The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`getFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam)`

Returns the feed items on the specified page for the specified user or record, for the specified feed type in the specified order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementsFromFeed\(*communityId*, *feedType*, *subjectId*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *sortParam*\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId

Type: [String](#)

If *feedType* is *Record*, *subjectId* can be any record ID, including a group ID. If *feedType* is *Streams*, *subjectId* must be a stream ID. If *feedType* is *Topics*, *subjectId* must be a topic ID. If *feedType* is *UserProfile*, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias *me*.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- *AllUpdates*—Displays all updates from people and records the user follows and groups the user is a member of.
- *FewerUpdates*—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- *CreatedDateAsc*—Sorts by oldest creation date. This sort order is available only for *DirectMessageModeration*, *Moderation*, and *PendingReview* feeds.
- *CreatedDateDesc*—Sorts by most recent creation date.
- *LastModifiedDateDesc*—Sorts by most recent activity.
- *MostViewed*—Sorts by most viewed content. This sort order is available only for *Home* feeds when the `ConnectApi.FeedFilter` is *UnansweredQuestions*.
- *Relevance*—Sorts by most relevant content. This sort order is available only for *Company*, *Home*, and *Topics* feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value *CreatedDateDesc* is used.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.RECORD`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, updatedSince)`

Returns the specified page of feed items for the specified user and the specified key prefix. Includes only feed items that have been updated since the time specified in the `updatedSince` parameter.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementsFromFilterFeedUpdatedSince\(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsFromFilterFeedUpdatedSince(String
communityId, String subjectId, String keyPrefix, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: [ConnectApi.FeedItemPage](#)

A paged collection of `ConnectApi.FeedItem` objects.

Usage

This method returns only feed items that have been updated since the time specified in the `updatedSince` argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[Testing ConnectApi Code](#)

getFeedItemsUpdatedSince(*communityId*, *feedType*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *updatedSince*)

Returns the specified page of feed items for the `Company`, `Home`, and `Moderation` feed types. Includes only feed items that have been updated since the time specified in the `updatedSince` parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementsUpdatedSince\(*communityId*, *feedType*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *updatedSince*\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
    ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
    String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: `String`

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: `ConnectApi.FeedItemPage`

A paged collection of `ConnectApi.FeedItem` objects.

Usage

This method returns only feed items that have been updated since the time specified in the `updatedSince` argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the company feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the company feed and return the updatesToken
String communityId = null;

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.Company);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
```

```
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
    (communityId, ConnectApi.FeedType.Company, 1, ConnectApi.FeedDensity.AllUpdates, null,
    1, page.updateToken);
```

SEE ALSO:

[setTestGetFeedItemsUpdatedSince\(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, ConnectApi.FeedItemPage, results\)](#)

[Testing ConnectApi Code](#)

getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince)

Returns the specified page of feed items for the `Files`, `Groups`, `News`, `People`, and `Record` feed types. Includes only feed items that have been updated since the time specified in the `updatedSince` parameter. Each feed item contains no more than the specified number of comments.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
    ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
    ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

One of these values:

- `Files`
- `Groups`
- `News`

- People
- Record

subjectId

Type: [String](#)

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

Return Value

Type: [ConnectApi.FeedItemPage](#)

A paged collection of `ConnectApi.FeedItem` objects.

Usage

This method returns only feed items that have been updated since the time specified in the *updatedSince* argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
(communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
null, 1, page.updatesToken);
```

SEE ALSO:

[setTestGetFeedItemsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result\)](#)

[Testing ConnectApi Code](#)

`getFeedItemsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly)`

Returns the specified page of feed items for the `RECORD` feed type. Includes only feed items that have been updated since the time specified in the `updatedSince` parameter. Specify whether to return feed items posted by internal (non-community) users only.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage getFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: [ConnectApi.FeedItemPage](#)

A paged collection of `ConnectApi.FeedItem` objects.

