

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

Filtering Records Extracted from a Salesforce Object

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

A filter consists of one or more filter conditions, where each filter condition compares a field value to a value. For example, `Amount >= 1000000`. You can also apply SOQL functions on the field value in a filter condition, like `CALENDAR_YEAR(CreatedDate) = 2011`. You can add multiple filter conditions using logical operators AND, OR, and NOT. You can also use a backslash (\) to escape double quotes included in strings.

The `sfdcDigest` transformation extracts all records for which the filter is true. If you configured the `sfdcDigest` transformation for incremental extraction, the filter applies to data extracted during the incremental run only—Wave Analytics doesn't apply the filter to records that were previously loaded into the dataset. If you add an invalid filter, the dataflow fails at run time.

For each instance of `sfdcDigest`, you can use one of the following types of filters:

- Structured filter
- Advanced filter

Tip: Are you trying to decide whether to use a filter in the `sfdcDigest` transformation or use a filter transformation? Use a filter transformation to filter records at any point in the dataflow. For example, you can add it after the dataflow joins two datasets. However, to reduce the number of rows processed in the dataflow and optimize dataflow performance, add the filter closest to the point at which records are extracted—when possible, add the filter in the `sfdcDigest` transformation.

[Structured Filter in sfdcDigest Transformation](#)

You define a structured filter using JSON syntax.

[Advanced Filter in sfdcDigest Transformation](#)

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

SEE ALSO:

[sfdcDigest Transformation](#)

Structured Filter in sfdcDigest Transformation

You define a structured filter using JSON syntax.

A structured filter uses the following JSON syntax for each filter condition.

```
{
  "field": "<field name>",
  "operator": "<operator>",
  "value": "<value>"|"["<value 1>", "<value 2>"]",
  "isQuoted": true|false}
```

The value can be a number, date, string, list of strings, or [date literal](#). Wave Analytics automatically quotes strings unless you set `isQuoted` to true, which indicates that the string is already quoted.

You can use one of the following operators in a filter condition.

Operator	Comment
=	<p>Filter condition is true if the value in the field equals the specified value. String comparisons using the equals operator are case-insensitive.</p> <p>Example:</p> <pre>"filterConditions": [{ "field": "OwnerId", "operator": "=", "value": "a07B00000012HYu" }]</pre>
!=	<p>Filter condition is true if the value in the field does not equal the specified value.</p> <p>Example (using backslashes to escape double quotes in a string value):</p> <pre>"filterConditions": [{ "field": "Nickname__c", "operator": "!=", "value": "\"Sammy\"" }]</pre>
>	<p>Filter condition is true if the value in the field is greater than the specified value.</p> <p>Example:</p> <pre>"filterConditions": [{ "field": "Amount", "operator": ">",</pre>

Operator	Comment
	<pre data-bbox="824 260 1438 369"> "value": "100000" }] </pre>
<	<p data-bbox="824 415 1438 474">Filter condition is true if the value in the field is less than the specified value.</p> <p data-bbox="824 495 1104 525">Example (using a date literal):</p> <pre data-bbox="824 541 1438 802"> "filterConditions": [{ "field": "CloseDate", "operator": "<", "value": "THIS_MONTH", "isQuoted": false }] </pre>
>=	<p data-bbox="824 856 1438 915">Filter condition is true if the value in the field is greater than or equal to the specified value.</p> <p data-bbox="824 936 909 966">Example:</p> <pre data-bbox="824 982 1438 1201"> "filterConditions": [{ "field": "Amount", "operator": ">=", "value": "100000" }] </pre>
<=	<p data-bbox="824 1255 1438 1314">Filter condition is true if the value in the field is less than or equal to the specified value.</p> <p data-bbox="824 1335 1136 1365">Example (using a SOQL function):</p> <pre data-bbox="824 1381 1438 1642"> "filterConditions": [{ "field": "CALENDAR_YEAR (CreatedDate)", "operator": "<=", "value": "2015", "isQuoted": true }] </pre>
LIKE	<p data-bbox="824 1696 1438 1818">Filter condition is true if the value in the field matches the specified value. The LIKE operator is similar to the LIKE operator in SQL; it provides a mechanism for matching partial text strings and supports wildcards.</p> <ul data-bbox="824 1839 1438 1869" style="list-style-type: none"> <li data-bbox="824 1839 1438 1869">• The % and _ wildcards are supported for the LIKE operator.

Operator	Comment
	<ul style="list-style-type: none"> • The % wildcard matches zero or more characters. • The _ wildcard matches exactly one character. • The LIKE operator is supported for string fields only. • The LIKE operator performs a case-insensitive match. • The LIKE operator supports escaping of special characters % or _. Use a backslash (\) to escape special characters. <p>Example:</p> <pre data-bbox="824 554 1438 785">"filterConditions": [{ "field": "FirstName", "operator": "LIKE", "value": "Chris%" }]</pre>
IN	<p>Filter condition is true if the value in the field equals any one of the values in the specified list. You can specify a quoted or non-quoted list of values. If the list is quoted, set <code>isQuoted</code> to true.</p> <p>Example:</p> <pre data-bbox="824 995 1438 1226">"filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"] }]</pre>
NOT IN	<p>Filter condition is true if the value in the field does not equal any of the values in the specified list.</p> <p>Example:</p> <pre data-bbox="824 1402 1438 1633">"filterConditions": [{ "field": "BillingState", "operator": "NOT IN", "value": ["California", "New York"] }]</pre>
INCLUDES	<p>For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field includes the specified value.</p> <p>Example:</p> <pre data-bbox="824 1806 1438 1879">"filterConditions": [{</pre>

Operator	Comment
	<pre data-bbox="824 260 1435 432"> "field": "BillingState", "operator": "INCLUDES", "value": ["California"] }] </pre>
EXCLUDES	<p data-bbox="824 466 1435 537">For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field excludes the specified value.</p> <p data-bbox="824 546 1435 579">Example:</p> <pre data-bbox="824 592 1435 827"> "filterConditions": [{ "field": "BillingState", "operator": "EXCLUDES", "value": ["California", "New York"] }] </pre>

Let's look at a few examples of structured filters.

Example: Let's look at an example with a basic structured filter. To perform pipeline analysis on opportunities in fiscal quarter 2 of fiscal year 2015, you create this dataflow definition file to create the relevant dataset.

```

{
  "Extract_Filtered_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" },
        { "name": "SystemModstamp" }
      ],
      "filterConditions": [
        {
          "field": "FiscalYear",
          "operator": "=",
          "value": "2015"
        },
        {
          "field": "FiscalQuarter",
          "operator": "=",

```

```

        "value": "2"
      }
    ]
  }
},
"Register_Opportunities_Dataset": {
  "action": "sfcdRegister",
  "parameters": {
    "alias": "Opportunities_2015Q2",
    "name": "Opportunities_2015Q2",
    "source": "Extract_Filtered_Opportunities"
  }
}
}
}

```

 **Note:** If you do not specify a logical operator for multiple filter conditions—as is the case in this example—Wave Analytics applies AND between the conditions.

 **Example:** Let's look at an example of a structured filter with a logical operator. To help forecast expected revenue, you create this dataflow to view all opportunities that have either closed or have greater than 90% probability of closing.

```

{
  "Extract_Opportunities": {
    "action": "sfcdDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "Probability" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" }
      ],
      "filterConditions": [
        {
          "operator": "OR",
          "conditions": [
            {
              "field": "StageName",
              "operator": "=",
              "value": "Closed Won"
            },
            {
              "field": "Probability",
              "operator": ">=",
              "value": "90"
            }
          ]
        }
      ]
    }
  }
}

```

```

    ]
  }
},
"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OpportunitiesExpectedToWin",
    "name": "OpportunitiesExpectedToWin",
    "source": "Extract_Opportunities"
  }
}
}
}

```

Example: Finally, let's look at an example of a structured filter with nested logical operators. You create this dataflow to view all opportunities that closed in the current fiscal quarter and are owned by either one of your two direct reports.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" }
      ],
      "filterConditions": [
        {
          "operator": "AND",
          "conditions": [
            {
              "field": "CloseDate",
              "operator": "=",
              "value": "THIS_FISCAL_QUARTER",
              "isQuoted": false
            },
            {
              "operator": "OR",
              "conditions": [
                {
                  "field": "OwnerId",
                  "operator": "=",
                  "value": "00540000000HfUz"
                },
                {
                  "field": "OwnerId",
                  "operator": "=",
                  "value": "00540000000HfV4"
                }
              ]
            }
          ]
        }
      ]
    }
  }
}

```

```

    }
  ]
}
},
"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "DirectReport_Opportunities",
    "name": "DirectReport_Opportunities",
    "source": "Extract_Opportunities"
  }
}
}
}

```

Advanced Filter in sfdcDigest Transformation

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

Example: Let's look at an example of an advanced filter. You want to extract only opportunity records that are owned by a specific user and that have either high value or a high probability of closing. You create this dataflow.

```

{
  "Extract_Filtered_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "Probability" },
        { "name": "OwnerId" }
      ],
      "complexFilterConditions": "OwnerId = '00540000000HfUz' AND (Amount > 100000
OR Probability > 75)"
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "FilteredOpportunities",
      "name": "FilteredOpportunities",
      "source": "Extract_Filtered_Opportunities"
    }
  }
}

```

```

    }
}

```

Overriding Salesforce Field Metadata

You can override the field metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

You can add the following field parameters to the `sfdcDigest` transformation to override the field metadata:

- `defaultValue`
- `type`
- `fiscalMonthOffset`
- `isYearEndFiscalYear`
- `firstDayOfWeek`
- `isMultiValue`
- `multiValueSeparator`
- `precision`
- `scale`

For a description of each of these field parameters, see [Field Parameters](#). For information about using metadata attributes to configure dates, see [Date Handling in Datasets](#).

 **Example:** Let's look at an example. You would like to override metadata extracted from the Opportunity object.

You add the bold text in the following dataflow definition to override field metadata from the Opportunity object.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        {
          "name": "Amount",
          "defaultValue": 0
          "precision": 18
          "scale": 2
        },
        { "name": "StageName" },
        {
          "name": "CloseDate",
          "fiscalMonthOffset": 9,
          "firstDayOfWeek": 2,
          "isYearEndFiscalYear": true
        },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        {
          "name": "OpportunitySupportTeamMembers__c",

```

```

        "type": "Text",
        "isMultiValue": true,
        "multiValueSeparator": ",",
        "precision": 255
      }
    ]
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}

```

Unsupported Salesforce Objects and Fields in Wave

The sfdcDigest transformation can't extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

For information about all Salesforce objects and fields, see the [Object Reference for Salesforce and Force.com](#).

Unsupported Objects

The sfdcDigest transformation can't extract data from these Salesforce objects.

 **Note:** The sfdcDigest transformation doesn't support extracts from BigObjects.

The sfdcDigest transformation cannot extract data from external objects created in Salesforce. External objects are similar to custom objects, except that they map to data located outside Salesforce.

If you include an unsupported or inaccessible object in the sfdcDigest transformation, the dataflow fails at run time with an error message.

Unsupported Fields

The sfdcDigest transformation can't extract data from these fields.

Object	Unsupported Fields
Account	CleanStatus
ActionPlanItem	ItemId
AuthSession	<ul style="list-style-type: none"> • LoginGeold

WorkBadgeDefinition	RewardFundId

If you include a field with an unsupported field in the `sfdcDigest` transformation, the dataflow ignores the field.

In addition, Salesforce recommends that you do not extract data from the `MayEdit` field of the `Account` object. Extracting data from this field significantly decreases performance and can cause the dataflow to fail.

Unsupported Field Types

The `sfdcDigest` transformation can't extract data from fields with these field types.

- base64
- composite (like address and location)
- data category group reference
- encrypted string

If you include a field with an unsupported field type in the `sfdcDigest` transformation, the dataflow ignores the field.

[sfdcDigest Transformation](#)

sfdcDigest Parameters

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

You can specify parameters in the following sections of the `sfdcDigest` node: `parameters`, `fields`, and `filterConditions`.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
<code>object</code>	Yes	API name of the Salesforce object from which you want to extract data. This object is the input source for this transformation. The <code>sfdcDigest</code> transformation doesn't

Parameter	Required?	Value
		support extraction from all Salesforce objects.
incremental	No	<p>Performs an incremental extraction, which extracts only changes to the Salesforce object since the last dataflow run. Valid values: true or false.</p> <p> Note: Incremental extraction is available if you have enabled replication.</p>
fullRefreshToken	No	<p>Performs a one-time full extraction to synchronize the data in the dataset with data in the Salesforce object. Specify any value for this parameter.</p> <p>After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the <code>fullRefreshToken</code> parameter is included in the dataflow definition. To run a full extraction again, change the value of the <code>fullRefreshToken</code> parameter to a different value.</p> <p> Note: Incremental extraction is available if you have enabled replication.</p>
fields	Yes	<p>An array of names of all fields from which you want to extract data from the specified Salesforce object. The <code>sfdcDigest</code> transformation doesn't support extraction from all field types.</p> <p>See Field Attributes.</p>
filterConditions	No	<p>A filter that restricts the records extracted from the specified Salesforce object. The <code>sfdcDigest</code> transformation extracts all records from the Salesforce object for which the filter is true. You can specify a structured or advanced filter.</p> <p>See Filter Conditions Parameters.</p>
complexFilterConditions	No	<p>For advanced filters only. A SOQL WHERE clause used to filter records extracted from the specified Salesforce object.</p>

Field Attributes

The following table describes the attributes in the `fields` section. It also describes optional attributes that you can provide to override the field metadata. You can override the metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field. If you don't override the values, Wave Analytics gets the values from Salesforce.

Attribute	Required?	Value
<code>name</code>	Yes	API name of the field in the Salesforce object that you want to include in the dataset. You can specify multiple fields.
<code>defaultValue</code>	No	For text and numeric fields that can be null. Default value that replaces a null value for the specified field.
<code>type</code>	No	Wave Analytics field type associated with the specified field. Valid types are Text, Numeric, or Date. Any value, including numeric values, can be Text. For example, by default, fiscal quarter from Salesforce objects is Number. However, you can change it to Text. Specify a type to override the type determined by Wave Analytics. Example: <pre>"type": "Text"</pre>
<code>fiscalMonthOffset</code>	No	For date fields only. The difference, in months, between the first month of the fiscal year and the first month of the calendar year (January). For example, if the fiscal year starts in January, the offset is 0. If the fiscal year starts in October, the offset is 9. Example: <pre>"fiscalMonthOffset": 9</pre>  Note: This attribute also controls whether Wave Analytics generates fiscal date fields. To generate fiscal date fields, set <code>fiscalMonthOffset</code> to a value other than 0. For more information, see Date Handling in Datasets .

Attribute	Required?	Value
isYearEndFiscalYear	No	<p>For date fields only. Indicates whether the fiscal year is the year in which the fiscal year ends or begins. Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year.</p> <ul style="list-style-type: none"> • If true, then the fiscal year is the year in which the fiscal year ends. The default is true. • If false, then the fiscal year is the year in which the fiscal year begins. <p>Example:</p> <pre>"isYearEndFiscalYear": true</pre> <p>This field is relevant only when <code>fiscalMonthOffset</code> is greater than 0.</p> <p>For more information, see Date Handling in Datasets.</p>
firstDayOfWeek	No	<p>For date fields only. The first day of the week for the calendar year and, if applicable, fiscal year. Use 0 to set the first day to be Sunday, 1 to set the first day to be Monday, and so on. Use -1 to set the first day to be on January 1. The default is -1.</p> <p>Example:</p> <pre>"firstDayOfWeek": 0</pre> <p>For more information, see Date Handling in Datasets.</p>
isMultiValue	No	<p>For text fields only. Indicates whether the specified field has multiple values.</p> <p>Example:</p> <pre>"isMultiValue": false</pre>
multiValueSeparator	No	<p>For text fields only. Character used to separate multiple values in the specified field when <code>isMultiValue</code> equals true. This value defaults to a semicolon (;) if you do not specify a value and <code>isMultiValue</code> equals true. Set to null when <code>isMultiValue</code> equals false.</p>

Attribute	Required?	Value
		Example: <pre>"multiValueSeparator": ";"</pre>
precision	No	The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive. Example: <pre>"precision": 10</pre>
scale	No	The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: <pre>"scale": 2</pre>

Filter Conditions Parameters

The following table describes the structured filter parameters in the `filterConditions` section. These parameters do not apply to advanced filters.

Parameter	Required?	Value
field	No	The field in the Salesforce object on which you want to apply a filter condition. Each filter condition in a structured filter uses the following syntax: <pre>{ "field": "<field name>", "operator": "<operator>", "value": "<value>", "isQuoted": true false}</pre>
operator	No	The purpose depends on the context. <ul style="list-style-type: none"> • <code>operator</code> can be used as a comparison operator—like <code>=</code>, <code><</code>, and

Parameter	Required?	Value
		<p>IN—that compares the field value against a constant value.</p> <ul style="list-style-type: none"> operator can also be used as a logical operator (AND, OR, or NOT) that links multiple filter conditions together. <p>In the example below, the bold operator is the logical operator. The other instances of operator are comparison operators.</p> <pre data-bbox="1036 604 1442 1297"> "filterConditions": [{ "operator": "OR", "conditions": [{ "field": "StageName", "operator": "=", "value": "Closed Won" }, { "field": "Probability", "operator": ">=", "value": "90" }] }] </pre>
value	No	The value used in a filter condition.
isQuoted	No	<p>Indicates whether you quoted the string value in a filter condition.</p> <p>Example with quoted values:</p> <pre data-bbox="1036 1528 1442 1822"> "filterConditions": [{ "field": "StageName", "operator": "IN", "value": "('Closed Won', 'Closed Lost')", "isQuoted": true }] </pre>

Parameter	Required?	Value
		<p>Example with non-quoted values:</p> <pre>"filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"], "isQuoted": false }]</pre> <p>If you don't include isQuoted for a filter on a string value, Wave Analytics assumes that the string value is not quoted and adds the quotes for you.</p>
conditions	No	Use to specify a logical operator to link multiple filter conditions together.

[Filtering Records Extracted from a Salesforce Object](#)

sfdcRegister Transformation

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

You don't need to register all datasets. For example, you don't need to register an intermediate dataset that is used to build another dataset and does not need to be queried. In addition, you don't need to register datasets that are created when you upload external data because Wave Analytics automatically registers these datasets for you.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

Example: Let's look at an example. You create a dataflow that extracts opportunities from the Opportunity object. To register the dataset, name it "Opportunities," and apply row-level security on it, you add the sfdcRegister transformation as shown in the following dataflow definition file.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },

```

```

        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    },
    "Register_Oppportunities_Dataset": {
      "action": "sfdcRegister",
      "parameters": {
        "alias": "Opportunities",
        "name": "Opportunities",
        "source": "Extract_Opportunities",
        "rowLevelSecurityFilter": "'OwnerId' == \"\$User.Id\""
      }
    }
  }
}

```

[sfdcRegister Parameters](#)

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

sfdcRegister Parameters

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
alias	Yes	API name of the registered dataset. This name can contain only underscores and alphanumeric characters, and must be unique among other dataset aliases in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. It also cannot exceed 80 characters.
name	Yes	Display name of the registered dataset. The name cannot exceed 80 characters.  Note: To change the name after you create the dataset, you must edit the dataset.
source	Yes	Node in the dataflow definition file that identifies the dataset that you want to register. This is the input source for this transformation.

Parameter	Required?	Value
rowLevelSecurityFilter	No	<p>The predicate used to apply row-level security on the dataset when the dataset is first created.</p> <p>Example: "rowLevelSecurityFilter": "OwnerId" == "\$User.Id"</p> <p> Note: To change the predicate after you create the dataset, you must edit the dataset.</p> <p>When entering the predicate in the Register transformation of the dataflow JSON, you must escape the double quotes around string values.</p> <p>After the dataset is created, Wave Analytics ignores its security predicate setting in the dataflow. To change the security predicate for an existing dataset, edit the dataset in the user interface.</p>

[sfdcRegister Transformation](#)

sliceDataset Transformation

The sliceDataset transformation removes fields from a dataset in your dataflow, leaving you with a subset of fields for use in a new dataset or in other transformations. This allows you to create multiple datasets, each with different sets of fields from a single dataset.

The transformation includes the `mode` parameter, which lets you choose between two modes: `drop` or `select`. Set it to `drop` to remove the fields you specify. Set it to `select` to keep the fields you specify.

 **Example:** Here's an example. Let's say your dataflow contains an `sfdcDigest` node, `ExtractOpportunities`, that extracts all fields from the Opportunity object. However, some of your users don't want Id fields in their Opportunities dataset. You resolve this by adding a `sliceDataset` node to your dataflow, specifying the source node, the fields you want to remove from that node, and `drop` mode.

```
{
  "RemoveFieldsFromExtractOpportunities": {
    "action": "sliceDataset",
    "parameters": {
      "source": "ExtractOpportunities",
      "mode": "drop",
      "fields": [
        {
          "name": "Id"
        },
        {
          "name": "ProductId"
        }
      ]
    }
  }
}
```

```

    }
  ]
}
}
}

```

sliceDataset Parameters

When you define a sliceDataset transformation, you set the action attribute to `sliceDataset` and specify the parameters.

sliceDataset Parameters

When you define a sliceDataset transformation, you set the action attribute to `sliceDataset` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
source	Yes	Node in the dataflow definition file that identifies the dataset that you want to slice. This is the input source for this transformation.
mode	Yes	The action you want to take on the specified fields. Set it to <code>drop</code> to <i>remove</i> the fields. Set it to <code>select</code> to <i>keep</i> the fields.
fields	Yes	An array of names of the fields that you want to drop or select from the specified source node.

update Transformation

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

When you create the transformation, you specify the keys that are used to match records between the two datasets. To dictate which field in the lookup dataset updates the field in the source dataset, you also map the corresponding fields from both datasets.

 **Example:** Let's look at an example. You have an existing Accounts dataset that contains account information—Id, Name, and AnnualRevenue. Unfortunately, some of the account names in the dataset are now incorrect because of a series of mergers and acquisitions. To quickly update the account names in the dataset, you perform the following tasks.

1. Create a .csv file that contains the new account names and associated account IDs for accounts that have name changes.
2. Upload the .csv file to create a dataset called UpdatedAccountNames.
3. Create a dataflow definition file to update account names in the Accounts dataset by looking up the new account names in the UpdatedAccountNames dataset.

You create the following dataflow definition file.

```

{
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": [ "Id" ],
      "right_key": [ "AccountID" ],
      "update_columns": { "Name": "NewAccountName" }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}

```

 **Example:** Let's look at another example, where a composite key is used to match records between both datasets. In this case, you match records using the account ID and account name fields.

You create the following dataflow definition file.

```

{
  "Extract_AccountDetails": {

```

```

    "action": "sfcdigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": ["Id", "Name"],
      "right_key": ["AccountId", "NewAccountName"],
      "update_columns": {
        "Name": "NewAccountName",
        "CreateDate": "NewCreateDate",
        "AnnualRevenue": "NewAnnualRevenue"
      }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfcdRegister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}

```

[update Parameters](#)

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

update Parameters

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
left	Yes	Node in the dataflow definition file that identifies the dataset that contains the records that you want to update.

Parameter	Required?	Value
right	Yes	Node in the dataflow definition file that identifies the lookup dataset that contains the new values.
left_key	Yes	Key column in the left dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order. For an example, see update Transformation on page 4014.
right_key	Yes	Key column in the right dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order.
update_columns	No	<p>An array of corresponding columns between the left and right datasets. Use the following syntax: <code>"update_columns": { "LeftColumn1": "RightColumn1", "LeftColumn2": "RightColumn2", ... "LeftColumnN": "RightColumnN" }</code>. The value from right column replaces the value from the corresponding left column. The field types of the left and right column must match.</p> <p> Note: If you specify a column name that does not exist, the dataflow fails.</p> <p>If you do not specify this parameter, the transformation updates the left dataset by matching all columns in the right dataset with those in the left. In this case, the right column names must match exactly with the left column names. Otherwise, an error might occur.</p>

SEE ALSO:

[update Transformation](#)

Overriding Metadata Generated by a Transformation

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

In the Schema section, you can override the metadata attributes for one object only.

The Schema section in this sample sfdcDigest transformation contains metadata overrides:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

```
"Extract_Opportunities": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "Opportunity",
    "fields": [
      { "name": "Name" },
      { "name": "Amount" }
    ]
  },
  "schema": {
    "objects": [
      {
        "label": "Sales Opportunities",
        "fields": [
          {
            "name": "Amount",
            "label": "Opportunity Amount"
          }
        ]
      }
    ]
  }
}
```

Object Attributes

You can override the following object attributes.

Object Attribute	Type	Description
label	String	The display name for the object. Can be up to 40 characters. Example: "label": "Sales Data"
description	String	The description of the object. Must be less than 1,000 characters. Add a description to annotate an object in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface.

Object Attribute	Type	Description
		Example: "description": "The SalesData object tracks basic sales data."
fields	Array	The array of fields for this object.

Field Attributes

You can override attributes of each specified dataset field.

Field Attribute	Type	Description
name	String	Name of the field in the dataset. Identifies the field that you want to override. Examples: "name": "Amount" <pre>"name": "Role.Name"</pre>
label	String	The display name for the field. Can be up to 255 characters. Example: "label": "Opportunity Amount"
description	String	The description of the field. Must be less than 1,000 characters. Add a description to annotate a field in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface. Example: "description": "The Amount field contains the opportunity amount."
isSystemField	Boolean	Indicates whether this field is a system field to be excluded from query results. Example: "isSystemField": false
format	String	The display format of the numeric value. Examples: "format": "\$#,##0.00" (Numeric) For more information about valid formats, see Numeric Formats .

Numeric Formats

An example of a typical numeric value is \$1,000,000.99, which is represented as \$#,##0.00. You are required to specify the precision and scale of the number. The format is specified by using the following symbols:

Symbol	Meaning
0	One digit
#	Zero or 1 digit
.	This symbol is the default decimal separator. Use the <code>decimalSeparator</code> field to set the decimal separator to a different symbol.
-	Minus sign
,	Grouping separator
\$	Currency sign

 **Note:** The format for numeric values isn't used in data ingestion. It is used only to specify how numeric values are formatted when displayed in the UI. Also, you can't override date formats.

 **Example:** Let's consider an example where you want to override the following object and field attributes that the `sfdcDigest` transformation extracts from the Opportunity object.

Object/Field	Attribute Changes
Opportunity object	<ul style="list-style-type: none"> Change the object label to "Sales Opportunities" Add an object description
Id field	<ul style="list-style-type: none"> Change the field label to "Opportunity Id" Hide the field from queries
Amount field	<ul style="list-style-type: none"> Change the field label to "Opportunity Amount" Change the format to <code>\$#,##0.00</code>
CloseDate field	<ul style="list-style-type: none"> Change the field label to "Closing Date"

To override the attributes, you add the Schema section with the override values to `sfdcDigest` in the dataflow definition file.

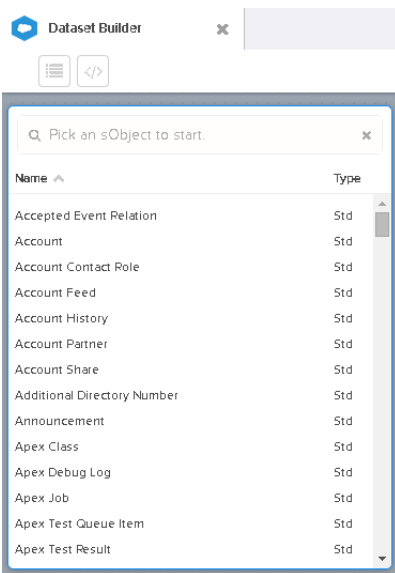

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
}
```

```
    ],
  },
  "schema": {
    "objects": [
      {
        "label": "Sales Opportunities",
        "description": "These are all sales opportunities.",
        "fields": [
          {
            "name": "Id",
            "label": "Opportunity Id",
            "isSystemField": true
          },
          {
            "name": "Amount",
            "label": "Opportunity Amount",
            "format": "$#,##0.00"
          },
          {
            "name": "CloseDate",
            "label": "Closing Date"
          }
        ]
      }
    ]
  }
},
"Register_Dataset_Opportunities": {
  "action": "sfdcRegister",
  "parameters": {
    "source": "Extract_Opportunities",
    "alias": "Opportunities",
    "name": "Opportunities"
  }
}
}
```

Create a Dataset with the Dataset Builder

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

1. On the home page or on an app page, click **Create > Dataset**.
2. Click **Salesforce**.
The dataset builder opens on the Dataset Builder tab.

3. Select the root object.
The root object is the lowest level child object that you can add to the canvas. After you select the root object, you can add only parent objects of the root object—you can't add its children objects. To change the root object, refresh the page and start over.
4. Hover over the root object, and then click .
The Select Fields dialog box appears. By default, the Fields tab appears and shows all available object fields from which you can extract data.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To access the dataset builder:

- "Edit Wave Analytics Dataflows"

Note: You can view this dialog box for any object included in the canvas.

- In the Fields tab, select the fields from which you want to extract data. To locate fields more quickly, you can search for them or sort them by name or type.

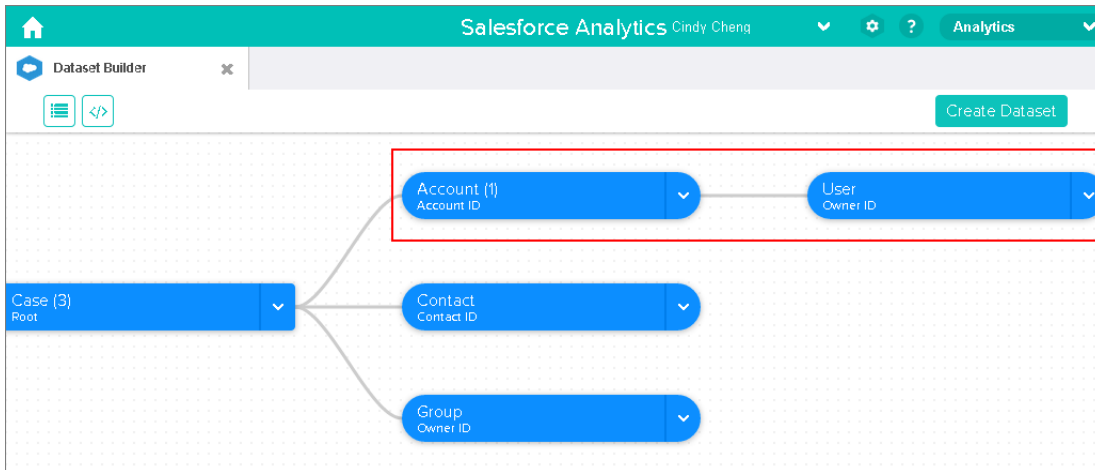

Important: You must select at least one field for each object that you add to the canvas. If you add an object and don't add any of its fields, the dataflow fails at run time.

- In the Relationships tab, click **Join** to add the related objects to the canvas. When you add a related object, the related object appears in the canvas.

7. To remove a related object, click **Delete**.

 **Warning:** When you delete a related object, you also delete all objects that descend from the related object in the diagram. For example, if you delete Account shown below, you delete the branch that contains Account and User.

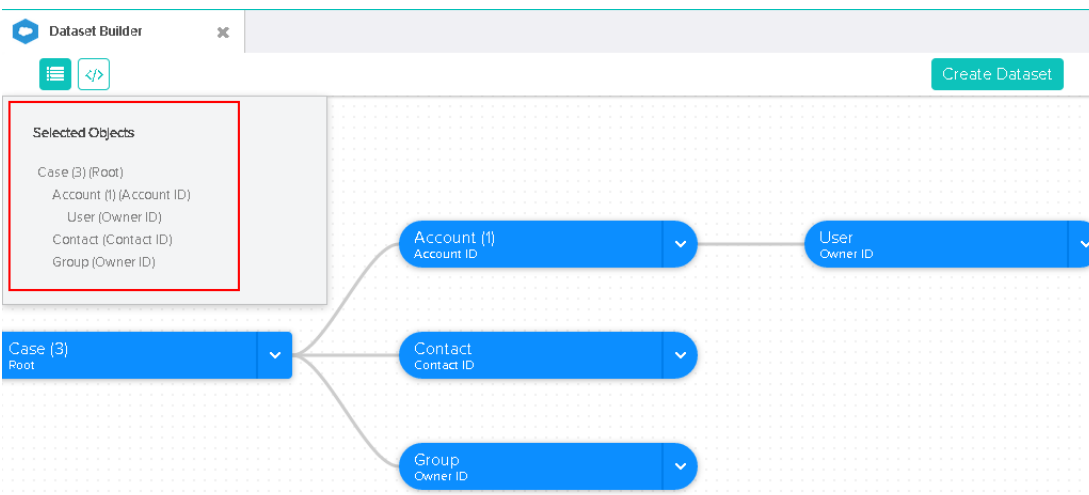

8. For each related object, select the fields from which you want to extract data.

9. To move the entire diagram, select a white space in the canvas and drag it.
You might need to move the diagram to view a different section of the diagram.

10. To view all objects included in the canvas, click .

The Selected Objects dialog box shows a tree structure of all objects included in the canvas. The root object appears at the top of the tree.

If you select one of the objects, the dataset builder focuses on the object by placing the object in the center of the canvas.

11. To view the associated JSON, click .

When you create the dataset, the dataset builder appends the JSON to the dataflow definition file.

12. Click Create Dataset.

13. Enter the name of the dataset, and select the app that will contain the dataset if it's not already selected.

 **Note:** If you enter a dataset name that is already used, when you create the dataset, the dataset builder appends a number to the dataset name. For example, if you entered MyOpportunities, the dataset builder creates MyOpportunities1. The dataset name cannot exceed 80 characters.

14. Click Create.

The dataset builder appends the underlying JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. You can manually run the dataflow to immediately create the dataset.

Optimize Your Dataflows with Replication

Replication decouples the extract of Salesforce data from your dataflows, letting you run it on a separate schedule. By scheduling these extracts ahead of time, your dataflow has less to do and runs faster. To lighten the load even more, replication extracts Salesforce data incrementally by default, meaning that only data that's changed gets extracted.

Without replication, a dataflow performs a separate extract each time it needs data from a Salesforce object. Let's take a look at an example. Imagine your organization has three dataflows, extracting data from Salesforce objects as follows:

	Accounts	Contacts	Opportunities	Campaigns	Leads	Cases	Users
Default Dataflow							
Sales Wave App Dataflow							
Service Wave App Dataflow							

Every time these dataflows run, they have to extract all this Salesforce data. And the more data there is, the longer the dataflow takes to run. What's more, the dataflows are duplicating effort by performing separate extracts from the same object. For example, Accounts data is extracted by all three dataflows.

With replication, all of these extracts are performed as a separate process, which you can schedule to take place before your dataflows run.

	Accounts	Contacts	Opportunities	Campaigns	Leads	Cases	Users
Replication							

This replicated data is then available to all your dataflows, which run faster because they no longer have to extract any data—just load and transform.

[Understand What Happens When You Enable Replication](#)

When you enable replication, Wave looks at the sfdcDigest nodes in your existing **scheduled** dataflows to see which Salesforce objects and fields you're currently extracting. Using this information, Wave enables replication for each of these objects to extract the data separately. Understanding exactly what happens when you enable replication helps you identify any additional actions that you might need to take to ensure replication runs successfully.

[Enable Replication](#)

Enable replication to decouple the extract of Salesforce data from your dataflows.

[Schedule, Run, and Monitor Replication](#)

You can schedule replication to run automatically, or run it manually, and monitor its progress, all in the data manager.

[Extract Data Incrementally in Replication](#)

By default, replication extracts data from each Salesforce object incrementally. Records are inserted, updated, or deleted to match changes in the object since the previous replication run. Because only changes are extracted, replication runs faster.

[Configure Replication Settings](#)

When a Salesforce object is enabled for replication, you can configure its replication settings to disable fields that you don't want to replicate, add a filter to only replicate specific data, or disable replication for an object. You do all this through the data manager.

[Disable Replication for an Object](#)

Disable replication for an object in the data manager to exclude it from replication.

[Add Objects and Fields to Replication](#)

It is not possible to add objects or fields to replication in the data manager. To add an object, add an sfdcDigest node for it to one of your dataflows. To add a field for an object, add it to an existing sfdcDigest node for the object in one of your dataflows. The new object or field is added automatically to replication when you upload the updated dataflow definition file.

[Considerations When Creating or Updating Dataflows with Replication Enabled](#)

If you have enabled replication, here are some things to keep in mind the next time you create or update one of your dataflows.

[Considerations When Using Wizard-Based Wave Apps with Replication](#)

If you use wizard-based Wave Analytics apps, such as Sales or Service Wave, here are some things to consider before and after you enable replication.

[Replication Limits and Limitations](#)

Here are some things to consider when you're working with replication.

Understand What Happens When You Enable Replication

When you enable replication, Wave looks at the sfdcDigest nodes in your existing **scheduled** dataflows to see which Salesforce objects and fields you're currently extracting. Using this information, Wave enables replication for each of these objects to extract the data separately. Understanding exactly what happens when you enable replication helps you identify any additional actions that you might need to take to ensure replication runs successfully.

Here's what happens, and the action we recommend that you take.

Your Existing Dataflows Are Validated

Because replication is based on your existing dataflows, Wave validates your scheduled dataflows to ensure that they are error free. Although dataflows with errors are not considered for replication, Wave alerts you to any errors in sfdcDigest nodes when you enable replication.

Recommended Action

Before you enable replication, review your scheduled dataflows for errors. In particular, look out for incorrect object or field names in `sfcdigest` nodes. If you see errors displayed when you enable replication, fix them in your dataflows before you continue. When you fix errors in a dataflow, Wave automatically considers it for replication when you upload the dataflow definition file.

! **Important:** Wave does not consider unscheduled dataflows when you enable replication. Make sure that any dataflow that you want to be considered is scheduled. See [Reschedule and Unschedule a Dataflow](#).

Your Dataflows Are Processed in Order of Dataflow Creation Date

Wave considers the `sfcdigest` nodes in your dataflows in the order in which they were created. If there are multiple `sfcdigest` nodes for the same object in your dataflows, they are merged. If there are conflicts with object-level parameters, the values from the most recently created dataflow are used for replication. Consider the following example dataflows, each containing an `sfcdigest` node for the Opportunity object:

Dataflow A (Created 08/01/2016)	Dataflow B (Created 08/15/2016)
<pre>{ "Extract_OpportunitiesA": { "action": "sfcdigest", "parameters": { "object": "Opportunity", "incremental": false, "fields": [{ "name": "Id" }, { "name": "Name" }, { "name": "StageName" }, { "name": "CloseDate" }, { "name": "AccountId" }, { "name": "OwnerId" }] } } }</pre>	<pre>{ "Extract_OpportunitiesB": { "action": "sfcdigest", "parameters": { "object": "Opportunity", "incremental": true, "fields": [{ "name": "Id" }, { "name": "Name" }, { "name": "StageName" }, { "name": "CloseDate" }, { "name": "AccountId" }, { "name": "OwnerId" }] } } }</pre>

In the resulting replication for this object, the `incremental` parameter is set to `true`, from the most recently created dataset. This also applies to other object-level attributes, such as `fullRefreshToken` and `enablePKChunking`.

Recommended Action

Review your dataflows to ensure that object-level parameters are consistent across all `sfcdigest` nodes for the same object.

All Fields in Multiple sfcdigest Nodes for an Object Are Included in Replication

If your dataflows have multiple `sfcdigest` nodes for the same object, each with a different set of fields, a superset of all these fields is included in replication. In addition, if the same field has different attributes, such as `type` or `isMultiValue`, the attributes from the most recently created dataflow are used for replication. Consider the following example dataflows, each containing an `sfcdigest` node for the Opportunity object:

Dataflow A (Created 08/01/2016)	Dataflow B (Created 08/15/2016)
<pre>{ "Extract_OpportunitiesA": { "action": "sfdcDigest", "parameters": { "object": "Opportunity", "fields": [{ "name": "Id"}, { "name": "Name" }, { "name": "StageName" }, { "name": "CloseDate", "fiscalMonthOffset": 9 }, { "name": "AccountId" }, { "name": "OwnerId" }] } } }</pre>	<pre>{ "Extract_OpportunitiesA": { "action": "sfdcDigest", "parameters": { "object": "Opportunity", "fields": [{ "name": "Id"}, { "name": "Name" }, { "name": "StageName" }, { "name": "CloseDate", "fiscalMonthOffset": 3 }] } } }</pre>

In the resulting replication for this object, the Id, Name, StageName, CloseDate, AccountId, and OwnerId are included. The `fiscalMonthOffset` attribute for CloseDate is set to 3 from the most recently created dataflow.

Recommended Action

Review the fields in the `sfdcDigest` nodes of your dataflows. If the resulting replication includes fields that you don't require, you can disable them in the replication settings for that object (see [Configure Replication Settings](#)). If you have field attribute conflicts, ensure that the attributes you want to use for replication are in the most recently created dataflow.

Advanced Filters on `sfdcDigest` Nodes Are Included in Replication

If an `sfdcDigest` node includes a `complexFilterConditions` parameter to apply an advanced filter, Wave adds this filter to the replication settings for that object. When there are multiple `sfdcDigest` nodes with complex filters for the same object, only the filter from the most recently created or updated dataflow is added to the replication settings. Wave ignores structured filters applied through `filterConditions` parameters.

Recommended Action

After you enable replication, review each object's replication settings to verify that filters have been applied correctly (see [Configure Replication Settings](#)). To use multiple filters for an object, we recommend that you remove any filter from replication settings, and add the filters to the corresponding dataflow using the filter transformation (see [filter Transformation](#)).

 **Note:** If you have participated in the replication pilot program and have `sfdcDigest` node filters in your replication dataflow, these filters are not added to replication. Add these filters manually through the object's replication settings. See [Configure Replication Settings](#).

[Filtering Records Extracted from a Salesforce Object](#)

Enable Replication

Enable replication to decouple the extract of Salesforce data from your dataflows.

Important: We recommend that you read [Understand What Happens When You Enable Replication](#) before you enable replication. This will help you identify any additional actions that you might need to take to ensure replication runs successfully.

To enable replication, perform the following steps.

1. From Setup, enter *Wave Analytics* in the Quick Find box, then select **Settings**.
2. Select **Enable Replication**, and then click **Save**.

Important: After you enable replication, make sure you run replication before your dataflows next run. Dataflows with sfdcDigest nodes fail until replication has run and completed for the first time. See [Schedule, Run, and Monitor Replication](#).

Schedule, Run, and Monitor Replication

You can schedule replication to run automatically, or run it manually, and monitor its progress, all in the data manager.

Important: After you enable replication, make sure you run replication and it completes before your dataflows next run. Dataflows with sfdcDigest nodes fail until replication has run for the first time.

[Schedule Replication](#)

Schedule replication to run automatically.

[Run Replication](#)

Run replication manually at any time in the data manager.

[Monitor Replication](#)

Monitor the progress of replication in the data manager.

Schedule Replication

Schedule replication to run automatically.

When you schedule replication, you schedule it to run for all your enabled objects at the same time. You cannot schedule separate replications for each object.

Note: A replication run counts towards your limit of 24 dataflow runs per day. For example, in an organization using the Sales Wave and Service Wave apps, a user dataflow, and replication, there are four separate dataflows. If you schedule each one to run every six hours, you will reach the daily limit. Consider this limit when you schedule replication.

To schedule replication, perform the following steps.

1. In Wave Analytics, click the gear icon () and then click **Data Manager** to open the data manager.
2. In the data manager, click the Ingest tab.
The Ingest tab displays a list of Salesforce objects enabled for replication.
3. Click **Edit Replication Schedule**.
The schedule dialog appears.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To enable replication:

- “Customize Application”

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To schedule replication:

- “Edit Wave Analytics Dataflows”

4. Enter the frequency and then click **Save**.
5. Click **Done**.

Run Replication

Run replication manually at any time in the data manager.

 **Note:** When you run replication manually, consider that it counts towards your limit of 24 dataflow runs per day.

To run replication, perform the following steps.

1. In Wave Analytics, click the gear icon () and then click **Data Manager** to open the data manager.
2. In the data manager, click the Ingest tab.
The Ingest tab displays a list of Salesforce objects enabled for replication.
3. Click **Run Replication Now**.
The Monitor page of the data manager opens to display the replication of each object as a separate job.

Monitor Replication

Monitor the progress of replication in the data manager.

To monitor replication, perform the following steps.

1. In Wave Analytics, click the gear icon () and then click **Data Manager** to open the data manager.
2. In the data manager, click **Monitor**.
The Jobs View of the monitor displays information about your replication jobs.

Extract Data Incrementally in Replication

By default, replication extracts data from each Salesforce object incrementally. Records are inserted, updated, or deleted to match changes in the object since the previous replication run. Because only changes are extracted, replication runs faster.

 **Note:** A full extract is performed the first time replication runs for an object.

To turn off incremental mode for a replicated object, add the `incremental` parameter to the object's `sfdcDigest` node in your dataflow, and set its value to `false`. For example:

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": false,
      "fields": [
```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To run replication:

- "Edit Wave Analytics Dataflows"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To monitor replication:

- "Edit Wave Analytics Dataflows"

```

    { "name": "Id" },
    { "name": "Name" },
    { "name": "StageName" },
    { "name": "CloseDate" },
    { "name": "AccountId" },
    { "name": "OwnerId" }
  ]
}

```

To force a full extract for a replicated object, add the `fullRefreshToken` parameter to the object's `sfdcDigest` node, and give it a random value. For example:

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fullRefreshToken": "bb",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
}

```

The next time you need to force a full extract for this object, change the value in the `fullRefreshToken` parameter.

Considerations When Using Incremental Extract with Replication

- If incremental mode is explicitly turned off in an `sfdcDigest` node, and not explicitly turned on in later nodes for the same object, it is not turned on when you enable replication. You have to manually turn it on by setting the `incremental` parameter to `true` in the dataflow.
- When you enable replication, incremental mode is not turned on for Salesforce objects that perform hard deletes on records, unless it's explicitly turned on in the dataflow.
- Changes made less than one hour before replication runs are not picked up. Bear this in mind if you have records that are frequently updated.
- As a best practice, force a full refresh regularly, using the `fullRefreshToken` parameter, to ensure that all changes are picked up.
- Formula fields can become out of sync with your replicated object in incremental mode. We recommend that you turn off incremental extracts for objects containing formula fields.
- If you make field changes in an `sfdcDigest` dataflow node, such as adding or removing fields, or changing attributes, Wave triggers a full extract of data the next time replication runs.

[Configure the Dataflow](#)

[sfdcDigest Transformation](#)

Configure Replication Settings

When a Salesforce object is enabled for replication, you can configure its replication settings to disable fields that you don't want to replicate, add a filter to only replicate specific data, or disable replication for an object. You do all this through the data manager.

To configure replication settings, perform the following steps.

1. In Wave Analytics, click the gear icon () and then click **Data Manager** to open the data manager.
2. In the data manager, click the Ingest tab.
The Ingest tab displays a list of Salesforce objects enabled for replication.
3. Click an object to open its replication settings.
A preview of the replicated data appears.
4. To disable replication for a field, hover over the field's column header and click the cross that appears.

 **Note:** You can't disable replication for a field that's used in a dataflow, or disable replication for an object's Id field.

5. To filter the data that's replicated, click  .

a. Enter a filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. For example:

```
RecordType = 'B2B' AND Status = 'Open'
```

b. Click **Done**.

 **Note:** Your preview data does not reflect any filter you add. Filters are only applied when you save the replication settings.

6. Click **Save** to save the replication settings.

 **Note:** If you disable replication for a field, you cannot enable it again through the replication settings. You can re-enable a field by adding it to the sfdcDigest node in your dataflow. See [Add Objects and Fields to Replication](#).

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To configure replication settings:

- "Edit Wave Analytics Dataflows"

Disable Replication for an Object

Disable replication for an object in the data manager to exclude it from replication.

 **Note:** You can't disable replication for an object that's used in a dataflow.

To disable replication for an object, perform the following steps.

1. In Wave Analytics, click the gear icon () and then click **Data Manager** to open the data manager.
2. In the data manager, click the Ingest tab.
The Ingest tab displays a list of Salesforce objects enabled for replication.
3. Click the actions button () to the right of the object and then select **Disable Replication**.
A warning message appears.
4. Read the warning message carefully and then click **Disable**.

 **Note:** If you disable replication for an object, you can't enable it again in the data manager. You can re-enable an object by adding an sfdcDigest node for it to your dataflow. See [Add Objects and Fields to Replication](#).

Add Objects and Fields to Replication

It is not possible to add objects or fields to replication in the data manager. To add an object, add an sfdcDigest node for it to one of your dataflows. To add a field for an object, add it to an existing sfdcDigest node for the object in one of your dataflows. The new object or field is added automatically to replication when you upload the updated dataflow definition file.

SEE ALSO:

- [Configure the Dataflow](#)
- [sfdcDigest Transformation](#)

Considerations When Creating or Updating Dataflows with Replication Enabled

If you have enabled replication, here are some things to keep in mind the next time you create or update one of your dataflows.

- Wave validates the dataflow definition file when you upload it. If you see errors displayed, correct them and upload the file again.
- Dataflow definition file uploads might take longer. This is because Wave is validating the file and using the sfdcDigest nodes to define replication settings.
- If you remove an object's sfdcDigest node from the definition file, replication is not disabled for that object. If necessary, disable replication for an object on the Replication tab of the data manager. See [Disable Replication for an Object](#).
- If you remove a field from an sfdcDigest node in the definition file, replication is not disabled for that field. If necessary, disable replication for the field in replication settings. See [Configure Replication Settings](#).
- If you add a field in the definition file, that field is enabled in the replication settings.
- If you unschedule the dataflow, Wave does not disable replication for the objects and fields.

Considerations When Using Wizard-Based Wave Apps with Replication

If you use wizard-based Wave Analytics apps, such as Sales or Service Wave, here are some things to consider before and after you enable replication.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To disable replication for an object:

- "Edit Wave Analytics Dataflows"

Enabling Replication When You Are Already Using Wave Apps

If you already have Wave apps when you enable replication, it's important that replication includes all the Salesforce objects and fields used in these apps. If it doesn't, the affected Wave app dataflows fail. Complete these steps to ensure all the required objects and fields are included.

1. Before you enable replication, set a recurring schedule on each of your Wave app dataflows. Wave considers objects and fields in only scheduled dataflows when you first enable replication.
2. After you enable replication, check replication settings to verify that all the required objects and fields have been included. See [Configure Replication Settings](#).
3. Run replication to ensure that all objects and fields in the Wave app dataflows have been replicated.
4. Run your Wave app dataflows to verify that they run to completion.
5. Schedule replication to run before all your dataflows, to keep your Wave app data up to date.

Creating a New Wizard-Based Wave App After Enabling Replication

When you create a wizard-based Wave app, objects and fields from the new dataflow are automatically added to replication, if they're not already included. Complete these steps after you create a Wave app.

1. Check replication settings to verify that all the required objects and fields have been included. See [Configure Replication Settings](#).
2. Run replication to ensure that all objects in the new dataflow have been replicated.
3. Run the new Wave app dataflow.
4. Schedule the new Wave app dataflow to run after replication.

Replication Limits and Limitations

Here are some things to consider when you're working with replication.

- You can enable up to 50 objects for replication. If you are currently extracting more than 50 objects in your dataflows, contact Salesforce Customer Support before you enable replication
- Replication only performs one extract per object. Keep this in mind if you need to perform multiple extracts from the same object. For example, if you need to extract both filtered and unfiltered data from an object.
- By default, replication extracts data from each object incrementally. However, changes made less than one hour before replication runs are not picked up. Keep this in mind if you have records that are frequently updated.
- Replication counts towards your limit of 24 dataflow runs per day. For example, in an organization using the Sales Wave and Service Wave apps, a user dataflow, and replication, there are four separate dataflows. If you schedule each one to run every six hours, you will reach the daily limit.
- There is a known issue where replication does not generate notification emails.

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

[Install the Wave Connector Excel App](#)

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

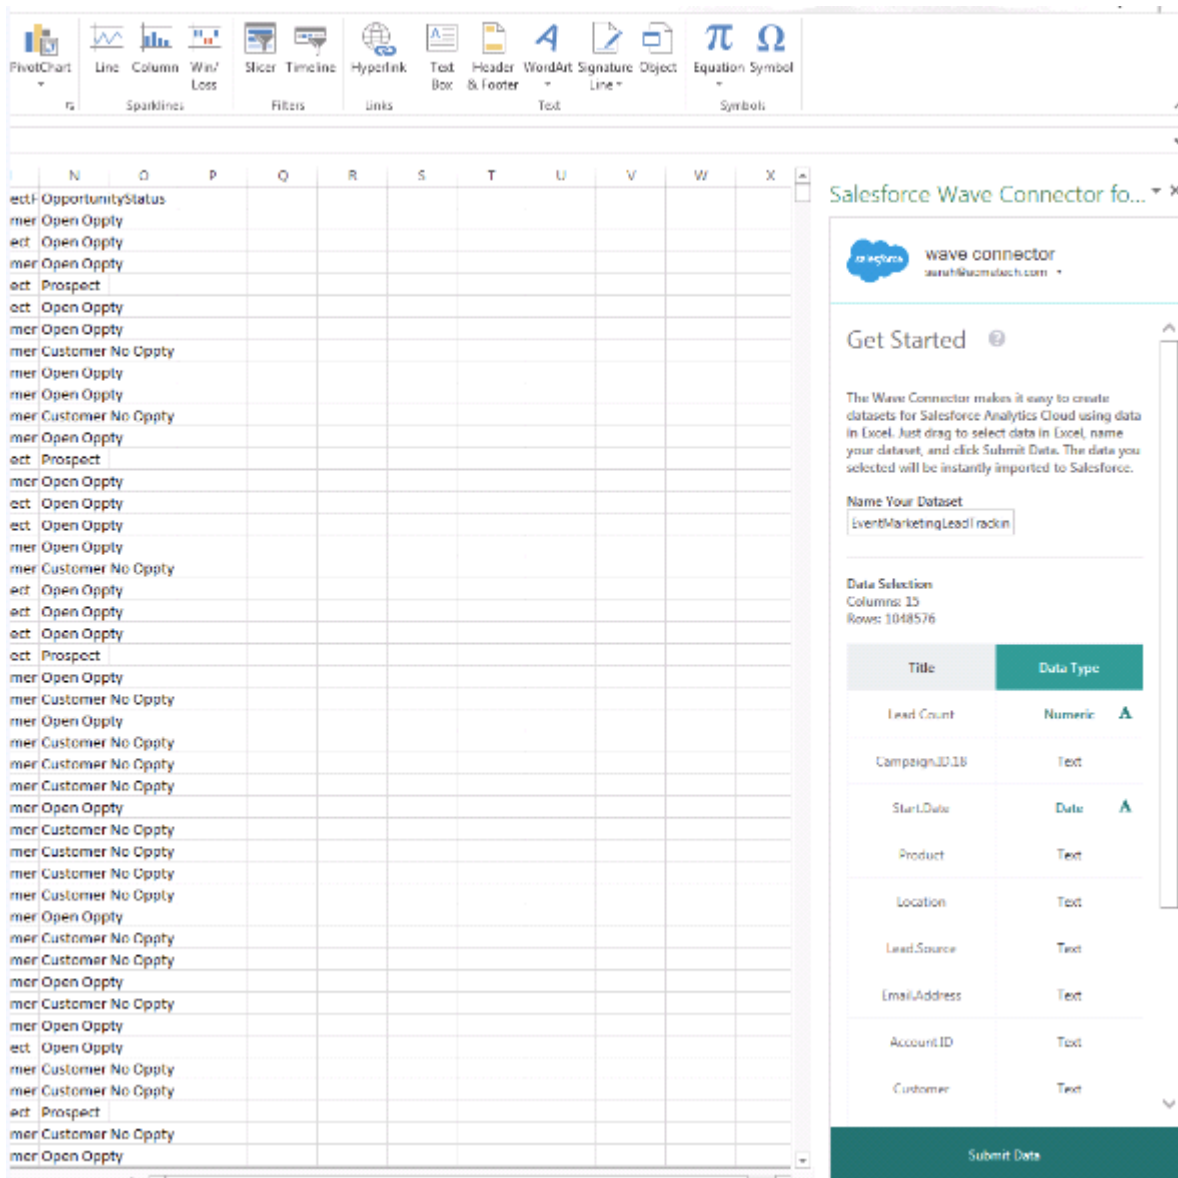

Install the Wave Connector Excel App

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

USER PERMISSIONS

To import data from Excel 2013 to Wave Analytics :

- Upload External Data to Wave Analytics

If you use Excel 2013 on the desktop or Office 365, the Office Online version of Excel, the Wave Connector gives you a great way to get your data into Salesforce Wave Analytics. After installing the Connector, you just select data from Excel, click Submit, and the Connector does the work for you, importing the data to Wave Analytics and creating a dataset.

Here's how to install the Connector:

1. Open Excel, either on your desktop or in Office Online.

2. Open the Insert tab.
3. Click Apps for Office.
4. Search for the Wave Connector, and click to install it.
5. Enter your Salesforce credentials to open the Connector.

Once you've installed the Connector, follow the instructions in the Connector window to create datasets based on Excel data. Opening the Connector automatically logs you in to Salesforce Wave Analytics. Click the Connector Help icon for complete information about using the app.

Create a Dataset with External Data

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

 **Tip:** Wave temporarily stores the uploaded CSV and metadata files for processing only. After the datasets are created, Wave purges the files. If you want to use the files again later, keep a copy.

Before uploading external data files, review the format requirements and examples of the .csv and metadata files in the [External Data Format Reference](#).

 **Note:** You can also use the the External Data API to upload external data files. Use the API to take advantage of additional features, like performing incremental extracts and performing append, delete, and upsert operations. For more information about the External Data API, see the [External Data API Developer's Guide](#).

1. On the home or app page, click **Create > Dataset**.

2. Type the name of your dataset in the Dataset Name field.
The name cannot exceed 80 characters.
3. If you want to create the dataset in a different app, change the app in the App drop-down list.
4. Click **CSV**.
5. Add the .csv file.
After you add the .csv file, Wave Analytics automatically generates and adds the corresponding metadata file.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To upload external data:

- "Upload External Data to Wave Analytics"

 **Note:** Instead of using the generated metadata file, if you want, you can upload a different metadata file that you created from scratch. If you upload your own metadata file, the **Preview Data** button is disabled.

6. Perform the following tasks to change the metadata attributes in the generated metadata file.

a. Click **Preview Data** to view and change the required metadata attributes.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

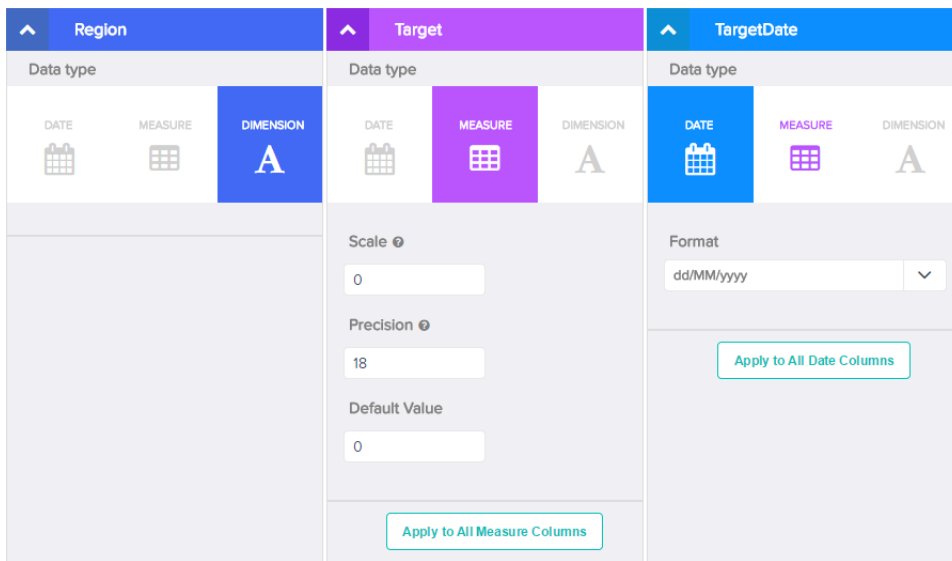

b. Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- c. Click the column header to change other attributes for the column.

You can change the attributes for measure and date columns only.

- d. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
- e. Click **Submit** to save the metadata changes to the metadata file.
-  **Note:** If there are errors, the **Submit** button is grayed out.
- f. Click **OK** to close the confirmation message.
- g. To change optional metadata attributes, click  to download the metadata file, edit the file, and then upload it.

7. Click Create Dataset.

Your data files are scheduled for upload. It might take some time to process the data upload job; you can monitor its status in the data monitor. If upload is successful, the new dataset is available from the home or app page.

- 8. Click Continue** to dismiss the confirmation message.

[Rules for Automatic Generation of a Metadata File](#)

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

[Monitor an External Data Upload](#)

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

Rules for Automatic Generation of a Metadata File

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

To enable Wave Analytics to generate the metadata file, a CSV file must meet the following requirements.

- The file type must be .csv, not .gz or .zip.
- The file must contain one row for the column header and at least one record.
- The CSV file must meet all Wave Analytics requirements as mentioned in the [External Data Format Reference](#).

Wave Analytics generates the metadata attributes for each CSV column based on the first 100 rows in the CSV file. Wave Analytics uses the following rules to convert the CSV column names to field labels.

- Replaces special characters and spaces with underscores. For example, "Stage Name" becomes "Stage_Name."
- Replaces consecutive underscores with one underscore, except when column name ends with "__c." For example, "stage*&name" becomes "stage_name."
- Prefixes the field label with "X" when the first character of the column name is numeric. For example, "30Day" becomes "X30Day."
- Replaces the field name with "Column" + column number when all characters in the column name are not alphanumeric. For example, the fourth column name "&^*(&*(%" becomes "Column4."
- Deletes underscores at the beginning and end of the field label to ensure that it doesn't start or end with an underscore.
- Increments the derived field label if the label is the same as an existing label. For example, if "X2" already exists, uses "X21," "X22," "X23."

 **Tip:** You can download the generated metadata file to change the metadata settings, and then upload it to apply the changes. You can download the metadata file when you create or edit a dataset.

Monitor an External Data Upload

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

The Jobs view (1) of the data monitor shows the status, start time, and duration of each dataflow job and external data upload job. It shows jobs for the last 7 days and keeps the logs for 30 days.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the data monitor:

- “Edit Wave Analytics Dataflows,” “Upload External Data to Wave Analytics,” or “Manage Wave Analytics”

Dataflow	Start Time	Duration	Status	Message
Default Salesf...	Today at 7:39 AM	24 seconds	Successful	
Default Salesf...	Yesterday at 7:39 AM	0 hours, 10...	Failed	Queue wait time exceeded limi
Sales_Targets...	2 Days Ago at 9:34 AM	0 hours, 1 ...	Failed	Error executing node load [roo
Node Name	Start Time	Duration	Node Type	Status
load	2 Days Ago at 9:34 AM	0 hours, 1 minute	sfdcFetch	error
digest	N/A	N/A	csvDigest	pending
optimize-register	N/A	N/A	optimizer	pending
register	N/A	N/A	sfdcRegister	pending

1. In Wave Analytics, click the gear icon () and then click **Data Manager**. The data manager opens on the Monitor tab, with the Jobs view selected by default. The Jobs view displays dataflow and upload jobs. It displays each upload job name as <dataset_name upload flow>. You can hover a job to view the entire name.

 **Note:** To view external data upload jobs in the Jobs view, **Show** in the File Uploads field (2) must be selected. It's selected by default.

- To see the latest status of a job, click the Refresh Jobs button ().
Each job can have one of the following statuses.

Status	Description
Queued	The job is in queue to start.
Running	The job is running.
Failed	The job failed.
Successful	The job completed successfully.
Warning	The job completed successfully, but some rows failed.

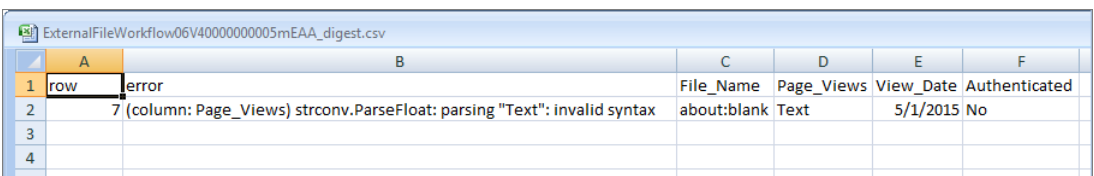

- To view the run-time details for a job, expand the job node (3).
- The run-time details display under the job. In the run-time details section, scroll to the right to view information about the rows that were processed.
- To troubleshoot a job that has failed rows, view the error message. Also, click the download button (1) in the run-time details section to download the error log.

 **Note:** Only the user who uploaded the external data file can see the download button.

The screenshot shows the Wave Analytics interface. At the top, there's a teal header with 'Wave Analytics' and 'My Private App'. Below that, a 'Jobs View' dropdown and a refresh button are visible. The main area displays a table of jobs. One job, 'Temp Upload ...', is highlighted with a yellow background and a 'Warning' status. Below the job list, there's a detailed view of the job's run-time details, including a table with columns: Status, Input Rows Processed, Input Rows Failed, Output Rows Processed, and Output Rows Failed. The 'warning' row shows 11 output rows failed. A red box highlights a download icon in the 'Output Rows Failed' column for the 'warning' row.

The error log contains a list of failed rows.

The screenshot shows a CSV file named 'ExternalFileWorkflow06V4000000005mEAA_digest.csv'. The first row is a header with columns A through F. The second row contains an error message: '7 (column: Page_Views) strconv.ParseFloat: parsing "Text": invalid syntax'. The columns are: File_Name (about:blank), Page_Views (Text), View_Date (5/1/2015), and Authenticated (No).

A	B	C	D	E	F
row	error	File_Name	Page_Views	View_Date	Authenticated
7	(column: Page_Views) strconv.ParseFloat: parsing "Text": invalid syntax	about:blank	Text	5/1/2015	No

- To troubleshoot a failed job, view the error message and the run-time details.

Edit a Dataset

USER PERMISSIONS

To view a dataset edit page:	"Use Wave Analytics" AND Editor access to the dataset's app
To update a dataset name, app, and extended metadata:	"Use Wave Analytics" AND Editor access to the dataset's app
To delete a dataset:	"Use Wave Analytics" AND Editor access to the dataset's app
To upload and preview data:	"Upload External Data to Wave Analytics" AND Editor access to the dataset's app
To edit a dataset security predicate:	"Edit Wave Analytics Dataflows"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

If you add an external data file, Wave Analytics generates and adds the corresponding metadata file. To make further changes to the metadata, you can click **Preview Data** or download and edit the generated metadata file. You can also upload your own metadata file to overwrite the generated file.

- On the home or app page, click the **Datasets** tab.
- Hover over the dataset that you want to edit, and then click **Edit**.
- Configure the following options if applicable.

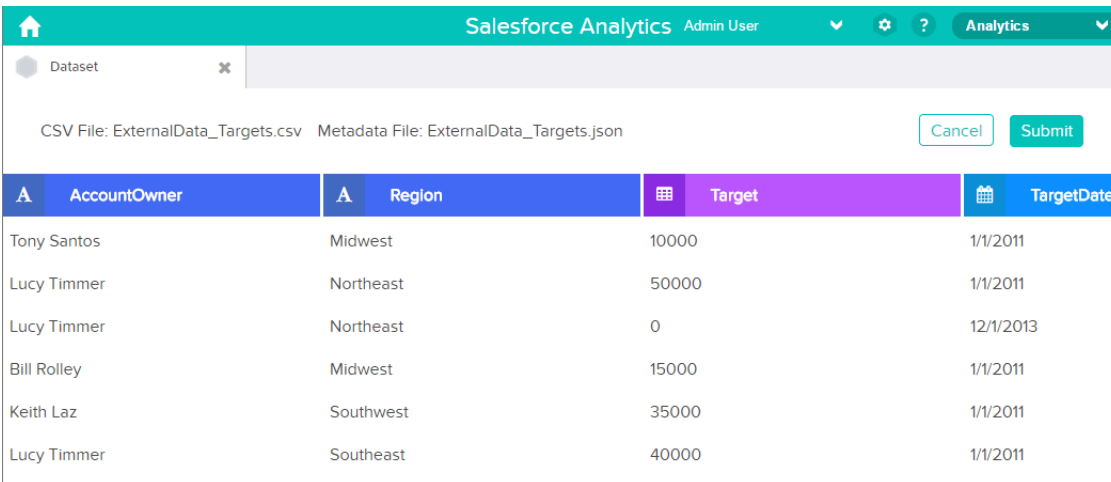

Option	Description
Dataset Name	Enter a new name if you'd like to change the name of the dataset. The name cannot exceed 80 characters.
App	Select a new app if you'd like to move the dataset to a different app.
Add Extended Metadata File (JSON)	Specify an extended metadata file if you'd like to customize the formatting of dashboards associated with the dataset. Refer to <i>Extended Metadata (XMD) Reference</i> for information about extended metadata files.
Add External Data File (CSV)	Specify an external data file if you'd like to replace the existing data in the dataset with data from the external data file. Maximum file size is 500 MB. You can upload a .CSV, .GZ, or .ZIP file.

Option	Description
	Refer to <i>External Data Format Reference</i> for information about external data files and metadata files.
Add Metadata File (JSON)	Specify a metadata file if you'd like to redefine the structure of the external data file. If you upload a new metadata file, you must also upload the corresponding external data file. Refer to <i>External Data Format Reference</i> for information about metadata files.
Security Predicate	Add a security predicate if you'd like to apply row-level security on the dataset. For information about predicates, see Row-Level Security for Datasets .

- If you uploaded a new .csv file, click **Preview Data** to view and change the required metadata attributes. You can change the optional metadata later.

 **Note:** The **Preview Data** button is disabled if you uploaded your own metadata file.

After you click **Preview Data**, the preview page appears.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

- For each column:
 - Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- b. Click the column header to change other required attributes for the column.

You can change the attributes for measure and date columns only.

- c. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
- 6. Click **Submit** to save the metadata changes in the preview page to the metadata file.
 - Note:** The **Submit** button is grayed out if there are errors.
- 7. Click **OK** to close the confirmation message.
- 8. To change optional metadata attributes—which are not visible in the preview page—click to download the metadata file, edit the file, and then upload it.
- 9. Click **Update Dataset**.
- 10. Click **Continue** to dismiss the confirmation message.

Update a Dataset's Extended Metadata

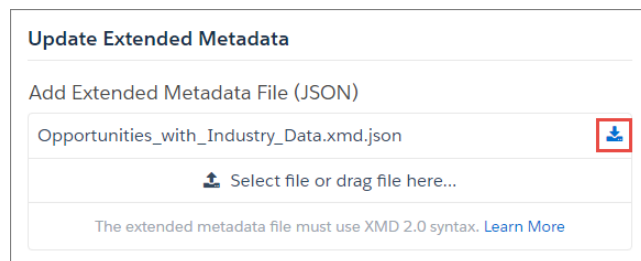

A dataset's extended metadata (XMD) file allows you to customize the formatting of dashboards associated with the dataset. You can update the XMD file through the dataset's edit page.

Update a Dataset's Extended Metadata

A dataset's extended metadata (XMD) file allows you to customize the formatting of dashboards associated with the dataset. You can update the XMD file through the dataset's edit page.

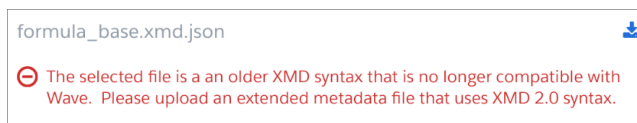

Important: An XMD file must use XMD 2.0 syntax and be no greater than 5 MB. Refer to *Extended Metadata (XMD) Reference* for information about extended metadata files and XMD 2.0 syntax.

1. On the Wave Analytics page, click the **Datasets** tab.
2. Hover over the dataset that you want to update, click , and then click **Edit**. The dataset edit page opens.
3. Under Add Extended Metadata File (JSON), click the Download button to download the current XMD file. Save this to use as a backup.

4. Under Add External Metadata File (JSON), click **Select file or drag file here...** to upload the new XMD file.
5. Click **Update Dataset**.
If the XMD file is not valid, you see an error message. Correct the syntax of the file and upload it again.

Note: If the XMD file displays an error message when you open the dataset edit page, the current file is not valid.

Perform step 2 to download the file, then convert it to XMD 2.0. Then perform steps 4–5 to reupload the converted file and update the dataset.

Refer to *Extended Metadata (XMD) Reference* for information about converting extended metadata files to XMD 2.0 syntax.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To update a dataset's extended metadata:

- "Use Wave Analytics" AND Editor access to the dataset's app

Delete a Dataset

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org's limit for rows across registered datasets.

When you delete a dataset, Wave Analytics permanently deletes the dataset and doesn't delete the corresponding lenses or dashboards that reference the dataset. Lenses and dashboards that reference a deleted dataset will no longer be available. As a result, Salesforce.com recommends that you remove the associated lenses and dashboards before you delete a dataset.

If a dataflow transformation —like edgemart or sfdcRegister— references the dataset, you must remove the reference before you can delete the dataset. For example, to delete the "Opportunities" dataset, you must remove the sfdcRegister transformation from the dataflow snippet shown below.

```
{
  ...
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  },
  ...}
```

 **Warning:** You can't recover a deleted dataset.

1. On the home or app page, click the **Datasets** tab.
2. Hover over the dataset that you want to delete, and then click **Edit**.
3. Click **Delete Dataset**.
If applicable, Wave Analytics shows a list of all lenses and dashboards that reference the dataset and that you have access to view. After you delete the dataset, any lens or dashboard that reference the dataset will become unusable.
4. Click **Delete Permanently** and confirm.

Prepare Datasets with Recipes

A dataset recipe is a user-interface tool that lets you take data from your existing datasets and replications, prepare it, and output the results to a new dataset. Use a recipe to combine data from multiple datasets or replications, bucket the data, add formula fields, and cleanse the data by transforming field values. You can remove fields and filter rows that you don't need, before you create the target dataset.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To delete a dataset:

- "Use Wave Analytics" AND Editor access to the dataset's app

A dataset recipe is simply a saved set of transformations, or steps, that you want to perform on a specific source dataset or replication. When you run a recipe, it applies the transformations and outputs the results to a new target dataset. You can schedule a recipe to run on a recurring basis to keep your target dataset up to date.

Use a recipe to combine data from different sources, and modify field values to ensure consistency in the new dataset you create. This new dataset can then be used as a standalone dataset for exploration or dashboard creation, or used in your dataflows or other recipes.

Here's what you can do with your source data in a recipe:

- Add fields from another dataset or replication.
- Remove fields.
- Filter rows.
- Add bucket fields.
- Add formula fields.
- Transform field values.

[Create a Dataset Recipe](#)

Use a recipe to combine data from multiple datasets or replications, add bucket and formula fields, filter rows, and transform field values. You can then output the results to a new target dataset.

[Manage and Monitor Dataset Recipes](#)

View the status of your recipes and target datasets on the Prepare tab of the data manager. You can open recipes to update or run them, or delete them.

Create a Dataset Recipe

Use a recipe to combine data from multiple datasets or replications, add bucket and formula fields, filter rows, and transform field values. You can then output the results to a new target dataset.

 **Tip:** Before you get started, it's a good idea to think about the requirements for the target dataset you want to create. Consider these questions:

- Does the data you want to work with exist in a dataset or as a replicated object?
- If you are combining data, how is the data related?
- What fields do you want in the target dataset?
- Do you need to transform any field values?
- In what app are you going to create the target dataset?
- Do you need to control access to the data in the target dataset?

When you're ready, follow these steps to create a dataset recipe.

[Start a Dataset Recipe](#)

To start a dataset recipe, perform the following steps.

[Set Preview Data in a Dataset Recipe](#)

A dataset recipe displays a preview of your data as you work. You can set the fields and number of rows that appear in this preview. If you are working with a large set of data, reducing the size of the preview speeds up the data refresh as you add steps to your recipe.

[Add Data in a Dataset Recipe](#)

Combine data in a recipe by adding fields from other datasets or replications.

[Add a Filter in a Dataset Recipe](#)

Filter data in a dataset recipe to remove rows that you don't need in your target dataset.

[Bucket a Measure Field in a Dataset Recipe](#)

Add a field to a dataset recipe to bucket values in a specified measure field.

[Bucket a Dimension Field in a Dataset Recipe](#)

Add a field to a dataset recipe to bucket values in a specified dimension field.

[Add a Formula Field in a Dataset Recipe](#)

Add a formula field to calculate new values from measures in your recipe, using arithmetic operators and math functions.

[Transform Fields in a Dataset Recipe](#)

Data is not always consistent, especially when you combine data from different sources. In a dataset recipe, you can transform fields to ensure that values are consistent in your target dataset. Change case, split or truncate values to get just the parts you need, and replace incorrect values.

[Navigate Fields in a Dataset Recipe](#)

As you add data and transform fields, the number of fields in your recipe preview increases. This makes it harder to find the fields that you want to work with. Use the field navigator to quickly find the fields that you need, and hide the ones you don't. The navigator also shows you the attributes of a field, such as its API name, and field type.

[Navigate and Edit Recipe Steps](#)

As you prepare your data, each change you make appears as a recipe step on the left. Think of these steps as your recipe history. You can move back and forward through this history to see how the data looks at different stages of the recipe. If you don't like what you see, you can edit or remove any step.

[Save a Dataset Recipe](#)

If you're not ready to create the target dataset, save the recipe and come back to it later. Saving simply saves your steps without you having to create the dataset.

[Run a Dataset Recipe](#)

Run a new recipe to create a target dataset, or run an existing recipe to update a target dataset.

Start a Dataset Recipe

To start a dataset recipe, perform the following steps.

1. In Wave Analytics, click the gear icon (⚙️) and then click **Data Manager** to open the data manager.
The data manager opens in a new browser tab.
2. In the data manager, click the Prepare tab.
The Prepare tab displays a list of your existing recipes.
3. Click **Create Recipe**.
4. From the list of datasets, click the one that contains the data you want to prepare. Alternatively, if you have enabled replication, you can click the Replications tab to select a replication instead.

 **Note:** Make sure the replication you select has run and completed at least once.

You are prompted to enter a name for the recipe.

5. Enter a recipe name and then click **Continue**.

 **Note:** The recipe name you enter here is also used for the target dataset name.

The dataset recipe page opens, displaying a preview of the data from your selected dataset or replication.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

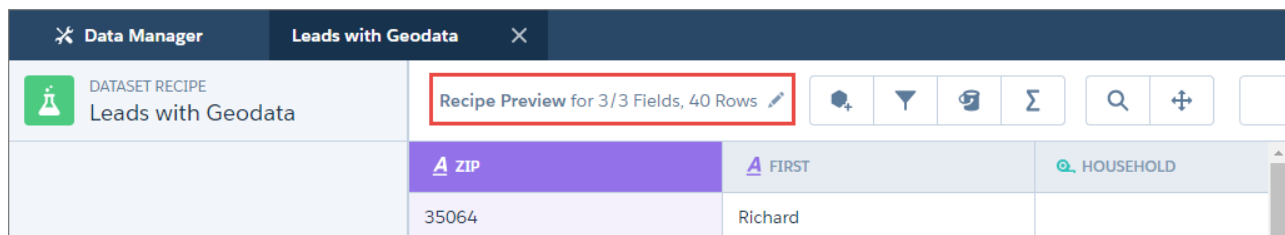

To create a recipe:

- "Edit Wave Analytics Dataflows"

Set Preview Data in a Dataset Recipe

A dataset recipe displays a preview of your data as you work. You can set the fields and number of rows that appear in this preview. If you are working with a large set of data, reducing the size of the preview speeds up the data refresh as you add steps to your recipe.

As you work in a dataset recipe, the size of your preview is always visible at the top of the page.

Data Manager		Leads with Geodata	
DATASET RECIPE Leads with Geodata		Recipe Preview for 3/3 Fields, 40 Rows	
ZIP	FIRST	HOUSEHOLD

- Selecting a smaller amount of data will allow you load and navigate the data at a faster speed.
- Selecting a smaller amount of data will allow you load and navigate the data at a faster speed.

3 out of 3 Fields

1

3 ZIP FIRST HOUSEHOLD

2

4 First rows in sort

Here's what you can do to set your recipe preview data:

1. Can't see a field in the list? Start typing the field name here to narrow down the list.
2. Not sure if you need a field in your preview? Click a field in the list to see a preview of its values here.
3. Don't need a field in your preview? Uncheck it here to remove it.
4. Want fewer rows in your preview? Choose to see the first 1000, 5000, or 10000 rows and select a field to sort them by.

Click **Apply** when you're done, to return to the recipe.

-  **Note:** The recipe preview can display up to 100 fields. If you remove a field from the preview, by default it's not included in the target dataset. However, you can reselect any field when you create the dataset.

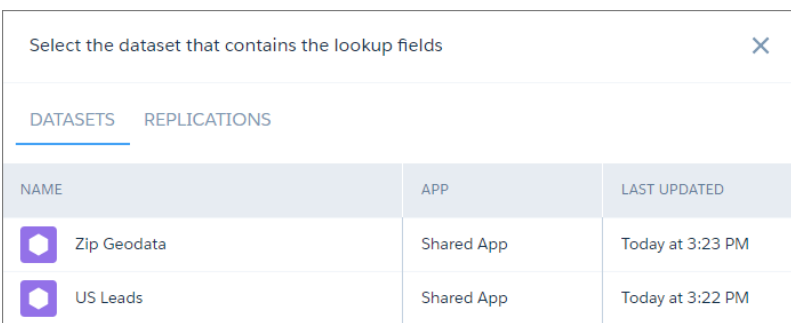

Add Data in a Dataset Recipe

Combine data in a recipe by adding fields from other datasets or replications.

When you add data to a recipe, you select the lookup dataset or replicated object that contains the fields you want to add. You also select the merge key fields to match the records in the existing and new data. For example, to add User fields to Opportunity records, use the User Id and Opportunity Owner Id fields as your merge keys.

Let's look at another example here, to illustrate how you add data. Imagine you have started a recipe from a US Leads dataset, and you want to add demographic data based on zip code from another dataset. You can use the Zip Code field from each dataset as the merge keys.

1. On the dataset recipe page, click the Add Data button ().
2. Select either the Datasets or Replication tab, and click the dataset or object you want to add.

3. Click a column header to select it as the merge key field in the origin dataset, and do the same in the lookup dataset.

Then click **Continue**.

 **Important:** Wave datasets contain date and time component fields, such as Year, Quarter, and Month, that are derived automatically from existing date and time fields. Use of these component fields as merge keys is not supported.

4. Click the column header or column checkbox to select each field that you want to add.

Then click **Continue**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

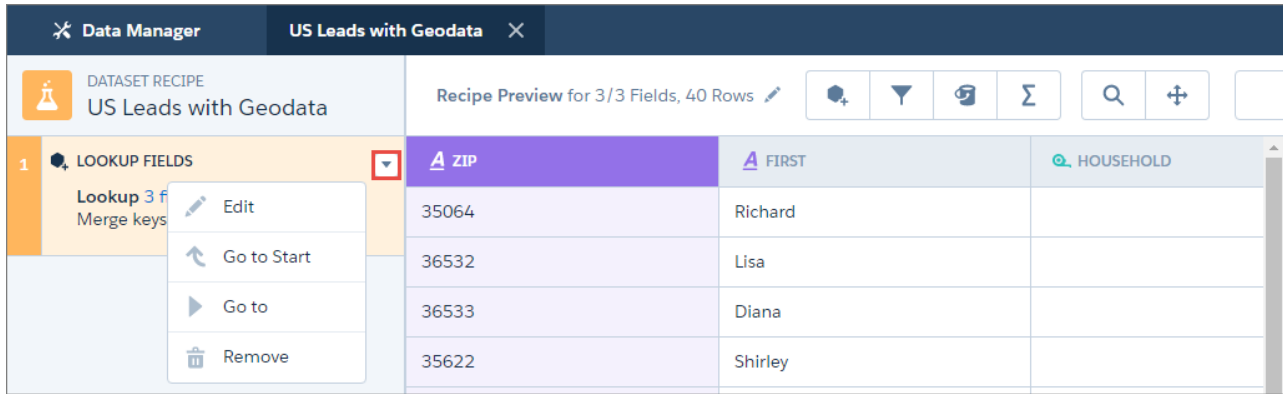

USER PERMISSIONS

To create a recipe:

- "Edit Wave Analytics Dataflows"

 **Note:** The lookup dataset preview can display up to 100 fields. Modify the preview or hide fields to ensure that you can see just the fields that you need. When you create the dataset, you can select all the lookup fields you want for the new dataset.

Each time you add data, a new step is created in your recipe, and the added fields appear in your recipe preview. Hover over a step and click  to access edit and remove options.

Add a Filter in a Dataset Recipe

Filter data in a dataset recipe to remove rows that you don't need in your target dataset.

To add a filter to a dataset recipe, follow these steps.

1. On the dataset recipe page, click the Filter Data button (). The Filter Data Rows dialog appears.

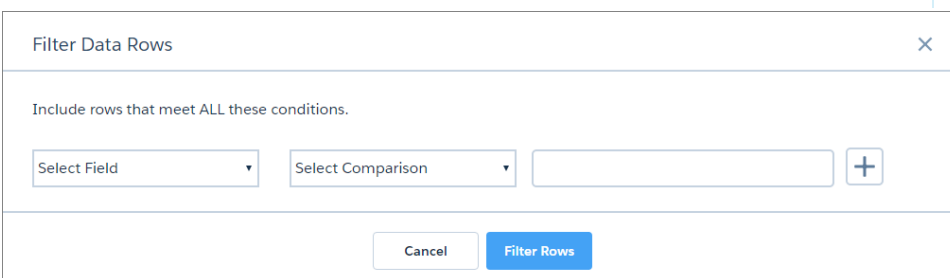

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

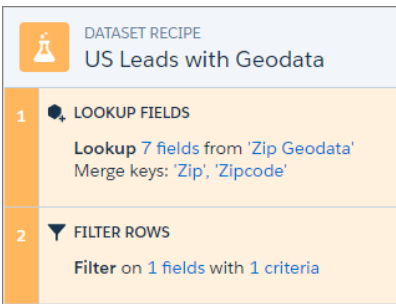

- To create a recipe:
- "Edit Wave Analytics Dataflows"

- From the **Select Field** list, select the field to filter by. You can select from any field in the recipe, even if it has been hidden.
- From the **Select Comparison** list, select the operator.
- In the third field, enter the filter value. Then click **Continue**.

 **Note:** Filters in dataset recipes are case-sensitive.

- To enter another condition, click  and repeat steps 2–4.
- When you have added all your conditions, click **Filter Rows**. The filter appears as a step in the left pane of the recipe.

 **Note:** Filters in dataset recipes only filter rows that meet all conditions.

Bucket a Measure Field in a Dataset Recipe

Add a field to a dataset recipe to bucket values in a specified measure field.

A bucket field lets you create new values based on existing values in another field. For example, use a bucket field to categorize households as small, medium, or large, based on the number of people in the household.

No. of People in Household	Size Category
1–2	Small
3–5	Medium
6 or more	Large

- Select the field to bucket by either clicking its column header in the recipe preview, or clicking it in the field navigator.
- Click the Add Bucket button (). The bucket dialog appears with two ranges.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To create a recipe:
- “Edit Wave Analytics Dataflows”

- For Range1, enter a value and name for the first bucket. Rows with values below the Range1 value are assigned this bucket name. In this example, rows with values less than 3 are assigned a value of *Small* in the new bucket field.

The Range2 value populates with the value you enter for Range1.

- If your bucket field has more than two buckets, click **Add>>** to add another range.
- For each additional range you add, enter the range of values and the bucket name. Rows with values greater than or equal to the first value, and less than the second value are assigned the bucket name. In this example, rows with values 3, 4, or 5 are assigned a value of *Medium* in the new bucket field.

- Repeat steps 4–5 to add any additional buckets that you need.
- For the final range, enter a value and bucket name. Rows with values greater than or equal to this value are assigned this bucket name. In this example, rows with values greater than or equal to 6 are assigned a value of *Large* in the new bucket field.

- When you have completed all the ranges, click **Create Bucketed field**. The new bucket field appears next to the source field in the recipe preview.

DATASET RECIPE US Leads with Geodata		Recipe Preview for 3/3 Fields, 40 Rows	
1	LOOKUP FIELDS Lookup 7 fields from 'Zip Geodata' Merge keys: 'Zip', 'Zipcode'	HOUSEHOLD	HOUSEHOLD RANGEBUCKET
			5 Medium
			2 Small
			4 Medium
			3 Medium
2	FILTER ROWS Filter on 1 fields with 1 criteria		5 Medium
3	BUCKETED FIELD Bucket numbers into 3 ranges		

 **Tip:** You can use a bucket field to filter rows in a recipe.

Bucket a Dimension Field in a Dataset Recipe

Add a field to a dataset recipe to bucket values in a specified dimension field.

A bucket field lets you create new values based on existing values in another field. For example, use a bucket field to categorize products in support cases according to their type.

Product	Product Category
HVAC Ctrl, HeatWave, Home A/C	HVAC
Humidity Ctrl, Humidity Unit, Home Humidity	Humidity
Compressor, Condenser, Thermostat	Parts

1. Select the dimension field to bucket by either clicking its column header in the recipe preview, or clicking it in the field navigator.
2. Click the Add Bucket button (). The bucket dialog appears.

Enter values to map to each bucket for your bucket field ✕

Bucket for Product	Values for Bucket1
1 <input type="text" value="Bucket1"/> <input type="button" value="+"/>	After you entered a value, press "Tab" to add another <div style="border: 1px solid #ccc; height: 100px; width: 100%;"></div>
<input type="checkbox"/> Map remaining values to <input type="text"/>	
<input type="button" value="Cancel"/> <input type="button" value="Create Bucketed Field"/>	

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To create a recipe:
- "Edit Wave Analytics Dataflows"

3. In the Bucket1 field, enter a name for the first bucket.
4. In the **Values for...** box, enter the values to be assigned to this bucket. Press Tab after each value to enter the next. In this example, rows containing *HVAC Ctrl*, *HeatWave*, or *Home A/C* product values are assigned a value of *HVAC* in the new bucket field.

Bucket for Product		Values for HVAC
1	HVAC +	After you entered a value, press "Tab" to add another HVAC Ctrl × HeatWave × Home A/C ×

5. To add more buckets, click  and repeat steps 3–4.
6. To bucket remaining values that you have not bucketed, select **Map remaining values to** and enter a bucket for these values. If you don't select this option, rows with unbucketed values keep the same value in the new bucket field.
7. When you have completed all the buckets, click **Create Bucketed field**. The new bucket field appears next to the source field in the recipe preview.

DATASET RECIPE Support Cases		Recipe Preview for 9/9 Fields, 2500 Rows	
1	 BUCKETED FIELD Bucket values into 3 categories	PRODUCT	PRODUCT TEXTBUCKET
		HeatWave	HVAC
		Humidity Ctrl	Humidity
		Compressor	Parts

 **Tip:** You can use a bucket field to filter rows in a recipe.

 **Note:** You can't bucket a date field.

Add a Formula Field in a Dataset Recipe

Add a formula field to calculate new values from measures in your recipe, using arithmetic operators and math functions.

A formula field lets you calculate new values based on existing values in measure fields. To help you, a formula builder suggests fields and functions as you type.

1. Click the Add a Formula Field button ().
The formula field dialog appears.

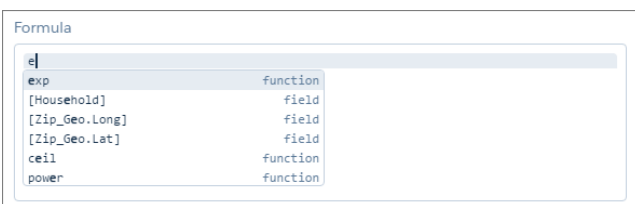

Define the formula for your new Formula Field ✕

Formula Field Name

Formula

[Help on writing a formula](#)

2. In the **Formula Field Name** field, enter a name.
3. In the **Formula** box, start typing the formula.
As you type, the builder suggests matching math functions and measure fields.

Formula

e|

exp	function
[Household]	field
[Zip_Geo.Long]	field
[Zip_Geo.Lat]	field
ceil	function
power	function

4. To select a suggestion, either click it, or use your cursor up and down keys to select it and then press Enter or Tab.
5. Use your keyboard to enter parentheses, arithmetic operators, and numbers as needed.
6. When you have completed the formula, click **Create Formula Field**.
The new formula field appears in the recipe preview.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To create a recipe:

- "Edit Wave Analytics Dataflows"

DATASET RECIPE US Leads with Geodata		Recipe Preview for 3/3 Fields, 40 Rows	
1	LOOKUP FIELDS Lookup 7 fields from 'Zip Geodata' Merge keys: 'Zip', 'Zipcode'	Q, % OF US HOUSEHOLD AVG	52
2	FILTER ROWS Filter on 1 fields with 1 criteria		129
3	BUCKETED FIELD Bucket numbers into 3 ranges		65
4	COMPUTED FIELD round(2.58/[Household]*100,0)		86
			52
			65
			65

 **Tip:** You can bucket a formula field or reference it in other formulas in the recipe.

You can use the following math functions in a formula field. The arguments in each function can be either literal values or measure fields.

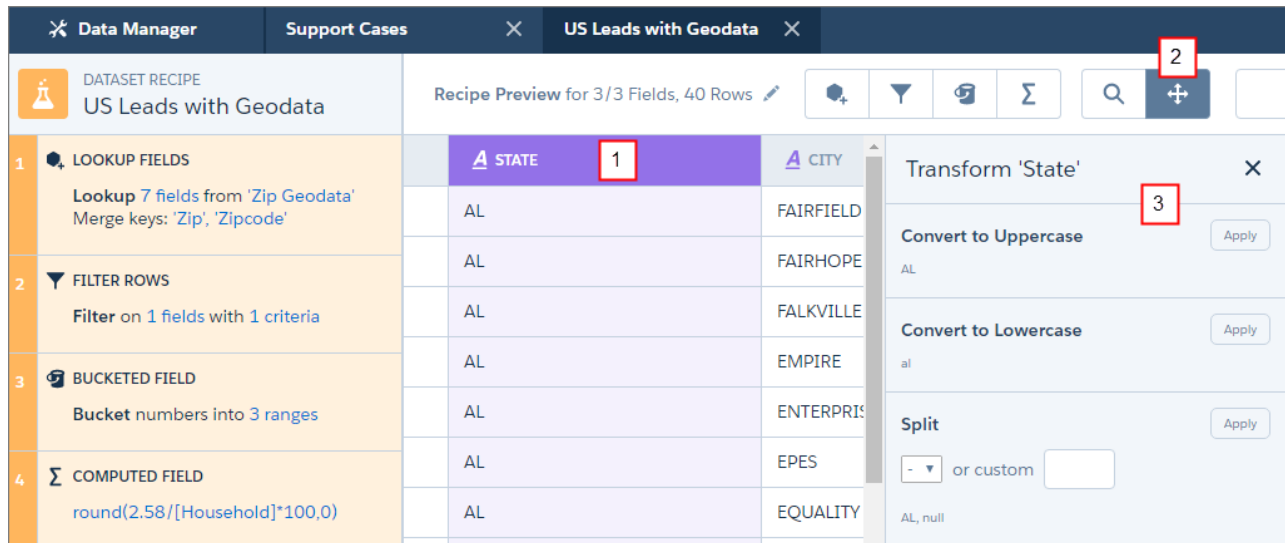

Function	Description	Format
abs	Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.	<i>abs (number)</i>
ceil	Rounds a number up to the nearest integer.	<i>ceil (number)</i>
exp	Returns a value for e raised to the power of a number you specify.	<i>exp (number)</i>
floor	Returns a number rounded down to the nearest integer.	<i>floor (number)</i>
log	Returns the base 10 logarithm of a number.	<i>log (number)</i>
power	Raises a number to a power of a specified number.	<i>power (number, power)</i>
round	Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.	<i>round (number, number of digits)</i>
sqrt	Returns the positive square root of a given number.	<i>sqrt (number)</i>
trunc	Truncates a number to an integer.	<i>trunc (number)</i>

Transform Fields in a Dataset Recipe

Data is not always consistent, especially when you combine data from different sources. In a dataset recipe, you can transform fields to ensure that values are consistent in your target dataset. Change case, split or truncate values to get just the parts you need, and replace incorrect values.

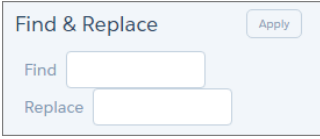

When you transform a field, a new field is added with the new values to the right of the original field. You can choose to keep or remove the original field.

To transform a field, click the field header (1), and then click the Transform Suggestions button (2). Your transform options appear in the side panel (3). Click **Apply** to apply a transform. When you're finished, click another field header to move on to another field.

These are the field transforms you can apply.

Transform	Description	Example
	Convert values in selected field to uppercase.	Correct US state values. <i>ca</i> becomes <i>CA</i> .
	Convert values in selected field to lowercase.	Correct lead email addresses captured at a trade show. <i>JSMITH@FORRESTER.COM</i> becomes <i>jsmith@forrester.com</i> .
	Divide values into multiple parts at the delimiter and create a new field for each part.	Divide phone numbers into area code and number. Select the - delimiter to split <i>925-900 2123</i> into two new values <i>925</i> and <i>900 2123</i> .
	Starting at the character Position in a value, extract the number of characters in Length into a new field.	Extract the month from date values. Enter a Position of <i>4</i> and a Length of <i>2</i> to extract the month value <i>10</i> from the month value <i>2016-10-23</i> .

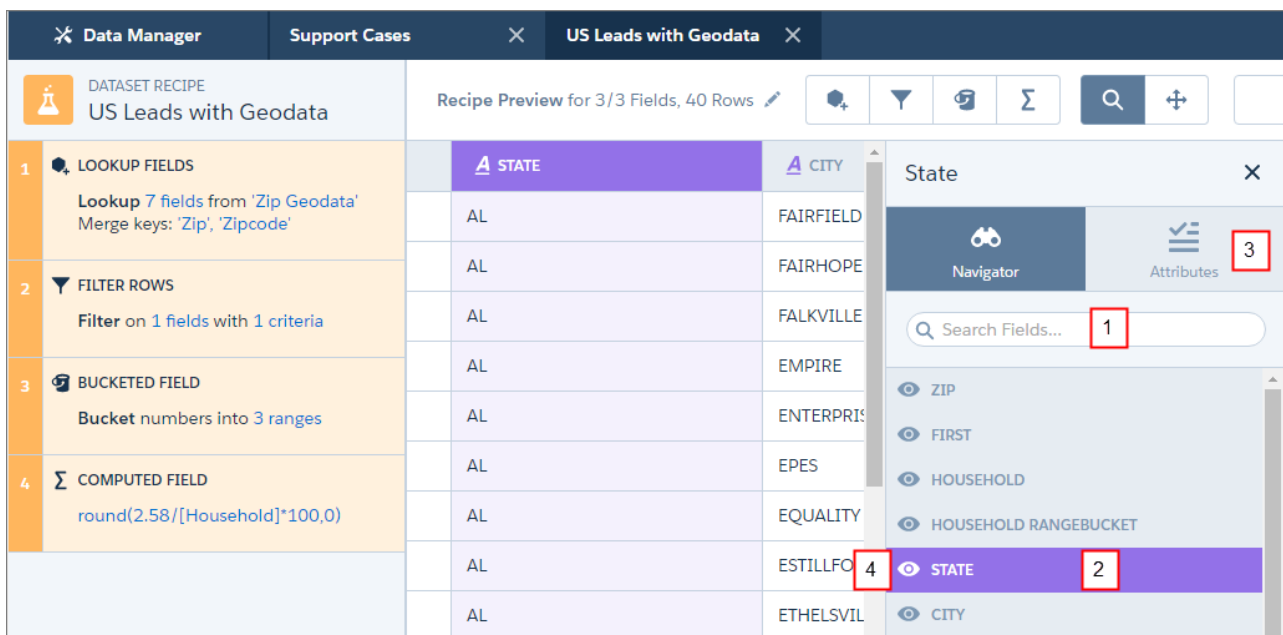

Transform	Description	Example
	Find a specific value in a field and replace it with a new value. A new field is created containing both replaced and unchanged values.	Make country values consistent. Find all instances of <i>US</i> and Replace them with <i>USA</i> .

Important: Wave datasets contain date and time component fields, such as Year, Quarter, and Month, that are derived automatically from existing date and time fields. Transformations on these component fields are not supported.

Navigate Fields in a Dataset Recipe

As you add data and transform fields, the number of fields in your recipe preview increases. This makes it harder to find the fields that you want to work with. Use the field navigator to quickly find the fields that you need, and hide the ones you don't. The navigator also shows you the attributes of a field, such as its API name, and field type.

To open the field navigator in a recipe, click the Navigate Fields button ().

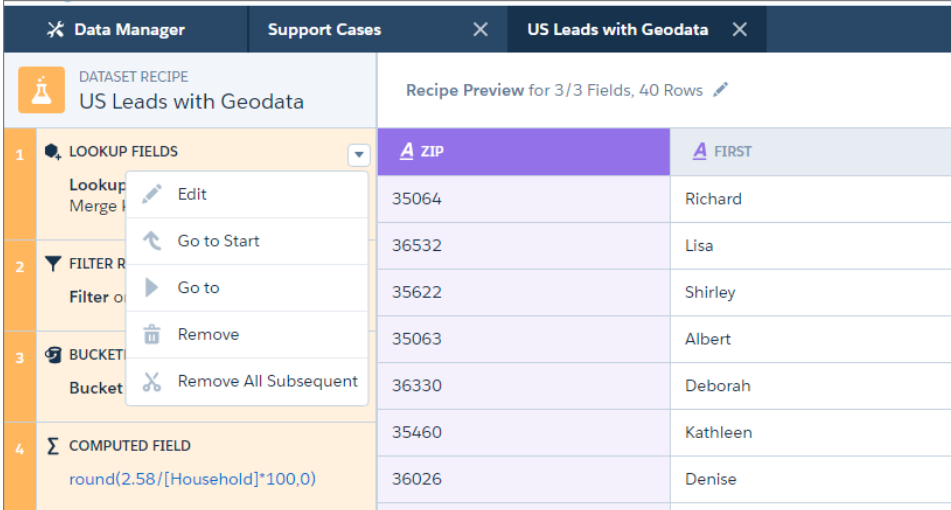

To quickly find a field, start typing its name in the Search Fields box (1) to narrow down the list of fields. When you see the field that you want, click it (2) to see it highlighted in the recipe preview. To learn more about the field's metadata, click **Attributes** (3). If you decide you don't need to see the field, click the eye (4) to hide it. Click the eye again to show a field. You can also hide a field by hovering over its header in the preview, and clicking the eye.

Note: If you hide a field in the navigator, by default it is not included when the recipe runs. However, you can choose to include the field when you run the recipe.

Navigate and Edit Recipe Steps

As you prepare your data, each change you make appears as a recipe step on the left. Think of these steps as your recipe history. You can move back and forward through this history to see how the data looks at different stages of the recipe. If you don't like what you see, you can edit or remove any step.

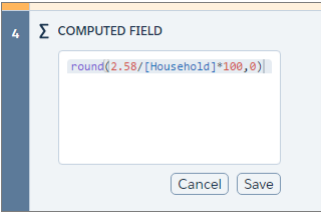

To access recipe step actions, hover over the step and click .

Step	Field 1	Field 2
1	ZIP	FIRST
	35064	Richard
	36532	Lisa
	35622	Shirley
	35063	Albert
	36330	Deborah
	35460	Kathleen
	36026	Denise

 **Note:** The actions available for each step depend on the step's position.

Here's what the actions do.

Action	Description
Edit	<p>Edit the current step. You can edit formula fields and field transformations inline.</p>  <p> Tip: You can also edit a step by clicking any of the blue values.</p>
Go to Start	Display the preview data as it was at the start of the recipe, before you added any steps. This action is only available for the first step.
Go to	Display the preview data as it was at the current step, before you added any subsequent steps.
Remove	Remove the current step.

Action	Description
Remove all Subsequent	Remove all steps after the current step.

 **Note:** Removing a step may cause subsequent steps to stop working. For example, if you remove a formula field step that is used in a later formula field, Wave can't calculate the second formula. When this happens, the affected step appears in red, with an explanation of the error, alerting you to the need to edit the step.

Save a Dataset Recipe

If you're not ready to create the target dataset, save the recipe and come back to it later. Saving simply saves your steps without you having to create the dataset.

To save a recipe, click **Save**.

You have two options when saving a recipe.

Save Recipe

Save the recipe with the name you provided when you started. The recipe does not run. Use this option to save your progress.

Save As New...

Save a copy of your recipe with the same name you provided when you started. The copy opens in a new tab in the data manager. Use this option to try out different transformations in a recipe, without changing your original recipe.

 **Important:** A recipe you create with the **Save As New** option has the same recipe name and target dataset name as the original recipe. We recommend that you run either the original recipe or the new recipe, but not both, to avoid creating target datasets with the same name.

Open a saved recipe on the Prepare tab of the data manager to update it or run it. See [Manage and Monitor Dataset Recipes](#).

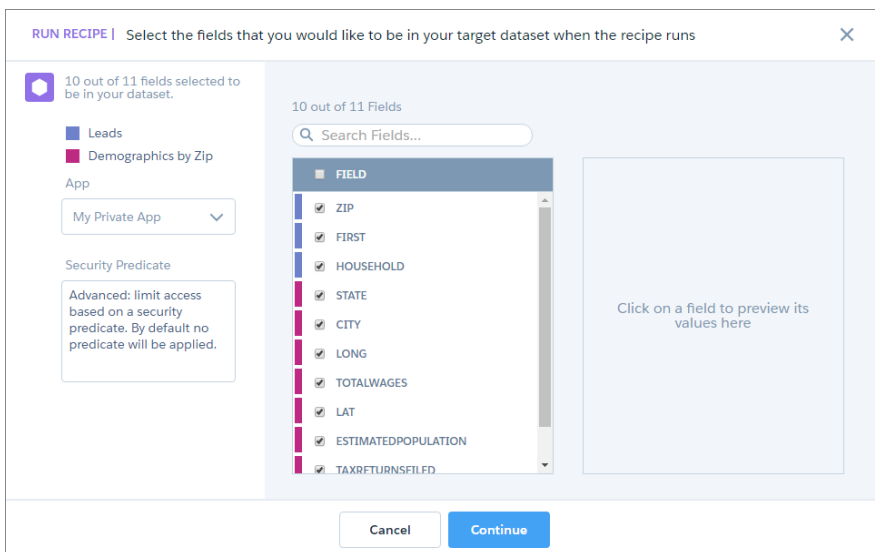

Run a Dataset Recipe

Run a new recipe to create a target dataset, or run an existing recipe to update a target dataset.

When you run a recipe, you select an app for the target dataset, enter a security predicate if necessary, and select the fields to include in your target dataset. You can run a recipe once only, or set it to run on a schedule.

 **Note:** A recipe run counts toward your limit of 24 dataflow runs per day. For example, in an org using the Sales Wave app, a user dataflow, and two recipes, there are four separate dataflows. If you schedule each one to run every six hours, you reach the daily limit. Consider this limit when you run or schedule a recipe.

1. On the dataset recipe page, click **Create Dataset**.
The Run Recipe dialog appears.

2. From the **App** picklist, select where you want to create the target dataset.
3. If required, enter a security predicate for the target dataset. See [Row-Level Security for Datasets](#).
4. In the list of fields, make sure the fields that you require are selected.

 **Note:** By default, fields that you have removed or hidden in the recipe preview are not selected. Make sure that you review these fields.

5. Click **Continue**.
The schedule dialog appears.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To create a recipe:

- “Edit Wave Analytics Dataflows”

Your recipe will be queued to run immediately. Select whether you also want it to run on a schedule.

Run on a schedule
 Every hours; offset

Run once only

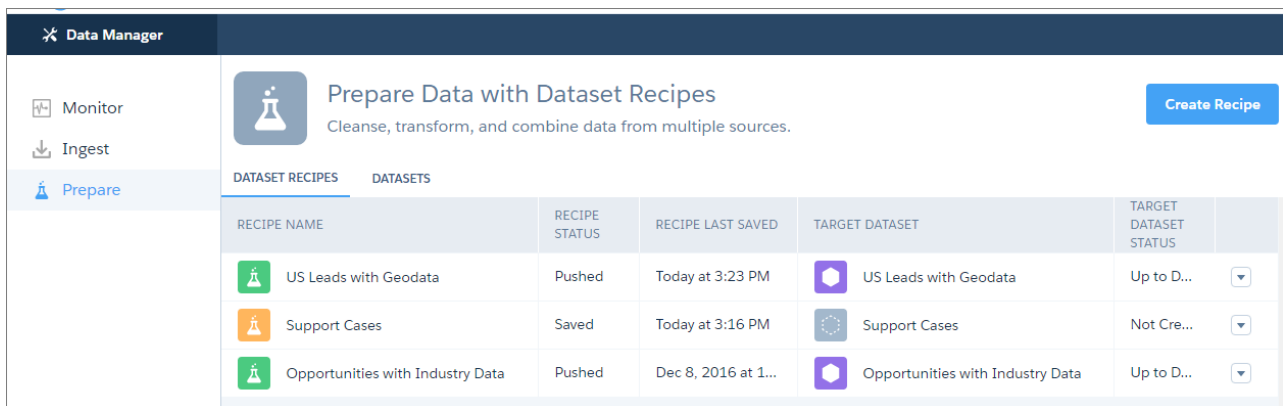

6. Either select to run on a schedule and enter a frequency, or select to run once only.
7. Click **Run Dataset Recipe**.
Your recipe is queued to run.

Manage and Monitor Dataset Recipes

View the status of your recipes and target datasets on the Prepare tab of the data manager. You can open recipes to update or run them, or delete them.

To open the data manager in Wave Analytics, click the gear icon () and then click **Data Manager**.

The Prepare tab in the data manager displays your recipes and their associated target datasets.

Data Manager

Row-Level Security for Datasets

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn't be accessible by everyone.

To implement row-level security, define a predicate for each dataset on which you want to restrict access to records. A *predicate* is a filter condition that defines row-level access to records in a dataset.

When a user submits a query against a dataset that has a predicate, Wave Analytics checks the predicate to determine which records the user has access to. If the user doesn't have access to a record, Wave Analytics does not return that record.

The predicate is flexible and can model different types of security policies. For example, you can create predicates based on:

- Record ownership. Enables each user to view only records that they own.
- Management visibility. Enables each user to view records owned or shared by their subordinates based on a role hierarchy.
- Team or account collaboration. Enables all members of a team, like an opportunity team, to view records shared with the team.
- Combination of different security requirements. For example, you might need to define a predicate based on the Salesforce role hierarchy, teams, and record ownership.

The type of security policy you implement depends on how you want to restrict access to records in the dataset.

 **Warning:** If row-level security isn't applied to a dataset, any user that has access to the dataset can view all records in the dataset.

Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

Row-Level Security Example based on Record Ownership

Let's look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

Row-Level Security Example based on Opportunity Teams

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

Row-Level Security Example based on Role Hierarchy and Record Ownership

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

You can create a predicate expression based on information in the dataset. For example, to enable each user to view only dataset records that they own, you can create a predicate based on a dataset column that contains the owner for each record. If needed, you can load additional data into a dataset required by the predicate.

The location where you define the predicate varies.

- To apply a predicate on a dataset created from a dataflow, add the predicate in the **rowLevelSecurityFilter** field of the Register transformation. The next time the dataflow runs, Wave Analytics will apply the predicate.
- To apply a predicate on a dataset created from an external data file, define the predicate in the **rowLevelSecurityFilter** field in the metadata file associated with the external data file. Wave Analytics applies the predicate when you upload the metadata file and external data file. If you already created the dataset from a external data file, you can edit the dataset to apply or change the predicate.

Row-Level Security Example based on Record Ownership

Let's look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

 **Note:** Although this example is about applying a predicate to a dataset created from a CSV file, this procedure can also be applied to a dataset that is created from Salesforce data.

1. Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

2. Determine Row-Level Security for Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

3. Add the Predicate to the Metadata File

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

4. Create the Dataset

Now that you updated the metadata file with the predicate, you can create the dataset.

5. Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see their own sales targets.

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

You will obtain sales targets from the CSV file shown below.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

If you were to create the dataset without implementing row-level security, any user that had access to the dataset would be able to see the sales targets for all account owners. For example, as shown below, Keith would be able to view the sales targets for all account owners.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'AccountOwner' == "$User.Name"
```

Note: All predicate examples in this document escape the double quotes because it's required when you enter the predicate in the Register transformation or metadata file. This predicate implements row-level security based on record ownership. Based on the predicate, Wave Analytics returns a sales target record when the user who submits the query on the dataset is the account owner.

Let's take a deeper look into the predicate expression:

- AccountOwner refers to the dataset column that stores the full name of the account owner for each sales target.
- \$User.Name refers to the Name column of the User object that stores the full name of each user. Wave Analytics performs a lookup to get the full name of the user who submits each query.

Note: The lookup returns a match when the names in AccountOwner and \$User.Name match exactly—they must have the same case.

Add the Predicate to the Metadata File

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

You must escape the double quotes around string values when entering a predicate in the metadata file.

In this example, you add the predicate to the metadata file shown below.

```
{
  "fileFormat": {
    "charsetName": "UTF-8",
    "fieldsDelimitedBy": ",",
    "fieldsEnclosedBy": "\"",
    "numberOfLinesToIgnore": 1 },
  "objects": [
    {
      "name": "Targets",
      "fullyQualifiedName": "Targets",
      "label": "Targets",
      "rowLevelSecurityFilter": "'AccountOwner' == \"${User.Name}\"",
      "fields": [
        {
          "name": "AccountOwner",
          "fullyQualifiedName": "Targets.AccountOwner",
          "label": "Account Owner",
          "type": "Text"
        },
        {
          "name": "Region",
          "fullyQualifiedName": "Targets.Region",
          "label": "Region",
          "type": "Text"
        },
        {
          "name": "Target",
          "fullyQualifiedName": "Targets.Target",
          "label": "Target",
          "type": "Numeric",
          "precision": 16,
          "scale": 0,
          "defaultValue": "0",
          "format": null
        },
        {
          "name": "TargetDate",
          "fullyQualifiedName": "Targets.TargetDate",
          "label": "TargetDate",
          "description": "",
          "type": "Date",
          "format": "dd/MM/yy HH:mm:ss",
          "isSystemField": false,
          "fiscalMonthOffset": 0
        }
      ]
    }
  ]
}
```

Create the Dataset

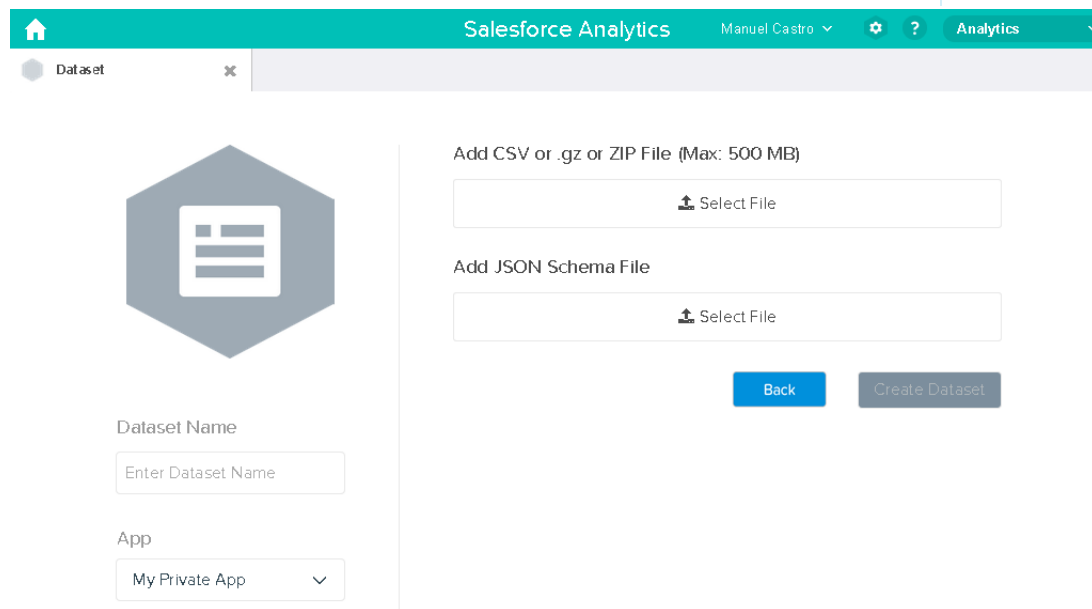

Now that you updated the metadata file with the predicate, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created.

To create the dataset, perform the following steps.

1. In Wave Analytics, go to the home page.
2. Click **Create > Dataset**
3. Click **CSV**.

The following screen appears.

4. Select the CSV file and metadata (schema) file.
5. In the **Dataset Name** field, enter "SalesTarget" as the name of the dataset.
6. Optionally, choose a different app where you want to store the dataset.
7. Click **Create Dataset**.

Wave Analytics confirms that the upload is successful and then creates a job to create the dataset. You can view the SalesTarget dataset after the job completes successfully.

8. To verify that the job completes successfully, perform the following steps:

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To upload a CSV and metadata file:

- "Upload External Data to Wave Analytics"

- a. Click the gear icon () and then select **Data Monitor** to open the data monitor.
By default, the Jobs View of the data monitor appears. It shows the statuses of dataflow and external data upload jobs.
- b. Click the Refresh Jobs button () to view the latest statuses of the jobs.

Test Row-Level Security for the Dataset

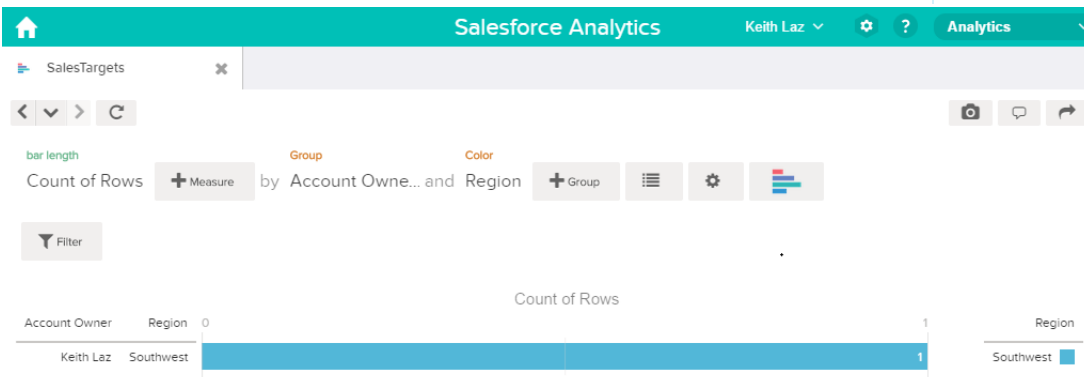

You must verify that the predicate is applied properly and that each user can see their own sales targets.

1. Log in to Wave Analytics as Keith.
2. Open the SalesTargets dataset.
As shown in the following lens, notice that Keith can see only his sales target.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

Row-Level Security Example based on Opportunity Teams

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

1. [Determine Which Data to Include in the Dataset](#)
First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.
2. [Design the Dataflow to Load the Data](#)
Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

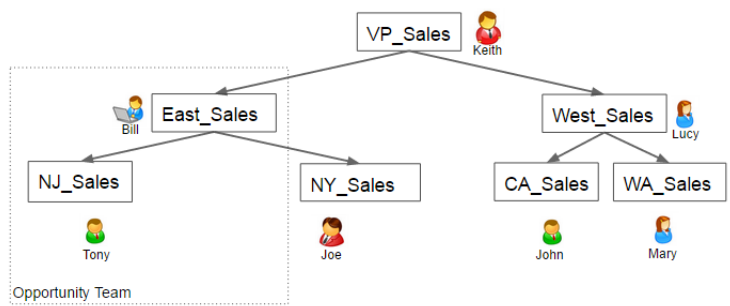

3. [Determine Row-Level Security for the Dataset](#)
Now it's time to think about row-level security. How will you restrict access to each record in this dataset?
4. [Modify the Dataflow Based on Row-Level Security](#)
It's now time to add the predicate in the dataflow definition file.
5. [Create the Dataset](#)
Now that you have the final dataflow definition file, you can create the dataset.
6. [Test Row-Level Security for the Dataset](#)
You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.

You will obtain opportunities from the Opportunity object and the opportunity teams from the OpportunityTeamMember object. Both are Salesforce objects.

In this example, your Salesforce organization has the following opportunity team and users.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Your organization also contains the following opportunities, most of which are owned by Keith.

Action	Opportunity Name	Account Name	Amount	Close Date	Stage	Opportunity Owner Alias
<input type="checkbox"/> Edit Del +	Acc - 1000 Widgets	Acc salesrep		9/4/2014	Prospecting	Tony
<input type="checkbox"/> Edit Del +	Acme - 1,200 Widgets	Acme	\$140,000.00	6/14/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	Acme - 200 Widgets	Acme	\$20,000.00	10/13/2012	Prospecting	Keith
<input type="checkbox"/> Edit Del +	Acme - 600 Widgets	Acme	\$70,000.00	8/10/2012	Needs Analysis	Keith
<input type="checkbox"/> Edit Del +	ESales_01	East_Sales_acc_01		9/4/2014	Prospecting	Bill
<input type="checkbox"/> Edit Del +	Global Media - 400...	Global Media	\$40,000.00	7/13/2012	Id. Decision Makers	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 1...	salesforce.com	\$100,000.00	6/14/2012	Negotiation/Review	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 2...	salesforce.com	\$20,000.00	8/12/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$50,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$500,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	West_Sales_01	West_Sales_Acc_01		9/4/2014	Prospecting	Lucy

Acc - 1000 Widgets is the only opportunity shared by an opportunity team. Bill is the Sales Manager for this opportunity. Tony is the opportunity owner.

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and OpportunityTeamMember objects, join the data, and then load it into the OppTeamMember dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```

{
  "Extract_OpportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
    }
  }
}

```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

```

    "right": "Extract_Opportunity",
    "right_key": [
      "Id"
    ],
    "right_select": [
      "Name", "Amount"
    ]
  }
},
"Register_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppTeamMember",
    "name": "OppTeamMember",
    "source": "Augment_OpportunityTeamMember_Opportunity",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to see the opportunity shared by the opportunity team.

For example, as shown below, Lucy would be able to view the opportunity that belongs to an opportunity team of which she is not a member.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'UserId' == "$User.Id"
```

This predicate compares the UserId column in the dataset against the ID of the user running a query against the dataset. The UserId column in the dataset contains the user ID of the team member associated with each opportunity. To determine the ID of the user running the query, Wave Analytics looks up the ID of the user making the query in the User object.

For each match, Wave Analytics returns the record to the user.

Modify the Dataflow Based on Row-Level Security

It's now time to add the predicate in the dataflow definition file.

You add the predicate to the Register transformation that registers the OppTeamMember dataset as shown below.

```
{
  "Extract_OppportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OppportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OppportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Oppportunity": {
    "action": "sfdcDigest",
    "parameters": {
```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```

    "object": "Opportunity",
    "fields": [
      { "name": "Id" },
      { "name": "Name" },
      { "name": "Amount" },
      { "name": "StageName" },
      { "name": "AccountId" },
      { "name": "OwnerId" }
    ]
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
      "right": "Extract_Opportunity",
      "right_key": [
        "Id"
      ],
      "right_select": [
        "Name", "Amount"
      ]
    }
  },
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OppTeamMember",
      "name": "OppTeamMember",
      "source": "105_Augment_OpportunityTeamMember_Opportunity",
      "rowLevelSecurityFilter": "'UserId' == \"\$User.Id\""
    }
  }
}

```

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

-  **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

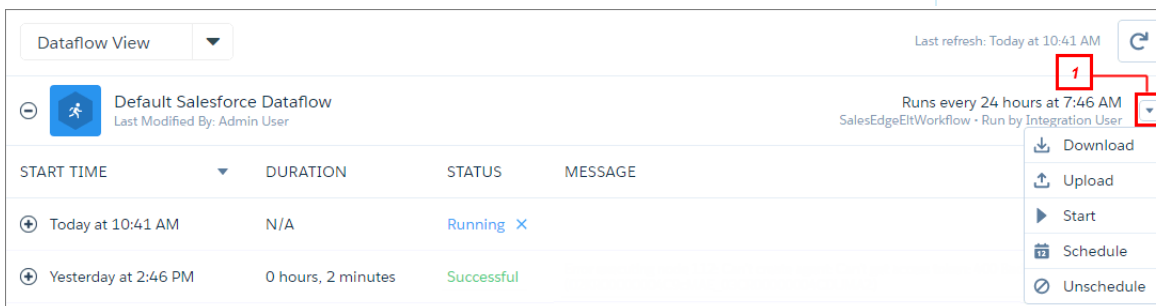

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- "Edit Wave Analytics Dataflows"

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a 'Last refresh: Today at 10:41 AM' indicator with a refresh icon. Below this, the 'Default Salesforce Dataflow' is listed, showing it was last modified by 'Admin User' and runs every 24 hours at 7:46 AM. A table below lists recent runs: one at 10:41 AM (Running) and one yesterday at 2:46 PM (Successful). On the right side, an actions menu is visible with options: Download, Upload, Start, Schedule, and Unschedule. A red box labeled '1' highlights the actions menu for the 'Default Salesforce Dataflow' job.

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppTeamMember dataset after the dataflow job completes successfully.

-  **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

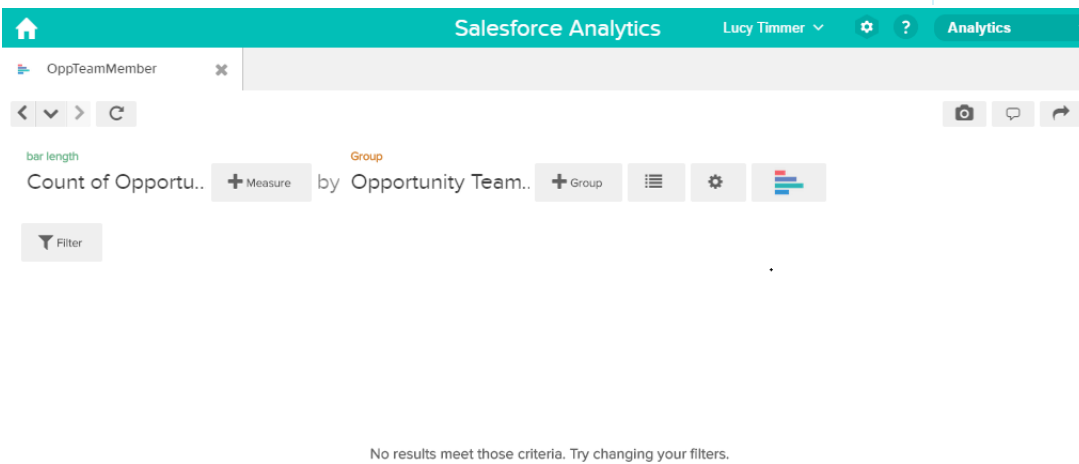

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Lucy.
2. Open the OppTeamMember opportunity.
Notice that Lucy can't view the opportunity associated with the opportunity team anymore because she is not a member of the team.

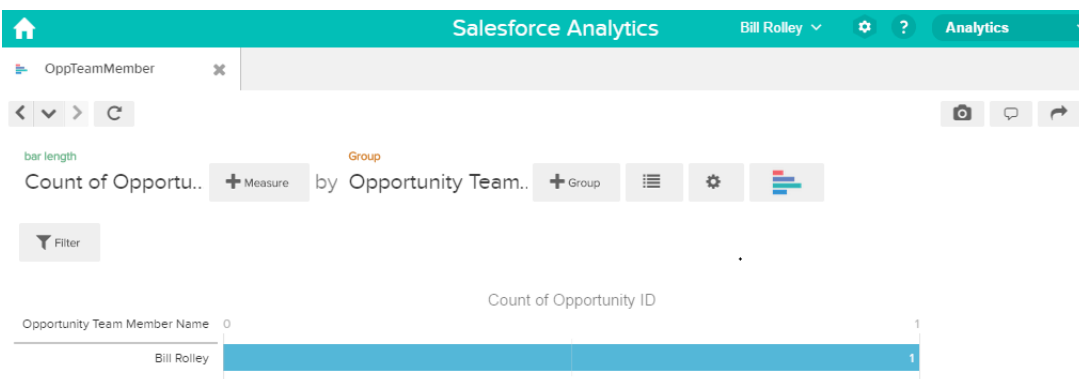

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

3. Log out and now log in as Bill.
Bill can view the opportunity that is shared by the opportunity team of which he is a member.

Row-Level Security Example based on Role Hierarchy and Record Ownership

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

1. Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

2. Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

3. Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

4. Modify the Dataflow Based on Row-Level Security

Now it's time to modify the dataflow definition file to account for the predicate.

5. Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

6. Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and User objects, join the data, and then load it into the OppRoles dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
}
```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

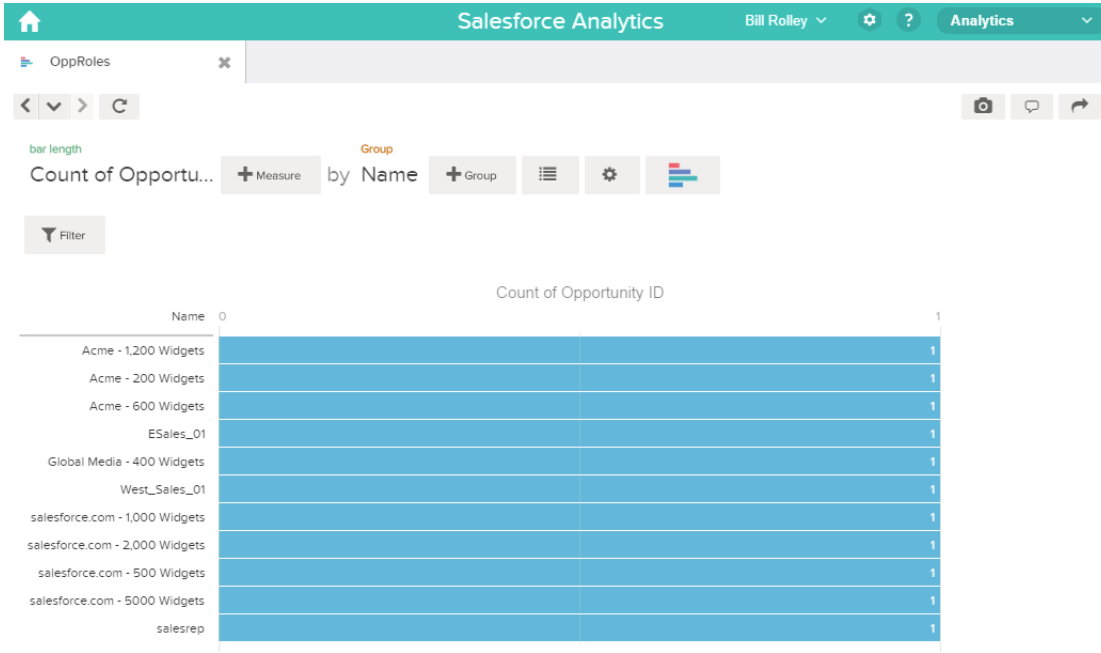

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```

"Extract_User": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "User",
    "fields": [
      { "name": "Id" },
      { "name": "Username" },
      { "name": "LastName" },
      { "name": "FirstName" },
      { "name": "Name" },
      { "name": "CompanyName" },
      { "name": "Division" },
      { "name": "Department" },
      { "name": "Title" },
      { "name": "Alias" },
      { "name": "CommunityNickname" },
      { "name": "UserType" },
      { "name": "UserRoleId" }
    ]
  }
},
"Augment_Opportunity_User": {
  "action": "augment",
  "parameters": {
    "left": "Extract_Opportunity",
    "left_key": [
      "OwnerId"
    ],
    "right": "Extract_User",
    "relationship": "Owner",
    "right_select": [
      "Name"
    ],
    "right_key": [
      "Id"
    ]
  }
},
"Register": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppRoles",
    "name": "OppRoles",
    "source": "Augment_Opportunity_User",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to view all opportunities. For example, as shown below, Bill would be able to view all opportunities, including those owned by his manager Keith.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```
'ParentRoleIDs' == "$User.UserRoleId" || 'OwnerId' == "$User.Id"
```

Note: The current dataflow doesn't contain logic to create a dataset column named "ParentRoleIDs." ParentRoleIDs is a placeholder for the name of a column that will contain this information. In the [next step](#), you will modify the dataflow to add this column to the dataset. This column name will change based on how you configure the dataflow.

Based on the predicate, Wave Analytics returns an opportunity record if:

- The user who submits the query is a parent of the opportunity owner based on the Salesforce role hierarchy. Wave Analytics determines this based on their role IDs and the role hierarchy.
- Or, the user who submits the query on the dataset is the opportunity owner.

Let's examine both parts of this predicate.

Predicate Part	Description
'ParentRoleIDs' == "\$User.UserRoleId"	<ul style="list-style-type: none"> ParentRoleIDs refers to a dataset column that contains a comma-separated list of role IDs of all users above the opportunity owner based on the role hierarchy. You will create this dataset column in the next section. \$User.UserRoleId refers to the UserRoleId column of the User object. Wave Analytics looks up the user role ID of the user who submits the query from the User object.
'OwnerId' == "\$User.Id"	<ul style="list-style-type: none"> OwnerId refers to the dataset column that contains the user ID of the owner of each opportunity. \$User.Id refers to the Id column of the User object. Wave Analytics looks up the user ID of the user who submits the query from the User object.

Modify the Dataflow Based on Row-Level Security

Now it's time to modify the dataflow definition file to account for the predicate.

In this scenario, you have to make changes to the dataflow based on the predicate.

- Add a column in the dataset that stores a comma-separated list of the role IDs of all parents for each opportunity owner. When you defined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs." To add the column, you redesign the dataflow as shown in the following diagram:

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

The new dataflow design contains the following changes:

- Extracts the role IDs from the UserRole object.
- Uses the Flatten transformation to generate a column that stores a comma-separated list of the role IDs of all parents of each user. When you determined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs."
- Link the new column to the OppRoles dataset.

- Add the predicate to the Register transformation that registers the OppRoles dataset.

You modify the dataflow as shown below.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Username" },
        { "name": "LastName" },
        { "name": "FirstName" },
        { "name": "Name" },
        { "name": "CompanyName" },
        { "name": "Division" },
        { "name": "Department" },
        { "name": "Title" },
        { "name": "Alias" },
        { "name": "CommunityNickname" },
        { "name": "UserType" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "ParentRoleId" },
        { "name": "RollupDescription" },
        { "name": "OpportunityAccessForAccountOwner" },
        { "name": "CaseAccessForAccountOwner" },
        { "name": "ContactAccessForAccountOwner" },
        { "name": "ForecastUserId" },
        { "name": "MayForecastManagerShare" },
        { "name": "LastModifiedDate" },
        { "name": "LastModifiedById" },
      ]
    }
  }
}
```

```

        { "name": "SystemModstamp" },
        { "name": "DeveloperName" },
        { "name": "PortalAccountId" },
        { "name": "PortalType" },
        { "name": "PortalAccountOwnerId" }
    ]
}
},
"Flatten_UserRole": {
    "action": "flatten",
    "parameters": {
        "multi_field": "Roles",
        "parent_field": "ParentRoleId",
        "path_field": "RolePath",
        "self_field": "Id",
        "source": "Extract_UserRole"
    }
},
"Augment_User_FlattenUserRole": {
    "action": "augment",
    "parameters": {
        "left": "Extract_User",
        "left_key": [
            "UserRoleId"
        ],
        "relationship": "Role",
        "right": "Flatten_UserRole",
        "right_key": [
            "Id"
        ],
        "right_select": [
            "Roles",
            "RolePath"
        ]
    }
},
"Augment_Opportunity_UserWithRoles": {
    "action": "augment",
    "parameters": {
        "left": "Extract_Opportunity",
        "left_key": [
            "OwnerId"
        ],
        "right": "Augment_User_FlattenUserRole",
        "relationship": "Owner",
        "right_select": [
            "Name",
            "Role.Roles",
            "Role.RolePath"
        ],
        "right_key": [
            "Id"
        ]
    }
}
}

```

```

},
"Register": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppRoles",
    "name": "OppRoles",
    "source": "Augment_Opportunity_UserWithRoles",
    "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
  }
}
}
}

```

 **Note:** In this example, the dataset has columns Owner.Role.Roles and OwnerId. A user can view the values of these columns for each record to which they have access.

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor. The Jobs View of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

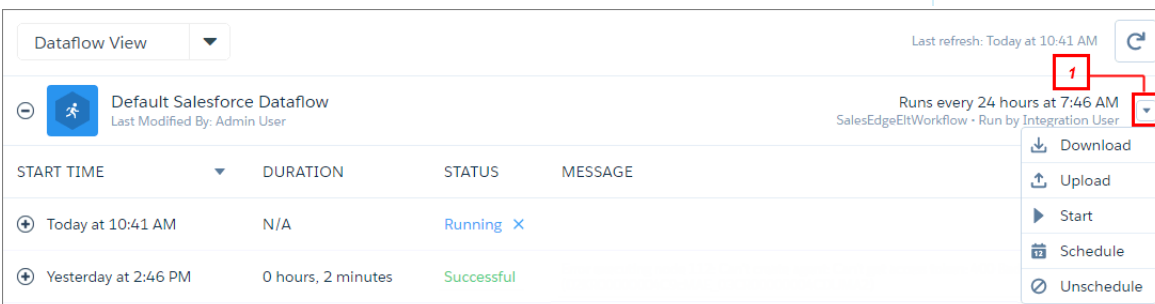

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- "Edit Wave Analytics Dataflows"

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).

6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppRoles dataset after the dataflow job completes successfully.

 **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Bill.
2. Open the OppRoles opportunity.
Notice that Bill can't see his manager Keith's opportunities anymore. Now, he can see only his opportunity and his subordinate Tony's opportunity.

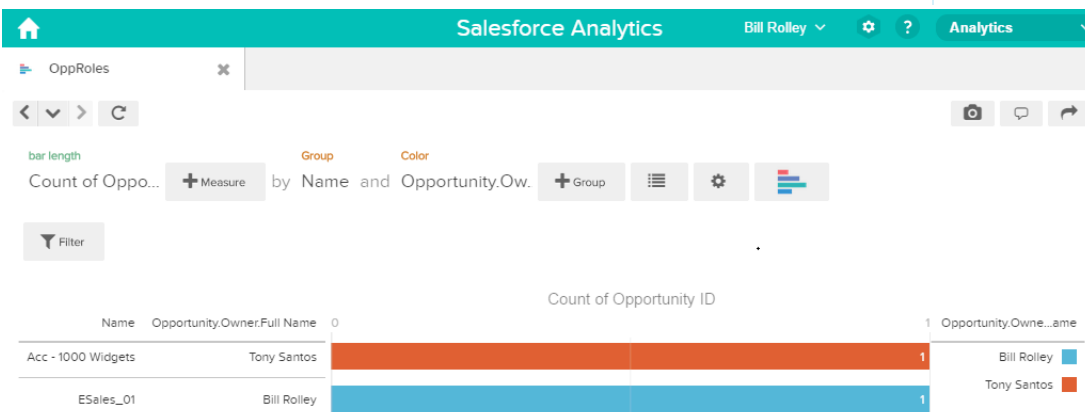

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

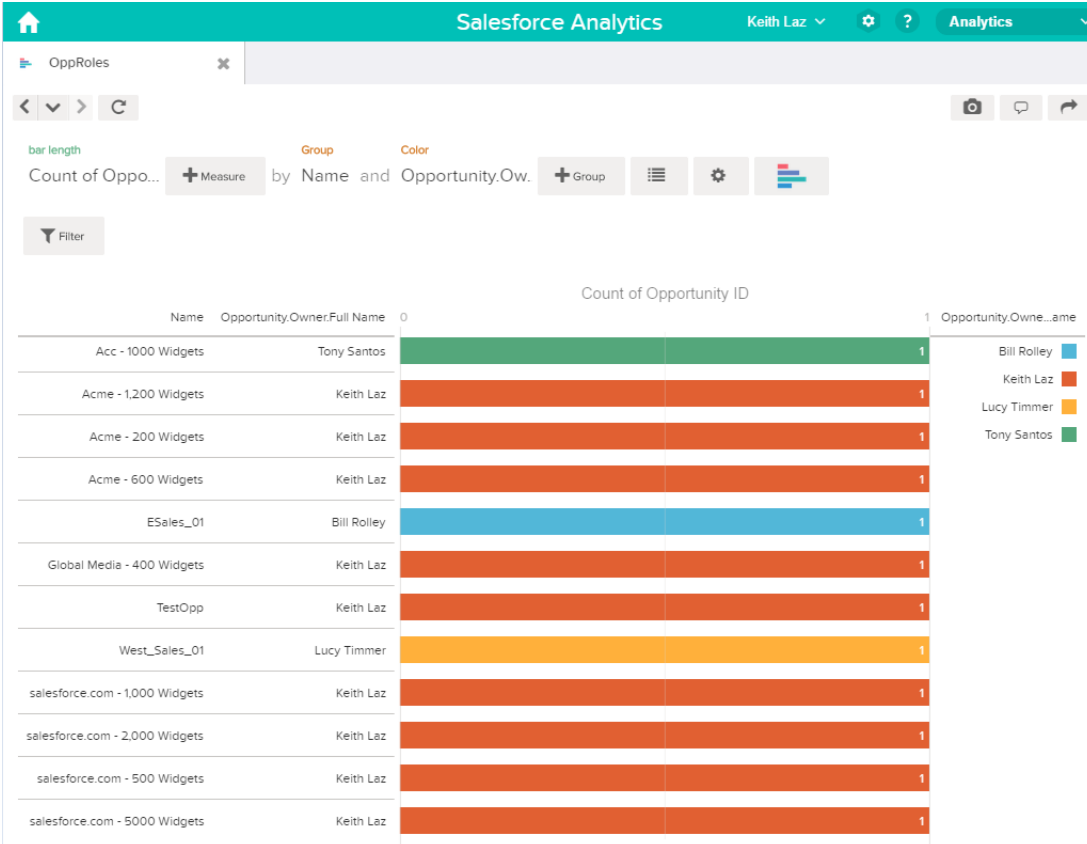

USER PERMISSIONS

- ""
- ""

3. Log out and now log in as Keith.

As expected, Keith can still see all opportunities.

Predicate Expression Syntax for Datasets

You must use valid syntax when defining the predicate expression.

The predicate expression must have the following syntax:

```
<dataset column> <operator> <value>
```

For example, you can define the following predicate expression for a dataset:

```
'UserId' == "$User.Id"
```

You can create more complex predicate expressions such as:

```
('Expected_Revenue' > 4000 || 'Stage Name' == "Closed Won") && 'isDeleted' != "False"
```

Consider the following requirements for the predicate expression:

- The expression is case-sensitive.
- The expression cannot exceed 1,000 characters.
- There must be at least one space between the dataset column and the operator, between the operator and the value, and before and after logical operators. This expression is not valid: `'Revenue' >100`. It must have spaces like this: `'Revenue' > 100`.

If you try to apply a predicate to a dataset and the predicate is not valid, an error appears when any user tries to query the dataset.

Dataset Columns in a Predicate Expression

You include at least one dataset column as part of the predicate expression.

Values in a Predicate Expression

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Escape Sequences

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (🔍). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters

Certain characters have a special meaning in Wave Analytics.

Operators

You can use comparison operators and logical operators in predicate expressions.

Sample Predicate Expressions for Datasets

Review the samples to see how to structure a predicate expression.

Dataset Columns in a Predicate Expression

You include at least one dataset column as part of the predicate expression.

Consider the following requirements for dataset columns in a predicate expression:

- Column names are case-sensitive.
- Column names must be enclosed in single quotes ('). For example, 'Region' == "South"
-  **Note:** A set of characters in double quotes is treated as a string rather than a column name.
- Single quotes in column names must be escaped. For example, 'Team\'s Name' == "West Region Accounts"

Values in a Predicate Expression

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Consider the following requirements for each value type.

Value Type	Requirements	Predicate Expression Examples
string literal	Enclose in double quotes and escape the double quotes.	<ul style="list-style-type: none"> • 'Owner' == "Amber" • 'Stage Name' == "Closed Won"
number literal	Can be a float or long datatype. Do not enclose in quotes.	<ul style="list-style-type: none"> • 'Expected_Revenue' >= 2000.00 • 'NetLoss' < -10000

Value Type	Requirements	Predicate Expression Examples
field value	<p>When referencing a field from the User object, use the <code>\$User.[field]</code> syntax. Use the API name for the field.</p> <p>You can specify standard or custom fields of type string, number, or multi-value picklist.</p> <p>When you define a predicate for a dataset, you must have read access on all User object fields used to create the predicate expression.</p> <p>However, when a user queries a dataset that has a predicate based on the User object, Wave Analytics uses the access permissions of the Insights Security User to evaluate the predicate expression based on the User object.</p> <p> Note: By default, the Security User does not have access permission on custom fields of the User object.</p> <p>To grant the Security User read access on a field, set field-level security on the field in the user profile of the Security User.</p>	<ul style="list-style-type: none"> • <code>'Owner.Role' == "\$User.UserRoleId"</code> • <code>'GroupID' == "\$User.UserGroupId__c"</code> <p> Note: Supported User object field value types are string, number, and multi-value picklist. Other types (for example, boolean) are not supported.</p>

Escape Sequences

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

You can use the `\'` escape sequence to escape a single quote in a column name. For example:

```
'Team\'s Name' == "West Region Accounts"
```

You can use the following escape sequences for special characters in string values.

Sequence	Meaning
<code>\b</code>	One backspace character
<code>\n</code>	New line
<code>\r</code>	Carriage return
<code>\t</code>	Tab
<code>\Z</code>	CTRL+Z (ASCII 26)
<code>\"</code>	One double-quote character

Sequence	Meaning
\\	One backslash character
\0	One ASCII null character

Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters

Certain characters have a special meaning in Wave Analytics.

Character	Name	Description
'	Single quote	Encloses a dataset column name in a predicate expression. Example predicate expression: <code>'Expected_Revenue' >= 2000.00</code>
"	Double quote	Encloses a string value or field value in a predicate expression. Example predicate expression: <code>'OpportunityOwner' == "Michael Vesti"</code>
()	Parentheses	Enforces the order in which to evaluate a predicate expression. Example predicate expression: <code>('Expected_Revenue' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"</code>
\$	Dollar sign	Identifies the Salesforce object in a predicate expression.  Note: You can only use the User object in a predicate expression. Example predicate expression: <code>'Owner.Role' == "\$User.UserRoleId"</code>

Character	Name	Description
.	Period	Separates the object name and field name in a predicate expression. Example predicate expression: <code>'Owner' == "\$User.UserId"</code>

Operators

You can use comparison operators and logical operators in predicate expressions.

[Comparison Operators](#)

Comparison operators return true or false.

[Logical Operators](#)

Logical operators return true or false.

Comparison Operators

Comparison operators return true or false.

Wave Analytics supports the following comparison operators.

Operator	Name	Description
==	Equals	True if the operands are equal. String comparisons that use the equals operator are case-sensitive. Example predicate expressions: <code>'Stage Name' == "Closed Won"</code>
!=	Not equals	True if the operands are not equal. String comparisons that use the not equals operator are case-sensitive. Example predicate expression: <code>'isDeleted' != "False"</code>
<	Less than	True if the left operand is less than the right operand. Example predicate expression: <code>'Revenue' < 100</code>
<=	Less or equal	True if the left operand is less than or equal to the right operand.
>	Greater than	True if the left operand is greater than the right operand.
>=	Greater or equal	True if the left operand is greater than or equal to the right operand.
in	Multi-value list filter	True if the left operand exists in the list of strings substituted for a multi-value picklist (field value). Example predicate expression:

Operator Name	Description
	<p>'Demog' in ["\$User.Demographic__c"]</p> <p>In this example, Demographic__c is of type multiPicklistField. During evaluation, the multi-value picklist field is substituted by a list of strings, with 1 string per user-selected item.</p> <p> Note: Comma-separated lists are not supported within the square-bracket construct.</p>

You can use the <, <=, >, and >= operators with measure columns only.

Logical Operators

Logical operators return true or false.

Wave Analytics supports the following logical operators.

Operator	Name	Description
&&	Logical AND	<p>True if both operands are true.</p> <p>Example predicate expression:</p> <p>'Stage Name' == "Closed Won" && 'isDeleted' != "False"</p>
	Logical OR	<p>True if either operand is true.</p> <p>Example predicate expression:</p> <p>'Expected_Revenue' > 4000 'Stage Name' == "Closed Won"</p>

Sample Predicate Expressions for Datasets

Review the samples to see how to structure a predicate expression.

The samples are based on the following Opportunity dataset.

Opportunity	Expected_Rev	Owner	OwnerRoleID	Stage_Name	IsDeleted
OppA	2000.00	Bill	20	Prospecting	True
OppB	3000.00	Joe	22	Closed Won	False
OppC	1000.00	可爱的花	36	Closed Won	False
OppD	5000.00	O'Fallon	18	Prospecting	True
OppE		Joe	22	Closed Won	True

Let's take a look at some examples to understand how to construct a predicate expression.

Predicate Expression	Details
'OwnerRoleId' == "\$User.UserRoleId"	Checks column values in the User object.
'Expected_Rev' > 1000 && 'Expected_Rev' <= 3000	
'Owner' = "Joe" 'Owner' = "Bill"	
('Expected_Rev' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"	Parentheses specify the order of operations.
'Stage Name' == "Closed Won" && 'Expected_Rev' > 70000	
'Owner' == "可爱的花"	String contains Unicode characters.
'Owner' == "O\'Fallon"	Single quote in a string requires the escape character.
'Stage Name' == ""	Checks for an empty string.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. There are multiple ways to create datasets. You can also edit datasets after they've been created.

 **Tip:** To ensure that you do not reach the limit (250 million) for the maximum number of rows in all registered datasets, deleted unused datasets.

SEE ALSO:

[Create a Dataset with External Data](#)

[Edit a Dataset](#)

[Delete a Dataset](#)

Data Monitor

The data monitor provides options for you to manage jobs.

SEE ALSO:

[Start and Stop a Dataflow](#)

[Reschedule and Unschedule a Dataflow](#)

[Monitor a Dataflow Job](#)

[Monitor an External Data Upload](#)

Data Manager

The data manager is where you monitor all your jobs and dataflows, view and edit your replications, and prepare your data with recipes.

To open the data manager in Wave Analytics, click the gear icon () and then click **Data Manager**.

DATAFLOW	START TIME	DURATION	STATUS
⊕ Default Salesforce Dataflow	Today at 11:36 AM	11 seconds	Successful
⊕ Account (Replication)	Today at 10:38 AM	13 seconds	Successful

You land on the Monitor tab, where you can see the progress of your recipe, replication, and other dataflow jobs. If you have replication enabled, the Ingest tab is where you can view and update settings for your replication-enabled Salesforce objects. Go to the Prepare tab to create and manage your dataset recipes.

SEE ALSO:

[Optimize Your Dataflows with Replication](#)

[Prepare Datasets with Recipes](#)

[Data Monitor](#)

External Data

You can integrate external data into Wave Analytics to make the data available for queries from explorer and designer.

The External Data API enables you to upload external data files to Wave Analytics. The External Data API can upload .csv files, and you can optionally specify the structure of your data by defining metadata in JSON format.

The External Data API is available in API version 31 and later.

The high-level steps for uploading external data by using the API are:

1. Prepare your data in CSV format, and then create a metadata file to specify the structure of the data.
2. Connect programmatically to your Salesforce organization.
3. Configure the upload by inserting a row into the `InsightsExternalData` object, and then set input values such as the name of the dataset, the format of the data, and the operation to perform on the data.
4. Split your data into 10-MB chunks, and then upload the chunks to `InsightsExternalDataPart` objects.
5. Start the upload by updating the `Action` field in the `InsightsExternalData` object.

6. Monitor the InsightsExternalData object for status updates, and then verify that the file upload was successful.

Explore and Visualize Your Data

When sifting through an overwhelming amount of business data, sometimes you know exactly what you're looking for. Other times you don't, but you recognize it when you see it. Salesforce Wave Analytics gives you a fast, fluid way to discover the compelling stories within your data and to create the right visuals to tell your story.

After your data is uploaded, explore freely. Drill through the data by using interactive visualizations. Surface unexpected insights that can transform your business. Then let Wave Analytics do the work of producing dynamic charts that look sharp and communicate volumes.

[Exploring and Visualizing Your Data Interactively](#)

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

[Collections of Data in Wave Analytics](#)

Wave collects and organizes your data in datasets, lenses, dashboards, and apps. These collections, also known as "Wave assets," represent levels of data refinement—from raw data that's uploaded from your source systems to highly curated, packaged views of your data.

[Data Exploration Concepts](#)

As you learn how to explore and visualize your data, it's helpful to review key concepts such as visualization, measure, and dimension.

[Explore Your Data](#)

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

[Clone a Visualization](#)

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

[Save a Visualization](#)

Save your visualization as a lens.

[Share a Visualization](#)

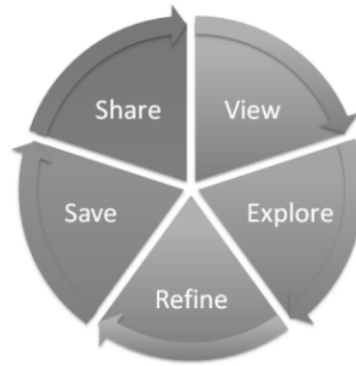

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that's presented. To share without giving access to the asset, use the download options.

[Export a Visualization as an Image](#)

Export your current visualization so that you can save it as an image file.

Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

- View—View the data set.
- Explore—Get to know the boundaries and shape of your data. Play with different views, zoom in and zoom out, and see what you get with different charting options.
- Refine—Narrow your view to the most important data. Decide the level of detail and categorization that’s easiest for your colleagues to understand. Choose the most appropriate chart visualization.
- Save—Save your work.
- Share—Share your view with others. For a more packaged presentation, use your visualization to build a dashboard.

Collections of Data in Wave Analytics

Wave collects and organizes your data in datasets, lenses, dashboards, and apps. These collections, also known as “Wave assets,” represent levels of data refinement—from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.

- A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.
- A *lens* is a particular view into a dataset’s data. It’s where you do exploratory analysis and visualization.
- A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.
- An *app* is a purpose-built set of analytics and answers about a specific area of your business. With apps, you can provide pathways through your data, plus powerful tools for spontaneous, deep explorations. After creating dashboards, lenses, and datasets, organize apps to present dashboards in relevant order, and then share apps with appropriate groups.

Data Exploration Concepts

As you learn how to explore and visualize your data, it’s helpful to review key concepts such as visualization, measure, and dimension.

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate. Measures have names (revenue) and values (\$1,000,000). When you’re viewing a chart visualization in Wave Analytics, it’s important to remember:

- The chart either shows a slice of your data based on the number of or amount of something, or it shows tabular data.
- A measure is typically *aggregated* in some way, which means that it’s displayed with some math already applied to it. For example, when you first view a dataset, you often see a simple aggregation such as the count of the number of rows. You typically aggregate by a different method—sum, average, maximum, and so on—as you explore and change or add measures, but you always specify how you want to aggregate at the time when you select the measure.

- You can identify measures by their position (the far left items in the top left corner of a lens) and by the text that indicates the aggregation method (such as Sum of Revenue).

 **Warning:** If you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum for a numeric field (36,028,797,018,963,967), the value overflows and Wave Analytics returns an incorrect result.

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. Like measures, dimensions also have names (region) and values (northeast). Time is usually considered a dimension rather than a measure.

Explore Your Data

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

[View Your Data in a Lens](#)

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it's how you view data in a dataset, it's the place where you explore the data graphically, and it's the basis for building any dashboard.

[Group Your Data into Categories](#)

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

[Filter Your Data](#)

Apply filters in a lens to unclutter your chart and focus on the subset of data that's most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

[Change the Sort Order](#)

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

[Change the Chart Type](#)

Switch between chart types to see which visualization options tell the most compelling story for your data.

[Change Measures](#)

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from "Count of Opportunities" to "Sum of Amount." Then add a second measure to see two visualizations side by side.

[Change the Chart Scale](#)

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

[Navigate Compare Table Columns](#)

Create new columns and navigate between existing ones using clicks or keystrokes.

[Create Calculated Columns Using the Compare Table](#)

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table's columns and rows.

[Window Functions Available in the Compare Table](#)

The compare table's function menu provides UI-based access to useful window functions, saving you the time of having to write them in SAQL. Once you choose a function, you can edit the generated SAQL in the formula editor.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

[Return to the Initial View](#)

Exploring your data can lead you down many paths. Not all of them are fruitful, and that’s OK. To go back to the dashboard’s original state, or just see those nifty animations again, you can use the reset option to quickly return to the initial view.

[Apply Groups and Filters by Copying and Pasting Using Your Browser’s Clipboard](#)

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer’s copy and paste tools to replicate specific groupings and filters from one tab to another.

[View the Query Behind Your Lens](#)

Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

[Clip a Lens to a Dashboard](#)

To include the lens in a dashboard, clip it. When you clip the lens, Wave adds the query as a step to the most recently used dashboard. If a dashboard isn’t open, Wave adds the step to a new dashboard in Wave dashboard designer. After you add the step to the designer, you can apply it to a widget in the dashboard. The widget overrides the visualization settings of the lens—the widget determines how to display the results of the query.

View Your Data in a Lens

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it’s how you view data in a dataset, it’s the place where you explore the data graphically, and it’s the basis for building any dashboard.

1. From the home page, click a dataset or a lens.
A lens opens in a new tab. For example, this lens opens as a bar chart that shows the number of rows in an opportunity dataset.

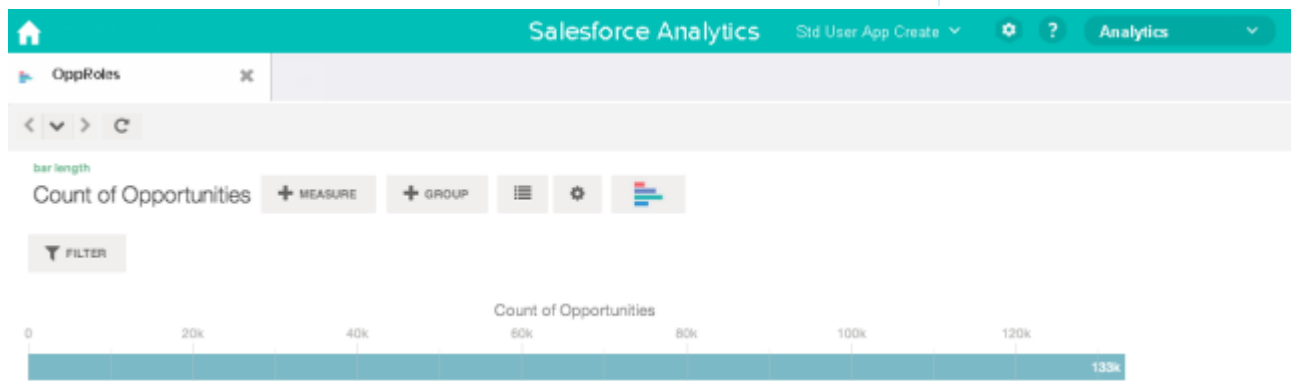

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To view visualizations:
- “Use Wave Analytics”

Group Your Data into Categories

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

1. Click the **Group** button.

2. Using the search box, type the first few letters of the dimension that you want to group by, such as Close Date.

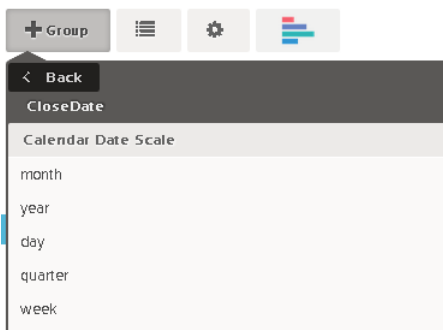

The dimensions in your data determine which categories you can group by.

3. Hover over the Close Date line. Click the **Scale** button that appears at the right.

4. In the Calendar Date Scale list, click Month.

The bar chart changes from a single bar to multiple bars that show the data grouped separately by the closed year and month.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Note: When a dimension is grouped, that dimension's null records are excluded from results, which affects the count of rows in a lens. To prevent the exclusion of null dimension records, assign a default value to those records.

- To add a secondary grouping, also called a *stacked grouping*, click the **Group** button. Using the search box, find the StageName dimension, and then select it.

At this point, we're just adding a group. If you had clicked the **Filter** button, a group and a filter would have been added.

The visualization changes to show the data grouped by both dimensions. The entries in the last subgroup are assigned a color for each category, and the color legend is displayed on the right. You can have a maximum of four groupings in a lens.

Filter Your Data

Apply filters in a lens to unclutter your chart and focus on the subset of data that's most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

1. Click **Filter**.

In the Add a Filter dialog box, measures are listed at the top, followed by dimensions.

2. Select the FiscalYear dimension.
The values for FiscalYear appear.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

3. Select 2012 and 2013, and then click **Add**. If you use the search box to find values to filter by, be aware that this search is case-sensitive. The filter that you've applied is displayed next to the **Filter** button.

The chart visualization changes to show data for fiscal years 2012 and 2013.

Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

1. Click the **Options** button.

2. In the dialog box, choose **Asc** (sorted ascending), **Dsc** (sorted descending), or **Off** (unsorted).

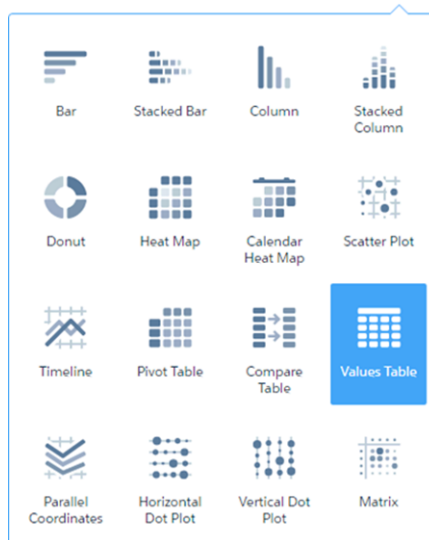

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

1. Click the **Change Chart Type** button.

A gallery of chart types that are available for this lens is displayed.

2. Hover over a chart type to see how many measures and dimensions that type of visualization requires.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

For example, a donut chart can have one measure and one or two dimensions.

3. Click a chart type, such as Stacked Bar. The chart visualization changes.

Change Measures

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

1. Click the aggregation **Sum**, and then click the Amount (monthly rec, USD) measure. The visualization changes to show the Sum of Amount.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To view visualizations:
- “Use Wave Analytics”

- To add a second measure, click the **Measure** button.

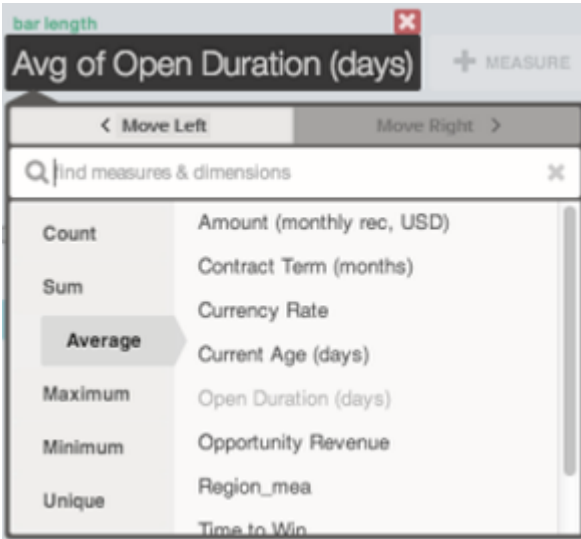

- Click the aggregation **Average**, and then click the Open Duration (days) measure.

The new measure is displayed on the right.

- To move the new measure to the left, click Avg of Open Duration (days), and then click **< Move Left**.

The two visualizations swap positions.

- To add additional measures, click the **Measure** button again. You can have a maximum of four measures in a lens.

Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

1. Click the **Options** button.

2. In the dialog box, choose a scale.

Navigate Compare Table Columns

Create new columns and navigate between existing ones using clicks or keystrokes.

You can navigate columns in the column editor using arrow buttons or your keyboard's left and right arrow keys.

Apply Groups and Filters by Copying and Pasting Using Your Browser's Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer's copy and paste tools to replicate specific groupings and filters from one tab to another.

From the home page, each time you click a dataset, it opens in a new tab. The copy and paste tools in explorer are designed to be used when you have the same dataset in multiple tabs.

1. If the chart type that you're viewing allows you to select a subset of data, make your selection by clicking or by clicking and dragging within the chart. Everything except your selected data is unavailable.

2. Click the **Actions** button.

3. Copy the selection to your browser's clipboard. Click **Copy** to capture the selected items in the clipboard. You can decide later whether to paste your selection as a group or as a filter. Click **Focus** to both capture the selected items in the clipboard and apply them as a filter to the current chart.
4. Switch to a different Wave Analytics tab that has the same dataset.
5. Click the **Actions** button.

6. Apply the selection from the clipboard to the current chart. Click **Paste as Group** to make the data display grouped by the selected dimensions. Click **Paste as Filter** to make the data display with your selection applied as a filter.

To restore a chart to the full dataset, remove your selection by clicking  and then **Clear**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

View the Query Behind Your Lens

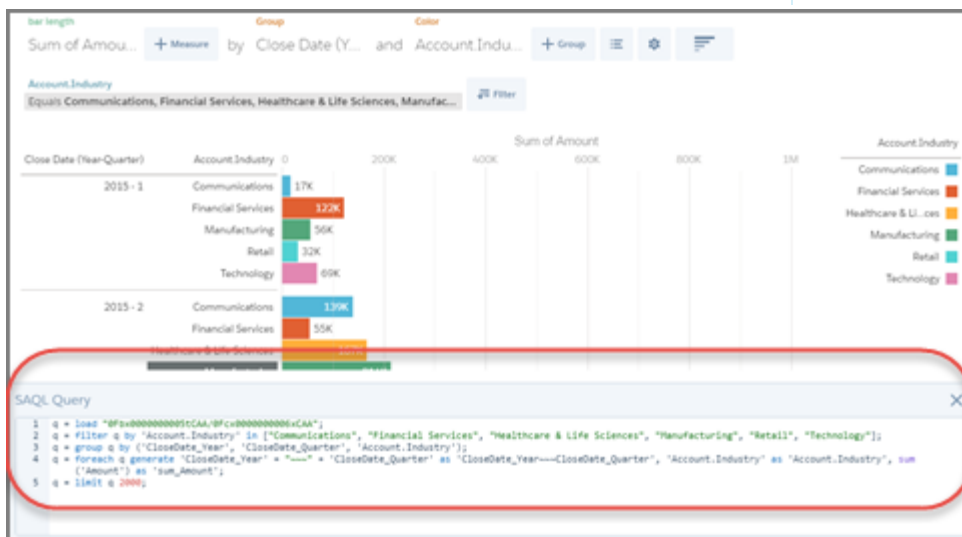

Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

1. Open the Options menu (⚙️) to access the **Show SAQL** control.

2. Select **On**.

The SAQL Query pane opens. Continue exploring and see your work expressed in SAQL.

For more information about SAQL, see the [Wave Analytics SAQL Reference](#).

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Clip a Lens to a Dashboard

To include the lens in a dashboard, clip it. When you clip the lens, Wave adds the query as a step to the most recently used dashboard. If a dashboard isn't open, Wave adds the step to a new dashboard in Wave dashboard designer. After you add the step to the designer, you can apply it to a widget in the dashboard. The widget overrides the visualization settings of the lens—the widget determines how to display the results of the query.

1. Open the lens.
2. Click . Wave creates a step based on query of the lens, and adds it to the step panel of the dashboard designer.
3. To save the step, save the dashboard.

 **Note:** Changes to the step properties don't affect the lens.

Clone a Visualization

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

1. Click the **Clone in New Tab** icon.

2. Continue exploring in the new tab, building upon the visualization. When you reach the next view that you want to keep, click **Save** and then **Clone in New Tab** again.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Save a Visualization

Save your visualization as a lens.

1. Click the **Save** icon.

2. Enter a title and a description for your lens, and select the app to save it in.
3. Click **Save**.

Share a Visualization

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that’s presented. To share without giving access to the asset, use the download options.

1. Click **Share**.

2. Click the tab for the sharing method that you want:
 - a. Post to Feed** posts to Chatter an image and the link to the lens, dashboard, or app. Select **User** or **Group** feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the **x**. Note that posted images are public.
 - b. Get URL** provides a unique URL to the asset. Copy the link and then paste it wherever you want to share it.
 - c. Download** gives you options to share a visualization without giving access to it. You can download it as an image (.png) or as filtered data in Microsoft® Excel® (.xlsx) or comma-separated values (.csv) format.
3. If applicable, click **Give Access** to set the level of sharing access.
4. Click **Done**.

Note: To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

Export a Visualization as an Image

Export your current visualization so that you can save it as an image file.

1. Click the **Actions** button.

2. Click **Export as Image**.
A new browser window opens with the visualization in a .png image file.
3. Right-click the image, and then choose **Save Image As...**
4. Type a file name, and then click **Save**.

Visualizing Data With Charts

If your goal is to understand vast amounts of business data, and to communicate that understanding with coworkers, partners, and customers, being able to visualize your data is critical. Wave provides a chart for every need, each a means for illustrating key aspects of your business in just the right way.

Wave charts are integrated with the Wave tools you already use to explore data. Start with a dataset, explore with a lens, clip it to Wave dashboard designer, and create a stunning dashboard.

Bubble Map Charts

Use a bubble map chart to visually indicate measure values in specified geographical areas. The bubble-map chart is found in the Wave dashboard designer.

Combo Charts

Use a combo chart to display two related series of data, such as discrete grouped values as vertical bars overlaid with a line chart representing an average value. The combo chart is found in the Wave dashboard designer and classic designer.

Donut Charts

Use a donut chart when you have multiple groupings and want to show not only the proportion of a single value for each grouping against the total, but also the total amount itself. The donut chart is found in the Wave dashboard designer, classic designer, and explorer.

Funnel Charts

Use a funnel chart to visualize sequential data that can be broken up into stages, such as a sales cycle. The funnel chart is found in the Wave dashboard designer and classic designer.

Gauge Charts

Use gauge charts to track progress along a single measure, such as how much revenue has been realized versus the target. The gauge chart is found in the Wave dashboard designer.

Horizontal Bar Charts

Use a horizontal bar chart to provide a quick visual comparison of related values. The horizontal bar chart is found in the Wave dashboard designer, classic designer, and explorer.

Heat Maps

Use a heatmap to visually enhance high and low-value data when there's a single measure and multiple dimensions. The heatmap chart is found in the Wave dashboard designer, classic designer, and explorer.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Map Charts

Use a map if you have data with a geographical component that can shade areas in proportion to mapped values, allowing for visual pop-out of high-value areas. The map chart is found in the Wave dashboard designer and classic designer.

Custom Map Charts

Using map charts that can shade areas in proportion to mapped values allows for visual pop-out of high-value areas. You can use custom maps with geographical units or to illustrate any type of area that can be represented by polygons. Custom map charts can be used in the Wave dashboard designer and classic designer.

Matrix Charts

Use matrix charts (new in Wave dashboard designer) to create a table that represents measures visually, allowing you to quickly spot extreme values. The matrix chart is found in the Wave dashboard designer, classic designer, and explorer.

Pyramid Charts

Use a pyramid chart to visually highlight relative sizes of stacked dimension values. The pyramid chart is found in the Wave dashboard designer.

Radar Charts

Use radar charts to display a small dataset with one dimension and at least three measure columns. The radar chart is found in the Wave dashboard designer.

Rating Charts

Use a rating chart to get a sense of how well a measured quality, such as customer satisfaction, is meeting expectations. The rating chart is found in the Wave dashboard designer.

Scatter Charts

Use a scatter chart to visualize correlation between two groups of data. The scatter chart is found in the Wave dashboard designer, classic designer, and explorer.

Timeline Charts

Use a timeline chart to show how a value changes over time. The timeline chart is found in the Wave dashboard designer, classic designer, and explorer.

Treemap Charts

Use treemaps to visualize hierarchical quantitative data, where containing rectangles designate relationship using color, and "leaf" rectangles represent quantity using area. The treemap chart is found in the Wave dashboard designer.

Vertical Bar Charts

Use a vertical bar chart (also called column chart) to show relative counts of things, such as leads or dollars. The vertical bar chart is found in the Wave dashboard designer, classic designer, and explorer.

Waterfall Charts

Use a waterfall chart to show the cumulative effect of sequentially introduced positive or negative values with breakdowns of value totals. Also known as "flying bricks" or "Mario" charts. To include breakdowns of value totals, use a stacked waterfall chart. The waterfall chart is found in the Wave dashboard designer and classic designer.

Bubble Map Charts

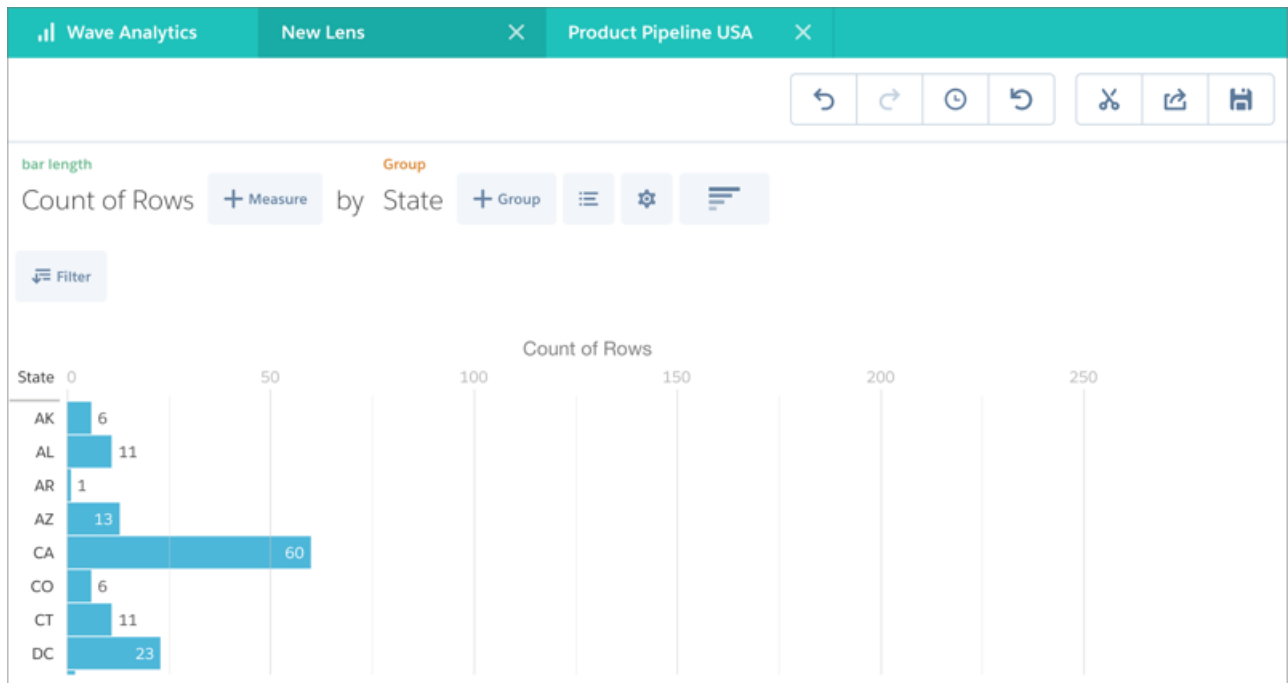

Use a bubble map chart to visually indicate measure values in specified geographical areas. The bubble-map chart is found in the Wave dashboard designer.

Create a Bubble Map Chart

Wave bubble-map charts use the same maps available to map charts, giving you another choice representing measure values on the map.

For example, you can use bubbles instead of color saturation alone to indicate the number of opportunities in the pipeline for each state in the United States.

1. In Wave, group the data by state, then change the measure.

2. Clip the lens to Wave dashboard designer.
3. Choose **Bubble Map** from **Chart Type**, then choose **US States** from **Map Type**.

Combo Charts

Use a combo chart to display two related series of data, such as discrete grouped values as vertical bars overlaid with a line chart representing an average value. The combo chart is found in the Wave dashboard designer and classic designer.

Donut Charts

Use a donut chart when you have multiple groupings and want to show not only the proportion of a single value for each grouping against the total, but also the total amount itself. The donut chart is found in the Wave dashboard designer, classic designer, and explorer.

Funnel Charts

Use a funnel chart to visualize sequential data that can be broken up into stages, such as a sales cycle. The funnel chart is found in the Wave dashboard designer and classic designer.

Gauge Charts

Use gauge charts to track progress along a single measure, such as how much revenue has been realized versus the target. The gauge chart is found in the Wave dashboard designer.

Create a Gauge Chart

If you've set goals for, as an example, average account value in each of the countries where your company operates, gauge charts are a good choice for showing how close you are to that goal.

You've got a dataset with account information, now you want to present it in a chart that shows how close the company is in reaching the associated goal. Each gauge chart can display 1 value per country, and highlight value ranges.

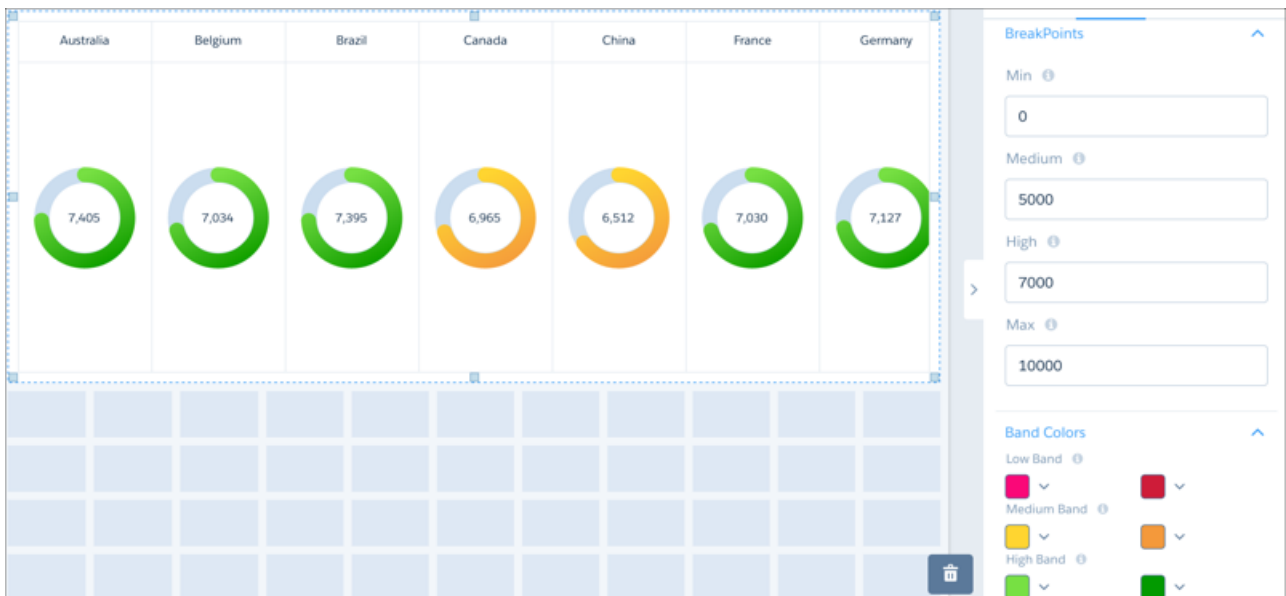

1. In Wave Analytics, create a lens using the accounts dataset, then clip it to Wave dashboard designer.

2. Change the chart type to **Polar Gauge** (round).
A **Flat Gauge** (linear) is also available.
3. Adjust the size of the center and set the number style.

4. Set the breakpoint values and associated band colors.

The breakpoints set the range values where the color bands transition. The maximum is 10,000, and you'd like to the average account to exceed 7,000 in each country.

5. Set the **Trellis** type to **Wrap** so the charts are easier to view all at once without having to scroll.

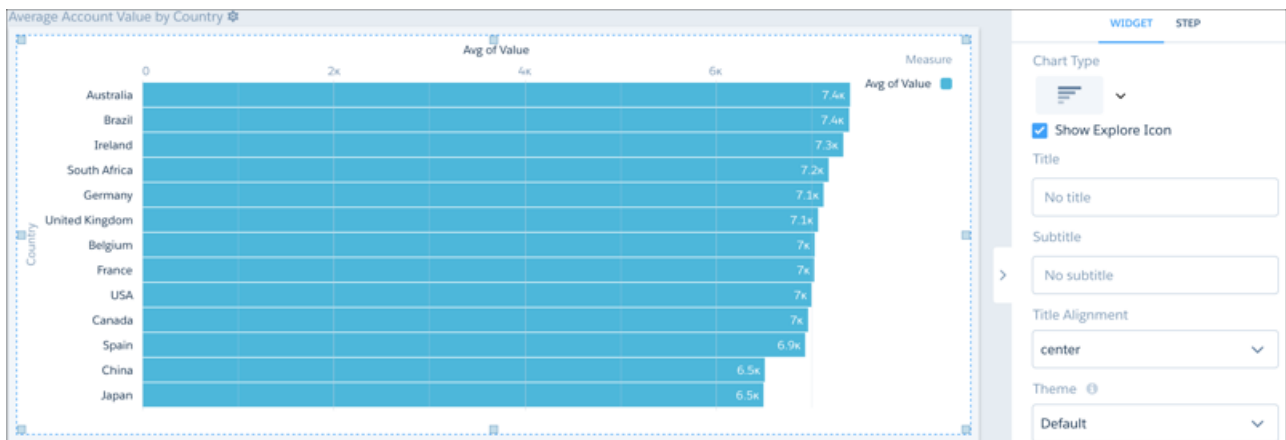

Values above 7,000 are easy to spot due to the color-band configuration of the gauge chart. It's also easy to see which countries are close to the desired value.

Horizontal Bar Charts

Use a horizontal bar chart to provide a quick visual comparison of related values. The horizontal bar chart is found in the Wave dashboard designer, classic designer, and explorer.

Optimize the Fit of a Horizontal Bar Chart

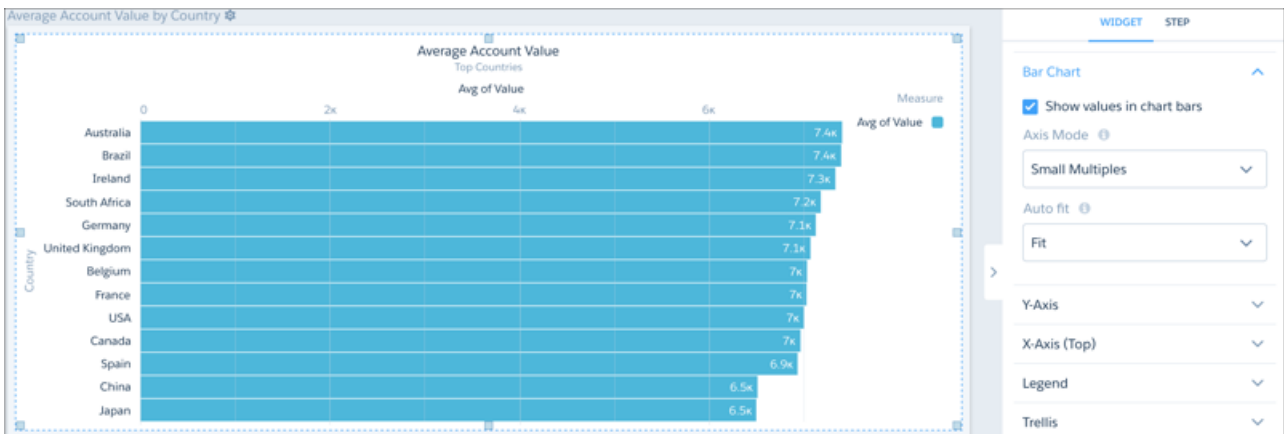

Using the auto-fit feature, you can fit a bar chart into a crowded dashboard without the necessity of long scroll bars or loss of information. You create a lens with a bar chart showing a list of top countries, then clip it to a dashboard you are building.

But after you add a title and subtitle, the lower bars drop out of view.

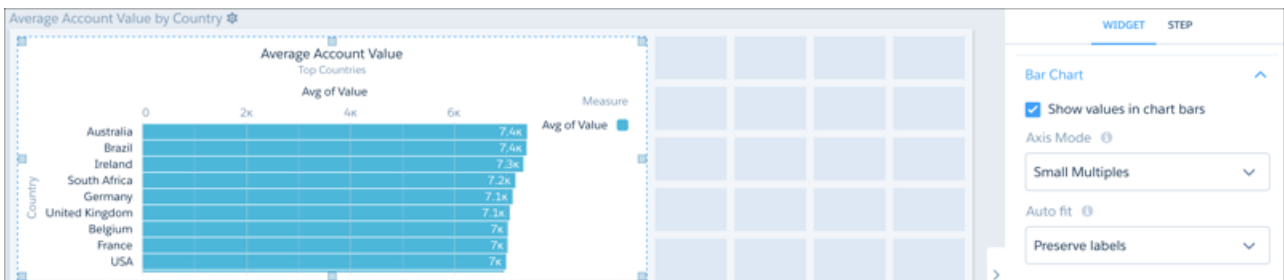

To bring all the bars back into view, choose **Fit** from **Auto fit**.

If you resize the bar chart while arranging the dashboard, you could lose the labels.

To restore the labels, choose **Preserve labels** from **Auto fit**.

Heat Maps

Use a heatmap to visually enhance high and low-value data when there's a single measure and multiple dimensions. The heatmap chart is found in the Wave dashboard designer, classic designer, and explorer.

Map Charts

Use a map if you have data with a geographical component that can shade areas in proportion to mapped values, allowing for visual pop-out of high-value areas. The map chart is found in the Wave dashboard designer and classic designer.

Data for map charts must contain geographical names corresponding to the geographical entities represented on the map. Wave map charts are not case-sensitive, but specific codes or names for geographical entities such as US states and world countries are expected.

For maps of the USA, each row of data must contain a single field identifying the state by its two-letter postal code (recommended) or its full common name. A row with data linked to the state of California, for example, must have an identifying field with "CA" or "California", but not "Calif".

For global maps, the identifying country names must follow ISO 3166-1 (alpha 3) three-letter code (recommended) or be spelled out using the country names set by ISO 3166-1 (alpha 3). A row with data linked to the United Kingdom, for example, must have an identifying field with "GBR" or "United Kingdom", but not "Great Britain".

Properties of Maps

The map chart is configured with the properties in the Wave dashboard designer. These properties have equivalent JSON properties.

This is an example map JSON with a United States map.

```
{
  "visualizationType": "choropleth",
  "step": "step_newmap",
  "map": "US States",
  "legend": {
    "show": false,
    "inside": false,
    "showHeader": true,
    "position": "right-top"
  },
  "title": {
    "label": "",
    "subtitleLabel": "",
    "align": "center"
  },
  "theme": "wave",
  "lowColor": "#C5DBF7",
  "highColor": "#1674D9",
  "trellis": {
    "enable": false,
    "type": "x",
    "chartsPerLine": 4
  }
}
```

Other available values for the `map` property are:

"World Countries", "Americas", "North America", "South America", "Central America", "Caribbean", "Europe", "Eastern Europe", "Northern Europe", "Southern Europe", "Western Europe", "Central Europe", "Scandinavia", "Asia", "South Asia", "South East Asia", "East Asia", "Australasia", "Africa", "East Africa", "Middle Africa", "North Africa", "Southern Africa", "Western Africa", "EMEA", "APAC".

Custom Map Charts

Using map charts that can shade areas in proportion to mapped values allows for visual pop-out of high-value areas. You can use custom maps with geographical units or to illustrate any type of area that can be represented by polygons. Custom map charts can be used in the Wave dashboard designer and classic designer.

Use a custom map if you have data with a geographical component that doesn't match any of the standard maps provided by Wave charts, such as custom regions. Other areas that can be represented with GeoJSON, such as stadium seat sections, city blocks, or floor plans, can also be represented as a map in Wave. Data is overlaid on a custom map using either an id or name property as a key.

Custom map charts in Wave can be created from GeoJSON with a geometry type of Polygon or MultiPolygon. See the [reference section](#) on page 4133 for more information.

Create a Custom Map Chart

Create a custom map by uploading a GeoJSON file containing the data that defines the map.

1. While logged in to your Salesforce org, navigate to the URL formed by appending `/analytics/wave/web/custommap.apexp` to your org's base URL.

For example, if your org's base URL is "https://na30.salesforce.com", go to `https://na30.salesforce.com/analytics/wave/web/custommap.apexp`.