Usage

This method returns only feed items that have been updated since the time specified in the `updatedSince` argument. A feed item is considered to be updated if it was created since the last feed request, or if `sort=LastModifiedDateDesc` and a comment was added to the feed item since the last feed request. Adding likes and topics doesn't update a feed item.

If `showInternalOnly` is `true` and Salesforce Communities is enabled, feed items from communities are included. Otherwise, only feed items from the internal community are included.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the feed items in the news feed and grabs the `updatesToken` property from the returned object. It then passes the value of `updatesToken` to the `getFeedItemsUpdatedSince` method to get the feed items updated since the first call:

```
// Get the feed items in the news feed and return the updatesToken
String communityId = null;
String subjectId = 'me';

// Get the feed and extract the update token
ConnectApi.FeedItemPage page = ConnectApi.ChatterFeeds.getFeedItemsFromFeed(communityId,
ConnectApi.FeedType.News, subjectId);

// page.updatesToken is opaque and has a value like '2:1384549034000'

// Get the feed items that changed since the provided updatesToken
ConnectApi.FeedItemPage feedItems= ConnectApi.ChatterFeeds.getFeedItemsUpdatedSince
(communityId, ConnectApi.FeedType.News, subjectId, 1, ConnectApi.FeedDensity.AllUpdates,
null, 1, page.updatesToken, true);
```

[setTestGetFeedItemsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result\)](#)

[Testing ConnectApi Code](#)

getFeedPoll(communityId, feedItemId)

Returns the poll associated with the feed item.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [getFeedElementPoll\(communityId, feedElementId\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll getFeedPoll(String communityId, String feedItemId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

Return Value

Type: [ConnectApi.FeedPoll](#)

 **Note:** Triggers on FeedItem objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

getFeedWithFeedElements(communityId, feedType, pageSize)

Get information about the feed and a page of feed elements for the feed type.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when `communityId` is `internal`.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

Return Value

Type: [ConnectApi.Feed](#)

getFeedWithFeedElements(*communityId*, *feedType*, *pageSize*, *recentCommentCount*)

Get a page of information about the feed and the feed elements with the specified number of comments per feed element for the feed type.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFeedWithFeedElements(String communityId,
ConnectApi.FeedType feedType, Integer pageSize, Integer recentCommentCount)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Landing`, `Moderation`, and `PendingReview`. `Landing` is valid only when `communityId` is `internal`.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in 0, feed elements aren't returned with the feed.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

Return Value

Type: [ConnectApi.Feed](#)

getFilterFeed(*communityId*, *subjectId*, *keyPrefix*)

Returns the first page of a feed for the specified user and the given key prefix.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A *key prefix* is the first three characters of a record ID, which specifies the entity type.

Return Value

Type: [ConnectApi.Feed](#)

getFilterFeed(*communityId*, *subjectId*, *keyPrefix*, *sortParam*)

Returns the first page of a feed in the specified order for the specified user and the given key prefix.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Feed getFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedType sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

sortParam

Type: [ConnectApi.FeedType](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: [ConnectApi.Feed](#)

getFilterFeedDirectory(communityId, subjectId)

Gets a feed directory object that contains a list of filter feeds available to the context user. A filter feed is the news feed filtered to include feed items whose parent is a specific entity type.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedDirectory getFilterFeedDirectory(String communityId, String
subjectId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

Return Value

Type: [ConnectApi.FeedDirectory](#)

A directory containing a list of filter feeds.

Usage

Call this method to return a directory containing a list of `ConnectApi.FeedDirectoryItem` objects. Each object contains a key prefix associated with an entity type the context user is following. A *key prefix* is the first three characters of a record ID, which specifies the entity type.

Use the key prefixes to filter the news feed so that it contains only feed items whose parent is the entity type associated with the key prefix, for example, get all the feed items whose parent is an Account. To get the feed items, pass a key prefix to the `ConnectApi.getFeedItemsFromFilterFeed` method.

The information about filter feeds never contains the key prefixes for the User (005) or Group (0F9) entity types, but all users can use those key prefixes as filters.