2. Click **New**.

The screenshot shows the Salesforce Analytics Custom Map List View interface. The page has a sidebar on the left with navigation options under 'Administer' and 'Build'. The main content area is titled 'Custom Map List View' and contains two tables: 'Available list of GeoJSONs' and 'Available list of Maps'. The 'New' button is highlighted with a red box.

Available list of GeoJSONs

GeoJSON Name	GeoJSON Label
polyBrazil_jname	polyBrazil_jlabel
floorPlan	Floor Plan

Available list of Maps

Map Name	Map Label
polyBrazil_mname	polyBrazil_mlabel
myFloorPlan	my floor plan

The insertion window for a new custom map appears. It has 2 panels, one for the GeoJSON and one for the map itself.

EclairNG Custom Map

Insert Custom Map Definitions

Enter a GeoJSON Definition and Associated Map Params

Results

- Fill in the required fields (shown in red) in the GeoJSON section and choose the GeoJSON file to load.

GeoJSON Label*

GeoJSON Definition* sales_territories.json

GeoJSON Name*

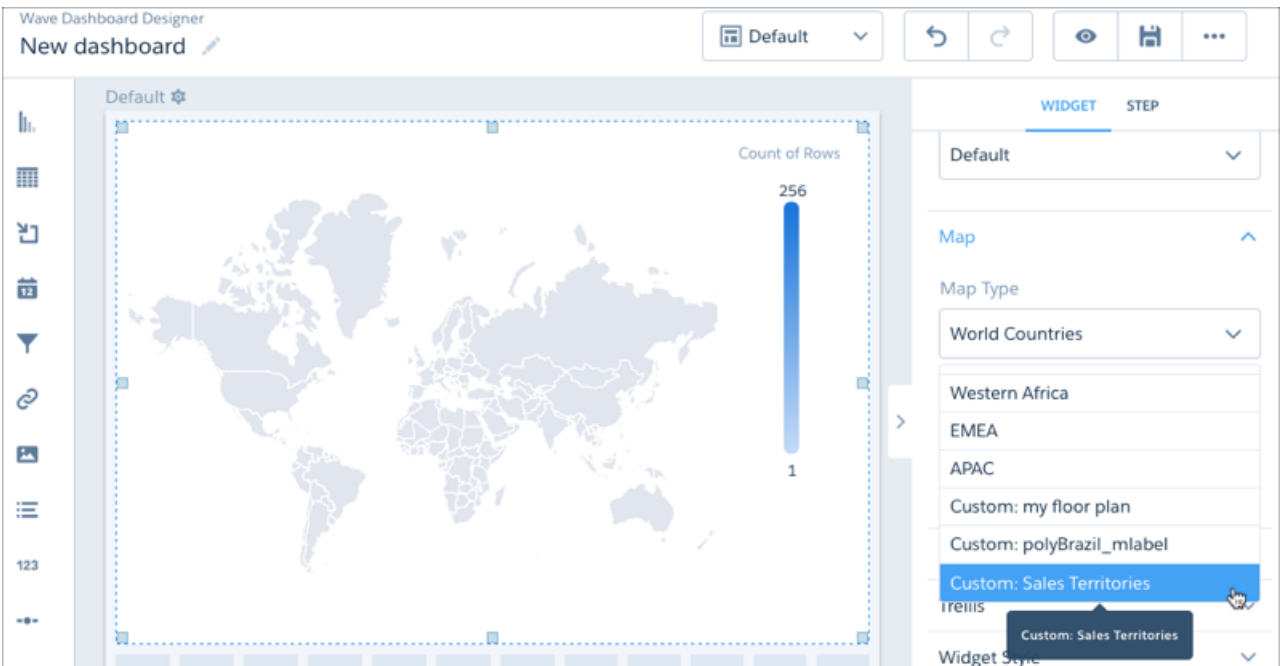

The GeoJSON name and label are used in the custom-map administration screens.

- Click **Insert** and look for a confirmation message in the Results section.
- Fill in the required fields (shown in red) in the map section.
The map name and label are used in Wave.
- Choose a projection based on the type of geo data you are uploading, and choose the GeoJSON definition you created.

Bounding Box Top	<input type="text"/>
Bounding Box Bottom	<input type="text"/>
Bounding Box Right	<input type="text"/>
Bounding Box Left	<input type="text"/>
Map Label*	Sales Territories
Map Name*	Sales Territories
Projection*	Mercator
GeoJSON	sales_territories

Mercator is most suitable for traditional geographical maps. Use AlbersUSA for a map of the United States of America that includes Hawaii and Alaska near the rest of the United States. Use Equirectangular for simple geometric shapes such as floor plans, city blocks, or zip-code areas.

7. Click **Insert Map** and look for a confirmation message in the Results section.
8. To see the map, navigate to Wave, choose the map chart, and click **Map Type**.

You must have appropriate step data clipped to the Wave dashboard designer to enable map charts. With trellis off, 1 measure and 1 grouping are required.

Properties of Custom Maps

Proper formatting of the underlying GeoJSON is critical for successfully overlaying data onto a custom map. For improved presentation, it may be necessary to adjust the map's bounding-box coordinates to zoom in on the overlaid areas.

GeoJSON Structure

Standard GeoJSON typically has a structure that contains feature blocks similar to the following:

```
{
  "type": "Feature",
  "geometry": {
    "type": "MultiPolygon",
    "coordinates": [
      [125.6, 10.1],
      [126.1, 11.0], ...
    ]
  },
  "id": "SI",
  "properties": {
    "name": "Sandwich Islands",
    "property1": "value1"
  }
}
```

Each feature block defines a shape, or map area. To correctly overlay data onto the map, the data must have a column with values uniquely matching one of the properties in the GeoJSON. For example, if each feature block in the GeoJSON has a property called "id" with values that exactly match the values in one of the columns in the data, then that column must also be named "id". That way "id" can be used as key to match rows of data to specific shapes in the GeoJSON. In the example, "id": "SI" would match a row in the id column that had the value "SI".

Wave has an important requirement for the GeoJSON structure regarding the property that's used as a key. It has to be at the same level as "properties". Often, however, it's a child of "properties":

```
{
  "type": "Feature",
  "geometry": {
    "type": "MultiPolygon",
    "coordinates": [
      [125.6, 10.1],
      [126.1, 11.0], ...
    ]
  },
  "properties": {
    "name": "Sandwich Islands",
    "id": "SI",
    "property1": "value1"
  }
}
```

The original GeoJSON must be edited to move the key property up one level. In a single feature block, doing that is trivial. But a large GeoJSON file could contain hundreds of GeoJSON feature blocks. Using a script is recommended.

Bounding Boxes

You can "zoom" into a map area by redefining the area of the map to display. This is done by giving the boundaries of the new area in terms of coordinates. These coordinates are called a bounding box. A bounding box limits the map to the shapes within the coordinates, or borders, of the bounding box.

When you create a map from a GeoJSON without a bounding box, every defined shape is displayed as an area on the map. For example, the following map of zip codes in the Los Angeles area does not use a bounding box:

The areas of interest, where data has been overlaid on the map, are indicated by the red rectangle. To make the map more readable, the view should zoom in on the zip-code areas that have data. The coordinates (in this case, latitude and longitude) bordering the area of interest can be found using a GeoJSON tool that gives the coordinates of the areas in the map. A second map is then created from the original GeoJSON, this time with bounding-box coordinates that were found:

EclairNG Custom Map

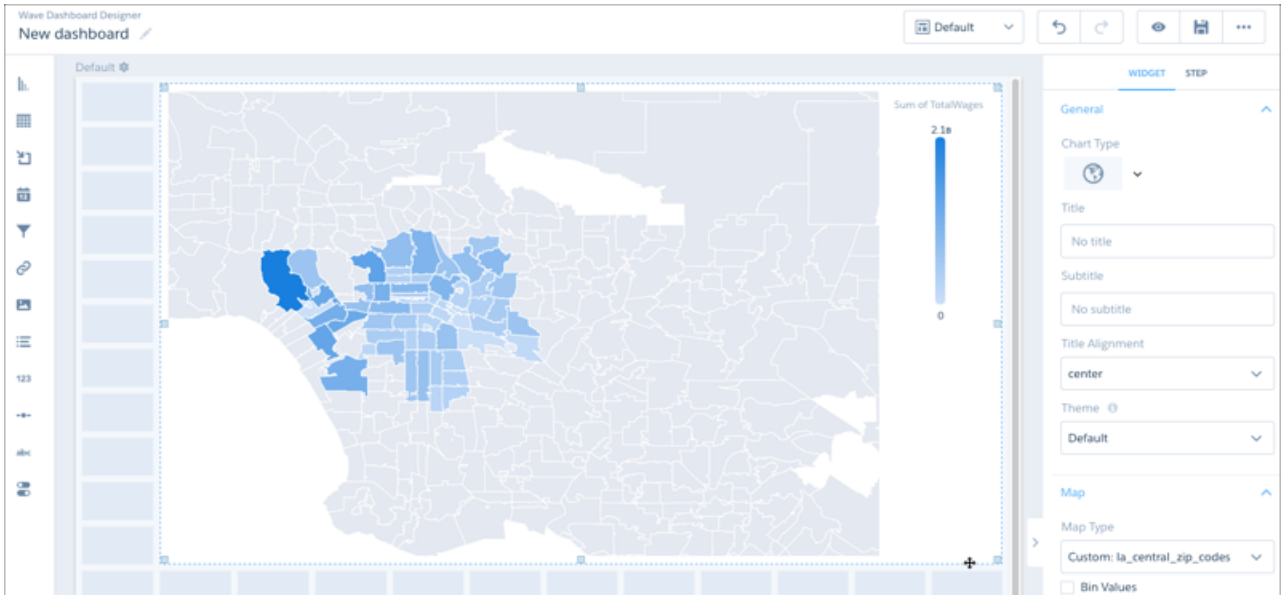

Insert Custom Map Definitions

Enter a GeoJSON Definition and Associated Map Params

GeoJSON Label*	<input type="text"/>
GeoJSON Definition*	<input type="button" value="Choose File"/> No file chosen
GeoJSON Name*	<input type="text"/>
<input type="button" value="Insert"/>	

Bounding Box Top	<input type="text" value="34.2"/>
Bounding Box Bottom	<input type="text" value="33.85"/>
Bounding Box Right	<input type="text" value="-117.65"/>
Bounding Box Left	<input type="text" value="-118.65"/>
Map Label*	<input type="text" value="la_central_zip_codes"/>
Map Name*	<input type="text" value="la_central_zip_codes"/>
Projection*	<input type="text" value="Equirectangular"/>
GeoJSON	<input type="text" value="la_zip_codes"/>
<input type="button" value="Insert Map"/>	

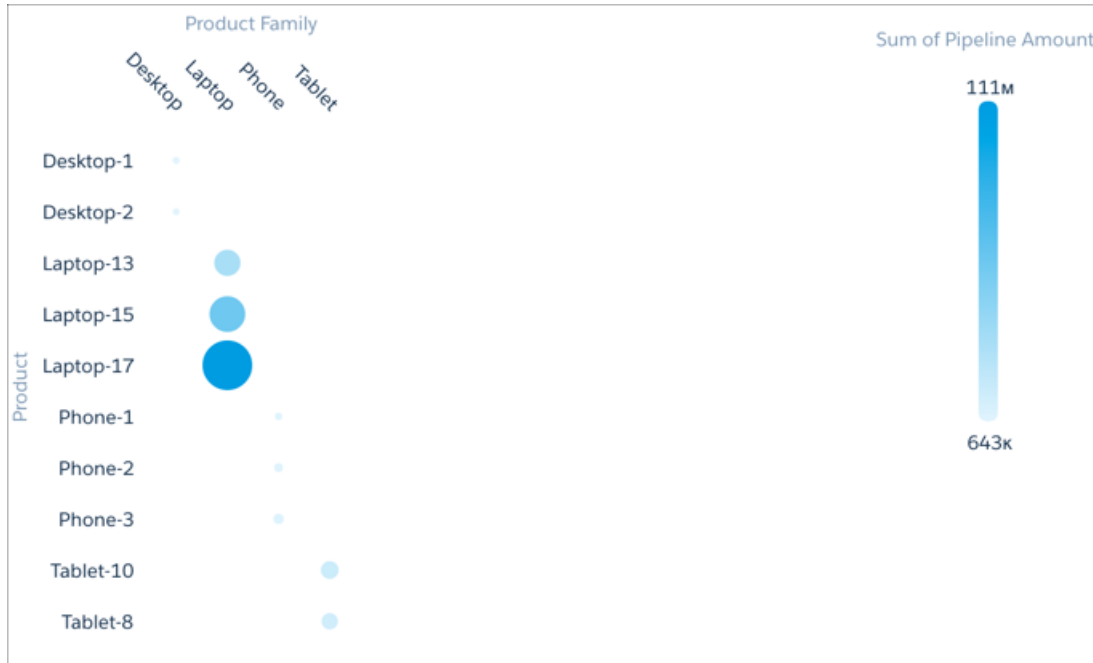

When viewed in Wave, this new map is zoomed in on the area of interest:

Matrix Charts

Use matrix charts (new in Wave dashboard designer) to create a table that represents measures visually, allowing you to quickly spot extreme values. The matrix chart is found in the Wave dashboard designer, classic designer, and explorer.

For example, you can show which product families are generating the most opportunities.

Pyramid Charts

Use a pyramid chart to visually highlight relative sizes of stacked dimension values. The pyramid chart is found in the Wave dashboard designer.

Create a Pyramid Chart

A pyramid chart is a good choice for presenting related measures for one particular dimension, such as accounts and account values in a particular category.

For example, you're interested in looking at the overall value and number of accounts in countries where your company does business. A bar chart can show that data in order, but it's not necessarily a compelling or easy-to-read visualization.

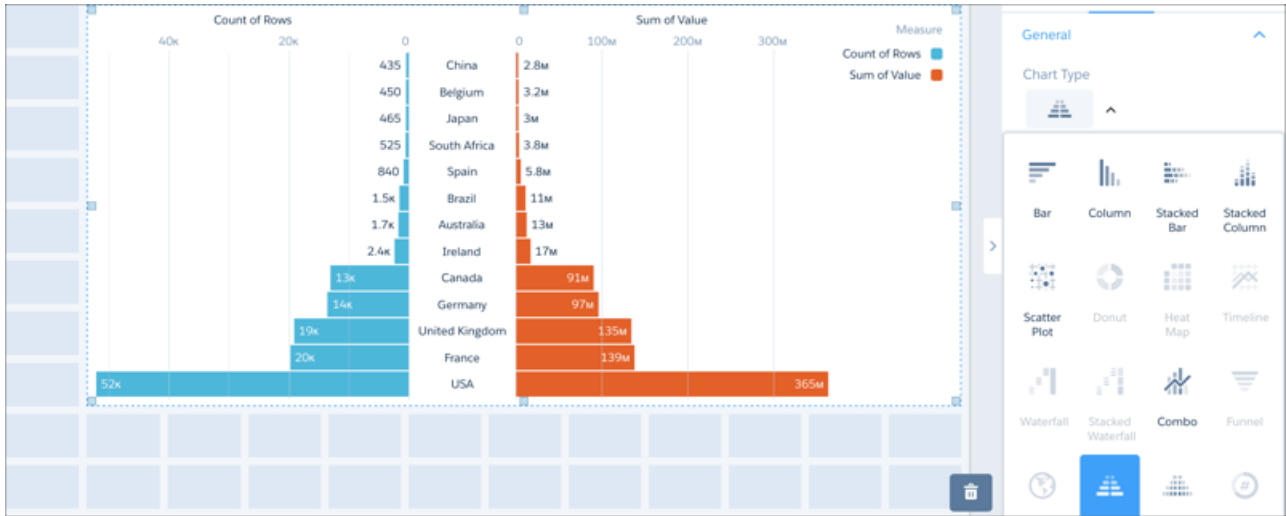

Changing it to a pyramid chart improves both overall appearance and readability.

1. Clip the bar chart to Wave dashboard designer.

A different color is automatically applied to the bars for the second measure.

2. Change the chart type to pyramid.

3. Edit the title of the left axis, remove the center axis, and position the legend at top-center.

These adjustments improve the pyramid's appearance, but the loss of the country names for the center axis could make it a little less clear. However, when the chart is saved to a dashboard, floating the pointer over a bar reveals an informative tooltip.

Radar Charts

Use radar charts to display a small dataset with one dimension and at least three measure columns. The radar chart is found in the Wave dashboard designer.

Create a Radar Chart

A radar chart is useful when you're trying to visually represent a dimension along three or more measure axes which have different scales. For example, if your business tracks key metrics for specific product segments, you want to visualize the product segments along with those metrics.

1. In Wave, group the data by product segment, then add the measures that reflect the key metrics.

Using a stacked bar chart to compare the product segments along the chosen measures, it's difficult to evaluate the performance of the different segments relative to each other.

2. Clip the lens to Wave dashboard designer, then choose **Metrics Radar** from **Chart Type**.
3. Enter a title for the chart and make other adjustments as necessary.

Rating Charts

Use a rating chart to get a sense of how well a measured quality, such as customer satisfaction, is meeting expectations. The rating chart is found in the Wave dashboard designer.

Create a Rating Chart

If you've set a goal for, as an example, customer satisfaction in each of the countries where your company operates, rating charts are a good choice for showing how close you are to that goal.

You've collected, averaged, and loaded the data from the surveys. Now you want to present it in a way that makes sense for customer satisfaction scores. Each rating chart can display 1 value per country, and highlight value ranges.

1. In Wave Analytics, create a lens using your customer-satisfaction dataset, then clip it to Wave dashboard designer.

2. Change the chart type to **Rating**.
3. Set the breakpoint values and associated band colors.

The breakpoints set the range values where the color bands transition. The maximum is 10, and you'd like to exceed 7.2 in each country.

4. Set the **Trellis** type to **Wrap** so the charts are easier to view all at once without having to scroll.

Values above 7.2 are easy to spot due to the two-color configuration of the rating chart. It's also easy to see which countries are close to the desired value.

Scatter Charts

Use a scatter chart to visualize correlation between two groups of data. The scatter chart is found in the Wave dashboard designer, classic designer, and explorer.

Timeline Charts

Use a timeline chart to show how a value changes over time. The timeline chart is found in the Wave dashboard designer, classic designer, and explorer.

Treemap Charts

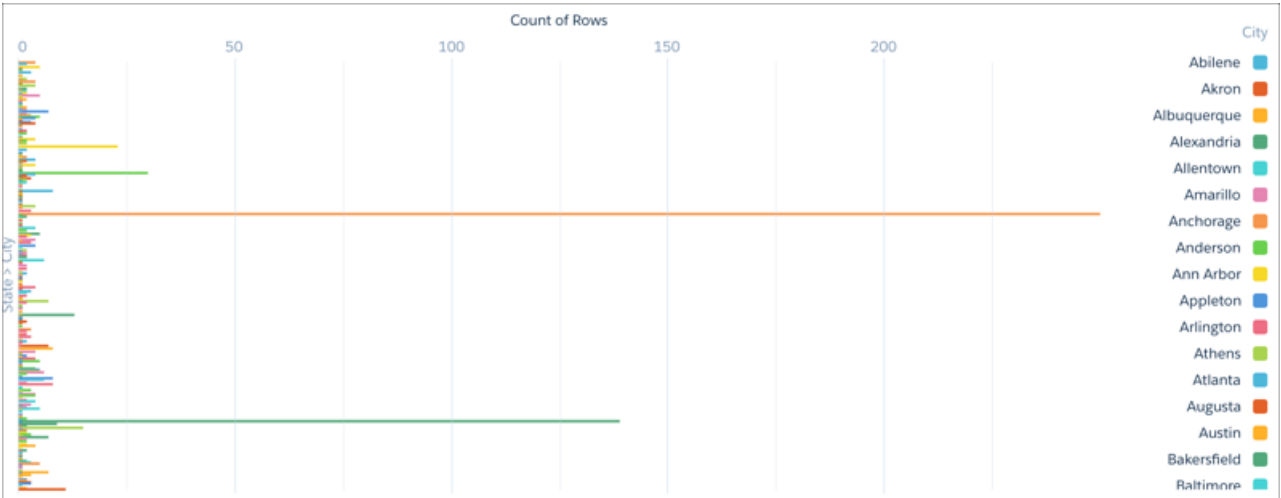

Use treemaps to visualize hierarchical quantitative data, where containing rectangles designate relationship using color, and "leaf" rectangles represent quantity using area. The treemap chart is found in the Wave dashboard designer.

Create a Treemap Chart

Treemap charts are especially useful for visualizing groupings that are difficult to organize well using other types of charts.

For example, you can show the number of opportunities by city in each state in a way that reveals top markets.

1. In Wave, group opportunities by state, then group by city.
2. Clip the lens to Wave dashboard designer, then view the resulting chart in the dashboard.

With the groupings in a bar chart, it's both difficult to take in the entire bar chart in a glance or quickly locate top markets.

3. Choose **Treemap** from **Chart Type**.

In the treemap chart, high-value cities are easy to spot. Using tooltips, you can view details for any rectangle representing a city.

Vertical Bar Charts

Use a vertical bar chart (also called column chart) to show relative counts of things, such as leads or dollars. The vertical bar chart is found in the Wave dashboard designer, classic designer, and explorer.

Waterfall Charts

Use a waterfall chart to show the cumulative effect of sequentially introduced positive or negative values with breakdowns of value totals. Also known as "flying bricks" or "Mario" charts. To include breakdowns of value totals, use a stacked waterfall chart. The waterfall chart is found in the Wave dashboard designer and classic designer.

Build Wave Dashboards

Build a Wave dashboard to continuously monitor key metrics of your business, analyzing the results by key dimensions, like region, products, and time period. You can add interactive charts that synthesize information into an easy-to-read format. You can add tables to show low-level record details and create columns with calculated values. You can also add filters to allow the dashboard viewer to focus the results.

Wave provides the following designers to build dashboards.

Classic designer

This legacy designer enables you to build basic dashboards.

Wave dashboard designer

This newer designer has significant usability enhancements compared to the classic designer, which help you build dashboards more efficiently.

After the admin grants you access, you can use either designer to create and edit dashboards. You can also convert dashboards built in the classic designer to the Wave dashboard designer.

[What Is a Dashboard?](#)

A Wave dashboard is a collection of widgets that work together to tell a data story from multiple angles. Depending on what you want the dashboard to show or how to behave, you can add different widgets, such as key performance indicators, charts, tables, filters, and images.

[Key Differences Between the Classic Designer and Wave Dashboard Designer](#)

Consider the following differences between the classic designer and the Wave dashboard designer.

[Build a Dashboard with the Wave Dashboard Designer](#)

The Wave dashboard designer is the newer designer that offers additional features to help you build dashboards more quickly and easily. Use a template to create a dashboard with a predefined layout. Create customized layouts to optimize the display of a dashboard on different types of devices, like mobile phones, tablets, and desktops. Use the wizards to quickly build widgets. Use drag-and-drop, snap-to-grid, and browser reflow to effortlessly add, position, and align widgets in a dashboard.

[Build a Dashboard with the Classic Designer](#)

The classic designer is the legacy designer that enables you to build basic Wave dashboards.

[Keyboard Shortcuts For Wave Dashboards and Lenses](#)

You can do some basic actions from your keyboard. The dashboard designer shortcuts vary based on whether you are using the classic designer or Wave dashboard designer.

[Best Practices for Building Wave Dashboards](#)

Follow best practices to design and build useful, effective Wave dashboards, while minimizing rework and addressing potential gaps.

[Convert Your Dashboard to the Wave Dashboard Designer](#)

To take advantage of its new features, convert dashboards created in the classic designer to the Wave dashboard designer.

What Is a Dashboard?

A Wave dashboard is a collection of widgets that work together to tell a data story from multiple angles. Depending on what you want the dashboard to show or how to behave, you can add different widgets, such as key performance indicators, charts, tables, filters, and images.

When you share Wave Analytics data via a dashboard, you're setting up your audience members to do some exploring of their own, without turning them loose on the whole data set.

One use of a dashboard is to provide a focus for your audience. A dataset can contain vast amounts of data. Some of that data is relevant to specific questions that your audience has; some of that data is irrelevant noise. Data that's critical to one set of questions is sometimes noise in relation to another set of questions.

Keep in mind that even though we call it a dashboard, we're actually doing much more with this interface than we do with a traditional dashboard in a car. This dashboard doesn't just tell us what's changed; it invites us to dig deeper into the underlying data. It's like using the speedometer in a car to tell us not just how fast we're going but how our speed has changed at various points in our trip, how traffic conditions ahead of us are changing, and how those changes affect our arrival time.

[Key Elements of a Wave Dashboard](#)

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around, and explore!

[Build a Dashboard with the Wave Dashboard Designer](#)

[Build a Dashboard with the Classic Designer](#)

Key Elements of a Wave Dashboard

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around, and explore!

You read a Salesforce Wave dashboard interactively by clicking its displayed elements. Every element is a picture of a live, filtered query.

Selection-Based Filters

A selection-based filter lets you apply whatever filters you wish while viewing the dashboard. For example, set the minimum and maximum values in a range widget to make the dashboard show the amounts that fall within that range. These types of filters are often tied to each other so that you can progressively drill deeper. For example, use one filter to look at sales of a product. Then use the next to filter sales by region. Finally, use another to filter sales by account. The dashboard shows the results based on all three filters. There are different types of selection-based filter widgets: date, list, range, and toggle.

Key Performance Indicators

Some information is best measured by a single number, also known a key performance indicator. Some number elements can be filtered based on selections in charts and filters. For example, in a bar chart that shows individual salespeople’s pipelines, click a bar to focus on a particular person’s pipeline. Notice that the number changes from showing the total value for all salespeople to show the value for the selected person.

Charts

A rich variety of charts shows you data from multiple angles. Many parts of a chart are interactive. For example, click a bar in a bar chart and watch what happens. Clicking a bar filters the query that the bar chart represents. Your revision changes other values in this chart, values in other charts, and number displays.

Tables

A table provides the record-level details. For example, a chart can show you a performance summary for each region, but the table can show you the opportunity-specific details. You can sort tables to show the top and bottom records. You can also create calculated columns in tables to compute values based on existing data.

Key Differences Between the Classic Designer and Wave Dashboard Designer

Consider the following differences between the classic designer and the Wave dashboard designer.

- The Wave dashboard designer provides a user interface for creating layouts for different types of devices. With the classic designer, you have to set up mobile layouts using the dashboard JSON.

- The Wave dashboard designer provides wizards that walk you through creating widgets, with their underlying steps created behind the scenes. With the classic designer, you have to manually create the lenses in explorer, clip them, and then apply them to widgets. (A “step” in the Wave dashboard designer is the same as a “lens” in the classic designer.)
- The Wave dashboard designer uses snap-to-grid, letting you quickly position, align, and resize widgets. In the classic designer, you specify pixels to define each widget’s position and size.
- You can create steps, including static steps, from within the Wave dashboard designer. In classic designer, you have to clip the lens from explorer to the designer or build the step using JSON.
- The Wave dashboard designer allows you to hide steps and properties to give you more workspace when designing a dashboard. This isn’t possible in the classic designer.
- The Wave dashboard designer has a single table widget that can be used to create a values table or compare table. The classic designer has a separate widget for each type of table.
- Unlike the box widget in the classic designer, the container widget in the Wave dashboard designer groups widgets, which allows you to move them all at once.
- Only dashboards built with the Wave dashboard designer support annotations and notifications.
- Only the classic designer and explorer support the following chart types: parallel coordinates, horizontal dot plot, vertical dot plot, and matrix. When clipped to a Wave dashboard designer, these chart types convert to a bar chart.

[Build a Dashboard with the Wave Dashboard Designer](#)

[Build a Dashboard with the Classic Designer](#)

Build a Dashboard with the Wave Dashboard Designer

The Wave dashboard designer is the newer designer that offers additional features to help you build dashboards more quickly and easily. Use a template to create a dashboard with a predefined layout. Create customized layouts to optimize the display of a dashboard on different types of devices, like mobile phones, tablets, and desktops. Use the wizards to quickly build widgets. Use drag-and-drop, snap-to-grid, and browser reflow to effortlessly add, position, and align widgets in a dashboard.

The Wave dashboard designer is enabled by default. If you can't access it, your admin might have disabled it.

1. [Create a Wave Dashboard with a Template](#)

Each template has a unique layout with empty widgets (widgets without steps), sections, and a color scheme. To populate the widgets with your data, use the widget wizards. To create your own layout, choose the blank template.

2. [Add Widgets to the Dashboard](#)

Widgets are the basic building blocks of a dashboard. In the Wave dashboard designer, you can add different widgets to perform functions. For example, widgets can calculate key performance indicators, filter dashboard results, visualize your data using interactive charts, and show record-level details in tables.

3. [Make the Dashboard Widgets Interactive](#)

Wave dashboards have unique features that allow you to make the widgets interactive. For example, widgets in the dashboard can be filtered to show only results for the region that’s selected in a list widget. Or, when the value of a number widget can change to red when it falls below a threshold.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

4. [Set Initial Filter Selections in the Dashboard](#)

If the Wave dashboard contains filter selection widgets or charts, you can set initial selections that are applied when the dashboard first opens. For example, you can use a selection to filter the dashboard to show only opportunities owned by the logged in user. While viewing the dashboard, the user can change the selections to filter the results differently or remove the filters altogether.

5. [Generate Unique Wave Dashboard Layouts for Different Devices](#)

After you add widgets to the dashboard, optimize the layout for each device on which the dashboards can be viewed. For example, you can remove widgets from a mobile phone layout to reduce the dashboard size for the smaller screen. You can also move widgets around in one layout and it doesn't affect the other layouts.

[What Is a Dashboard?](#)

[Best Practices for Building Wave Dashboards](#)

[Key Differences Between the Classic Designer and Wave Dashboard Designer](#)

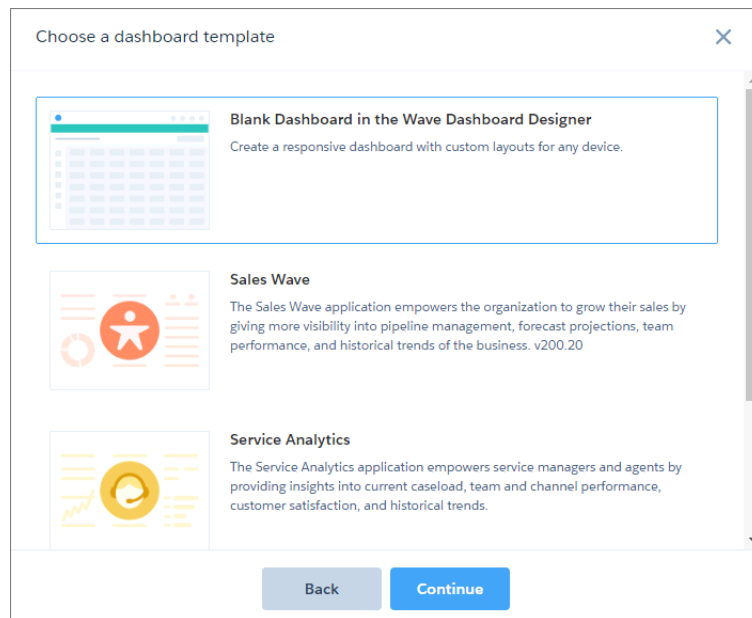

[Grant Users Access to the Wave Dashboard Designer and Classic Designer](#)

[Build a Dashboard with the Classic Designer](#)

Create a Wave Dashboard with a Template

Each template has a unique layout with empty widgets (widgets without steps), sections, and a color scheme. To populate the widgets with your data, use the widget wizards. To create your own layout, choose the blank template.

1. From the home page, select **Create > Dashboard**.

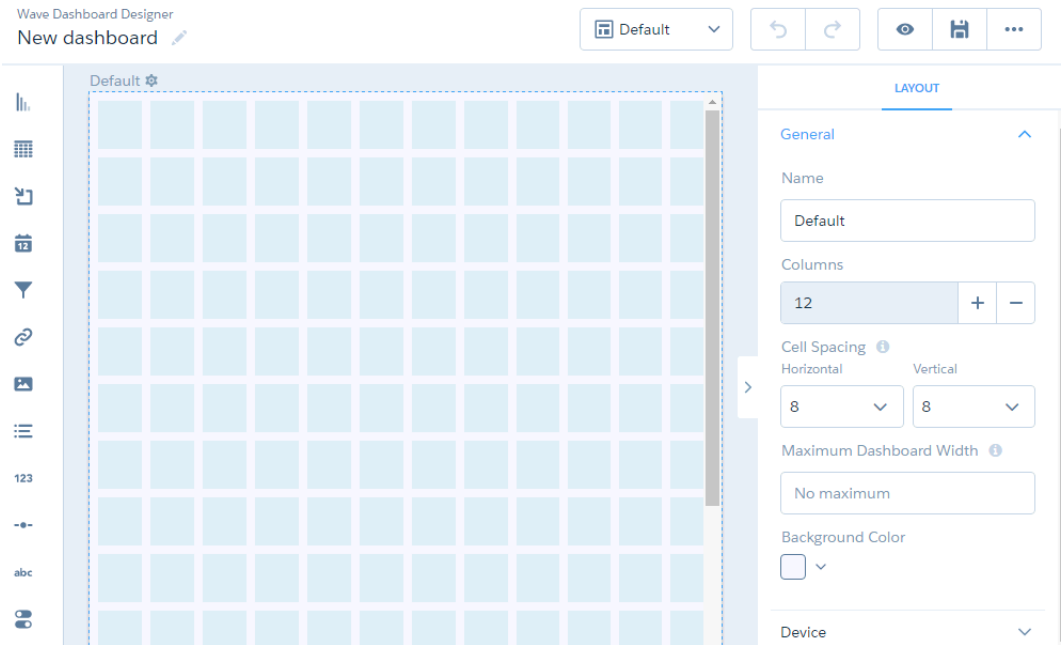

2. Select a template, and then click **Continue**.
For example, select **Blank Dashboard in the Wave Dashboard Designer**.

USER PERMISSIONS

To create a dashboard:

- "Create and Edit Wave Analytics Dashboards"

In addition to the blank template, you can choose a template with a prebuilt dashboard design. These templates are built for Wave dashboard designer only.

3. To edit the dashboard, click .
4. If you selected a prebuilt template, you can add a step to each widget by clicking the icon inside an empty widget. A wizard guides you through adding the step. When you complete the wizard, Wave populates the widget based on the results of the step. Wave also adds the step to the step panel.
5. To save the dashboard to an app, click .
6. Enter a title and description, and then select the app in which you want to save the dashboard. The permissions on the app determine each user's access to the dashboard. To ensure that the right users have the right access to the dashboard, review the app permissions.
7. Click **Save**.
8. Click  and then click **Dashboard Properties** to set the default widget properties. When you create a widget, you can specify whether the widget uses the default properties. Use defaults to ensure that the background and borders of all widgets are consistent.

Dashboard Properties

These properties are default widget properties that you can apply to each widget to ensure a consistent appearance. The properties apply only to dashboards created in the Wave dashboard designer.

Dashboard Properties

These properties are default widget properties that you can apply to each widget to ensure a consistent appearance. The properties apply only to dashboards created in the Wave dashboard designer.

Property	Description
Background Color	Default background color for widgets
Border	Default border around widgets
Border Color	Default color for widget borders
Border Width	Default width of widget borders (in pixels)
Border Radius	Default roundness of the corners of widget borders

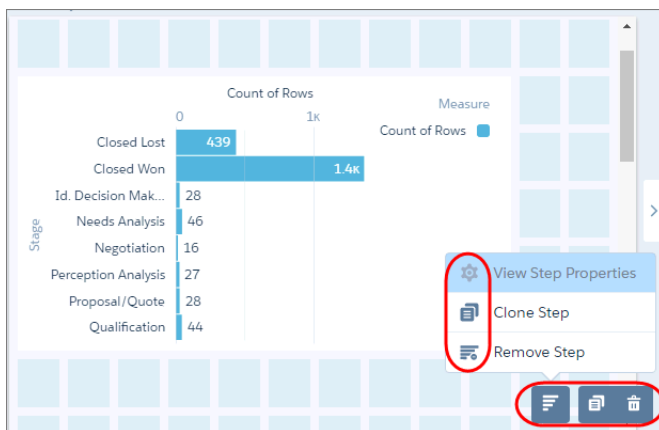

Add Widgets to the Dashboard

Widgets are the basic building blocks of a dashboard. In the Wave dashboard designer, you can add different widgets to perform functions. For example, widgets can calculate key performance indicators, filter dashboard results, visualize your data using interactive charts, and show record-level details in tables.

Some widgets require a step. A step returns the data. A widget determines how to use or display the data. For example, a step calculates the average opportunity amount, grouped by region. A bar chart widget displays the results in a bar chart format with each bar showing the average opportunity amount for a region. If the step is faceted, when you select a bar in the chart, other widgets are filtered, showing results for only the selected region.

Most widgets have a wizard that you can use to build the widget, including the underlying step. You can also build your own step and apply it to a widget. Multiple widgets can use the same step, unless it's a date or range widget. In that case, no other widgets can use the step.

Clone widgets to create similar looking components in a Wave dashboard. For example, you can clone chart widgets and change the chart type to get a different view of the same results. You can also quickly create three number widgets and swap out their steps to show total open, total won, and total lost opportunity amounts. To swap out a step, remove the step from the widget and then add a new step to it. To clone widgets, remove steps, clone steps, and view step properties, select the widget while editing the dashboard, and then click the appropriate button.

To configure how a widget displays, set the properties in the Widget tab. For example, you can show data values and the axis title for a chart widget. You can also apply default properties to ensure that widgets look consistent, like having the same border and background color.

To configure how the widget behaves, set step properties in the Step tab. For example, you can choose which measure to display in the widget when its step contains multiple measures. Changes to step properties impact all widgets that are built on the step.

[Add Number Widgets to Include Key Metrics](#)

Key metrics help you track critical measurements of your business. You can add other widgets to the Wave dashboard to filter the key metric results to focus on a particular area. For example, you can show the total number of open cases or total opportunity amount for the last quarter or the northern region.

[Add Chart Widgets to Visualize Data](#)

Charts in a Wave dashboard allow you to visually summarize and trend your data. For example, a donut chart can show the distribution of opportunities across industry type. Because charts are interactive, dashboard viewers can select a segment of a chart to filter the results of other faceted widgets.

[Add a Global Filter Widget to Exclude Dataset Records from the Dashboard](#)

Global filters restrict the content available to all users who view the Wave dashboard. Use a global filter to apply the same filter to multiple steps in the dashboard. For example, if the dashboard has two charts comparing two sales reps' performance, both charts should have the same filters so you are comparing apples to apples. You can add multiple global filter widgets to a dashboard. You can also specify which steps to apply the global filter to. Unlike selection-based filter widgets, a global filter can't be changed while previewing or presenting the dashboard.

[Add Selection-Based Filter Widgets to Enable Users to Filter the Results](#)

Users viewing the dashboard can make selections in these widgets to apply whatever filters they wish. These widgets give them the ability to slice and dice the data to view results from different angles. For example, the dashboard viewer can select a region in a list widget to focus the dashboard results on a specific sales location. Unlike with a global filter or query filter, the viewer can change the selection to filter the results differently or remove the filter altogether.

[Add a Table Widget to Show Record Details and Create Calculated Columns](#)

You can add different types of tables in a Wave dashboard. To view record-level details, add a values table. For example, this type of table can show case details, like how long the case has been open and who owns it. To create custom columns in a table based on calculations from existing fields, add a compare table. If the underlying step contains at least one grouping, you can create a pivot table.

[Add a Container Widget to Create Sections in the Dashboard](#)

Use sections in a Wave dashboard to group related widgets. For example, you can use a container widget to create a filter panel on the left side of the dashboard to store all filter selection widgets. To distinguish the filter panel from the rest of the dashboard, you can apply a background color and border to the container. When you move a container, the contained widgets also move while maintaining their spacing and alignment.

[Add an Image Widget to Display Graphics in the Dashboard](#)

You can include company logos to brand the Wave dashboard, icons to categorize results, or graphics to animate the dashboard.

[Add Text Widgets to Label Parts of the Dashboard](#)

Label your Wave dashboard so that users understand what they are looking at. You can also add text that describes the dashboard or provides usage information for widgets.

[Add a Link Widget to Link to a Wave Lens or Dashboard](#)

Instead of packing all possible key performance metrics, charts, and tables into a single dashboard, break up the content into multiple dashboards. Then use link widgets to tie the dashboards together. Dashboard viewers appreciate not having to figure out what to focus on in a busy dashboard. You can also use links to create analysis paths for users to follow or to link related assets.

[Create Steps in the Wave Dashboard Designer](#)

Steps return results that are displayed in widgets. For example, a number widget displays the result of a calculation—that calculation is defined in a step. Steps can query a data source, like a dataset or a Salesforce object. They can also be a static list of user-defined values—a static step. You can reuse each step in multiple widgets. In addition to clipping a lens from an exploration, you can use the following ways to create steps in the Wave dashboard designer: use the wizard or create it manually.

Widget Properties for Wave Dashboards

Widget properties define how widgets appear in the Wave dashboard. For example, you can apply labels, backgrounds, and borders. To make widgets look consistent, you can set up default widget properties in the layout and then assign them to each widget. Widget properties vary based on the widget type and the designer used to create them. The properties listed here apply only to widgets created in the Wave dashboard designer.

Step Properties for Wave Dashboards

Step properties define the query that returns results to display in the widget. These properties also specify how the widget behaves and interacts with other widgets in the Wave dashboard. The properties apply to dashboards created in the Wave dashboard designer only.

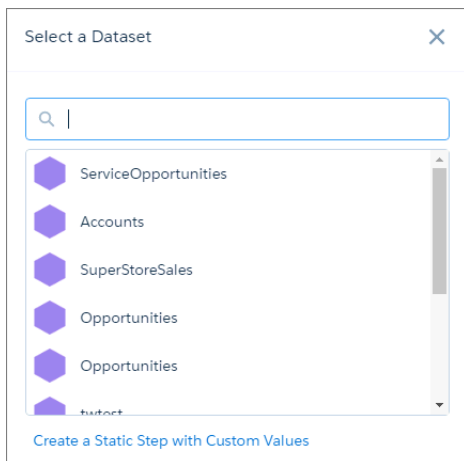

Add Number Widgets to Include Key Metrics

Key metrics help you track critical measurements of your business. You can add other widgets to the Wave dashboard to filter the key metric results to focus on a particular area. For example, you can show the total number of open cases or total opportunity amount for the last quarter or the northern region.

The number widget requires a step that has at least one measure. If the step has multiple measures, you can choose which measure to display—by default, the first measure shows. If you include groupings, the widget displays the measure for the first group in the first defined grouping.

1. Drag the number widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

- b. Select the dataset that contains the measure. Type in the search box if your dataset isn't easy to find.
The explorer shows a bar chart with the Count of Rows measure.
- c. Add measures that you want to show in the widget.

To add a measure, click  **Measure**. To change a measure, select the measure in the explorer and then choose a new one.

- d. If needed, click **Filter** to filter the results.

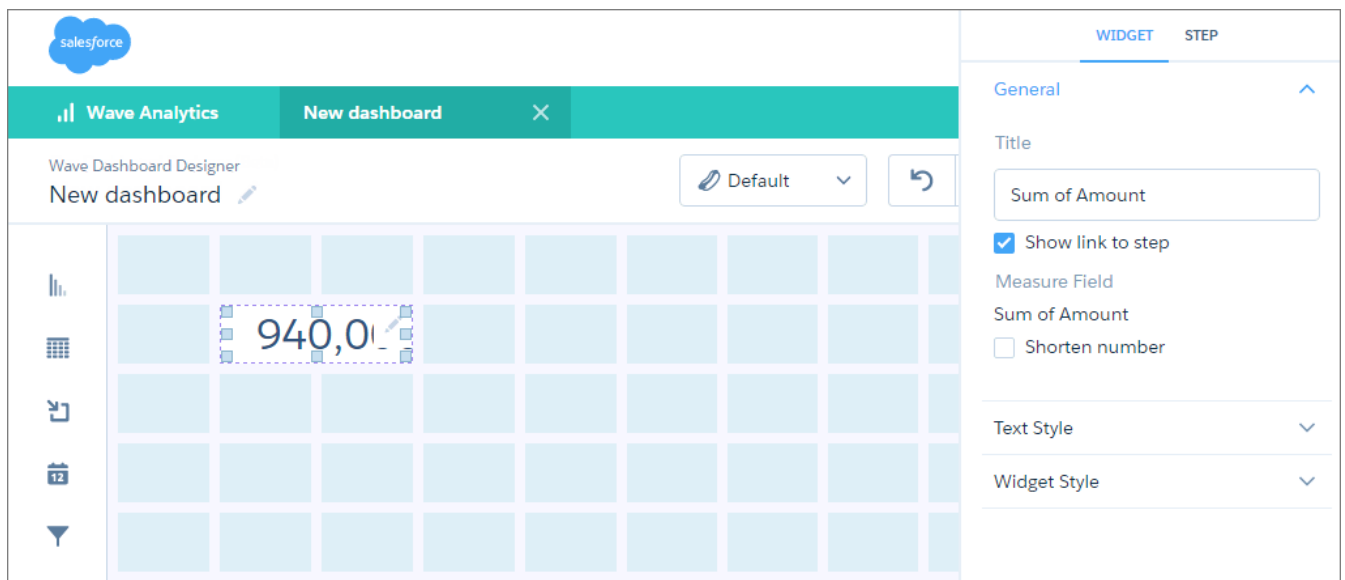

You can add multiple filters.

- e. Click **Save**.

Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard. In addition, the widget shows the calculated measure.

4. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.

When you set a property, the widget immediately shows the effects of your change.

6. To show and set the step properties, click **Step** in the panel.

7. To preview your changes to the dashboard, click .

8. To save your changes to the dashboard, click .

 **Important:** If you close the dashboard without saving it, you lose your changes.

[Widget Properties for Wave Dashboards](#)

[Step Properties for Wave Dashboards](#)

[Create Steps in the Wave Dashboard Designer](#)

Add Chart Widgets to Visualize Data

Charts in a Wave dashboard allow you to visually summarize and trend your data. For example, a donut chart can show the distribution of opportunities across industry type. Because charts are interactive, dashboard viewers can select a segment of a chart to filter the results of other faceted widgets.

Wave supports multiple chart types. Each type has unique widget properties and step requirements. For details about each chart type, see [Visualizing Data With Charts](#).

 **Note:** Unlike the explorer and classic designer, the Wave dashboard designer doesn't support the following chart types: parallel coordinates, horizontal dot plot, vertical dot plot, and matrix. Although you can create a step with these chart types, the Wave dashboard designer converts them to a bar chart when added to a chart widget.

The selection in this widget filters the results of other widgets with faceted steps. You can configure this widget's step to accept single or multiple selections, and specify whether the selections are optional or required. You can also set an initial selection that applies when the dashboard opens. While viewing the dashboard, you can undo the selection or change the selection to filter the results differently.

 **Note:** To enable this widget to filter other widgets, you must enable faceting on its step.

1. Drag the chart widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

- b. Select the dataset on which you want to build the chart.
The explorer shows a bar chart with the Count of Rows measure.
- c. Add measures that you want to show in the widget.
To add a measure, click  **Measure**. To change a measure, select the measure in the explorer and then choose a new one.
- d. If needed, add groupings.

- e. If needed, click **Filter** to filter the results.

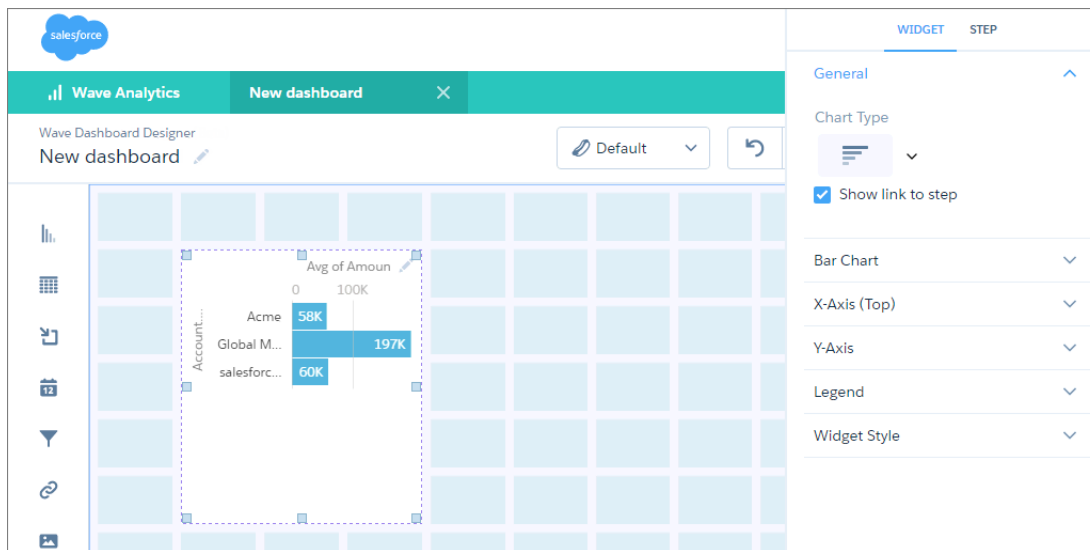

You can add multiple filters.

- f. Click **Save**.

Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard. In addition, the widget shows the results in a bar chart.

4. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.

For example, select a different chart type in the Chart Type widget property. If the step requirements aren't met for a chart type, you can't select the chart type in a widget. For instance, some chart types require steps with only one measure.

6. To show and set the step properties, click **Step** in the panel.

You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required.

7. To set the initial selections that are applied when a user opens the dashboard, click **...**, and then click **Pick Initial Filters**.

You can make initial selections on any chart, date, list, toggle, or range widget. For example, you can select a bar in a bar chart and set that as the initial filter. If the underlying step for the bar chart is faceted, other widgets with faceted steps are also filtered based on this initial selection. While viewing the dashboard, the viewer can change the selection in the chart to filter the results differently or remove the filter altogether.

Note: No selections are made in this widget when the user opens the dashboard unless you pick the initial filter. If the step is configured to require a selection, select the initial filter. Otherwise, the first value in the filter list is used.

8. To preview your changes to the dashboard, click .

9. To save your changes to the dashboard, click .

Important: If you close the dashboard without saving it, you lose your changes.

SEE ALSO:

[Widget Properties for Wave Dashboards](#)

[Step Properties for Wave Dashboards](#)

[Create Steps in the Wave Dashboard Designer](#)

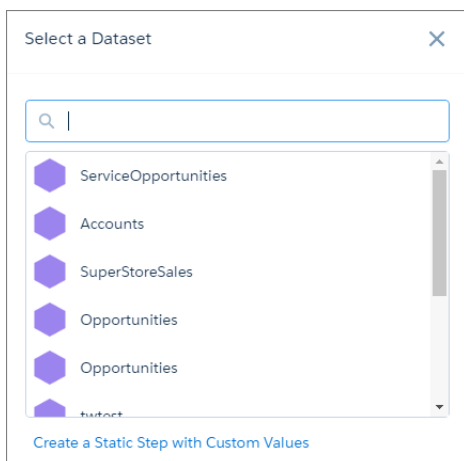

Add a Global Filter Widget to Exclude Dataset Records from the Dashboard

Global filters restrict the content available to all users who view the Wave dashboard. Use a global filter to apply the same filter to multiple steps in the dashboard. For example, if the dashboard has two charts comparing two sales reps' performance, both charts should have the same filters so you are comparing apples to apples. You can add multiple global filter widgets to a dashboard. You can also specify which steps to apply the global filter to. Unlike selection-based filter widgets, a global filter can't be changed while previewing or presenting the dashboard.

The global filter widget requires a step that has at least one filter and no groupings. Each filter can be based on a measure, dimension, or date field. All filters defined in the step are applied to the global filter.

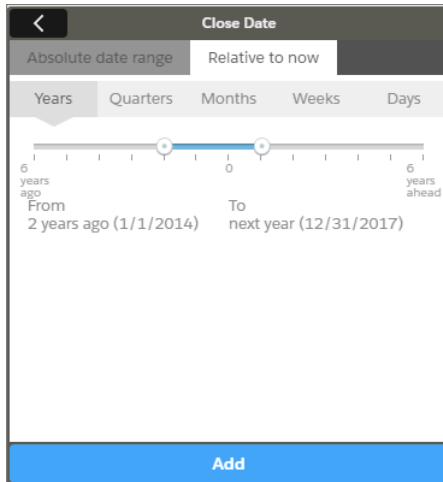

1. Drag the global filter widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

Note: If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

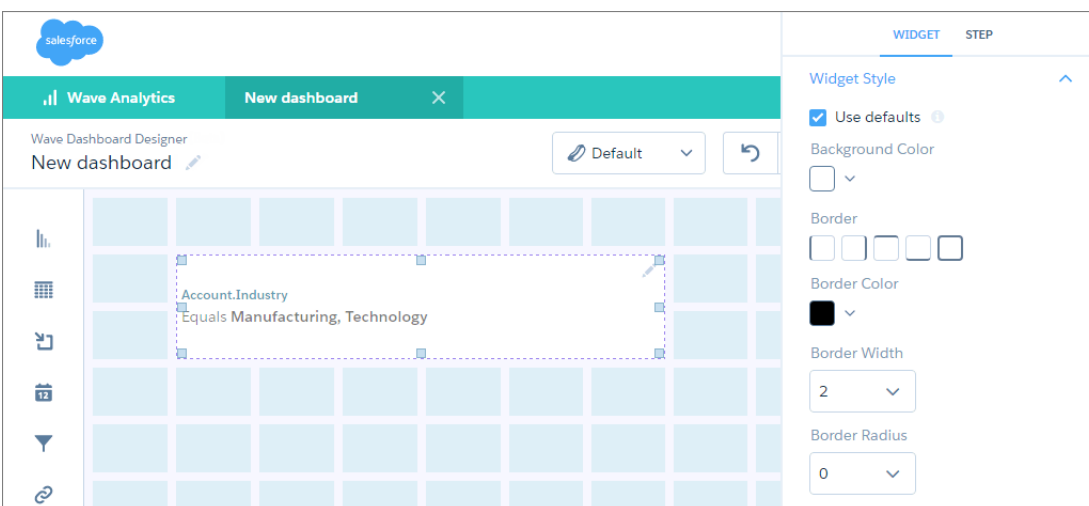

- b. Select the dataset that you want to apply the filter on.
- c. Click  **Filter**.
- d. Select a measure, date, or dimension field that you want to filter on.

- e. To create the filter, select particular values of the field.
For example, to filter based on dates, select the start and end dates in the Absolute date range tab or Relative to now tab.

- f. To apply the filter, click **Add**.
If needed, you can add multiple filters.
- g. Click **Save**.
Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard. In addition, the widget displays the filters.
4. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.
When you set a property, the widget immediately shows the effects of your change.
6. To show and set the step properties, click **Step** in the panel.

7. To preview your changes to the dashboard, click .
8. To save your changes to the dashboard, click .

 **Important:** If you close the dashboard without saving it, you lose your changes.

To apply the global filter on a widget, select **Apply global filters** in the step properties of the widget. By default, the global filter is applied to all widgets that have steps that: 1) are built in the explorer; 2) are based on the same dataset; and 3) have groupings based on the same field used in the global filter. To apply the global filter on widgets based on steps built from SAQL queries, you must also set `autoFilter` equal to `true` in the step definition in the dashboard JSON. For more information about setting `autoFilter`, see [Query](#).

SEE ALSO:

[Widget Properties for Wave Dashboards](#)

[Step Properties for Wave Dashboards](#)

[Create Steps in the Wave Dashboard Designer](#)

Add Selection-Based Filter Widgets to Enable Users to Filter the Results

Users viewing the dashboard can make selections in these widgets to apply whatever filters they wish. These widgets give them the ability to slice and dice the data to view results from different angles. For example, the dashboard viewer can select a region in a list widget to focus the dashboard results on a specific sales location. Unlike with a global filter or query filter, the viewer can change the selection to filter the results differently or remove the filter altogether.

A selection-based filter is different from a query filter. When a selection is made, all values in the step's original query still appear in the widget, just with particular values highlighted. However, a query filter modifies the step's query, reducing the number of results that appear in the widget. A global filter is a query filter that can be applied to multiple steps in a dashboard.

The following illustration shows the difference between a selection and a query filter on the same step.

You can create different types of selection-based filter widgets based on measure, date, and dimension fields. You can also set an initial selection for each of them. For example, when the viewer opens the dashboard, the date widget can select last year, by default, to show dashboard results for last year only.

Note: You must facet or bind the steps of widgets to filter them based on a selection in another widget. For more information, see [Filter the Dashboard Results with Faceting](#).

[Add a Date Widget to Filter Dashboard Results Based on a Date](#)

A date filter widget allows dashboard viewers to filter the Wave dashboard results based on a selected date range. The range can use relative dates based on UTC (like last month) or absolute dates (like 1/15/2016). For example, you can add a date widget to filter support cases, showing only cases that closed this month or last month.

[Add a List Widget to Filter Dashboard Results Based on a Dimension](#)

A list filter widget allows dashboard viewers to filter the Wave dashboard results based on a dimension. For example, a list widget can filter results based on a particular case status or region.

[Add a Range Widget to Filter Dashboard Results Based on a Measure](#)

A range widget allows dashboard viewers to filter the Wave dashboard results based on a measure. For example, a range widget can show only opportunities with amounts between \$100,000 and \$900,000.

[Add a Toggle Widget to Filter Dashboard Results Based on a Dimension](#)

A toggle widget allows dashboard viewers to filter the Wave dashboard results based on a date or dimension. For example, a toggle widget can show results based on a specific record type.

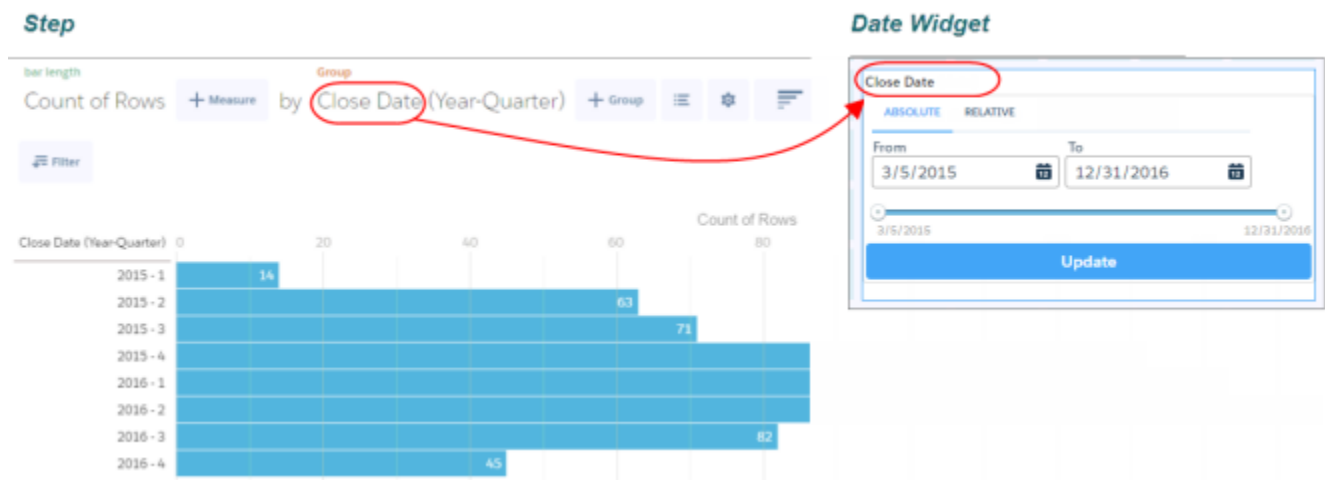

SEE ALSO:

[Set Initial Filter Selections in the Dashboard](#)

Add a Date Widget to Filter Dashboard Results Based on a Date

A date filter widget allows dashboard viewers to filter the Wave dashboard results based on a selected date range. The range can use relative dates based on UTC (like last month) or absolute dates (like 1/15/2016). For example, you can add a date widget to filter support cases, showing only cases that closed this month or last month.

The date widget requires a step that has a single grouping based on a date field.

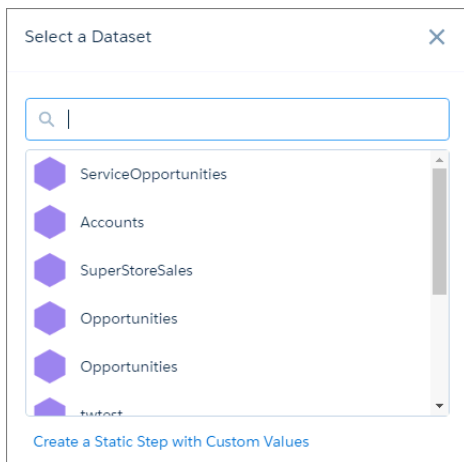

The selection in this widget filters the results of other widgets with faceted steps. You can configure this widget's step to accept single or multiple selections, and specify whether the selections are optional or required. You can also set an initial selection that applies when the dashboard opens. While viewing the dashboard, you can undo the selection or change the selection to filter the results differently.

 **Note:** To enable this widget to filter other widgets, you must enable faceting on its step.

1. Drag the date widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

- b. Select the dataset that you want to apply the filter on.
 - c. Select the date field that you want to filter on.
 - d. If needed, click **Filter** to filter the results.
You can add multiple filters.
 - e. To add the step to the widget, click **Create**.
Wave adds the step to the steps panel. The widget shows the absolute date range, which spans from the minimum to the maximum values of the date field. Wave doesn't apply any selections to the widget.
4. To change the widget and step properties, click the widget.
The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.
When you set a property, the widget immediately shows the effects of your change.
6. To show and set the step properties, click **Step** in the panel.
You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required.
7. To set the initial selections that are applied when a user opens the dashboard, click , and then click **Pick Initial Filters**.
You can make initial selections on any chart, date, list, toggle, or range widget. For example, you can select a bar in a bar chart and set that as the initial filter. If the underlying step for the bar chart is faceted, other widgets with faceted steps are also filtered based on this initial selection. While viewing the dashboard, the viewer can change the selection in the chart to filter the results differently or remove the filter altogether.

 **Note:** No selections are made in this widget when the user opens the dashboard unless you pick the initial filter. If the step is configured to require a selection, select the initial filter. Otherwise, the first value in the filter list is used.

8. To preview your changes to the dashboard, click .
9. To save your changes to the dashboard, click .

 **Important:** If you close the dashboard without saving it, you lose your changes.

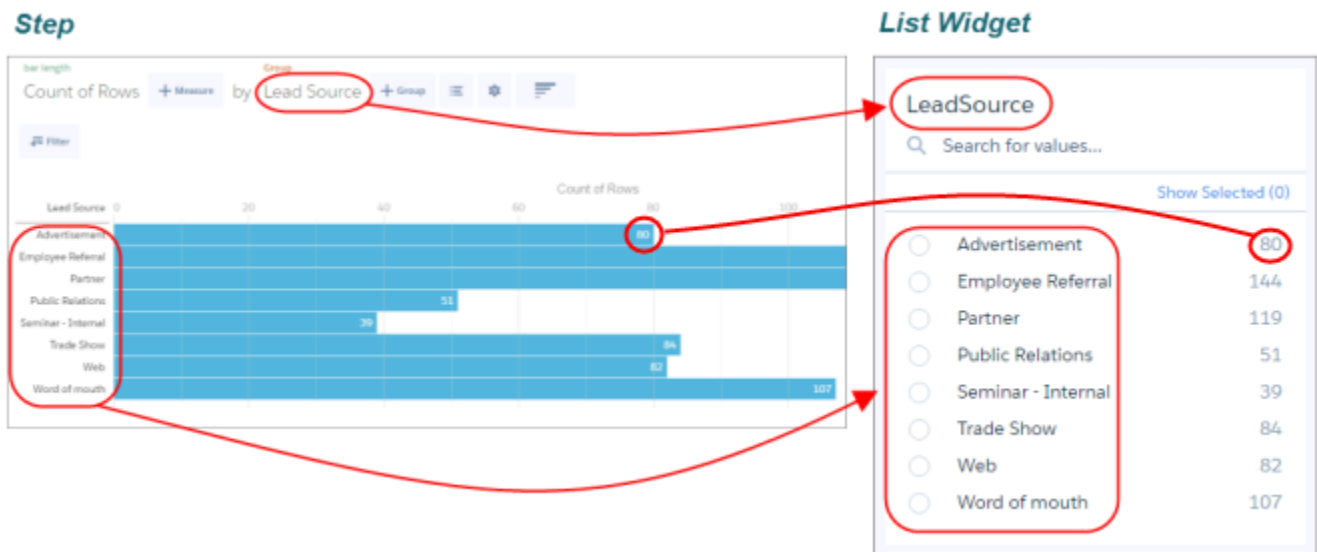

SEE ALSO:

- [Widget Properties for Wave Dashboards](#)
- [Step Properties for Wave Dashboards](#)
- [Create Steps in the Wave Dashboard Designer](#)

Add a List Widget to Filter Dashboard Results Based on a Dimension

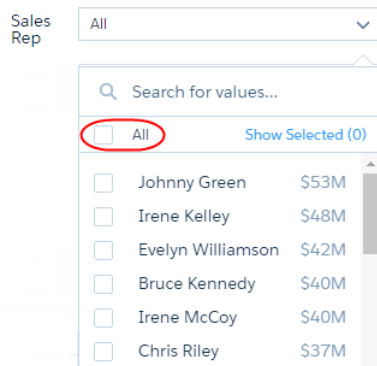

A list filter widget allows dashboard viewers to filter the Wave dashboard results based on a dimension. For example, a list widget can filter results based on a particular case status or region.

The list widget requires a step that has a single grouping based on a dimension. The values of the grouping appear as the values in the list.

Note: You can also create a static step to specify a custom list of values for the list widget. For more information, see [Create a Static Step with Custom Values](#).

The selection in this widget filters the results of other widgets with faceted steps. You can configure this widget's step to accept single or multiple selections, and specify whether the selections are optional or required. You can also set an initial selection that applies when the dashboard opens. While viewing the dashboard, you can undo the selection or change the selection to filter the results differently.

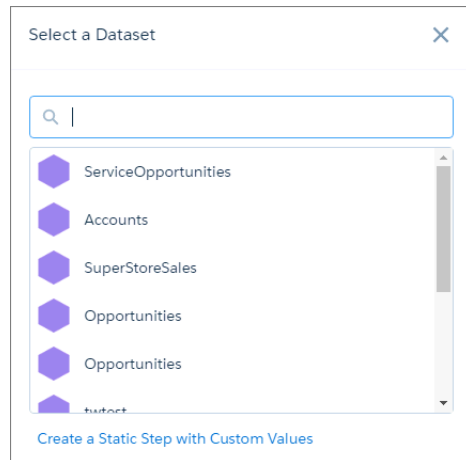

Note: To enable this widget to filter other widgets, you must enable faceting on its step.

1. Drag the list widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget. If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.

The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

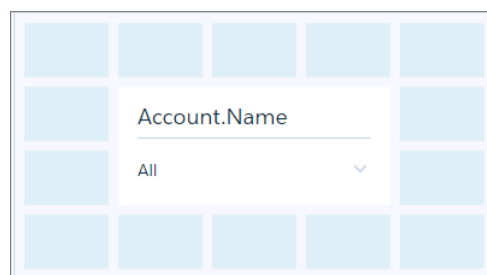

b. Select the dataset that you want to apply the filter on.

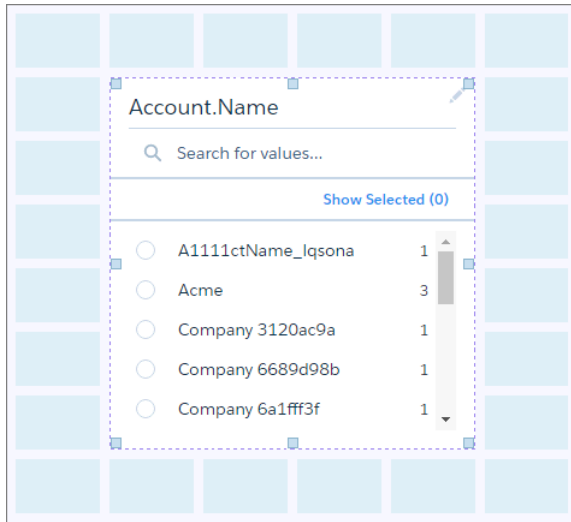

c. Select the dimension field that you want to filter on.

d. To add the step to the widget, click **Create**.

Wave adds the step to the steps panel. In addition, by default, the list widget is collapsed and Wave doesn't apply any selections to the widget.

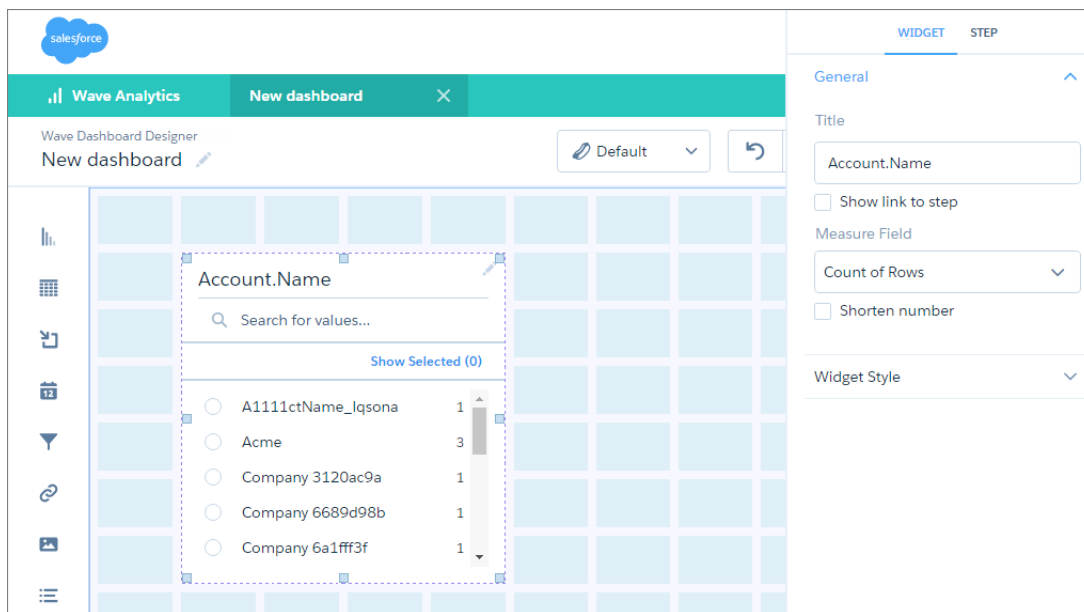

e. To expand the list and show more values, increase the size of the widget.

 **Note:** If you don't expand the list, when a user views the dashboard, they can select the drop-down arrow to see the values in the list.

4. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.
When you set a property, the widget immediately shows the effects of your change.
6. To show and set the step properties, click **Step** in the panel.

You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required. You can also specify whether to show the measure next to each value in the list.

- To set the initial selections that are applied when a user opens the dashboard, click , and then click **Pick Initial Filters**. You can make initial selections on any chart, date, list, toggle, or range widget. For example, you can select a bar in a bar chart and set that as the initial filter. If the underlying step for the bar chart is faceted, other widgets with faceted steps are also filtered based on this initial selection. While viewing the dashboard, the viewer can change the selection in the chart to filter the results differently or remove the filter altogether.

 **Note:** No selections are made in this widget when the user opens the dashboard unless you pick the initial filter. If the step is configured to require a selection, select the initial filter. Otherwise, the first value in the filter list is used.

- To preview your changes to the dashboard, click .
- To save your changes to the dashboard, click .

 **Important:** If you close the dashboard without saving it, you lose your changes.

[Create Steps in the Wave Dashboard Designer](#)

Add a Range Widget to Filter Dashboard Results Based on a Measure

A range widget allows dashboard viewers to filter the Wave dashboard results based on a measure. For example, a range widget can show only opportunities with amounts between \$100,000 and \$900,000.

The range widget requires a step that has a single measure and no groupings. The selected range applies to the values of the measure. The range shown in the widget is from the minimum to the maximum values of the measure.

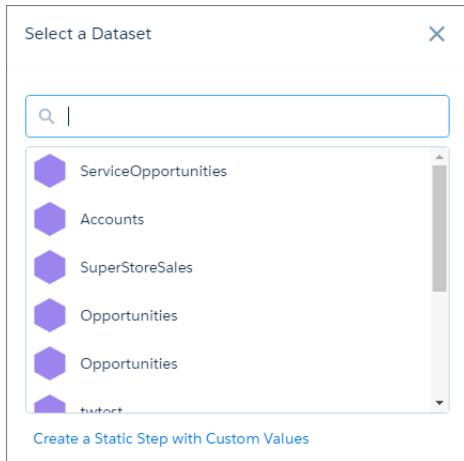

The selection in this widget filters the results of other widgets with faceted steps. You can configure this widget's step to accept single or multiple selections, and specify whether the selections are optional or required. You can also set an initial selection that applies when the dashboard opens. While viewing the dashboard, you can undo the selection or change the selection to filter the results differently.

 **Note:** To enable this widget to filter other widgets, you must enable faceting on its step.

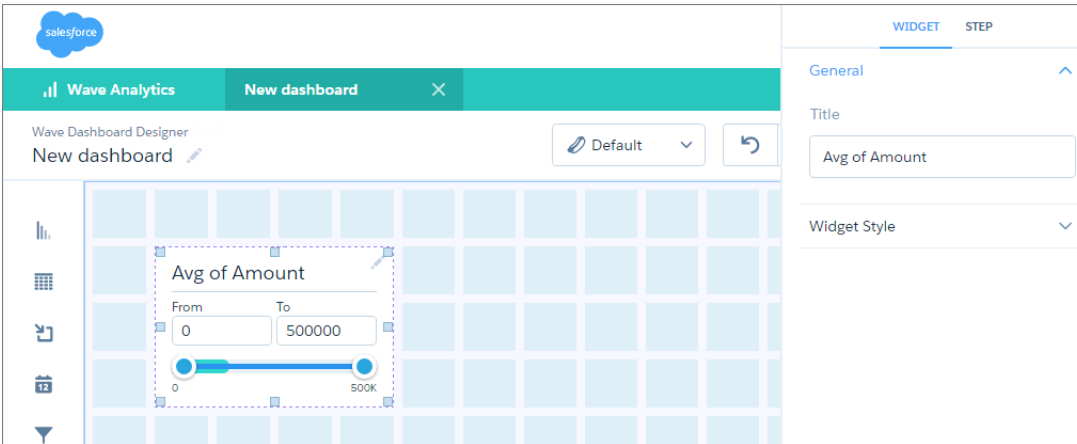

- Drag the range widget to the dashboard canvas.

2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

- b. Select the dataset that you want to apply the filter on.
 - c. Select the measure field that you want to filter on.
 - d. If needed, click **Filter** to filter the results.
You can add multiple filters.
 - e. To add the step to the widget, click **Create**.
Wave adds the step to the steps panel. The range of the widget spans from the minimum to the maximum values of the measure field. Wave doesn't apply any selections to the widget.
4. To change the widget and step properties, click the widget.
The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.
When you set a property, the widget immediately shows the effects of your change.
 6. To show and set the step properties, click **Step** in the panel.
You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required.
 7. To set the initial selections that are applied when a user opens the dashboard, click , and then click **Pick Initial Filters**.
You can make initial selections on any chart, date, list, toggle, or range widget. For example, you can select a bar in a bar chart and set that as the initial filter. If the underlying step for the bar chart is faceted, other widgets with faceted steps are also filtered based on this initial selection. While viewing the dashboard, the viewer can change the selection in the chart to filter the results differently or remove the filter altogether.

 **Note:** No selections are made in this widget when the user opens the dashboard unless you pick the initial filter. If the step is configured to require a selection, select the initial filter. Otherwise, the first value in the filter list is used.
 8. To preview your changes to the dashboard, click .
 9. To save your changes to the dashboard, click .
-  **Important:** If you close the dashboard without saving it, you lose your changes.

Add a Toggle Widget to Filter Dashboard Results Based on a Dimension

A toggle widget allows dashboard viewers to filter the Wave dashboard results based on a date or dimension. For example, a toggle widget can show results based on a specific record type.

The toggle widget requires a step that has a single grouping based on a dimension. The values of the grouping appear as the toggle options.

Step**Toggle Widget**

 **Note:** You can also create a static step to specify a custom list of values for the toggle widget. For more information, see [Create a Static Step with Custom Values](#).

The selection in this widget filters the results of other widgets with faceted steps. You can configure this widget's step to accept single or multiple selections, and specify whether the selections are optional or required. You can also set an initial selection that applies when the dashboard opens. While viewing the dashboard, you can undo the selection or change the selection to filter the results differently.

 **Note:** To enable this widget to filter other widgets, you must enable faceting on its step.

1. Drag the toggle widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget. If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard. The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

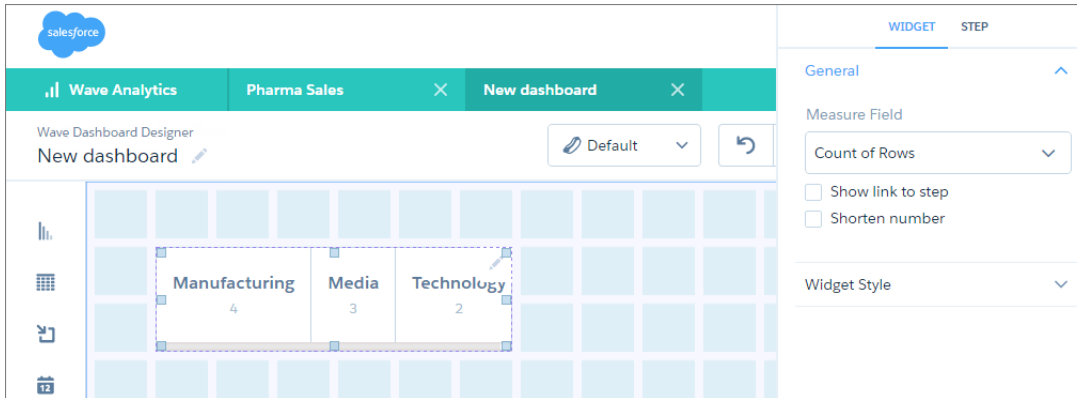

- b. Select the dataset that you want to apply the filter on.
- c. Select the date or dimension field that you want to filter on.
- d. If needed, click **Filter** to filter the results.
You can add multiple filters.
- e. To add the step to the widget, click **Create**.
Wave adds the step to the steps panel. Wave doesn't apply any selections to the widget.

- f. If needed, increase the size of the widget to show the display names of all toggle options.

- 4. To change the widget and step properties, click the widget.
The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

5. Set the widget properties to customize the appearance of the widget.
When you set a property, the widget immediately shows the effects of your change.
 6. To show and set the step properties, click **Step** in the panel.
You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required.
 7. To show and set the step properties, click **Step** in the panel.
You can configure this step to accept single or multiple selections, and specify whether the selections are optional or required. You can also specify whether to show the measure in the toggle options.
 8. To set the initial selections that are applied when a user opens the dashboard, click , and then click **Pick Initial Filters**.
You can make initial selections on any chart, date, list, toggle, or range widget. For example, you can select a bar in a bar chart and set that as the initial filter. If the underlying step for the bar chart is faceted, other widgets with faceted steps are also filtered based on this initial selection. While viewing the dashboard, the viewer can change the selection in the chart to filter the results differently or remove the filter altogether.

 **Note:** No selections are made in this widget when the user opens the dashboard unless you pick the initial filter. If the step is configured to require a selection, select the initial filter. Otherwise, the first value in the filter list is used.
 9. To preview your changes to the dashboard, click .
 10. To save your changes to the dashboard, click .
-  **Important:** If you close the dashboard without saving it, you lose your changes.

[Step Properties for Wave Dashboards](#)

[Create Steps in the Wave Dashboard Designer](#)

Add a Table Widget to Show Record Details and Create Calculated Columns

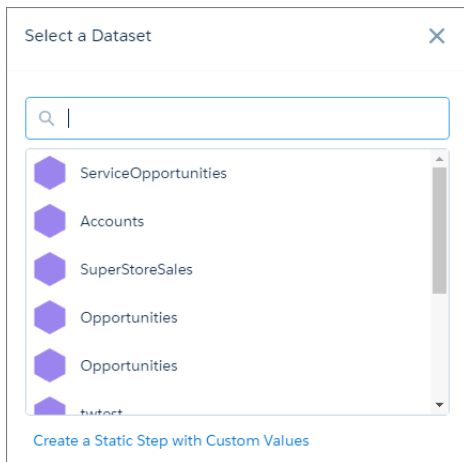

You can add different types of tables in a Wave dashboard. To view record-level details, add a values table. For example, this type of table can show case details, like how long the case has been open and who owns it. To create custom columns in a table based on calculations from existing fields, add a compare table. If the underlying step contains at least one grouping, you can create a pivot table.

The table widget requires a step that specifies which columns to include in the table. The step varies depending the type of table. A values table shows the dataset fields as columns. You can choose which fields to show. A compare table shows calculated fields based on the columns available in the table. A pivot table shows the values of the last grouping as columns.

 **Note:** By default, the table widget shows up to 100 records. You can show up to 10,000 records. To increase the number of records, change the `limit` parameter in the SAQL query. For more information about SAQL queries, see [Wave Analytics SAQL Reference](#).

1. Drag the table widget to the dashboard canvas.
2. To use an existing step for the widget, drag the step from the step panel and place on top of the widget.
If you don't see the step panel, click the dashboard header to show it.
3. To create a step:
 - a. Click the button inside the widget to open the wizard.
The Select a Dataset screen appears, showing datasets in the most recently used order.

 **Note:** If you see a bar chart in the explorer instead, Wave selected the dataset that you used to create your previous widget step. To use a different dataset, click **Back**.

- b. Select the dataset that contains the columns that you want to include in the table.
The explorer shows a bar chart with the Count of Rows measure.

c.

To make it easier to see which columns you are adding to the table, click  and change the chart type to:

Values table

Use to show dataset fields as table columns. To choose which columns to include in the table, click the columns at the top of the explorer. You can't create calculated columns in a values table.

Compare table

Use to add calculated columns to the table. To add dimensions from the dataset as columns in the table, click **+Group**. To add other columns, including calculated columns, click **+**. For more information about creating a compare table, see [Creating Calculated Columns Using a Compare Table](#).

Pivot table

Use to show the values of the last grouping as columns. To add dimensions as columns in the table, click **+Group**. The table is pivoted based on the last defined grouping.

- d. If needed, click **Filter** to filter the records included in the table.

You can add multiple filters.

e. Click **Save**.

The widget shows the results in the table. Wave adds the step to the steps panel.

4. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

The screenshot shows a dashboard widget with a pivot table and a configuration panel on the right. The pivot table is titled 'CASE.PRIORITY' and has columns for 'STAGE', 'HIGH', 'LOW', and 'MEDIUM'. The rows represent different stages of a process. The configuration panel on the right has tabs for 'WIDGET' and 'STEP', and sections for 'General' and 'Widget Style'.

STAGE	HIGH	LOW	MEDIUM
Closed Lost	31	284	110
Closed Won	101	843	367
Id. Decision Makers	1	19	6
Needs Analysis	2	29	13
Negotiation	1	15	-
Perception Analysis	6	12	7
Proposal/Quote	2	19	7
Qualification	2	28	14

The configuration panel on the right includes the following options:

- General** (expanded)
 - Show as pivot table
 - Action Menu ⓘ
 - Show explore icon ⓘ
 - Show custom action ⓘ
- Widget Style** (collapsed)

5. Set the widget properties to customize the appearance of the widget.

6. To show and set the step properties, click **Step** in the panel.

7. To preview your changes to the dashboard, click  .

8. To save your changes to the dashboard, click  .

 **Important:** If you close the dashboard without saving it, you lose your changes.

[Widget Properties for Wave Dashboards](#)

[Step Properties for Wave Dashboards](#)

[Create Steps in the Wave Dashboard Designer](#)

Add a Container Widget to Create Sections in the Dashboard

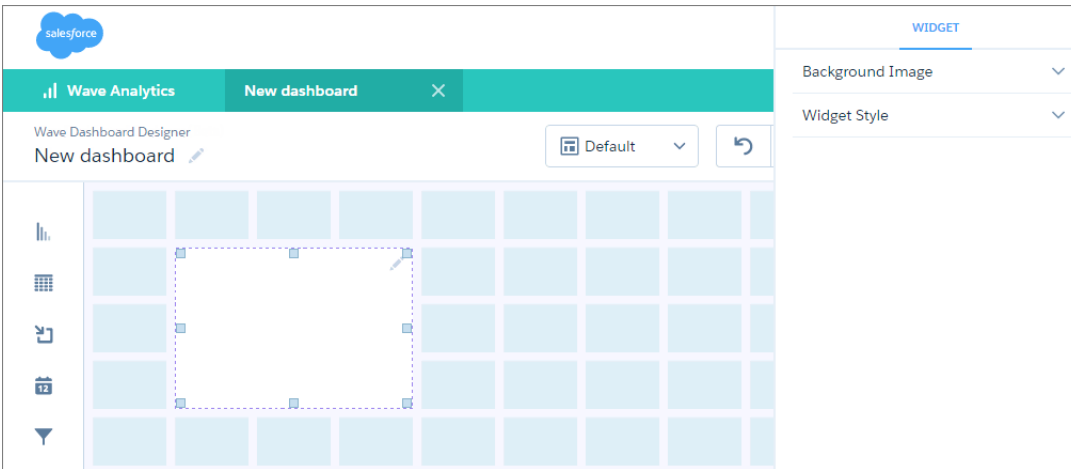

Use sections in a Wave dashboard to group related widgets. For example, you can use a container widget to create a filter panel on the left side of the dashboard to store all filter selection widgets. To distinguish the filter panel from the rest of the dashboard, you can apply a background color and border to the container. When you move a container, the contained widgets also move while maintaining their spacing and alignment.

You can place any widget inside a container widget, except another container widget.

1. Drag the container widget to the dashboard canvas.
An empty container appears.
2. Drag other widgets inside the container.
You can increase the size of the container to fit more widgets.

3. To change the widget properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

4. Set the widget properties to customize the appearance of the widget.
For example, apply a background color or image.
5. To preview your changes to the dashboard, click  .
6. To save your changes to the dashboard, click  .

 **Important:** If you close the dashboard without saving it, you lose your changes.

SEE ALSO:

[Widget Properties for Wave Dashboards](#)

Add an Image Widget to Display Graphics in the Dashboard

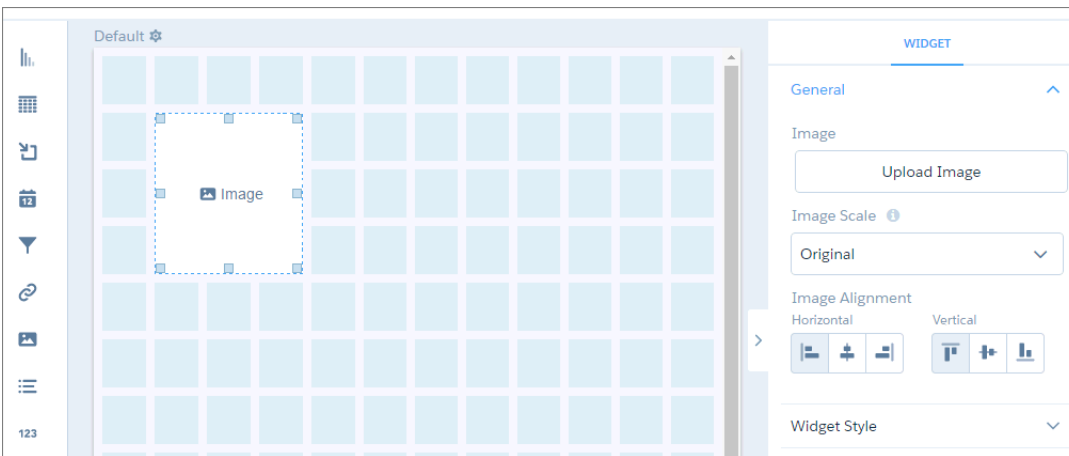

You can include company logos to brand the Wave dashboard, icons to categorize results, or graphics to animate the dashboard.

You can also add images as backgrounds for container widgets and layouts. Wave in a web browser supports .svg, .png, .jpeg, .jpg, .gif, .bmp. The Wave Analytics mobile app supports all of these file types, except .svg.

 **Tip:** To overlay one image on top of another, place an image widget inside a container widget. To display a background image for the entire dashboard, add a background image in the layout properties. Click  in the upper left corner to show the layout properties.

1. Drag the image widget to the dashboard canvas.
2. To change the widget properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

3. Click **Image** inside the image widget.

4. To upload a new image, click **Browse Files**. Or, select an uploaded image from the Gallery tab. Wave uploads images to the gallery for the app displayed at the top left corner of the screen. Each image file must be no more than 2 GB.
5. Set the widget properties to customize the appearance of the widget.
6. To preview your changes to the dashboard, click .
7. To save your changes to the dashboard, click .

Important: If you close the dashboard without saving it, you lose your changes.

SEE ALSO:

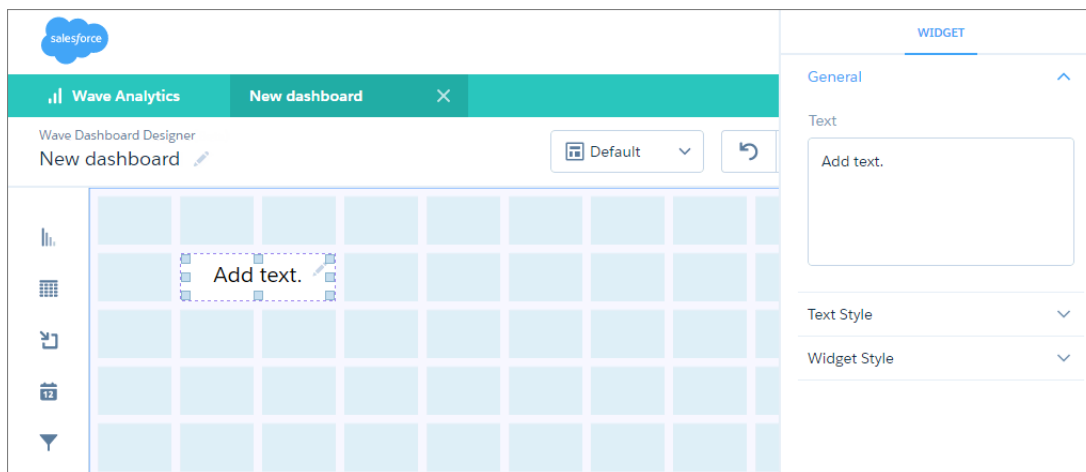

[Widget Properties for Wave Dashboards](#)

Add Text Widgets to Label Parts of the Dashboard

Label your Wave dashboard so that users understand what they are looking at. You can also add text that describes the dashboard or provides usage information for widgets.

1. Drag the text widget to the dashboard canvas.
2. To change the widget properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

3. Set the widget properties to customize the appearance of the widget.
For example, enter the text that you want to appear in this widget.
4. To preview your changes to the dashboard, click  .
5. To save your changes to the dashboard, click  .

Important: If you close the dashboard without saving it, you lose your changes.

SEE ALSO:

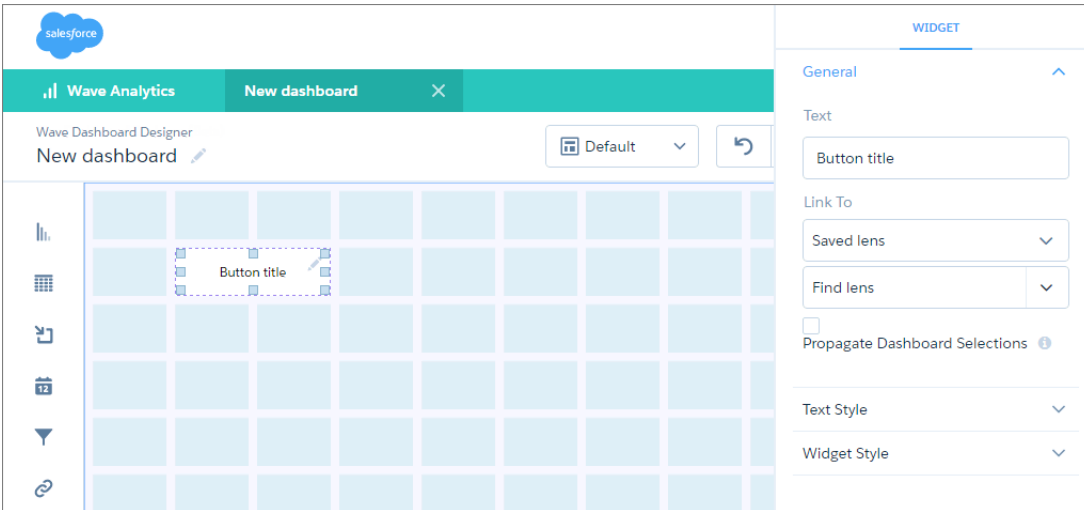

[Widget Properties for Wave Dashboards](#)

Add a Link Widget to Link to a Wave Lens or Dashboard

Instead of packing all possible key performance metrics, charts, and tables into a single dashboard, break up the content into multiple dashboards. Then use link widgets to tie the dashboards together. Dashboard viewers appreciate not having to figure out what to focus on in a busy dashboard. You can also use links to create analysis paths for users to follow or to link related assets.

1. Drag the link widget to the dashboard canvas.
2. To change the widget properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

3. Set the widget properties to customize the appearance of the widget.
For example, specify the lens or dashboard to link to. Specify whether the filters selections in the dashboard are passed to the linked asset. For example, you view a dashboard that shows only open cases. When you click the link, the linked dashboard applies the same selection filter, showing only open cases.
4. To preview your changes to the dashboard, click .
5. To save your changes to the dashboard, click .

 **Important:** If you close the dashboard without saving it, you lose your changes.

SEE ALSO:

[Widget Properties for Wave Dashboards](#)

Create Steps in the Wave Dashboard Designer

Steps return results that are displayed in widgets. For example, a number widget displays the result of a calculation—that calculation is defined in a step. Steps can query a data source, like a dataset or a Salesforce object. They can also be a static list of user-defined values—a static step. You can reuse each step in multiple widgets. In addition to clipping a lens from an exploration, you can use the following ways to create steps in the Wave dashboard designer: use the wizard or create it manually.

The widget wizard creates a basic step that meets the minimum requirements for the widget. If you need a more robust step, like one that has multiple measures or a customized SAQL query, manually create your own. The method you choose depends on how much flexibility you need.

Because IDs are not always descriptive, you can add a step label. For example, you can add the “Won Opportunity Amount” label to step ID “Amount_1.” Specify the label when you create the step because Wave generates the step ID based on the label. After creating the step, you can change the label but not the ID, unless you edit the JSON.

 **Tip:** If you create a query but Wave takes too long to execute it, speed up the query results by performing the calculation in the dataflow. The dataflow stores the results in the dataset, allowing for quick retrieval of the precalculated values.

Widget Steps in a Wave Dashboard

Some widgets require steps. A step contains a query that returns results. The widget determines how to display the results. For example, a step calculates the average opportunity amount, grouped by region. The widget displays the results in a bar chart format with each bar showing the average amount for a region. In the Wave dashboard designer, most widgets have a wizard that you can use to build the widget and its step. You can also build your own step and attach it to a widget.

Create a Step with the Explorer

Instead of using a widget wizard to create the step, you can build your own step using the explorer. Unlike with the widget wizard, you can customize your step, like adding multiple measures.

Create a Step with the SAQL Editor

You can use the SAQL Editor to customize the query of a step. SAQL query steps are more robust than steps created by widget wizards and the explorer. For example, you can write a SAQL query that queries two datasets.

Create a Static Step with Custom Values

You can use static steps to apply custom values to filters, groups, measures, sort order, and limits of other step queries. For example, you can create a toggle widget that filters case records based on the following values that you came up with: High Priority Cases, Medium Priority Cases, and Low Priority Cases. You can define the logic used to determine the case priority.

Clone a Step

Clone a step to quickly create a step based on an existing one. Cloning is useful when you can reuse an existing step with just a few tweaks.

Widget Steps in a Wave Dashboard

Some widgets require steps. A step contains a query that returns results. The widget determines how to display the results. For example, a step calculates the average opportunity amount, grouped by region. The widget displays the results in a bar chart format with each bar showing the average amount for a region. In the Wave dashboard designer, most widgets have a wizard that you can use to build the widget and its step. You can also build your own step and attach it to a widget.

In the Wave dashboard designer, a “lens” and a “step” are similar, but not the same. They both contain queries used to calculate results. However, unlike a step, a lens includes the visualization and can be saved as a standalone asset in an app. For example, a lens can show the results of a query as a timeline chart or a compare table.

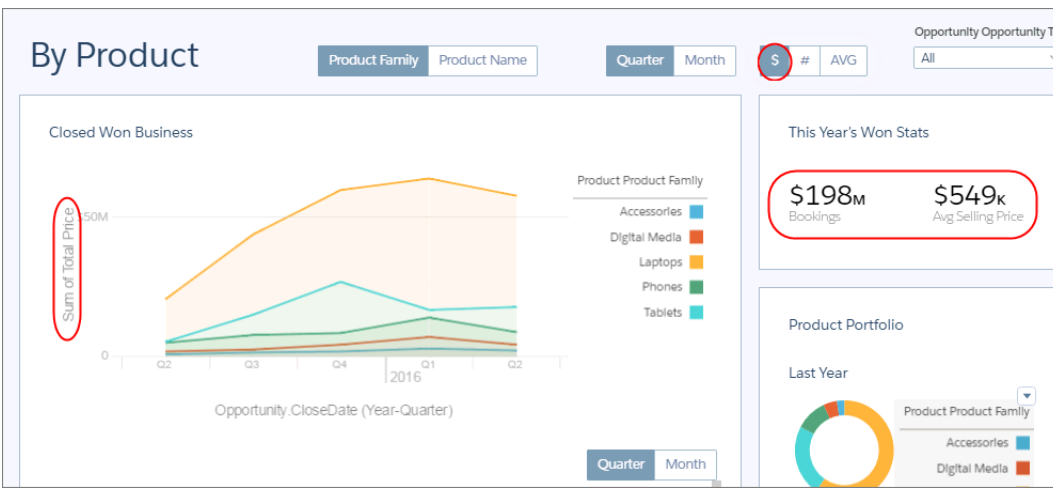

You can build a widget using one of the following types of steps.

Query Step

Most steps are query steps. A query step contains a query against a data source. The type of query is based on the data source. For instance, Wave can execute a SAQL query against one or more datasets or a soql query against a Salesforce object. You can create a query step in different ways.

You can use the explorer to query a single dataset. You can calculate measures, group results by dates and dimensions, and filter records based on dataset fields. Here’s an example of an explorer-built step that populates a chart widget.

to show the value of opportunities, and "#" to show the number of opportunities. In this example, "\$" is selected in the toggle widget, and the dashboard shows the value of opportunities.

For more information, see [Create a Static Step with Custom Values](#).

SEE ALSO:

[Create Steps in the Wave Dashboard Designer](#)

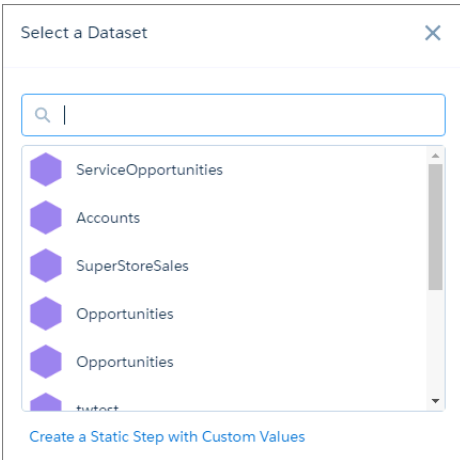

[Make the Dashboard Widgets Interactive](#)

Create a Step with the Explorer

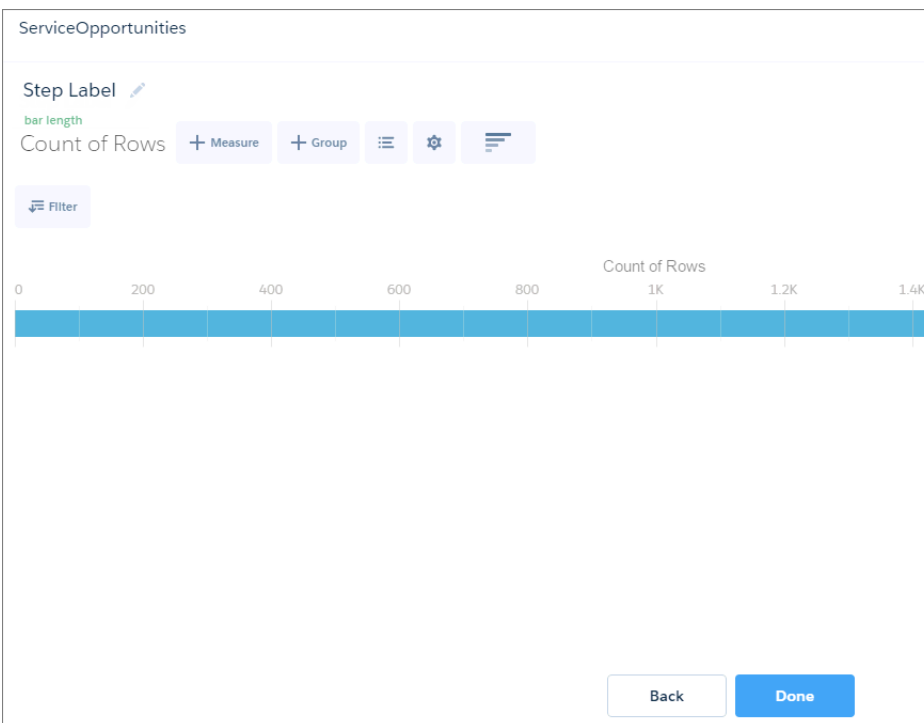

Instead of using a widget wizard to create the step, you can build your own step using the explorer. Unlike with the widget wizard, you can customize your step, like adding multiple measures.

One way to create a step with explorer is to clip an exploration to a dashboard. For information about this method, see [Clip a Lens to a Dashboard](#). You can also create the step from the designer, which is covered here.

1. To open the steps panel, click an empty space in the dashboard canvas.
2. Click **Create Step**.
The Select a Dataset screen appears, showing datasets in the most recently used order.

3. Select the dataset that contains the data that you want to include in the step. Type in the search box if your dataset isn't easy to find. The explorer appears, showing the Count of Rows measure, by default.

4. Next to the Step Label, click .
5. Enter the step label.
6. Add measures that you want to show in the widget.

To add a measure, click . To change a measure, select the measure in the explorer and then choose a new one.

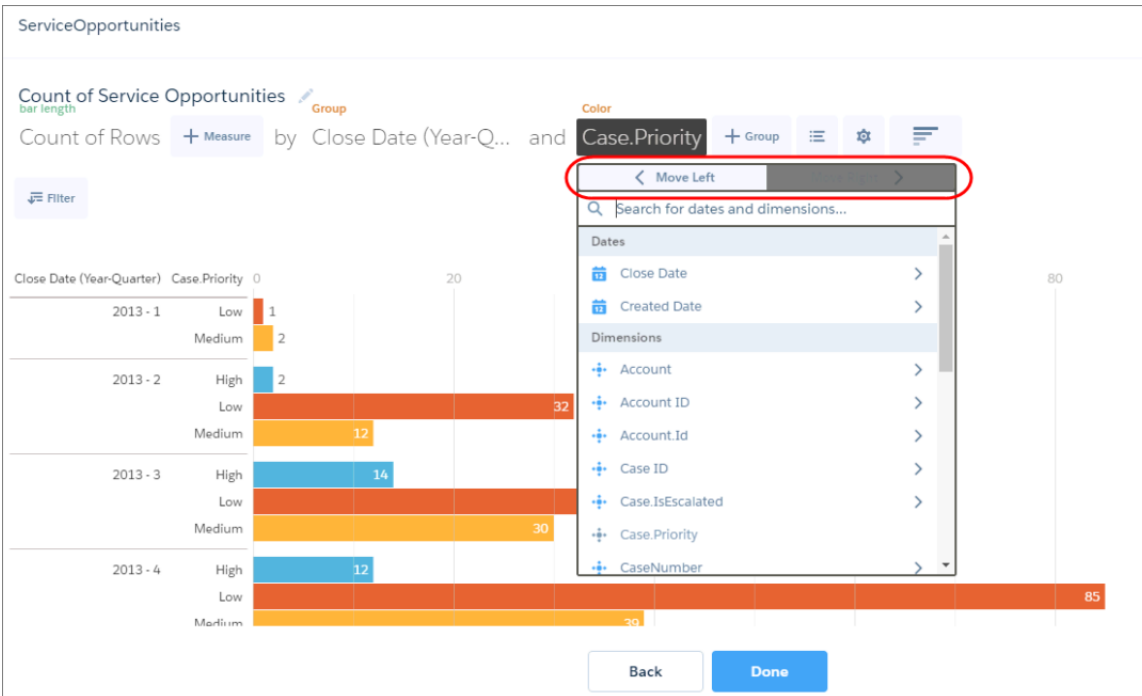

You can add as many measures as needed. If you add multiple measures, you can specify which one to show in a widget by configuring the step properties.

7.

To group the measures by a date or dimension, click

You can add multiple groups. To change a grouping, click the grouping and select a new field. To reorder the groupings, click the grouping and then click **Move Left** or **Move Right**.

8. If needed, click **Filter** to filter the results.

You can add multiple filters.

9.

To change the chart type for the step, click

This setting applies only if you don't set the chart type in the widget properties. The widget properties override this setting.

10. To sort the results, show the results using a logarithmic scale, or show the SAQL query, click .

When viewing the SAQL query, you can edit it to override the query generated by the explorer. For more information about SAQL query steps, see [Create a Step with the SAQL Editor](#).

11. Click **Done**.

Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard.

12. Click **Save**.

13. Save the dashboard so you don't lose your changes.

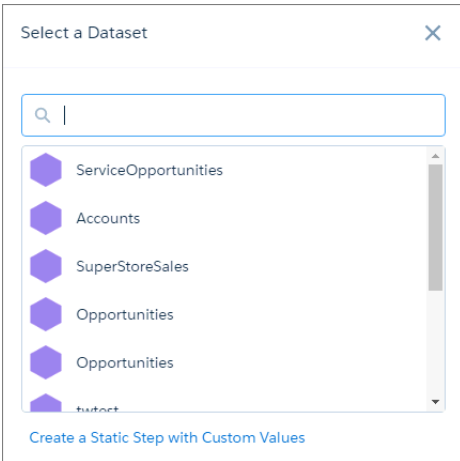

Create a Step with the SAQL Editor

You can use the SAQL Editor to customize the query of a step. SAQL query steps are more robust than steps created by widget wizards and the explorer. For example, you can write a SAQL query that queries two datasets.

1. To open the steps panel, click an empty space in the dashboard canvas.

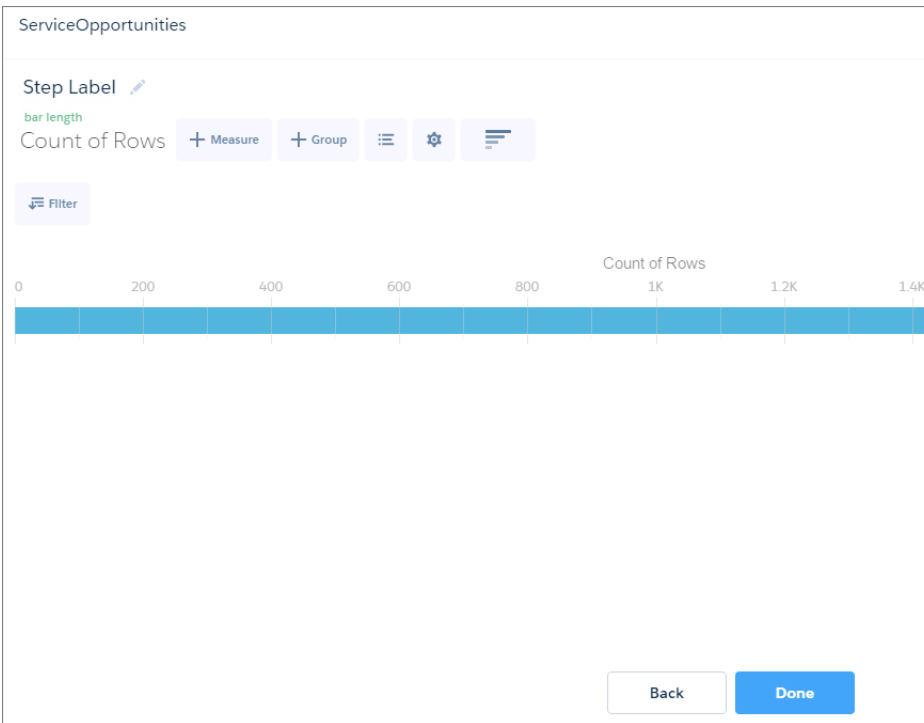

2. Click **Create Step**.

The Select a Dataset screen appears, showing datasets in the most recently used order.

3. Select the dataset that contains the data that you want to include in your query. Type in the search box if your dataset isn't easy to find.

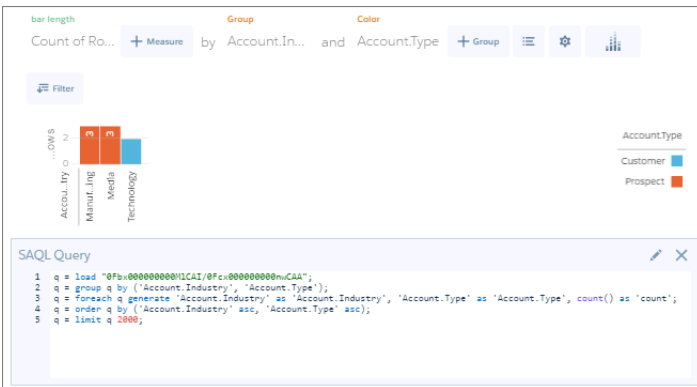

The explorer appears, showing the Count of Rows measure.

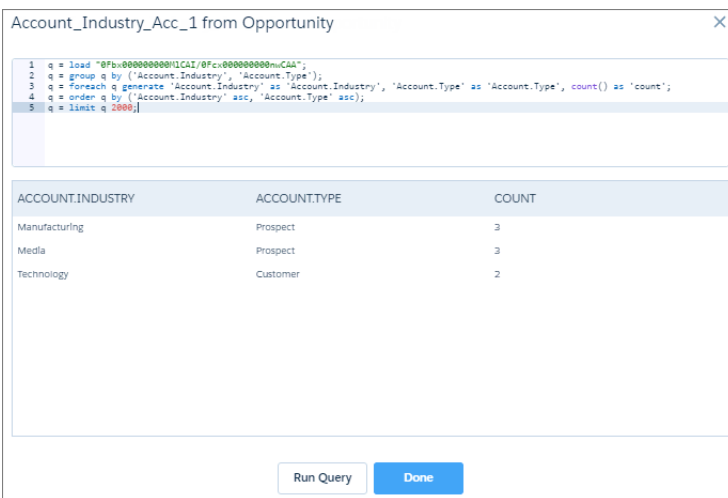

4. Click .

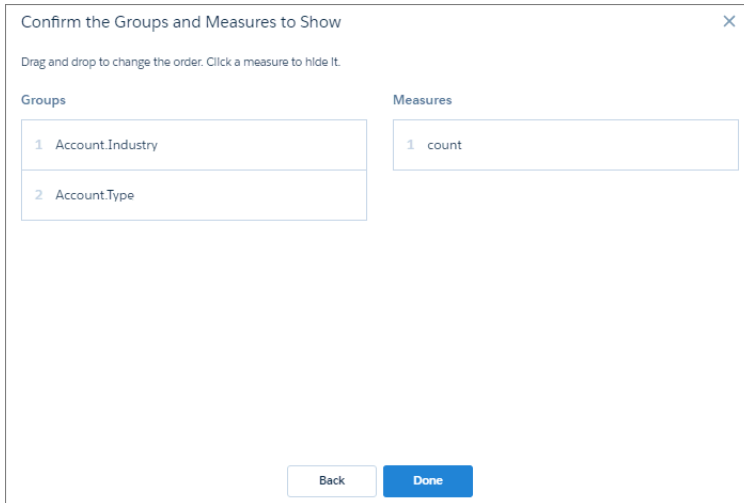

- In the Show SAQL option, click **On**.
The SAQL query for the current step shows at the bottom.

- To edit the SAQL query, click  .

- Edit the SAQL query, as needed.
The SAQL editor provides contextually smart auto-completion suggestions. When you make changes in the SAQL editor, the **Done** button is disabled until you select **Run Query** and the editor verifies that the query is valid. If the query is not valid, an error appears.
- Click **Done**.

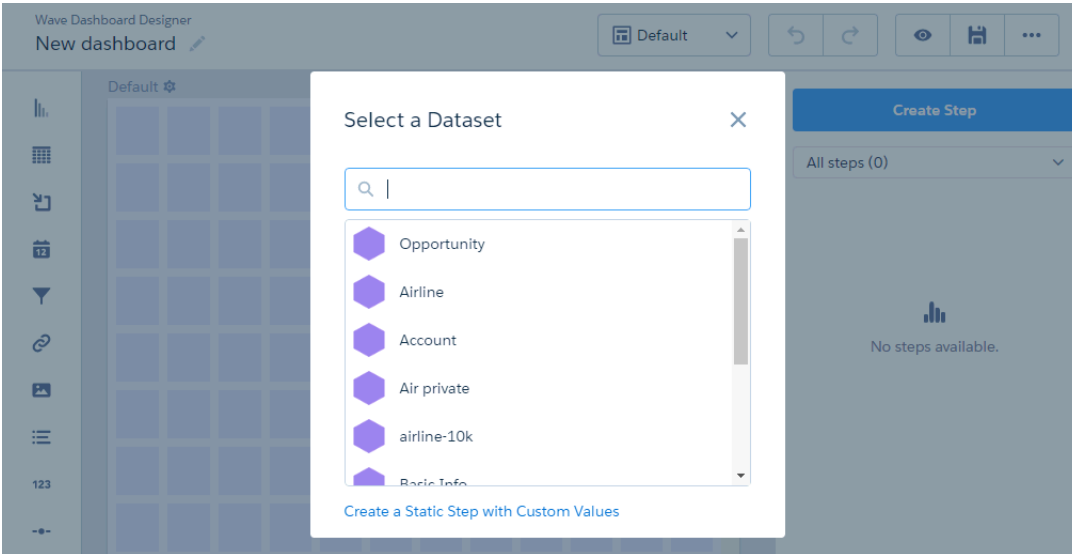

9. Confirm or change the order of the groupings and measures.
10. To hide a measure, click it. Click it again to show it.
11. Click **Done**.
Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard.
12. Save the dashboard so you don't lose your changes.

Create a Static Step with Custom Values

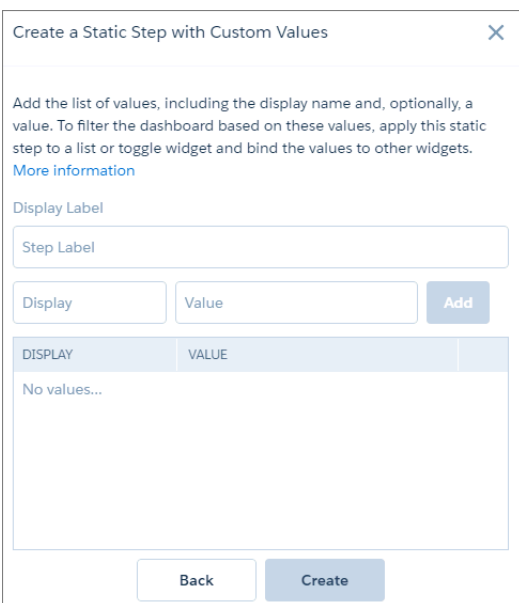

You can use static steps in apply custom values to filters, groups, measures, sort order, and limits of other step queries. For example, you can create a toggle widget that filters case records based on the following values that you came up with: High Priority Cases, Medium Priority Cases, and Low Priority Cases. You can define the logic used to determine the case priority.

1. In the step panel of the Wave dashboard designer, click **Create Step**.
If you don't see the step panel, click the dashboard header to show it.

2. Click **Create a Static Step with Custom Values**.

3. Enter a step label.

4. Add the list of values, including the display name and value for each.

 **Note:** The display name appears in the associated widget. Values are optional, but if included, you can bind them to other steps to filter the results of other widgets in the dashboard.

5. To create the static step, click **Create**.

Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard.

6. To apply this static step to a list or toggle widget:

- a. Drag the step to an empty space in the canvas.

By default, a toggle widget is added to the dashboard, showing the custom values as toggle options.

- b. To change the widget and step properties, click the widget.

The Widget panel groups the widget properties into sections. So that you don't accidentally overlook some properties, notice that some sections might be collapsed, by default. To expand or collapse a section, click the arrow next to the section header.

- c. Set the widget properties to customize the appearance of the widget.

 **Note:** In the Measure widget property, you can select a value only after you add measures for the list options. To add measures, edit the dashboard JSON and add measures to the corresponding step.

- d. To preview your changes to the dashboard, click  .

- e. To save your changes to the dashboard, click  .

 **Important:** If you close the dashboard without saving it, you lose your changes.

If you applied the static step to a list or toggle widget, you can see the widget in the dashboard. But it's not tied to any other widgets. To filter the dashboard results based on selections in the list or toggle widget, bind the custom values to the steps of the other widgets. For more information about binding static steps, see the [Wave Analytics Bindings Developer Guide](#).

SEE ALSO:

[Widget Properties for Wave Dashboards](#)

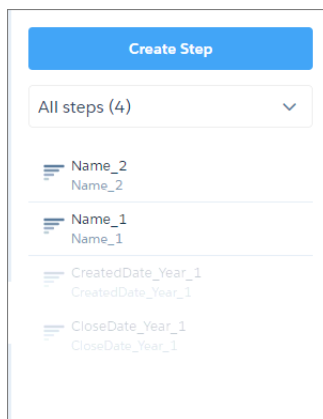

[Step Properties for Wave Dashboards](#)

Clone a Step

Clone a step to quickly create a step based on an existing one. Cloning is useful when you can reuse an existing step with just a few tweaks.

 **Note:** You can't clone a SAQL query step for a single compare table column or a static step.

1. To open the steps panel, click an empty space in the dashboard canvas.

 **Note:** You can't apply grayed-out steps to widgets. But you can clone them and view their properties.

2. Select **All steps**, and then hover over the step that you want to clone.

- 3.

Click .

It opens in exploration mode, where you can easily modify it. If the step was created using SAQL, the clone opens in the SAQL editor instead.

4. Make your changes to the clone.

5. Click **Save**.

The clone is saved with “Clone of” prepended to the original step’s name. Wave adds the step to the steps panel, making it available for use by other widgets in the dashboard.

6. Save the dashboard so you don’t lose your changes.

-  **Note:** When you clone a step and edit its SAQL query, the resulting JSON doesn’t always reflect the function applied to measures. After you run and save the SAQL, the function is changed to `count`. For example, if the original step contained this `measures` array:

```
"query": {
  "measures": [
    ["max", "DailyActiveUsers"]
  ]
}
```

and the SAQL was edited, run, and saved, the updated JSON contains this `measures` array instead:

```
"query": {
  "measures": [
    ["count", "*", "max_DailyActiveUsers"]
  ]
}
```

This discrepancy has no effect on the data viewed in the dashboard.

Widget Properties for Wave Dashboards

Widget properties define how widgets appear in the Wave dashboard. For example, you can apply labels, backgrounds, and borders. To make widgets look consistent, you can set up default widget properties in the layout and then assign them to each widget. Widget properties vary based on the widget type and the designer used to create them. The properties listed here apply only to widgets created in the Wave dashboard designer.

Wave groups widget properties into sections.

General

Property	Description
Chart Type	Select the type of chart to visualize the data.
Show as pivot table	Indicates whether the table is pivoted. A pivot table requires the underlying step to have at least one grouping. Wave pivots the table on the last defined grouping. Disabled, by default.
Show Explore Icon	Allow dashboard viewers to click a link in the widget to open the underlying step in explorer.  Note: This option only applies widgets based on steps in compact form. You can't explore widgets that are built on SAQL form steps.
Title	Title of the widget.
Subtitle	Subtitle of the chart. Appears below the title in a smaller font.
Title Alignment	Horizontal alignment of the title.
Theme	Set a color scheme for the chart.
Update instantly	Instantly update the dashboard results based on a filter selection. Otherwise, you have to click Update to apply the filter.
Measure Field	The measure to show in the widget. You can use this field to specify the measure to show when multiple measures are defined in the underlying step. You can also use this option to not show the measure in the widget.
Shorten number	Display shortened numbers, like 60 K instead of 60,499. Shortened numbers are rounded.
Text	Widget label.
Link To	Link to a dashboard, lens, or step.
Customize display and format	Customize the display values for a list or toggle widget. The widget can display values from multiple fields. For example, a list widget can show sales rep and region, with values like SalesRepA-West, SalesRepB-West, and SalesRepC-North—allowing you to filter on both fields. You can also display measures as part of the value, and format the display. Click Add field... dropdown, select a grouping or measure defined in the step query. You can insert additional characters directly into the editor box to format the display. For instance, you can add parentheses to enclose the measure value as shown here.

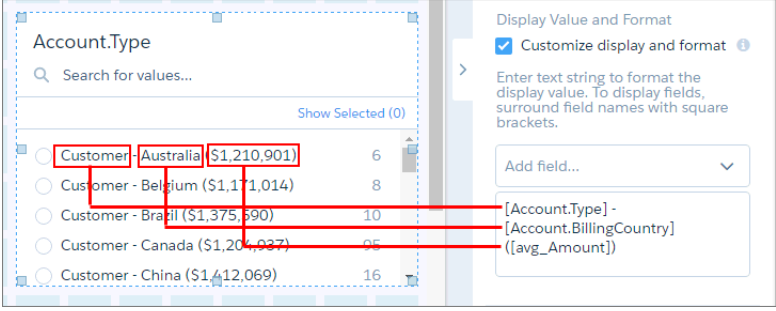

Property	Description
	
Apply Selected Filters	Selections in chart, list, toggle, range, and date widgets in the source dashboard are applied as selections in the linked asset. For example, you select North America in a list widget based on the Region dataset field. Wave applies that same selection to steps in the linked dashboard that have faceting enabled and have a grouping based on the Region field in the same dataset.
Image	The file name of the image. The image must be available in the gallery of the Wave app that contains the dashboard. This property applies to image widgets created during or after Spring '17.
Image ID	15-character ID of the image. The image must be uploaded to the Documents tab of Salesforce and the Externally Available Image option must be enabled. This property applies to image widgets created before Spring '17.
Image Scale	Indicate how to fit the image.
Image Alignment	Horizontal and vertical alignment of the image.
Show custom action	Show the widget properties that you set to show custom bulk actions on a table widget's action menu.
Custom Action Label	Display label for the button in the table widget's action menu. The dashboard viewer clicks the button to execute the action.
Visualforce Page Name	Name of the Visualforce page that defines the bulk action.
Visualforce Namespace Prefix	Optional. Namespace prefix of the Visualforce page that defines the bulk action.

Chart Details

Property	Description
Compute total	Computes the total based on all segments of the waterfall or stacked waterfall chart.
Show values in chart bars	Show the measure value of each bar in the chart.
Normalize values	Show stacked groups as a percentage of the total.
Axis Mode	Specify how multiple measures appear in the chart. You can select one of the following values: Single Axis Show all measures on the same axis.

Property	Description
	<p>Dual Axis Show the first measure on its own axis and the remaining measures on a separate axis.</p> <p>Small Multiples Show each measure in a separate graph.</p>
Auto fit	<p>Fit entire chart inside the widget. Else, if needed, scroll to see the remainder of the chart.</p> <p>You can select one of the following values:</p> <p>None No scaling is applied. Scroll bars appear for charts larger than the widget.</p> <p>Fit Scale the chart to exactly fit the widget.</p> <p>Preserve labels Scale the chart to fit the widget while preventing labels from overlapping. Scroll bars appear for charts larger than the widget.</p>
Handling Missing Values	<p>Specify whether to connect data points regardless of missing data.</p> <p>You can select one of the following values:</p> <p>connect Show a continuous graph, ignoring missing values.</p> <p>disconnect Show gaps in the graph where values are missing.</p>
Fill area	Fill area under the timeline chart.
Show points	Show data points on the line.
# of stem segments	The number of values that appear in the funnel's stem.
Icon	Icon used in the ratings chart.
Number of icons	Number of icons that appear for each rating.
Show value as	<p>Specify how to show values.</p> <p>You can select one of the following choices:</p> <p>None Do not show values.</p> <p>Number Show as numbers.</p> <p>Compact Number Show compact form of numbers, summarized using letter suffixes.</p> <p>Percentage Show as percentages of the total.</p>

Property	Description
Show max value	Show the maximum measure value in each rating.
Show values on left	Show the measure value on the left of each rating. Default is on the right.
Show measure title	Show the title of the measure in the chart.
Show measure axes	Show the axes for measures in the chart.
Show total in title	Show the total in the measure title.
Show total in center	Show the total of the measure in the center of the donut chart.
Center Size	The percentage of the donut chart or polar gauge used to create the center circle.
Map Type	Select the type of map.
Colors	Depending on the chart type, specifies the colors of the low and high values, or colors for the start, total, positive, and negative values.

Date

Property	Description
Default Date Mode	Specify whether the date widget displays absolute or relative dates, by default.
Allow date mode switching	Indicates whether the dashboard viewer can switch between absolute and relative dates in the date widget.
Default Calendar Type	Specifies whether the date widget displays dates using the calendar or fiscal year, by default.
Allow calendar type switching	Indicates whether the dashboard viewer can switch between the fiscal and calendar year in the date widget.

X-Axis, Y-Axis, Left Axis, Center Axis

Property	Description
Start axis at zero	Start the axis at 0.
Show axis	Show the axis.
Show title	Show the title of the axis.
Title	Enter title of the axis. The default title is the name of the dimension for x-axis or names of the measures for y-axis. Multiple measures appear as a comma-separated list.
Reference Line	Show a reference line, which you can use to show a threshold, boundary, or reference point in the chart. For x-axis, it's a vertical line. For y-axis, it's a horizontal line.

Legend

Property	Description
Show legend	Show the chart legend.
Show legend header	Show legend header.
Show legend inside chart area	Show legend inside the chart area to reduce space required for the legend. The legend might overlap with the chart.
Position	Location of legend inside the chart widget.

BreakPoints

Property	Description
Min	Minimum value of the low color band.
Medium	The value separating the low and medium colors.
High	The value separating the medium and high colors.
Max	Maximum value of the high color band.

Band Colors

Property	Description
Low Band	The color range for the low band.
Medium Band	The color range for the medium band.
High Band	The color range for the high band.

Trellis

Property	Description
Show as trellis	Create separate graphs based on groupings.
Type	<p>Select the type of trellis, which affects how the graphs appear.</p> <p>You can select one of the following values:</p> <p>Horizontal Separate horizontally, with a graph for each value in the first grouping.</p> <p>Vertical Separate vertically, with a graph for each value in the first grouping.</p> <p>Matrix Display graphs in a table, with the first grouping in columns and the second grouping in rows.</p>

Property	Description
	Wrap Display graphs line-by-line for each value in the first grouping, wrapping at the value set in the per-line setting.
Number of charts per line	Number of charts per line when the trellis wraps to multiple lines.

Text Style

Property	Description
Text Color	Color of the text.
Text Size	Size of the text.
Number Color	Color of the number.
Number Size	Size of the number.
Title Color	Color of the title.
Title Size	Size of the title.
Alignment	Horizontal alignment of the text.

Background Image

Property	Description
Image	The file name of the image. The image must be available in the gallery of the Wave app that contains the dashboard. This property applies to container widgets created during or after Spring '17.
Image ID	15-character ID of the image. The image must be uploaded to the Documents tab of Salesforce with the Externally Available Image option enabled. This property applies to container widgets created before Spring '17.
Image Scale	Indicate how to fit the image.
Image Alignment	Horizontal and vertical alignment of the image.

Widget Style

Property	Description
Use defaults	Use the default widget properties defined in the dashboard properties.
Background Color	Background color of the widget.
Border	Border around the widget.
Border color	Color of the widget border.
Border Width	Width of the widget border (in pixels).

Property	Description
Border Radius	Roundness of the corners of the widget border.

Step Properties for Wave Dashboards

Step properties define the query that returns results to display in the widget. These properties also specify how the widget behaves and interacts with other widgets in the Wave dashboard. The properties apply to dashboards created in the Wave dashboard designer only.

Property	Description
Display Label	Step label. Use to provide a descriptive label for the step.
Facet	<p>Enables this step to facet and be faceted by other steps. Faceting is when a selection in a widget filters other steps in the dashboard. By default, steps from the same dataset are faceted. To facet steps from different datasets, connect the data sources.</p> <p> Note: If this step's query contains a cogrouping, it facets others steps based on the first specified dataset only. Steps based on other datasets specified in the cogrouping aren't faceted.</p>
Apply global filters	Apply the global filters to this step.
Selection Type	Indicate whether dashboard viewers can make one or multiple selections in the associated widget. You can also specify whether selections are required. If a selection is required, set an initial selection in the Initial Filters step property. If a selection is required but not set, Wave selects the first value in the list.
Initial Filters	Show the initial filters that are applied when the dashboard opens. You must enable selections in the Selection Type step property before you can set an initial filter. To set the initial filters for steps, click  and then select Pick Initial Filters . Any selections that you make on the widget filter the underlying step and immediately filter other widgets with faceted steps.

Make the Dashboard Widgets Interactive

Wave dashboards have unique features that allow you to make the widgets interactive. For example, widgets in the dashboard can be filtered to show only results for the region that's selected in a list widget. Or, when the value of a number widget can change to red when it falls below a threshold.

[Filter the Dashboard Results with Faceting](#)

Faceting is the simplest and most common way to specify interactions between widgets. Widgets can be linked simply by enabling faceting in their associated steps. When the underlying steps are faceted, selections made on chart widgets or filter selection widgets (date, list, range, and toggle) automatically filter other widgets in the dashboard. For example, when you select a rep in the Sales Rep list widget, Wave applies the same filter to the chart and table widgets in the dashboard.

[Dynamically Modify the Query and Widgets with Bindings](#)

Compared to facets, bindings are more programmatic, and provide more ways to specify interactions. Bindings can dynamically modify the query of a step or change the display of a widget based on what happens in another widget. For example, you can use bindings to change the color of the metric in a number widget based on whether its value is high, medium, or low. You can also use a binding to change the measure in a step query based on a selection in a static step. Each binding is unidirectional, meaning it affects other steps, but other steps don't affect it.

[Widget Steps in a Wave Dashboard](#)

Filter the Dashboard Results with Faceting

Faceting is the simplest and most common way to specify interactions between widgets. Widgets can be linked simply by enabling faceting in their associated steps. When the underlying steps are faceted, selections made on chart widgets or filter selection widgets (date, list, range, and toggle) automatically filter other widgets in the dashboard. For example, when you select a rep in the Sales Rep list widget, Wave applies the same filter to the chart and table widgets in the dashboard.

By default, steps from the same dataset are faceted together. To facet steps from different datasets, connect the datasets. Steps with a cgrouping that query multiple datasets only facet steps based on the first dataset specified in the `datasets` field.

1. To enable the faceting option for a step, complete the following tasks.
 - a. Click  to edit the dashboard.
 - b. Select the widget that uses the step.
The panel shows the widget properties.
 - c. Click **Step** to view the step properties.

- d. Select **Facet**.

 **Note:** Changes to the step properties affect all widgets that use this step.

2. To enable a step in SAQL form to receive facets, you must also set the `autofilter` attribute to `true` in the dashboard JSON. For more information about the `autofilter` attribute for a step definition, see the [Wave Analytics Dashboard JSON Reference](#).
3. To facet steps between different data sources—like different datasets or static steps—you must also connect them.

[Configure Cross-Dataset Faceting with Connected Data Sources](#)

By default, steps from the same dataset are faceted—automatically filtering each other. To facet steps from different datasets or even static steps in a Wave designer dashboard, connect them using common fields between them.

SEE ALSO:

[Add Selection-Based Filter Widgets to Enable Users to Filter the Results](#)

Configure Cross-Dataset Faceting with Connected Data Sources

By default, steps from the same dataset are faceted—automatically filtering each other. To facet steps from different datasets or even static steps in a Wave designer dashboard, connect them using common fields between them.

 **Note:** You can't connect static steps that specify date and measure ranges.

1. Click  to edit the dashboard.
2. Click  and then select **Connect Data Sources**.
3. Click **New Connection**.

New Connection
✕

Connection Name

Data Source 1

Choose Data Source 1

 Connects To

Data Source 2

Choose Data Source 2

Back

Save

4. Enter a name for the connection.
5. Click **Choose Data Source 1** to select the first data source. For each data source, select a dataset or a static step used in the dashboard.
6. Choose one field from the data source so that Wave can match records between the specified sources.

 **Note:** Faceting only works on the fields used to define the connection. For example, the connection in the following screenshot is based on the StageName field. As a result, the StageName list widget is faceted to the bar chart. If a selection is made in the

Account.Type list widget, faceting doesn't happen—the results are not filtered. To enable faceting on the Account.Type field, define another connection based on this field using the same data sources.

The screenshot shows the Wave Analytics configuration interface. On the left, the 'Connection Name' is 'Connection opportunity-ServiceOpportunity3'. Under 'Data Source 1', 'ServiceOpportunity3: StageName' is selected. Under 'Data Source 2', 'opportunity1: StageName' is selected. A red circle highlights 'StageName' in both data source selections, with a red arrow pointing to the right. On the right, two dropdown menus are shown: 'StageName' with 'Closed Won' selected and 'Account.Type' with 'All' selected. Below these, a bar chart titled 'Sum of Amount' is displayed. The chart has 'Case Priority' on the y-axis (High, Low, Medium) and 'Sum of Amount' on the x-axis (0 to 800M). The bars show values: High (\$113M), Low (\$896M), and Medium (\$399M). A red circle highlights 'StageName' in the 'Data source: opportunity1' label above the chart, and another red circle highlights 'ServiceOpportunity3' in the 'Data source: ServiceOpportunity3' label below the chart.

7. Click **Choose Data Source 2** to select the second source, and then choose a field.
8. To add another data source, click **Add Data Source**. This option appears after you connect two data sources. You can connect two or more data sources.
9. Click **Save**.

Dynamically Modify the Query and Widgets with Bindings

Compared to facets, bindings are more programmatic, and provide more ways to specify interactions. Bindings can dynamically modify the query of a step or change the display of a widget based on what happens in another widget. For example, you can use bindings to change the color of the metric in a number widget based on whether its value is high, medium, or low. You can also use a binding to change the measure in a step query based on a selection in a static step. Each binding is unidirectional, meaning it affects other steps, but other steps don't affect it.

For more information about bindings, see [Wave Analytics Bindings Developer Guide](#)

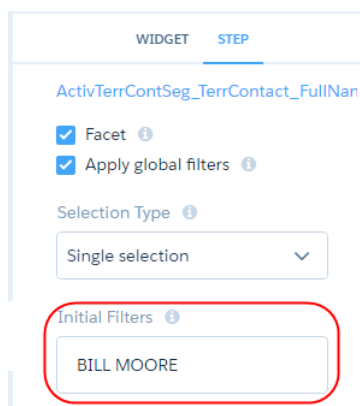

Set Initial Filter Selections in the Dashboard

If the Wave dashboard contains filter selection widgets or charts, you can set initial selections that are applied when the dashboard first opens. For example, you can use a selection to filter the dashboard to show only opportunities owned by the logged in user. While viewing the dashboard, the user can change the selections to filter the results differently or remove the filters altogether.

You must set the initial selection for widgets that require it. If you don't, Wave selects the first value when the dashboard opens.

Wave ignores the selection if it can't find the initial selection value in the step results when opening the dashboard. This issue can occur when the underlying step for the filter selection widget has a `saql` step type and not all results are returned. (This issue doesn't happen for other step types.) For more information about query limits for a `saql` step type, see [saql Step Type Properties](#).

1. While editing the dashboard, click  and then select **Pick Initial Filters**. Wave previews the dashboard.
2. Make selections in chart, list, toggle, date, and range widgets.
3. Click **Done**. Wave saves the selections as start values for the widget steps. You can view the initial filter selections in the step properties.

[Dynamically Set Initial Filter Selections Based on the Logged In User](#)

You can set initial filter selections to show information that's relevant to the logged in user. For example, you can filter a sales dashboard such that each sales rep views only their sales opportunities and performance. You can set initial filter selections based on the user ID, user name, role ID, or role name of the logged in user.

SEE ALSO:

[Add Selection-Based Filter Widgets to Enable Users to Filter the Results](#)

Dynamically Set Initial Filter Selections Based on the Logged In User

You can set initial filter selections to show information that's relevant to the logged in user. For example, you can filter a sales dashboard such that each sales rep views only their sales opportunities and performance. You can set initial filter selections based on the user ID, user name, role ID, or role name of the logged in user.

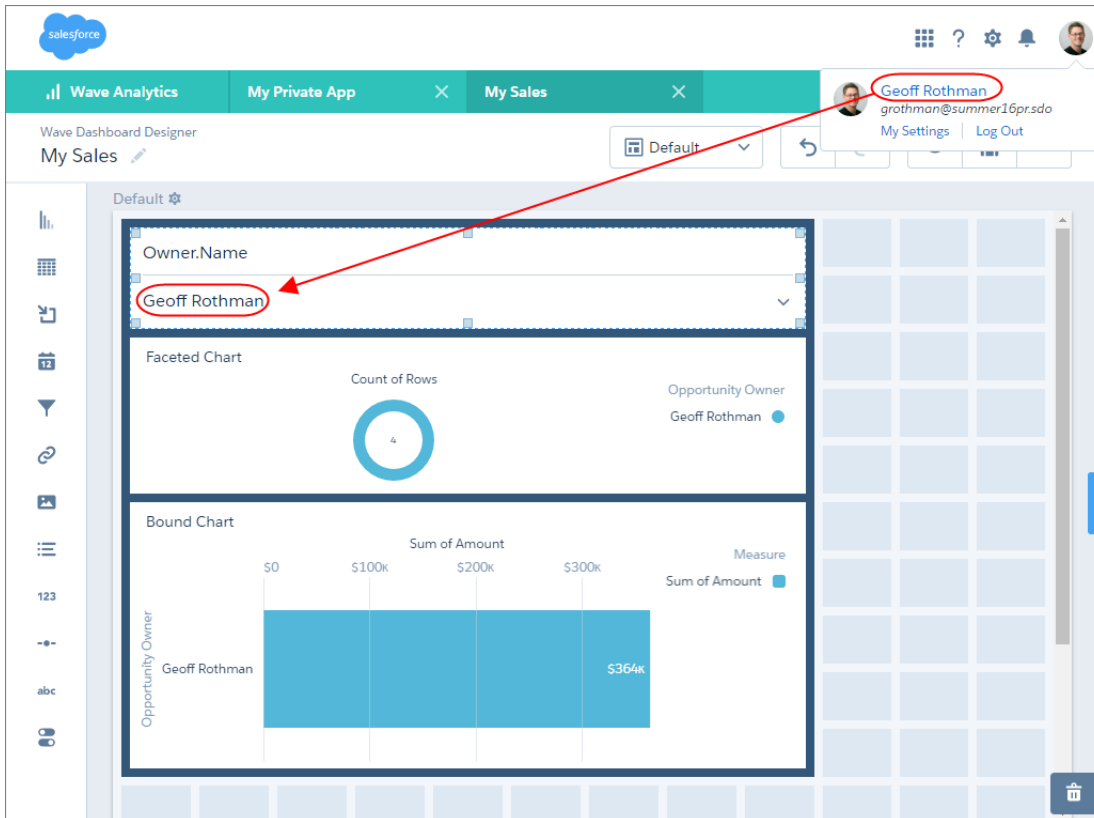

You can set initial selections based on the following Salesforce user tokens: `user.id`, `user.name`, `user.rollename`, and `user.roleid`. At runtime, Wave retrieves the values of these tokens from Salesforce environment variables—these values don't come from datasets.

Note: You can't use the user tokens in other parts of a step, like in query filters or groupings.

Example: When the dashboard opens, you want it to dynamically filter charts based on the name of the currently logged in user.

To add the filter, create a list widget and then, in the dashboard JSON, add an initial filter selection based on the `user.name` token in the widget's step (`Owner_Name_1`). This selection filters the following charts:

- Donut chart because its step (`Owner_Name_3`) is faceted with step `Owner_Name_1`.
- Bar chart because its step (`Owner_Username_3`) contains a binding based on step `Owner_Name_1`.

See the bold text in the following dashboard JSON to see how to set the initial filter, as well as facet and bind the steps.

For information about editing the dashboard JSON, see the [Wave Analytics Dashboard JSON Reference](#).

Generate Unique Wave Dashboard Layouts for Different Devices

After you add widgets to the dashboard, optimize the layout for each device on which the dashboards can be viewed. For example, you can remove widgets from a mobile phone layout to reduce the dashboard size for the smaller screen. You can also move widgets around in one layout and it doesn't affect the other layouts.

When you generate a new layout, Wave adds the widgets from the currently selected layout to the new layout. This step is important because each layout can contain different widgets. Before you get started, select the layout that contains the widgets that you want to include in your new layout.

If you add a widget to a layout, Wave doesn't add it to other layouts. To add it, open the other layout and drag the widget from the "Unused Widgets" section in the layout properties.

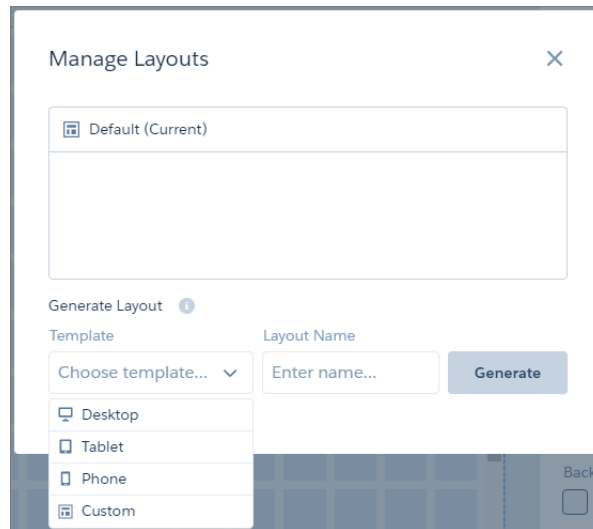

The screenshot shows the Wave Dashboard Designer interface for a dashboard titled "DTC Sales". The main workspace displays a dashboard with a summary table and a line chart. The summary table has columns for "TOTAL", "Open Opportunities", "Won Opportunities", and "Lost Opportunities", with values 76..., 23..., 39..., and 14... respectively. Below the table is a line chart titled "Cumulative Won Opportunities Over Time" showing an upward trend. The right-hand side of the interface shows the "LAYOUT" properties panel. In the "Unused Widgets (1)" section, a widget named "chart_3" of type "Bar" is highlighted with a red circle. A red arrow points from this widget to the "Won Opportunities" column in the summary table.

Note: Although a mobile layout can show all charts, some charts are not supported on mobile devices. For more information, see [Wave Analytics mobile limitations](#).

1. With the dashboard open in the Wave dashboard designer, from the Layouts menu, select **Manage Layouts**.

The screenshot shows the Wave Dashboard Designer interface for a "New dashboard". The main workspace displays a grid of placeholder widgets. The right-hand side of the interface shows the "LAYOUT" properties panel. In the "Unused Widgets (1)" section, a widget named "chart_3" of type "Bar" is highlighted with a red circle. A red arrow points from this widget to the "Manage Layouts" option in the layout menu.

2. Select the layout template, and enter a unique layout name.

Each layout template comes with predefined layout properties that you can change.

3. Click **Generate**.

The layout properties appear for the new layout. If needed, click  to show the Layout panel.

4. In the Layout panel, expand the following sections and change the default properties, if needed.

General

Set the layout name, designer grid settings, and background color.

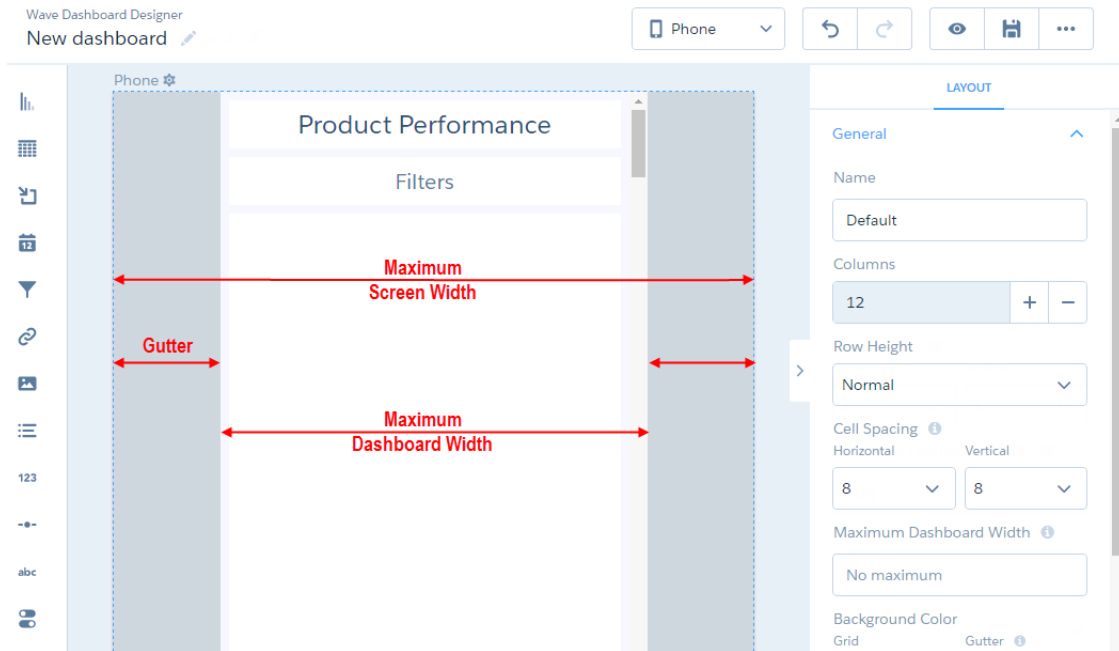

Device

Specify information about the devices that can use this layout. For more information about how Wave uses these properties to choose the right layout, see [Wave's Rules for Choosing a Layout for a Device](#).

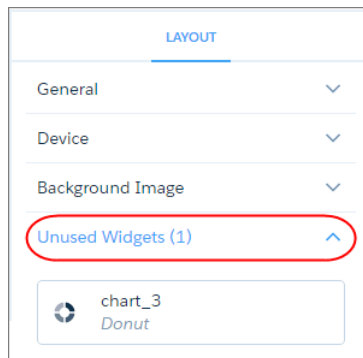

Background Image

To apply a background image to the entire dashboard when this layout is used, enter the details about the background image. You don't have to include a background image.

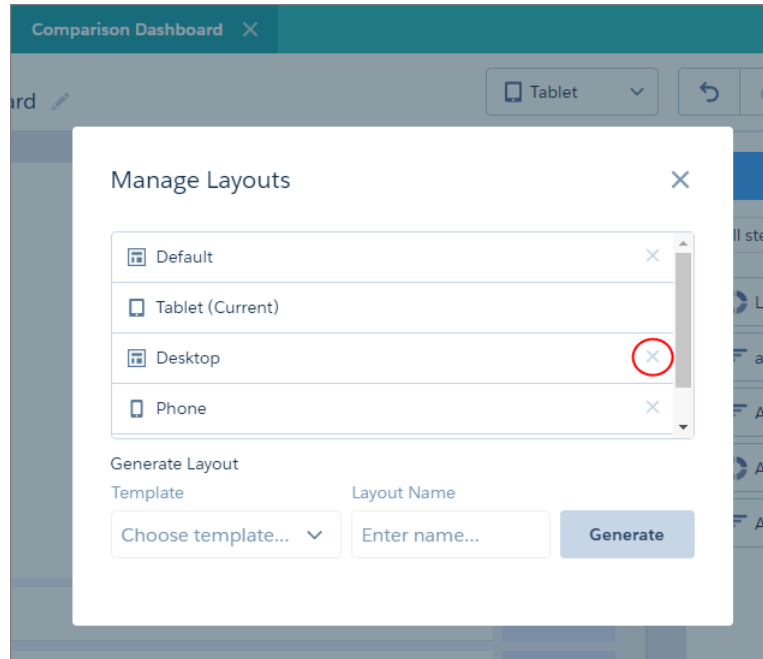

The designer previews the dashboard and layout based on the layout property settings. The designer updates the preview in real time so that you can see how your changes affect the display. If you shrink the maximum dashboard width, the designer shows you how the dashboard fits when using this layout. If needed, the designer rearranges the widgets to fit the new size.

5. Rearrange the widgets, if needed.
6. To hide a widget from the layout, select the widget, and click . If you hide a widget, it appears in the Unused Widgets section of the layout properties.

7. To add an unused widget to the layout, drag the widget from the Unused Widgets section to the canvas.
8. To add a new widget, drag the widget from the widget toolbar to the canvas.
 -  **Note:** Wave adds the widget only to the current layout.
9. To save your layout changes and the dashboard, click .
10. To delete a layout, in the Layouts menu, click **Manage Layouts**, and then click  next to the layout.

[Layout Properties for Wave Dashboards](#)

Layout properties specify the layout name, designer grid settings, background settings, and requirements for devices that can use this layout. The properties apply only to dashboards created in the Wave dashboard designer.

[Wave’s Rules for Choosing a Layout for a Device](#)

If multiple layouts are defined for a dashboard, Wave chooses the optimal layout when displaying the dashboard on a device. To determine the optimal layout, Wave uses the device properties specified for each layout. By understanding Wave’s logic, you can set the properties appropriately.

Layout Properties for Wave Dashboards

Layout properties specify the layout name, designer grid settings, background settings, and requirements for devices that can use this layout. The properties apply only to dashboards created in the Wave dashboard designer.

General Properties

These general properties apply to the specified layout.

Property	Description
Name	Name of the layout.
Columns	Number of columns in the Wave designer grid. Increase the number of columns to increase the precision in the layout.
Row Height	Height of the rows in the Wave designer grid. Values are Normal and Fine . When using the Fine option, the vertical spacing is set to 0 and can’t be changed. Wave determines the default sizes of widgets based on number of columns and the row height to ensure that the widgets are readable and retain their relative sizes.

Property	Description
Cell Spacing	Horizontal and vertical spacing (in pixels) between cells in the Wave designer grid.
Maximum Dashboard Width	Maximum width (in pixels) that the dashboard can use. If needed, Wave rearranges the existing dashboard widgets based on this setting in the layout.
Background Color	You can set the background color of the following areas. Grid Color of the Wave designer grid. Gutter Color of the gutter that appears when the device's screen is wider than the dashboard's maximum width.

Device Properties

Wave uses these values to choose the optimal layout for the device accessing the dashboard.

Property	Description
Screen Width	Width of the devices supported by this layout. Specify the minimum and maximum width (in pixels).
Orientation	Orientation of the devices supported by this layout.
Platform	Platform of the devices supported by this layout.

Background Image Properties

Property	Description
Image	The file name of the image. The image must be available in the gallery of the Wave app that contains the dashboard. This property applies to background images created during or after Spring '17.
Image ID	15-character ID of the image. The image must be uploaded to the Documents tab of Salesforce with the Externally Available Image option enabled. This property applies to background images created before Spring '17.
Image Scale	Indicate how to fit the image in the background.
Image Alignment	Horizontal and vertical alignment of the background image.

Wave's Rules for Choosing a Layout for a Device

If multiple layouts are defined for a dashboard, Wave chooses the optimal layout when displaying the dashboard on a device. To determine the optimal layout, Wave uses the device properties specified for each layout. By understanding Wave's logic, you can set the properties appropriately.

Wave uses the following rules when determining which layout to use for a device.

1. A layout is eligible for use when the device accessing the dashboard meets all the device properties set in the Layout panel.
2. If more than one layout is eligible, the one with the most device properties set is used. If there's a tie, the most recently defined layout is used.
3. If no layouts are eligible with the device, the first defined layout is used.

Build a Dashboard with the Classic Designer

The classic designer is the legacy designer that enables you to build basic Wave dashboards.

 **Note:** Although you can build a dashboard in the classic designer, Salesforce.com recommends using the new Wave dashboard designer, which supports more features and is easier to use. The new designer replaces the classic designer.

1. [Create the Dashboard in Classic Designer](#)

When you create a Wave dashboard, you can apply a prepackaged layout or start with a blank canvas to create your own layout. To build the dashboard, you can use the classic designer or the new Wave dashboard designer. In this example, we'll use the classic designer.

2. [Add Key Performance Indicators to the Wave Dashboard](#)

Sometimes, a single number can provide a quick and critical measurement of the business. For example, the total number of open support cases and number of new support cases open this week are key metrics that a service manager would find useful. Add Number widgets to provide key indicators to a dashboard.

3. [Add Visualizations to the Wave Dashboard](#)

Add charts to visualize and interact with the data to tell a story about it. Each chart is based on the underlying query in a lens.

4. [Facet Widgets to See Data from Multiple Angles](#)

Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets in the Wave dashboard are filtered in the same way. You can turn faceting on or off for each widget.

5. [Add Images to the Wave Dashboard](#)

Add images to your dashboard to help your audience with context and to make the dashboard more fun to read. For example, if your dashboard is designed to help track sales of multiple products, consider distinguishing the products by their logos.

6. [Link to Lenses and Other Dashboards](#)

Use links to tie a Wave dashboard to related lenses and dashboards. This widget is useful when you want to break up analysis across multiple assets, rather than cramming it all into a single dashboard. It's also useful for creating pathways to analyze your data.

7. [See Details About a Widget's Lens](#)

To ensure that a widget in a Wave dashboard is showing the right data, review details about the widget's lens.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

8. [Filter or Remove Clipped Lenses from the Wave Dashboard](#)

Curate the clipped lenses in a dashboard to reduce clutter. You can filter the list of clipped lenses to see which ones aren't used and then remove them from your dashboard.

[Key Differences Between the Classic Designer and Wave Dashboard Designer](#)

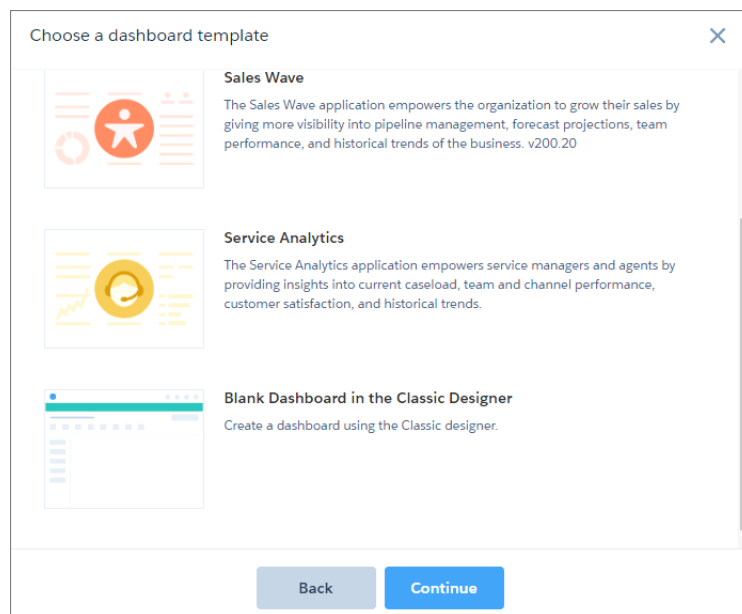

[Build a Dashboard with the Wave Dashboard Designer](#)

Create the Dashboard in Classic Designer

When you create a Wave dashboard, you can apply a prepackaged layout or start with a blank canvas to create your own layout. To build the dashboard, you can use the classic designer or the new Wave dashboard designer. In this example, we'll use the classic designer.

This topic is about creating dashboards in Wave Analytics. For information on creating dashboards for reports, review the article [Create a Salesforce Classic Dashboard](#).

1. From the home page, click **Create > Dashboard**.
The layout templates appear.

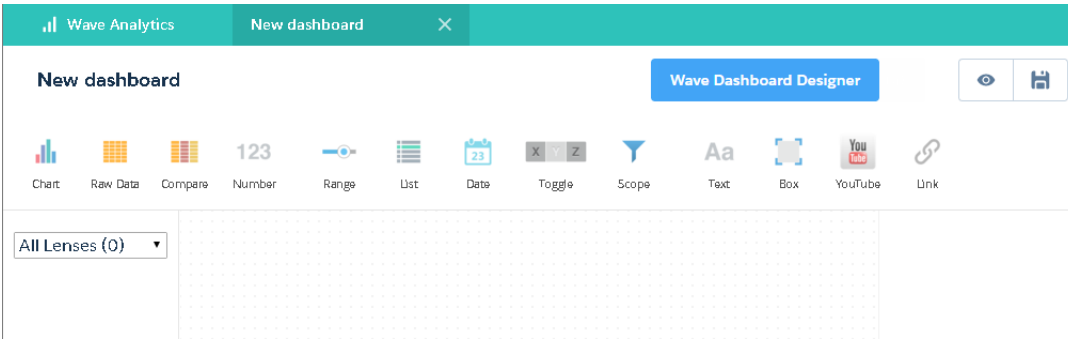

USER PERMISSIONS

To create a dashboard:

- "Create and Edit Wave Analytics Dashboards"

2. Choose a layout template, or select an option to create a blank dashboard in the classic designer or Wave dashboard designer. The layout templates create dashboards in the Wave dashboard designer. In this case, we'll create a blank dashboard using the classic designer.
3. Select **Blank Dashboard in the Classic Designer**, and then click **Continue**.
If you haven't previously declined to use the Wave dashboard designer, the "Ready for Wave Dashboard Designer?" pop-up appears.

4. Select **Not Now**.
The classic designer opens.

5. Click  to save the dashboard to an app.

Save ✕

Title *

Description

App

Save

6. Click **Save**.

Add Key Performance Indicators to the Wave Dashboard

Sometimes, a single number can provide a quick and critical measurement of the business. For example, the total number of open support cases and number of new support cases open this week are key metrics that a service manager would find useful. Add Number widgets to provide key indicators to a dashboard.

1. To add a key performance indicator to a classic designer dashboard, open the Opportunities dataset, and click  to calculate the total value of all opportunities in the pipeline.
 - a. In the measure picker, select `Sum` from the left column.
 - b. Pick a dataset field from the right column that you would like to sum. In this case, select `Amount`.

Note: Don't add any groupings. A number, by definition, consists of just one group. Later, you will add a chart that shows the value for different groupings.

2. While we're here, let's add another kind of measure to bring more context to the story that we're telling with this dashboard. For example, you can select `Count` of `iswon` to get the number of successfully closed deals.

3. Click  to clip this lens to the classic designer.

Tip: If you have multiple dashboards, the lens is clipped to whichever dashboard you had open last.

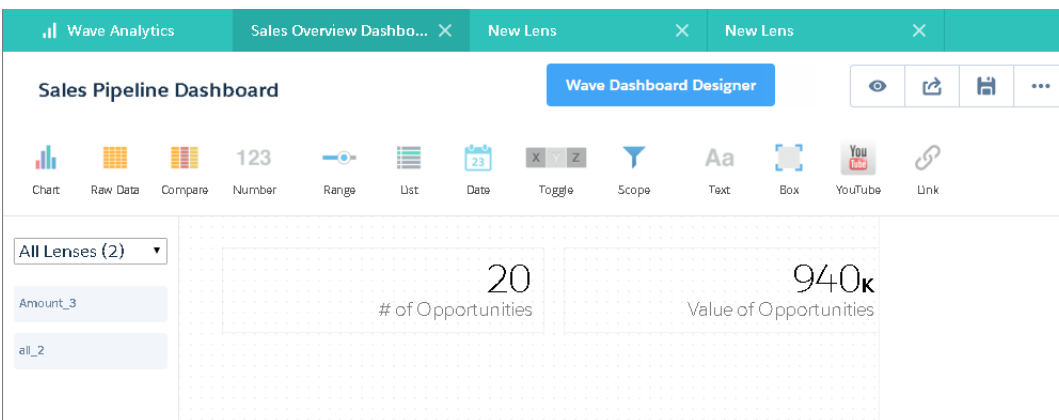

4. In the classic designer, click the number widget (`123`) to create an empty number widget, and then select the first clipped lens that contains a sum of amount. The number that appears in the number widget is the first measure (on the far left) that you specified in the lens.

5. To choose a different measure from the lens or configure other useful properties, select the Number widget and set the properties in the Widget Properties section.

a. Give the widget a title. The default title, which is taken from the field name, is sometimes too cryptic for the audience.

b. For a large number, select **Shorten number** to reduce the length of the display. Doing so turns a number such as `2,148,352` into the more readable `2M`.

6. Using the same procedure, add another number widget based on the second clipped lens that provides a count of won deals. Your dashboard now contains the two number widgets.

Add Visualizations to the Wave Dashboard

Add charts to visualize and interact with the data to tell a story about it. Each chart is based on the underlying query in a lens.

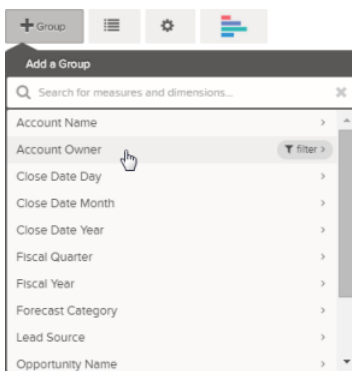

In the next steps, we'll create two interactive charts in the classic designer dashboard that let the audience analyze the sales pipeline. The first will analyze the pipeline by account owner. The second will analyze it by stage. Both charts are based on an Opportunities lens, which contains a count of the number of opportunities and no groupings.

1. Verify that the Sales Pipeline dashboard is open.

You must have the dashboard open to clip lenses to it.

 **Note:** If no dashboard is open, Wave creates a dashboard.

2. From the home page, open the Opportunities lens.
3. Group the data by Account Owner.

4. Click  to clip the lens to the dashboard.
5. Change the Account Owner grouping to a Stage Name grouping.
To change a grouping, click the grouping and then select the new grouping.
6. Clip the lens to the dashboard.

Now that you have both lenses clipped to the dashboard, let's build charts based on them.

7. View the Sales Pipeline dashboard in the classic designer.

8. In the classic designer, click the chart widget, and then select the first clipped lens that contains number of opportunities grouped by account owner.

The chart shows of the results from the underlying query in the clipped lens.

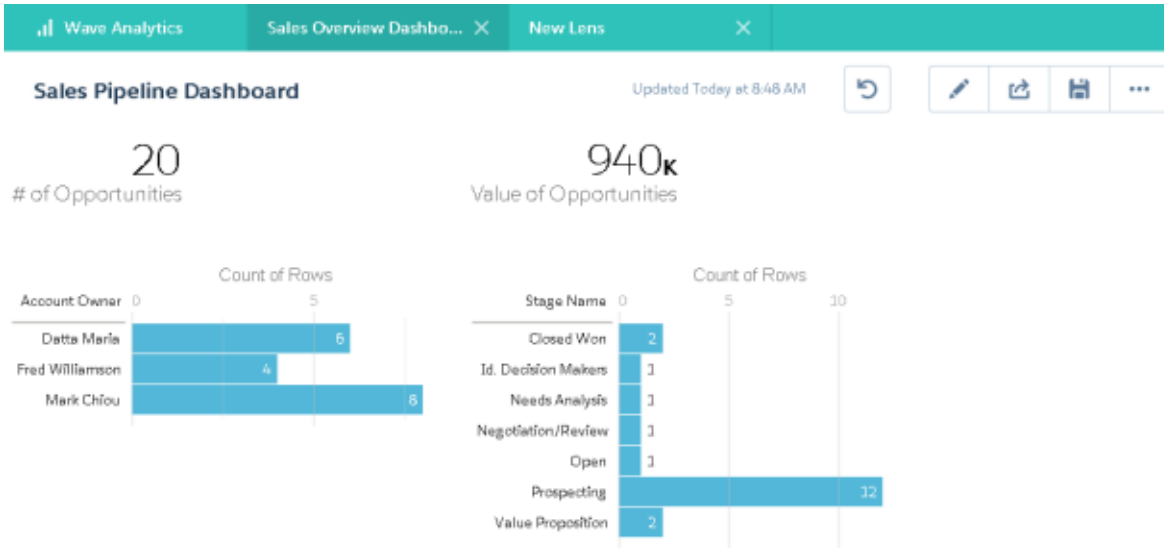

9. Create another chart based on the other clipped lens—the one grouped by stage name. The new chart widget shows how many opportunities are in each stage.

10. Click  to view the dashboard in presentation mode.

Now you're looking at the audience's view of your dashboard, and you're ready to ask some questions.

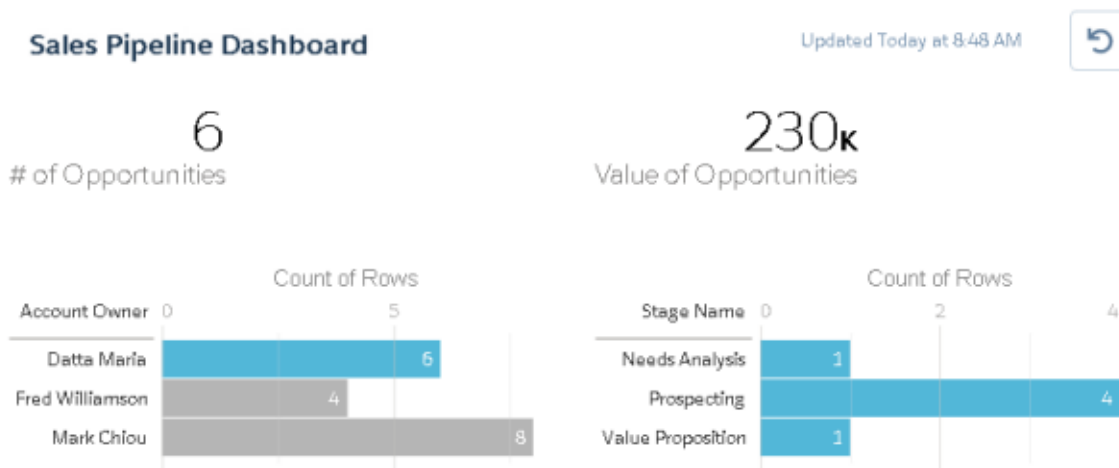

Facet Widgets to See Data from Multiple Angles

Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets in the Wave dashboard are filtered in the same way. You can turn faceting on or off for each widget.

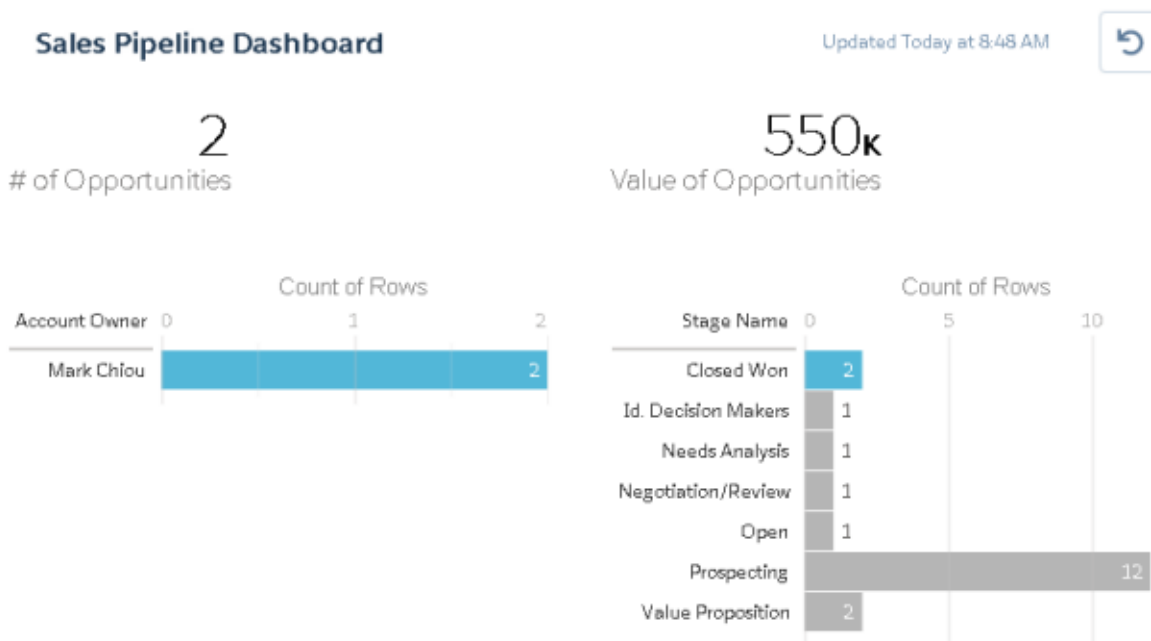

Now we let’s look at how faceting works with the number and chart widgets that we added to our classic designer dashboard.

1. In the Sales Pipeline dashboard, click the first bar in the chart that shows the number of opportunities grouped by account owner. Notice that first bar is now highlighted and the results of the other widgets changed. Because of faceting, the number widgets and the other chart now show the results for the selected account owner only. Each of your widgets shows the same set of data from a different angle. Widgets created from the same dataset are faceted, by default.

2. Click the first bar again to remove the filter based on the account owner. Notice that the results are now shown for all account owners.
3. In the chart that shows the number of opportunities grouped by stage name, click the first bar.

The Account Owners chart changes to show the values of the deals that each salesperson has in the selected stage. Because Mark is the only one that has deals in this stage, only he appears in the Account Owners chart.

4. To disable faceting for a particular widget, clear the **Facet this lens** option in the lens properties.

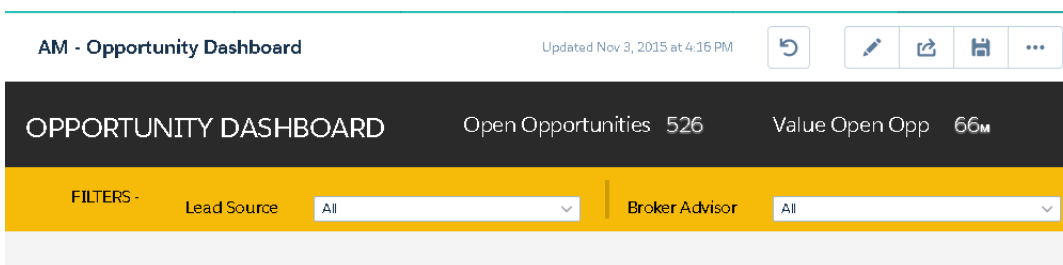

Tip: You can use bindings to facet widgets created from different datasets. For more information, see the [Wave Analytics Dashboard JSON Reference](#).

Add Images to the Wave Dashboard

Add images to your dashboard to help your audience with context and to make the dashboard more fun to read. For example, if your dashboard is designed to help track sales of multiple products, consider distinguishing the products by their logos.

1. Upload the image that you want to use to Documents and select the “Externally Available Image” option.
If you don’t select the option, the image will not appear in the dashboard.
2. Copy the record ID for the document in the URL in the address bar.
3. In the dashboard, click the box widget and paste the record ID into the **Image Document ID** field in widget properties.

Note: You can also use the box widget to shade a section of the dashboard or add a background color to the dashboard. For example, you can use colored areas to highlight key metrics and filters.

To do this, don't include an image and set the background color in the **Background Color** field of the widget properties.

SEE ALSO:

[Uploading and Replacing Documents](#)

Link to Lenses and Other Dashboards

Use links to tie a Wave dashboard to related lenses and dashboards. This widget is useful when you want to break up analysis across multiple assets, rather than cramming it all into a single dashboard. It's also useful for creating pathways to analyze your data.

1. In the dashboard, click the link icon.
2. In the widget properties, specify the link properties, such as the ones listed here.

Destination Type

Specify whether the link widget leads to a saved lens, saved dashboard, or new lens.

Destination

Specify the lens or dashboard asset to link to.

 **Note:** If you try to create a Link widget in a dashboard that has not been saved in Spring '16 and you don't see the asset in the picklist, open the asset first, and then look for the asset in the picklist.

Include Dashboard State

When enabled, the selections made in widgets with faceted steps are transferred to the linked lens or dashboard. When transferring dashboard states, Wave Analytics verifies that the destination has lenses that are compatible with the lenses from the source dashboard.

 **Note:** Wave doesn't transfer a dashboard state in the following cases.

- The source lens isn't faceted.
- The destination lens uses a different dataset than the source lens.
- When linking to another dashboard, the destination lens uses different groupings than the source lens. If the link destination is a lens, then groupings don't prevent dashboard state from being transferred.

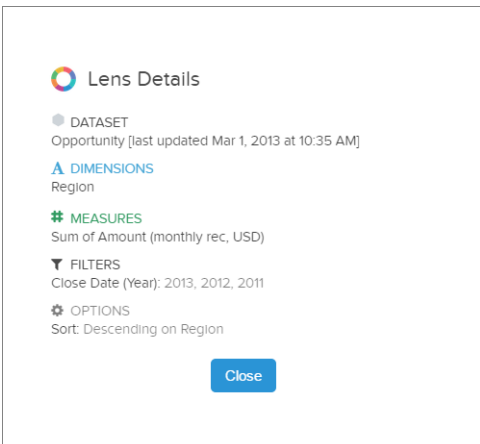

Text

The link label that you click to access the linked asset.

See Details About a Widget's Lens

To ensure that a widget in a Wave dashboard is showing the right data, review details about the widget's lens.

1. When viewing the dashboard in presentation mode, not edit mode, hover over a widget and click  .

Lens details display.

2. Review the dataset and applied dimensions, measures, filters, and other details about the widget's lens.

Filter or Remove Clipped Lenses from the Wave Dashboard

Curate the clipped lenses in a dashboard to reduce clutter. You can filter the list of clipped lenses to see which ones aren't used and then remove them from your dashboard.

1. From the clipped lens menu, filter by **All Lenses**, **Active Lenses**, or **Unused Lenses**.

2. Optionally, if a lens isn't used, then you can remove it from your dashboard by clicking . If the lens is saved to Wave Analytics, then it's still available and can be opened from Lenses after being removed from your dashboard.

Keyboard Shortcuts For Wave Dashboards and Lenses

You can do some basic actions from your keyboard. The dashboard designer shortcuts vary based on whether you are using the classic designer or Wave dashboard designer.

Lens Keyboard Shortcut	Description
l	Clip to designer
s	Save
n	Clone in new tab
d	Delete
Ctrl+E (Windows) Cmd+E (Mac OS)	Open Expert Editor Mode (JSON editor)

Classic Designer Keyboard Shortcut	Description
Arrow keys	Move the widget in 10-pixel increments.
Ctrl+Arrow keys (Windows) Cmd+Arrow keys (Mac OS)	Move the widget in 1-pixel increments.
Shift+Arrow keys	Resize the widget by 10 pixels.
Ctrl+Shift+Arrow keys (Windows) Cmd+Shift+Arrow keys (Mac OS)	Resize the widget by 1 pixel.
x	Delete the widget from the canvas.
[Put the widget beneath other widgets.
]	Put the widget on top of other widgets.

Wave Dashboard Designer Keyboard Shortcut	Description
Arrow keys	Move the widget.
c	Share the dashboard.
d	Delete the dashboard.
e	Toggle between previewing or editing the dashboard.
q	Show clipped lenses or create a lens in the dashboard.
r	Reset the dashboard back to the last saved state.
s	Save the dashboard.
x	Redo the change.
z	Undo the latest change.
Delete	Delete the selected widgets in the dashboard.

Wave Dashboard Designer Keyboard Shortcut	Description
Drag+Shift	Reflow other widgets down when dragging a widget in the dashboard canvas.  Note: Drag the widget before you press Shift .
Ctrl+click (Windows) Cmd+click (Mac OS)	Select multiple widgets.
Ctrl+A (Windows) Cmd+A (Mac OS)	Select all widgets in the dashboard canvas.

JSON Editor Keyboard Shortcut	Description
Ctrl+E (Windows) Cmd+E (Mac OS)	View dashboard with changes to JSON.
Ctrl+3 (Windows) Cmd+3 (Mac OS)	Disregard changes and load the original JSON.
Ctrl+F (Windows) Cmd+F (Mac OS)	Search (RegExp, case-sensitive, or whole-word searches available).
Ctrl+F twice (Windows) Cmd+F twice (Mac OS)	Search and replace (RegExp, case-sensitive, or whole-word searches available).

Best Practices for Building Wave Dashboards

Follow best practices to design and build useful, effective Wave dashboards, while minimizing rework and addressing potential gaps.

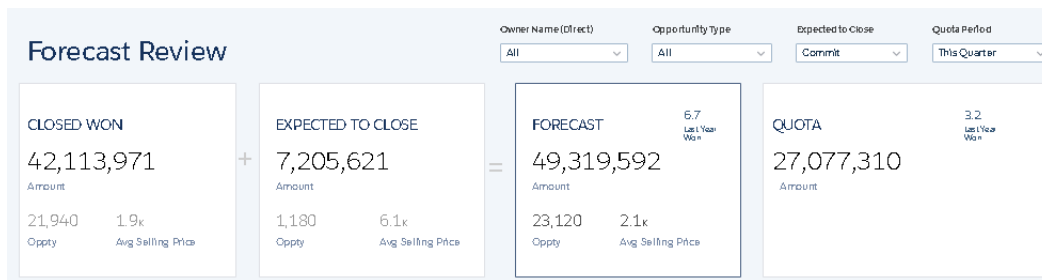

- Before you build the dashboard, take into account the following design best practices:
 - Sketch your dashboard on paper or a whiteboard before you start building.
 - Keep in mind that a chart in Wave Analytics is primarily a way to ask questions, not a way to illustrate a conclusion. A good dashboard invites the audience to drill down and seek ever more focused and useful information.
 - Prioritize elements, top left to bottom right. With languages that are read left to right, people start by looking at the top left corner and working their way down. Consider the audience's language and design for it. If your audience has limited time or attention, place important elements where they will be noticed.
 - Place high-level, actionable charts near the top left, and place charts with supporting information lower.
 - Group filters together at the top or left so that they are quickly noticeable. You can use a container widget to section them off in the dashboard.

- Place information that can be read at a glance high and to the left, and place the details lower. For example, place numbers that display a single measure, such as revenue for the current quarter, high and to the left.

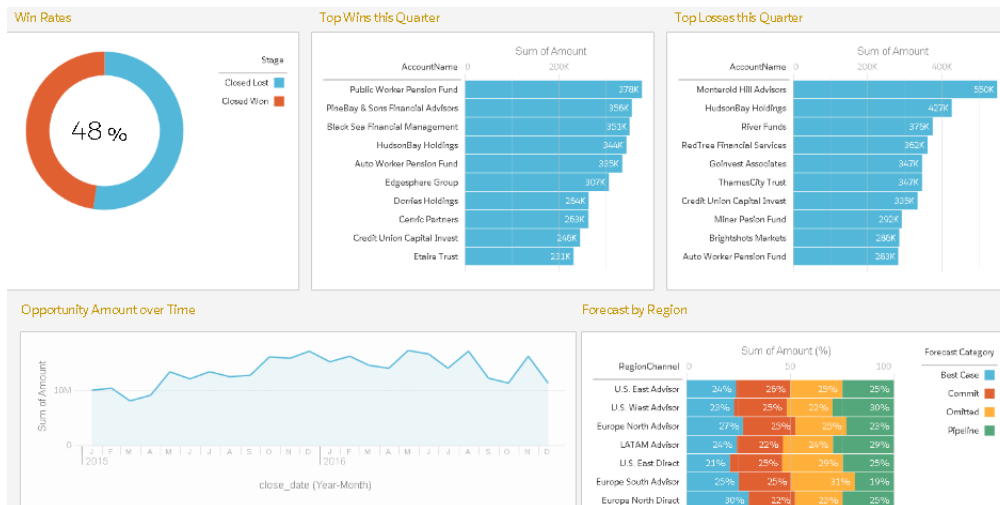

Highlight facts that the audience wants to know at a glance.

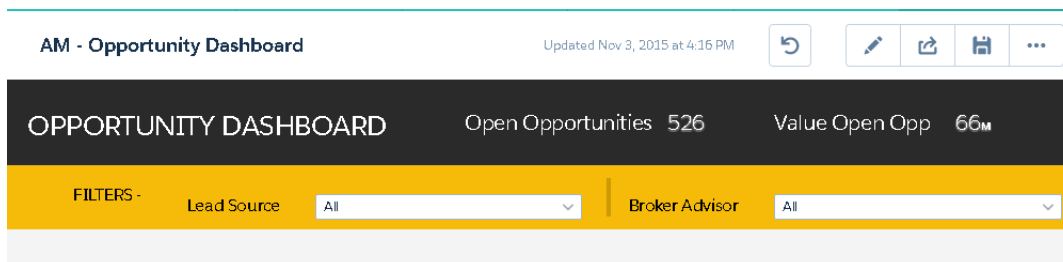

- Choose chart types based on the characteristics of the data, not for look or variety. For example, if most of your charts display value changes over time, it's OK if they're all line graphs.
- If a chart seems to need a lengthy caption or title, reconsider whether the chart is doing its job. Well-chosen data often speaks for itself.
- Use container widgets to frame and organize related elements in the dashboard.

- While you build the dashboard:
 - Apply labels to sections and charts to annotate the dashboard.

- Use colors to define sections.

- Don't clutter the dashboard—leave some empty space. If needed, break a dashboard into a series of dashboards, using link widgets to help the user navigate them.
- After you build the dashboard:
 - Have users review the dashboard before making it final. You can post a dashboard to Chatter to get feedback. Users can annotate the widgets in the dashboard to have conversations about the content.

[Build a Dashboard with the Classic Designer](#)

Convert Your Dashboard to the Wave Dashboard Designer

To take advantage of its new features, convert dashboards created in the classic designer to the Wave dashboard designer.

When editing the dashboard, click the **Wave Dashboard Designer** button to convert it to the new designer.

When you convert a dashboard to the new designer, Wave makes a copy of the dashboard. Before you delete the original version of the dashboard, know that you can't open the new version in the classic designer. Any changes that you make in the new designer can't be converted back to the classic designer.

[Considerations Before Converting to the Wave Dashboard Designer](#)

Although dashboards created in the classic designer and Wave designer have a similar look and feel, they use different runtime engines and have different JSON syntax. When you convert a dashboard to the Wave designer, certain elements of your dashboard might not convert correctly. You might need to make some manual changes to preserve the original behavior.

Considerations Before Converting to the Wave Dashboard Designer

Although dashboards created in the classic designer and Wave designer have a similar look and feel, they use different runtime engines and have different JSON syntax. When you convert a dashboard to the Wave designer, certain elements of your dashboard might not convert correctly. You might need to make some manual changes to preserve the original behavior.

Widgets

The following widget issues can arise when you convert a classic dashboard to Wave designer.

- Wave designer resizes and rearranges widgets to fit them into the 12-column grid and to ensure that no widgets (except containers) overlap. After conversion, you can use the snap-to-grid feature in Wave designer to quickly resize and rearrange widgets. You can also add more columns to the grid to get better precision when laying out the widgets.
- Wave designer converts the following chart types to bar charts because it doesn't support them: calendar heatmap, parallel coordinates, horizontal dot plot, vertical dot plot, and matrix.
- Wave designer removes YouTube and Box widgets because it doesn't support them.
- Wave designer drops the setting for the **Allow Filtering by** step property. After the conversion, you can reapply the setting to the **Selection Type** widget property. The name and location of the property is different in Wave designer.

 **Note:** If the step contains no measures, you still must specify `"measures": []`

Steps

The following step issues can arise when you convert a classic dashboard to Wave designer.

- If you specify the compare table step query in SAQL form, you can't specify custom labels for compare table columns. To specify custom labels, the step must be in compact form. You can specify the column label in the `header` attribute, as shown here.

```
"query": {
  "columns": [{
    "query": {
      "groups": [ "Product" ],
      "measures": [
        [
          "count",
          "*"
        ]
      ]
    },
    "header": "Number of rows"
  ]
}]
}
```

- The step breaks in the following cases:
 - A field in a static step doesn't have a consistent format across all rows in the step. For instance, if a "value" field is defined as an array, then every row in the step must define "value" as an array.

For example, this step is valid:

```
"values": [
  {
    "display": "Amount",
    "value": { "Type": "sum('SplitAmount')" }
  },
  {
    "display": "Percentage",
    "value": { "Type": "avg('SplitAmount')" }
  }
]
```

The following step is not valid.

```
"values": [
  {
    "display": "Amount",
    "value": { "Type": "sum('SplitAmount')" }
  },
  {
    "display": "Percentage",
    "value": [],
    "Type": "avg('SplitAmount') "
  }
]
```

- A `grain` step contains SAQL. Wave designer doesn't support SAQL in `grain` steps. To fix this issue, manually convert the `grain` step in the dashboard JSON to an `aggregateflex` step using [this process](#). Wave designer supports SAQL queries in the other types of steps, like `aggregateflex`.
- A `multi` step for a compare table contains a column-level SAQL query. While converting the dashboard, Wave designer converts `multi` steps to `aggregate` steps because it doesn't support `multi` steps. However, it can't convert `multi` steps that have a column-level SAQL query. To fix this issue, re-create the step as shown here.

- A `multi` step contains bindings. During conversion, the Wave designer generates the `measures` and `groupings` sections in the dashboard JSON using the metadata in the `columns` definitions of the original `multi` step. However, if the metadata contains bindings, Wave designer can't resolve them to determine what values to add to the new step. In this case, Wave designer adds the step query, but not the values for the `measures` and `groupings` sections. To fix the step, determine which measures and groupings are being defined in the bindings specified in the query, and add them to the `measures` and `groupings` sections.

 **Note:** If the step contains no measures, you still must specify `"measures": []`.

Mobile Layouts

The following mobile layout issues can arise when you convert a classic dashboard to Wave designer.

- Mobile layouts created in classic designer dashboards are dropped when the dashboard is converted to Wave designer. To fix this issue, re-create the layouts again using the layouts user interface in the Wave designer.
- Unlike classic designer dashboards, Wave designer dashboards don't support paging--you can only use one page.

Start Values and Selections

The following issues with start values and selections can occur when you convert a classic dashboard to Wave designer.

- When invoking an embedded dashboard, you can specify criteria to be passed as selections. If you set a selection value for a step and that value doesn't exist in the step's result set, the selection isn't applied. This behavior is different from classic designer, which blindly applies this invalid selection, resulting in no data returned.
- If a step returns more than 2,000 results, a configured start value for the step or a manually coded selection value for an embedded dashboard might not be set. Specifically, if the start or selection value isn't one of the initial 2,000 results returned by the step, the value isn't found and, therefore, not set. To reduce the chance of this happening, increase the query limit up to 10,000 in the step definition. For more information about the `limit` parameter in a step query, see the [Wave Analytics SAQL Reference](#).

Bindings

The following binding issues can arise when you convert a classic dashboard to Wave designer. If a binding doesn't work after the conversion, the dashboard doesn't render. If this issue occurs, contact Salesforce Customer Support.

- Wave designer dashboards run on the new runtime engine, which has a new bindings syntax. When converted to Wave designer, the dashboard bindings are not updated with the new syntax. The new runtime engine can process a subset of the original bindings syntax. It can process bindings that set measure selections, groupings, filters, sort order, or limits based on string or numeric values in steps. Other bindings might not work after conversion. To resolve invalid bindings, rewrite the bindings using the new bindings syntax.
- The new runtime engine is stricter when evaluating bindings defined using the old bindings syntax. If a binding isn't well formed, the step returns an error.

For example, an error occurs if the binding contains redundant parentheses. The outermost binding function can't be enclosed in parentheses, as shown here.

```
"measures": "{ { (value (field (selection (Select_Graph), 'compact'))) } }"
```

The following error occurs in this case.

```
"(value (field (selecti -^ Expecting 'FUNCTION', got '('."
```

To fix this issue, remove the outermost set of parentheses, as illustrated here.

```
"measures": "{ { value (field (selection (Select_Graph), 'compact')) } }"
```

- When defining date ranges in a static step, use a double array, as shown here.

```
"step_days": {
  "values": [{
    "display": "30 Days",
```

```

      "value": [
        [
          [
            "day",
            0
          ],
          [
            "day",
            365
          ]
        ]
      ]
    }],
    ...
  }

```

Here's the binding that references the static step.

```

"filters": [
  [
    "OpportunityServices__c.CloseDate",
    "{{selection(step_days)}}",
    ">=<="
  ]
]

```

Because the selection binding is defined inside an array, the following example throws an error.

```

"step_days": {
  "values": [{
    "display": "30 Days",
    "value": [
      [
        "day",
        -30
      ],
      [
        "day",
        0
      ]
    ]
  ]
},
...
}

```

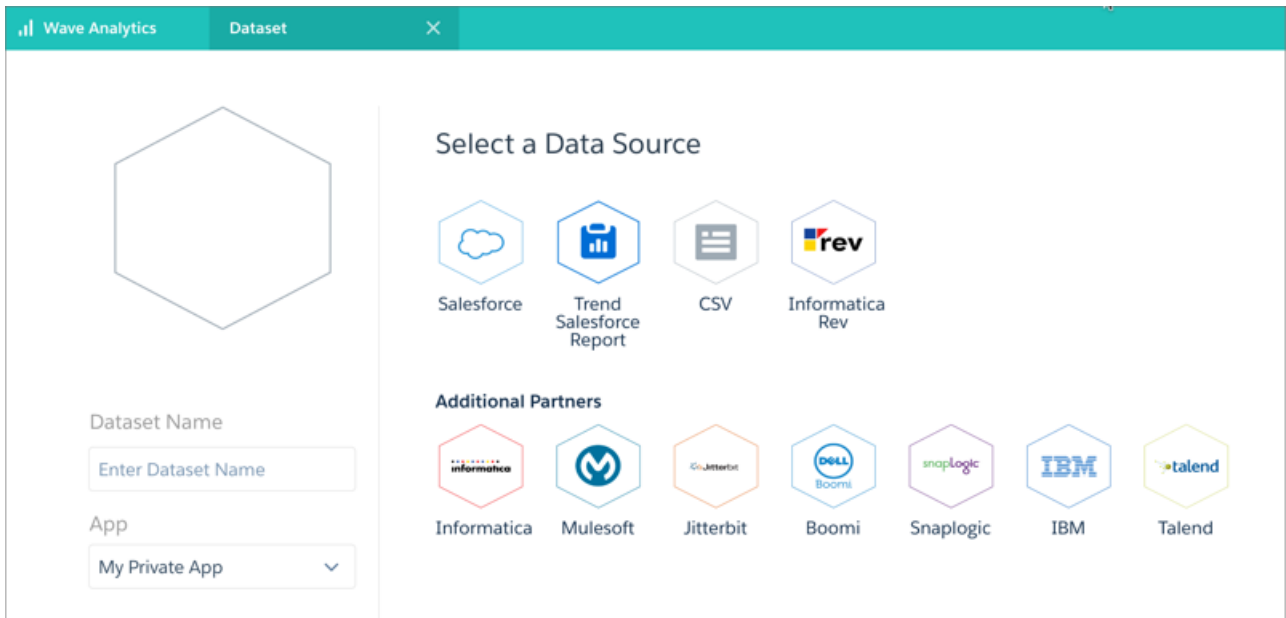

Here's the binding that references the static step above.

```

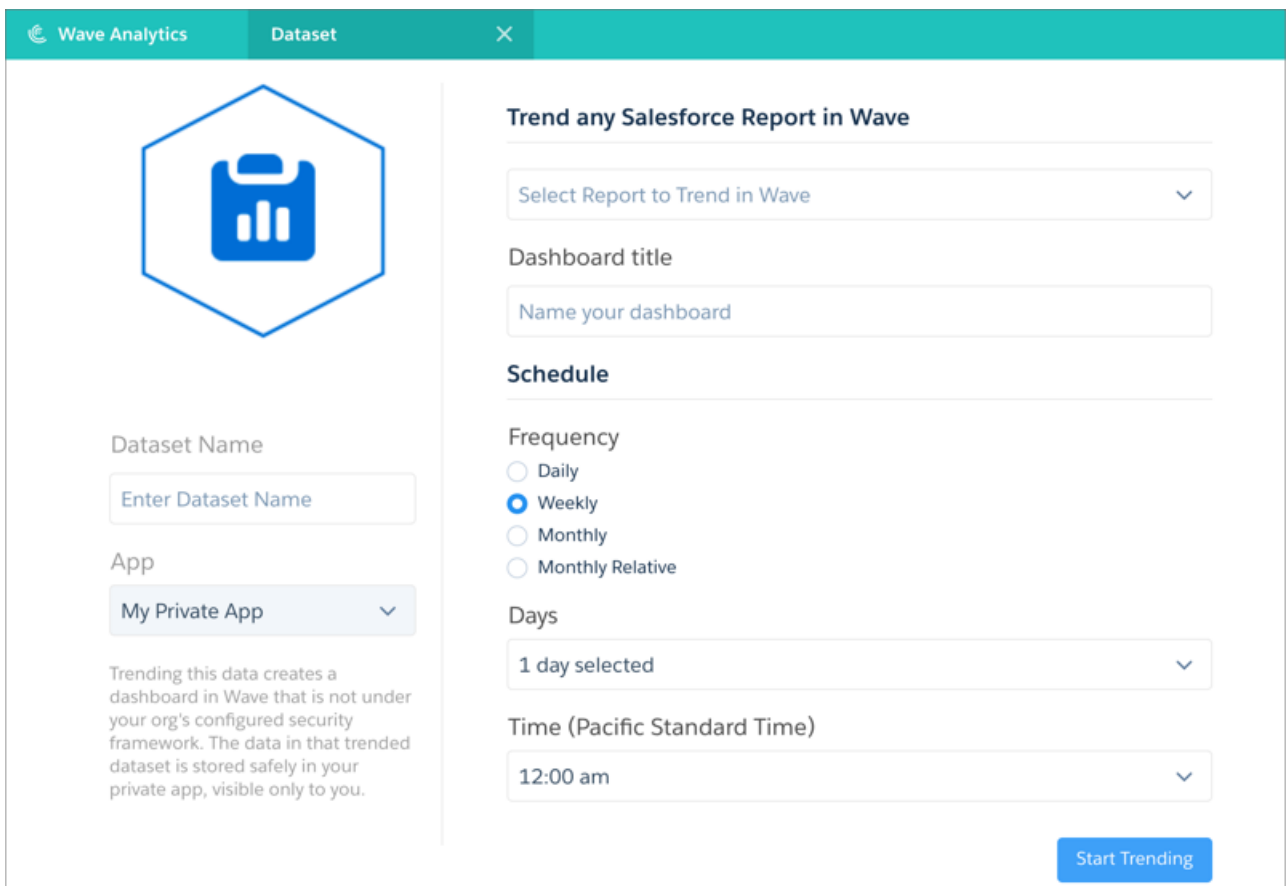

"filters": [
  [
    "OpportunityServices__c.CloseDate",
    [ "{{selection(step_days)}}" ],
    ">=<="
  ]
]

```

- Choose **Trend Salesforce Report** from the available data sources.

- Select a report.

If the report you want to trend does not exist, you must create it first.

 **Note:** Only the saved version of a report is trended. If you've made unsaved changes to a report, then trend the report, the changes are not reflected in the trending dashboard.

4. Enter a title for the trending dashboard and the new trending dataset.
5. Set a schedule for updating the dashboard. This sets the frequency of how often snapshots of report data are taken.

 **Note:**

- Once you set the schedule, it can't be changed.
 - If you choose a schedule that updates on the 29th, 30th, or 31st of the month, no updates will occur on months that have too few days to meet that schedule.
 - To avoid unwanted behavior during changes to daylight savings, don't choose 2 A.M. as an update time.
6. Choose a different app if you do not want to save the trending dataset in **My Private App**.
If you save the dataset to a shared app, all users who can view that app can view the dataset.
 7. Click **Start Trending**.
When the new trending dashboard is ready, you'll receive an email with a link. Once the dashboard is ready, you can also begin to explore the associated dataset, which appears in the Wave datasets list.
 8. Connect to the new trending dashboard using the link in the notification email, or by going to the app in which you saved it (after receiving the notification email).

 **Note:** At first, the trending dashboard displays only 1 data point. As snapshots are taken and added to the new Wave trending dataset underlying the dashboard, more data points are added.

You can also trend any report directly by clicking **Trend in Wave** on that report.

In Lightning Experience:

In classic Salesforce:

Once you start trending, the **Trend in Wave** button on the report becomes **View Trend**.

To stop trending from Wave, open the trending dataset by choosing to edit it, then click **Stop Trending**.

To stop trending from Lightning Experience, go to the trending report and open the menu next to **View Trend** and choose **Stop Trending**.

To stop trending from classic Salesforce, go to the trending report and click **View Trend** on the report to open a dialog, then click **Stop Trending**.

 **Note:** If you stop trending, you cannot restart where the trending left off (there is no pause button). Trending the same report again creates a new dataset and a new trending dashboard.

For best results with trending, follow these guidelines:

- Choose reports that have changes on a frequency matching the trending schedule you set up.
- Always clone the source reports into your personal folders. After you start trending, don't edit the reports. Keeping the report unchanged ensures a consistent view. If you plan to share trending dashboards, save them to view-only apps. This keeps the data consistent and prevents anomalies from appearing on the trending Wave dashboard.
- To get focused, easily observable, and actionable insights, tightly scope source reports. For example, trend only new business deals closing in the current quarter rather than all opportunities. A broad scope makes it more difficult to spot trends.
- Group and summarize your reports in the report builder with key information before you start trending them.
- Do not create joined reports just for trending. Trending dashboards can't be created from joined reports.

Share Trending Dashboards

You can share a trended dashboard just as you can with any Wave dashboard.

You can share a trending dashboard just as you share any dashboard. You can post an image of it to a feed, or download and share an image. You can also embed your trending Wave dashboard as you would any other dashboard.

To share the dashboard directly using its URL, first share the trending dashboard's underlying snapshots dataset by saving it to a Wave app that your target audience can access.

USER PERMISSIONS

To trend reports in Wave Analytics:

- "Use Wave Analytics" OR "Use Wave Analytics Templated Apps"
- AND
- "Trend Report Data in Wave Analytics"

The screenshot displays the Wave Analytics 'Dataset' configuration page. On the left, the dataset name is 'SalesOps2016Q1-Q2' and it is associated with a 'Shared App'. Below the app selection, there is a 'Delete Dataset' button. On the right, the 'Update Extended Metadata' section has a field for 'Add Extended Metadata File (JSON)' with the file 'SalesOps2016Q1_Q2.xmd.json' and a 'Select file or drag file here...' button. The 'Update Data' section includes 'Add External Data File (CSV) (Max: 500 MB)' and 'Add Metadata File (JSON)', both with 'Select file or drag file here...' buttons. A 'Preview Data' button is located below the metadata section. The 'Security' section has a 'Security Predicate' field with the placeholder text 'Enter a security predicate...'.

Important: Sharing the trending Wave dashboard or the underlying dataset could expose data to users who normally would not have access to that data.

It is possible to share trending Wave dashboards with users who would normally be prevented from seeing data based on security settings. If you save a trending dashboard to any app that is not My Private App, then anyone with access to that app (and the underlying dataset) can view all data in that Wave dashboard regardless of any sharing restrictions or field-level security that has been set.

Limits and Limitations for Trending Data in Wave

To prevent the performance of your org from degrading, certain limitations are placed on the size of the snapshots and the number of trended datasets each user can create.

- Maximum number of trended datasets per user: 5
- Maximum number of rows per snapshot: 100,000
- Max total number of rows in a trended dataset: 5000000
- Maximum monthly number of rows for all snapshots per org: 40 million
- Trended datasets count towards the overall Wave platform limits, including total number of rows

To control the impact that trending datasets have on general org-wide limits, configure these limits, available on the Wave Analytics Settings page:

- **Max number of rows per snapshot** is an option to control the maximum number of rows that a trended report can have when a snapshot is taken. If the report exceeds the limit, the snapshot is not taken and an error email is sent to the user.
- **Max total number of rows in a trended dataset** is an option to limit the maximum number of rows that the Wave dataset containing the snapshots can have. If the dataset exceeds the limit, the oldest snapshot is deleted from the dataset.

These limits don't apply to admin users.

Once trending begins, do not change access rights to the underlying report or add or delete dimensions and measures. Changing the report or the access rights can cause an error or inaccuracies at the time a snapshot is taken.

Snapshots are taken every Sunday at midnight (local time), unless you set a different schedule when trending a report. Processing and surfacing the data requires more time, which can delay snapshots.

If trending is stopped and then restarted, a new snapshot dataset is created, with a new trending dashboard. The previously trended dataset is not included in the new dashboard. Data can be moved into the new dataset using the Salesforce data APIs.

The Wave dashboard designer is enabled by default for most orgs. Make sure that it remains enabled for your org. To render, trending dashboards rely on the Wave dashboard designer being enabled.

Users whose profiles have View Encrypted Data enabled can't create trended datasets because Wave does not support encrypted data.

Roll out the capability gradually to your user base and observe data usage and performance. Stop trending datasets that are no longer needed for active use and delete the underlying trended datasets to recover storage limits.

Extend Wave Everywhere

Incorporate Wave Analytics throughout your business. The Wave Analytics visualizations you've built are more powerful when you share them across your Salesforce experience by integrating them into custom pages, Visualforce pages, community sites, and more. More ways to share include packaging assets, presentation mode, annotations, and downloading filtered data from Wave. In addition, custom menus in lenses and dashboards allow you to perform common Salesforce actions directly from Wave.

[Embed Dashboards Everywhere](#)

Embed Wave dashboards in every Salesforce experience. From embedded dashboards, users can explore and click to linked assets. If you set them up with a Share icon, embedded dashboards offer Post to Feed and Download sharing options.

[Integrate Wave into Salesforce with an Analytics Tab](#)

Access your personal Analytics home and run Wave apps from a tab within Salesforce Classic or Lightning Experience.

[Wave Migration, Packaging, and Distribution](#)

You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

[Enable Actions and Links with Custom Actions Menus in Lenses and Dashboards](#)

Custom menus in Wave Analytics lenses and dashboards let users take advantage of Salesforce actions and open records from Salesforce or other websites. You create action menus by working with a Wave dataset's extended metadata (XMD) file.

[Configure Bulk Actions on Table Records](#)

You can create custom bulk actions that apply to all records shown in a table widget of a Wave designer dashboard. Use bulk actions to update records or perform an action on each of them.

Embed Dashboards Everywhere

Embed Wave dashboards in every Salesforce experience. From embedded dashboards, users can explore and click to linked assets. If you set them up with a Share icon, embedded dashboards offer Post to Feed and Download sharing options.

Compare the options for embedding dashboards.

User Interface	Where	How	Component
Lightning Experience only	Home, record, and app home pages	Component in the Lightning app builder	Wave Dashboard
Salesforce Classic only	Record detail page	Component in the enhanced page layout editor	Wave Analytics Assets
Lightning Experience and Salesforce Classic	Any page	Visualforce page component	wave:dashboard
Salesforce1	Lightning app page or Visualforce tab	Lightning app builder or Visualforce page component	Wave Dashboard or wave:dashboard
Communities	Visualforce page	Visualforce component on a Force.com community page	wave:dashboard

Embedded Wave dashboards can include these features.

- Annotations, notifications, and full-screen presentation
- Sharing and downloading options
- Links to other Wave dashboards
- Record actions menus
- Link to the native app, whether it's Wave on desktop or Wave Mobile (available for Wave users but not Community users)

Embedded Wave dashboards have these limitations.

- The option to explore in Wave isn't included.
- The charts don't include hover-over information (tooltips).
- Some filters, such as date selectors, are difficult to set.

[Embed Wave Dashboards in Lightning Pages](#)

Add Wave Analytics dashboard components to Lightning home pages, record pages, and app home pages to provide interactive visualizations of your data. Users can drill in and explore the dashboard within the frame on the Lightning page or in a Wave Analytics window.

[Embed Wave Dashboards in Salesforce Classic Pages](#)

Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, you can include a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

[Add a Wave Analytics Dashboard to a Visualforce Page](#)

By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

[Whitelist Trusted Sites for Embedded Dashboards](#)

Embed Wave in any web page or web-based app. By specifying your trusted sites in the Wave Analytics whitelist, you can include embedded Wave dashboards in websites and apps outside of Salesforce servers.

[View Embedded Dashboards on Mobile Devices](#)

Add Wave dashboard components to Visualforce pages in Salesforce websites accessed by mobile users, including Communities. Or add Wave dashboard components to Lightning app pages. Embedded Wave dashboards can responsively select layouts optimized for any device—including phones and tablets.

[Share Wave with Communities](#)

With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages in their community.

Embed Wave Dashboards in Lightning Pages

Add Wave Analytics dashboard components to Lightning home pages, record pages, and app home pages to provide interactive visualizations of your data. Users can drill in and explore the dashboard within the frame on the Lightning page or in a Wave Analytics window.

To add a dashboard to your Lightning page, follow these steps.

1. Select the **Wave Dashboard** component in the Lightning app builder.
2. From the Dashboard drop-down list, select the dashboard to display.
3. From the layout drop-down list, select the type of screen where your Lightning page will be viewed.

EDITIONS

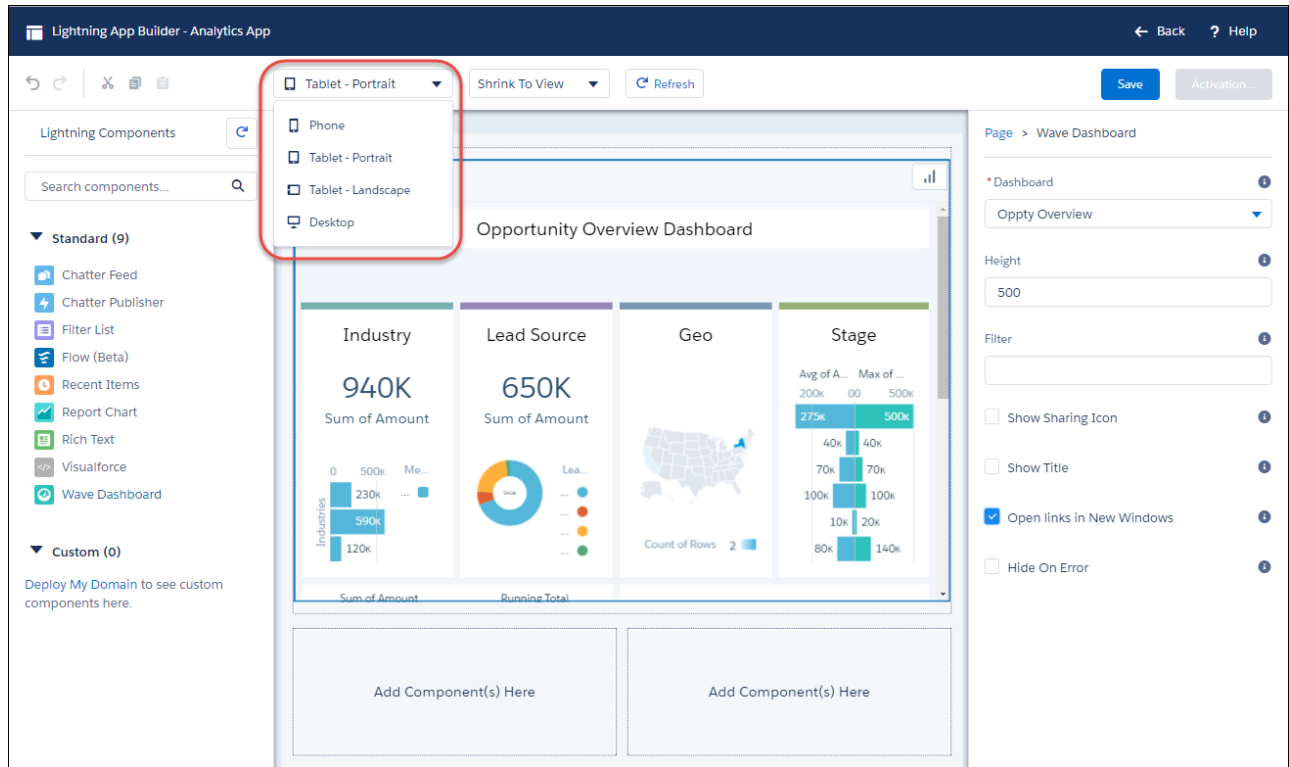

Available in: Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view embedded Wave dashboards:

- Analytics Cloud - Wave Analytics Platform permission set license with "Use Wave Analytics" permission

4. Configure the attributes of the embedded Wave Analytics dashboard:

- The **Show Sharing Icon** option lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.
- The **Show Title** checkbox gives you control over the visibility of the dashboard title.
- With the **Open Links in New Windows** attribute, you can specify where links from the dashboard to other assets are opened.
- The **Hide On Error** checkbox gives you control over whether the Wave Analytics dashboard appears if there is an error (such as the dashboard can't be found).
- With the **Filter** attribute, you can set up the embedded dashboard to show only the data that's relevant for the record being viewed. The **Filter** attribute links data fields in the dashboard to the object's fields. For example, the filter here applies the name of the account on the record page as a filter so that the dashboard shows only information related to that account name:

```
{'datasets':{'account': [{'fields':['Name'], 'filter':{'operator': 'matches', 'values': ['$Name']}}]}}
```

Refer to the table to understand the notation for the **Filter** attribute.

Tip: This is a new syntax as of Spring '17. The previous syntax, noted [here](#), is still supported.

Notation	Description	Notes
datasets	Wave dataset	Where to find it: On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset system name.)

Notation	Description	Notes
fields	Dimension or Measure in the Wave dataset	Where to find it: Click the Explore icon to open the widget. Then select Show SAQL from the Options menu. For dimension names, look for “group by” statements. For measure names, look for statements with functions such as “sum” or “stddev.”
values	Field in the Salesforce object, or a specific value	Where to find it: In Setup, find the object you want, and select Fields. Use the Field Name (also known as the API Name). For custom fields, use the name with “__c” at the end.
selection	With the selection option, the dashboard is shown with all its data, and the specified dimension values are highlighted	The selection option can be used alone or with the filter option. Selection takes dimension values only. To use this option, the dashboard must include a list, date, or toggle widget that groups by the specified dimension.
filter	With the filter option, the dashboard is shown with only filtered data	The filter option can be used alone or with the selection option. Filter takes dimension or measure values.
operator	Use with the filter option	Supported operators for dimensions: in, not in, matches Supported operators for measures: ==; !=; >= ; > ; <= ; <

 **Note:** If a filter or selection is specified that does not exist, the field mapping is ignored the dashboard appears with all its data and no selection.

The **Filter** attribute follows this format:

```
{'datasets' : {'dataset1': [ {'fields': ['field1'], 'selection': ['$value1', '$value2']},
  {'fields': ['field2'], 'filter': { 'operator': 'operator1', 'values': ['$value3', '$value4'] } } ]}}
```

The example above shows a filter that causes the embedded dashboard to appear with only the filtered data showing. Here’s an example that applies the account name as a selection within a dashboard that shows all of its data:

```
{'datasets' : {'account': [ {'fields': ['Name'], 'selection': ['$Name'] } ]}}
```

 **Note:** The above syntax is new in Spring ‘17. The previous syntax continues to be supported, and it works the same as the new selection option. For reference, here’s the previous syntax:

```
{ 'datasetSystemName1': {'field1': ['$value1']}, 'datasetSystemName2': {'field1': ['$value1', '$value2'], 'field2': ['$value3'] } }
```

For example:

```
{'opportunity': {'AccountId': ['$Id']}}
```

For information about working with the Lightning App Builder, start on the [Lightning App Builder](#) overview page.

Embed Wave Dashboards in Salesforce Classic Pages

Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, you can include a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

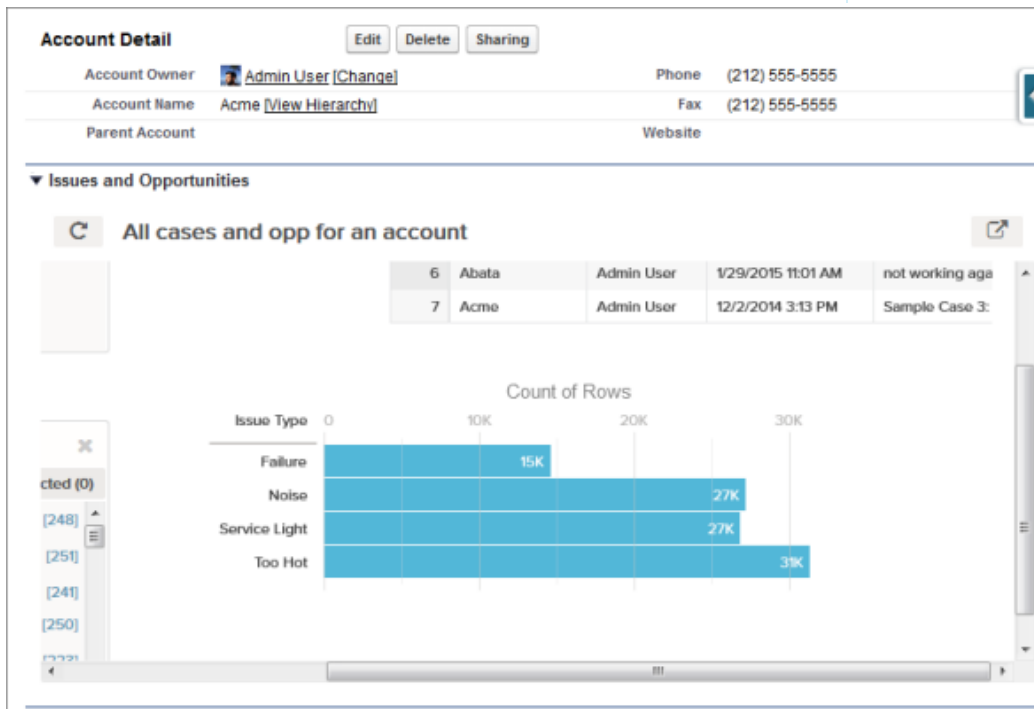

USER PERMISSIONS

To customize page layouts:

- “Customize Application”

To view embedded Wave dashboards:

- Analytics Cloud - Wave Analytics Platform permission set license with “Use Wave Analytics” permission

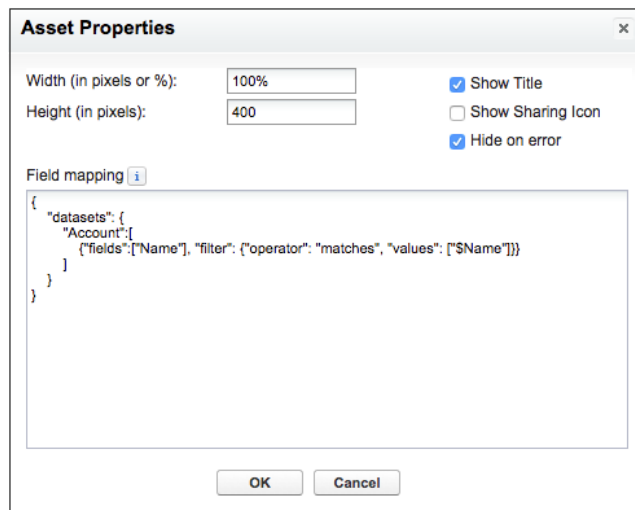

1. In the enhanced page layout editor, select Wave Analytics Assets in the left column of the palette.

2. Drag an item from the list of available dashboards to a detail section on the page layout.
3. After the dashboard is positioned in the layout, you can change properties such as height by double-clicking the element or clicking the wrench icon next to it ().

To set up the dashboard to show only the data that’s relevant for the record being viewed, use field mapping. Field mapping links data fields in the dashboard to the object’s fields. For example, the field mapping here applies the name of the account on the record page as a filter so that the dashboard shows only information related to that account name:

Refer to the table to understand the notation for adding the field mapping property.

 **Tip:** This is a new syntax as of Spring '17. The previous syntax, noted [here](#), is still supported.

Notation	Description	Notes
datasets	Wave dataset	Where to find it: On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset system name.)
fields	Dimension or Measure in the Wave dataset	Where to find it: Click the Explore icon to open the widget. Then select Show SAQL from the Options menu. For dimension names, look for “group by” statements. For measure names, look for statements with functions such as “sum” or “stddev.”

Notation	Description	Notes
values	Field in the Salesforce object, or a specific value	Where to find it: In Setup, find the object you want, and select Fields. Use the Field Name (also known as the API Name). For custom fields, use the name with “__c” at the end.
selection	With the selection option, the dashboard is shown with all its data, and the specified dimension values are highlighted	The selection option can be used alone or with the filter option. Selection takes dimension values only. To use this option, the dashboard must include a list, date, or toggle widget that groups by the specified dimension.
filter	With the filter option, the dashboard is shown with only filtered data	The filter option can be used alone or with the selection option. Filter takes dimension or measure values.
operator	Use with the filter option	Supported operators for dimensions: in, not in, matches Supported operators for measures: ==; !=; >= ; > ; <= ; <

 **Note:** If a filter or selection is specified that does not exist, the field mapping is ignored the dashboard appears with all its data and no selection.

The field mapping follows this format:

```
{
  "datasets": {
    "dataset1": [
      {
        "fields": ["field1"],
        "selection": ["$selection1", "$selection2"],
        "filter": {
          "operator": "operator1",
          "values": ["$value1, $value2"], ["$value3", "$value4"]
        }
      },
      {
        "fields": ["field2", "field3"],
        "selection": ["$selection3", "$selection4"]
      }
    ],
    "dataset2": [
      {
        "fields": ["field4"],
        "filter": {
          "operator": "operator2",
          "values": ["$value5"]
        }
      }
    ]
  }
}
```

For example, if the dashboard has a dataset named Service with the dimensions Account and Industry, this field mapping would show the dashboard with all its data but the record's account ID and industry would be highlighted:

```
{
  "datasets": {
    "service": [
      {
        "fields": ["AccountId"],
        "selection": ["$Id"]
      },
      {
        "fields": ["Industry"],
        "selection": ["$Industry"]
      }
    ]
  }
}
```

With this field mapping, the dashboard would appear with just the record's account ID and industry data:

```
{
  "datasets": {
    "service": [
      {
        "fields": ["AccountId"],
        "filter": {
          "operator": "matches",
          "values": ["$Id"]
        }
      },
      {
        "fields": ["Industry"],
        "filter": {
          "operator": "in",
          "values": ["$Industry"]
        }
      }
    ]
  }
}
```

Here's another example with two datasets and a combination of selections and filters. This field mapping will show the dashboard with only data that is not in ExistingOpps but is in TX, AL, and DE, with revenue that is greater than or equal to 1000000. In addition, the dashboard will show Retail1, Wholesale1, and TX highlighted.

```
{
  "datasets": {
    "Opportunities": [
      {
        "fields": ["OpptyName"],
        "selection": ["$Retail1", "$Wholesale1"],
        "filter": {
          "operator": "not in",
          "values": ["$ExistingOpps"]
        }
      }
    ],
  }
}
```

```

    {
      "fields": ["State", "Country"],
      "selection": ["$TX"],
      "filter": {
        "operator": "in",
        "values": ["$TX"], ["$AL", "$DE"]]
      }
    }
  ],
  "Accounts": [
    {
      "fields": ["Revenue"],
      "selection": [],
      "filter": {
        "operator": ">=",
        "values": ["1000000"]
      }
    }
  ]
}

```

 **Note:** The above syntax is new in Spring '17. The previous syntax continues to be supported, and it works the same as the new selection option. For reference, here's the previous syntax:

```

{
  "dataset1": {
    "field1": ["$value1"]
  },
  "dataset2": {
    "field2": ["$value2"],
    "field3": ["$value3"]
  }
}

```

For example, if the dashboard shows data from a dataset named Service, with the dimensions Account and Industry, the field mapping would be defined like this:

```

{
  "service": {
    "AccountId": ["$Id"],
    "Industry": ["$Industry"]
  }
}

```

Additional properties of Wave Analytics Assets:

- The `Show title` checkbox gives you control over the visibility of the dashboard title.
- The `Show Sharing Icon` option lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.
- The `Hide on error` checkbox gives you control over whether the Wave Analytics asset appears if there is an error (such as the dashboard can't be found).
- Dashboards include the date and time when they were last refreshed.

Be aware of these limits and limitations:

- You can add one dashboard per page layout.
- Wave Analytics dashboards aren't supported in the original page layout editor. If you open and then save a layout with a Wave dashboard in the original page layout editor, the dashboard is deleted.

For information about working with the enhanced page layout editor, see [Customizing Page Layouts with the Enhanced Page Layout Editor](#).

Add a Wave Analytics Dashboard to a Visualforce Page

By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

To add a dashboard to your Visualforce page, configure the `<wave:dashboard>` component. You can add one dashboard per Visualforce page. However, the dashboard can include links to other dashboards or Wave Analytics assets.

Here are two examples. Note that the dashboard is identified by the `dashboardId`, which is an 18-character code beginning with 0FK. You can find the `dashboardId` at the end of the URL when viewing a dashboard. An alternative way to identify the dashboard is by its `developerName`, which can be requested through the API.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view embedded Wave dashboards:

- Analytics Cloud - Wave Analytics Platform permission set license with "Use Wave Analytics" permission OR Analytics Cloud - Wave Community Users permission set license with "View Wave Analytics on Communities Pages" permission

```
<apex:page sidebar="true" standardController="Opportunity">

  <wave:dashboard dashboardId="0FKB000000006Y7OAI"
    showTitle="true"
    height="800px"
    openLinksInNewWindow="true"
    filter="{ 'datasets' : { 'opportunity': [ { 'fields': ['Id'], 'selection':
[ '!Opportunity.Id' ] ] } } }"/>
```

```

</apex:page>

<apex:page standardController="case">

    <wave:dashboard dashboardId="0FKxx000000000uGAA"
        height="1000px"
        showTitle="false"
        showSharing="true"
        openLinksInNewWindow="false"
        hideOnError="true"
        filter="{ 'datasets' : { 'ServiceCase4': [ { 'fields':['Id'], 'selection':
[ '!case.Id' ] }, { 'fields':['OwnerId'], 'filter': { 'operator':'in', 'values':
[ '!case.OwnerId', '!case.Product__c' ] } ] } } }"/>

</apex:page>

```

- The `showTitle` attribute gives you control over the visibility of the dashboard title.
- The `showSharing` attribute lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.
- With the `openLinksInNewWindow` attribute, you can specify where links from the dashboard to other assets are opened.
- The `hideOnError` attribute gives you control over whether a Wave Analytics asset appears if there is an error (such as the dashboard can't be found).
- Dashboards include the date and time when they were last refreshed.
- With the `filter` attribute, you can either select or filter on dataset fields at run time. For example, this attribute can be used to set up the embedded dashboard to show only the data that's relevant for the record being viewed by linking data fields in the dashboard to an object's fields. Filters are configured with JSON strings, in the following format:

```

filter="{ 'datasets' : { 'dataset1': [ { 'fields':['field1'], 'selection': [ '!value1',
'!value2' ] }, { 'fields':['field2'], 'filter': { 'operator':'operator1', 'values':
[ '!value3', '!value4' ] } ] } } }"

```

For example:

```

filter="{ 'datasets' : { 'Sales': [ { 'fields':['Region', 'Stage'], 'selection': [ ['West',
'Prospecting'], ['North', 'Qualification'] ] } ] } }"

```

Refer to the table to understand the notation for the `filter` attribute.

Tip: This is a new syntax as of Spring '17. The previous syntax, noted [here](#), is still supported.

Notation	Description	Notes
datasets	Wave dataset	Where to find it: On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset system name.)
fields	Dimension or Measure in the Wave dataset	Where to find it: Click the Explore icon to open the widget. Then select Show SAQL from the Options menu. For dimension names, look for "group by" statements. For measure names, look for statements with functions such as "sum" or "stddev."

Notation	Description	Notes
values	Field in the Salesforce object, or a specific value	Where to find it: In Setup, find the object you want, and select Fields. Use the Field Name (also known as the API Name). For custom fields, use the name with “__c” at the end.
selection	With the selection option, the dashboard is shown with all its data, and the specified dimension values are highlighted	The selection option can be used alone or with the filter option. Selection takes dimension values only. To use this option, the dashboard must include a list, date, or toggle widget that groups by the specified dimension.
filter	With the filter option, the dashboard is shown with only filtered data	The filter option can be used alone or with the selection option. Filter takes dimension or measure values.
operator	Use with the filter option	Supported operators for dimensions: in, not in, matches Supported operators for measures: ==; !=; >=; >; <=; <

 **Note:** In Visualforce, values must have the format *object.field*.

For example, this syntax applies the name of the account in the Visualforce page as a selection on the dashboard:

```
filter="{ 'datasets': { 'Account': [ { 'fields': [ 'Name' ], 'selection': [ '!Account.Name' ] ] } } }
```

This example syntax applies the name of the account in the Visualforce page as a filter so that the dashboard shows only the filtered data:

```
filter="{ 'datasets': { 'Account': [ { 'fields': [ 'Name' ], 'filter': { 'operator': 'matches', 'values': [ '!Account.Name' ] } ] } } }
```

 **Note:** If a filter or selection is specified that does not exist, the field mapping is ignored the dashboard appears with all its data and no selection.

 **Note:** The above syntax is new in Spring '17. The previous syntax continues to be supported, and it works the same as the new selection option. For reference, here's the previous syntax:

```
filter="{ 'datasetSystemName1': { 'field1': [ '!value1' ] }, 'datasetSystemName2': { 'field1': [ '!value1', '!value2' ], 'field2': [ '!value3' ] } }
```

For example:

```
filter="{ 'opportunity': { 'Id': [ '!Opportunity.Id' ] } }
```

and

```
filter="{ 'ServiceCase4': { 'Id': [ '!case.Id' ], 'OwnerId' : [ '!case.OwnerId' ], 'Product__c' : [ '!case.Product__c' ], 'Reason' : [ '!case.Reason' ] } }
```

For more information about embedding Wave Analytics, see the [Visualforce Developer Guide Standard Component Reference](#).

Whitelist Trusted Sites for Embedded Dashboards

Embed Wave in any web page or web-based app. By specifying your trusted sites in the Wave Analytics whitelist, you can include embedded Wave dashboards in websites and apps outside of Salesforce servers.

First, add a Wave dashboard component to your site, using [Visualforce embedding](#), [Lightning App Builder](#), or Lightning Out. This code sample shows how to add a Wave dashboard component via Lightning Out.

```
$Lightning.use("wave:waveApp", function() {
    $Lightning.createComponent("wave:waveDashboard", {
        dashboardId: "0FKxx00000006bOGAQ"
    }, "app");
}, url, accessToken)
```

Second, set up a whitelist using the Content Security Policy (CSP). See [Set Up a Whitelist of Trusted Sites for Embedded Wave Dashboards](#).

The whitelist for embedded Wave includes the following by default:

- *.salesforce.com:*
- *.force.com:*
- Your org's custom domain.

View Embedded Dashboards on Mobile Devices

Add Wave dashboard components to Visualforce pages in Salesforce websites accessed by mobile users, including Communities. Or add Wave dashboard components to Lightning app pages.

Embedded Wave dashboards can responsively select layouts optimized for any device—including phones and tablets.

Dashboards built in the Wave dashboard designer are responsive to any screen size. If you've created a tablet, phone, watch, or custom layout in the Wave dashboard designer, the dashboard automatically optimizes to fit your screen. For more information, see [Generate Unique Wave Dashboard Layouts for Different Devices](#).

When your dashboard has the right layouts, embed it via Visualforce or the Lightning app builder. Note that for Salesforce1, only Lightning app pages are supported. See [Lightning Pages](#) for more information.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view Wave Analytics:

- "Use Wave Analytics"

Share Wave with Communities

With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages in their community.

 **Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

Community users can view dashboards embedded in Visualforce pages in their community, and they can explore lenses, facets, and links in the embedded dashboards. Community users can't access the Wave Analytics home page or create, update, or delete any Wave asset. They also can't upload data. This table summarizes differences between internal Wave users and external Community users.

	Wave Users	Community Users
Access, Explore, and Facet Dashboards and Lenses (embedded in Visualforce pages)	✓	✓
Create, Update, or Delete Dashboards and Lenses	✓	
Share Dashboards and Lenses	✓	✓
Access the Wave Home Page	✓	
Access Wave Templated Apps (for example, Sales Wave)	✓	
Analyze Large Datasets	✓	✓
Benefit from Security Predicates	✓	✓
Use Custom Action Menus	✓	
Access Wave from Mobile Devices	✓	

To set up Wave Analytics for Communities, complete the following steps.

1. Enable Wave Analytics for Communities and set up community members. See [Enable Wave Analytics for Communities](#).
2. Create Wave dashboards and save them in a Wave app that you can share with your community.
3. Embed your Wave dashboards in Visualforce pages in your community. For more information, see [Add a Wave Analytics Dashboard to a Visualforce Page](#). If you embed a dashboard in a new Visualforce page, create a tab for the page and add the tab to your community.
4. From the Wave app containing your dashboards, select **Share**.
5. In the Share dialog, select **Enable sharing with Communities**.

EDITIONS

Available in: Salesforce Classic

Available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions. Also available in: **Developer Edition**

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND is a member of the community they're trying to update

To modify Wave Analytics settings:

- Analytics Cloud - Wave Analytics Platform permission set license with "Manage Wave Analytics" permission

To view, explore, and share embedded Wave dashboards:

- Analytics Cloud - Wave Community Users permission set license with "View Wave Analytics on Communities Pages" permission

UtilityElectric

GIVE ACCESS POST TO FEED GET URL

Shared with:

Entire Organization	None	▼
Partner Community Users	None	▼
Customer Community Users	None	▼
Admin User	Manager	▼

Invite others:

User: Viewer:

Enable sharing with Communities ⓘ

When an app is enabled for sharing with external users, a message appears to let you know at a glance. You can easily check and change the sharing status of apps.

- Invite community partners and customers to share the app by entering their names and clicking **Add**. Community members in the sharing list are highlighted in orange to distinguish them as external users, and Viewer is the only access available for them.

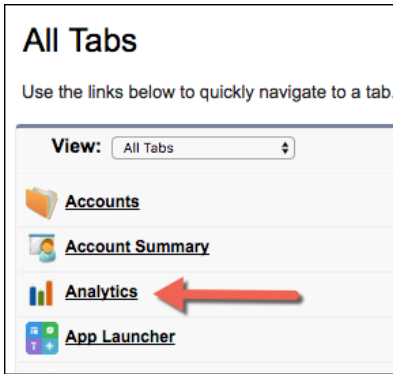

Note that security is enforced at these levels.

- By role, group, or user, via the Sharing dialog.
- At the Wave app level, via the **Enable sharing with Communities** checkbox.
- At the org setup level, via security predicates.

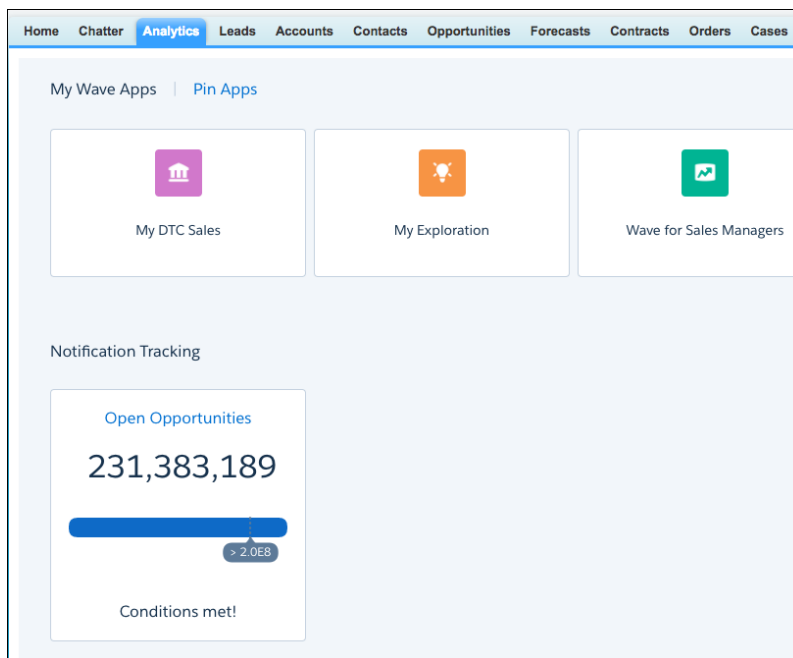

Integrate Wave into Salesforce with an Analytics Tab

Access your personal Analytics home and run Wave apps from a tab within Salesforce Classic or Lightning Experience.

The Analytics tab is available in new Wave-enabled orgs.

In existing orgs, set up the Analytics tab as you would any new tab.

Wave in the Analytics tab can include these Wave features:

- Annotations, notifications, and full-screen presentation
- Sharing and downloading options
- Links to other Wave assets
- Record actions menu
- Link to native Wave (available for Wave users but not Community users)

Wave Migration, Packaging, and Distribution

You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

[Migrate Wave Assets with Change Sets](#)

Use change sets to move customized Wave assets between orgs that have a deployment connection. For example, create a Wave app containing dashboards, lenses, datasets, dataflows in your Sandbox org, then migrate the app assets to your production org once testing is complete.

[Package Wave Assets in Managed Packages](#)

You can create managed packages of Wave assets, including Wave apps, dashboards, lenses, datasets, and dataflows. Use packages to distribute those assets to other users or organizations, including those outside your company.

[Distribute Wave Assets Through AppExchange](#)

Once your managed package is certified through our security review, you can make it available to your customers by uploading it to AppExchange. You can specify your package release type, control major and minor version numbers, and specify licensing options through the Licensing Management Application.

[Use the Metadata API for Wave Assets and User XMD](#)

Wave provides full support for the Metadata API, which can be used to retrieve, deploy, create, update, or delete customizations for your organization.

Migrate Wave Assets with Change Sets

Use change sets to move customized Wave assets between orgs that have a deployment connection. For example, create a Wave app containing dashboards, lenses, datasets, dataflows in your Sandbox org, then migrate the app assets to your production org once testing is complete.

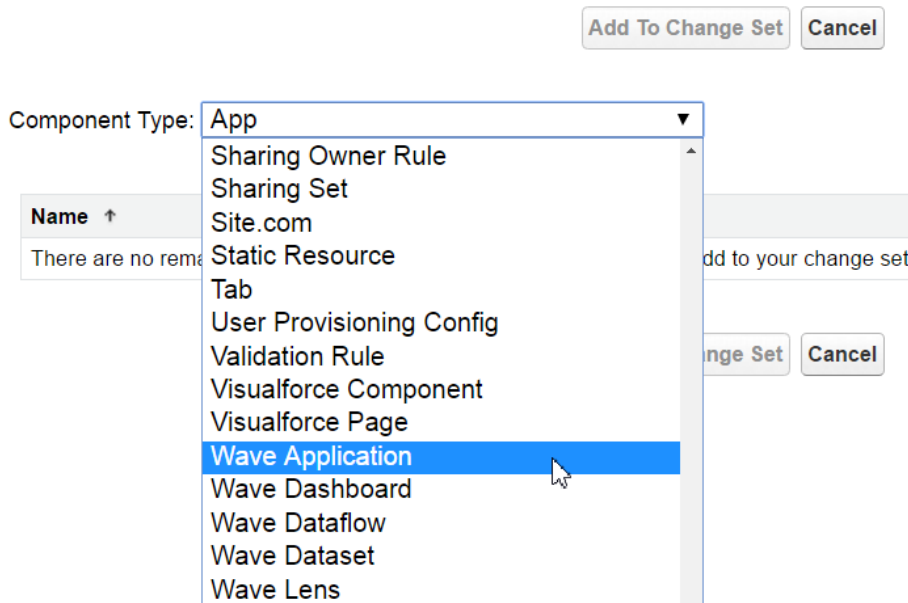

Tip: Remember, this topic describes how to migrate Wave assets—such as lenses, customized dashboards, dataset containers, and so on. It does not discuss migrating Salesforce or Wave data from org to org. Where this topic refers to a Wave dataset, what actually gets migrated is the container; the dataset metadata.

To migrate Wave assets:

1. Create and test your Wave assets in your source org, such as Sandbox.
2. From Setup in your source org, select **Outbound Change Sets** on page 6153 and create a new one.
3. Click **Add** in the Change Set Components section, then use the **Component Type** drop-down list to select and add your Wave assets to the change set. Note that you must add dependent dataflows manually. That is, if you add a dataset to a change set, the associated dataflows are not automatically picked up.

Choose components to add to your change set.

Important: Wave Analytics components include Wave apps, dashboards, dataflows, datasets, lenses, and master user XMD. As you package Wave components, keep these tips and best practices in mind.

- Wave unmanaged packages, as opposed to managed packages, are considered a developer-only feature and are not supported for general-purpose distribution. While Wave unmanaged packages should work as expected within the constraints of Salesforce unmanaged packages, they have not been subject to the same level of testing as managed packages. Unmanaged packages come without many of the safeguards of managed packages, and are intended for developers familiar with their limitations. Also refer to the relevant topic in the [ISV Guide](#).
 - Wave Admin permissions are required to create a package, but not for deployment, which requires only Salesforce admin permissions.
 - There is no spidering between datasets and dataflows, meaning there is no dependency following. When packaging both, they must be added manually. If they are not, an error appears during deployment. The same is true for change sets—when packaging both datasets and dataflows, add them manually.
 - Before the Spring '17 release, images would not render when deploying a dashboard that used an image widget that referenced image files not available on the target org. There were two workarounds; to either manually upload the images, or add a folder containing the images to the package. As of the Spring '17 release, images are packaged with the dashboard, and references between dashboards are maintained. Consequently, you will be unable to delete a dashboard if it is referenced in a link. In such cases, either re-create the image or link widgets in the dashboard in the source org, and then re-package, or fix the link issues in the target org.
 - Take care when packaging dataflows. Invalid schema overrides, and unsupported or illegal parameters are removed (for example, `Type = dim` is no longer supported, it's now `Type = text`). Comments in JSON are removed. Nodes may appear in a different order.
4. Click **View/Add Dependencies** to ensure all dependent assets and appropriate [permission sets and profile settings](#) on page 6199 are added.
 5. Click **Upload** and select your target org, such as Production. Make sure that the target org allows inbound connections. The inbound and outbound orgs must have a deployment connection.

6. From **Setup** in your target org, select **Inbound Change Sets** on page 6150 and find the one you uploaded from your source org.
7. Validate and deploy the change set, making sure to assign the right users to any permission sets and profiles you included. Your Wave assets will be available in the target org.

For details on using change sets to migrate configuration changes between orgs, view the [Release Management: Deploying Changes Using Change Sets \(Salesforce Classic\)](#) video.

- [Deploy Inbound Change Sets](#)

Package Wave Assets in Managed Packages

You can create managed packages of Wave assets, including Wave apps, dashboards, lenses, datasets, and dataflows. Use packages to distribute those assets to other users or organizations, including those outside your company.

A package is a container for something as small as an individual component or as large as a set of related apps. Packages can be distributed to other Salesforce users and organizations, including those outside your company. While packages come in two forms—unmanaged and managed—Wave supports only managed packages, which must be created from a Developer Edition organization.

Why only managed packages? There are some key advantages, especially around licensing and managing licenses. Using the AppExchange and the License Management Application (LMA), partners, ISVs, and developers can sell and manage user-based licenses for the app. Managed packages are also upgradeable, meaning you don't have to start over; you can incrementally upgrade.

To package Wave assets:

1. From Setup in your Developer Edition org, select **Packages** and click **New** to [create a managed package](#) on page 6169.
2. Click **Add** in the Components tab, then use the **Component Type** drop-down list to select and add your Wave assets to the package. Note that you must add dependent dataflows manually. That is, if you add a dataset to a package, the associated dataflows are not automatically picked up.

 **Important:** Wave Analytics components include Wave apps, dashboards, dataflows, datasets, lenses, and master user XMD. As you package Wave components, keep these tips and best practices in mind.

- Wave unmanaged packages, as opposed to managed packages, are considered a developer-only feature and are not supported for general-purpose distribution. While Wave unmanaged packages should work as expected within the constraints of Salesforce unmanaged packages, they have not been subject to the same level of testing as managed packages. Unmanaged packages come without many of the safeguards of managed packages, and are intended for developers familiar with their limitations. Also refer to the relevant topic in the [ISV Guide](#).
- Wave Admin permissions are required to create a package, but not for deployment, which requires only Salesforce admin permissions.
- There is no spidering between datasets and dataflows, meaning there is no dependency following. When packaging both, they must be added manually. If they are not, an error appears during deployment. The same is true for change sets—when packaging both datasets and dataflows, add them manually.
- Before the Spring '17 release, images would not render when deploying a dashboard that used an image widget that referenced image files not available on the target org. There were two workarounds; to either manually upload the images, or add a folder containing the images to the package. As of the Spring '17 release, images are packaged with the dashboard, and references between dashboards are maintained. Consequently, you will be unable to delete a dashboard if it is

referenced in a link. In such cases, either re-create the image or link widgets in the dashboard in the source org, and then re-package, or fix the link issues in the target org.

- Take care when packaging dataflows. Invalid schema overrides, and unsupported or illegal parameters are removed (for example, `Type = dim` is no longer supported, it's now `Type = text`). Comments in JSON are removed. Nodes may appear in a different order.

3. Click **View Dependencies** to ensure all dependent assets and appropriate [permission sets and profile settings](#) on page 6199 are added.
4. Once packaged, [prepare your apps for distribution](#) on page 6234.

SEE ALSO:

[Package and Distribute Your Apps](#)

[Introduction to the License Management App](#)

Distribute Wave Assets Through AppExchange

Once your managed package is certified through our security review, you can make it available to your customers by uploading it to AppExchange. You can specify your package release type, control major and minor version numbers, and specify licensing options through the Licensing Management Application.

To distribute a Wave managed package:

1. Submit your package for a security review.

Before a package can be listed on AppExchange, it must meet established standards. Since packages containing Wave assets can potentially contain standard Salesforce objects too, they are subject to the same [security requirements](#) as all other AppExchange listings.

2. When your package is ready, click **Upload**, then fill in the required information.
3. Add version specifics, including the name (usually a description and date) and the version number.
4. Choose the release type—*Managed - Beta* or *Managed - Released*—and an appropriate version number.
The *Managed - Beta* type is for testing, usually with a subset of customers, and allows changes that the *Managed - Released* type does not.
5. Add a description for your AppExchange listing.
6. Optionally, add URLs for release notes and instructions, a password (if you wish to keep the package private), and any other objects required.
7. Click **Upload**.

 **Note:** Deployment requires Salesforce admin permissions.

Use the AppExchange and the [License Management Application](#) (LMA) to manage user-based licenses. You can request the application through your partner community site.

[Security Review Overview](#)

[Introduction to the License Management App](#)

Use the Metadata API for Wave Assets and User XMD

Wave provides full support for the Metadata API, which can be used to retrieve, deploy, create, update, or delete customizations for your organization.

Every time your Salesforce organization is customized, its metadata is modified. Editing page layouts, creating a custom field, or adding a Wave dataflow are all metadata updates. Metadata is the information that describes the configuration of your organization and of your Wave assets. It's data about your data. For example, the metadata type `WaveLens` includes properties that describe the lens—what dataset it uses, the label of the dashboard, what visualization widget type it uses (pivottable, stackbar, heatmap, and so on).

You can create your own custom metadata types, which enable you to create your own setup objects whose records are metadata rather than data. Rather than building apps from data records in custom objects or custom settings, you can create custom metadata types and add metadata records, with all the manageability that comes with metadata: package, deploy, and upgrade.

While the [Metadata API](#) is the foundation on which change sets and packaging is built, developers can use the Metadata API to manipulate their Wave assets. For example, your application could retrieve metadata about your dashboards and back it up to (and restore from) some repository, effectively providing version control.

You can package and deploy user XMD too. User XMD is a JSON document that allows an application to override certain metadata for a dataset. You can govern settings to control how the data is presented—for example, colors, formats, and labels. To deploy the overridden dataset metadata, you must package the user XMD attributes. Metadata API support allows migration tools to migrate datasets with user XMD between orgs—for example, you can migrate user XMD overrides from sandbox to production. Partners can deploy their application-specific user XMD with their AppExchange package. They retain control of the user XMD and can update it with future package versions. Refer to the [WaveXmd](#) metadata type in the Metadata API Developer Guide.

The following Wave metadata types are supported in the Metadata API:

- `WaveApplication`
- `WaveDashboard`
- `WaveDataflow`
- `WaveDataset`
- `WaveLens`
- `WaveXmd`
- `WaveTemplateBundle`

SEE ALSO:

[Understanding Metadata API](#)

Enable Actions and Links with Custom Actions Menus in Lenses and Dashboards

Custom menus in Wave Analytics lenses and dashboards let users take advantage of Salesforce actions and open records from Salesforce or other websites. You create action menus by working with a Wave dataset's extended metadata (XMD) file.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

To edit a dataset's extended metadata (XMD) file:

- "Edit Wave Analytics Dataflows"

To create actions:

- "Customize Application"

Hover over the labels to see if an actions menu is available. Click the value, cell, or legend displays the menu, to see the menu's contents and select from the available actions or open a record.

Actions in the Actions Menu

Actions come from [object-specific actions](#) and/or [global actions](#) that you've previously added to Salesforce objects. Salesforce actions let users create records that have automatic relationships to other records, make changes and updates to specific records, and interact with records in ways you define. For example, you can add actions that let users create new cases, events, and accounts as well as update record, post to Chatter, and so on.

Open Record Link in a Quick Actions Menu

Links can pass specific bits of data, such as Salesforce account IDs, from lenses or dashboards to records. For example, a link from an account name in a dashboard could be configured to pass the related account ID to Salesforce; when a user clicks an open record link, the appropriate account record opens in a new tab. Custom links can also look up records for employees in Workday® or expense reports in Concur®. Any website can be linked to as long as it uses HTTP or HTTPS protocols.

Actions Menu Support for Objects and Actions

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for custom objects, sObjects, and the following standard Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports Chatter actions (Post, File, Thanks, Link, Poll, and Question), [object-specific actions](#), and [global actions](#). It does not support Salesforce1 actions.

Other objects and actions will be supported in future releases.

Create Action Menus

Follow these basic steps to add an action to a Wave custom actions menu:

1. Create the action and add it to a Salesforce object that's part of a Wave dataset.
2. Apply the action to the object's page layout.
3. Work with the dataset's [Extended Metadata \(XMD\)](#) file to make the action or link available from action menus in Wave charts and tables. Add a dimensions section to the XMD and edit its attributes to create the menu and control the behavior of actions and links to records. Prebuilt Wave apps, such as Sales Wave Analytics, already include menus, and their dataset XMD files already include dimensions sections. You can customize dashboards in prebuilt Wave apps by editing the XMD. For more information, see *Dimensions Section* in the [Extended Metadata \(XMD\) Reference](#).

-  **Note:** To add an open record link to menu for a dataset with records from *multiple* Salesforce org instances, add an organizations section to the XMD file. The organizations section lets you map from org IDs to the URLs for each org instance referred to in the dataset. See *Organizations Section* in the [Extended Metadata \(XMD\) Reference](#)

The example in the following links walks you through adding an action to Wave menus. Follow the steps in the order shown here.

-  **Note:** These steps work for any Salesforce object and Wave dataset in your org. The example uses the Opportunities object and dataset from the Sales Wave Analytics app created in the [Wave Apps Basics](#) Trailhead module. If you want to follow along, complete the first two units of the module first.

1. [Create an Action and Add It to an Object](#)
Select the action you'd like to make available to users in your org, and add it to an object.
2. [Apply an Action to an Object's Page Layout](#)
Open the page layout assigned to the profile for the users you want to access the action, and apply the action to it.
3. [Edit the Dataset Extended Metadata File to Make the Action Available to Users](#)
Specify the field in a dataset to indicate where the action appears in Wave charts and tables. Also, specify the ID field for the Salesforce object that's impacted by the action.

Create an Action and Add It to an Object

Select the action you'd like to make available to users in your org, and add it to an object.

-  **Important:** Create Sales Wave Analytics in the [Wave Apps Basics](#) Trailhead module to follow the example that starts here.

You can add actions to fields in any Salesforce object. The example shows how to add an Update a Record action to the Opportunities object in the app you create in [Wave Apps Basics](#). Once it's added, users can update fields in the Opportunities objects directly from a Wave chart or table without having to flip back and forth from Wave to the Sales Cloud. As part of the example, you also add fields that can be updated using the action.

1. Go to Setup in the Developer Edition org you used for the [Wave Apps Basics](#) Trailhead module.
2. In the Quick Find box at the top of Setup, enter the name of the object you want to add actions to. In the case of our example, type *opportunities* in the Quick Find box. Then select **Buttons, Links, and Actions**.
3. Click **New Action** to see what's available.
4. Open the Action Type drop-down list and select the action you want to add. In this case, select **Update a Record**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

To edit a dataset's extended metadata (XMD) file:

7. Click **Save**.

Apply an Action to an Object's Page Layout

Open the page layout assigned to the profile for the users you want to access the action, and apply the action to it.

The example here shows how to apply the action you just added to the opportunity page layout assigned to the Standard User profile. It uses the example Developer Edition org containing the Sales Wave Analytics app created in the [Wave Apps Basics](#) Trailhead module.

Page layouts control the layout and organization of content, including custom actions, on record detail pages. Each record detail page can have multiple page layouts to give different users a unique experience. In the example, you'll enable a user to see the Update Opportunity custom action in opportunity records in Wave. You do that by adding the action to the opportunity page layout assigned to the user's Standard User profile.

You can use the same techniques with any Salesforce page layout and user profile.

1. Go to Setup in Salesforce and enter the name of the object in the Quick Find box. For the example, enter *Opportunities*. Then select **Page Layouts** to see what's available. Notice that there are different page layouts for opportunity data.
2. To see which page layout is assigned to a user's profile, in the case Standard User, click **Page Layout Assignment**.

Page Layout Assignment
Opportunity

The table below shows the page layout assignments for different profiles.

Profiles	Page Layout
Analytics Cloud Integration User	Opportunity Layout
Analytics Cloud Security User	Opportunity Layout
Contract Manager	Opportunity Layout
Custom: Marketing Profile	Opportunity (Marketing) Layout
Custom: Sales Profile	Opportunity (Sales) Layout
Custom: Support Profile	Opportunity (Support) Layout
Gold Partner User	Opportunity Layout
Marketing User	Opportunity Layout
Partner Community Login User	Opportunity Layout
Partner Community User	Opportunity Layout
Read Only	Opportunity Layout
Solution Manager	Opportunity Layout
Standard User	Opportunity Layout
System Administrator	Opportunity Layout

Edit the page layout assigned to the profile for the users you want to access the action. In our example, edit the Opportunity Layout, which is assigned to the Standard User profile. (Users who are assigned the other opportunity page layouts can't see this custom action, unless you apply the action to those page layouts as well.)

3. Open the layout. Click the **Opportunity Layout** link next to a profile—it doesn't matter which profile. Next, select the actions to add to the layout. For the example, you add the Update Opportunity layout.
4. In the palette, click **Quick Actions**. The list of all available actions appear to the right.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

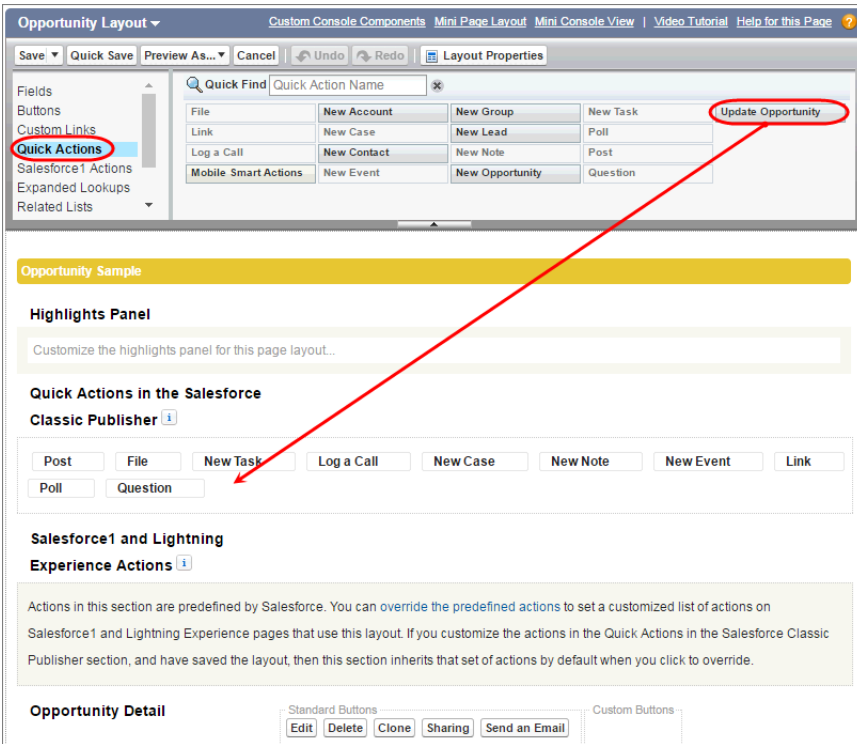

To edit a dataset's extended metadata (XMD) file:

- "Edit Wave Analytics Dataflows"

To create actions:

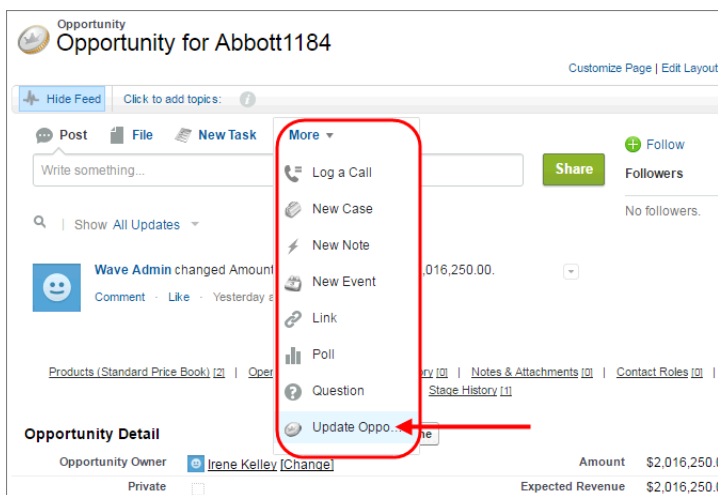

- "Customize Application"

5. Drag the **Update Opportunity** custom action and drop it after the existing actions in the Quick Actions in the Salesforce Classic Publisher section.

6. Click **Save**.

This action is now available on the Opportunity details page for all users assigned the Opportunities page layout. You can see it in the Developer Edition org you sign up for in the [Wave Apps Basics](#) Trailhead module used for the example. If you've done that and created the app, go the org, find an opportunity, and check it out. You can access it from the More option.

Note: If a page layout is based on a record type that certain users can't access, actions for that type aren't available to them.

Edit the Dataset Extended Metadata File to Make the Action Available to Users

Specify the field in a dataset to indicate where the action appears in Wave charts and tables. Also, specify the ID field for the Salesforce object that’s impacted by the action.

The object’s ID field ties the action in Wave to a record in Sales Cloud or another part of Salesforce. When Salesforce loads records into Wave, it also loads record IDs into the dataset. When a user performs an action on a record in Wave, it uses the ID to identify the corresponding record (the one users impact with the action) in Salesforce. Each Salesforce record ID contained in a Wave dataset record points back to a record in Salesforce.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

To edit a dataset’s extended metadata (XMD) file:

Wave Opportunities Data

#	Opportunity ID	Opportunity Name
1	00658000002FLZZAAA	Opportunity for Ad...
2	00658000002FLZ6AAO	Opportunity for Ad...
3	00658000002FLcXAAW	Opportunity for Ale...
4	00658000002FLaKAAW	Opportunity for All...
5	00658000002FLdqAAG	Opportunity for All...
6	00658000002FLYTAA4	Opportunity for All...
7	00658000002FLa5AAG	Opportunity for Alv...

You specify these fields in *dimensions* in the [extended metadata \(XMD\)](#) file for the dataset containing the object you want the user to take action on.

For our example, that's the XMD file for the Opportunities dataset, which contains the two fields to specify: Opportunity Name and Opportunity ID. Often you'd manually add *dimensions* to the file and specify all its attributes. Our example uses the Sales Wave Analytics app created in the [Wave Apps Basics](#) Trailhead module. Like all prebuilt Wave apps, Sales Wave Analytics already includes actions, so you edit the *dimensions* section that's already in the XMD file. Read complete details about adding actions in the XMD file in the Dimensions topic in the [Extended Metadata \(XMD\) Reference](#).

 **Note:** Dataset XMD files can also include a *dimension* (singular) section, which is used for other purposes. Be sure to refer to the Dimensions topic in the XMD Reference, *not* the Dimension topic.

1. Add fields to the XMD file for the Wave dataset—in this case Opportunities. In Wave, click the **Browse** tab and open the Sales Wave app. Click the  icon in the upper left and select **Browse All** to see all the apps dashboards and datasets.
2. Position the cursor over the Opportunities dataset. Click the down arrow and then **Edit**.

The edit dataset page appears.

3. In the Add Extended Metadata File (JSON) field, click  to download the XMD file for the Opportunities dataset.

4. Open the XMD file in a text editor.

 **Tip:** If the JSON isn't formatted, copy it into a JSON formatter tool, like [JSON Editor Online](#), and then paste the results back into the XMD file. In JSON Editor Online, copy the unformatted JSON into the left pane and click the right arrow to show the formatted version in the right pane.

 **Warning:** If you modify JSON in your production org, check with your security department to see which external JSON tools are recommended.

5. Because the JSON contains lots of lines, search for the second `dimensions` attribute, which is shown below.

```
{
  "values_query_columns": ...,
  "hide_measures": ...,
  "formats": {...},
  "colors": {...},
  "labels": {
    "measures": {...},
    "keys": {...},
    "dimensions": {...} //Not this one.
  },
  "dimensions": [ //This one.
    {
      "recordIdField": "AccountId",
      "field": "Account.Name",
      "linkTemplate": "/{{row.AccountId}}",
      "linkTooltip": "Open Account"
    }
  ],
}
```

```

    {
      "recordIdField": "Id",
      "field": "Name",
      "linkTemplate": "/{{row.Id}}",
      "linkTooltip": "Open Opportunity"
    },
    {
      "recordIdField": "OwnerId",
      "field": "Owner.Name",
      "linkTemplate": "/{{row.OwnerId}}",
      "linkTooltip": "Open User"
    }
  ]
}

```

 **Note:** There are two fields called “dimensions” in the example code. Ignore the one under “labels”—it’s part of the Labels XMD section.

If you’re adding actions to charts and tables that aren’t part of a Wave app, you’d have to manually add a dimensions attribute. You’d also have to manually enter the field (Name) that contains the custom action along with the ID field (Id) that identifies the Salesforce opportunity records. Because Sales Wave Analytics comes with actions, the fields are already added to the XMD dimensions section.

 **Tip:** If you added fields to the XMD file, to apply your changes, you’d have to save your changes and then upload the file in the page where you downloaded it.

If you’ve followed along with the example using the Sales Wave app created in [Wave Apps Basics](#), have a look at the results of your work in a Wave dashboard.

1. Go to the Sales Wave app and open the Sales Leader Pipeline Changes dashboard.
2. Scroll down to the Top Open Deals widget.

 **Important:** If this DE org contains old data, widgets in a Sales Wave app dashboard might not show results. If a widget doesn’t show any results, refresh the Salesforce data in this DE org using the Trailhead Data Manager, and then run the dataflow to refresh the data in the Sales Wave app datasets. For more information, see “Say Hello to the Trailhead Data Manager” in [Wave Apps Basics](#).

3. Hover over an opportunity name to see the Show Record Actions Menu arrow.

#	↕ Opportunity Name	↕ Opportunity Owner	↕ Amount
1	Opportunity for Butler33	Doroth Gardner	\$8,577,295
2	Opportunity for F...	edy	\$5,839,810
3	Opportunity for Jacobs1464	Laura Palmer	\$5,198,280
4	Opportunity for Zimmerman1763	Nicolas Weaver	\$4,747,520
5	Opportunity for Barnett1692	Nicolas Weaver	\$4,708,010

 **Note:** You can see the action because you are assigned the same page layout as Kelly.

4. Click the arrow and select the new **Update Opportunity** action.
5. See that you can update the opportunity record—including the Type and Probability fields you added—directly from Wave. The record will be updated in the Sales Cloud and synced back to Wave the next time the Wave dataflow runs.

Configure Bulk Actions on Table Records

You can create custom bulk actions that apply to all records shown in a table widget of a Wave designer dashboard. Use bulk actions to update records or perform an action on each of them.

You define the bulk action in a Visualforce page. The Visualforce page can make calls to Apex methods. You can also configure the Visualforce page to display the results of the action or show an interactive form. For example, you can create a form that allows the dashboard viewer to change the account owner of each opportunity shown in the table widget.

Before we get into the details about how to create a bulk action, review the following high-level process.

1. Wave passes the SAQL query used to populate the table widget to the Visualforce page.

 **Note:** The SAQL query that Wave passes usually contains a limit. To return more results, modify the `limit` statement in the SAQL query.

2. You write custom Visualforce and, if needed, Apex code to extract the SAQL query.

 **Tip:** When issuing a Wave API request for the SAQL query, if most of your logic is in Javascript on the client side, then you should use AJAX from Javascript. If most of your logic is in Apex, then use HTTP from your Apex class.

3. Your code executes the SAQL query against the Wave Query API.
4. The Wave API returns the results of the query—dataset rows—to the Visualforce page.
5. You write more custom code that performs actions on the returned dataset rows. For example, you can perform a bulk edit, bulk create, or integrate with 3rd party.

 **Note:** Bulk actions only work on steps that query datasets. If the table widget is built on a step with type `static` or `soql`, the action doesn't work.

[Bulk Actions Example](#)

You want to add the “Create Opportunities” option in a table widget’s action menu. This action must create an opportunity for each account shown in a table widget.

Bulk Actions Example

You want to add the “Create Opportunities” option in a table widget’s action menu. This action must create an opportunity for each account shown in a table widget.

#	ACCOUNT SOURCE	ACCOUNT.ANNUALREVENUE	BILLING COUNTRY	INDUSTRY
1	-	\$100,000,000	USA	
2	-	\$100,000,000	USA	
3	-	-	USA	
4	-	-	USA	Techn
5	-	-	-	Chem
6	Advertisement	\$135	Belgium	Electr

 **Note:** This widget-level action menu is different from the record-level action menu that you can access from a record.

To keep the user informed of what is happening, the action must also display a Visualforce page that shows the progress of the following tasks.

1. The Visualforce page retrieves a list of accounts from the SAQL query used to populate the table widget. If the table widget’s results were previously filtered because of selections in other dashboard widgets, only the filtered records are returned.

Querying Accounts...

Account	Opportunity

2. The Visualforce page creates an opportunity for each retrieved account.

Creating Opportunities...	
Account	Opportunity
Open Source Inc.	Creating...
Missoula & Sons Inc.	Creating...
Open Source Inc.	Creating...
Missoula & Sons Inc.	Creating...

- The Visualforce page shows the opportunity created for each account.

Opportunities Created	
Account	Opportunity
Open Source Inc.	From Open Source Inc.
Missoula & Sons Inc.	From Missoula & Sons Inc.
Open Source Inc.	From Open Source Inc.
Missoula & Sons Inc.	From Missoula & Sons Inc.

To implement this bulk action, perform the following tasks.

- [Define Action Behavior with Apex Controller Class and Methods](#)
Define an Apex controller class and methods that generate a list of accounts shown in the table widget, create an opportunity for each account, and return the progress of each task.
- [Create a Visualforce Page That Executes the Action](#)
The Visualforce page calls the methods defined in the Apex controller class to invoke the action and provide a status on the tasks.
- [Assign Bulk Action to Table Widget](#)
Configure the table widget properties to expose the bulk action defined in the Visualforce page.

Define Action Behavior with Apex Controller Class and Methods

Define an Apex controller class and methods that generate a list of accounts shown in the table widget, create an opportunity for each account, and return the progress of each task.

- From setup, enter *Apex Classes* in the Quick Find box.
- Select **Apex Classes**.
- Click **New**.

4. Add the following code.

```
public class CreateOpportunitiesController {
    public string query{get; set;}

    /* To determine the records to perform the bulk action on, extract the SAQL query */
    public PageReference init() {
        query = ApexPages.currentPage().getParameters().get('query');
        return null;
    }

    /* Takes the account records from the SAQL query, creates an opportunity for each account,
    and then returns a map between account ID and new opportunity name. Note: Account.Name
    and AccountId referenced below refer to the dataset field names. Update them to match
    your dataset fields. */
    @RemoteAction
    public static Map<String, String> create(List<Map<String, String>> accountRecords)
    {
        Map<String, String> result = new Map<String, String>();

        List<Opportunity> opps = new List<Opportunity>();
        for (Map<String, String> accountRecord : accountRecords) {

            String name = accountRecord.get('Account.Name') + ' - Sprint Review - 12/2';

            String accountId = accountRecord.get('AccountId');
            result.put(accountId, name);
            Opportunity opp = new Opportunity(
/* You can set different fields from the Opportunity object than those listed below,
```

```

like Amount. */
        Name = name,
        Type = 'New Customer',
        AccountId = Id.valueOf(accountId),
        CloseDate=Date.valueOf('2016-12-31'),
        StageName='Prospecting');
    opps.add(opp);
}
insert opps;
return result;
}
}

```

5. Click **Save**.

Create a Visualforce Page That Executes the Action

The Visualforce page calls the methods defined in the Apex controller class to invoke the action and provide a status on the tasks.

1. From setup, enter *visualforce* in the Quick Find box.
2. Select **Visualforce Pages**.
3. Click **New**.
4. Enter the Visualforce page label and description.

5. Replace the existing markup with this code.

```

<apex:page controller="CreateOpportunitiesController" action="{!init}" showheader="false"
  sidebar="false" standardStylesheets="false" title="Create Opportunities" >
  <apex:stylesheet
value="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.6/css/bootstrap.min.css"/>

  /* Use jQuery to process API calls */
  <apex:includeScript value="https://code.jquery.com/jquery-3.1.0.min.js"/>
  <style>
    th {
      width: 50%;
    }
  </style>

```

```

    }
    h4 {
        font-size: 24px;
    }
    table {
        font-size: 20px;
        width: 100%;
    }
</style>
<div class="container-fluid">

/* Add HTML table to the Visualforce page that shows the accounts, the opportunity
creation status, and then finally the new opportunity name */
    <h4 id="message">Querying Accounts...</h4>
    <table name="results" id="results" data-role="table" class="table-bordered
table-striped table-responsive">
        <thead><tr><th>Account</th><th>Opportunity</th></tr></thead>
        <tbody></tbody>
    </table>
</div>

<script>
    $(function() {
        $.ajaxSetup({
            headers: {"Authorization": 'Bearer {!$Api.Session_ID}' }
        });

        setTimeout(executeQuery, 1000);
    });

/* Executes the SAQL query and displays the resulting accounts. Note: Account.Name and
AccountId referenced below refer to the dataset field names. Update them to match your
dataset fields. */
    function executeQuery() {
        var query = {};
        query.statements = "{!JSENCODE(query)}";
        var queryObj = {query: query.statements};
        $.ajax({
            type: 'POST',
            url: '/services/data/v39.0/wave/query',
            data: JSON.stringify(queryObj),
            contentType: 'application/json',
            success: function(data) {
                $('#message').html('Creating Opportunities...');
                var record = null;
                var row = null;
                $('#results tbody').empty();

                for (var i = 0; i < data.results.records.length; i++) {
                    record = data.results.records[i];
                    row = $('<tr>');
                    row.append($('<td>').html(record['Account.Name']));
                    row.append($('<td class="' + record.AccountId +
'">').html('Creating...'));

```

```

                $('#results tbody').append(row);
            }

            setTimeout(function() {createOpportunities(data.results.records);},
1000);
        },
    });
}

/* Calls the Apex controller method that creates opportunities for each account and
returns the opportunity name for each account to the HTML table. */
function createOpportunities(accountRecords) {
    CreateOpportunitiesController.create(accountRecords, function(result, event)
{
        console.log(result);
        if (event.status) {
            for (var i = 0; i < accountRecords.length; i++) {
                $('#td.' +
accountRecords[i].AccountId).html(result[accountRecords[i].AccountId]);
            }
            $('#message').html(accountRecords.length + ' Opportunities Created');
        }
        else {
            $('#message').html('Error: ' + event.message);
        }
    });
}
</script>
</apex:page>

```

6. Click **Save**.

Assign Bulk Action to Table Widget

Configure the table widget properties to expose the bulk action defined in the Visualforce page.

1. Open the Wave dashboard that contains the table widget.
2. Edit the dashboard.
3. Select the table widget.
4. In the widget properties, select **Show custom action**.
5. Enter the following widget properties.

Property	Description
Custom Action Label	Label for the action in the action menu.
Visualforce Page Name	API name of the Visualforce page.
Visualforce Namespace Prefix	Optional. Namespace prefix specified for the Visualforce page.

#	ACCOUNT SOURCE	ACCOUNT.ANNUALREVENUE	BILLING C.
1	-	\$100,000,000	USA
2	-	\$100,000,000	USA
3	-	-	USA
4	-	-	USA
5	-	-	-
6	Advertisement	\$135	Belgiu
7			

6. Save the dashboard.

Put It All Together with Wave Apps

Create Wave apps to run presentations, organize your data projects, and control asset sharing.

Wave Analytics apps can contain datasets, lenses, and dashboards. Create them to organize and run your analytics presentations, and share them with other people in your organization.

Examples of Wave apps are the prebuilt Salesforce apps such as the Sales Wave Analytics app and Service Wave Analytics app. Like the apps you create yourself, these are collections of Wave assets—in both cases, the apps include dashboards and datasets. The difference is that Salesforce has created the assets to provide a ready-made path through Salesforce data to help users get started fast with Wave. Your own apps contain assets that you create yourself.

App-Level Sharing

Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.

Create an App

Create an app to organize and contain any combination of lenses, dashboards, and datasets.

Set Up Navigation Through Your App

Target your app for customers with custom navigation that shows them the right dashboards.

Share an App

To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it's in.

Delete an App

If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

App-Level Sharing

Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.

All Wave Analytics users start off with Viewer access to the default Shared App that's available out of the box; administrators can change this default setting to restrict or extend access. Each user also has access to a default app out of the box, called My Private App, intended for personal projects in progress. The contents of each user's My Private App aren't visible to administrators, but dashboards and lenses in My Private App can be shared.

All other apps created by individual users are private, by default; the app owner and administrators have Manager access and can extend access to other users, groups, or roles.

Here's a summary of what users can do with Viewer, Editor, and Manager access.

Action	Viewer	Editor	Manager
View dashboards, lenses, and datasets in the app	X	X	X
See who has access to the app	X	X	X
Save contents of the app to another app that the user has Editor or Manager access to	X	X	X
Save changes to existing dashboards, lenses, and datasets in the app (saving dashboards requires the appropriate permission set license and permission)		X	X
Change the app's sharing settings			X
Rename the app			X
Delete the app			X

Create an App

Create an app to organize and contain any combination of lenses, dashboards, and datasets.

1. On the home page, click **Create**.
2. Click **App**.
3. Type the name of your app.
4. Click **Create**.
Your app is created and displayed in a new tab. You can now put lenses, dashboards, and datasets in it.
5. Add a description of the app's purpose and contents so that your colleagues understand how to use the data.
 - a. Click in the description box under the app's name.
 - b. Type a description.
 - c. Click the check mark to save.
6. Optionally, change the app's default icon to make it easier to distinguish from other apps.
 - a. Hover over the default icon.
 - b. Click **Change Icon**.
 - c. Click an icon from the gallery.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To create an app:

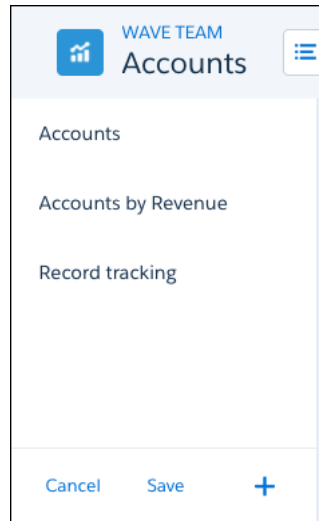

- "Create Wave Analytics Apps"

Set Up Navigation Through Your App

Target your app for customers with custom navigation that shows them the right dashboards.

Follow these steps to set up an app's navigation.

1. Click  to open the navigation panel.
2. If you're the manager of an app, you see the **Organize** button. Click it to set up the app.

3. Change the presentation order by sliding dashboards up or down, and click dashboard names to hide or show them.
4. To add more dashboards from the app, click the plus sign.
5. To retain the navigation for your app, click **Save**.
Share the app with colleagues or customers. When they run the app, it starts with the first dashboard in your navigation list.

Share an App

To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it's in.

1. On the app page, click the **Share** button.
2. On the Give Access tab:
 - a. Choose whether you're sharing the app with a user, group, or role.
 - b. Start typing the name and select from the suggested matches.
 - c. Choose the level of sharing access: Viewer, Editor, or Manager.
 - d. Click **Add**.
 - e. Click **Save**, then click **Done**.

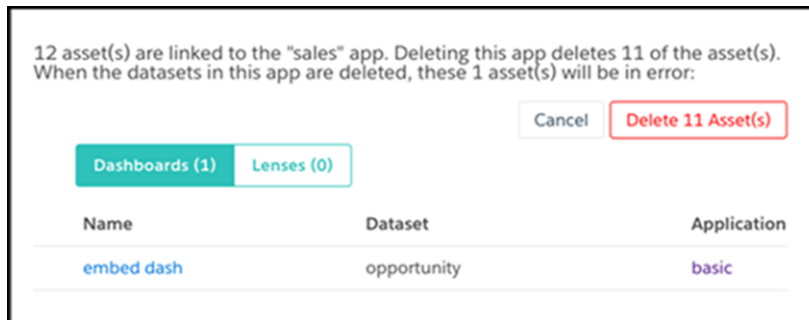

Delete an App

If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

1. Open the app, and then click **Delete**.

 **Warning:** You can't recover a deleted app.

If applicable, Wave Analytics lists the lenses and dashboards outside of your app that will be affected. When the datasets belonging to your app are deleted, any lens or dashboard that references those datasets becomes unusable.

 **Important:** Only lenses and dashboards to which you have access appear in the list. If you don't have access to them, lenses and dashboards aren't listed even though they have references to datasets in your app.

2. Click **Delete Asset(s)**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

Prebuilt Wave Apps

Prebuilt Wave Analytics apps guide you along a ready-made path through your Salesforce data. You get best-practice dashboards and KPIs in a single place your team can use to drive business success.

Prebuilt Wave apps from Salesforce help speed your organization's time-to-value with Wave Analytics. Instead of having to build visualizations yourself, with Wave apps you answer questions in a handy configuration wizard that's part of each app. Wave takes care of the rest, creating dashboards designed and built by Salesforce based on our years of experience helping companies manage their customer interactions.

Prebuilt apps are designed for desktop and mobile devices. They come with dashboards that you can embed in Salesforce pages to give users direct access to business intelligence right from the cloud where they do their everyday work. And you can drill deeper into key aspects of your business by customizing Wave apps to meet your specific needs.

To get started, see step-by-step instructions for each app by following these links.

[The Sales Wave Analytics App](#)

The Sales Wave Analytics app brings the power of Wave Analytics to Sales Cloud on any device that supports Wave. With intuitive visualizations based on your Salesforce data, Sales Wave Analytics lets you move from insight to action quickly and helps you turn data into smarter sales.

[The Service Wave Analytics App](#)

The Service Wave Analytics app gets you started fast with Wave Analytics and provides a clear path through your Service Cloud data on any device. Whether you're a service manager or agent, you get everything you need in one place to uncover key data insights to help you grow your business.

[The Field Service Wave Analytics App](#)

The Field Service Wave Analytics app brings the power of Wave Analytics to Field Service Lightning on any device that supports Wave.

[Event Monitoring Wave App](#)

The Event Monitoring Wave App integrates with event monitoring and setup audit trail data to give you insights into your user and org behavior.

[The B2B Marketing Wave Analytics App](#)

B2B Marketing Wave Analytics provides advanced analytics for the data-driven marketer, letting you explore both your marketing and sales data in one place. With powerful dashboards that consolidate Pardot and Sales Cloud data, you can quickly explore data, understand the impact of marketing on revenue, and take instant action to drive marketing results.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

The Sales Wave Analytics App

The Sales Wave Analytics app brings the power of Wave Analytics to Sales Cloud on any device that supports Wave. With intuitive visualizations based on your Salesforce data, Sales Wave Analytics lets you move from insight to action quickly and helps you turn data into smarter sales.

Tip: Follow the steps in the order shown to get started with Sales Wave Analytics. If you haven't used Wave before, learn more about it from the [Wave Analytics Library](#).

1. [About the Sales Wave Analytics App](#)

Learn the benefits of Sales Wave Analytics before you create and use the app to explore your Sales Cloud data.

2. [Sales Wave Analytics Prebuilt Dashboards and Datasets](#)
The Sales Wave app includes prebuilt dashboards and datasets to accelerate your data exploration.
3. [Set Up Permissions for the Sales Wave Analytics App](#)
Set up your organization to use the Sales Wave app by enabling Wave and creating and assigning permission sets.
4. [Create and Share the Sales Wave Analytics App](#)
Follow these steps to create Sales Wave Analytics and start uncovering the value of your Salesforce data—fast.
5. [Personalize Sales Wave Analytics with the Configuration Wizard](#)
The Sales Wave Analytics configuration wizard lets you create the app to reflect how you prefer to view Salesforce data.
6. [Upgrade the Sales Wave Analytics App](#)
Take advantage of the latest Sales Wave Analytics features by upgrading your app every time we release a new version.
7. [Update the Sales Wave Analytics Quota \(Target\) Dataset](#)
If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Analytics Quota dataset so the app includes quotas data for your team.
8. [Schedule the Sales Wave Analytics Daily Dataflow](#)
Schedule a daily dataflow at a time outside standard business hours before you start exploring with Sales Wave Analytics.
9. [Integrate Sales Wave Analytics With Salesforce](#)
Make Sales Wave Analytics more usable by performing a variety of optional integrations and customizations.
10. [Understand Sales Wave Analytics App Limitations](#)
Sales Wave Analytics requires that Sales Cloud include specific data and supports a limited set of Salesforce objects.
11. [Get to Know Sales Wave Analytics Data Terminology](#)
To make the best use of Sales Wave Analytics, it's helpful to understand the metrics and terms used in the app.

About the Sales Wave Analytics App

USER PERMISSIONS

To use Wave templated apps:

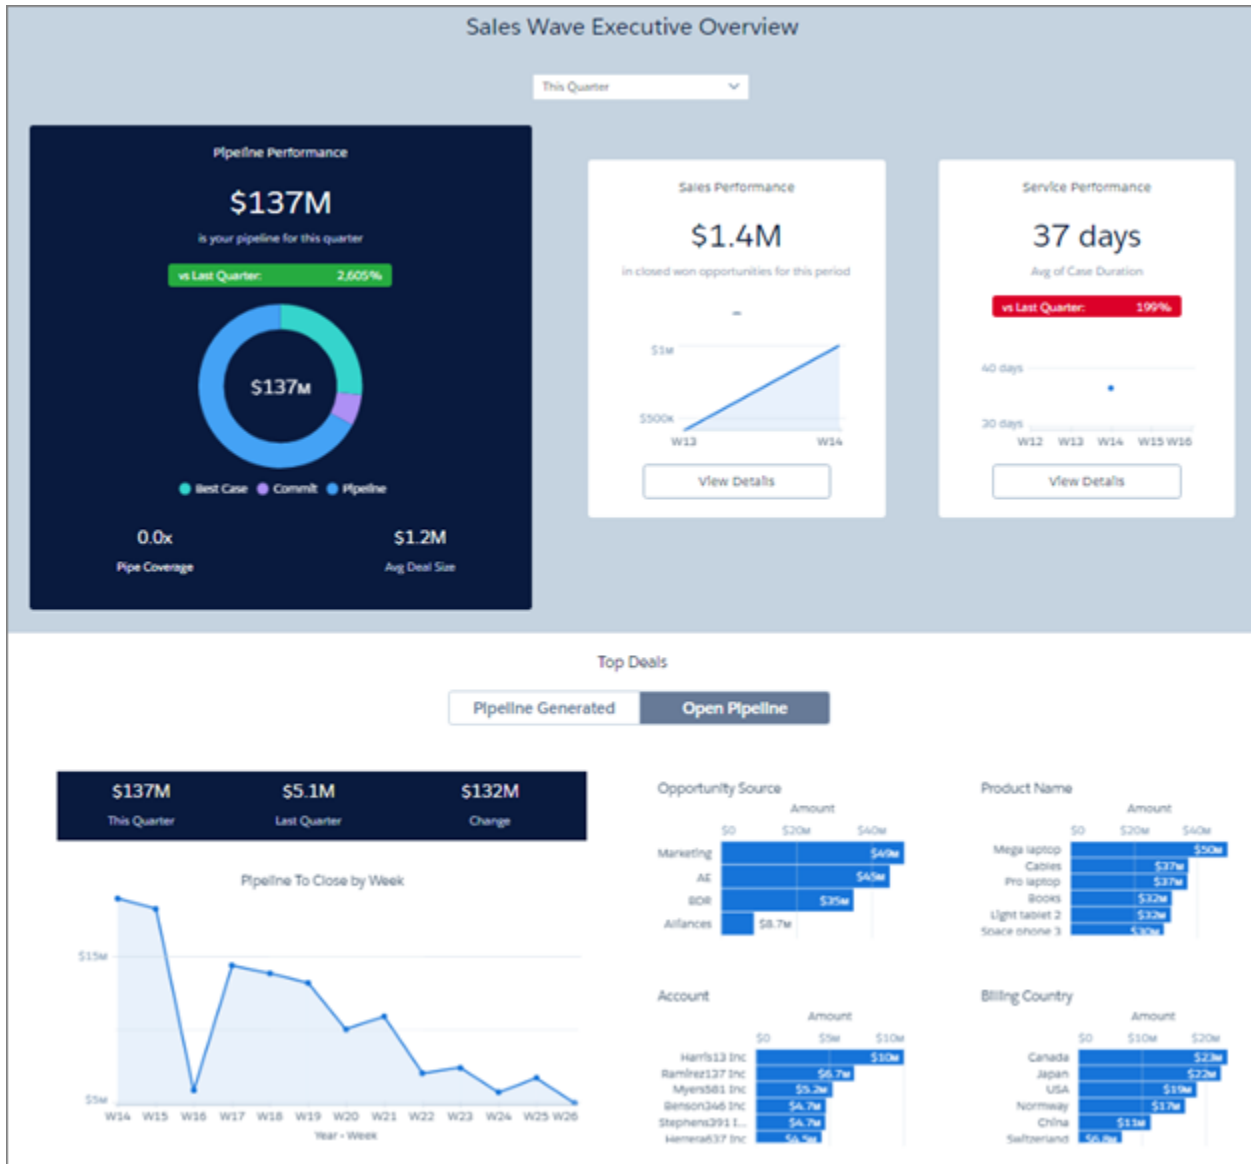

- Use Wave Analytics Templated Apps

To use Sales Wave Analytics:

- Access Sales Cloud Analytics Templates and Apps

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- Edit Wave Analytics Dataflows

Salesforce created the Sales Wave Analytics app to make it easy to analyze Sales Cloud data. Whether you're a sales manager, a rep, or on the operations side, Sales Wave Analytics gives you a new level of insight into your Salesforce data.

- Managers start with an overview of team key performance indicators (KPIs) and can dive right in to specifics about quota, changes in the pipeline, and average sales cycle time. They can also focus on the performance of members of their team and take action to accelerate business closings.
- Reps can view their own quota attainment, bookings, and pipe activities for a given period. They can also quickly find opportunities for new business to help hit their quotas.
- Operations staff can sort through performance by geography, source, and customer to spot trends to help speed new deals.

App creation is easy: using a built-in configurator, answer a few questions about how you prefer to view data, and Wave takes care of the rest. Once you've created the app, use its prebuilt datasets and dashboards to explore Sales Cloud data from any device that supports Wave.

You get actionable insights fast from your sales data using the intuitive Wave interface. And you can drill deeper into key aspects of your business by customizing Sales Wave Analytics around your business needs.

Note: Your organization can use the Sales Wave app with or without the Salesforce Wave Analytics platform by purchasing a Sales Wave Analytics license. Each Salesforce Wave Analytics license includes a Sales Wave Analytics App license.

Sales Wave Analytics Prebuilt Dashboards and Datasets

The Sales Wave app includes prebuilt dashboards and datasets to accelerate your data exploration.

Note: These dashboards and datasets are part of Sales Wave Analytics only if you created your app after July 2016. If you use an older version of Sales Wave Analytics, create the app again to see these dashboards and datasets.

Sales Wave Analytics Dashboards

The prebuilt dashboards in the Sales Wave app contain key performance indicators that help you get value from your Salesforce data—fast. The dashboards let you manage pipeline and forecast and understand key business performance drivers, visualize trends, assign actions. They also help you get fast answers to questions you have about business results.

USER PERMISSIONS

To use Wave apps:

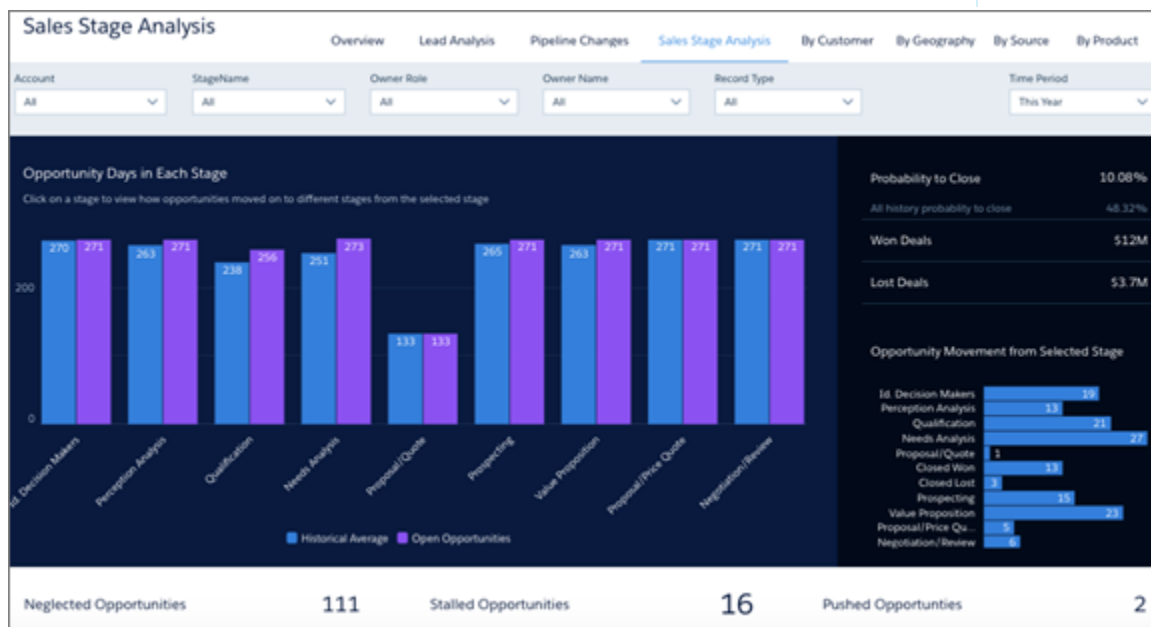

- Use Wave Analytics Templated Apps

To use Sales Wave Analytics:

- Access Sales Cloud Analytics Templates and Apps

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- Edit Wave Analytics Dataflows

The following table guides you through Sales Wave Analytics dashboards, which give you an immediate picture of how your business is doing. You can also explore further on your own at any point. To learn more about exploring data in Wave, see [Explore and Visualize Your Data](#).

Note: The dashboards and datasets included in Sales Wave Analytics differ depending on how you answer configuration wizard questions when you create the app.

Table 60: Sales Wave Dashboards

Dashboard Name	Contents	Target User Role	Special Requirements
Executive Overview	Sales execs start here with summary and detailed views of pipeline, sales, and service performance as well as top deal closings and lead conversion rates.	Executive	
Sales Rep Overview	Sales reps start here for a summary of KPIs. Review quota attainment, bookings, and pipeline for a particular time period. Also see key opportunities for accelerating deal closing and number of activities completed in a week.	Sales representative	Must import quotas data to Sales Wave Analytics to see quota attainment.
Opportunity Discovery	Focuses on products sold or not sold to accounts and identifies whitespace or cross-sell and up-sell opportunities.	Sales representative	Must import quotas data to Sales Wave Analytics for this dashboard to appear.
Manager Overview	Sales managers start here for an overview of team KPIs. Review team quota attainment, pipe coverage, bookings, pipe generation, and average sales cycle time. You can select individual reps to review their performance.	Sales manager	<ul style="list-style-type: none"> • Must import quotas data to Sales Wave Analytics to see quota attainment. • Must answer “yes” to configuration wizard question about whether you use the Products object to see pipe coverage.
Pipeline Changes	Highlights pipeline changes, such as closed won/lost, moved in/out, and amount reduced/expanded.	Sales manager	Must import quotas data to Sales Wave Analytics to see quota attainment.
Team Productivity	Shows how reps on your team compare across key performance categories such as close/won, quota attainment, and sales cycle time.	Sales manager	Must import quotas data to Sales Wave Analytics to see quota attainment.
Quota Progress	Helps your team hit its quota by letting you drill into key opportunities.	Sales manager	Must import quotas data to Sales Wave Analytics to see quota attainment.

Dashboard Name	Contents	Target User Role	Special Requirements
Leader Overview	Learn pipe coverage, quota attainment, open pipeline, and other results for each role on the team.	Sales leader	Must import quotas data to Sales Wave Analytics to see quota attainment.
Leader Pipeline Changes	Get an up-to-date view of pipeline changes: the size of the pipe at the beginning and end of a selected time period and what's moved in and out.	Sales leader	None.
Lead Analysis	Analyze lead conversion, including open and converted leads and conversion rate.	Sales leader	None.
Sales Stage Analysis	Analyze efficiency of each phase of the sales process. Discover if deals are moving smoothly, where there are bottlenecks, what's happening to speed up or slow down closing, and so on.	Sales leader	None.
Performance by Geography	Analyze closed business and discover trends across geographic locations.	Sales leader	None.
Performance by Source	Analyze closed business and discover trends across sources.	Sales leader	None.
Performance by Customer	Analyze closed business and discover trends across customers.	Sales leader	None.
Performance by Product	Analyze closed business and discover trends across products.	Sales I	None.

Sales Wave Analytics Datasets

The table describes Sales Wave Analytics datasets become part of the app when you create it.

Table 61: Sales Wave Datasets

Dataset Name	Contents	Special Requirements
Accounts	Data about accounts. Includes accounts without opportunities.	None.
Opportunities	Data about accounts, opportunities, and users.	None.
Oppty Products	Data about products with opportunities and accounts.	None.

Dataset Name	Contents	Special Requirements
Pipeline Trending	Opportunity historical Data. Tracks opportunity amount, close date, and stage changes over the life of an opportunity.	None.
Quota	Quotas data. ;	Upload a CSV file on page 4295 with quotas data to update this dataset if you use quotas in Sales Wave Analytics.
Quota with Users	Applies role hierarchy information to quotas data during manager roll-up.	None.
Users	Provides details about all users in an org.	None.
Roles	Basic data about user roles.	None.
Cases	Data about cases related to accounts.	Only included if you choose to import cases data to Sales Wave Analytics through the configuration wizard.
Events	Data about events.	None.
Tasks	Data about tasks.	None.
Leads	Salesforce leads data, including converted leads connected to accounts and opportunities.	Only included if you choose to import leads data to Sales Wave Analytics through the configuration wizard.
Campaigns	Salesforce campaign data, including opportunities connected to campaigns.	Only included if you choose to import campaigns data to Sales Wave Analytics through the configuration wizard.
Campaign Members	Data about campaign members with campaigns. See who's connected to which campaigns.	Only included if you choose to import campaigns data to Sales Wave Analytics through the configuration wizard.

Set Up Permissions for the Sales Wave Analytics App

Set up your organization to use the Sales Wave app by enabling Wave and creating and assigning permission sets.

Each Sales Wave Analytics App license is a single-user license that provides access to Sales Wave Analytics. It includes a single Sales Wave Analytics app single-user license. The table shows data storage limits for the app. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

Table 62: Sales Wave Analytics Data Storage Limits

License	Limit
Analytics Cloud - Sales Wave Analytics App	25 million rows when used without Analytics Cloud - Wave Analytics Platform license. Use of Sales Wave Analytics app license does not increase data limit for platform license.
Analytics Cloud - Additional Data Rows	100 million rows.

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

 **Important:** Sales Wave Analytics App license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.

Your org can use the Sales Wave Analytics app with or without the Salesforce Wave Analytics platform.

Each Sales Wave app user needs a Sales Analytics Apps permission set license. The Sales Analytics Apps permission set license enables the following permissions.

Table 63: Sales Wave Analytics User Permissions

Permission	Function
"Access Sales Cloud Analytics Templates and Apps"	Provides specific access to the Sales Wave Analytics App as well as the data and prebuilt dashboards included with it.
"Download Wave Analytics Data"	Download screenshots and data in tabular format through the Wave Analytics user interface.
"Edit Wave Analytics Dataflows"	Enables admins to upload and download JSON for existing data flows.
"Manage Wave Analytics Templated Apps"	Gives admins the ability to create Wave apps for users in their orgs, in this case the Sales Wave Analytics app.
"Use Wave Analytics Templated Apps"	Enables access to all Wave templated apps.

You assign the Sales Analytics Apps permission set license when you create and assign permission sets to users in your organization.

Sales Wave Analytics App Setup Process

To set up your organization to use Sales Wave Analytics, follow these steps:

1. Enable Wave for your organization.
2. Define the main Sales Wave Analytics user types in your organization.
3. Create permission sets to group related user permissions according to the needs of each user type.

When you create permission sets, you also select the Sales Analytics Apps permission set license.

4. Assign a permission set to an individual user, which also *auto-assigns* the Sales Analytics Apps permission set license to that user. For efficiency, you can assign a permission set to groups of users. You can assign multiple permission sets to a user.

After you've completed these steps, create and share Sales Wave Analytics with the users in your organization. Users can only explore Sales Wave Analytics dashboards and datasets after you've shared the app with them.

Tip:

For best results, follow the steps for setting up the Sales Wave Analytics app in the order shown here.

1. [Identify Sales Wave Analytics App User Types](#)
Identify Sales Wave Analytics app user types and the tasks they perform to assure that the setup process meets your team's analytics needs.
2. [Enable Wave Analytics and Create Sales Wave Analytics Permission Sets](#)
After Salesforce provisions you with the Sales Wave Analytics App license, enable Wave and create permission sets for Sales Wave Analytics users.
3. [Assign Sales Wave Analytics Permission Sets to Users](#)
Assign permission sets to one or more Sales Wave Analytics users—either one at a time, or in bulk—to give them access to the app.

Identify Sales Wave Analytics App User Types

Identify Sales Wave Analytics app user types and the tasks they perform to assure that the setup process meets your team's analytics needs.

The Sales Wave Analytics App license includes the permissions required by users in your organization to administer Sales Wave Analytics and to import, work with, and explore data. Set up the Sales Wave Analytics in the most useful way by thinking through the different ways people can access Sales Wave Analytics features and categorizing users into types. Here are a few examples.

In most cases, Sales Wave Analytics addresses the needs of two basic types of people on your team:

- Users, who view Sales Wave Analytics dashboards and datasets.
- Administrators or managers, who access all Sales Wave Analytics functionality to create apps, dashboards, and datasets, import data, and otherwise customize the Sales Wave Analytics experience.

Accordingly, when you set up Sales Wave Analytics, creating two basic permission sets probably meets the needs of most users in your organization:

- A “view” permission set that contains the permissions needed by most basic-level users when they access Sales Wave Analytics.
- A “manage” permission set that's reserved for a select few administrators and managers and contains permissions to use all Sales Wave Analytics features.

In the detailed Sales Wave Analytics app setup instructions that follow, we show you how to create and assign these two permission sets.

Enable Wave Analytics and Create Sales Wave Analytics Permission Sets

After Salesforce provisions you with the Sales Wave Analytics App license, enable Wave and create permission sets for Sales Wave Analytics users.

Enable the Wave Platform

To use Sales Wave Analytics, first enable Wave Analytics for your organization.

USER PERMISSIONS

To create permission sets:

- “Manage Profiles and Permission Sets”

1. In the Salesforce Setup menu, under administer, click **Analytics Cloud | Getting Started**

2. Click **Enable Analytics**

Create Permission Sets

The next step in the setup process is to create permission sets made up of Sales Wave Analytics user permissions. We show you how to create two permission sets:

- *Manage Sales Wave Analytics* permission set, for users who create and administer Sales Wave Analytics.
 - *View Sales Wave Analytics* permission set, for users who explore app dashboards and datasets.
1. Create a Manage Sales Wave Analytics permission set, which gives users access to all app features.
 - a. In the Setup menu, under administer, click **Manage Users | Permission Sets** and then click **New**.
 - b. Enter `Manage Sales Wave Analytics` in the Label field, which automatically creates the API name, as well. You can change the API name, but it can't include spaces, end with an underscore, or have two consecutive underscores. You can also enter a description, but it's optional.
 - c. Select the permission set license to associate with this permission set by using the License drop-down option. In this case, select `Sales Analytics Apps` in the Permission Set License section.

Enter permission set information

Label: Manage Sales Wave

API Name: Manage_Sales_Wave

Description: Permission set for Sales Wave admin

Session Activation Required:

Select the type of users who will use this permission set

Who will use this permission set?

-Choose "--None--" if you plan to assign this permission set to multiple users with different user and permission set licenses.
 -Choose a specific user license if you want users with only one license type to use this permission set.
 -Choose a specific permission set license if you want this permission set license auto-assigned with the permission set.

Not sure what a permission set license is? [Learn more here.](#)

License: XOrg Proxy User, Permission Set Licenses, Analytics Cloud - Wave Analytics Platform, Analytics Cloud Explorer, Field Service Dispatcher, Field Service Mobile, Field Service Scheduling, Field Service Standard, Identity Connect, **Orders Platform**, **Sales Analytics Apps**, Sales Console User, Service Analytics Apps

If you select a specific permission set license, any user assigned to the permission set is *auto-assigned* the permission set license. If you leave the default of --None--, you must *manually* assign the permission set license to users before you can add them to the new permission set.

d. Click **Save**. The Permission Set Overview page shows the new permission set. Now add user permissions to the set.

e. Click **System Permissions** to open the list of user permissions enabled by the Sales Wave Analytics license. Then click **Edit**.

- f. Select the following user permissions: “Use Wave Analytics Templated Apps,” “Access Sales Cloud Analytics Templates and Apps,” “Manage Wave Analytics Templated Apps,” and “Edit Wave Analytics Dataflows.” Make sure to select all four. Click **Save**. You’ve successfully created a permission set that enables users to create and administer Sales Wave Analytics and access all app features. You can now assign it to users, which is covered in [Assign Sales Wave Permission Sets](#).
2. To create a View Sales Wave Analytics permission set, which enables users to view app dashboards and datasets, repeat the steps to create a Manage Sales Wave Analytics permission set, with these exceptions:
 - a. Name the permission set `View Sales Wave Analytics`.
 - b. Select only the “Use Wave Analytics Templated Apps” and “Access Sales Cloud Analytics Templates and Apps” user permissions and click **Save**. You’ve successfully created a permission set that enables users to view the Sales Wave Analytics dashboards and datasets. You can now assign it to users, which is covered in [Assign Sales Wave Permission Sets](#) on page 4286.

You can build other permission sets out of the individual permissions enabled by the Sales Wave Analytics license, depending on the needs of users in your organization.

Assign Sales Wave Analytics Permission Sets to Users

Assign permission sets to one or more Sales Wave Analytics users—either one at a time, or in bulk—to give them access to the app.

1. In the Setup menu, under administer, click **Manage Users | Permission Sets**.
2.  **Warning:** Assign the Manage Sales Wave Analytics permission set sparingly because it lets users administer Sales Wave Analytics, which lets them create, edit, and delete the app. Assign it only to users who administer or manage the app.

Click the permission set you want to assign to users. If you’ve followed the instructions in [Enable Wave Analytics and Create Sales Wave Analytics Permission Sets](#) on page 4284, select either the Manage Sales Wave Analytics or View Sales Wave Analytics permission sets.

3. Click **Manage Assignments** and click **Add Assignments**.
4. Select the users who need to manage or use Sales Wave Analytics, and click **Done**.

When you assign the permission set to users, Salesforce *auto-assigns* the Sales Analytics Apps *permission set license* to those users.

After you’ve completed these steps, create and share Sales Wave Analytics with the users in your organization. Users can only explore Sales Wave Analytics dashboards and datasets after you’ve shared the app with them.

Create and Share the Sales Wave Analytics App

Follow these steps to create Sales Wave Analytics and start uncovering the value of your Salesforce data—fast.

Using the built-in configuration wizard lets you create the Sales Wave Analytics app to reflect the way you like to view your sales data. If you’re not happy with the result, you can delete the app and create it again quickly. You can also watch the video  [Create the Sales Wave App, Part 1: Using the Configuration Wizard \(Lightning Experience\)](#), which covers the steps described here.

1. Log in to Salesforce.
2. Set [Salesforce field-level security](#) on page 542 to enable the Wave Analytics Cloud Integration User to see all fields you’d like your app to use. Integration users run the dataflow, and if they don’t have proper field-level security permissions, the dataflow can fail.
 - a. Go to Setup and enter the name of an object—for example, Accounts or Cases—in the Quick Find box and hit Enter.

USER PERMISSIONS

To assign a permission set to users:

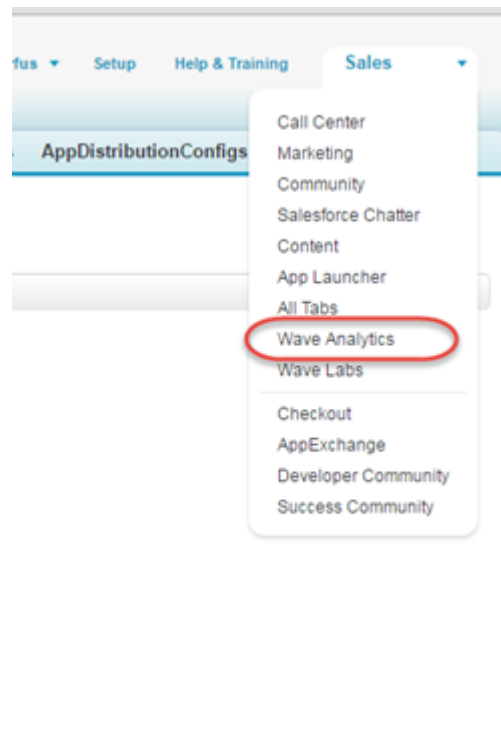

- “Assign Permission Sets”

USER PERMISSIONS

To create and manage Wave apps:

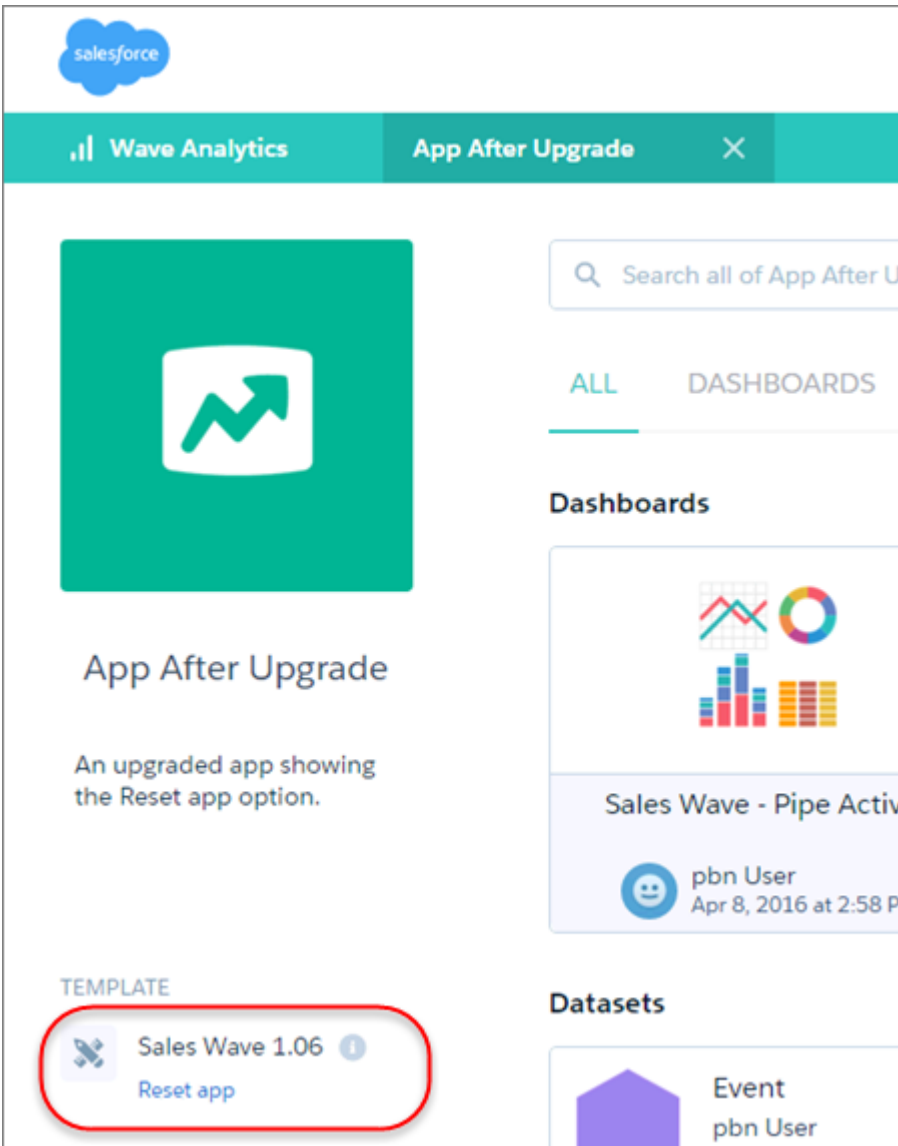

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

- b. Click the name of the object.
 - c. The next window shows all the fields for the object. Go to the one(s) where you need to edit field-level security.
 - d. Look for the Analytics Cloud Integration User, check the box(es) for the required fields under Visible, and click Save.
 - e. Repeat the Steps a through d for all objects with fields you want to use.
 - f. Refresh your browser cache.
3. Select **Wave Analytics** from the Force.com menu (top right of the Salesforce window).

4. Click **Create**, select **App**, select **Sales Wave Analytics**, and then click **Continue** to open the configuration wizard. The wizard presents a series of pages with questions and possible answers about your Salesforce data. Sales Wave Analytics personalizes the wizard questions based on a check of your org's data. It also preselects default answers to the questions and recommends answers to some of them.
-  **Note:** The original version of Sales Wave Analytics is also known as Sales Wave Analytics (Classic). Select that template to create an app with the previous set of dashboards based on the original dashboard designer.
5. Answer the wizard questions according to how your company prefers to view data. Go to [Personalize Sales Wave Analytics with the Configuration Wizard](#) for complete instructions on using the wizard.
 6. Go to the last wizard question, which gives you the option of having Wave check to see if data in your org supports the answers you select. We recommend that you answer Yes and run the check, because app creation fails if your org doesn't contain the right data. Wave displays an error message that tells you what to do if required data is missing. Make any required changes in Salesforce, refresh your browser cache, and come back to the wizard and finish creating your app.
 7. Give your app a name that's easily recognizable to others in your company.
 8. Click **Create**. That starts a dataflow that creates the app and its assets (which include a [dataflow](#) definition file, datasets, and dashboards).

9. The app creation process can take a few minutes. You can check the status of the dataflow: Open the Wave Home page, click the gear menu at the upper right of the page, and select Data Monitor. Then select Dataflow View in the pulldown at the upper left and look for your app.
10. If you'd like to change your answers after looking at the dashboards, click the Reset app link on the left side of the app home page. The reset feature is available only after you've upgraded to the latest version of an app. See [Upgrade the Sales Wave Analytics App](#) on page 4292.

Clicking **Reset app** opens the configuration wizard showing the answers you chose when you created the app. Choose new answers, and click Reset on the last page of the wizard. Sales Wave creates your app again using your new settings. You can also use the reset feature if you deleted dashboards and want to restore them.

- !** **Important:** Resetting your app gets rid of dashboard customizations, including fields or objects added to the dataflow, actions you enable, or changes to security settings and dashboard colors and labels. If you've made any customizations, save copies of your dataflow definition file or dashboards. That way, you can copy them into your app if you reset it.

11. You can also delete your app and start the app creation process all over again. To delete, position your cursor over the icon for the app and click Delete. Then click Yes to confirm deletion of all the assets associated with the app.

 **Note:** If you delete your app, Wave doesn't retain the answers you selected when you created that version of the app, and you have to start the configuration wizard process all over again. If you wish to reuse the answers you selected, keep the app until you've completed recreating the app and then delete it.

12. Now that you've created the app, share it with users in your organization. You can only share it with users who have the Use Wave Analytics Templated Apps and Access Sales Cloud Analytics Templates and Apps permissions enabled. (For more about Sales Wave app permissions, see [Set Up Salesforce Permissions for the Sales Wave App](#)). To share the app, roll your cursor over the icon for the app and click **Share**. Next, type in the names of team members, click **Add**, and click **Save**.

If your business tracks quotas at the user level, update the Quota (Target) dataset that's created along with the app before you start exploring your data. See [Update the Sales Wave Analytics Quota \(Target\) Dataset](#).

When you first create the app, Sales Wave Analytics dashboards show the number associated with role name in the hierarchy. To see the name of the person responsible for that role, you can update the role value by editing the corresponding dataset's Extended Metadata (XMD) file. See [Integrate Sales Wave Analytics With Salesforce](#) for details.

SEE ALSO:

[Personalize Sales Wave Analytics with the Configuration Wizard](#)

[Upgrade the Sales Wave Analytics App](#)

Personalize Sales Wave Analytics with the Configuration Wizard

The Sales Wave Analytics configuration wizard lets you create the app to reflect how you prefer to view Salesforce data.

When you create the Sales Wave app, the built-in configuration wizard checks the data in your org and builds a series of questions and default and recommended answers based on that data. Depending on your data, you may not see all the questions described here and some may contain different default answers. Your answers determine how users view your sales data in Sales Wave Analytics's dashboards. Answer these questions according to the way your organization uses Sales Cloud data so the dashboards are as meaningful and useful as possible.

It starts with two pages of basic questions about how your organization uses the Salesforce Accounts and Opportunities objects. In one of the questions about Opportunities, you're asked if you use the Products object. If you answer yes, you see a page with questions about how you use the Products object. The next several pages help you enhance Sales Wave Analytics with additional data. The last page lets you choose to have Sales Wave Analytics check your org to be sure your data supports the answers you select.

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

Sales Wave - Personalize X

These questions focus on how Sales Wave displays data from the Accounts object. Step 1 of 8

What is the first field you want to use to segment your customers? *
Your choice determines the primary way Sales Wave dashboards filter customer data.

Account Type x ▼

What is the second field you want to use to segment your customers? *
Your choice determines the second way Sales Wave dashboards filter customer data.

Industry x ▼

What Accounts field do you want to use to segment your sources for new business? *
Your choice determines the first way Sales Wave filters data about sources for new business. The second comes from Opportunities (next page).

Account Source x ▼

How do you want Sales Wave to display geographic data?

Back
Looks good, next

The wizard includes instructions to help you choose appropriate answers, and many questions are self-explanatory. Here are tips for how to use the wizard, including details about how to answer more complex questions.

General Guidelines

Follow these guidelines to assure a great result when you use the wizard.

- **Most questions provide answers in pick lists showing fields from Salesforce objects.** The lists include standard Salesforce fields and any custom fields you've set up on an object. Answer these questions by selecting from the fields shown. Most questions of this type let you choose only one field, and some let you choose multiple fields.
- **You can choose a field from an object only once.** After you select a field, it's no longer available as an answer to other questions.
- **Other questions are yes/no, provide a set of options, or require you to enter text.**
- **Questions marked with an asterisk (*) require answers.**
- **Using the default answers results in a useful set of dashboards.** If you're not sure what to select, use the answer that's preselected. Some questions do not have preselected answers. In those cases, Sales Wave Analytics reminds you to make a selection. If you're not happy with the result, you can delete the app and create it again.
- **You control only parts of the app with wizard settings, such as the filters used in dashboards.** We built the app to provide immediate analytics value without much work on your part.
- **Only some answers make sense given the question's context.** The answer pick-lists contain many fields, but only some make sense for your app. For example, it's unlikely that you'd filter Accounts data by Photo URL, even though the Accounts object includes a Photo URL field.

Page 1: Set How Sales Wave Analytics Displays Accounts Data

Questions on this page let you determine how Sales Wave Analytics filters customer data, sources for new business, and geographic data. All are required.

- Question 3: Asks about the field from Accounts you use to track if an account is new business. This is one way Sales Wave Analytics filters new business data. The second way comes from a field in the Opportunities object, which you choose on Page 2.
- Question 4: Asks about how you want to view geographic data. You can select either a bar chart or a standard world or country map.
- Question 5: Asks about the field from Accounts you want Sales Wave Analytics to use as the primary filter for geographic data. If you selected a world map in Question 4, be sure to select the field that contains country information. If you selected a country map, select the field that contains state information.

Page 2: Set How Sales Wave Analytics Displays Opportunities Data

Questions on this page let you determine how Sales Wave Analytics filters data about opportunities. It also asks about how your organization uses the Opportunities object. All are required.

- Question 2: Lets you choose the second way Sales Wave Analytics filters new business data. You determine the first in Page 1, Question 3.
- Question 5: Asks if you track products at the opportunity level. If you do, answer yes and the Sales Wave Analytics wizard displays a separate page asking you about how you use the Products object.

Page 3: Set How Sales Wave Analytics Displays Products Data

This page displays only if you answer yes to the question on the previous page asking if you track products. If you answer no, you go directly to Page 4 and this page won't appear. The questions here let you determine how Sales Wave Analytics filters data about products.

Page 4: Enhance Datasets and Dashboards

This page asks you to about miscellaneous—but important—aspects of how you want Sales Wave Analytics to use and display data. It includes questions about your fiscal year start date, security settings, account and opportunity teams, and record types. All are required.

- Question 2: Many organizations keep data about their sales team's quotas in a tool outside Salesforce. If you want to import that data so it appears in Sales Wave Analytics dashboards, select Yes. You then have to import a previously created CSV file with the quotas data. See [Update the Sales Wave Analytics Quota \(Target\) Dataset](#).
- Question 3: Lets you control Sales Wave Analytics user access to data. Here are the available options:
 - Option 1 enforces [Salesforce role hierarchy](#) on page 560, which means that users can only see data in Opportunities and Accounts owned by them and their subordinates.
 - Option 2 enables team benchmarking. It lets users see data in Opportunities and Accounts owned by them and their subordinates as in Option 2. It also lets users see data from Opportunities and Accounts owned by others at the same level in the role hierarchy.
 - Option 3 lets all users see all Sales Cloud data regardless of role.
- Question 4: Lets you control how Sales Wave Analytics handles [account team](#) on page 1207 information. Here are the options:
 - Option 1 lets you add account teams data to datasets.
 - Option 2 lets you add account teams data to datasets and also lets account team members see all members' records, not just their own.
 - Option 3 lets you exclude account teams data from datasets.
- Question 5: Lets you control how Sales Wave Analytics handles [opportunity team](#) on page 1891 information. Here are the options:
 - Option 1 lets you add opportunity teams data to datasets.

- Option 2 lets you add opportunity teams data and also lets opportunity team members see all members' records, not just their own.
- Option 3 lets you exclude opportunity teams data from datasets.
- Questions 6 and 7 let you choose to add record types from the Opportunities object to Sales Wave Analytics and indicate which record types to include.
 - Question 6: Answer Yes to add an Opportunity record type filter to dashboards. If you answer Yes, also answer Question 7.
 - Question 7: If you answered Yes to question 6, choose the Opportunity record types you want to include. To include *all* record types, leave the answer blank. If you select one or more record types, Sales Wave Analytics includes only those types and *excludes any you don't select*.

Page 5: Import Additional Accounts and Opportunities Data

The questions on this page let you add data from Accounts and Opportunities fields to datasets. Once the data is imported, you can view it in dashboards after first modifying them through the user interface or by changing the dashboard JSON. The questions ask you separately about fields including measures, which are numerical values, and dimensions, which are values expressed in words. All questions are optional.

Page 6: Add Objects

Select additional Salesforce objects you want to analyze in Sales Wave Analytics.

Pages 7 and 8: Add Fields From the Objects Selected on Page 6

Add fields to the datasets Sales Wave Analytics creates according to the way you answer the question on Page 6. You can select measures (numerical fields) and dimensions (text fields) from the objects you selected on Page 6.

Page 9: Check Your Org's Data

Go to the last wizard question, which gives you the option of having Wave check to see if data in your org supports the answers you select. We recommend that you answer Yes and run the check, because app creation fails if your org doesn't contain the right data. Wave displays an error message that tells you what to do if required data is missing. Make any required changes in Salesforce, refresh your browser cache, and come back to the wizard and finish creating your app.

SEE ALSO:

[Create and Share the Sales Wave Analytics App](#)

Upgrade the Sales Wave Analytics App

Take advantage of the latest Sales Wave Analytics features by upgrading your app every time we release a new version.

The banner at the top of your app home page tells you that we've released a new version. It also provides a link to more information about the release. There's also a link inviting you to start the upgrade process in the left-hand column of the home page, just below the app name.

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

Here's how to upgrade your app.

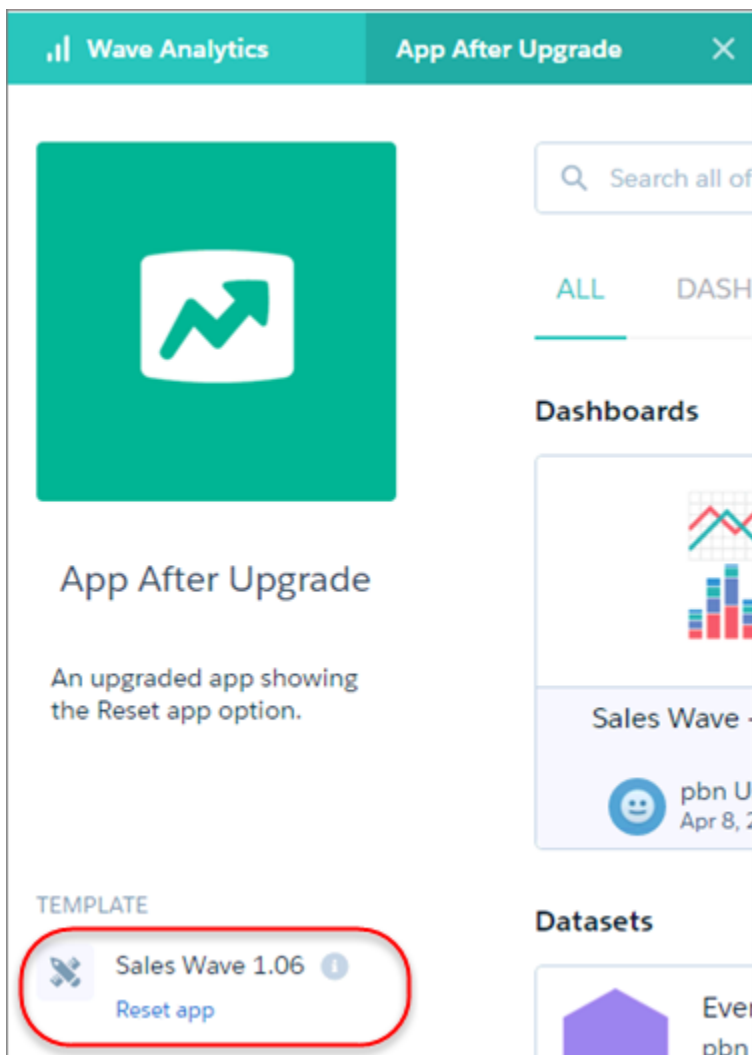

1. Click either the "What's new" link in the banner or the "New version available" link in the left-hand column of your app's home page.
2. You can read information about the new version on top of the page that opens. At the bottom of the page, find the buttons: **Upgrade current app** and **Create new app**.
3. See descriptions of what the buttons do by hovering over them. If you click **Upgrade current app**, you overwrite your current app and all its assets, replacing it with an app based on the new version. This also deletes any customizations, including any new fields or object you've added to the dataflow or changes you've made to security settings and dashboard labels and colors. If you click **Create new app**, you create a second copy of your current app based on the new version. Decide which option suits your circumstances, and click the appropriate button.
4.  **Warning:** If you've customized your app, click **Create new app** instead of **Upgrade current app** to make an app copy based on the new version. This preserves the current version and any customizations, which you can then manually copy into the new version of the app.

If you click **Upgrade current app**, you see a screen warning you that the upgrade option overwrites the current app and gets rid of any customizations you've made to it. If you're OK with that, check the box and click **Continue**. If you're not, click **Back** to return to the previous screen. Clicking **Continue** takes you to the configuration wizard. Skip ahead to step 6.

5. If you click **Create new app**, you're taken to the configuration wizard. You don't see a warning, since you're not overwriting your current app, which is preserved with any customizations you've made to it.
6. The configuration wizard is preloaded with the settings you chose last time you used the wizard. You can either keep those settings or change them. Go through each page of the wizard.

7. Once you complete the wizard, Wave shows a screen that indicates which assets are impacted by the upgrade. Review the screen to see how many datasets, dashboards, and lenses will be changed, deleted, or added by the upgrade. It also shows how changed assets will be modified—whether the change is to data or appearance. On the same screen, you have the option to download a file with code for changes made to the app. If you've customized the app, download and save the file so you can copy and paste customization code into the upgraded version.
8. *Upgrade option only:* If you're upgrading your app, click **Upgrade current app**. Remember, this overwrites any customizations you've made. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.
9. *Create option only:* If you're creating a new app, name your app something different from the current version and click **Create new app**. This option saves your current app and all its customizations. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.

If the link below the app name says "Reset app," you're using the latest version and don't need to upgrade.

Update the Sales Wave Analytics Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Analytics Quota dataset so the app includes quotas data for your team.

When you create Sales Wave Analytics, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave Analytics, you need to update the Quota dataset by completing the following steps. You can also watch the video [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow \(Lightning Experience\)](#), which covers the steps described here.

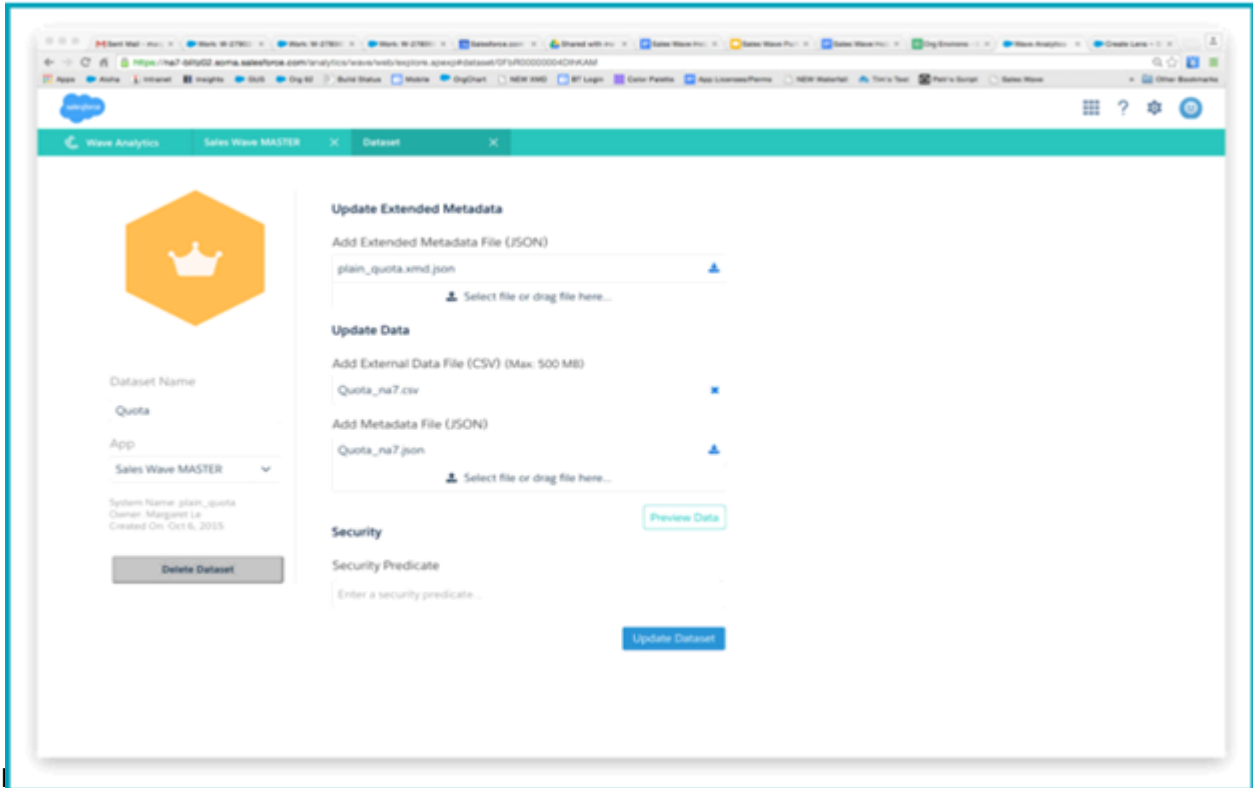

-  **Note:** When you work with .CSV files you want to import to Sales Wave Analytics, create and open them using only a UTF-8-compliant text editor. Opening them in Microsoft Excel or other spreadsheet software reformats .CSV files and makes them unusable in Sales Wave Analytics.
 -  **Note:** If your business doesn’t track quotas at the user level, you can skip this step. Complete the step only if you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level.
 -  **Important:** When you create the .CSV file, be sure it contains the following fields, in this order, with exactly these names. Field names are case-sensitive:
 1. StartDate (in yyyy-mm-dd format)
 2. QuotaAmount
 3. OwnerName
 4. Username
1. Create a .CSV file to include the fields just described, that is StartDate (in yyyy-mm-dd format, QuotaAmount, OwnerName, Username.. For an example, see [Sales Wave Analytics Example .CSV File](#).
 2. Save the file to a location that you can easily remember.
 3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.
 4. Hover over the dataset, then click **Edit**.

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

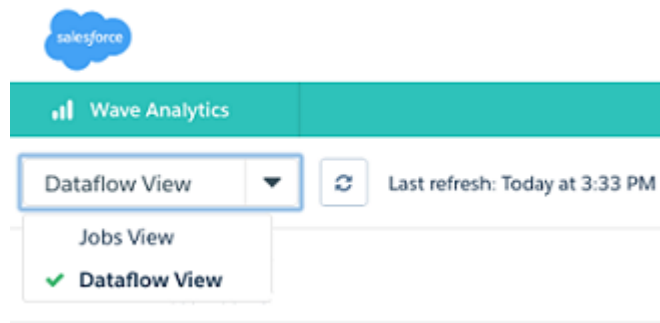

- Salesforce displays the dataset editing screen for the Quota dataset. From the Update Data section, select **Select file or drag file**

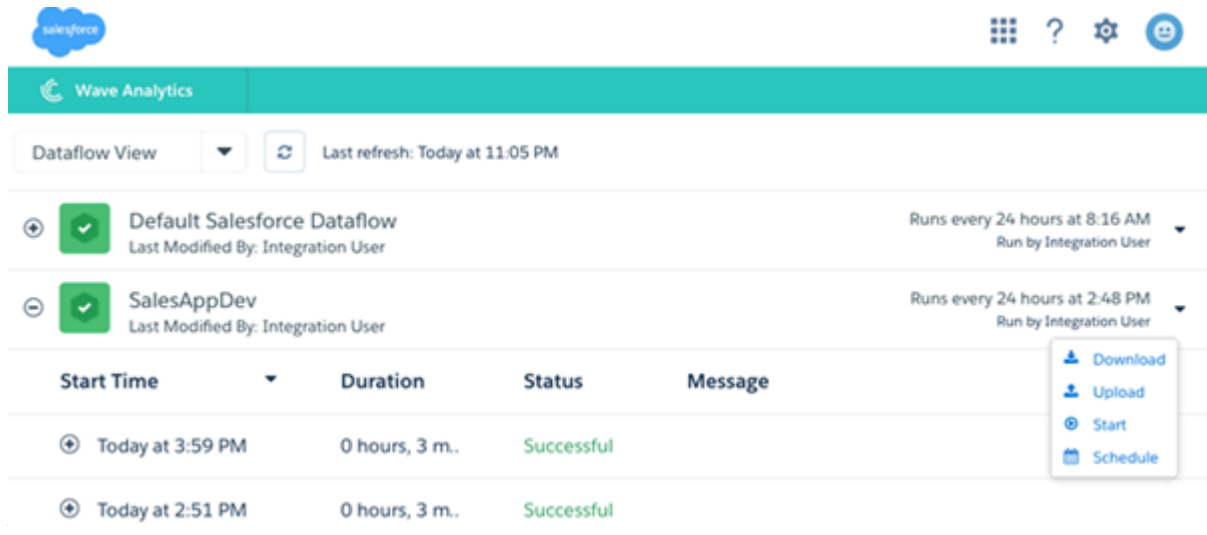

- In the dialog box that opens, navigate to the .CSV file you created in Step 1, and double-click it.
- Click **Update Dataset**.
- If your fiscal period is different than calendar period, that is if it starts another date besides January 1, you also need to update the Quota Metadata file.
 - Copy the JSON from [Sales Wave Analytics App Quota Dataset JSON File](#) and paste it into a text editor of your choice.
 - Change the value of "fiscalMonthOffset" from 4 to a number that represents the month your fiscal period starts. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December.
 - Save the file to your desktop and upload it to Sales Wave Analytics by dragging it to **Select file or drag file here...** in the Add Metadata File (JSON) section of the dataset editing screen.
 - Click **Update Dataset**.
- After uploading your quota data, re-run the dataflow to update the dashboards.
 - Click the Gear menu at the upper right of the Sales Wave screen and select Data Monitor.

- b. Select Dataflow view from the menu at the top left of the Data Monitor screen.

- c. Find your app; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name, and click

it. The dataflow assures that Sales Wave has your company’s latest sales data. You can learn more about dataflows from [Schedule the Sales Wave App Daily Dataflow](#).

[Sales Wave Analytics Example .CSV File](#)

Here’s an example of the .CSV file you create to update the Sales Wave Analytics Quota (Target) dataset.

[Sales Wave Analytics App Quota Dataset JSON File](#)

Use this file to update the Sales Wave Analytics Quota dataset with your fiscal year start date if it’s *not* January 1.

Sales Wave Analytics Example .CSV File

Here’s an example of the .CSV file you create to update the Sales Wave Analytics Quota (Target) dataset.

Note: This file is for example purposes only. Create a unique .CSV file with quota data for members of your team including the following fields:

- QuotaAmount

- StartDate
- OwnerName
- Username

Create the file using a UTF-8 compliant text editor, and do not open the file with Microsoft Excel or another spreadsheet application. Field names are case-sensitive and must appear in your file exactly as shown here.

See [Update the Sales Wave Analytics Quota \(Target\) Dataset](#) on page 4295.

Example:

```
QuotaAmount,StartDate,OwnerName,Username
5000000,2014-01-01,Priya Anand,user9.kthjbnrxfifo@yourDomain.com

```

Sales Wave Analytics App Quota Dataset JSON File

Use this file to update the Sales Wave Analytics Quota dataset with your fiscal year start date if it's *not* January 1.

Copy the contents of this file into an editor of your choice and change the "fiscalMonthOffset" value (shown in **bold**) to the month your fiscal period begins. In metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December. In the code below, the number is set to "4", which stands for May. Use the number that represents the month your fiscal period begins. Then save the file and upload it to Sales Wave Analytics following the instructions in [Update the Sales Wave Analytics Quota \(Target\) Dataset](#).

```
{
  "objects": [
    {
      "connector": "CSV",
      "fullyQualifiedName": "Quota_csv",
      "label": "Quota.csv",
      "name": "Quota_csv",
      "fiscalMonthOffset": 4
    }
  ]
}
```

```

    "fields": [
      {
        "fullyQualifiedName": "QuotaAmount",
        "name": "QuotaAmount",
        "type": "Numeric",
        "label": "QuotaAmount",
        "precision": 18,
        "defaultValue": "0",
        "scale": 0
      },
      {
        "fullyQualifiedName": "StartDate",
        "name": "StartDate",
        "type": "Date",
        "label": "StartDate",
        "format": "yyyy-MM-dd",
"fiscalMonthOffset": 4,
        "isYearEndFiscalYear": true
      },
      {
        "fullyQualifiedName": "OwnerName",
        "name": "OwnerName",
        "type": "Text",
        "label": "OwnerName"
      },
      {
        "fullyQualifiedName": "Username",
        "name": "Username",
        "type": "Text",
        "label": "Username"
      }
    ]
  }
}

```

Schedule the Sales Wave Analytics Daily Dataflow

Schedule a daily dataflow at a time outside standard business hours before you start exploring with Sales Wave Analytics.

When you create Sales Wave Analytics, the creation process includes a dataflow that imports the latest Sales Cloud data to Wave. You can schedule the dataflow to be rerun every day to assure that your app uses up-to-date Salesforce data. Schedule the dataflow to take place sometime outside normal business hours so the dataflow doesn't interrupt your use of the app.

 **Note:** The Sales Wave Analytics dataflow runs only once when you create the app. Schedule it to run daily so the app uses the latest sales data.

You can also watch the video  [Create the Sales Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow \(Lightning Experience\)](#), which covers the steps described here.

1. Go to **Wave Analytics** in the Force.com menu (top right of the Salesforce window) if you're not already there. Open the Data Monitor by clicking the gear icon at the upper right of the screen.

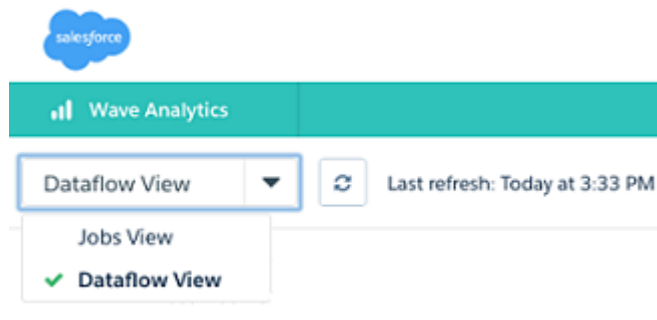

USER PERMISSIONS

To create and manage Wave apps:

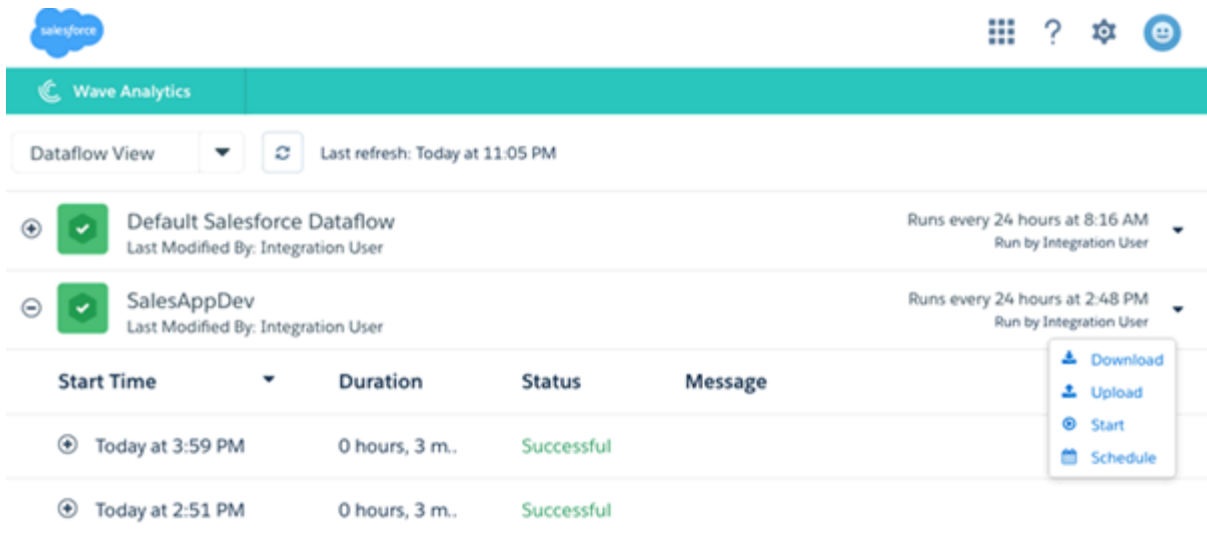

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

3. Find the app you created; you may have to scroll down the page. Open the menu on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn't interrupt business activities. Click

Save.

Integrate Sales Wave Analytics With Salesforce

USER PERMISSIONS

To use Wave templated apps:	“Use Wave Analytics Templated Apps”
To use Sales Wave Analytics:	“Access Sales Cloud Analytics Templates and Apps”
To create and manage Wave apps:	“Manage Wave Analytics Templated Apps” “Edit Wave Analytics Dataflows”
To edit a dataset’s extended metadata (XMD) file:	“Edit Wave Analytics Dataflows”

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Make Sales Wave Analytics more usable by performing a variety of optional integrations and customizations.

Overriding role names in datasets, embedding the “Sales Wave Analytics - Account Overview” dashboard in your Salesforce Accounts page, and expose Sales Wave Analytics as a tab in Salesforce Classic can make it easier for your team to use the app.

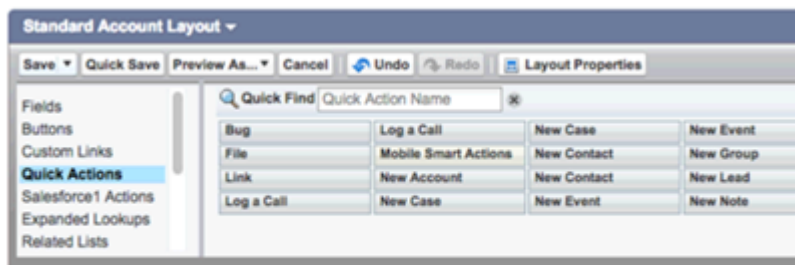

Add Actions to Sales Wave Analytics Dashboards

Sales Wave Analytics dashboards use actions that are enabled on the Account and Opportunity page layouts. To add actions, you edit the page layout for those objects.

In Salesforce, go to the Accounts or Opportunities tab, open the page for an account or opportunity, and click the **Edit Layout link** at the top right of the page.

In the Quick Actions in the Publisher section, click the **override the global publisher layout link**. If you or someone else in your org has already done this, you won’t see the link. Note that this section may be called something slightly different in the org you use, for example “Quick Actions in the Salesforce Classic Publisher.”

In the Account Layout or Opportunity Layout panel (depending on which object you’re adding actions to) at the top of the page, click **Quick Actions** on the left. Drag the action(s) that begin with the word “New” (for example, New Task, New Note) to the Quick Actions in the Publisher section.

Click **Save** to save your changes. The actions you added to the layout are now available from charts and tables in Sales Wave Analytics dashboards.

Override Role Name in Datasets

Sales Wave Analytics uses Salesforce Role Hierarchy to help you to understand your company’s sales performance. When you first create the app, Sales Wave Analytics dashboards show the number associated with role name in the hierarchy. That’s not the most useful way

to view the role. To see the name of the person responsible for that role, you can update the role value by editing the corresponding dataset's Extended Metadata (XMD) file.

Let's say your role hierarchy is the following:

```
CEO (Manager: Paul)
    Sales_WW (Manager: Yves)
        Sales_WEST
        Sales_EAST
```

To have the manager's name appear in Sales Wave Analytics dashboards, update the Opportunity dataset XMD file with the following:

```
{"labels": {
  "keys": {
    "RoleName": {
      "CEO": "Paul",
      "Sales_WW": "Yves"
    },
  }
}}
```

For more information, see [Wave Analytics Extended Metadata \(XMD\) Reference](#).

Embed the Account Overview Dashboard in Account Page Layout

We've optimized the Sales Wave Analytics Account Summary and Opportunity Summary dashboards to be embedded in the Salesforce Account page layout. You can do that by following the instructions in [Embed Your Dashboard in a Salesforce Page](#).

To be able to filter the dashboard based on the account that you're viewing, use this string as filter:

```
{
  "opportunity1": {
    "AccountId": ["$Id"]
  }
}
```

`opportunity1` corresponds to the system name of the Opportunity dataset. Its name can be different in your organization.

Make Sales Wave Analytics Available in a Salesforce Classic Tab

You can access Sales Wave Analytics by going to Wave Analytics in the Force.com menu and selecting the app from the Wave home page. To make it easier for your team to reach the app, you can expose it as a tab in Salesforce Classic. To do so, create a new tab that points to a Visualforce page that includes the "Sales Wave - Overview" dashboard. Complete instructions are available in [Add a Wave Analytics Dashboard to a Visualforce Page](#).

Understand Sales Wave Analytics App Limitations

Sales Wave Analytics requires that Sales Cloud include specific data and supports a limited set of Salesforce objects.

Sales Wave Analytics Limitations

These limitations apply to Sales Wave Analytics.

Sales Wave Analytics Data Requirements

Sales Cloud data must meet the following requirements for Sales Wave Analytics dashboards to function correctly:

- Use standard sales objects.
- Have at least one event and one task connected with an opportunity.
- Enable history tracking for Amount, Stage, and CloseDate fields on the Opportunities object.
- Cases must be connected to Accounts if you choose to import Cases data to Sales Wave Analytics using the configuration wizard.
- There are two requirements if you choose to import Leads data to Sales Wave Analytics using the configuration wizard.
 1. At least one lead must be converted to an opportunity.
 2. The lead must be connected to an account.
- There are two requirements if you choose to import Campaigns data to Sales Wave Analytics using the configuration wizard.
 1. At least one opportunity must be connected to a campaign.
 2. At least one campaign member must be connected to a campaign.
- There are two requirements if you choose to import opportunity record types to Sales Wave Analytics using the configuration wizard.
 1. At least one opportunity record type must be defined.
 2. The opportunity record type must be connected to at least one opportunity.

Sales Wave Analytics Support for Salesforce Objects and Fields

Sales Wave Analytics supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave creates a dataflow that exposes selected fields from the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Projects (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Sales Wave limits custom objects support to no more than 10 custom objects for each org that implements Sales Wave. This limitation is contractual, not technical.

To add custom objects or extra fields not included when you first create the app, you must update the Sales Wave dataflow. For details, see [Create Datasets with a Dataflow](#)

Sales Wave Analytics Support for Non-Salesforce Data

Sales Wave Analytics does not support external data sources [except a CSV file](#) that contains quota data at the user level. Importing other external data requires an extra license. See your Salesforce representative for details.

To include data about quotas in Sales Wave Analytics, you must upload a CSV file with the details. For more information, see [Update the Sales Wave App Quota \(Target\) Dataset](#).

Get to Know Sales Wave Analytics Data Terminology

To make the best use of Sales Wave Analytics, it's helpful to understand the metrics and terms used in the app.

Table 64: Sales Wave Dashboards

Metric/Term	Formula	Description/Notes
Closed Won		Amount of opportunities that have been closed and won.
Closed Lost		Amount of opportunities that have been closed and lost.
Closed Total	Closed Won + Closed Lost	Total amount of opportunities that have been closed.
Quota		Amount that was planned/committed/targeted for a certain time period.
Quota Attainment	Closed Won / Quota	How much of quota has been achieved.
Expected to Close	Many	Can use Forecast Category or Stage Name to calculate.
Forecast	Closed Won + Expected to Close	Amount that is expected/outlooked to end at for a time period.
Forecast to Quota	Forecast / Quota	Ratio of forecast to quota.
Need to Close	Quota - Closed Won	Amount needed to hit quota.
Need to Find	Quota - Forecast	Amount needed to hit quota, after accounting for opportunities expected to close in the future.
Open Pipe		Total amount of open opportunities in the pipeline, where Forecast Category does not equal Closed or Omitted.
Open Pipe Coverage	Open Pipe / Need to Close	How much in pipe to cover what is needed to close.
Bookings		Amount of Closed Won opportunities for new business.
Diff	This Year - Last Year	Difference between two items.
Y / Y %	(This Year / Last Year) - 1	Year-over-year growth rate.
Avg Selling Price	Total Amount (\$) / Total Count (#)	Average selling price for Opportunities, Products, and so on.
Avg Win Rate by \$	Closed Won / Closed Total	Success rate on closed opportunities, based on amount (\$).

Metric/Term	Formula	Description/Notes
Avg Win Rate by #	Closed Won / Closed Total	Success rate on closed opportunities, based on count (#).
Avg Sale Cycle	Closed Date - Created Date	How long it took to close the deal.
Avg Discount %	abs ((Selling Price / List Price)-1)	How much was reduced from what was listed.

The Service Wave Analytics App

The Service Wave Analytics app gets you started fast with Wave Analytics and provides a clear path through your Service Cloud data on any device. Whether you're a service manager or agent, you get everything you need in one place to uncover key data insights to help you grow your business.

Tip: Follow the steps in the order shown to get started with Sales Wave Analytics. If you haven't used Wave before, learn more about it from the [Wave Analytics Library](#).

1. [About the Service Wave Analytics App](#)

Salesforce created the Service Wave Analytics app to make it easy for service managers and agents to use data to drive the success of your service business. Learn the app's benefits before you create and use the app to explore your Service Cloud data.

2. [Service Wave Analytics Prebuilt Dashboards and Datasets](#)

The Service Wave Analytics app includes prebuilt dashboards and datasets to accelerate data exploration for both service managers and agents.

3. [Set Up Permissions for the Service Wave Analytics App](#)

Set up your organization to use the Service Wave app by enabling Wave and creating and assigning permission sets.

4. [Create and Share the Service Wave Analytics App](#)

Follow these steps to create the Service Wave Analytics and start uncovering the value of your Salesforce data—fast.

5. [Personalize Service Wave Analytics with the Configuration Wizard](#)

Create Service Wave Analytics with the configuration wizard so the app reflects how your company prefers to view Service Cloud data.

6. [Setup Service Wave Analytics CSAT Metrics Example](#)

This scenario provides detail to help you answer the questions on Page 4 of the Service Wave Analytics configuration wizard.

7. [Upgrade the Service Wave AnalyticsApp](#)

Take advantage of the latest Service Wave Analytics features by upgrading your app every time we release a new version.

8. [Schedule the Service Wave Analytics Daily Dataflow](#)

Schedule a daily dataflow at a time outside standard business hours before you start exploring with Service Wave Analytics.

9. [Embed Service Wave Analytics Sidebar Dashboards in a Salesforce Page](#)

Add Service Wave Analytics dashboards to Salesforce pages so your service team can get a complete view of their cases and take appropriate action.

10. [Understand Service Wave Analytics App Limitations](#)

Service Wave Analytics requires that Service Cloud include specific data, initially supports a limited set of Salesforce objects, and has other miscellaneous limitations.

About the Service Wave Analytics App

Salesforce created the Service Wave Analytics app to make it easy for service managers and agents to use data to drive the success of your service business. Learn the app's benefits before you create and use the app to explore your Service Cloud data.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To use Wave templated apps:

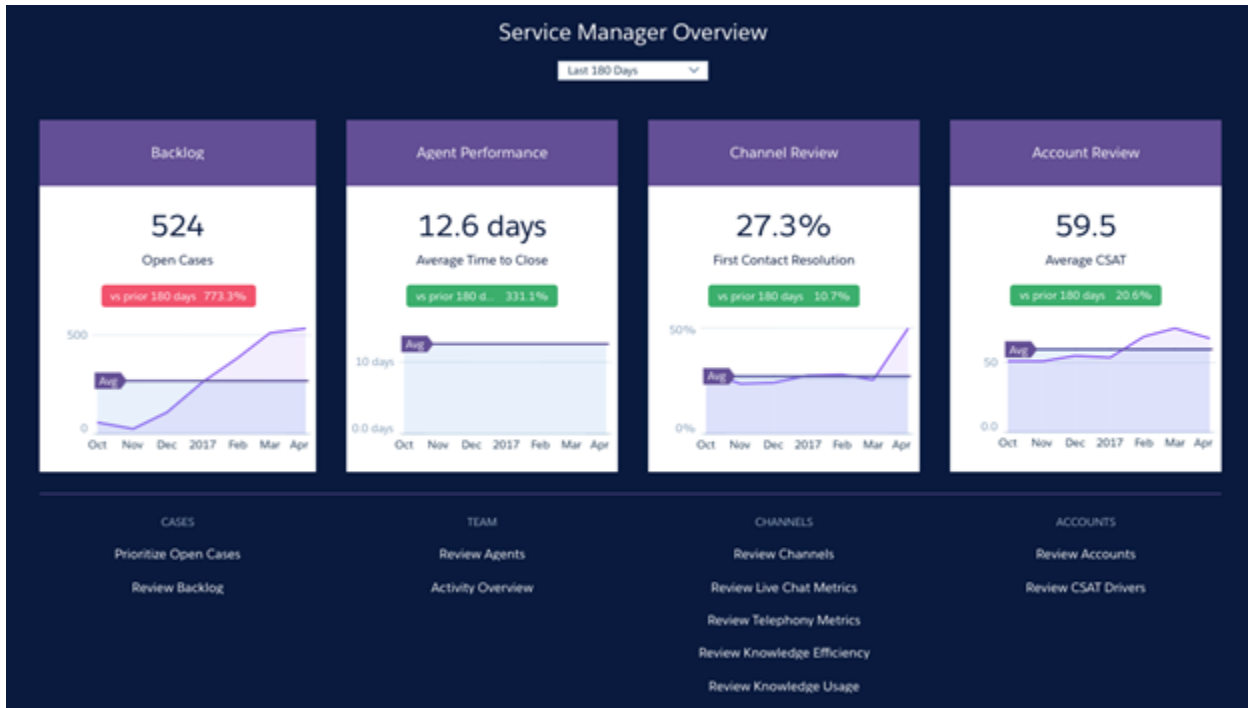

- "Use Wave Analytics Templated Apps"

To use Service Wave:

- "Access Service Cloud Analytics Templates and Apps"

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Service Wave Analytics gives you best-practice key performance indicators (KPIs) about your Salesforce service data in a single place. We've based the app's dashboards on learnings from many years of helping businesses manage customer relationships. The goal is to provide the right amount of information at the right time to help both managers and agents make the right decision.

Service managers get a complete view of service customer data that includes trending as well as historical and peer benchmarks. Agents can quickly view a snapshot of each case and customer to help them make quick decisions about their next customer interactions.

We've done a lot of the hard work: Our team has built complex queries, formulas, and ratios that draw from your service and sales data and assembled them into easy-to-read visualizations. You just create the app: using a built-in configurator, answer a few questions about the data and fields you'd like to see, and Wave takes care of the rest. Once you've created the app, use its prebuilt datasets and dashboards to explore Service Cloud data from any device that supports Wave.

You get actionable insights fast from your data using the intuitive Wave interface. And you can drill deeper into key aspects of your business by customizing Service Wave around your needs.

 **Note:** Your organization can use Service Wave without Salesforce Wave Analytics platform by purchasing a Service Wave license. A Service Wave license is included with the Wave platform license.

Service Wave Analytics Prebuilt Dashboards and Datasets

The Service Wave Analytics app includes prebuilt dashboards and datasets to accelerate data exploration for both service managers and agents.

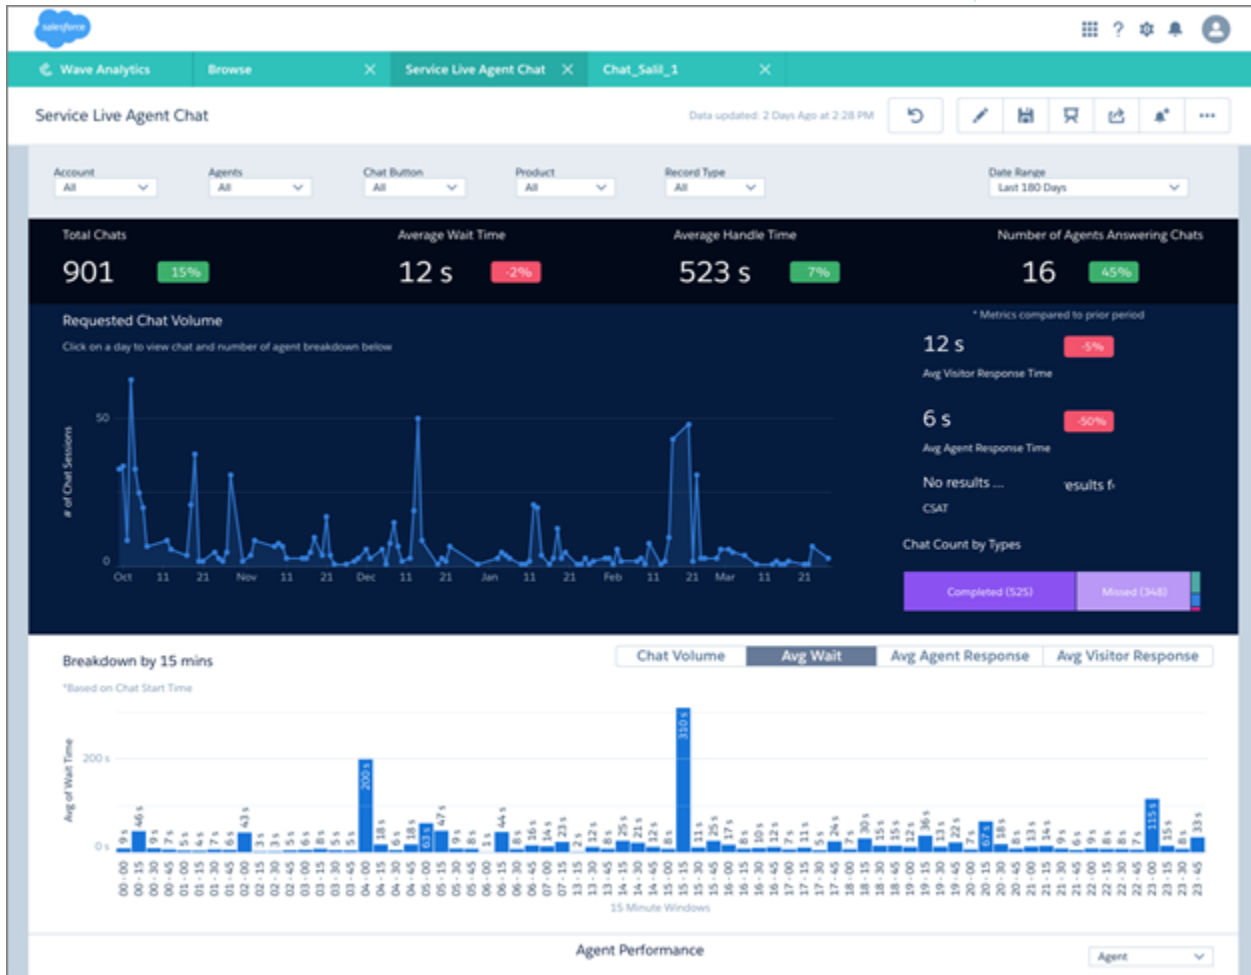

Note: The dashboards and datasets included in your instance of Service Wave Analytics can differ. The ones you see depend on how you answer configuration wizard questions when you create the app.

Service Wave Analytics Dashboards

The prebuilt dashboards in the Service Wave app contain best practices that help you get value from your Salesforce data—fast. The dashboards let you manage pipeline and forecast and understand key business performance drivers, visualize trends, assign actions. They also help you get fast answers to questions you have about business results.

USER PERMISSIONS

- To use Wave apps:
 - Use Wave Analytics Templated Apps
- To use Service Wave:
 - “Access Service Cloud Analytics Templates and Apps”
- To create and manage Wave apps:
 - Manage Wave Analytics Templated Apps
 - “Edit Wave Analytics Dataflows”

Dashboards available from the app provide a complete view of service customer data that includes all your key service performance indicators in one place. Managers can quickly view average case closing times, customer satisfaction, trending, and historical and peer benchmarks. They can also get insight into the teams' use of knowledge to resolve cases and other data so they can quickly take appropriate action.

Another set of dashboards -- called sidebars -- are specifically for service agents. Embed sidebars in a Salesforce page, such as the service console, to make them more accessible to agents during their day-to-day work. For a given case, an agent can view customer history, number of cases, and CSAT. Agents can also see previous customer actions and their result so they can find out what worked. The goal is to provide agents the right amount of information at the right time to help them take the right action.

The following table guides you through Service Wave dashboards. You can also explore further on your own at any point. To learn more about exploring data in Wave, see [Explore and Visualize Your Data](#) on page 4096.

Table 65: Service Wave Dashboards

Dashboard Name	Contents	Target User
Manager Overview (About Service Wave)	Start here. Summarizes key performance indicators (KPIs) from your Service Cloud, including open cases in the backlog, agent average time to close, and first contact resolution rate. Helps you gauge health of the business and surface issues requiring further investigation. Also, provides springboard to all other dashboards.	Service manager
Account Profile	Provides a full breakdown of a selected customer's service history and current backlog and includes customer satisfaction (CSAT) data and trends. If you track Opportunity data, you can also see pending and closed deals.	Service manager
Agent Activity	Helps determine how well agents use their time. Shows how much work agents do and how their work aligns with case-closing numbers and duration as well as CSAT.	Service manager
Agent Performance	Shows agent and team performance against key activity and customer satisfaction metrics. Performance trends and benchmarks on agent performance help you provide direction and drive agent success.	Service manager
Channel Review	Shows CSAT and activities—duration and volume—on cases by channel to help you monitor success of each channel.	Service manager
Backlog	Gives complete view of your backlog to show how efficiently your team resolves cases and how quickly your backlog is growing. Helps you prioritize and acquire/assign resources accordingly.	Service manager

Dashboard Name	Contents	Target User
Customer Satisfaction	Highlights CSAT measures so you can identify specific areas to improve the service experience. Indicates most/least satisfied customers and associates agents, products, and channels with CSAT.	Service manager
Knowledge Impact	Provides a view into how knowledge articles attached to cases impact CSAT and resolution time. See which agents used the most articles to determine who needs training/coaching in the use of knowledge to help resolve service issues	Service manager
Knowledge Use	Helps you understand how agents use knowledge articles to help you drive article creation. See which articles are attached the most and the least and which have the most views or votes (high ratings) over time.	Service manager
Live Agent Chat	Shows how your team uses chat to help solve support cases. Includes number of chats, days of the week with most activity, missed or abandoned chats, chat length, and average handle time.	Service manager
Omni	Gives managers insight into agent utilization based on Omni-Channel work record tracking. Includes incoming agent work volume, average speed to answer, average handle time, average active time, and other agent utilization metrics.	Service manager
Open Cases	Shows current open case workload to help you prioritize, investigate problematic cases, and view escalations and SLA compliance. Let's you prioritize cases by accounts and pending deals so you can take appropriate action.	Service manager
Telephony	Helps you understand the impact of telephone contact with customers during service case resolution. Filter call volume and duration by inbound or outbound call, the result of the call, and other factors. Also relates call volume to agent performance.	Service manager
Sidebar – By Customer	Provides a snapshot of customers, including the service products they're using, case reason, and priority. Also shows which	Service agent

Dashboard Name	Contents	Target User
	agents have helped customers and provides a CSAT overview.	
Sidebar – By Similarity	Shows a snapshot of historical data to help guide further customer interactions. Shows if there are other cases similar to the ones they're resolving. Helps agents identify potential product issues or candidates for creating knowledge and find agents who have worked similar cases.	Service agent
Sidebar – By Case History	Gives an overview of case history or lifecycle so agents can be more informed during customer conversations. Includes a snapshot of case interactions and duration of case against the average.	Service agent
My Performance Summary	Gives agents visibility to their own productivity so they're always aware of their results towards targets as tracked in Salesforce. Includes ranking within the support center, trends, and benchmarking so they're always prepared for meetings with managers and reviews. Typically results in higher agent satisfaction and performance and lower turnover rates.	Service agent

Service Wave Analytics Datasets

The table lists all the possible standard datasets that become part of Service Wave when you create the app.

Table 66: Service Wave Datasets

Dataset Name	Contents
Service Activity	Replaces Service Event and Service Task datasets used in Classic version of app. Data about events and tasks associated with cases, including last modified date and case duration. (Your Service Cloud data must include at least one event and one task for Service Wave dashboards to function correctly.)
Service Case	Data about cases, including duration, last modified date, and customer satisfaction measure.
Service Case History	Data about case history, including owner, type, and creation date.
Service Chat Transcript	One of two Service Wave datasets with data about your team's use of LiveAgent for chat. Includes data from Live Agent transcripts , such as response times, numbers of messages per chat, and chat duration.

Dataset Name	Contents
Service Chat Transcript Event	One of two Service Wave datasets with data about your team's use of LiveAgent for chat. Includes data about Live Agent events , such as if chats are accepted, queued, declined, or transferred.
Service Knowledge	Data about use of knowledge articles in cases, such as number of views, ratings, last referenced dates, and case associations.
Service Knowledge Attached	Data about attachment of knowledge articles to cases including whether articles are shared by email, article version number, and case type.
Service Omni Agent Work	One of two Service Wave datasets with data from Omni-Channel Agent Work object. Includes data that helps you track information about the assignments your agents work on, including the queue, channel, status, and speed to answer. (Your org must use Omni-Channel to create and route work items for Service Wave to create this dataset. You must also answer Yes to the configuration wizard question about Omni-Channel.)
Service Omni User Presence	One of two Service Wave datasets with data from Omni-Channel User Presence object. User presence records contain fields that help you track information about agent availability. (Your org must use Omni-Channel to create and route work items for Service Wave to create this dataset. You must also answer Yes to the configuration wizard question about Omni-Channel.)
Service Opportunities	Data about opportunities so you can filter cases by opportunity for prioritization and appropriate action.
Service Event <i>(Only in Classic version of app.)</i>	Data about events associated with cases, including last modified date and case duration. (Your Service Cloud data must include at least one event for Service Wave dashboards to function correctly.)
Service Task <i>(Only in Classic version of app.)</i>	Data about tasks associated with cases, including last modified date and case duration. (Your Service Cloud data must include at least one task for Service Wave dashboards to function correctly.)

Set Up Permissions for the Service Wave Analytics App

Set up your organization to use the Service Wave app by enabling Wave and creating and assigning permission sets.

Each Service Wave Analytics App license is a single-user license that provides access to Service Wave. It includes a single Service Wave app single-user license. The table shows data storage limits for the app. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

USER PERMISSIONS

To create and manage Wave apps:

- [Manage Wave Analytics Templated Apps](#)
- ["Edit Wave Analytics Dataflows"](#)

Table 67: Service Wave Data Storage Limits

License	Limit
Analytics Cloud - Service Wave Analytics App	25 million rows when used without Analytics Cloud - Wave Analytics Platform license. Use of Service Wave app license does not increase data limit for platform license.
Analytics Cloud - Additional Data Rows	100 million rows.

 **Important:** Service Wave Analytics App license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.

Your org can use the Service Wave Analytics app with or without the Salesforce Wave Analytics platform.

Each Service Wave user needs a Service Analytics Apps permission set license. The Service Analytics Apps permission set license enables the following permissions.

Table 68: Service Wave User Permissions

Permission	Function
"Use Wave Analytics Templated Apps"	Enables access to all Wave templated apps.
"Access Service Cloud Analytics Templates and Apps"	Provides specific access to the Service Wave Analytics app as well as the data and prebuilt dashboards included with it.
"Manage Wave Analytics Templated Apps"	Gives admins the ability to create Wave apps for users in their orgs, in this case the Service Wave Analytics app.
"Edit Wave Analytics Dataflows"	Enables admins to upload and download JSON for existing data flows.

You assign the Service Analytics Apps permission set license when you create and assign permission sets to users in your organization.

Service Wave App Setup Process

To set up your organization to use Service Wave, follow these steps:

1. Enable Wave for your organization.
2. Define the main Service Wave user types in your organization.
3. Create permission sets to group related user permissions according to the needs of each user type.
When you create permission sets, you also select the Service Analytics Apps permission set license.
4. Assign a permission set to an individual user, which also *auto-assigns* the Service Analytics Apps permission set license to that user.
For efficiency, you can assign a permission set to groups of users. You can assign multiple permission sets to a user.

After you've completed these steps, create and share Service Wave with the users in your organization. Users can only explore Service Wave dashboards and datasets after you've shared the app with them.

 **Tip:** For best results, follow the steps for setting up the Service Wave app in the order shown here.

1. [Identify Service Wave Analytics App User Types](#)

Identify Service Wave Analytics user types and the tasks they perform to assure that the setup process meets your team's analytics needs.

2. [Enable Wave Analytics and Create Service Wave Analytics Permission Sets](#)

After Salesforce provisions you with the Service Wave Analytics App license, enable Wave and create permission sets for Service Wave Analytics users.

3. [Assign Service Wave Analytics Permission Sets to Users](#)

Assign permission sets to one or more Service Wave Analytics users—either one at a time, or in bulk—to give them access to the app.

Identify Service Wave Analytics App User Types

Identify Service Wave Analytics user types and the tasks they perform to assure that the setup process meets your team's analytics needs.

The Service Wave Analytics App license includes the permissions required by users in your organization to administer Service Wave and to import, work with, and explore data. Set up the Service Wave in the most useful way by thinking through the ways people access features and categorizing users into types. Here are a few examples.

In most cases, Service Wave Analytics addresses the needs of two basic types of people on your team:

- Users, who view Service Wave dashboards and datasets.
- Administrators or managers, who access all Service Wave functionality to create apps, dashboards, and datasets, import data, and otherwise customize the Service Wave experience.

Accordingly, when you set up Service Wave, creating two basic permission sets probably meets the needs of most users in your organization:

- A “view” permission set that contains the permissions needed by most basic-level users when they access Service Wave.
- A “manage” permission set that's reserved for a select few administrators and managers and contains permissions to use all Service Wave features.

In the detailed Service Wave app setup instructions that follow, we show you how to create and assign these two permission sets.

Enable Wave Analytics and Create Service Wave Analytics Permission Sets

After Salesforce provisions you with the Service Wave Analytics App license, enable Wave and create permission sets for Service Wave Analytics users.

Enable the Wave Platform

To use Service Wave, first enable Wave Analytics for your organization.

1. In the Salesforce Setup menu, under administer, click **Analytics Cloud | Getting Started**
2. Click **Enable Analytics**

Create Permission Sets

The next step in the setup process is to create permission sets made up of Service Wave user permissions. We show you how to create two permission sets:

- *Manage Service Wave* permission set, for users who create and administer Service Wave.
 - *View Service Wave* permission set, for users who explore app dashboards and datasets.
1. Create a Manage Service Wave permission set, which gives users access to all app features.
 - a. In the Setup menu, under administer, click **Manage Users | Permission Sets** and then click **New**.

USER PERMISSIONS

To create permission sets:

- “Manage Profiles and Permission Sets”

- b. Enter `Manage Service Wave` in the Label field, which automatically creates the API name, as well. You can change the API name, but it can't include spaces, end with an underscore, or have two consecutive underscores. You can also enter a description, but it's optional.
- c. Select the permission set license to associate with this permission set by using the License drop-down option. In this case, select `Service Analytics Apps` in the Permission Set License section.

Enter permission set information

Label

API Name

Description

Session Activation Required [i](#)

Select the type of users who will use this permission set

Who will use this permission set?

-Choose "--None--" if you plan to assign this permission set to multiple users with different user and permission set licenses.
 -Choose a specific user license if you want users with only one license type to use this permission set.
 -Choose a specific permission set license if you want this permission set license auto-assigned with the permission set.

Not sure what a permission set license is? [Learn more here.](#)

Licenses

- XOrg Proxy User
- Permission Set Licenses
- Analytics Cloud - Wave Analytics Platform
- Analytics Cloud Explorer
- Field Service Dispatcher
- Field Service Mobile
- Field Service Scheduling
- Field Service Standard
- Identity Connect
- Orders Platform
- Sales Analytics Apps
- Sales Console User
- Service Analytics Apps**

If you select a specific permission set license, any user assigned to the permission set is *auto-assigned* the permission set license. If you leave the default of --None--, you must *manually* assign the permission set license to users before you can add them to the new permission set.

- d. Click **Save**. The Permission Set Overview page shows the new permission set. Now add user permissions to the set.
 - e. Click **System Permissions** to open the list of user permissions enabled by the Service Wave license. Then click **Edit**.
 - f. Select the following user permissions: "Use Wave Analytics Templated Apps," "Access Service Cloud Analytics Templates and Apps," "Manage Wave Analytics Templated Apps," and "Edit Wave Analytics Dataflows." Make sure to select all four. Click **Save**. You've successfully created a permission set that enables users to create and administer Service Wave and access all app features. You can now assign it to users, which is covered in [Assign Service Wave Analytics Permission Sets to Users](#).
2. To create a View Service Wave permission set, which enables users to view app dashboards and datasets, repeat the steps to create a Manage Service Wave permission set, with these exceptions:
 - a. Name the permission set `View Service Wave`.
 - b. Select only the "Use Wave Analytics Templated Apps" and "Access Service Cloud Analytics Templates and Apps" user permissions and click **Save**. You've successfully created a permission set that enables users to view the Service Wave dashboards and datasets. You can now assign it to users, which is covered in [Assign Service Wave Analytics Permission Sets to Users](#).

You can build other permission sets out of the individual permissions enabled by the Service Wave Analytics App license, depending on the needs of users in your organization.

Assign Service Wave Analytics Permission Sets to Users

Assign permission sets to one or more Service Wave Analytics users—either one at a time, or in bulk—to give them access to the app.

1. In the Setup menu, under administer, click **Manage Users | Permission Sets**.
2.  **Warning:** Assign the Manage Service Wave permission set sparingly because it lets users administer Service Wave, which lets them create, edit, and delete the app. Assign it only to users who administer or manage the app.

Click the permission set you want to assign to users. If you've followed the instructions in [Enable Wave Analytics and Create Service Wave Permission Sets](#) on page 4314, select either the Manage Service Wave or View Service Wave permission sets.

3. Click **Manage Assignments** and click **Add Assignments**.
4. Select the users who need to manage or use Service Wave, and click **Done**.

When you assign the permission set to users, Salesforce *auto-assigns* the Service Analytics Apps *permission set license* to those users.

After you've completed these steps, create and share Service Wave with the users in your organization. Users can only explore Service Wavedashboards and datasets after you've shared the app with them.

USER PERMISSIONS

To assign a permission set to users:

- "Assign Permission Sets"

Create and Share the Service Wave Analytics App

Follow these steps to create the Service Wave Analytics and start uncovering the value of your Salesforce data—fast.

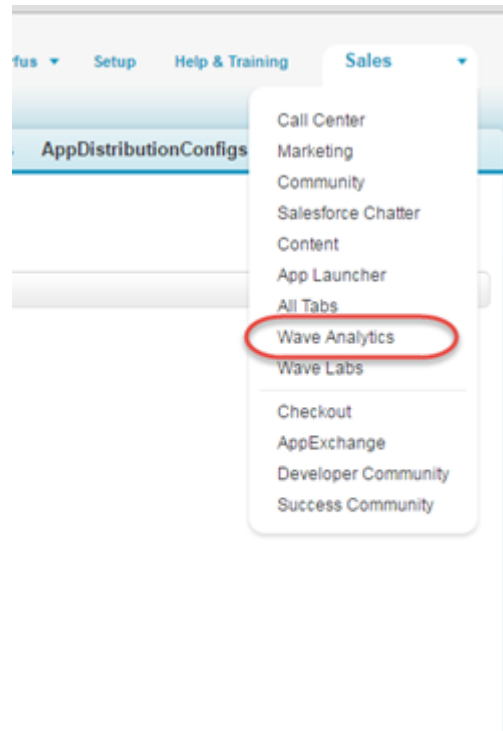

Use the built-in configuration wizard to create the Service Wave app to reflect the way you like to view your Service Cloud data.

1. Log in to Salesforce.
2. Set [Salesforce field-level security](#) on page 542 to enable the Wave Analytics Cloud Integration User to see all fields you'd like your app to use. Integration users run the dataflow, and if they don't have proper field-level security permissions, the dataflow can fail.
 - a. Go to Setup and enter the name of an object—for example, Accounts or Cases—in the Quick Find box and hit Enter.
 - b. Click the name of the object.
 - c. The next window shows all the fields for the object. Go to the one(s) where you need to edit field-level security.
 - d. Look for the Analytics Cloud Integration User, check the box(es) for the required fields under Visible, and click Save.
 - e. Repeat the Steps a through d for all objects with fields you want to use.
 - f. Refresh your browser cache.
3. Select **Wave Analytics** from the Force.com menu (top right of the Salesforce window).

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

4. Click **Create**, select **App**, select **Service Wave Analytics**, and then click **Continue**. Salesforce opens the Service Wave configuration wizard. The wizard presents a series of screens, each with a set of questions and their possible answers in pull-down menus. Service Wave checks the data in your org and builds the questions and default answers in the configuration wizard.
 - ❗ **Important:** Service Wave requires that your org has at least one closed case and one task. If you see an error message, add the data specified in the message to Salesforce, then repeat steps 1–3, and refresh your browser cache.
 - 💡 **Tip:** The original version of Service Wave is also known as Service Wave Analytics (Classic). Select that template to create an app with the previous set of dashboards based on the original dashboard designer.
5. Answer the wizard questions according to how your company prefers to view data. For more information about how to answer these questions, see [Personalize Service Wave Analytics with the Configuration Wizard](#).
6. Go to the last wizard question, which gives you the option of having Wave check to see if data in your org supports the answers you select. We recommend that you answer Yes and run the check, because app creation fails if your org doesn't contain the right data. Wave displays an error message that tells you what to do if required data is missing. Make any required changes in Salesforce, refresh your browser cache, and come back to the wizard and finish creating your app.
7. Give your app a name that's easily recognizable to others in your company.
8. Click **Create**. That starts a dataflow that creates the app and its assets (which include a [dataflow](#) definition file, datasets, and dashboards).
9. The app creation process can take a few minutes. You can check the status of the dataflow: Open the Wave Home page, click the gear menu at the upper right of the page, and select Data Monitor. Then select Dataflow View in the pulldown at the upper left and look for your app.
10. If you'd like to change your answers after looking at the dashboards, click the Reset app link on the left side of the app home page. The reset feature is available only after you've upgraded to the latest version of an app. See [Upgrade the Service Wave Analytics App](#).

Clicking **Reset app** opens the configuration wizard showing the answers you chose when you created the app. Choose new answers, and click Reset on the last page of the wizard. Your app is created again using your new settings. If you deleted dashboards and want to restore them, you can also use the reset feature.

Important: Resetting your app gets rid of any dashboard customizations. That includes fields or objects added to the dataflow, actions you enable, or changes to security settings and dashboard colors and labels. If you've made any customizations, we recommend that you save copies of your dataflow definition file or dashboards. That way, you can copy them into your app if you reset it.

11. You can also delete your app and start the app creation process all over again. To delete, position your cursor over the icon for the app and click Delete. Then click Yes to confirm deletion of all the assets associated with the app.

Note: If you delete your app, Wave doesn't retain the answers you selected when you created that version of the app, and you have to start the configuration wizard process again. If you wish to reuse the answers you selected, keep the app until you've completed recreating the app and then delete it.

12. Now that you've created the app, share it with users in your organization. You can only share it with users who have the Use Wave Analytics Templated Apps and "Access Service Cloud Analytics Templates and Apps" permissions enabled. (For more about Service Wave app permissions, see [Set Up Permissions for the Service Wave Analytics App](#)). To share the app, roll your cursor over the icon for the app and click **Share**. Next, type in the names of team members, click **Add**, and click **Save**.

Taking a few extra steps can make Service Wave better serve the needs of your organization:

- [Embed the sidebar dashboards](#) on page 4325 in a Salesforce page of your choice, such as the service console. This step provides a seamless analytics experience for service agents. Embedding sidebars in pages used regularly by agents gives them access to key metrics as part of their regular work to help them take the most effective customer action.
- Add datasets to the app based on Salesforce data using the [Wave dataset builder](#) on page 4022. Service Wave includes a default set of datasets based on your Salesforce data. Creating additional datasets lets your service managers and view other Salesforce data through the app.

 **Note:** Service Wave does not support data sources external to Salesforce or registering new datasets from the app-generated dataflow.

- Add objects, fields, and filters to Service Wave. [Edit the app's dataflow](#) on page 3952 to include standard and custom objects and fields from Salesforce. For complete instructions about adding data to Wave, see [Wave Analytics Data Integration](#).

 **Note:** To create new datasets with just the Service Wave app license, use the [Wave dataset builder](#). Wave associates new datasets created using the builder with the Wave default dataflow. If you edit the dataflow for the Service Wave app to register new datasets, you can't access the resulting datasets.

Personalize Service Wave Analytics with the Configuration Wizard

Create Service Wave Analytics with the configuration wizard so the app reflects how your company prefers to view Service Cloud data.

When you create Service Wave Analytics, the built-in configuration wizard checks the data in your org and builds a series of questions and default answers based on that data. Depending on your data, you may not see all the questions described here and some may contain different default answers.

Your answers let Service Wave know how you want users to view your Service Cloud data in the app's dashboards. Answer these questions according to the way your organization uses Service Cloud data so the dashboards are as meaningful and useful as possible.

The wizard includes instructions to help you choose appropriate answers, and many questions are self-explanatory. Here are tips for how to use the wizard, including details about how to answer more complex questions.

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

General Guidelines

Following these guidelines can help you get a great result when you use the wizard.

- **Most questions provide answers in pick lists of fields from Salesforce objects.** The lists include standard Salesforce fields and custom fields you've set up on an object. Answer these questions by selecting from the fields shown. Most questions of this type let you choose only one field, and some let you choose multiple fields.
- **You can choose a field from an object only once.** After you select a field, it's no longer available as an answer to other questions.
- **Other questions are yes/no (Boolean), provide a set of options, or require you to enter text.**
- **Questions marked with an asterisk (*) require answers.**
- **Default answers result in a useful set of dashboards.** If you're not sure what to select, use the answer that's preselected. Some questions do not have preselected answers. In those cases, Service Wave reminds you to make a selection.

- **You can only control parts of the app with wizard settings, such as filters and widgets.** We built the app to provide immediate analytics value without much work on your part.
- **Only some answers make sense given the question's context.** The questions often contain many fields, but only some make sense for your app. For example, it's unlikely that you'd filter Accounts data by Photo URL, even though the Accounts object includes a Photo URL field.

Page 1: Determine How Service Wave Displays Case Metrics

Choose the metrics that are important to your organization about the duration of cases, such as how quickly they're resolved and if they're resolved within the bounds of any service level agreement (SLA). All are mandatory and allow you to make only a single selection, except the following:

- Question 1, optional: Asks you to indicate the primary field you use in Salesforce to track case duration, if any. If you don't track case duration, Service Wave uses its own formula to calculate case duration based on the date a case was opened and closed. If the case is still open, it uses today's date as part of the calculation. Allows only a single selection. If you use the Business Hours field in the Cases object, Service Wave can include a business hours case duration calculation. See the question about business hours on Page 3 of the wizard.
- Question 2, optional: Asks if you use other (secondary) fields related to case duration. You can select multiple fields, for example, *Duration with customer* or *Duration with agent*.
- Question 3: Asks you to select the field you use to track SLA compliance. Typically, you would track SLA compliance with a custom formula field on the Cases object or the standard Milestone Status field. (Milestone Status field values include compliant, open violation, and closed Violation). If you track SLA compliance using a Boolean custom formula field, you can't select that field from the wizard. In that case, do the following: Select any field and then manually edit the dataflow to include the Boolean field (see [Configure the Dataflow](#)). Then, find and replace the field name in Service Wave dashboard JSON (see [Wave Analytics Dashboard JSON Guide](#)).
- Question 4: Asks you to select the field you use to record that a case is resolved on first contact. You would typically track first contact resolution using a Boolean custom formula field on the Cases object or the standard Closed when Created (IsClosedOnCreate) field.

Page 2: Control How the App Drills Into Your Data

Tell Service Wave how you prefer to drill down into data about the status, severity, owner, reason, and type of cases. Also choose how Service Wave displays data about service cases' channels of origin and if they're resolved at first contact. All questions are mandatory and let you select only a single answer, except the following:

- Question 11: Asks if you use queues to assign case ownership. Answer Yes only if you have a queue in your Service Cloud org and have at least one case attached to the queue.
 -  **Important:** If you answer Yes and you do not have queues and a case attached to the queue, Service Wave creation fails. The optional data check you can run at the end of the wizard returns an error message if you answer Yes and don't use queues.
- Question 12, optional: Select measure fields from the Cases object not addressed in previous questions so your dashboards drill into measures that are important to your organization. Measures are quantitative values like case resolution time, number of open and closed cases, and revenue.
- Question 13, optional: Select dimension fields from the Cases object not addressed in previous questions so your dashboards drill into dimensions that are important to your organization. Dimensions are qualitative values, such as date, region, and product name.

Page 3: Select Report Areas

Choose the areas of service data you want Service Wave dashboards to report on. These might include customer satisfaction (CSAT), use of knowledge resources and telephony, and whether cases are attached to sales opportunities. All questions are mandatory and let you make only a single selection.

- Question 2: Asks if you track CSAT score. If you answer Yes, the wizard presents a page of questions about how you track CSAT. See Page Four: Set Up CSAT Metrics.
- Question 3: Asks if you use knowledge resources in the support process. If you answer Yes, the wizard presents a page of questions about how you use knowledge. See Page Five: Set Up Knowledge Data.
 - ❗ **Important:** If your Service Cloud org does not use knowledge and you answer Yes, Service Wave creation fails. The optional data check you can run at the end of the wizard returns an error message if you answer Yes and don't use knowledge.
- Question 4: Asks about use of telephony in the support process. If you answer Yes, Service Wave creates a dashboard related to telephony.
 - ❗ **Important:** You must track telephone usage data on the Task object for Service Wave to successfully create a telephony dashboard. Your org must have telephony data in standard activity fields on the Task object, such as call duration, call object identifier, call result, and call type. Answer Yes if you store call data in these fields. Answer No if you store call data in custom objects or outside Salesforce. If your Service Cloud org does not track telephone usage data and you answer Yes, Service Wave creation fails. The optional data check you can run at the end of the wizard returns an error message if you answer Yes and don't use telephony.
- Question 7: Asks if you use the Event object to track case activity. Select Yes if your org uses the Event object, and Service Wave adds data from the object to datasets. Defaults to No.
 - ❗ **Important:** If your Service Cloud org does not use events and you answer Yes, Service Wave creation fails. The optional data check you can run at the end of the wizard returns an error message if you answer Yes and don't use events.
- Question 8: Asks if you use business hours to calculate case durations. Select Yes if your org uses the Business Hours field, and Service Wave adds a business hours case duration calculation to datasets. Defaults to "No, need business hours visibility" if the Analytics Cloud Integration User profile does not enable visibility to Business Hours. If that's the case and you use Business Hours, edit field-level security to provide the correct visibility for the Business Hours field on the Cases object, as described in [Create and Share the Service Wave Analytics App](#) on page 4316. After doing that, the next time you run the wizard you'll be able to select Yes to add the business hours calculation to Service Wave datasets.
 - ❗ **Important:** If your Service Cloud org does not use business hours and you answer Yes, Service Wave creation fails. The optional data check you can run at the end of the wizard returns an error message if you answer Yes and don't use business hours.
- Question 9: Asks if you use Live Agent for chat. Select Yes if your company uses LiveAgent, and Service Wave adds a chat dashboard.
 - ❗ **Important:** If you do not use Live Agent and you answer Yes, Service Wave creation fails.
- Question 10: Asks if you use Omni-Channel to create and route work items. Select Yes if your company uses Omni-Channel, and Service Wave adds datasets with Omni-Channel data.
 - ❗ **Important:** If you do not use Omni-Channel and you answer Yes, Service Wave creation fails.

Page 4: Set Up CSAT Metrics (Optional)

Tell Service Wave how you track CSAT so that information is surfaced correctly in dashboards. You see this page—and must answer its questions—only if you answer Yes to Question 1 on Page 3. Follow these instructions carefully to assure success. See [Setup Service Wave Analytics CSAT Metrics Example](#) for detail.

- Question 1: Asks which object you use to track CSAT. Service Wave defaults to the Cases object. If you use a different object to track CSAT, select it from the pick list.
- Question 2: Asks you to select the field from the object selected in Question 1 you use to track CSAT.

- Question 3, optional: *Answer only if you select an object other than Cases in Question 1.* Service Wave has to create a join between that object and Cases for you to see CSAT data in dashboards. (For an example join, see [Setup Service Wave Analytics CSAT Metrics Example](#).) Enter the API name the field where you store case identification information. Usually, that's the 'Id' field, in which case you enter `Id`.

If it's a field other than Id, find the API name for the field. Go to Setup—>Cases—>Fields. In the top chart showing standard fields, the API name is shown in the field name column. For example `IsSelfServiceClosed` is the API name for the Closed by Self-Service User field. The chart further down for custom fields includes an API Name column.

- Question 4, optional: *Answer only if you select an object other than Cases in Question 1.* Determine which field from the object selected in Question 2 to use for the other side of the join with the Cases object. Use the field that contains the case ID. Enter the API name for the field here.

To find the API name for the field, go to Setup-->AnyObject-->Fields. In the top chart showing standard fields, the API name is shown in the Field Name column. The chart further down for custom fields includes an API Name column.

Page 5: Set Up Knowledge Data (Optional)

You see this page, and must answer its questions, only if you answer Yes to Question 2 on Page 3. Asks how you'd like Service Wave to surface data about knowledge articles in dashboards.

- Question 1, optional: Asks about the article type you want to see data about in Service Wave dashboards. Choose only a single article type.

Page 6: Check Your Org's Data

Go to the last wizard question, which gives you the option of having Wave check to see if data in your org supports the answers you select. We recommend that you answer Yes and run the check, because app creation fails if your org doesn't contain the right data. Wave displays an error message that tells you what to do if required data is missing. Make any required changes in Salesforce, refresh your browser cache, and come back to the wizard and finish creating your app.

Setup Service Wave Analytics CSAT Metrics Example

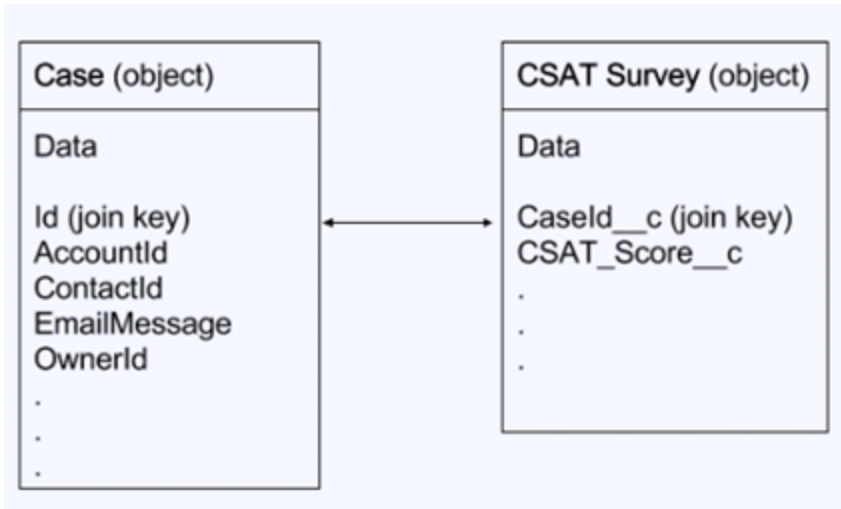

This scenario provides detail to help you answer the questions on Page 4 of the Service Wave Analytics configuration wizard.

If you track customer satisfaction (CSAT) data, such as the CSAT score for a service case, in an object other than Cases, take particular care in how you answer the questions on this page.

For example, if you store the CSAT score in a custom object, for example "CSAT Survey", select this object in question 1. In Question 2, specify the field that has the CSAT metric you would like to report, for example "CSAT Score." Service Wave needs to relate the custom object specified in Question 1 to the Cases object so dashboards can include data about cases, accounts, and agents by CSAT. This relationship is created through a join.

To specify the relationship between the Cases object and your custom CSAT object, designate join keys from both objects and enter their API names in Questions 3 and 4. On the Cases object, this will typically be the "Id" field. On the example custom object "CSAT Survey," this is the custom field that stores the case ID, which in this scenario is the field with the API name `CaseId__c`.

The following diagram shows the join between the two objects.

Upgrade the Service Wave AnalyticsApp

Take advantage of the latest Service Wave Analytics features by upgrading your app every time we release a new version.

The banner at the top of your app home page tells you that we've released a new version. It also provides a link to more information about the release. There's also a link inviting you to start the upgrade process in the left-hand column of the home page, just below the app name.

Here's how to upgrade your app.

1. Click either the "What's new" link in the banner or the "New version available" link in the left-hand column of your app's home page.
2. You can read information about the new version on top of the page that opens. At the bottom of the page, find the buttons: **Upgrade current app** and **Create new app**.
3. See descriptions of what the buttons do by hovering over them. If you click **Upgrade current app**, you overwrite your current app and all its assets, replacing it with an app based on the new version. Upgrading also deletes any customizations, including any new fields or object that you've added to the dataflow or changes you've made to security settings and dashboard labels and colors. If you click **Create new app**, you create a second copy of your current app based on the new version. Decide which option suits your circumstances, and click the appropriate button.
4.  **Warning:** If you've customized your app, click **Create new app** instead of **Upgrade current app** to make an app copy based on the new version. Creating a new app preserves the current version and any customizations, which you can then manually copy into the new version of the app.

If you click **Upgrade current app**, you see a screen warning you that the upgrade option overwrites the current app and gets rid of any customizations you've made. If you're OK with overwriting customizations, check the box and click **Continue**. If you're not, click **Back** to return to the previous screen. Clicking **Continue** takes you to the configuration wizard. Skip ahead to step 6.

5. If you click **Create new app**, you're taken to the configuration wizard. You don't see a warning, since you're not overwriting your current app, which is preserved with any customizations you've made to it.
6. The configuration wizard is preloaded with the settings you chose last time you used the wizard. You can either keep those settings or change them. Go through each page of the wizard.
7. Once you complete the wizard, Wave shows a screen that indicates which assets are impacted by the upgrade. Review the screen to see how many datasets, dashboards, and lenses will be changed, deleted, or added by the upgrade. It also shows how changed

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

assets will be modified—whether the change is to data or appearance. On the same screen, you have the option to download a file with code for changes made to the app. If you’ve customized the app, download and save the file so you can copy and paste customization code into the upgraded version.

8. *Upgrade option only:* If you’re upgrading your app, click **Upgrade current app**. Remember, this overwrites any customizations you’ve made. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.
9. *Create option only:* If you’re creating a new app, name your app something different from the current version and click **Create new app**. This option saves your current app and all its customizations. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.

If the link below the app name says “Reset app,” you’re using the latest version and don’t need to upgrade.

Schedule the Service Wave Analytics Daily Dataflow

Schedule a daily dataflow at a time outside standard business hours before you start exploring with Service Wave Analytics.

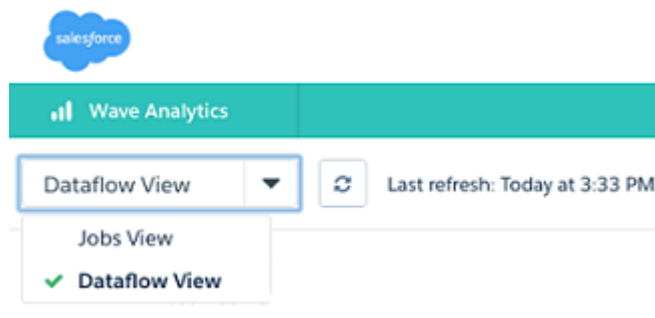

When you create Service Wave Analytics, the creation process includes a dataflow that imports the latest Service Cloud data to Wave. You can schedule the dataflow to be rerun every day to assure that your app uses up-to-date Salesforce data. Schedule the dataflow to take place sometime outside normal business hours so the dataflow doesn’t interrupt your use of the app.

 **Note:** The Service Wave dataflow runs only once when you create the app. Schedule it to run daily so the app uses the latest services data.

1. Go to **Wave Analytics** in the Force.com menu (top right of the Salesforce window) if you’re not already there. Open the Data Monitor by clicking the gear icon at the upper right of the screen.

2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

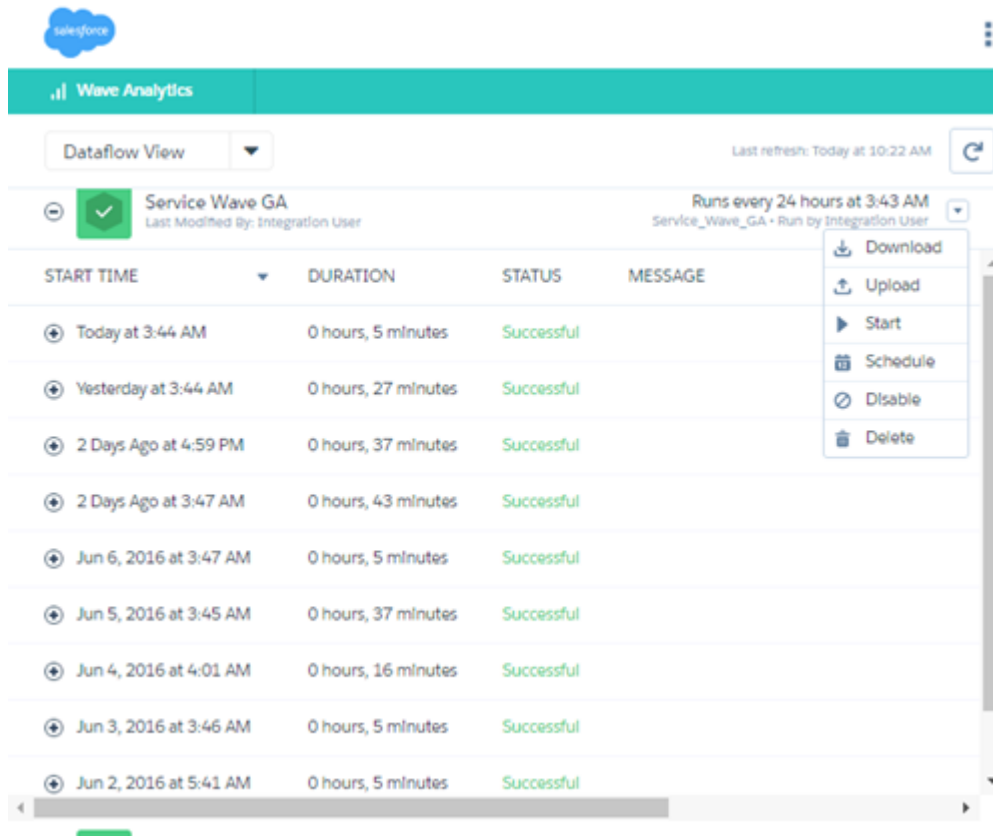

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

- Find the app you created; you may have to scroll down the page. Open the menu on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn't interrupt business activities. Click **Save**.

Embed Service Wave Analytics Sidebar Dashboards in a Salesforce Page

USER PERMISSIONS

To use Wave templated apps:	"Use Wave Analytics Templated Apps"
To use Service Wave:	"Access Service Cloud Analytics Templates and Apps"
To create and manage Wave apps:	"Manage Wave Analytics Templated Apps" "Edit Wave Analytics Dataflows"
To edit a dataset's extended metadata (XMD) file:	"Edit Wave Analytics Dataflows"
To create a Visualforce page	"Customize Application"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

Add Service Wave Analytics dashboards to Salesforce pages so your service team can get a complete view of their cases and take appropriate action.

Service Wave Analytics includes three specialized dashboards—called sidebars—to give service agents instant access to visualizations of data about their cases.

- The By Customer sidebar gives agents a snapshot of their customers, including products, case reasons and priority, and CSAT.
- The By Similarity sidebar shows data about previous cases so agents can guide customer interactions based on what they did in similar cases.
- The By Case History sidebar provides a quick view of the lifecycle of a case so agents can be informed during customer conversations.

Administrators can embed them in a Salesforce page so agents can access Service Wave seamlessly while they carry out their normal case work. For example, if your Salesforce makes the Service Cloud available through a service console, that's an ideal place to embed the sidebar dashboards. Here's how.

1. Create a Visualforce page for each sidebar. Go to Setup and enter Visualforce Pages in the Quick Find box, then select Visualforce Pages, and click New. Enter a label with the name of the sidebar and, optionally, a description.
2. Replace the text that appears when you open the editor with the following: `<apex:page standardController="case">
<wave:dashboard dashboardId="Your_dashboard_id" height="1000px" showTitle="false"
filter="Filter_condition" /></apex:page>`
 - a. Replace `Your_dashboard_ID` with the dashboard ID for the sidebar. You can find the dashboard ID by opening the sidebar in Service Wave; the ID is the last 15 characters of the URL for the sidebar.

Depending on which sidebar you're embedding, go to one of the following steps:

- **By Customer sidebar:** Go to Step 3.
 - **By Similarity sidebar:** Go to Step 4.
 - **By Case History sidebar:** Go to Step 5.
3. If you're creating a page for the By Customer sidebar, replace `filter="Filter_condition"` with one of the following, then skip to Step 6.
 - a. If you're embedding a sidebar dashboard from the Service Wave Analytics (Classic) app built with the old dashboard designer, use this syntax: `filter="{ 'ServiceCase1': { 'AccountId': ['{!case.AccountId}'] } }"`.
 - b. If you're using the latest version of Service Wave Analytics based on the new dashboard designer, use this syntax: `:filter="{ 'datasets' : { 'ServiceCase1': [{ 'fields': ['AccountId'], 'filter': { 'operator': 'in', 'values': '{!case.AccountId}' }] } }"`.

In both cases, replace `'ServiceCase1'` with the name of the Service Case dataset. To find the name, open a dashboard, hit **Command+e** to view the JSON for the dashboard, and search for `ServiceCase`. The name of the dataset is appended with a numeral that's incremented each time you create the app, such as `'ServiceCase2'`. Enter the entire dataset name including the numeral.

4. If you're creating a page for the By Similarity sidebar, replace `filter="Filter_condition"` with one of the following, then skip to Step 6.
 - a. If you're using Service Wave Analytics (Classic) with previous dashboards built with the old dashboard designer, use this syntax: `filter="{ 'ServiceCase': { 'Reason': ['{!case.Reason}'], 'Product__c': ['{!case.Product__c}'] } }"`.
 - b. If you use the latest version of Service Wave Analytics based on the new dashboard designer use this syntax: `filter="{ 'datasets' : { 'ServiceCase1': [{ 'fields': ['Reason'], 'filter': { 'operator': 'in', 'values': '{!case.Reason}' } }, { 'fields': ['Product__c'], 'filter': { 'operator': 'in', 'values': '{!case.Product__c}' } }] } }`.

In both cases, do the following.

- Replace `'ServiceCase1'` with the name of the Service Case dataset. See Step 3 to learn how to find the name.

- Replace `'Product__c'` with the API name of the custom field you use to track products. This field is the answer you selected in the configuration wizard, Page 2, Question 4. Find the API name of this field by going to Setup and typing `Cases` in the Quick Find box. Then click Fields and review your custom field names to find the field you use for products. Look for the API name of the field, and use that in place of `'Product__c'` in both places in the query.

 **Note:** If you use a custom field to track case reasons, replace `'Reason'` with the API name of your custom field. Find the API name using the same technique you use for finding the custom field you use to track products.

5. If you're creating a page for the By Case History sidebar, replace `filter="Filter_condition"` with one of the following, then skip to Step 6.

- a. If you're using Service Wave Analytics (Classic) with previous dashboards built with the old dashboard designer, use this syntax:

```
filter="{ 'ServiceCase1': { 'Id': [ '!case.Id' ], 'OwnerId' : [ '!case.OwnerId' ], 'Product__c' : [ '!case.Product__c' ], 'Reason' : [ '!case.Reason' ] } }"
```

Also do the following:

- Replace `'Product__c'` with the name of the custom field you use to track product family. See Step 4 to learn how to find the name of that field.
- Replace `'Reason'` with the API name of the field you use to track the case reason. This field is the answer you selected in the configuration wizard, Page 2, Question 5. Find the API name of this field by going to Setup and typing `Cases` in the Quick Find box. Then click Fields and review your custom field names to find the field you use for case reason. Look for the API name of the field, and use that in place of `'Reason'` in the query

- b. If you're using the latest version of Service Wave Analytics based on the new dashboard designer use this syntax:

```
filter="{ 'datasets' : { 'ServiceCase1': [ { 'fields': ['Id'], 'filter': { 'operator': 'in', 'values': [ '!case.Id' ] } } ] } }"
```

In both cases, replace `'ServiceCase1'` with the name of the Service Case dataset. See Step 3 to learn how to find the name.

6. Save the page, and open it in preview mode to be sure it shows the dashboard.
7. Add the page to the console or whatever page you prefer in Salesforce. Through Setup, find the specific page layout you want to include the sidebar. For example, some customers use a page layout for information from the Cases object. In that case, enter `Cases` in the QuickFind box in Setup, then open Page Layouts under Cases, and look for the page layout you want to edit.
8. Click Edit Layout and select the **Custom Console Components** tab near the top. Go the Right Sidebar section and select one of the pages you just created. First, select Visual Force page from **Type**, then select the page you just created from the **Component** drop-down. Enter a label.
9. Set the width to 450px and save the layout. The sidebar should appear embedded in the page you just edited.
10. Repeat this step with the other two sidebars, as needed.

Understand Service Wave Analytics App Limitations

Service Wave Analytics requires that Service Cloud include specific data, initially supports a limited set of Salesforce objects, and has other miscellaneous limitations.

Service Wave Limitations

The following limitations apply to Service Wave.

Service Wave Data Requirements

Service Cloud data must include at least one each of the following for Service Wave dashboards to function correctly: Events, tasks, closed cases, or published articles attached to a case or an opportunity.

Custom formula fields on the Cases object must exist or be created for the SLA missed (text) and FCR (Boolean) fields.

Service Wave Support for Salesforce Objects and Fields

Service Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields. The app creates a dataflow that exposes selected fields from the following Salesforce objects:

- Account
- Cases
- Contact
- Events
- User
- UserRole
- Task

Service Wave also uses fields from the following options depending on the answers you select in the configuration wizard:

- CaseArticle
- CaseHistory
- CSAT (customer object)
- Group
- Single Knowledge article (custom object)
- RecordType
- Opportunity

Service Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Service Wave limits custom objects support to no more than 10 custom objects for each org that implements Service Wave. This limitation is contractual, not technical.

To add custom objects or extra fields not included when you first create the app, you must update the Service Wave dataflow. For details, see [Create Datasets with a Dataflow](#). For details, see [Create Datasets with a Dataflow](#)

More Service Wave Limitations

Service Wave does not support external data sources or registering new datasets from the app-generated dataflow.

Including CSAT score in dashboards/dataflow is optional. The app configuration wizard lets you associate CSAT from a custom case field or Custom Object associated to the Cases object.

You must manually add any security predicates or other dataset filters to the app dataflow.

The app does not support multi-hierarchy (team/manager) when you create it. You must manually add that functionality.

The Knowledge Usage dashboard currently reports on a single Article Type, which you select when you use the configuration wizard.

The Field Service Wave Analytics App

The Field Service Wave Analytics app brings the power of Wave Analytics to Field Service Lightning on any device that supports Wave.

With intuitive visualizations based on your field service data, Field Service Wave Analytics provides just-in-time analytics for field service managers and dispatchers. You get clear data insights to improve every on-site experience. Field Service Wave empowers managers with answers to help their technicians deliver personalized, actionable customer service.

 **Tip:** Follow the steps in the order shown to get started with Field Service Wave Analytics. If you haven't used Wave before, learn more about it from the [Wave Analytics Library](#).

1. [About the Field Service Wave Analytics App](#)
Learn the benefits of Field Service Wave Analytics before you create and use the app to help manage field service operations.
2. [Field Service Wave Analytics Prebuilt Dashboards](#)
The Fields Service Wave app includes prebuilt dashboards to accelerate Field Service Lightning data exploration.
3. [Set Up and Create the Field Service Wave Analytics App](#)
Set up Field Service Wave Analytics app permissions, make sure your org is enabled to use Field Service Lightning, and assign field level security correctly so you can create and share the app.

About the Field Service Wave Analytics App

Learn the benefits of Field Service Wave Analytics before you create and use the app to help manage field service operations.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To use Wave templated apps:

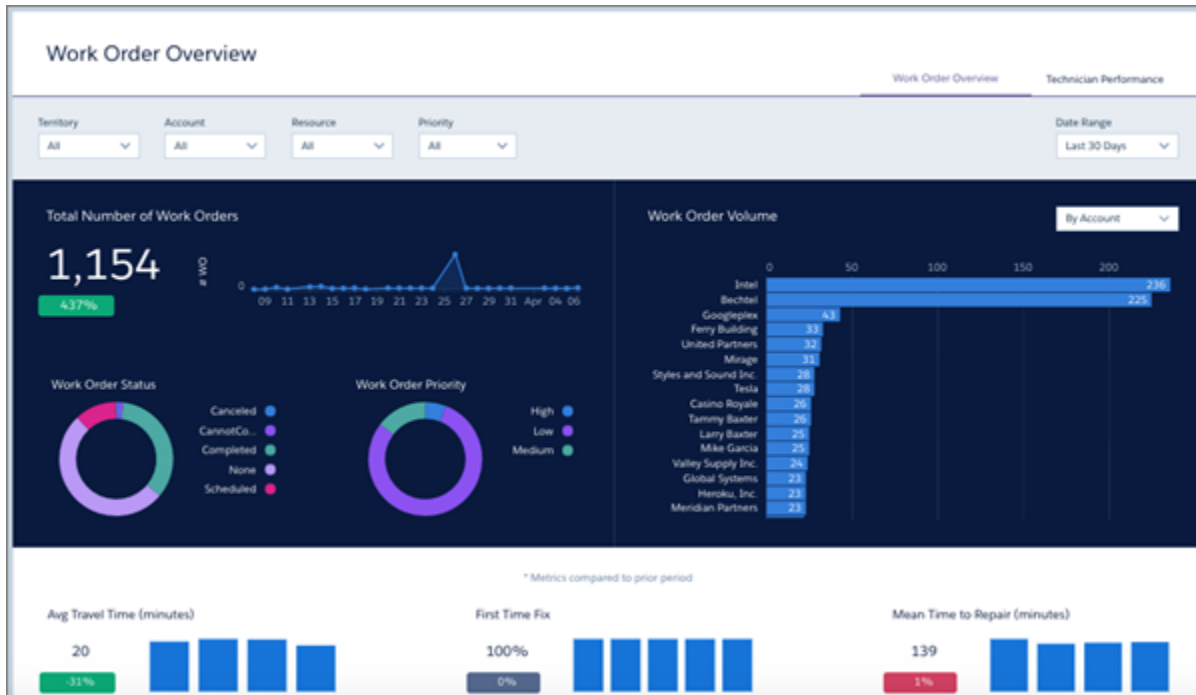

- "Use Wave Analytics Templated Apps"

To use Field Service Wave Analytics:

- "Access Service Cloud Analytics Templates and Apps"

To create and manage Wave apps:

- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Salesforce created the Field Service Wave Analytics app to help service managers analyze customer service data their teams generate when they use Field Service Lightning. The app is bundled with the Service Wave Analytics app.

Important: Your org must be enabled to use Field Service Lightning. Wave datasets are based on Field Service Lightning's new object model.

We've designed Field Service Wave to give you just-in-time analytics to optimize the outcome of your field service business. Service managers get a new level of insight into their field service data that they can use to maximize the efficiency of their technical service agents.

Using the app, service managers can access insights to improve every on-site service visit. You gain visibility into mobile workforce utilization, first-time-fix rate, and travel time. Problem detection lets you optimize field technician agent productivity. Performance analysis visualizations help your team prioritize and resolve work orders faster to improve customer satisfaction. Armed with actionable analytics, your agents can deliver personalized, effective customer service.

Wave automatically creates the app for you based on your Field Service Lightning data. Select the Field Service Wave Analytics template, click Create, and Wave does the rest. You get actionable insights fast from your field service data using the intuitive Wave interface. And you can drill deeper into key aspects of service engagements and technician performance by customizing Field Service Wave around your business needs.

Note: Your organization can use Field Service Wave with or without the Salesforce Wave Analytics platform by purchasing a Service Wave Analytics license. Each Salesforce Wave Analytics license includes a Service Wave Analytics license.

Field Service Wave Analytics Prebuilt Dashboards

The Fields Service Wave app includes prebuilt dashboards to accelerate Field Service Lightning data exploration.

USER PERMISSIONS

To use Wave apps:

- Use Wave Analytics Templated Apps

To use Field Service Wave Analytics:

- “Access Service Cloud Analytics Templates and Apps”

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

The prebuilt dashboards in the Fields Service Wave app contain key performance indicators that help you get value from your Salesforce field service data—fast. The dashboards help you understand key elements of customer service work order status and field team performance. You can prioritize customer service engagements, make technician utilization decisions, and quickly drill down to isolate problems and take action. Quickly review first-time fix rates, utilization, SLA compliance, and travel analysis. Start from a territory overview of all accounts, products, and teams and zoom into the technician and work order level.

The following table guides you through Field Service Wave dashboards. You can also explore further on your own at any point. To learn more about exploring data in Wave, see [Explore and Visualize Your Data](#).

Table 69: Field Service Wave Dashboards

Dashboard Name	Contents	Target User Role
Work Order Performance	Service managers start here for a summary of KPIs. Review work order volume, average work time, average travel times, and first-time fix rate. Also review technician agent data, including the number of work orders per technician, their planned and actual travel times, and utilization rates.	Service manager/dispatcher
Technician Performance	Focuses on each technician’s work order volume. Review agent-by-agent work order prioritization, travel time, first-time fix rates, mean time to repair, due date and SLA violations.	Service manager

Set Up and Create the Field Service Wave Analytics App

Set up Field Service Wave Analytics app permissions, make sure your org is enabled to use Field Service Lightning, and assign field level security correctly so you can create and share the app.

Set Up Field Service Wave Analytics App Permissions

The Service Wave Analytics license provides access to the Field Service Wave Analytics app. To set up permissions for Field Service Wave, follow the detailed instructions starting at [Set Up Permissions for the Service Wave Analytics App](#).

USER PERMISSIONS

To create and manage Wave apps:

- Manage Wave Analytics Templated Apps
- “Edit Wave Analytics Dataflows”

Make Sure That Field Service Lightning Is Enabled in Your Org

Important: Important: Your org must be enabled to use Field Service Lightning and its new standard object model to use Field Service Wave.

1. Go to Salesforce Setup.
2. Enter **Field Service** in the Quick Find/Search box. If **Field Service Settings** appears in Setup, click it.
3. In the center window, under Field Service Settings, check to see if the box for **Enable Field Service Lightning** is checked.

If you're unsure that your org is set up to use Field Service Lightning, contact your Salesforce representative.

Assign Field Level Security

Before you create Field Service Wave, set [Salesforce field-level security](#) to enable the Wave Analytics Cloud Integration User to see all fields you'd like your app to include. Integration users run the dataflow, and if they don't have proper field-level security permissions, the dataflow can fail. For instructions, see [Create and Share the Service Wave Analytics App](#), Step 2.

Create Field Service Wave

Once you've completed the previous setup processes, create Field Service Wave.

1. Go to Wave Analytics.
2. Click Create in the upper right corner.
3. Select the Field Service Wave Analytics template.
4. Name your app and click Create.

Wave creates your app. This may take a few minutes while Wave runs a new dataflow and creates the app's dashboards. Refresh your browser, and click the app you just created to see the dashboards.

Share Field Service Wave

Now that you've created the app, share it with users in your organization. You can only share it with users who have the Use Wave Analytics Templated Apps and "Access Service Cloud Templates and Apps" permissions enabled. To share the app, roll your cursor over the icon for the app and click **Share**. Next, type in the names of team members, click **Add**, and click **Save**.

Event Monitoring Wave App

The Event Monitoring Wave App integrates with event monitoring and setup audit trail data to give you insights into your user and org behavior.

 **Note:** As part of Event Monitoring, you also get the Event Monitoring Wave App. Use this app to upload and access only the data provided to you as part of your subscription. Please prevent your users from using the app to upload or access any other data. Salesforce sometimes monitors such usage. The Event Monitoring Wave App is available in English only. If you have an Analytics Cloud - Wave Analytics Platform license, you can access dashboards in the Event Monitoring Wave app.

The Event Monitoring Wave App is the first built-in way to explore your monitoring data in Salesforce. App creation is easy and with its prebuilt dashboards and datasets, you can start exploring right away. This app helps you drill into your org's data and swiftly identify suspicious behavior, slow page performance, and poor user adoption.

1. [Set Up Salesforce Permissions for the Event Monitoring Wave App](#)

Set up your org to use the Event Monitoring Wave App by enabling Wave, assigning permission set licenses, and then creating and assigning permission sets.

2. [Create and Share the Event Monitoring Wave App](#)

After you've enabled the correct permissions, the setup for the Event Monitoring Wave App is simple.

3. [Upgrade the Event Monitoring Wave App](#)

Take advantage of the latest Event Monitoring Wave features by upgrading your app every time we release a new version.

4. [Schedule the Event Monitoring Wave Daily Dataflow](#)

Schedule a daily dataflow before you start exploring with Event Monitoring Wave.

5. [Learn About Event Monitoring Wave App Prebuilt Dashboards](#)

The Event Monitoring Wave App comes with a set of prebuilt dashboards so you can start exploring your data right away. Data from your org is automatically loaded into your Event Monitoring Wave App datasets when it's generated.

6. [Get to Know Event Monitoring Wave App Terminology](#)

To make the best use of the Event Monitoring Wave App, it's helpful to understand the metrics and terms used in the app.

Set Up Salesforce Permissions for the Event Monitoring Wave App

Set up your org to use the Event Monitoring Wave App by enabling Wave, assigning permission set licenses, and then creating and assigning permission sets.

 **Note:** As part of Event Monitoring, you also get the Event Monitoring Wave App. Use this app to upload and access only the data provided to you as part of your subscription. Please prevent your users from using the app to upload or access any other data. Salesforce sometimes monitors such usage. The Event Monitoring Wave App is available in English only. If you have an Analytics Cloud - Wave Analytics Platform license, you can access dashboards in the Event Monitoring Wave app.

Each Event Monitoring Wave license provides access to Event Monitoring Wave to up to 10 users. The table shows data storage limits for the app. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To use the Event Monitoring Wave App:

- "Use Wave Analytics Templated Apps"

To create and manage Event Monitoring Wave Apps:

- "Access Event Monitoring Wave Templates and Apps"
- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

USER PERMISSIONS

To create and manage Event Monitoring Wave Apps:

- "Access Event Monitoring Wave Templates and Apps"
- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

Table 70: Event Monitoring Wave Data Storage Limits

License	Limit
Analytics Cloud - Event Monitoring Wave App	50 million rows when used without Analytics Cloud - Wave Analytics Platform license. Provides access to up to 10 users.
Analytics Cloud - Additional Data Rows	100 million rows.

 **Important:** Event Monitoring Wave App license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.

Event log file data is available for the past 30 days. If you have a Developer Edition org, it's available for the last 24 hours.

Your org can use the Event Monitoring Wave App with or without the Salesforce Wave Analytics platform. The Event Monitoring Wave app is available for free to any org with the paid Event Monitoring license. The Event Monitoring Wave App license enables the following permissions.

Table 71: Event Monitoring Wave User Permissions

Permission	Function
"Use Wave Analytics Templated Apps"	Enables access to all Wave templated apps, including the Event Monitoring Wave App.  Warning: This permission allows users to access event monitoring data without requiring the "View Event Log Files" and "API Enabled" user permissions. Use caution when assigning it.
"Access Event Monitoring Wave Templates and Apps"	Gives admins the ability to create Event Monitoring Wave apps.
"Manage Wave Analytics Templated Apps"	Gives admins the ability to create templated Wave apps for users in their orgs.
"Edit Wave Analytics Dataflows"	Enables admins to upload and download JSON for existing data flows.

Event Monitoring App Setup Process

For best results, follow the steps for setting up the Event Monitoring Wave app in the order shown.

1. [Event Monitoring Wave App Permission Set License and User Permissions](#)
The Event Monitoring Wave App permission set license enables the user permissions required to explore data with and manage the Event Monitoring Wave app.
2. [Identify Event Monitoring Wave App User Types](#)
Identify Event Monitoring Wave app user types and the tasks they perform to assure that the setup process meets your team's event monitoring analytics needs.
3. [Enable Wave Analytics and Event Monitoring and Assign Permission Set Licenses](#)
After Salesforce provisions you with the Event Monitoring Wave license, enable Wave and Event Monitoring and assign Event Monitoring Wave App permission set licenses.

4. [Create Event Monitoring Wave App Permission Sets and Assign Users to Them](#)

Give users in your organization access to Event Monitoring Wave features by creating and assigning one or more permission sets based on the capabilities they need.

Event Monitoring Wave App Permission Set License and User Permissions

The Event Monitoring Wave App permission set license enables the user permissions required to explore data with and manage the Event Monitoring Wave app.

Each Event Monitoring app user needs an Event Monitoring Wave App permission set license. The Event Monitoring Wave App permission set license enables the following permissions.

Table 72: Event Monitoring Wave App Permissions

User Permission	What It Enables
"Use Wave Analytics Templated Apps"	General access to all Wave templated apps, including the Event Monitoring Wave app.
"Access Event Monitoring Wave Templates and Apps"	The ability to create Event Monitoring Wave apps.
"Manage Wave Analytics Templated Apps"	The ability to create templated Wave apps for users in their orgs.
"Edit Wave Analytics Dataflows"	Editing, starting, stopping, and rescheduling the dataflow. Creating, editing, and running dataset recipes. Monitoring dataflow and system jobs in the data monitor. Use discretion when assigning this user permission because it enables access to all Salesforce object data to which the Integration User has access. See Salesforce Data Access in Wave Analytics .

Identify Event Monitoring Wave App User Types

Identify Event Monitoring Wave app user types and the tasks they perform to assure that the setup process meets your team's event monitoring analytics needs.

The Event Monitoring Wave license includes the permissions required by users in your organization to administer Event Monitoring Wave and explore event data. Set up the Event Monitoring Wave in the most useful way by thinking through the different ways people can access Event Monitoring Wave features and categorizing users into types. Here are a few examples.

In most cases, Event Monitoring Wave addresses the needs of two basic types of people on your team:

- Users, who view Event Monitoring Wave dashboards and datasets.
- Administrators or managers, who access all Event Monitoring Wave functionality to create apps, dashboards, and datasets, and otherwise customize the Event Monitoring app experience.

Accordingly, when you set up Event Monitoring Wave, creating two basic permission sets probably meets the needs of most users in your organization:

- A "view" permission set that contains the permissions needed by most basic-level users when they access Event Monitoring Wave.
- A "manage" permission set that's reserved for a select few administrators and managers and contains permissions to use all Event Monitoring Wave features.

In the detailed Event Monitoring Wave app setup instructions that follow, we show you how to create and assign these two permission sets.

Enable Wave Analytics and Event Monitoring and Assign Permission Set Licenses

After Salesforce provisions you with the Event Monitoring Wave license, enable Wave and Event Monitoring and assign Event Monitoring Wave App permission set licenses.

Enable the Wave Platform

1. In the Salesforce Setup menu, under administer, click **Analytics Cloud | Getting Started**.
2. Click **Enable Analytics**.

Enable Event Monitoring

1. In Setup, enter *Event* in the *Quick Find* box, then select **Event Monitoring Setup**.
2. Enable **Enable Event Log File Integration with Event Monitoring Wave App**.

Assign Permission Set Licenses

Next, assign a permission set license to each user in your org who needs to access the Event Monitoring Wave App.

1. In the Setup menu, click **Manage Users | Users**.
2. Click the name of a user you want to access Wave. You might want to start with User, Admin, or whatever name has been given to the system administrator.
3. Position the cursor over Permission Set License Assignments and click **Edit Assignments**.

4. Select the Event Monitoring Wave App Permission Set Licenses and click **Save**.

Important: Repeat these steps for every user in your org who requires access to the Event Monitoring app.

Create Event Monitoring Wave App Permission Sets and Assign Users to Them

Give users in your organization access to Event Monitoring Wave features by creating and assigning one or more permission sets based on the capabilities they need.

After assigning Event Monitoring Wave App permission set licenses to users, create permission sets made up of Event Monitoring Wave user permissions and assign them to users. You can create any permission sets you need to meet the needs of your users. We show you how to create two:

- *Manage Event Monitoring Wave* permission set, for users who create and administer Event Monitoring Wave.
- *View Event Monitoring Wave* permission set, for users who explore app dashboards and datasets.

Let's begin with the *Manage Event Monitoring Wave* permission set.

1. From Setup enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
2. Click **New**.

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

3. Enter `Manage Event Monitoring Wave` in the Label field. This automatically creates the API name, which you can change if you'd like.
 4.  **Warning:** Follow this step precisely or some users in your organization may not be able to access Event Monitoring Wave.
Select the permission set license to associate with this permission set by using the License drop-down option. For Event Monitoring Wave, *keep the default value --None--*.
 5. Select the feature permissions to enable for your permission set. Use `Find Settings...` to search for them quickly. Select "Use Wave Analytics Templated Apps," "Access Event Monitoring Wave Templates and Apps," "Manage Wave Analytics Templated Apps," and "Edit Wave Analytics Dataflows." Make sure to select all four.
 6. Click **Save**. You've successfully created a permission set that enables users to create and administer Event Monitoring Wave and access all app features. You can now assign it to users. See [Assign Permission Sets to a Single User](#).
-  **Warning:** Assign the Manage Event Monitoring Wave permission set sparingly because it lets users administer Event Monitoring Wave, which lets them create, edit, and delete the app. Assign it only to users who administer or manage the app.

To create *View Event Monitoring Wave* repeat the steps but use `View Event Monitoring Wave` in the Label field. Select only the "Use Wave Analytics Templated Apps" and "Access Event Monitoring Wave Templates and Apps" user permissions.

Create and Share the Event Monitoring Wave App

After you've enabled the correct permissions, the setup for the Event Monitoring Wave App is simple.

If you haven't enabled permissions and event log file integration, complete the steps in [Enable Wave Analytics and Event Monitoring and Assign Permission Set Licenses](#) on page 4337.

-  **Note:** Because event log files have a 24-hour generation period, you won't see your data in the app for the first day after you create it. The app includes some sample data so you can preview your dashboards in the meantime. Event log file data is available for the past 30 days. If you have a Developer Edition org, it's available for the last 24 hours.
1. Log in to Salesforce.
 2. Select Wave Analytics from the App Picker.
 3. Click **App**, select **Event Monitoring Wave App**, and then click **Continue**.
 4. Give your app a name.
 5. Click **Create**. The app creation process can take a while. You can check the progress by selecting **Data Monitor** from the gear menu at the top of the page. If any part of your app creation fails, you'll need to recreate the app.
 6. After your app is ready to go, you can share it with other users in your org. Remember that only users with the "Manage Wave Analytics Templated Apps" and "Access Event Monitoring Wave Templates and Apps" permissions can see the app. To share your app, hover your mouse over the app tile on the Wave Analytics home screen and click **Share**. You can also share from the app itself.

USER PERMISSIONS

To use the Event Monitoring Wave App:

- "Use Wave Analytics Templated Apps"

To create and manage Event Monitoring Wave Apps:

- "Access Event Monitoring Wave Templates and Apps"
- "Manage Wave Analytics Templated Apps"
- "Edit Wave Analytics Dataflows"

Upgrade the Event Monitoring Wave App

Take advantage of the latest Event Monitoring Wave features by upgrading your app every time we release a new version.

The banner at the top of your app home page tells you that we've released a new version. It also provides a link to more information about the release. There's also a link inviting you to start the upgrade process in the left-hand column of the home page, just below the app name.

Here's how to upgrade your app.

1. Click either the "What's new" link in the banner or the "New version available" link in the left-hand column of your app's home page.
2. You can read information about the new version on top of the page that opens. At the bottom of the page, find the buttons: **Upgrade current app** and **Create new app**.
3. See descriptions of what the buttons do by hovering over them. If you click **Upgrade current app**, you overwrite your current app and all its assets, replacing it with an app based on the new version. Upgrading also deletes any customizations, including any new fields or object that you've added to the dataflow or changes you've made to security settings and dashboard labels and colors. If you click **Create new app**, you create a second copy of your current app based on the new version. Decide which option suits your circumstances, and click the appropriate button.
4.  **Warning:** If you've customized your app, click **Create new app** instead of **Upgrade current app** to make an app copy based on the new version. Creating a new app preserves the current version and any customizations, which you can then manually copy into the new version of the app.

If you click **Upgrade current app**, you see a screen warning you that the upgrade option overwrites the current app and gets rid of any customizations you've made. If you're OK with overwriting customizations, check the box and click **Continue**. If you're not, click **Back** to return to the previous screen. Clicking **Continue** takes you to the configuration wizard. Skip ahead to step 6.

5. If you click **Create new app**, you're taken to the configuration wizard. You don't see a warning, since you're not overwriting your current app, which is preserved with any customizations you've made to it.
6. The configuration wizard is preloaded with the settings you chose last time you used the wizard. You can either keep those settings or change them. Go through each page of the wizard.
7. Once you complete the wizard, Wave shows a screen that indicates which assets are impacted by the upgrade. Review the screen to see how many datasets, dashboards, and lenses will be changed, deleted, or added by the upgrade. It also shows how changed assets will be modified—whether the change is to data or appearance. On the same screen, you have the option to download a file with code for changes made to the app. If you've customized the app, download and save the file so you can copy and paste customization code into the upgraded version.
8. *Upgrade option only:* If you're upgrading your app, click **Upgrade current app**. Remember, this overwrites any customizations you've made. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.
9. *Create option only:* If you're creating a new app, name your app something different from the current version and click **Create new app**. This option saves your current app and all its customizations. You can also click **Back** to go back into the configuration wizard and change your selections or click the **X** in the upper-right corner to cancel.

If the link below the app name says "Reset app," you're using the latest version and don't need to upgrade.

USER PERMISSIONS

To create and manage Event Monitoring Wave Apps:

- "Access Event Monitoring Wave Templates and Apps"
- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

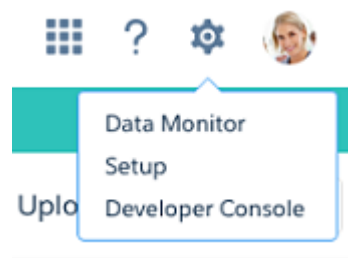

Schedule the Event Monitoring Wave Daily Dataflow

Schedule a daily dataflow before you start exploring with Event Monitoring Wave.

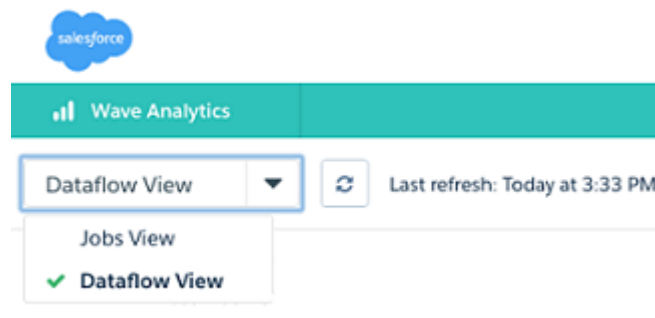

When you create Event Monitoring Wave, the creation process includes a dataflow that imports the latest Event Monitoring data to Wave. You can schedule the dataflow to be rerun every day to assure that your app uses up-to-date Salesforce data. Salesforce generates and uploads event log files in the early morning, usually at 6:00 AM. Schedule the dataflow for a couple of hours after so that the app has the latest data and that the dataflow doesn't interrupt your use of the app. We recommend running the dataflow between 8:00 and 9:00 AM.

 **Note:** The Event Monitoring Wave dataflow runs only once when you create the app. Schedule it to run daily so the app uses the latest event data.

1. Go to **Wave Analytics** in the Force.com menu (top right of the Salesforce window) if you're not already there. Open the Data Monitor by clicking the gear icon at the upper right of the screen.

2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

3. Find the app you created; you may have to scroll down the page. Open the menu on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn't interrupt business activities. Click **Save**.

Learn About Event Monitoring Wave App Prebuilt Dashboards

The Event Monitoring Wave App comes with a set of prebuilt dashboards so you can start exploring your data right away. Data from your org is automatically loaded into your Event Monitoring Wave App datasets when it's generated.

USER PERMISSIONS

To create and manage Event Monitoring Wave Apps:

- "Access Event Monitoring Wave Templates and Apps"
- Manage Wave Analytics Templated Apps
- "Edit Wave Analytics Dataflows"

Most of the dashboards represent a single event type on the EventLogFile object. The [EventLogFile object reference](#) contains detailed information about each event type. Two of the dashboards, My Trust and Setup Audit Trail, don't correspond to event types. Let's get a quick idea about what each dashboard does.

Apex Executions

Corresponds to the Apex Execution event type. This dashboard lets you track trends in Apex code executions and performance.

API

Corresponds to the API Event event type. The API dashboard gives you information about both your users' API usage and API performance in your org. You can see how often each object is being used, how fast each object is being processed, and what methods are being invoked on that object.

Dashboard

Corresponds to the Dashboard event type. The Dashboard dashboard helps you track dashboard adoption and performance.

Visualforce Requests

Corresponds to the Visualforce Request event type. Here you can see trends in Visualforce adoption and page performance.

Files

Corresponds to the Content Transfer event type. When users in your org perform content transfers (downloads, uploads, or previews), they show up on this dashboard. You can also track file adoption.

Lightning

Corresponds to the UI Tracking event type. This dashboard shows you which pages users are accessing in Lightning Experience or Salesforce1.

Login-As

Corresponds to the Login As event type. This dashboard lets you see which admins are using the login-as feature and on which user accounts.

My Trust

The My Trust dashboard gives you an overall idea of what kind of events are taking place in your org over time. It also shows the average speed of these transactions.

Page Views (URIs)

Corresponds to the URI event type. The Page Views dashboard lets you see which pages users are accessing in the Salesforce Classic desktop app.

Report Downloads

Corresponds to the Report Export event type. This dashboard lets you see which users are downloading your reports and where they're downloading them from.

Report

Corresponds to the Report event type. The Reports dashboard shows you trends in reporting as well as which users are running specific reports. You can also find out which reports are having performance issues.

Rest API

Corresponds to the REST API event type. This dashboard shows you trends in REST API usage and which endpoints are seeing the most traffic. You can also view information about the IP ranges issuing the requests and which methods are being called.

Setup Audit Trail

Corresponds to the Setup Audit Trail page in Setup. See what kinds of changes your users are making in the Setup area.

User Logins

Corresponds to the Login event type. The User Logins dashboard shows login trends by user and information about where and how users are accessing your org.

Get to Know Event Monitoring Wave App Terminology

To make the best use of the Event Monitoring Wave App, it's helpful to understand the metrics and terms used in the app.

Term	Description
APT	Average page time. An aggregate metric across multiple transactions.
EPT	Experienced page time. The timing of a page transaction as seen by the user.
Event	A user-initiated interaction in Salesforce. For example, a login, the firing of an API call, or the download of a report. Events are related to the EventLogFile sObject.

The B2B Marketing Wave Analytics App

B2B Marketing Wave Analytics provides advanced analytics for the data-driven marketer, letting you explore both your marketing and sales data in one place. With powerful dashboards that consolidate Pardot and Sales Cloud data, you can quickly explore data, understand the impact of marketing on revenue, and take instant action to drive marketing results.

 **Note:** Help for the B2B Marketing Wave Analytics app currently resides within the Salesforce Pardot Knowledge Base. Go to the [B2B Marketing Wave Analytics overview page](#) to get started.

Develop on the Wave Platform

Find resources for developing with Wave.

[The Wave REST API](#)

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API.

[Salesforce Analytics Query Language \(SAQL\)](#)

Use SAQL to access data in Wave Analytics datasets. Wave Analytics uses SAQL behind the scenes in lenses and dashboards to gather data for visualizations.

[Wave Migration, Packaging, and Distribution](#)

You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

The Wave REST API

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API.

Using the Wave REST API, you can:

- Send queries directly to the Wave Platform.
- Access datasets that have been imported into the Wave Platform.
- Create and retrieve Wave Analytics lenses.
- Access XMD information.
- Retrieve a list of dataset versions.

- Create and retrieve Wave Analytics applications.
- Create, update, and retrieve Wave Analytics dashboards.
- Retrieve a list of dependencies for an application.
- Determine what features are available to the user.
- Work with and schedule Trend in Wave report snapshots.
- Manipulate replicated datasets.
- Get, add, update, and delete 'eclair' geo map charts.

For complete information about the API, see the [Wave REST API Developer Guide](#).

SEE ALSO:

[Enable the Wave REST API](#)

Salesforce Analytics Query Language (SAQL)

Use SAQL to access data in Wave Analytics datasets. Wave Analytics uses SAQL behind the scenes in lenses and dashboards to gather data for visualizations.

Developers can write SAQL to directly access Wave Analytics data via:

- Wave REST API
Build your own app to access and analyze Wave Analytics data or integrate data with existing apps.
- Dashboard JSON
Create advanced dashboards. A dashboard is a curated set of charts, metrics, and tables.

For complete information about SAQL, see the [Wave Analytics SAQL Reference](#).

SEE ALSO:

[View the Query Behind Your Lens](#)

Wave Migration, Packaging, and Distribution

You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

[Migrate Wave Assets with Change Sets](#)

Use change sets to move customized Wave assets between orgs that have a deployment connection. For example, create a Wave app containing dashboards, lenses, datasets, dataflows in your Sandbox org, then migrate the app assets to your production org once testing is complete.

[Package Wave Assets in Managed Packages](#)

You can create managed packages of Wave assets, including Wave apps, dashboards, lenses, datasets, and dataflows. Use packages to distribute those assets to other users or organizations, including those outside your company.

[Distribute Wave Assets Through AppExchange](#)

Once your managed package is certified through our security review, you can make it available to your customers by uploading it to AppExchange. You can specify your package release type, control major and minor version numbers, and specify licensing options through the Licensing Management Application.

[Use the Metadata API for Wave Assets and User XMD](#)

Wave provides full support for the Metadata API, which can be used to retrieve, deploy, create, update, or delete customizations for your organization.

Wave Analytics Glossary

Familiarize yourself with common Wave Analytics terminology.

App

An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders. They allow users to organize their data projects—private and shared—and to control sharing.

Dashboard

A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.

Dashboard JSON file

A *dashboard JSON file* defines the components that a dashboard contains and describes how they're connected.

Data monitor

The *data monitor* tool allows you to monitor dataflow and system jobs. You can also use it to start, stop, reschedule, download, and upload dataflows.

Dataflow

A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying.

Dataflow definition file

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic.

Dataflow job

A *dataflow job* processes the logic in a dataflow.

Dataset

A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.

Dataset builder

The *dataset builder* is a point-and-click user interface that allows you to easily select and extract data from related Salesforce objects to create a single dataset.

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Designer

Designer is the interface where you create dashboards. There are two versions: Wave dashboard designer (the new one) and classic designer (the legacy one).

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions.

Explorer

Explorer is the interface where you explore datasets and lenses.

Extended metadata (XMD)

Extended metadata (XMD) allows you to customize the formatting of many dashboard elements in Wave Analytics.

External data

External data is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

External Data API

Use *External Data API* to upload external data files to Wave Analytics to create datasets.

Lens

A *lens* is a particular view into a dataset's data. It's where you do exploratory analysis and visualization.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

Metadata file

A *metadata file* is a JSON file that describes the structure of an external data file.

Predicate

A *predicate* is a filter condition that defines row-level access to records in a dataset.

Salesforce Analytics Query Language (SAQL)

Use *SAQL* to access and analyze data in Wave Analytics datasets.

Step

A *step* determines the results shown in a widget. Steps either get data dynamically or statically. For example, a step can query a dataset to get the average opportunity amount for each account, or it can retrieve an unchanging, user-defined value.

Transformation

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

Visualization

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

Wave Analytics Limits

This section describes Wave Analytics limits.

API Call Limits

These limits apply to all supported editions.

Limit	Value
Maximum concurrent Wave Analytics API calls per org	100
Maximum Wave Analytics API calls per user per hour	10,000

Dataset Storage Limits

These limits apply to all supported editions and are contractual, not technical. The licensee agrees to strictly monitor its total number of data rows. Use of the Sales Wave Analytics app license does not increase the data limit for the platform license.

Limit	Value
Maximum number of rows for all registered datasets combined	250 million per platform license (purchased before October 20, 2015) 100 million per Analytics Cloud - Wave Analytics Platform license

Limit	Value
	25 million per Analytics Cloud - Sales Wave App license + 100 million per Analytics Cloud - Additional Data Rows license
Maximum number of fields in a dataset	5,000 (including up to 1,000 date fields)
Maximum value for each numeric field in a dataset	36,028,797,018,963,967
Minimum value for each numeric field in a dataset	-36,028,797,018,963,968

Dataflow Limits

Wave uses the bulk API, which counts towards Salesforce bulk API limits. The dataflow submits a separate bulk API call to extract data from each Salesforce object. The dataflow uses a batch size of 100K to 250K, depending on whether the dataflow or the bulk API chunks the data. As a result, to extract 1 million rows from an object, the dataflow creates 4-10 batches.

Limit	Value
Maximum number of dataflow runs in a rolling 24-hour period	24

ELT Job Limits

ELT jobs include user dataflows, CSV uploads, dataset recipes, and replication.

Limit	Value
Timeout for ELT jobs that have been scheduled but not executed	5 minutes

Replication Limits

If you are currently extracting more than 50 objects in your dataflows, contact Salesforce Customer Support before you enable replication.

Limit	Value
Maximum number of objects that can be enabled for replication	50

Trending Data Limits

Trended datasets count toward the overall Wave platform limits, including total number of rows.

Limit	Value
Maximum number of trended datasets per user	5
Maximum number of rows per snapshot	100,000
Maximum number of rows for all monthly snapshots per org	40 million

Lens and Dashboard Creation Limits

These limits apply to the creation of lenses and dashboards.

Limit	Value
Character limit for description fields	1000
Default number of rows in a compare table	2000 (To set a different value, use the SAQL <code>limit</code> statement)
Default number of rows in a values table	100 (To set a different value, use the SAQL <code>limit</code> statement)
Maximum number of notifications per user	5

Sales Wave Analytics App Limits

The remaining limits in this section apply to Sales Wave Analytics. Sales Wave Analytics limits custom object support to no more than 10 custom objects and one dataflow for each org that implements the app. These are contractual, not technical, limits.

External Data Limits

Limit	Value
Maximum file size per external data upload	If you use the External Data API: 40 GB. If you use the user interface: 512 MB.
Maximum file size for all external data uploads in a rolling 24-hour period	50 GB
Maximum number of external data files that can be uploaded in a rolling 24-hour period	50
Maximum number of characters in a field	32,000
Maximum number of fields in a record	5,000 (including up to 1,000 date fields)
Maximum number of characters for all fields in a record	400,000

Query Limits

Trended datasets count toward the overall Wave platform limits, including total number of rows.

Limit	Value
Maximum concurrent queries per organization	50 per platform
Maximum concurrent queries per user	10
Maximum number of rows returned per query	10,000 10,000 is the default value. To set a different value, use the SAQL <code>limit</code> statement
Query timeout	2 minutes

Wave Developer Addition Limits

Wave is built on the force.com platform and is subject to the force.com platform limits. For example, the SOQL query limit (20,000 characters) controls the number of fields from which the sfdcDigest transformation can extract data. If you exceed a force.com limit, an error occurs. See [force.com platform limits](#).

Limit	Value
Maximum number of data rows	250,000
Maximum number of concurrent queries	5

Wave Analytics Limitations

Wave Analytics differs from other Salesforce features in some ways.

General Limitations

This section describes Wave Analytics limitations.

Update Schedule

All customers receive Wave Analytics updates on the same schedule, regardless of instance.

Localization and Internationalization

Wave Analytics has been localized with the following exceptions.

- We do not support right-to-left languages, such as Arabic and Hebrew.
- A subset of error messages is available only in English.
- The mobile iOS app includes only English versions of sample datasets and dashboards.

Wave Analytics provides internationalization support with the following limitations.

- You must set both locale and language to see translated labels.
- Data within datasets is not modified for localization or internationalization.
- Each dataset can have a single locale specified in the metadata. The metadata locale is not overridden by individual user locale settings. All users see the same date, time, and number formats, and dimension names, regardless of their own locale and language settings.
- Search in filters is case-sensitive and accent-sensitive. For example, using the filter “Andre” does not return “André” in the results.
- Multicurrency is not supported. When Wave Analytics extracts your organization’s default currency, it uses the currency for monetary values and doesn’t convert to another currency.
- Sorting data within datasets might not work as expected.

Sales Wave Analytics Limitations

These limitations apply to Sales Wave Analytics.

Sales Wave Analytics Data Requirements

Sales Cloud data must meet the following requirements for Sales Wave Analytics dashboards to function correctly:

- Use standard sales objects.
- Have at least one event and one task connected with an opportunity.
- Enable history tracking for Amount, Stage, and CloseDate fields on the Opportunities object.
- Cases must be connected to Accounts if you choose to import Cases data to Sales Wave Analytics using the configuration wizard.
- There are two requirements if you choose to import Leads data to Sales Wave Analytics using the configuration wizard.
 1. At least one lead must be converted to an opportunity.
 2. The lead must be connected to an account.
- There are two requirements if you choose to import Campaigns data to Sales Wave Analytics using the configuration wizard.
 1. At least one opportunity must be connected to a campaign.
 2. At least one campaign member must be connected to a campaign.
- There are two requirements if you choose to import opportunity record types to Sales Wave Analytics using the configuration wizard.
 1. At least one opportunity record type must be defined.
 2. The opportunity record type must be connected to at least one opportunity.

Sales Wave Analytics Support for Salesforce Objects and Fields

Sales Wave Analytics supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave creates a dataflow that exposes selected fields from the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Projects (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Sales Wave limits custom objects support to no more than 10 custom objects for each org that implements Sales Wave. This limitation is contractual, not technical.

To add custom objects or extra fields not included when you first create the app, you must update the Sales Wave dataflow. For details, see [Create Datasets with a Dataflow](#)

Sales Wave Analytics Support for Non-Salesforce Data

Sales Wave Analytics does not support external data sources **except a CSV file** that contains quota data at the user level. Importing other external data requires an extra license. See your Salesforce representative for details.

To include data about quotas in Sales Wave Analytics, you must upload a CSV file with the details. For more information, see [Update the Sales Wave App Quota \(Target\) Dataset](#).

Service Wave Limitations

The following limitations apply to Service Wave.

Service Wave Data Requirements

Service Cloud data must include at least one each of the following for Service Wave dashboards to function correctly: Events, tasks, closed cases, or published articles attached to a case or an opportunity.

Custom formula fields on the Cases object must exist or be created for the SLA missed (text) and FCR (Boolean) fields.

Service Wave Support for Salesforce Objects and Fields

Service Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields. The app creates a dataflow that exposes selected fields from the following Salesforce objects:

- Account
- Cases
- Contact
- Events
- User
- UserRole
- Task

Service Wave also uses fields from the following options depending on the answers you select in the configuration wizard:

- CaseArticle
- CaseHistory
- CSAT (customer object)
- Group
- Single Knowledge article (custom object)
- RecordType
- Opportunity

Service Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Service Wave limits custom objects support to no more than 10 custom objects for each org that implements Service Wave. This limitation is contractual, not technical.

To add custom objects or extra fields not included when you first create the app, you must update the Service Wave dataflow. For details, see [Create Datasets with a Dataflow](#). For details, see [Create Datasets with a Dataflow](#)

More Service Wave Limitations

Service Wave does not support external data sources or registering new datasets from the app-generated dataflow.

Including CSAT score in dashboards/dataflow is optional. The app configuration wizard lets you associate CSAT from a custom case field or Custom Object associated to the Cases object.

You must manually add any security predicates or other dataset filters to the app dataflow.

The app does not support multi-hierarchy (team/manager) when you create it. You must manually add that functionality.

The Knowledge Usage dashboard currently reports on a single Article Type, which you select when you use the configuration wizard.

Field-Level Security

Field-level security isn't available for external data that is uploaded via files. Field-level security that was implemented in the original database or Salesforce object isn't preserved when the data is loaded into a Wave Analytics dataset. For more information, see the [Wave Analytics Security Implementation Guide](#).

Actions Menu Support for Objects and Actions

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for custom objects, sObjects, and the following standard Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports Chatter actions (Post, File, Thanks, Link, Poll, and Question), [object-specific actions](#), and [global actions](#). It does not support Salesforce1 actions.

Other objects and actions will be supported in future releases.

Dashboards on Mobile Devices

To view a Wave dashboard on a mobile device, use the Wave Analytics mobile app.

SEE ALSO:

[Tradeoffs and Limitations of Shield Platform Encryption](#)

Reports and Dashboards

Salesforce offers a powerful suite of reporting tools that work together to help you understand and act on your data.

Reports

Reports give you access to your Salesforce data. You can examine your Salesforce data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others. Before building, reading, and sharing reports, review these reporting basics.

Dashboards

Dashboards help you visually understand changing business conditions so you can make decisions based on the real-time data you have gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities. Before building, reading, and sharing dashboards, review these dashboard basics.

Reports

Reports give you access to your Salesforce data. You can examine your Salesforce data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others. Before building, reading, and sharing reports, review these reporting basics.

As you prepare to report on your Salesforce data, keep these tips in mind:

- Well-designed reports run faster.
- Before building your report, consider writing down each of the questions your report must answer. This way, your report is sure to return all the data you need.
- Reports are shared via folders. Whomever has permission to the folder your report is saved in also has access to your report. Ensure that you save your report in an appropriate folder.

Before building your first report, familiarize yourself with these features and concepts.

Report Builder

The *report builder* is a visual, drag-and-drop tool which you use to create reports and edit existing ones. The report builder is where you choose a report type, report format, and the fields that make up your report.

To launch the report builder, click **New Report**.

Fields

One or more *fields* describe each report result. If you imagine that your report as a table of information, then each row is a result and each column is a field.

For example, a human resources manager creates a report about employees. Each result is an employee, and each field is a different piece of information about the employee: first name, last name, job title, start date, and so forth.

When you create or edit a report, you choose which fields you want to include in your report. To ensure your reports run quickly, it's a good idea to include only the fields that you need.

Filters

Limit the data that your report returns by using *filters*. Filters are useful for many reasons, such as focusing your report on specific data, or ensuring that your report runs quickly.

For example, say your report returns all the Cases in your company, but you only want to see Cases which are open and assigned to you. Filter the report on the `Owner` field and `Status` field.

Add filters in the Report Builder. In Lightning Experience, you can add, edit, or remove filters while reading a report, too.

Report Types

The *report type* governs which fields are available in your report. For example, File and Content reports have fields like `File ID`, `File Name`, and `Total Downloads`. Accounts reports have fields like `Account ID`, `Account Name`, and `Phone`.

The first thing you do when creating a report is choose a report type.

Report Format

The *report format* specifies how your report results are laid out. Possible formats are tabular, summary, matrix, or joined. Joined reports aren't available in Lightning Experience.

1. [Build a Report](#)

When you have questions about your Salesforce data, build a report to get the answers.

2. [Filter Report Data](#)

What if your report gives you more data than you need? Use filters to pare down your report until it only shows the data that you want.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

7. [Schedule and Subscribe to Reports](#)

Schedule and Subscribe to Reports and receive notifications that keep you informed about metrics you care most about without having to manually run reports. In Salesforce Classic, you can specify criteria that trigger report notifications.

8. [Run and Read a Report](#)

Click on a report's name to run it. After running a report, there are a series of tools you can use to help you read the information.

9. [Export a Report](#)

To work with report data in a dedicated tool, such as a spreadsheet, export report data as a Microsoft Excel® (.xlsx) or comma-separated values (.csv) file.

10. [Share a Report](#)

Share your reports with colleagues so everyone's working with the same info.

11. [Organize Reports](#)

Keep your reports at your fingertips by sorting them into folders and deleting unused reports. If you have a lot of reports, you can use the search field to find the one you need.

12. [Report Limits](#)

As you report on your data, be aware of these limits and restrictions.

13. [Troubleshoot Reports](#)

Use these tips to help solve problems that arise when you're working with reports.

14. [Get the Right Data into Your Report](#)

A well-designed report helps you turn raw data into information people can act on. Summarize values and group them into meaningful categories, filter out irrelevant facts, and gather data about multiple objects at once.

15. [Communicate Your Report Data Effectively](#)

A report produces information in the form of a table. You can set up that table to help people scan quickly for the information they need. You can also add a graph to help users understand the data visually, and you can display the report's data on a dashboard.

16. [The Report Run Page](#)

The Report Run page lets you control what happens to your report when you run it.

17. [Report Run Page Options](#)

Customize the report run page to support the specific information you need for the way you work.

18. [Get Started with Reports](#)

Set up your reporting environment, use the report builder to create a basic report, and organize your reports to make it easy to find information when you need it. In most cases, you can start with a standard report and customize it to your needs.

19. [Reports Give You Access to Your Data](#)

Use reports to leverage the data your organization has accumulated over time. You can examine your organization's data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

Build a Report

When you have questions about your Salesforce data, build a report to get the answers.

1. [Build a New Report](#)

Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

2. [Report on Historical Changes](#)

On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

3. [Report on Historical Data with Reporting Snapshots](#)

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

4. [Categorize Data Quickly with Buckets](#)

Bucketing lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

5. [Combine Different Types of Information in a Joined Report](#)

The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

6. [Show Report Data Graphically](#)

To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.

7. [Show Report Data in Tables](#)

To help readers scan for data easily, try hiding details and ranges, limiting the number of results shown, and highlighting with color. You can also show your table in a dashboard component.

8. [Report on Salesforce Data with Excel](#)

Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft® Excel®. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel's formulas, charts, and pivot tables to customize and analyze your data. When Salesforce disables TLS 1.0, we're ending support for Connect for Office.

9. [Upgrade the Report Wizard](#)

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

Build a New Report

Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

Watch a Demo: [▶ Getting Started with Report Builder \(Salesforce Classic\)](#)

To customize an existing report using report builder, click the name of a report and click **Customize**. To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

1. Choose a Report Type

The report type you choose determines which records and fields appear in your report. For example, the Opportunities report type gives you access to Opportunity records and fields like Amount, Stage, and Type.

2. Choose a Report Format

A report can use the tabular, summary, matrix, or joined format. Choose a format that's complex enough to capture the data you want to show, but simple enough to communicate it effectively.

3. Create a Report

Create a report to get an up-to-the-minute view of an aspect of your business, such as the status of customers, opportunities, support cases, and so on.

4. Creating a Custom Report

You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

5. Create a Custom Report in Accessibility Mode

6. Group Your Report Data

Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

7. Keep Working While Your Report Preview Loads

For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

8. Customizing Reports

Report builder is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.

9. Report Fields

The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

10. Summarize Your Report Data

A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

11. Subtotal Report Results

Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

12. [Smart Totaling in Reports](#)

“Smart” totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses “smart” totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

13. [Work with Formulas in Reports](#)

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

14. [Save Your Report](#)

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

[Combine Different Types of Information in a Joined Report](#)

Choose a Report Type

The report type you choose determines which records and fields appear in your report. For example, the Opportunities report type gives you access to Opportunity records and fields like Amount, Stage, and Type.

There are two types of report types: standard report types and custom report types.

Standard report types give you access to most Salesforce data. For example, the Opportunities report type gives you access to Opportunity records and fields in your report. If you’re going to report on Opportunity Amounts or Probability or Type, then Opportunities is the report type is for you.

Custom report types give you access to custom objects in Salesforce, or custom views of standard objects (like Opportunities), which your administrator configures. For example, your administrator can create a custom report type which gives access to Opportunities, plus related fields from Products. With that custom report type, you can easily report on Opportunities for a given product.

1. From the Reports tab, click **New Report**.
2. Select the report type, and then click **Create**.

Note: You can’t change the report type after the report is created.

The report builder opens, granting access to records and fields based on your selected report type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
AND
“Report Builder”

Standard Report Types

Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

Pre-Designed Custom Report Types

Some Salesforce features come with custom report types that are designed for you in advance, so you don't have to create a new report.

SEE ALSO:

[Set Up a Custom Report Type](#)

[Why doesn't my report return the data I expect?](#)

Standard Report Types

Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

Tip: You may not see some of these folders if your administrator has customized the visibility of the Report tab folders.

If you can't find a report to customize for your own needs, you can also create a new custom report to access exactly the right information.

1. [Account and Contact Reports](#)

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

2. [Activity Reports](#)

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

3. [Administrative Reports](#)

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

4. [Campaign Reports](#)

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

5. [File and Content Reports](#)

Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

6. [Forecast Reports](#)

Forecast reports give you information about your customizable forecast data.

7. [Lead Reports](#)

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

USER PERMISSIONS

To run reports:

- "Run Reports"

To schedule reports:

- "Schedule Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

8. [Opportunity Reports](#)

Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

9. [Product and Asset Reports](#)

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren't associated with a product.

10. [Self-Service Reports](#)

Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you're offering.

11. [Reporting on Support Activity](#)

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

SEE ALSO:

[Find a Report](#)

[The Report Run Page](#)

[Creating a Custom Report](#)

[Reports Give You Access to Your Data](#)

Account and Contact Reports

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

Standard Report: Field History

If your organization tracks field history on accounts or contacts, you can report on that information using the account history or contact history report.

Standard Report: Person Accounts

If your organization uses person accounts, fields specific to person accounts are available and prefixed with `Person Account:` in account reports. In addition, you can include the `Is Person Account` field in both account and contact reports. Your administrator may have given a different label to `Person Account`.

Mass Mail Merge

You can also create a report of your contact information, export that data to Microsoft® Excel®, and then do a mass mail merge using Microsoft® Word®.

Last Activity

The last activity date is either the due date of the most recently logged event against the record or the most recently closed task associated with the record. The Last Activity date can show up in activities related lists and reports, as well as on record details pages (such as accounts, contacts, and leads).

View Filter for Account Reports

The standard `view` filter for account reports allows you to limit your account data according to the following options. These options vary depending on your organization's edition and setup.

- My accounts: Shows accounts that you own.
- My account team accounts: Shows accounts where you are on the account team.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

- My account team and my accounts: Shows accounts you own and those where you are on the account team.
- My team's accounts: Shows your accounts and accounts owned by all of your subordinates in the role hierarchy.
- My territories: For organizations that use territory management, this option shows accounts that belong to the territories to which you are assigned.
- My territory team's accounts: For organizations that use territory management, this option shows accounts that belong to your territories and your territories' descendants.
- My team's account team and their own accounts: For users who report to you in the role hierarchy, shows accounts they own or for which they are on the account team.
- All visible accounts: Shows all accounts that you can view, as determined by your sharing model.
- Territories: For organizations that use previous versions of territory management (not Enterprise Territory Management), the additional `Territories` filter can be set to All, Multiple Territories, or Missing Territory. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.
- Customer Portal: If your organization uses a Salesforce Customer Portal, add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

SEE ALSO:

[The Report Run Page](#)

[Limit Report Results](#)

Activity Reports

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

Standard activity reports allow you to select the date range and status of the activities you want included. The standard activity reports list your tasks and appointments for a selected date range or events with all invitees.

You can also create custom reports for activities by clicking the Reports tab, **New Report**, and choosing **Activities** as the type of data on which to report.

-  **Note:** Click **Show Hierarchy** to see your org's role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you're viewing data for the Sales Operations Director role. Click any role name to see and share the data that's visible to people in that role.

Special Features of Activity Reports

Consider the following when running activity reports:

Standard Reports

- Choose the HTML Email Status report if you have the HTML email tracking enabled. This reports on anything in the HTML Email Status related list of your leads and contacts.
- Choose the Events with Invitees report to include only multi-person events in your report. The standard filters for events with invitees are:
 - Assigned to...—Shows only multi-person events that you own.
 - Assigned to the team of...—Shows multi-person events that anyone in your team owns.
 - Invitee is...—Shows only multi-person events that list you as an invitee.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

- Invitee is in the team of...—Shows the multi-person events that show anyone on your team as an invitee.
- The My Delegated Approval Requests report lists all the approval requests for which you are the approval proxy. Note that the All Pending Approval Requests report is listed in the Activity Reports folder.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, to show the activities for users who report to you, use the **Hierarchy** links in the Tasks and Appointments report. Note that you can view only your own activities and activities owned by users below you in the role hierarchy.
- If your organization uses Shared Activities, reports (including custom report types and Tasks and Events reports) display different results depending on your permissions. Say you're reporting on events, and your report results include an event that is related to two or more contacts and also has invitees. If you're an administrator, your report results show an event for the primary contact plus a separate event for each invitee. If you're not an administrator, your report results show just one event, for the primary contact.

Report Types

- Using report builder, you can create activity reports that show activities related to another type of record. For example, a custom Activities with Leads report shows activities associated with leads.
- Activities with Leads reports do not display data for the Address Line 1, Address Line 2, and Address Line 3 fields.

Tips for Activity Reports

- Set a search criteria of "Event Invitation equals 0" to filter out events that are meeting invites sent to users for a multi-person event.
- Archived activities aren't included in reports. Events and closed tasks older than a year are archived. However, open tasks aren't archived. You can still see archived activities for a record by selecting **View All** in the Activity History section of a record's detail page.
- Activities for private contacts are displayed only in reports for the contact owner.
- The standard filters for activity reports allow you to limit your report results using the following options. Some of these options will not be visible depending on your edition.
 - My Activities—Shows activities that you own.
 - My Delegated Activities—Shows activities that you created but are owned by someone else in the same role as you, and below your role, in the role hierarchy.
 - My Team's Activities—Shows activities owned by users who report to you in the role hierarchy.
 - All Activities—Shows all activities that you can view, as determined by your sharing model.
- If you receive an error message that your activity report has too many results, customize the report to include a filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities."

SEE ALSO:

- [The Report Run Page](#)
- [Limit Report Results](#)

Administrative Reports

USER PERMISSIONS

To view the Administrative Reports folder:	“View Setup and Configuration”
To run user reports:	“Run Reports” AND “View Setup and Configuration”
To create, edit, save, and delete user reports:	“Create and Customize Reports” AND “View Setup and Configuration”
To run document reports:	“Run Reports”
To create, edit, save, and delete document reports:	“Create and Customize Reports”
To run pending approval request reports:	“Run Reports” AND “View All Data”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

Note: You can see the Administrative Reports folder on the Reports tab only if you have the “View Setup and Configuration” permission. You don't need this permission to view the Administrative Reports report type—all users can view it and manage any document reports associated with that type. To view other types of reports associated with that type, such as user and approval request reports, you must have the permission.

Special Features of Administrative Reports

Consider the following when running administrative reports:

Standard Reports

- The All Active Users report lists the active users in your organization and when they last logged in.
- The Users Logged in This Week report lists all of the users who have logged in to Salesforce in the past seven days. If Communities is enabled, you can add a `Community` column so that you can see which communities users have logged in to as well.
- The Documents report lists the documents within each document folder.
- The All Pending Approval Requests report lists the approval requests awaiting approval for each approval process. Note that the My Delegated Approval Requests report is listed in the Activity Reports folder.
- If your organization uses territories, the User Territory Report in the Territory Reports folder summarizes the territories to which users have been assigned.

Report Types

- Create a custom report that lists your organization's reports and the last time each report was used. Choose Administrative Reports and select Reports as the report type.
- If your organization uses Communities, you can report on login history for external members of your communities.

1. Create a custom report.
 2. Choose Administrative Reports.
 3. Select Users as the report type.
 4. Add `Community` to your report columns.
 5. Add a filter that includes profiles of community users.
- If your organization uses a Salesforce Customer Portal, you can report on Customer Portal users:
 1. Create a custom report.
 2. Choose Administrative Reports.
 3. Select Users as the report type.
 4. Add `License Type`, `Profile`, and `Role` to your report columns. You can't report on roles for high-volume portal users because they don't have roles.

 **Note:** Permission sets aren't supported.

You can also add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

- You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.

Tips for Administrative Reports

- Users with the "Manage Internal Users" permission can create a custom user report that lists the details of users' login attempts. The relevant fields—such as `Login Date/Time`, `Source IP Address`, and `Login Status`—are grouped in the Login History section of the Select Columns step. Note that the `Client Type` field shows whether the user logged in via a Web browser or an alternate interface such as Connect for Lotus Notes or a partner portal. You can also see which users have never logged in by setting report criteria: choose the `Login Date/Time` field and the "equals" operator and leave the third value blank.

SEE ALSO:

[The Report Run Page](#)

[Limit Report Results](#)

Campaign Reports

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

Special Features of Campaign Reports

Consider the following when running Campaign Reports:

Standard Reports

- On the Campaign Detail custom report and the Campaign ROI Analysis report, you can include campaign-hierarchy statistics that provide aggregate values for a parent campaign and all the campaigns below it in the campaign hierarchy. If your campaigns include a custom picklist that indicates hierarchy level (for example, "tactic," "program," and "initiative"), you can run a report that summarizes data at any hierarchy level across all campaigns.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- Use the Campaign Leads or Campaign Contacts reports to list the leads or contacts associated with your campaigns.
- Use the Campaign Member Report for a list of campaign members by campaign.
- Use the Campaign Member Analysis report to summarize information about who has responded to campaigns.
- Use the Campaign Revenue Report to analyze which opportunities have resulted from your campaigns. In Enterprise, Unlimited, Performance, and Developer Editions, you can also analyze products, quantity schedules, and revenue schedules in this report.
- The Campaign ROI Analysis Report calculates the return on investment (ROI) and average costs for your campaigns. The ROI is calculated as the net gain ($\text{Total Value Won Opps} - \text{Actual Cost}$) divided by the Actual Cost . The ROI result is expressed as a percentage.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Note: The Campaigns with Influenced Opportunities report respects sharing rules on accounts, contacts, and campaigns. Objects with sharing rules set to private will not display in the report.

Report Types

- Use the Campaigns with Campaign Members custom report type to create a report that contains information about the leads and contacts on multiple campaigns. Use the Campaign Call Down report to see contacts and leads for a specific campaign. These reports are only available to users that have the “Read” permission on both contacts and leads.
- Use the Campaigns with Leads and Converted Lead Information report to view lead lifetime information sorted by a campaign or campaigns.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Tips for Campaign Reports

- Some reports allow you to limit the data to one campaign by using the lookup icon to select a campaign. If the user running a report no longer has access to view the selected campaign, the report does not show any results. This report behavior is similar to what happens when a campaign is deleted.
- `Member Status` is the status of a lead or contact in reference to the campaign. The campaign owner can create up to 50 member status values. Sample Member Status values include, “Planned,” “Sent,” or “Attended.” Additionally, you can now add the `Member First Associated`, `Responded`, and `Member First Responded` fields to campaign reports. These fields allow you to see the date the member was added to the campaign, whether the member responded to the campaign, and the date the member initially responded to the campaign.
- The `Last Activity` of a campaign is the most recent due date of an activity on the record. The following past or future activities set this date:
 - Any event
 - Closed tasks

[Limit Report Results](#)

File and Content Reports

Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

Standard File and Content Reports

Run these prebuilt reports about files and content.

Content Authors

View how many files, content packs, Google Docs, and Web links each author has published in Salesforce CRM Content.

Content Publication Time Frame

Determine how many files, content packs, Google Docs, and Web links were published in a library during a given time frame.

File and Content Downloads

See which users downloaded what files, and when they downloaded the files.

File and Content Engagement

See the number of times a file has been downloaded, shared, liked, and commented on.

File and Content Links

See which files users are sharing using content deliveries or **Share via link**. See when each link was created, when it expires, when it was last accessed, whether it is password protected, and the total number of times the link has been accessed. Each of the links in this report can be accessed by users outside of your organization.

Library Administrators

View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

Library Content

View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

Most Content Downloads

Determine which files and content packs are downloaded most frequently and which Web links and Google Docs are opened most frequently.

Most Content Subscriptions

Determine which files, content packs, Google Docs, and Web links have the most subscribers.

Stale Content

Determine which files have not been downloaded or revised recently.

File and Content Report Types

Build standard reports about files and content.

Content Report

Generate a report about Salesforce CRM Content.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Archived	Flag that indicates whether a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.
Content Created By	Contributor who published the file, content pack, Google Doc, or Web link.

Field	Description
Content ID	Identifier that enables you to group by file rather than version. The Content Title is not guaranteed to be unique because multiple versions of the same file can have different titles.
Content Published Date	Date a file, content pack, Google Doc, or Web link was first published.
Content Title	Title of a file, content pack, Google Doc, or Web link.
Record Type	Title of the record type associated with the file, content pack, Google Doc, or Web link.
Featured Content	Flag that indicates whether a piece of content is featured.
Individual Content Size (MB)	Size of an individual file, exclusive of other versions of the same file.
Last Subscribed Date	Date on which the content was subscribed to most recently.
Num Downloads	Number of times a file has been downloaded or the total number of downloads in a library. The number of times a Google Doc or Web link has been opened is also included in this count.  Tip: To see which users have downloaded a certain file, go to the file's content details page and click the Downloads tab.
Num Negative Ratings	Number of thumbs-down votes.
Num Positive Ratings	Number of thumbs-up votes.
Num Subscriptions	Number of users who are subscribed to a file, content pack, Google Doc, or Web link, or the total number of subscriptions in a library.
Num Versions	Number of times a new version of a file has been published.
Overall Rating	The number of positive votes minus the number of negative votes. For example, if a file has two positive votes and no negative votes, its Overall Rating is 2.
Tag	Salesforce CRM Content tag assigned to a file, content pack, Google Doc, or Web link.
Total Content Size (MB)	Size of a file, inclusive of all the file's versions.
Version Revised Date	Date and time a new version of the file was published.
Version Revised By	Contributor who published the file version.
Library Name	Name of the library.
Library Created Date	Date and time the library was created.

Library and User Report

Generate a list of users who are assigned to libraries.

Field	Description
Administrator	Flag that indicates whether or not the user is a library administrator.

Field	Description
Group	Flag that indicates whether or not the library member is a single user or a public group.
Library Created	Date and time the library was created.
Library Name	Name of the library.
Member Name	First and last name of the library member.

File and Content Report

Generate a report about files uploaded to your organization.

Field	Description
Archived	Flag that indicates whether or not a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.
Title	Title of a file, content pack, Google doc, or Web link.
Created By	User who uploaded the file, content pack, Google Doc, or Web link.
Download Date	Date of the first file download.
Downloaded By	User who downloaded the file.
Download User Type	Profile type of the user who download the file.
File Type	MIME type of the uploaded file.
ID	Identifier that enables you to group by file rather than version. The <code>Title</code> is not guaranteed to be unique because multiple versions of the same file can have different titles.
Last Revised By	Last user to edit or upload a new version of the file.
Last Revised Date	Date of last file revision.
Likes	Number of times file posts have been liked. This number doesn't count likes applied to comments on the file post.
Links	Number of external file links that have been generated. External links are generated when a user shares a file using Share via link or when a user shares content from a library using a content delivery.
Post Comments	Number of comments made on file posts in feeds.
Posts	Number of times the file has been posted to a feed. This number doesn't count the number of times the file has been attached to comments on posts.
Published Date	Date a file, content pack, Google Doc, or Web link was first published or uploaded.
Shares	Number of times the file has been posted to a user's feed, shared using Share with people , and shared using Share with groups .
Size (MB)	Size of the most recent file version in megabytes.

Field	Description
Total Downloads	Number of times the file has been downloaded.
Total Size (MB)	Combined Size of all uploaded file versions.
Versions	Number of uploaded file versions.

Tips for Using File and Content Reports

- Salesforce CRM Content users who have the `Manage Content` option checked in their library permission can sort report data by the library they have access to (“My Libraries”) or by all the libraries in an organization (“All Libraries”). Users without the `Manage Content` option can only sort data by the libraries they have access to.
- Sort custom reports by `Library Name` to view data for individual files as well as library summaries, such as total storage used and total number of downloads.
- Sort according to the `Content ID` to view data for a particular document.
- If you have Customer Portal or partner portal users with the “Create Libraries” user permission, run the Library Administrators report to determine which new libraries have been created by portal users.

[Limit Report Results](#)

Forecast Reports

Forecast reports give you information about your customizable forecast data.

- ✔ **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).
- ✔ **Note:** If you don't see the Forecast Reports folder, your organization may not have customizable forecasting enabled. Customizable Forecasting includes five standard report types. You can't create custom report types with Customizable Forecasting.

Special Features of Customizable Forecast Reports

Consider the following when running customizable forecast reports:

Standard Reports

Create a forecast history report if you want the report to include information about forecasts you already submitted. Select `ALL Forecasts` to show the state of the forecasts after each update. Choose `Latest Forecasts` to display only the current state of the forecasts.

Report Types

- When creating a custom forecast report, choose the **Customizable Forecast: Opportunity Forecasts** report type if you want to include information about the opportunities that contribute to your forecast.
- You can include custom user fields in custom opportunity forecast reports as columns and as column values. Custom user fields are available as either opportunity owner or account owner custom information. The custom field label will be used for both opportunity owner or account owner information, which can cause confusion if they are both on the same report and have similar field labels.
- If you have the “View All Forecasts” permission, forecast summary and forecast history reports include all users' data for the chosen forecast hierarchy, including users in branches of the forecast hierarchy that have no forecast manager.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

Tips on Customizable Forecasting Reports

- You must specify a reporting interval by fiscal year or by date.
- Forecast reports include private opportunities.
- Opportunity amounts are included in forecast reports if the opportunity is set to close within the forecast period.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Create a forecast summary report if you want to view information about the amounts in your forecast without details of the opportunities that contribute to that amount.
- If your organization uses territories, you can create custom forecast reports that summarize information by territory name.
- You can view an opportunity forecast report based on the forecast hierarchy by drilling down in your forecast hierarchy.
 1. Select the desired role or territory from the **Hierarchy** links.
 2. Choose the appropriate forecast users or teams from the **Show Opportunities Owned By** or **Show Forecasts Owned By** scopes at the top of the report.
 3. Click **Run Report** again to refresh the report data for your chosen parameters.

For example, to see your opportunity information, including your overrides on opportunity amounts or quantities and overrides from users below you in the forecast hierarchy, set the **Hierarchy** link to your forecast role. To see the opportunity information of someone beneath you in the forecasting hierarchy, drill down into that role.

 **Warning:** The My Team view shows forecasts across multiple hierarchy levels. Consequently, values may be included in a subordinate's forecast total and a forecast manager's forecast total. This may lead to larger than expected values in the column total because subordinate amounts are included multiple times in the total.

 **Note:** Click **Show Hierarchy** to see your org's role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you're viewing data for the Sales Operations Director role. Click any role name to see and share the data that's visible to people in that role.

Lead Reports

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

Special Features of Lead Reports

Consider the following when running lead reports:

Standard Reports

Choose the Lead History report type to track the history of standard and custom fields on leads where field histories are set to tracked. Use this report to see tracked fields' old and new values.

 **Tip:** If you have the "Create and Customize Reports" permission, you can use the **View** drop-down on a Lead History Report to view lead history data by My Leads, My Team's Leads, User Owned Leads, Queue Owned Leads, and All Leads.

Tips for Lead Reports

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- Limit your report view to “My team’s leads” to see leads owned by users who report to you in the role hierarchy.
- Lead reports can show all leads, both converted and unconverted. To limit your report to just unconverted leads, enter filter criteria of “Converted equals 0.”
- The `Last Activity` of a lead is the most recent due date of an activity on the record. The following past or future activities set this date:
 - Any event
 - Closed tasks
- You can create a report of your lead information, export that data to Excel, and then do a mass mail merge using Microsoft® Word.

Lead Report Limitations

- You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can't use filter logic if you are filtering by `Field/Event`.

Opportunity Reports

Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

1. [Tips for Working with Opportunity Reports](#)

Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

2. [Standard Opportunity Reports](#)

Standard opportunity reports help you report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

3. [Opportunity Report Types](#)

Report types provide a report template that you can customize to capture the unique data you're after without creating a report from scratch. Many of the opportunities custom report types include information from associated objects, such as products, partners, and quotes.

SEE ALSO:

- [The Report Run Page](#)
- [Limit Report Results](#)

[Tips for Working with Opportunity Reports](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

- You can use the following columns to provide additional detail:
 - **Age**—For an open opportunity, the number of days since the opportunity was created. For a closed opportunity, the number of days between the creation date and the closed date.
 - **Stage Duration**—The number of days the opportunity was in the stage listed in the **Stage** column. You can run the Opportunity Stage Duration report to see how much time an opportunity spent at different stages.
 - **Last Activity**—The most recent due date of an activity on the opportunity record, including any opportunity event or closed task.
- If your organization uses Forecasts or Customizable Forecasts, you'll see forecast report options paired with opportunity report options in the standard reports folders and the custom reports wizard. Opportunities owned by users who do not have a role in your organization's hierarchy are omitted from opportunity, forecast, and sales reports. This restriction does not apply to Personal or Group Edition organizations, which do not have a role hierarchy. For reports that include the **Partner** column (except for the Partner Opportunities report), only the primary partner of the opportunity is displayed.
- Not all Opportunity Product fields are available in report filters. For example, the **Product Family** field is not available in Opportunity Product report filters because it is related to that object through the Pricebook Entry object. To make the **Product Family** field available in Opportunity Product report filters—for cross-sell or upsell reporting—create a custom formula field to store its contents and use that formula field in your filter. From the object management settings for opportunities, go to the fields area, then create a custom field of type Formula, making sure to use **Text** for your formula return type and `TEXT(PricebookEntry.Product2.Family)` for your formula.
- In Professional, Enterprise, Unlimited, Performance, and Developer edition organizations, the **Hierarchy** links let you browse report results based on the role or territory hierarchies.
- If your organization uses previous versions of territory management (not Enterprise Territory Management), the Hierarchy filter on opportunity reports lets you view data according to either the role or territory hierarchies. In addition, the Territories filter lets you display either opportunities from all territories or opportunities that lack an associated territory.
- You can include the **Primary Campaign Source** field on all standard opportunity reports. This field is controlled by field-level security.
- Use the View filter to limit your opportunity report results. View options vary depending on your organization's Edition and setup.
 - **My opportunities**—Shows only your opportunities.
 - **My team-selling opportunities**—Shows opportunities for which you are on the opportunity team.
 - **My team-selling and my opportunities**—Shows your opportunities and opportunities for which you are on the opportunity team.
 - **My team's opportunities**—Shows your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If your organization uses previous versions of territory management (not Enterprise Territory Management), the effect of this option depends on the value of the Hierarchy filter above. If you select **Role**, you see your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If you select **Territory**, you see opportunities that you own and any opportunities owned by your territories' descendants.
 - **My team's team-selling and their opportunities**—For users who report to you in the role hierarchy, shows opportunities they own or for which they are on the opportunity team.
 - **My territories**—For organizations that use territory management, this option shows opportunities that belong to the territories to which you are assigned.

Standard Opportunity Reports

Standard opportunity reports help you report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

1. In the **Folders** pane on the Reports tab, select **Opportunity Reports**.
2. Click the report you want.

Report Name	Description
Closed Opportunities	Won opportunities
Opportunities by Type	Types of available opportunities.
Opportunity Field History	Field history on opportunities. Available only if your organization tracks this information.
Opportunity History	Status changes on opportunities. Available only if your organization tracks this information.
Opportunity Pipeline Trend	A historical snapshot of your opportunities; opportunity amounts are grouped by historical stage for specified months. This report is available in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations only.
Opportunity Pipeline	Opportunities by stage.
Opportunity Pipeline with Splits	Opportunities summarized by split information such as assigned user and percentage.
Opportunity Product	Opportunities by month and product.
Opportunity Product Report with Splits	Split assignments and percentages for each product. You can also summarize information by these fields: <ul style="list-style-type: none"> • Split Total Price—Split percentage multiplied by Total Price. • Split Expected Product Amount—Split Total Price multiplied by Probability.

EDITIONS

Available in: Salesforce Classic

Opportunities with Historical Trending Report

The Opportunities with Historical Trending report is a custom report type designed to help you analyze historical trends in your sales pipeline.

We've selected some of the most useful Opportunity fields for you in the default report:

Amount

Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the `Opportunity Currency` picklist to track the amount in another currency.

Close Date

Date when you plan to close the opportunity. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.

Stage

Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal.

Probability

Percentage of estimated confidence in closing the opportunity.

Product and Asset Reports

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren't associated with a product.

Special Features of Product and Asset Reports

Consider the following when running product and asset reports:

Standard Reports

Use the Assets without Products report, available from the "Products and Asset Reports" folder to list the assets that are not associated with a product. Depending on how you use assets, these assets can represent your competitor's products.

Report Types

- To create a custom report showing what assets your customers have, click **New Report** from the Reports tab and choose the Accounts with Assets or Contacts with Assets report type from the Accounts & Contacts report type category.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- To view a list of the cases filed for a particular asset, click **New Report** from the Reports tab and choose the Assets with Cases report type from the Price Books, Products and Assets option.

SEE ALSO:

Self-Service Reports

Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you're offering.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

Standard Reports

- The Self-Service Usage Report gives you information on how many cases are viewed and logged, the number of comments that have been added, and the number of searches Self-Service users have performed.
- The Self-Service User Report provides information about the customers who are logging into your Self-Service portal, including the associated account and last login date. You can also include Self-Service fields in any custom contact report.
- The Helpful Solutions report displays statistics from Self-Service portals that display solutions. On each Self-Service solution page, customers can indicate whether the solution is helpful. You can use the results of this survey when choosing the top five solutions for your Self-Service Home page and to verify that customers are able to find the solutions they need.

SEE ALSO:

[Limit Report Results](#)

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

Fields Available for Case Reports

You can report on a number of key case fields in addition to the ones that are included in the standard and custom report types.

Cases	
Field	Description
# Cases Submitted	The number of cases submitted by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Cases Viewed	The number of cases viewed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Comments Added	The number of comments added to all cases by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
Entitlement Process Start Time	The time the case entered an entitlement process. This field displays if an entitlement process applies to the case.
Entitlement Process End Time	The time the case exited an entitlement process. This field displays if an entitlement process applies to the case.
Super User	A contact enabled to view case information, add comments, and upload attachments for all cases submitted via the Self-Service portal by anyone in his or her company. (Self-Service User Report)
Self-Service Commented>	A checkbox showing a comment was added to a case via the Self-Service portal.
New Self-Service Comment	A checkbox showing a comment has been added to a case via the Self-Service portal and has not been reviewed by the case owner.
Is Incoming	A checkbox showing a case was received by email via the Email-to-Case or On-Demand Email-to-Case feature. (Cases with Emails Report)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Cases

Field	Description
Age	The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case. Age can be expressed in days, hours, or minutes. Note that the age of a case does <i>not</i> take into account any holidays that are associated with the case's business hours. Holidays suspend business hours during specified dates and times.
Closed	A checkbox showing a case has a closed status.
Escalated	A checkbox showing a case was escalated by an escalation rule.
Public Case Commented	A checkbox showing a case has comments that may be displayed via the Self-Service portal.
Has Attachment	A checkbox showing a case with emails has attachments. (Cases with Emails Report)
Old Value	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
New Value	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
Business Hours	The number of business hours that have elapsed since a case was last updated. Note that holidays are <i>not</i> taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)
Business Hours Since Similar Change	The number of hours that elapsed since the same field on a case was last updated. Note that holidays are <i>not</i> taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)
History ID	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
Contact Account Name	The account associated with the contact on the case. View together with the <code>Account Name</code> field to see if the account on the case is different from the account on the contact.
Parent Case ID	The ID of a parent case, which can be used to access a parent case via the API.

Fields Available for Solution Reports

You can report on a number of key solution fields in addition to the standard and custom fields.

Field	Description
# Solution Searches	The number of solution searches performed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
Self-Service Access Count	The number of times a solution was viewed in the Self-Service portal.
Self-Service Answer Count	The number of times the survey question “Does this Solution help you answer your question?” is answered, either positively or negatively, on a solution in the Self-Service portal.
Self-Service Positive Count	The number of times the survey question “Does this Solution help you answer your question?” is answered positively on a solution in the Self-Service portal.
Author	The name of the user who originally created the solution.
Num Related Cases	The number of cases associated with the solution.
Reviewed	Checkbox that indicates whether the solution has a reviewed status.
Old Value	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
New Value	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
History ID	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
Language	The language in which the master solution is written.
Translation Language	The language in which the translated solution is written. (Translated Solutions report)
Solution ID	The unique identifier for each solution. (Translated Solutions report)
Out of Date	Checkbox that indicates that the translated solution may need translating to match its master solution. (Translated Solutions report)
Master Solution Title	The title of the master solution. Displays up to 250 characters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Field	Description
Translated Solution Title	The title of the translated solution. Displays up to 250 characters.
Master Solution Details	The solution details of the master solution. Displays up to 1000 characters.
Translated Solution Details	The solution details of the translated solution. Displays up to 1000 characters.

Pre-Designed Custom Report Types

Some Salesforce features come with custom report types that are designed for you in advance, so you don't have to create a new report.

 **Note:** Pre-designed custom report types are not the same as standard report types.

1. [Territory Reports](#)

Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

2. [Reports for Answers](#)

Create custom report types so users can analyze questions, replies, and votes.

3. [Salesforce CRM Call Center Reports](#)

Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.

4. [Create a Custom Report Type for Approval History](#)

Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.

5. [Reports That You Can Run on Activities](#)

Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

6. [Report on Sales Reps' Meetings with Customers](#)

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

7. [Create a Custom Report Type in Collaborative Forecasts](#)

To make a forecasting report available to users, administrators must create a custom report type. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

8. [Custom Report Types in Collaborative Forecasts](#)

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

9. [Idea Reports](#)

Create custom report types so users can create reports about ideas, idea comments, and votes.

10. [Report on Salesforce Knowledge Articles](#)

Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

USER PERMISSIONS

To run reports:

- "Run Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

11. [Live Agent Session Reports](#)

Use Live Agent Session reports to consolidate data about agents' activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.

12. [Report on Partners](#)

Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

13. [Report on Relationship Groups](#)

You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

14. [Enable the Account Owner Report](#)

The Account Owner report lists all accounts and who owns them.

15. [Report on File Search Activity](#)

Use a report to determine the top 300 search term queries for file searches and to identify which content is missing or needs to be renamed based on users' search terms and the click-rank.

Territory Reports

Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

Special Features of Territory Reports

Consider the following when running territory reports:

Standard Reports

- The territory report lists all territories in your organization. Select **No Users** in the `Users` drop-down list and click **Run Report** to see the territories in your organization that do not have any assigned users.
- The User Territory report, User Multiple Territory report, and User Missing Territory report summarize the users who have been assigned to any territories, more than one territory, or no territories, respectively.
- The Account Territory report, Account Multiple Territory report, and Account Missing Territory report summarize the accounts that have been assigned to any territories, more than one territory, or no territories, respectively.
- The Opportunity Territory report summarizes the opportunities that are in territories. To see opportunities owned by users who are not currently active in the opportunity's territory, customize the Opportunity Territory report with the following advanced filter: `Active in Territory` equals "False." The Opportunity Missing Territory report summarizes the opportunities that are associated with accounts that do not have a territory.
- Reports run from custom report types that include territories may display results differently than standard reports that include territories. This is because reports run from custom report types only display results *with* territories, such as accounts with territories, whereas standard reports that include territories may display results *without* territories. For example, if you select the Account Territory Report, results display accounts without territories. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

EDITIONS

Available in: Salesforce Classic

Territory management is available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud.

Tips for Territory Reports

- Standard and custom territory fields are available in territory reports. They are also available in account reports, activity reports that include accounts, opportunity reports, and user reports.

[The Report Run Page](#)

[Limit Report Results](#)

Reports for Answers

Create custom report types so users can analyze questions, replies, and votes.

-  **Note:** Answers is scheduled for retirement in all Salesforce orgs as of Winter '18 release. For more information, see [Chatter Answers to Retire in Winter '18](#). Starting with Summer '13, Answers isn't available in new orgs. Instead, you can use Chatter Questions, a Q&A feature that's seamlessly integrated into Chatter. With Chatter Questions, users can ask questions and find answers without ever needing to leave Chatter. Existing orgs will continue to have access to Answers if it was enabled before the Summer '13 release from now until Winter '18.

As an administrator, you can create custom report types so users can create reports about questions, replies, and votes. Custom report types are the only way to make reports about your answers community available for your users—Salesforce does not provide sample answers reports or a standard report folder for answers.

To create a folder of answers reports for your users:

1. Set up a custom report type for answers.
 - The primary object for your report is Questions.
 - There isn't a specific report category for answers, so you probably want to store your report in the Other Reports or Administrative Reports category.
 - When setting up object relationships, Questions can have a relationship with Replies, and Replies can have a relationship with Votes.
2. Create a new public folder for answers reports. This step requires the "Manage Public Reports" permission.
3. Using your custom report type, create one or more new custom reports for answers. Assign the reports to the new answers reports folder you created.

After completing these steps, a folder of answers reports is available to your users on the Reports home page.

[Reports Give You Access to Your Data](#)

EDITIONS

Available in: Salesforce Classic

Answers is available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

Salesforce CRM Call Center Reports

Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.

Special Features of Call Center Reports

Consider the following when running call center reports:

Standard Reports

- The My Team's Calls This Week gives you information about the calls that were handled by the call center users on your team during the past week, including associated records and the result of each call.
- The My Calls Today report gives you information about the calls that you initiated or received during the past day, including associated records and the result of each call.
- The My Calls This Week report gives you information about the calls that you initiated or received during the past week, including associated records and the result of each call.

Create a Custom Report Type for Approval History

Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. Fill out the fields.

For this field...	Do this...
Primary Object	Select Process Instance. A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.
Report Type Label	Enter a label. Users see this label when they create reports. Example: <i>Approval Process Instances</i>
Report Type Name	Enter a unique name for the report type.
Description	Enter a description. Users see this label when they create reports.
Store in Category	Select Administrative Reports. If you like, you may select a different category. This determines in which folder your users

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To run reports:

- "Run Reports"
- AND
- "Read" on the records included in report

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

For this field...	Do this...
	find the custom report type when they create approval history reports.
Deployment Status	When you're ready to let all users access the report type, select Deployed.

4. Click **Next**.
5. Click the box under the primary object.
6. Select Process Instance Node.

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn't meet the step criteria or if the approval process instance is otherwise completed without entering the step.

7. For the A to B relationship, select one of these options.

Option	Description
Each "A" record must have at least one related "B" record.	<p>The report includes only process instances that enter at least one approval step to create a process instance node.</p> <p>The report excludes process instances for records that were submitted for approval but that didn't meet any step criteria.</p>
"A" records may or may not have related "B" records.	The report includes all process instances.

8. Click **Save**.

After the report type is deployed, notify the relevant users with the names of the category folder and the custom report type, so that they can start creating and running approval history reports.

Reports That You Can Run on Activities

Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

To View This Information	Use This Report
Activities related to another record type, such as opportunities	Click Create New Custom Report on the Reports tab and select the Activities report type.
Number of contacts related to an activity	Activity reports. Add the <code>Relation Count</code> column to your reports. For example, you have a task with five contacts. When you run the Tasks and Events report, it displays "5" to indicate the number of contacts related to the task.
One row per contact for each activity	<p>The Activities with Contacts report. Select at least one field from the Contact object.</p> <p>For example, your report includes a task with five contacts. If you include the <code>Last Name</code> field from the contact object on the report, you see five rows (one row for each contact) related to this activity. If you don't add fields from the contact object, you see only one row for the activity.</p> <p>The Activities with Contacts report is the only report that:</p> <ul style="list-style-type: none"> • Displays all contacts on an activity • Can be filtered using attributes of contacts other than the primary contact <p>Other reports show the primary contact and the total number of contacts on an activity, but they don't show details of the other contacts.</p> <p>The Activities with Contacts report doesn't indicate which contacts are primary or secondary.</p>
An activity's primary contact in two different reports: Tasks and Events, and Activities with Cases	<p>Either the Tasks and Events report or the Activities with Cases report.</p> <p>For example, if the primary contact for a task is Ron Dean, these reports display that name in the <code>Contact</code> field.</p> <p>The primary contact also appears in the <code>Name</code> field on the task detail page or event detail page.</p>

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** Editions

Report on Sales Reps' Meetings with Customers

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
 - a. For Primary Object, choose **Users**.
 - b. Complete the remaining required fields: label, description, and category.
 - c. Click **Next**.
2. Define a relationship between activities and users.
 - a. Relate the Activity Relationships object to the Users object.
 - b. Click **Save**.
3. Define the fields that appear in this report type.
 - a. In the Fields Available for Reports section, click **Edit Layout**.
 - b. Add the following Activity Relationships fields to the layout: *Date*, *Subject*, *Name*, *Related To*, *Relation Count*.
 - c. Change the label for the *Name* field to *Contact* and for the *Related To* field to *Opportunity*.
 - d. For each field, select the option to display the field by default.
 - e. Click **Save**.
4. Create a report.
 - a. In the Reports tab, select the report type that you created in steps 1–3.
 - b. Choose **Summary Format**, and create a grouping by Full Name.
 - c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

 **Note:** If Shared Activities isn't enabled, custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

"Report Builder"

To view activities owned by you and users below you in the role hierarchy:

- No permissions needed

To view all activities:

- "View All Data"

Create a Custom Report Type in Collaborative Forecasts

To make a forecasting report available to users, administrators must create a custom report type. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

 **Note:** This information applies to Collaborative Forecasts and not Customizable Forecasts. To create a forecasting custom report type, enable Collaborative Forecasts.

1. Start creating a custom report type from Setup by entering *Report Types* in the *Quick Find* box, then selecting **Report Types** and **New Custom Report Type**.
2. For Primary Object, select a Forecasting object, such as Forecasting Items or Forecasting Quotas.
3. For Store in Category, select Forecasts.
4. Let your reps know the locations and names of the report types.

Custom Report Types in Collaborative Forecasts

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

 **Note:** This information applies to Collaborative Forecasts and not Customizable Forecasts. To create a forecasting custom report type, enable Collaborative Forecasts.

This table lists the forecasting custom report types that you can create.

Primary Object	Use to create a report for...
Forecasting Items	<p>Viewing information about forecasting amounts, including adjustment amount information. As a best practice, if you use a forecast type based on revenue, use these default fields in the report type.</p> <ul style="list-style-type: none"> • Owner Only Amount—The sum of a person’s revenue opportunities, without adjustments. For example, if you own two opportunities, each worth \$10,000, the Owner Only Amount is \$20,000. • Amount Without Adjustments—The sum of a person’s owned revenue opportunities and the person’s subordinates’ opportunities, without adjustments. Subordinates include everyone reporting up to a person

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To create or update custom report types:

- “Manage Custom Report Types”

To delete custom report types:

- “Modify All Data”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** (no custom field forecasts), **Enterprise, Performance, Unlimited,** and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Primary Object**Use to create a report for...**

in the forecast hierarchy. This amount is visible only on reports. For example, if the sum of the amount of all opportunities owned by you is \$20,000, and the sum of the amount of your subordinates' opportunities is \$55,000, the Amount Without Adjustments is \$75,000.

- **Amount Without Manager Adjustments**—The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and the owner's subordinates' opportunities, including adjustments made by the forecast owner on the owner's or subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy. For example, Anne has an Amount Without Adjustments of \$75,000, made up of \$20,000 of her own opportunities and \$55,000 of opportunities owned by Ben, her subordinate. She adjusts Ben's amount to \$65,000 for a total of \$85,000. If you adjust Anne's number from \$85,000 to \$100,000, you see \$85,000 in Amount Without Manager Adjustments, because Anne sees this amount (and Anne can't see your adjustments because you're her manager). To see the amount that includes your adjustment to \$100,000, look at Forecast Amount.
- **Forecast Amount**—The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments. For example, you're a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling \$85,000. If you adjust the forecast to \$100,000, the Forecast Amount is \$100,000.

If you use a forecast type based on quantity, use these default fields in the report type.

- Owner Only Quantity, Quantity Without Adjustments, Quantity Without Manager Adjustments, and Forecast Quantity

Regardless of whether you forecast based on revenue or quantity, add these fields.

- **Has Adjustment**—A checkbox that indicates whether a manager adjustment has been made on a forecast owner's amount.
- **Has Owner Adjustment**—A checkbox that indicates whether a forecast user has adjusted the user's own forecast amount.

If you use cumulative forecast rollups, add this field to your report.

- **ForecastingItemCategory**—This field indicates which rollup each forecast amount is for: Open Pipeline, Best Case Forecast, Commit Forecast, Closed Only, Pipeline, Best Case, Commit, or Closed. If you changed the forecast category names, those changes appear in the ForecastingItemCategory values.

Forecasting Items with Opportunities as a related object

Viewing opportunity information for specific forecasting line items. For example, you can create a summary report for each of your subordinates that includes the opportunity names and last activity dates for their forecasting items, with adjustment information and final forecast amounts.

-  **Note:** For opportunities with no opportunity products specified, this report type includes two forecasting items: one for the Opportunity-Revenue forecast type and one for the Product Family forecast type. These product family forecasting items roll up into the Products Not Specified row of the Product Family forecast.

Forecasting Items with Opportunity Splits as a related object

Viewing opportunity split information for specific forecasting line items. For example, you can create a summary report for each of your subordinates that includes the opportunity split amounts and percentages for their forecasting items, with adjustment information and final forecast amounts.

Primary Object**Use to create a report for...**

Forecasting Items
with Opportunity
Product as a related object

Viewing product family information for specific forecasting line items. For example, you can create a summary report for each of your subordinates that includes the product families and total price for their forecasting items, with adjustment information and final forecast amounts.

Note: This report type shows forecasting items only for the Product Family-Revenue and Product Family-Quantity forecast types. It includes opportunities with and without opportunity products specified.

Forecasting Quotas

Viewing data about individual or team quotas. As a best practice, include all the default fields in the report type. For example, you can include lookup fields, such as the full name of the owner. When running the report, you can filter by your name to see quotas that you created and their related accounts and owners.

Forecasting Quotas
with Forecasting
Items as a related object

Viewing quota attainment. For example, you can use Forecasting Quotas and Forecasting Items to create the custom report type. Then, when you create the report, include a team's quotas and forecasted revenue for closed forecasts and create a formula field to display the attained quota percentage.

Note: If you delete a forecast type, reports that use that forecast type don't run.

Idea Reports

Create custom report types so users can create reports about ideas, idea comments, and votes.

As an administrator, you can create custom report types so users can analyze what happens to ideas. Custom report types are the only way to make idea reports available for your users—Salesforce does not provide sample idea reports or a standard report folder for ideas.

To create a folder of idea reports for your users:

1. Create a custom report type for ideas.

If you create a custom report type that uses Ideas as the primary object and Votes as the secondary object, child (merged) ideas will not appear in the report unless you select "A" records may or may not have related "B" records. Child ideas have no votes because their votes are transferred to the master idea. This means child ideas do not appear in a report if the Votes object is required.

2. Create a new public folder for idea reports. This step requires the "Manage Public Reports" permission.
3. Using your custom report type, create one or more new custom reports for ideas. Assign the reports to the new idea reports folder you created.

After completing these steps, a folder of idea reports will be available to your users on the Reports home page.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

Report on Salesforce Knowledge Articles

Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

As an administrator, you can create custom report types so agents can create reports on Salesforce Knowledge articles. Custom report types are the only way to make reports about articles available for your readers. Salesforce does not provide sample article reports or a standard report folder for articles.

 **Tip:** The *Knowledge Base Dashboards and Reports* AppExchange package provides over two dozen reports that help you monitor the knowledge base and analyze usage metrics.

1. [Create a Folder for Article Reports](#)
Create a public folder where you can store article reports for your users.
2. [Article Reports](#)
Create a custom report type to report on Salesforce Knowledge article data.
3. [Create an Article Report](#)
Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.
4. [Fields Available on Salesforce Knowledge Reports](#)
The fields you can use in a knowledge report depend on the type of information you are reporting on.

Create a Folder for Article Reports

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Create a public folder where you can store article reports for your users.

1. In the Report Folder section of the Reports tab, click **Create New Folder**.
2. Enter *Article Reports* in the Folder Label field.
3. Optionally, modify the Group Unique Name.
4. Choose a Public Folder Access option.
Select read/write if you want users to be able to add and remove reports.
5. Choose a folder visibility option.
6. Click **Save**.

Reports you store in this folder are available on the Reports tab.

Article Reports

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Create a custom report type to report on Salesforce Knowledge article data.

To create a custom report:

1. From Setup, enter *Report Types* in the Quick Find box, then select **Report Types** and click **New Custom Report Type**.

See [Create a Custom Report Type](#) on page 411

2. In the Primary Object drop-down menu, select the article-related object you want to report on:

Primary Object	Description
Article types (Classic Knowledge only)	Compare information such as creation dates, published channels, and number of associated cases for your custom article type, such as an FAQ. To access any history and custom fields for the custom article type, add the article type's version as a secondary object.
Knowledge Articles	Compare information about individual articles, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics. In reports using the Knowledge Articles primary object, each article has five records (rows): one for each channel (All Channels, Internal App, Customer, Partner, and Public Knowledge Base).
Knowledge Article Searches	Analyze the number of searches per day, month, or year for each channel and role.
Knowledge Article Version	Compare information about individual translations, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics.
Article Version History	Compare information about individual article versions, such as their creation dates, published channels, and number of associated cases.
Knowledge Article Views	Analyze the number of views per day, month, or year for each channel and role.
Knowledge Article Votes	Analyze the number of votes per day, month, or year for each channel and role.
Knowledge Keyword Search	See which keywords users are looking for in your knowledge base.
Knowledge Search Activity	<ul style="list-style-type: none"> • Analyze the number of searches per day, month, or year for each channel and language. • For each search, see the: <ul style="list-style-type: none"> – Date – ID and title of the article that was clicked

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

- See which keywords users are looking for in your knowledge base.
- For each keyword, see the average number of:
 - Results
 - Articles that appear in the search results
- For each article, see the average number of:
 - Clicks
 - Unique users who clicked it

3. Complete the required fields and click **Save**.

In the Store in Category drop-down menu, we recommend choosing **Customer Support Reports** or **Other Reports**. This is the category where users find the custom report type on the Reports tab.

4. Make your choices on the Define Report Records Set page.

Primary Object	Available Secondary Objects
Article types (Classic Knowledge only)	Article type Versions
Knowledge Articles	Article View Statistics, Article Vote Statistics, Case Article
Knowledge Article Searches	None
Knowledge Article Version	Article View Statistics, Article Vote Statistics
Article Version History	None
Knowledge Article Views	None
Knowledge Article Votes	None
Knowledge Keyword Search	None
Knowledge Search Activity	None

5. Click **Save**.

6. As needed, remove and rearrange fields from your report layout.

To learn which fields are available on each primary object, see [Fields Available on Salesforce Knowledge Reports](#) on page 4403.

 **Note:** An article's score is calculated slightly differently in the API than it is in a custom report. We recommend standardizing on one or the other and not attempting to use both.

Create an Article Report

Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.

Using your [custom report types](#), create article reports and save them to your [article reports folder](#).

1. On the Reports tab, click **New Report**.
2. Choose the category where your custom report types are stored; for example, **Customer Support Reports** or **Other Reports**.
The Cases with Articles report is available by default in the Customer Support Reports folder.
3. Find your report type and click **Create**.
4. When viewing your report, click **Save As** and save it in the new Article Reports folder to make the report available to other users.

 **Note:**

- In reports using the Knowledge Article custom report type, there are at least five rows per article (one for each channel, including "All Channels").
- Daily values are reported independently for the last 90 days and monthly values for the last 18 months. After those time periods, use the monthly aggregate and yearly aggregate values, respectively.
- In reports using the Knowledge Article Votes, Knowledge Article Views, or Knowledge Article Searches custom report types, each row represents a day, channel, and role combination. For example, if a user with the Kingmaker role views articles in the internal app and the next day the same reader views more articles in the internal app, the Article Views report has two rows: one for each unique date.
- In reports using Knowledge Article Version (KAV), except Knowledge Article Version History, you can filter by data category. You can add up to four filters and set their logic to AT, ABOVE, BELOW, or ABOVE OR BELOW. The logic between filters is OR. You can use the same category group multiple times, however, you must use the same operator each time.
- To report on Approval Processes for Knowledge Articles, use **Process Instance** and **Process Instance Node** when creating a custom report type. Then filter the report on object type, which is the article type.

Fields Available on Salesforce Knowledge Reports

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

The fields you can use in a knowledge report depend on the type of information you are reporting on.

The following tables list the available fields by primary object for Salesforce Knowledge reports.

Fields Available on Article types (Classic Knowledge only) Reports

The Article Type primary object allows you to add a secondary object of the article type version.

Table 73: Article Type Report Primary Object Fields

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type ID	The ID associated with the article type.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (<code>__ka</code>) and Knowledge Article Version (<code>__kav</code>) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
First Published Date	Date the article was originally published.
Knowledge Article Version	The article's version number.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Master Language	The original language of the article.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

 **Note:** Currently you can't use Knowledge Article Version and Last Modified Date in the same report.

Table 74: Article Type Report Secondary Object Fields

Field	Description
Archived By	User who archived the article.
Article Type	The article type associated with the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
Custom fields	Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.
Is Latest Version	Indicates if the article is the most recent version.
Is Master Language	Indicates that the article is not a translation, but the original article.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).

Field	Description
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Articles Reports

Field	Description
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Last Published Date	Date the article was last published.
Summary	Description of the article provided by the author.
Title	The article's title.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.

Field	Description
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Searches Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.
Count	The number of article searches applicable to the duration shown (day, month, or year).
Cumulative Count	The total number of article searches for the history of the record.
Date	Last date on which an article search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record. Each row in the report represents searches per channel per role.

Fields Available on Knowledge Article Version Reports

Field	Description
Archived By	User who archived the article.
Archived Date	Date the article was archived.
Article Number	Unique number automatically assigned to the article.
Article Type	The article type associated with the article.
Case Association Count	Number of cases attached to the article.
Created By	User who created the article.
Created Date	Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.
First Published Date	Date the article was originally published.
Is Latest Version	Indicates if the article is the most recent version.
Is Master Language	Indicates that the article is not a translation, but the original article.

Field	Description
Knowledge Article Version ID	Unique ID automatically assigned to the article translation.
Language	The article's language.
Last Modified By	User who changed the article most recently.
Last Modified Date	Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.
Date the article was last published.	Date the article was last published.
Master Language	The original language of the article.
Out of Date	Indicates that the master article has been updated since this translation was published.
Publication Status	Indicates whether the article or translation is in progress (draft), published, or archived.
Summary	Description of the article provided by the author.
Title	The article's title.
Translation Completed Date	Date the translation was completed.
Translation Exported Date	Date the article was exported for translation.
Translation Imported Date	Date the translation was imported.
URL Name	Text used as hyperlink for the article.
Validation Status	Indicates if the article is valid or not.
Version Number	The version number of the article.
Visible in Customer	Indicates that the article is published in the Customer Portal.
Visible in Internal App	Indicates that the article is published in the internal app (Articles tab).
Visible in Partner	Indicates that the article is published in the partner portal.
Visible in Public Knowledge Base	Indicates that the article is published in the public knowledge base.

Fields Available on Knowledge Article Views Reports

You can add up to 6 of the 8 fields below.

Field	Description
Channel	The channel that's applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.

Field	Description
Count	The number of article views applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article views for the history of the record.
Date	Last date on which an article view took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.
Score	Article's average view rating. Scoresake into account a half-life calculation. Every 15 days, if an article has not been viewed its average rating moves up or down. This calculation ensures that over time, older or outdated articles don't maintain artificially high or low ratings compared to newer, more frequently viewed articles.
Total Views	Number of times a published article has been viewed.

Fields Available on Knowledge Article Votes Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Count	The number of article votes applicable to the duration shown (day, month, year).
Cumulative Count	The total number of article votes for the history of the record.
Date	Last date on which an article vote took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Related Role	Name of the role that applies to the record.

Fields Available on Knowledge Keyword Search Reports

Field	Description
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Count	The number of keyword searches applicable to the duration shown (day, month, year).

Field	Description
Date	Last date on which a keyword search took place for the record. All rows represent a date, channel, and role combination.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Found	Indicates whether the keyword shown was found during a search of the knowledge base.
Keyword	Search term used to search published articles in the knowledge base.

Fields Available on Knowledge Search Activity Reports

Field	Description
Average Click Rank	The order in which the article appeared in search results when results are sorted by relevance and when readers clicked it from the list of results.
Channel	The channel that's applicable to the article. Possible values are <code>All Channels</code> , <code>Internal App</code> , <code>Customer</code> , <code>Partner</code> , and <code>Public Knowledge Base</code> .
Clicked Article Title	The title of the clicked article taken when the search results are sorted by relevance by the reader.
Duration	The time period the search count is applied to. Possible values are <code>Daily</code> , <code>Monthly</code> , and <code>Yearly</code> . For example, a record where the Count is 70 and the Duration is <code>Monthly</code> indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.  Note: Activity totals are collected nightly and aren't in real time.
Language	The language filter that's applied to the reader's search.
Number of Results	The number of search results that were returned for the search term. If Duration is also included, this value is aggregated based on the time period specified.
Number of Searches	The number of searches for the duration that's shown (day, month, or year).
Number of Users	The number of individual users who clicked the article.
Search Date	The date of the search.
Search Term	The first 100 characters of the search term that was used to search published articles in the knowledge base.

Create a Salesforce Knowledge Search Activity Custom Report Type: Walkthrough

This walkthrough guides you through building a custom report type that supports the Knowledge Search Activity object. This data helps knowledge managers identify ways to monitor content performance and to deliver the most relevant content to end users.

Create a Knowledge Search Activity Report Type

This enables your users to create reports with the Knowledge search fields they need to monitor the performance of their content.

[Walk through it: Knowledge Search Activity Custom Report Type](#)

1. Click **New Custom Report Type**.
2. Select Knowledge Search Activity.
3. Enter a name for the report type.
Your users will select the report type by this name when they use it to create a new report.
4. Enter a description.
This helps your users identify the business objective of this new report type. You might want to enter, "Monitor the performance of your knowledge article content in search results."
5. Select a category.
This is where your users will find the new report type when they create new reports.
6. Select **Deployed**.
We'll get it active right away.
7. Click **Next**.
Don't worry, we're almost done.
8. Click **Save**.
9. Click **Edit Layout**.
Customize the fields that are available on reports built using this report type.

EDITIONS

Available in: Salesforce Classic, Lightning Experience

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Professional**, **Enterprise**, and **Unlimited** Editions.

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To create a public reports folder:

- "Manage Public Reports"

Live Agent Session Reports

Use Live Agent Session reports to consolidate data about agents' activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. You can create a custom report type for Live Agent sessions to aggregate data about your agents' activity while they support customers. These reports include data for all of the chats that occurred during a specific Live Agent session.

Customize Live Agent session reports to include columns of information about any of the following categories, as well as any custom fields related to Live Agent sessions:

Column Name	Description
Agent: Full Name	Name of the agent associated with the session.
Assistance Flags Lowered (Agent)	Number of times an agent lowered an assistance flag during a Live Agent Session.
Assistance Flags Lowered (Supervisor)	Number of times a supervisor lowered an assistance flag during an agent's Live Agent Session.
Assistance Flags Raised	Number of times an agent raised an assistance flag during a Live Agent Session.
Chat Requests Assigned	Number of chat requests assigned to an agent.
Chat Requests Declined (Manually)	Number of chat requests declined manually by an agent.
Chat Requests Declined (Push Timeout)	Number of chat requests that timed out while assigned to an agent.
Chat Requests Engaged	Number of chats in which an agent was engaged during the session.
Created By: Full Name	Full name of the creator of the session record.
Created Date	Date the session record was created.
Last Modified By: Full Name	Full name of the person who last modified the session record.
Last Modified Date	Date the session record was last modified.
Live Agent Session ID	ID of the Live Agent session record.
Live Agent Session Name	Automatically generated ID of the Live Agent session.
Login Time	Time and date the agent logged in to the session.
Logout Time	Time and date the agent logged out of the session.
Time Idle	Total amount of time in seconds an agent was not engaged in chats during a session. The following formula indicates how an agent's idle time is calculated: (Time Spent Online + Time Spent Away) - Time Spent in Chats = Time Idle.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: **Performance** Editions and in **Developer** Edition orgs that were created after June 14, 2012

Live Agent is available in: **Unlimited** Edition with the Service Cloud

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Time Spent at Capacity	Total amount of time in seconds in which an agent's queue was full.
Time Spent Away	Total amount of time in seconds an agent spent in "Away" status.
Time Spent in Chats	Total amount of time in seconds an agent spent engaged in chats.
Time Spent Online	Total amount of time in seconds an agent spent online.

Report on Partners

Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

To report on all partnerships or primary partnerships within opportunities:

1. From the Reports tab, choose the Partner Opportunities report.
2. Choose **Customize** to change the report and view only primary partner relationships. Add a field filter where *Primary equals 1*.

In any other opportunity report, when you customize the report to display the Partner column, only the primary partner displays.

You can also run the Partner Accounts report to analyze the partnerships of your accounts.

Report on Relationship Groups

You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

Custom report types are the only way to make relationship group reports available for your users—Salesforce does not provide sample relationship group reports or a standard report folder for relationship groups.

Administrators can create a public folder of relationship group reports as follows:

1. Create a custom report type for relationship group objects.

 **Tip:** To create a report type about the members of relationship groups, select `Relationship Groups` as the primary report type object and add `Relationship Group Members` as an object relationship. Alternatively, to create a report type about the accounts that are primary on a relationship group, select `Accounts` as the primary report type object and add `Relationship Groups (Primary Account)` as an object relationship.

2. Create a new public folder for relationship group reports. This step requires the "Manage Public Reports" permission.
3. Using your custom report type, create one or more new custom reports for relationship groups. Assign the reports to the new relationship groups reports folder you created.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To report on partners:

- "Read" on accounts or opportunities
- AND
- "Run Reports"

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

After completing these steps, a folder of relationship group reports will be available to users on the Reports home page.

Enable the Account Owner Report

The Account Owner report lists all accounts and who owns them.

Organizations that have their organization-wide sharing access level set to Private for accounts may want to restrict users from running the Account Owner report.

To show or hide this report:

1. From Setup, enter *Account Owner Report* in the **Quick Find** box, then select **Account Owner Report**. This option is available only in organizations that have a private account sharing model.
2. Select the checkbox to allow all users to run this report. If you leave the box unchecked, only administrators and users with the “View All Data” permission can run this report.
3. Click **Save**.

Report on File Search Activity

Use a report to determine the top 300 search term queries for file searches and to identify which content is missing or needs to be renamed based on users’ search terms and the click-rank.

User Permissions Needed	
To create or update custom report types:	“Manage Custom Report Types”
To create a public reports folder:	“Manage Public Reports”
To run the File Search Activity report:	“Run Reports” AND “View All Data” OR “Content Administrator”. Users with “Manage Library” for the library don’t need the “View All Data” or “Content Administrator” permissions to run the report.

Custom report types are the only way to make reports about file search activity available for your users—Salesforce does not provide sample file search activity reports or a standard report folder.

 **Note:** Activity totals are collected nightly and aren’t in real time.

 [Walk Through It: Report on File Search Activity](#)

Primary Object for File Search Activity Report

When you create a custom report type, select **File Search Activity** for the **Primary Object**.

Available File Search Activity Report Fields

The following table lists the available fields for File Search Activity reports.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions.

USER PERMISSIONS

To show or hide account owner report:

- “Customize Application”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Salesforce Files available in: **All** editions, **except** Customer Portals

Field	Description
Average Click Rank	The order in which the file appeared in search results when users clicked it from the list of results.
Average Number of Results	The number of search results that were returned for the search term. If Duration is also included, this value is aggregated based on the time period specified.
Duration	The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.
Language	The language filter that's applied to the user's search.
Number of Searches	The number of searches for the duration that's shown (day, month, or year).
Number of Users	The number of individual users who clicked the file.
Search Date	The date of the search.
Search Terms	The first 100 characters of the search term that was used to search published files.

[Create a Report](#)

Choose a Report Format

A report can use the tabular, summary, matrix, or joined format. Choose a format that's complex enough to capture the data you want to show, but simple enough to communicate it effectively.

Choose one of the following report formats using the **Format** menu of the report builder. Tabular format is the default.

Format	Description
Tabular	Tabular reports are the simplest and fastest way to look at data. Similar to a spreadsheet, they consist simply of an ordered set of fields in columns, with each matching record listed in a row. Tabular reports are best for creating lists of records or a list with a single grand total. They can't be used to create groups of data or charts, and can't be used in dashboards unless rows are limited. Examples include contact mailing lists and activity reports.
Summary	Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by <code>Stage</code> and <code>Owner</code> . Summary reports with no groupings show as tabular reports on the report run page.
Matrix	Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date <i>and</i> by product, person, or geography. Matrix reports without at least one row and one column grouping show as summary reports on the report run page. 🔗 Building Matrix Reports (Salesforce Classic)
Joined	Joined reports let you create multiple report blocks that provide different views of your data. Each block acts like a "sub-report," with its own fields, columns, sorting, and filtering. A joined report can even contain data from different report types. Joined reports are available only in Enterprise, Performance, Unlimited, and Developer Editions. 🔗 Introducing Joined Reports in Salesforce (Salesforce Classic)

Changing the Report Format

Changing the format affects filters and groupings, as follows:

When you change...	What Happens?
Tabular to Summary or Matrix	The <code>Rows to Display</code> filter is removed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

When you change...	What Happens?
Summary, Matrix, or Joined to Tabular	All groupings, charts, and custom summary formulas are removed from the report. Grouping fields are not converted to columns in the tabular report. If the joined report contained multiple blocks, the columns from only the first block are included in the tabular report.
Summary to Matrix	The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. If you're using the report wizard, the third summary grouping is removed.
Matrix to Summary	The first row grouping becomes the first summary grouping. The second row grouping becomes the <i>third</i> summary grouping. The first column grouping becomes the <i>second</i> summary grouping. The second column grouping is removed. If you're using the report wizard, <i>both</i> the second row grouping and second column grouping are removed.
Tabular, Summary, or Matrix to Joined	The existing report becomes the first block in the joined report, and the report type becomes the principle report type for the joined report. Joined report blocks are formatted as summary reports, so if you switch from a summary to a joined report, your groupings stay the same. If you switch from a matrix to a joined report, groupings are converted the same way as when you switch from a matrix to a summary report. The following items aren't supported in joined reports, and aren't converted: <ul style="list-style-type: none"> • Bucket fields • Cross filters • The Rows to Display filter

SEE ALSO:

[Build a New Report](#)

Create a Report

Create a report to get an up-to-the-minute view of an aspect of your business, such as the status of customers, opportunities, support cases, and so on.

To create a new report:

1. From the Reports tab, click **New Report**.
2. Select the report type for the report, and click **Create**.
3. Customize your report, then save or run it.

SEE ALSO:

[Customizing Reports](#)

Creating a Custom Report

You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

Users with the “Manage Custom Report Types” permission can define custom report types that extend the types of reports from which all users in their organization can create or update custom reports. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Users with the “Manage Reporting Snapshots” permission can create and schedule snapshots. A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”

Create a Custom Report in Accessibility Mode

 **Note:** This topic only applies if you're not using report builder. *Report builder* is a visual editor for reports.

To create a new custom report using the custom report wizard:

1. From the Reports tab, choose the **Create New Custom Report** button.
2. Select the type of data for the report, and click **Next**.

To create reports on custom objects, choose the **Other Reports** report type category, unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object or is a lookup object on a standard object, select the standard object for the report type category instead.

To create reports on an external object, choose the **Other Reports** category. To create reports on an external object with a child standard or custom object, select the category containing the custom report type that you created for that relationship.

3. [Choose the report format.](#)
4. Follow the steps of the wizard using the **Next** button. For each report, customize the following:

- **Specify Row and Column Headers:** On the Select Grouping page for summary and matrix reports, choose the fields by which you want to group and subtotal the data. In a summary report, choosing more than one sort field allows you to sub-sort your data. For matrix reports, select summary fields for the row labels and column headings. When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.

 **Note:** On the Select Grouping page, if you set `Group Dates By` to "Calendar Month in Year" or "Calendar Day in Month," you won't be able to drill down to those date groupings in reports or dashboards. Users are taken to the unfiltered report instead.

- **Summarize Data:** On the Select Columns to Total page, choose the types of summary information to display for numeric fields.
- **Build Custom Summary Formulas:** On the Select Columns to Total page for summary and matrix reports, create custom summary formulas to calculate additional totals based on existing report summaries. A formula is an algorithm that derives its value from other fields, expressions, or values. See [Build a Custom Summary Formula](#) on page 4428.
- **Choose Fields:** On the Select Columns page, choose the fields to display in the report. You can display only those fields that are visible in your page layout and field-level security settings. If you choose the `Description` field or any other long text field, only the first 255 characters are displayed.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- **Order Columns:** On the Order Columns page, select the order for displaying the chosen fields.
- **Limit Report Results:** On the Select Criteria page, choose the appropriate settings from the drop-down lists, then use the filter options filter options to limit the report to records with specific data.

The report wizard supports up to 10 filters. On reports with more than 10, additional filters are dropped and the report shows an error for any filter logic.

 **Tip:** To use a tabular report on a dashboard, first limit the row count, by setting the `Rows to Display` option, the sort column, and the order on the Select Criteria page of the report. You can't use gauge or metric components on dashboards using tabular reports.

- **Chart Settings:** On the Select the Chart Type and Report Highlights step of the report wizard, [set chart properties](#) to display your report data in a chart. Charts are available only for summary and matrix reports.

5. Click **Run Report** to view the report, or click **Export Details** to save the report as an Excel file or other format.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

- Tip:** Customizing your reports can require running them a few times as you adjust the report criteria and options. We recommend using a filter that gives you a smaller sampling of data until you are finished customizing the report and ready to save.

Group Your Report Data

Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

Data for Grouping

The Fields pane displays fields from the selected report type, organized by folder. Before you group data in a summary report, drag and drop at least a few fields into the preview pane.

Add a Grouping

Add a group by dropping a field onto a drop zone.

Click **Show > Drop Zones** to make them visible. You can also click a column menu for a field in the report and choose **Group by this Field**.

- Tip:** If you group your report by a date field, you can click the group menu, select **Group Dates By**, and specify the grouping time frame: day, week, month, quarter, year, etc.

Grouping Data in Different Report Formats

Summary and joined reports can have up to three grouping levels. Matrix reports can have two row and two column groupings. For matrix reports, you can't use the same field for both row and column groupings. For joined reports, you can use the fields from the Common Fields category in the Fields pane to group across all report blocks.

Remove a Grouping

To remove a group, click the group menu and choose **Remove Group**. You can also grab the group and:

- Drag it to the column bar to remove the group, but keep the field as a column in the report.
- Drag it back to the Fields pane to remove the group and the field from the report.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

Change Order of a Grouping

Drag groups to change their order, or click the group menu and choose **Move Group Up** or **Move Group Down** for column groupings, or **Move Group Left** or **Move Group Right** for row groupings.

[Report Fields](#)

[Subtotal Report Results](#)

Keep Working While Your Report Preview Loads

For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

The data you see in the Preview panel is real data, but it's only a subset of the data in the report, designed to show you what the report will look like when you run it. Don't worry if rows are missing or not sorted as expected in the Preview panel.

 **Note:** For each external object in the report, your org calls out to the external system each time the preview loads. If the URL of a report callout approaches or exceeds 2 KB, your org splits the request into multiple HTTP calls, with each URL being less than 2 KB.

You can continue working in the report preview while the following actions occur:

- Add, remove, or reorder fields
- Add or remove summary fields
- Add, remove, or reorder groupings
- Remove formulas

 **Note:**

- If you remove a summary field or formula used in a chart, the chart reloads, but the report preview loads asynchronously.
- Asynchronous loading isn't available for matrix and joined reports.

You can't work in the report preview while the following actions occur:

- Add or edit formulas
- Remove a report's only grouping
- Remove a column used to [limit the row count](#) for a tabular report
- Sort the report by group or column
- Update standard or custom filters
- Change report format
- Show or hide report details
- Add or remove a chart
- Add or remove conditional highlighting
- Change **Group Dates By**
- Change a converted currency field

- [Save the report](#)

[Report Fields](#)

Customizing Reports

Report builder is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.

To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Fields Pane (1)

The Fields pane displays fields from the selected report type, organized by folder. Find the fields you want using the Quick Find search box and field type filters, then drag them into the Preview pane to add them to the report.

Create, view, edit, and delete custom summary formulas and bucket fields in the Fields pane as well.

In the joined report format, the Fields pane displays fields from all report types added to the report, organized by report type.

Filters Pane (2)

Set the view, time frame, and custom filters to [limit the data](#) shown in the report.

Preview Pane (3)

The dynamic preview makes it easy for you to customize your report. Add, reorder, and remove columns, summary fields, formulas, groupings, and blocks. Change the report format and display options, or add a chart.

The preview shows only a limited number of records. Run the report to see all your results.

Watch a Demo: [▶ Getting Started with Report Builder \(Salesforce Classic\)](#)

[Create a Report](#)

[Build a New Report](#)

Report Fields

The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

Adding Field Filters

With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.

Finding Fields

Find a field by typing its name into the Quick Find search box. You can also filter the list by type:

- Click  to see all field types, as well as custom summary formulas.
- Click  to see just text fields.
- Click  to see just number fields (numeric, percentage, or currency).
- Click  to see just date fields.

Adding and Removing Fields

To add a field to a tabular, summary, or matrix report, double-click it or drag it into the Preview pane. To add a field to a joined report, drag it to the Preview pane. Press **CTRL** to select multiple fields. Drag an entire folder to add all its fields. If a tabular, summary, or matrix report already contains a field, you can't add it again. You can add the same field multiple times to a joined report as long as you add it to different blocks. In the preview pane, click **Show > Details** to see your report fields. While **Show > Details** is disabled, you can only add summary fields.

To remove a field, grab its column header and drag it back to the Fields pane. With tabular, summary, and matrix reports, you can click the column menu and choose **Remove Column**, or click **Remove All Columns**.

Working with More than One Field

You can select multiple fields to add, remove, or reorder. For example, you can add **Created By**, **Type** and **Opportunity Name** to your report at the same time.

To select multiple fields or columns, press **CTRL** (Windows) or **Command** (Mac).

Note:

- When you add multiple fields, they appear in the report in the order selected.
- For summary and tabular formats, disable **Show > Details** when adding multiple summarizable fields to a report. The Summarize dialog automatically appears, letting you select summaries for all the fields at once.
- Enable **Show > Details** when adding non-summary fields, such as text fields to a report.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

- When working with a joined report, you can select multiple fields from the Common Fields category and one report type. You can't select multiple fields from different report types.

Ordering and Sorting Fields

Reorder report columns by grabbing a column header and dragging it to a new location. Press **CTRL** to select multiple columns. To sort your report by a column, click its column header. You can also click the column menu and choose **Sort Ascending** or **Sort Descending** from the drop-down list. Sort is disabled when **Show > Details** isn't selected.

Changing the Currency Displayed

If your organization has enabled multiple currencies, you can change the currency shown for all currency fields. Click **Show > Display Currencies Using**, then select an active currency to display.

SEE ALSO:

[Work with Formulas in Reports](#)

[Group Your Report Data](#)

[Summarize Your Report Data](#)

[Highlight Data Ranges](#)

Summarize Your Report Data

A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

The Fields pane displays fields from the selected report type, organized by folder.

A summary is the **Sum**, **Average**, **Max**, or **Min** for a number field. (Use the  filter to find them faster.)

To add a summary field:

- Double-click a number field in the Fields pane.
- Drag a number field into the preview. Press **CTRL** to select multiple fields. For matrix reports, there are drop zones before, between, and after sets of summaries. For example, the sum, average, max, and min of **Annual Revenue** are a set, and you can't drop a new summary field between them.
- Choose **Summarize this Field** in the column menu for a field already in the report.

To change an existing summary field, or add other summaries on that same field, click  next to the summary field and choose **Summarize this Field**.

To remove a summary field:

- Click its menu and choose **Summarize this Field** and deselect all options.
- Click its menu and choose **Remove Summary**.
- Drag the summary set back to the Fields pane. Note that all summaries for that field are removed. Press **CTRL** to select multiple summary fields.

Reorder sets of summary fields in matrix reports by dragging them. The summaries for each field move together when dragged. For example, if your report contains the sum and average of **Annual Revenue**, and the max and min of **Probability**, you can drag

EDITIONS

[Report Fields](#)

[Subtotal Report Results](#)

Subtotal Report Results

Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

For example, if you subtotal a summary report by Opportunity Owner, the report groups the accounts by Opportunity Owner, lists the number of opportunities owned by each user, and shows subtotals by Opportunity Owner for all the columns in the report. You could further subtotal each user's opportunities by product.

1. Click **Customize** or **Edit** from any report.
2. In the report builder, [add a summary field](#) to the report. Summaries show up at grouping levels as well as for individual rows.

SEE ALSO:

[The Report Run Page](#)

[Build a Custom Summary Formula](#)

[Build a New Report](#)

[Subtotal Report Results](#)

Smart Totaling in Reports

"Smart" totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses "smart" totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

For example, suppose an opportunity has two products, and you run the Opportunity Product Report with the total opportunity amount selected as a column to sum by. The amount appears twice in the details of the report, once for each product on the opportunity.

In this case, "smart" totaling correctly calculates any subtotals, grand totals, and averages, adding that opportunity amount only once.

 **Note:** For dashboard components, "smart" totaling isn't used. For example, in a dashboard table, the total displayed is simply the sum of the values listed in the table.

Work with Formulas in Reports

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

The Fields pane displays fields from the selected report type, organized by folder.

To add a new formula to a summary or matrix report, double-click **Add Formula**. Once you define it and click **OK**, it's automatically added to the preview as a column for summary reports, and a summary field for matrix reports. With joined reports, you can add either a cross-block or a standard custom summary formula. To edit a formula, hover over the name in the Fields pane and click .

To remove a formula from the preview, grab its header and drag it back to the Fields pane, or click its menu and choose **Remove Formula**. Press **CTRL** to select multiple formulas. Removing a formula from the preview doesn't delete it. To delete a formula, hover over the name and click , or click **Delete Formula** from the field menu.

Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.

1. [Build a Custom Summary Formula](#)

Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

2. [Use a Summary Function in a Custom Summary Formula](#)

Summary functions let you use grouping values in custom summary formulas for summary, matrix, and joined reports. There are two summary functions: `PARENTGROUPVAL` and `PREVGROUPVAL`.

3. [PARENTGROUPVAL and PREVGROUPVAL](#)

Use `PARENTGROUPVAL` to calculate values relative to a parent grouping. Use `PREVGROUPVAL` to calculate values relative to a peer grouping.

4. [Get the Most Out of Custom Summary Formulas](#)

Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

Build a Custom Summary Formula

Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

A formula is an algorithm that derives its value from other fields, expressions, or values. Custom summary formulas can contain 3900 or fewer characters. Custom summary formulas are available for summary, matrix, and joined reports. They can't be shared across multiple reports.

1. In report builder, click **Add Formula** in the Fields pane.
 2. Enter a name for your formula as it will appear on the report. The label must be unique. Optionally, enter a description.
 3. From the **Format** drop-down list, select the appropriate data type for your formula based on the output of your calculation.
 4. From the **Decimal Places** drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the **Decimal Places** for your currency setting apply. If you select **None** for **Decimal Places**, the effective values are:
 - For currency, displays up to 18 digits, with the default decimal-place precision for the currency
 - For percentages, displays up to 18 digits, with no decimal places
 - For numbers, displays up to 18 digits, without changing the decimal-place precision
 5. Set the **where will this formula be displayed?** option. The formula calculation will be displayed in the report at the level you select. To display the formula calculation at every level, including the Grand Total, select **All summary levels**.
 6. Build your formula:
 - a. Select one of the fields listed in the **Summary Fields** drop-down list. This field's value is used in your formula.
 - b. Select the kind of summary type to use in your formula. This option is not available for **Record Count**

Summary Type	Description
Sum	The summary value of data in a field or grouping of fields.
Largest Value	The largest value of data in a field or grouping of fields.
Smallest Value	The smallest value of data in a field or grouping of fields.
Average	The average of data in a field or grouping of fields.
 - c. Click **Operators** to add operators to your formula.
 - d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click **Insert**.
 - e. Repeat these steps as necessary.
7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.

EDITIONS

Use a Summary Function in a Custom Summary Formula

Summary functions let you use grouping values in custom summary formulas for summary, matrix, and joined reports. There are two summary functions: `PARENTGROUPVAL` and `PREVGROUPVAL`.

- Double-click **Add Formula** in the Fields pane.
- In the Custom Summary Formula dialog, under Functions, select *Summary*.
- Select `PARENTGROUPVAL` or `PREVGROUPVAL`.
- Select the grouping level and click **Insert**.
- Define the formula, including where to display the formula.
- Click **OK**.

SEE ALSO:

- [Work with Formulas in Reports](#)
- [PARENTGROUPVAL and PREVGROUPVAL](#)

`PARENTGROUPVAL` and `PREVGROUPVAL`

Use `PARENTGROUPVAL` to calculate values relative to a parent grouping. Use `PREVGROUPVAL` to calculate values relative to a peer grouping.

PARENTGROUPVAL

Use this function to calculate values relative to a parent grouping.

Description: This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.

Use: **Summary and Joined:** `PARENTGROUPVAL(summary_field, grouping_level)`

Matrix: `PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping)`

Where `summary_field` is the summarized field value, `grouping_level` is the parent level for summary reports, and `parent_row_level` and `parent_column_level` are the parent levels for matrix reports.

Example:

```
TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY)
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports”
- AND
- “Report Builder”

This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by `Product Name`.

PREVGROUPVAL

Use this function to calculate values relative to a peer grouping. If there's no previous grouping, the function returns a null value.

Description: This function returns the value of a specified previous grouping. A "previous" grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

Use:

```
PREVGROUPVAL(summary_field, grouping_level [, increment])
```

Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.

Example:

```
AMOUNT:SUM - PREVGROUPVAL (AMOUNT:SUM, CLOSE_DATE)
```

This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by `Close Date` and rows by `Stage`.

Example: Three Week Moving Average

To calculate a three-week moving average of opportunity amounts:

```
(OppProductTrends__c.Amount__c:SUM+ PREVGROUPVAL (OppProductTrends__c.Amount__c:SUM,  
OppProductTrends__c.as_of_date__c) + PREVGROUPVAL (OppProductTrends__c.Amount__c:SUM,  
OppProductTrends__c.as_of_date__c,2) ) /3
```

[Work with Formulas in Reports](#)

[Build a Custom Summary Formula for a Joined Report](#)

Get the Most Out of Custom Summary Formulas

Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

Functions for use with custom summary formulas in reports are available under the function category. Select a function, then click **Help on this function** for information.

- A summary formula can't reference another summary formula.
- Regardless of the summary formula data type, your summary formula can contain fields of different data types, including: number, currency, percent, and checkbox (true/false) fields. For example, a summary formula in an Opportunities with Partners report can reference opportunity `Amount or Stage Duration`, as well as account `Annual Revenue`.
- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- When a field is deleted or is unavailable (for example, because of field-level security), all custom summary formulas that contain the field are removed from the report.
- The summary types `Sum`, `Largest Value`, `Smallest Value`, and `Average` are not available for use with the `Record Count` field.
- The `Smallest Value` summary type includes blank (null) or zero values in the summary formula calculation if these values are present in your report data.
- The `Largest Value` summary type includes the largest blank (non-null) value present in your report data.
- Percents are represented as decimals in summary formulas. 20% is represented as 0.20.
- Operators can be used to give fields in summary formulas a negative value. For example: `{ !EMPLOYEES : SUM } + - { !SALES : SUM }`.
- For custom summary formulas on matrix reports, Salesforce calculates results for all formulas where the `where will this formula be displayed?` option is not set to `All summary levels`. The formula determines the value returned. If null is returned, the cell will be empty.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits. Summary fields of 21 digits will display precisely, but more than 21 digits may not be precise. If `"#Too Big!"` appears in report cells, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- Formulas treat blank (null) report cells as zero values.
- `"#ERROR!"` displays on report cells whenever an error occurs while calculating a formula's value. `"#ERROR!"` also displays when formulas divide by zero. To resolve the error, check your formula and provide an alternative value.
- Cross-block custom summary formulas are available for joined reports.

[Build a Custom Summary Formula for a Joined Report](#)

Save Your Report

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

1. Verify the name, description, and folder, then choose where to go next:

- Click **Save** to save the report and go to the Reports home page
- Click **Save & Return to Report** to save it and go back to the report run page.

 **Note:** To save your report at a specific role hierarchy drill-down level on sales, forecast, opportunity, and activity reports, select *Save Hierarchy Level*.

 **Tip:** If you add a colon to your report name, it displays in two separate lines when you view the report. Use this to categorize reports by name, or better display long names. For example, if you enter *First Line: Second Line* for Report Name, you'll see this on the run page:

Report on Historical Changes

On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

 **Note:** Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.

1. [Track Changes in Your Sales Pipeline](#)

A historical report can help you monitor your company's sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

2. [See How Forecast Amounts Have Changed](#)

Let's build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

3. [Track History for Cases](#)

Monitor activity across cases and identify your case status changes in the last three months of a case's life cycle.

4. [Learn about Historical Trend Reporting](#)

Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.

5. Limitations on Historical Trend Reporting

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

Track Changes in Your Sales Pipeline

A historical report can help you monitor your company's sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

You'll probably want to compare historical and current values of key attributes of opportunities, such as dates, amounts, and status, to see how your pipeline has changed over time. For example, this summary report points out opportunity amounts and close dates that have changed since yesterday.

Opportunity Name	Amount (Historical)		Close Date (Historical)	
	Yesterday	Today	Yesterday	Today
Acme	\$26,000	\$16,000	2/15/2013	2/28/2013
Advanced Interconnections Corp* - 32K	\$18,000	\$20,000	2/28/2013	2/28/2013
Advanced Interconnections Corp* - 8K	\$12,000	\$8,000	2/15/2013	2/28/2013
Allied Technologies - 40K	\$30,000	\$39,000	2/15/2013	2/15/2013
Data Solutions	\$10,000	\$3,000	2/28/2013	2/28/2013
DFC Inc. - 50K	\$55,000	\$45,700	2/15/2013	2/28/2013
Eastern Shipping	\$21,500	\$21,500	2/28/2013	2/28/2013

1. Snapshot up to five dates to track day-to-day or week-to-week trends.
2. Current and historical values are shown side by side for easy comparison.
3. Changed dates and amounts are highlighted in red or green.

1. Watch Your Pipeline Change Over Time

Let's say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

2. Identify Historical Deals Over a Given Value

Suppose you want to focus only on deals in your pipeline worth more than \$5,000, but you're not concerned about today's fluctuations. You'll need a historical trending report that filters out any deal whose value was below \$5,000 yesterday.

3. Find Deals that Have Been Pushed Out

To focus on deals that are taking more time to close than expected, create a historical trending report that finds deals in your pipeline that have had their close dates moved to a later date.

4. Identify Shrinking Deals

Historical trending analysis can help you prioritize by quickly identifying deals that may be at risk. For example, target the deals in your pipeline that have decreased in value since yesterday. You'll need a historical trending report that gives you the deals whose value yesterday was greater than their value today.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Watch Your Pipeline Change Over Time

Let's say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

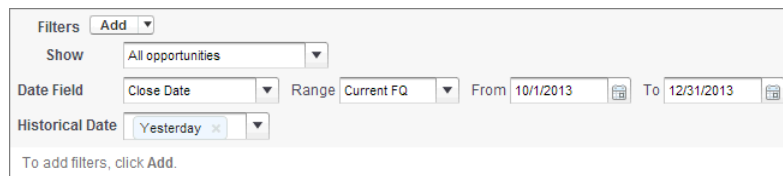

1. Create an opportunity history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Opportunities**, select *Opportunities with Historical Trending*.

In order to see *Opportunities with Historical Trending*, turn on Historical Trend Reporting for Opportunities in the Salesforce Setup. To learn how to turn on Historical Trend Reporting for Opportunities, see *Set Up Historical Trend Reporting* in the Salesforce help.

- c. Click **Create**.
2. For Show, select *All Opportunities*.

Note that the default value in the **Historical Date** field is *Yesterday*, and the **Amount (Historical)** field shows yesterday's date.

 **Tip:** "Yesterday" is a *rolling* date value, meaning that it points to a date that is relative to today's date. If you run this same report tomorrow, **Amount (Historical)** will show today's date.

3. Click the down arrow in the headers of the **Amount (Historical)** and the **Amount—Today** columns. Click *Summarize This Field*, then select *Sum*.
The total amount appears at the bottom of each column.
4. Click the down arrow in the header of the **Amount** column and select *Show Changes*.
5. Click **Run Report**.
6. In the **Change** column, observe the difference between the total value of the **Amount (Historical)** column and that of the **Amount—Today** column.

 **Tip:** You can see changes at a glance by looking for values that are colored green or red.

You've created a simple historical trending report that can help you analyze your pipeline's behavior.

Identify Historical Deals Over a Given Value

Suppose you want to focus only on deals in your pipeline worth more than \$5,000, but you're not concerned about today's fluctuations. You'll need a historical trending report that filters out any deal whose value was below \$5,000 yesterday.

1. Create an opportunity history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Opportunities**, select *Opportunities with Historical Trending*.
 In order to see *Opportunities with Historical Trending*, turn on Historical Trend Reporting for Opportunities in the Salesforce Setup. To learn how to turn on Historical Trend Reporting for Opportunities, see *Set Up Historical Trend Reporting* in the Salesforce help.
 - c. Click **Create**.
2. For *Show*, select *All Opportunities*.
3. Filter for historical values over \$5,000.
 - a. Click **Add** and select *Historical Field Filter*.
 - b. Set *Amount (Historical)* to *Yesterday*.
 - c. Select *greater than* for the operator.
 - d. Enter *5,000* in the last field.
 - e. Click **OK**.

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

Opportunity Name	Amount (Historical)		Close Date (Historical)	
	Yesterday	Today	Yesterday	Today
Acme	\$26,000	\$16,000	2/15/2013	2/28/2013
Advanced Interconnections Corp* - 32K	\$18,000	\$20,000	2/28/2013	2/28/2013
Advanced Interconnections Corp* - 8K	\$12,000	\$8,000	2/15/2013	2/28/2013
Allied Technologies - 40K	\$30,000	\$39,000	2/15/2013	2/15/2013
Data Solutions	\$10,000	\$3,000	2/28/2013	2/28/2013
DFC Inc. - 50K	\$55,000	\$45,700	2/15/2013	2/28/2013
Eastern Shipping	\$21,500	\$21,500	2/28/2013	2/28/2013

4. Click **Run Report**.
5. In the finished report, observe that all the deals in the *Amount — Historical* column are worth more than \$5,000.

Tip: Values in the Amount, Close Date and Stage fields are shown in green or red to indicate the direction of change. You can reverse the colors by clicking the down arrow in the column header.

You've created a simple report that pulls out all the deals that have were worth more than a given amount as of a given historical snapshot date.

Find Deals that Have Been Pushed Out

To focus on deals that are taking more time to close than expected, create a historical trending report that finds deals in your pipeline that have had their close dates moved to a later date.

1. Create an opportunity history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Opportunities**, select *Opportunities with Historical Trending*.
 In order to see *Opportunities with Historical Trending*, turn on Historical Trend Reporting for Opportunities in the Salesforce Setup. To learn how to turn on Historical Trend Reporting for Opportunities, see *Set Up Historical Trend Reporting* in the Salesforce help.
 - c. Click **Create**.
2. For *Show*, select *All Opportunities*.
3. Filter for close dates that are later now than they were in the past.
 - a. Click **Add** and select *Historical Field Filter*.
 - b. Set *Close Date (Historical)* to Feb. 1, 2013.

 **Tip:** Use the calendar under **Fixed Days** to select the date.
 - c. Click **OK**.
4. Click the down arrow in the header of the *Close Date* column and select *Show Changes*.
5. Click **Run Report**.
6. For each deal in the report, compare the date in the *Close Date - Historical* column with the date in the *Close Date - Today* column.

 **Tip:** You can see changes at a glance by looking for values that are colored green or red.

Identify Shrinking Deals

Historical trending analysis can help you prioritize by quickly identifying deals that may be at risk. For example, target the deals in your pipeline that have decreased in value since yesterday. You'll need a historical trending report that gives you the deals whose value yesterday was greater than their value today.

1. Create an opportunity history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Opportunities**, select *Opportunities with Historical Trending*.
In order to see *Opportunities with Historical Trending*, turn on Historical Trend Reporting for Opportunities in the Salesforce Setup. To learn how to turn on Historical Trend Reporting for Opportunities, see *Set Up Historical Trend Reporting* in the Salesforce help.
 - c. Click **Create**.
2. For *Show*, select *All Opportunities*.
3. Filter out any deal that wasn't worth more yesterday than today.
 - a. Click **Add** and select *Historical Field Filter*.
 - b. Set *Amount (Historical)* to *greater than*.
 - c. Set the last field to *Field*.

Here we're choosing to compare the historical amount with whatever amount is in the *Amount — Today* column, and not with a specific amount.

- d. Click **OK**.

4. Click **Run Report**.

You've created a simple report that flags deals that have shrunk since yesterday. Note that all the results in the *Amount — Today* column are shown in red, to indicate decreases in value.

 **Tip:** To change the color-coding for amount changes, click the down arrow above the *Change* column and click **Reverse Colors**.

See How Forecast Amounts Have Changed

Let's build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

For this example, we'll assume you're about a month into the current fiscal quarter.

1. Create a forecast history report.
 - a. On the Reports tab, click **New Report**.
 - b. Under **Select Report Type > Forecasts**, select *Forecasting Items with Historical Trending*. Before you can select this report type, your organization must have enabled Historical Trending for Forecasting Items. If you do not see the report type listed, talk to your administrator.
 - c. Click **Create**.
2. In the Filters area, choose **Show > All forecasting items**, then set up your filters.
 - a. For **Date Field**, choose End Date. For **Range**, choose Current FQ. The **From** and **To** date fields automatically get the beginning and end dates for the current quarter.
 - b. For **Historical Date**, choose 3 Months Ago, 2 Months Ago, then 1 Month Ago from the dropdown menu. Each date you select is added to the field.

Filter for the historical data you want.

The screenshot shows the 'Filters' section of a report builder. It includes a 'Show' dropdown set to 'All forecasting items', a 'Date Field' dropdown set to 'End Date', a 'Range' dropdown set to 'Current FQ', and 'From' and 'To' date fields set to '4/1/2014' and '6/30/2014' respectively. Below these, the 'Historical Date' field contains a list of dates: '4/1/2014', '4/8/2014', '4/15/2014', and 'Yesterday'. A small 'Add' button is visible next to the 'Historical Date' field.

 **Tip:** To move *Yesterday* to the right side of the field, delete it, and then add it again from the dropdown menu.

If you're using multiple forecast types, add a filter for Forecasting Type: API Name to prevent duplicate values from appearing on the report.

3. Choose the data you want to monitor for historical changes. In this case, we're interested in the category in which the changes were made and how the forecast amount changed.
 - a. In the **Preview** pane, change **Tabular Format** to **Matrix Format**.
 - b. Drag the **Owner: Full Name** field from the Field area to the Preview pane to create a row grouping.
 - c. Drag the **Forecast Category** field over to the right of **Owner: Full Name** to create another row grouping.
 - d. Drag the **Forecast Amount (Historical)** field to the matrix area of the Preview pane, below the yellow bar. In the **Summarize** dialog, select **Sum**.

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

Select the fields that contain the data you want to track.

Columns appear for each of the historical dates you chose in the filters area that contain records.

4. Click **Run Report** to see what data you've gathered so far. Then click **Customize** to keep adjusting your filters and fields if necessary.
5. Once you've defined the data you want to track, create a chart to show it graphically.
 - a. In the Preview area, click **Add Chart** and select the line chart icon.
 - b. On the Chart Data tab, choose `Sum of Forecast Amount (historical)` for the **Y-Axis** and `Snapshot Date` for the **X-Axis**.
 - c. For **Group By**, choose `Forecast Category`, and select **Cumulative**.
 - d. Click **OK**, then click **Run Report** again.
6. Click **Save As**. Choose a name and folder for the report and click **Save**.

Track History for Cases

Monitor activity across cases and identify your case status changes in the last three months of a case's life cycle.

1. One way to optimize contact center operations is to observe the `Status` field over time, watching for cases that move backward to a previous status. This can help reveal ways to resolve cases more effectively.
2. For another example, try analyzing historical values of the `Priority` field to identify cases that may have been incorrectly classified when they were opened. Watching for frequent changes in priority may also lead to ways to improve the handling of complex cases.

Learn about Historical Trend Reporting

Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.

For organizations created in Winter '14 and thereafter, historical trend reporting is activated by default. If your organization is older than that, you must activate historical trend reporting in the Setup menu.

Salesforce retains historical data for the previous three months, plus the current month. (The amount of historical data you can work with in practice depends on your organization's data design and use patterns.) You can select up to five date snapshots in that span to compare, using up to four historical filters.

Longer durations than days or weeks are not recommended. They may result in reports timing out and not returning. For small organizations with fewer records, month-to-month trend reporting may work, but this is not what historical trend reporting is designed for.

Tip: You can also create and customize historical trend reporting reports via the Metadata API and the Reports and Dashboards REST API.

Limitations on Historical Trend Reporting

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

- Salesforce retains historical data for the previous three months, plus the current month.
 - Up to 5 million rows of historical trending data can be stored for each object. Historical data capture stops when the limit is exceeded. The admin is alerted by email when any object reaches 70 percent of the limit, and again if the limit is exceeded.
 - Each historical trend report can contain up to 100 fields. In Opportunities reports, this includes the standard preselected fields, which can't be disabled.
 - Formula fields are not supported.
 - Row limit filters are not supported.
 - The summary report format is not supported.
 - You can specify up to five historical snapshot dates in each historical trend report.
 - You can use up to four historical filters on each historical trend report.
 - These field types are supported: Number, Currency, Date, Picklist, Lookup.
 - Dated exchange rates are not supported. When you run the historical trend report, it only uses the latest dated exchange rate.
 - Internet Explorer 6 is not supported.
 - You can't subscribe to historical trend reports.
 - The Report Wizard is not supported. Historical trend reports can only be created with the Report Builder.
 - Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.
- Important:** If a picklist field is already being used in a historical trending data filter, think hard before changing any of its values. You could make that field less useful for historical reporting in the future.

Report on Historical Data with Reporting Snapshots

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

After you set up a reporting snapshot, users can:

- Create and run custom reports from the target object.
- Create dashboards from the source report.
- Define list views on the target object, if it's included on a custom object tab.

For example, a customer support manager could set up a reporting snapshot that reports on the open cases assigned to his or her team everyday at 5:00 PM, and store that data in a custom object to build a history on open cases from which he or she could spot trends via reports. Then the customer support manager could report on point-in-time or trend data stored in the custom object and use the report as a source for a dashboard component. For the total number of reporting snapshots you can create, see *Salesforce Limits*.

1. [Prepare Reporting Snapshots](#)

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.

2. [Define a Reporting Snapshot](#)

After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

3. [Map Reporting Snapshot Fields](#)

After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

4. [Schedule and Run a Reporting Snapshot](#)

After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

5. [Manage Reporting Snapshots](#)

After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter *Reporting Snapshots* in the **Quick Find** box, then select **Reporting Snapshots** to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

6. [Troubleshoot Reporting Snapshots](#)

The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the **Result** column. To view the details of a run, click the date and time of the run in the **Run Start Time** column.

Prepare Reporting Snapshots

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.

To set up a reporting snapshot:

1. Create a new custom report that includes the fields you want to load as records into a target object.
2. Create a new custom object in which to store the records loaded from the source report.
3. Create fields on the target object that will receive the source report's results when the reporting snapshot runs.

Tips on Source Reports for Reporting Snapshots

- If you save a tabular source report with its details hidden, the report will not be available to include in a reporting snapshot. Furthermore, if you hide the details of a tabular source report included in a reporting snapshot, the reporting snapshot will fail when it runs. To verify that the details of the tabular source report are not hidden, view the report, click **Show Details**, and save the report. The **Show Details** button only displays if the report's details are hidden.
- When creating the source report for your reporting snapshot, note the names of the fields you added to the report, as those field names may be useful to you when you create fields on the target object in which to store the report results.
- You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports..
- You can include up to 100 fields in your source report.
- You can delete the schedule of when a reporting snapshot runs. You can't stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the `Source Report` drop-down list..
- If you select Load No Data in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the reporting snapshot runs. .
- The `(No fields with compatible data type)` field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report..

Tips on Target Objects for Reporting Snapshots

Consider the following when setting up target objects for reporting snapshots:

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, use field-level security to make the target object's fields visible to the appropriate users.
- You can't delete a custom object if it's a target object in a reporting snapshot.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.
- You can add up to 100 fields to the target object.
- Target objects cannot contain validation rules or be included in a workflow.
- Reporting snapshots cannot contain target objects that trigger Apexcode to run when new records are created..

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

- When a reporting snapshot runs, it can add up to 2,000 new records to the target object. If the source report generates more than 2,000 records, an error message is displayed for the additional records in the Row Failures related list. You can access the Row Failures related list via the Run History section of a reporting snapshot detail page.

Tips on Reporting Snapshots

- Be aware of the type of license your `Running User` has. For example, if the `Running User` of a reporting snapshot has a Salesforce license, users who have Force.com Platform or Salesforce Platform One licenses will not be able to view it. Alternatively, if the `Running User` has a Force.com Platform or Salesforce Platform One license, users who have Salesforce licenses will be able to see the reporting snapshot. If you have users with Force.com Platform or Salesforce Platform One licenses, we recommend creating a separate reporting snapshot for them with a `Running User` that has a Force.com Platform or Salesforce Platform One user license.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view `Summary Fields in Source Report` and `Fields in Target Object` to see the number of summary or target fields, respectively..
- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.
- When a reporting snapshot is defined, deleted, or its source report or target object is changed, it is tracked in your organization's setup audit trail history.
- The Run History section on a reporting snapshot detail page displays details on when the reporting snapshot ran. Details include:
 - The date and time at which the reporting snapshot ran
 - The name of the source report, target object, and running user
 - The time it took for the reporting snapshot to run
 - The total number of detail or summary rows in the source report, depending on the report type
 - The number of records created in the target object
 - Whether or not the reporting snapshot ran successfully

SEE ALSO:

[Report on Historical Data with Reporting Snapshots](#)

[Create a Custom Report in Accessibility Mode](#)

Define a Reporting Snapshot

After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

1. From Setup, enter "Reporting Snapshots" in the `Quick Find` box, then select **Reporting Snapshots**.
2. Click **New Reporting Snapshot**.
3. Enter a name, unique name, and description for your reporting snapshot.
4. Choose a user in the `Running User` field by clicking the lookup icon.

The user in the `Running User` field determines the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

Only users with the "Modify All Data" permission can choose running users other than themselves.

5. Select a report from the `Source Report` drop-down list.

The report you choose determines the report results that will load as records into the target object when the reporting snapshot runs.

You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports.

6. Select a custom object from the `Target Object` drop-down list.

The custom object you choose will receive the source report's results as records when the reporting snapshot runs.

If a record used for an reporting snapshot has no record type associated with it, the record type of the running user is associated with the reporting snapshot by default.

7. Click **Save** to save the definition of your reporting snapshot, or click **Save & Edit Field Mappings** to save your reporting snapshot and map its fields.
8. [Map the fields](#) on the source report to the fields on the target object.

SEE ALSO:

[Standard Report Types](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

Map Reporting Snapshot Fields

After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

1. From Setup, enter *Reporting Snapshots* in the *Quick Find* box, then select **Reporting Snapshots**.
2. Select the name of the reporting snapshot whose fields you want to map.
3. Click **Edit** on the Field Mappings section.
4. For summary reports, select the *Grouping Level* at which summary data is extracted from the source report. Data loaded into the target object is taken from summary fields at the grouping level you specify. The *Grand Summary* summarizes on the total for all grouping levels.
5. In the Fields from Source Report column, click a *Load No Data* drop-down list and select a field from the source report to map to a custom object field in the Fields in Target Object column. Only summary fields can be mapped for reporting snapshots based on summary reports. Note that the fields for summary reports may vary depending on the grouping level selected.
6. Click **Quick Save** to save field mappings and continue mapping fields, or click **Save** to save field mappings and return to the reporting snapshot's detail page.
7. Next, [schedule](#) the reporting snapshot to run.

Considerations for Mapping Reporting Snapshot Fields

- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- A custom summary formula can be mapped only if the grouping level in the reporting snapshot and the grouping level in the custom summary formula match.
- If you select *Load No Data* in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the reporting snapshot runs..
- The *(No fields with compatible data type)* field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.
- You cannot map fields from the source report to the following fields on the target object: *Created By*, *Last Modified By*, *Created Date*, and *Last Modified Date*.
- When you map fields from the source report to the target object, some data may lose its context when loaded to the target object. For example, if you map a date and time field from the source report to a text field on the target object, the date and time load to the target object without the time zone.
- When executing a reporting snapshot, if the running user does not have "read" or "write" access to a mapped field in the target object, that field is dropped from the mapping, but does not cause the execution to fail. If a required field in the target object is not mapped, the execution fails. To ensure that fields are always mapped, make them required or set default values for them.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

- To map a field in the source report to a lookup field on the target object, you must map to the ID of the object associated with the lookup. For example, to map to an opportunity lookup field, you must map to the `Opportunity ID`. To get the `Opportunity ID` in the source report, you may need to use a custom report type to include ID and other related fields.

SEE ALSO:

- [Report on Historical Data with Reporting Snapshots](#)
- [Build a Custom Summary Formula](#)

Schedule and Run a Reporting Snapshot

After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

The number of reporting snapshots you can schedule to run is determined by your Edition. After a reporting snapshot has run, you can send an email notification to yourself and other users that includes details about the reporting snapshot run, such as the date and time it ran, whether it ran successfully, and how many records were loaded into the target object from the source report. Also, the notification includes a link to the reporting snapshot detail page in Salesforce.

- From Setup, enter "Reporting Snapshots" in the `Quick Find` box, then select **Reporting Snapshots**.

- Select the name of the reporting snapshot that you want to schedule to run.

Reporting snapshots will not run as scheduled if the user in the `Running User` field does not have access to the folder in which the source report is stored.

Note: If the running user becomes inactive, the report doesn't run. Salesforce sends an email notification to either activate the user, delete the report schedule, or change the running user to an active one. Salesforce sends the notification to users with the "Manage Users," "Modify All Data," and "Manage Billing" permissions. If no user has all these user permissions, Salesforce sends the notification to users with the "Manage Users" and "Modify All Data" user permissions.

- Click **Edit** on the Schedule Reporting Snapshot section.

The Schedule Reporting Snapshot section on a reporting snapshot detail page displays details on when the reporting snapshot is scheduled to run.

- Select a notification setting to send an email when the reporting snapshot finishes running:

- Click **Me** to send an email to the email address specified on your Salesforce user record.
- Click **Others . . .** to send an email to additional users. You can only send reporting snapshot notifications to email addresses included on Salesforce user records. Furthermore, you can only select Users and Public Groups in the `Search` drop-down list.

- Schedule the reporting snapshot to run:

- In the `Frequency` field, select the frequency at which the reporting snapshot runs. When you click the `Daily`, `Weekly`, or `Monthly` fields, more options display that allow you to refine frequency criteria.

If you schedule a reporting snapshot to run on a specific day of every month, the reporting snapshot will only run on months that have that specific day. For example, if you schedule a reporting snapshot to run on the 31st day of every month, then the

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- "Manage Reporting Snapshots"

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- "Run Reports"

AND

"Create" on the target object

reporting snapshot will only run on months that have 31 days. If you want a reporting snapshot to run on the last day of every month, choose last from the `On day of every month` drop-down list.

- In the `Start` and `End` fields, specify the dates during which you wish to schedule the reporting snapshot to run.
- In the `Preferred Start Time` drop-down list, click the **Find available options...** link to choose a preferred start time for the reporting snapshot to run.
 - Your preferred start time may not be available if other users have already selected that time to run a reporting snapshot or your organization has reached its reporting snapshot limit.
 - Reporting snapshots run in the time zone of the user who schedules the run. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time, and you schedule a reporting snapshot to run every day at 2:00 PM, then the reporting snapshot will run every day at 2:00 PM Pacific Standard Time.
 - If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
 - The reporting snapshot runs within an hour of the time you select in the `Preferred Start Time` drop-down list. For example, if you select 2:00 PM as your preferred start time, the reporting snapshot may run any time in between 2:00 PM or 2:59 PM, depending on how many other reporting snapshots are scheduled to refresh at that time.

6. Click **Save** to schedule the reporting snapshot to run.

When the reporting snapshot runs, it adds new records to the target object.

Optionally, once you have scheduled a reporting snapshot to run, you can perform the following actions after you click **Edit** on the Schedule Reporting Snapshot section of a reporting snapshot detail page:

- Click **Edit** to update the notification and frequency settings of the reporting snapshot.
- Click **Delete** to permanently delete the existing schedule of when the reporting snapshot runs.

A reporting snapshot will fail during a scheduled run if:

- The source report includes more than 100 fields
- The source report was changed from summary to tabular
- The selected grouping level for a summary source report is no longer valid
- The running user does not have access to the source report
- The running user does not have the “Run Reports” permission
- The target object has more than 100 custom fields
- The target object contains validation rules
- The target object is included in a workflow
- The target object is a detail object in a master-detail relationship
- The target object runs an Apex trigger when new records are created on it
- The running user does not have the “Create” permission on the target object. Note that if the target object's status is `In Development`, the running user must have the “Customize Applications” permission.

Manage Reporting Snapshots

After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter *Reporting Snapshots* in the Quick Find box, then select **Reporting Snapshots** to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

From the Reporting Snapshots page, you can:

- Select a list view from the **View** drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- Define a new reporting snapshot by clicking **New Reporting Snapshot**.
- Update the reporting snapshot name, description, running user, source report, and target object by clicking **Edit** next to its name. Only users with the “Modify All Data” permission can choose running users other than themselves. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.

If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view **Summary Fields in Source Report** and **Fields in Target Object** to see the number of summary or target fields, respectively.

- Delete a reporting snapshot by clicking **Del** next to its name. After the reporting snapshot is deleted, it cannot be restored from the Recycle Bin.

! **Important:** When you delete a reporting snapshot, the source report and target object aren’t deleted; however, when the source report runs, it won’t load the target object with data.

You can delete the schedule of when a reporting snapshot runs. You can’t stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the **Source Report** drop-down list.

- Display detailed information about a reporting snapshot and customize it further by clicking its name. Then you can:
 - Click links in the Identification section that redirect you to the reporting snapshot running user, source report, and target object. In addition, you can view the preferred date and time at which the reporting snapshot will approximately run next in the **Next Run** field, and view the date and time at which it last ran in the **Last Run** field.
 - Click **Edit** in the Field Mappings section to further customize the fields mapped from the source report to the target object.

The Reporting Snapshot Field Mappings section displays which source report fields are mapped to the target object’s fields. You can view the number of fields in the source report available for mapping to the target object in the **Columns in Source Report** field. Also, you can view the number of fields available for mapping in the target object in the **Fields in Target Object** field.
 - Click **Edit** in the Schedule Reporting Snapshot section to schedule when to run the reporting snapshot.

The Schedule Reporting Snapshot section displays details about when the reporting snapshot is currently scheduled to run.
 - The Run History section displays details about when the reporting snapshot ran. Details include:
 - The date and time at which the reporting snapshot ran
 - The name of the source report, target object, and running user
 - The time it took for the reporting snapshot to run

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- “Manage Reporting Snapshots”

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- “Run Reports”

AND

“Create” on the target object

- The total number of detail or summary rows in the source report, depending on the report type
- The number of records created in the target object
- Whether or not the reporting snapshot ran successfully

Up to 200 records are stored in the Run History section. After 200 records are stored, the oldest record is automatically deleted and cannot be retrieved from the Recycle Bin.

Troubleshoot Reporting Snapshots

The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the `Result` column. To view the details of a run, click the date and time of the run in the `Run Start Time` column.

Tip:

- If the `Total Row Number` is blank, the run failed before the report was completed (for example, the report was invalid or the running user is inactive).
- When a reporting snapshot runs, it can add up to 2000 new records to the target object. Any records over 2000 are recorded in the Row Failures related list. If the `Total Row Number` is blank and the run history indicates “Some rows failed,” the report likely contained more than 2000 summaries.
- The details of a failed run are available on the Row Failures related list for 14 days before they are automatically deleted. You cannot retrieve details about row failures from the Recycle Bin.
- If you have a unique field in the target object, and records in the report have more than one of the same value in the column mapped to that unique field, duplicate records are not added. The run history indicates when records are not added to the reporting snapshot.
- If field mappings failed, the snapshot still runs, but the run history shows that there was a partial error.

A reporting snapshot could fail during a scheduled run for a number of reasons. This table lists the errors a failed run may display and how the errors can help you troubleshoot the reporting snapshot so that it will run successfully.

Running user does not have permission to run reports.

The user in the `Running User` field does not have the “Run Reports” or “Create and Customize Reports” permission. Choose a user with the appropriate permissions or enable the appropriate permissions for the running user.

Cannot run reporting snapshot because source report has been deleted.

The report in the `Source Report` field was deleted and no longer available to run. Choose another source report for your reporting snapshot or restore the deleted report from the Recycle Bin.

Running user does not have permission to access source report.

The user in the `Running User` field does not have access to the folder in which the source report is stored. Choose a user with access to the source report or provide the existing running user with access to the folder in which the source report is stored.

USER PERMISSIONS

To create, save, and schedule a reporting snapshot:

- “Manage Reporting Snapshots”

To run a reporting snapshot as a running user and add the results to a custom object, the running user must have:

- “Run Reports”

AND

“Create” on the target object

Source report definition is obsolete.

The report in the `Source Report` field references a custom or external object that is no longer available for reports or the relationships between the objects in the report have changed.

Source report definition is invalid.

The report in the `Source Report` field cannot run because it contains invalid formulas or filter criteria. Update the report so that it can run without errors.

Running user does not have permission to access report type.

The user in the `Running User` field does not have permission to access a report type associated with the report in the `Source Report` field. Choose a running user that has the correct permissions or provide the existing running user with the appropriate permissions.

Source report must be tabular.

The report in the `Source Report` field is no longer in tabular format. Choose a new source report or update the existing source report's format to tabular.

Source report last saved with details hidden on report results.

The report in the `Source Report` field was saved with its details hidden. To display the details of the source report, view the report, click the **Show Details** button, and save the report.

Target object has been deleted or is inaccessible to running user.

The custom object in the `Target Object` field has been deleted or the user in the `Running User` field does not have permission to access the target object. Restore the deleted custom object, choose a new target object, or provide the existing running user with "Create" permissions to the custom object in the `Target Object` field. Note that if the custom object's status is `In Development`, the running user must have the "Customize Application" permission to access the target object.

Running user does not have permission to edit target object.

The user in the `Running User` field does not have "Create" permissions on the custom object in the `Target Object` field. Choose a running user that has such permissions or provide the existing running user with "Create" permissions to the custom object in the `Target Object` field.

Target object must not be a detail object in a master-detail relationship.

The custom object in the `Target Object` field is a detail object in a master-detail relationship, meaning that a master object controls certain behaviors on the target object's records. Choose a target object that is not included in a master-detail relationship.

Target object must not be included in a workflow.

The custom object in the `Target Object` field is included in a workflow. Choose a target object that is not included in a workflow.

Target object must not include an insert trigger.

An Apex trigger runs when new records are created for the custom object in the `Target Object` field. Remove the Apex trigger or choose a target object for which an Apex trigger does not run when new records are created.

Target object must not include validation rules.

The custom object in the `Target Object` field contains validation rules. Choose a target object that does not contain validation rules or delete validation rules from the existing target object.

Running user is inactive.

The user in the `Running User` field is no longer active. Choose an active user.

One or more required fields on the target object are not mapped.

One or more required fields on the target object are not mapped. Map all required fields on the target object to fields on the source report.

Source report contains too many fields, has a formula field with too many functions, or contains too many criteria.

The report in the `Source Report` field contains too many fields, criteria, or functions within a formula field. Remove any unnecessary fields, criteria and functions within formula fields from the source report.

Source report cannot have more than 100 selected columns.

The report in the `Source Report` field contains more than 100 fields. Remove any unnecessary fields from the source report.

Target object cannot have more than 100 custom fields.

The custom object in the `Target Object` field contains more than 100 custom fields. Remove any unnecessary fields from the target object.

Your report exceeded the time limit for processing.

The report in the `Source Report` field may contain too much data to process. Reduce the amount of data the report processes when running by limiting the report's date range and remove any unnecessary fields from the source report.

This Reporting Snapshot Unique Name already exists. Please choose a unique name.

The new snapshot you are trying to create has the same unique name as that of an existing snapshot.

A summary field did not return a valid number.

A summary field in the results has not returned a valid number. For example, the field may have attempted to divide by 0. Check your formulas and test for 0 and "null" in calculations if they appear in your data.

There is a problem with this reporting snapshot. The source report format was changed from tabular to summary. The field mappings in the reporting snapshot are no longer correct. You can change the report format back to tabular or update the field mappings in the snapshot definition.