The `ConnectApi.FeedDirectory.favorites` property is always empty when returned by a call to `getFilterFeedDirectory` because you can't filter a news feed by favorites.

Example

This example calls `getFilterFeedDirectory` and loops through the returned `FeedDirectoryItem` objects to find the key prefixes the context user can use to filter their news feed. It then copies each `keyPrefix` value to a list. Finally, it passes one of the key prefixes from the list to the `getFeedItemsFromFilterFeed` method. The returned feed items include every feed item from the news feed whose parent is the entity type specified by the passed key prefix.

```
String communityId = null;
String subjectId = 'me';

// Create a list to populate with key prefixes.
List<String> keyPrefixList = new List<String>();
```

```
// Prepopulate with User and Group record types
// which are available to all users.
keyPrefixList.add('005');
keyPrefixList.add('0F9');

System.debug(keyPrefixList);

// Get the key prefixes available to the context user.
ConnectApi.FeedDirectory myFeedDirectory =
    ConnectApi.ChatterFeeds.getFilterFeedDirectory(null, 'me');

// Loop through the returned feeds list.
for (ConnectApi.FeedDirectoryItem i : myFeedDirectory.feeds) {

    // Grab each key prefix and add it to the list.
    keyPrefixList.add(i.keyPrefix);
}
System.debug(keyPrefixList);

// Use a key prefix from the list to filter the feed items in the news feed.
ConnectApi.FeedItemPage myFeedItemPage =
    ConnectApi.ChatterFeeds.getFeedItemsFromFilterFeed(communityId, subjectId,
keyPrefixList[0]);
System.debug(myFeedItemPage);
```

getLike (communityId, likeId)

Returns the specified like.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike getLike(String communityId, String likeId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

likeId

Type: [String](#)

The ID for a like.

Return Value

Type: [ConnectApi.ChatterLike](#)

getLikesForComment(*communityId*, *commentId*)

Returns the first page of likes for the specified comment. The page contains the default number of items.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String commentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

getLikesForComment(*communityId*, *commentId*, *pageParam*, *pageSize*)

Returns the specified page of likes for the specified comment.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForComment(String communityId, String
commentId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

getLikesForFeedElement (communityId, feedElementId)

Get the first page of likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,  
String feedElementId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

Return Value

Type: [ConnectApi.ChatterLikePage Class](#)

If the feed element doesn't support the `ChatterLikes` capability, the return value is [ConnectApi.NotFoundException](#).

getLikesForFeedElement(*communityId*, *feedElementId*, *pageParam*, *pageSize*)

Returns the specified page of likes for a feed element.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedElement(String communityId,  
String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterLikePage Class](#)

If the feed element doesn't support the `ChatterLikes` capability, the return value is [ConnectApi.NotFoundException](#).

getLikesForFeedItem(*communityId*, *feedItemId*)

Returns the first page of likes for the specified feed item. The page contains the default number of items.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [getLikesForFeedElement\(*communityId*, *feedElementId*\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String feedItemId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

getLikesForFeedItem(*communityId*, *feedItemId*, *pageParam*, *pageSize*)

Returns the specified page of likes for the specified feed item.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [getLikesForFeedElement\(*communityId*, *feedElementId*, *pageParam*, *pageSize*\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage getLikesForFeedItem(String communityId, String
feedItemId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

getReadByForFeedElement(*communityId*, *feedElementId*)

Get information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

Return Value

Type: [ConnectApi.ReadByPage](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getReadByForFeedElement(communityId, feedElementId, pageParam, pageSize)

Get a page of information about who read a feed element and when.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByPage getReadByForFeedElement(String communityId, String feedElementId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ReadByPage](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getRelatedPosts(*communityId*, *feedElementId*, *filter*, *maxResults*)

Get posts related to the context feed element.

API Version

37.0

Available to Guest Users

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RelatedFeedPosts getRelatedPosts(String communityId, String
feedElementId, ConnectApi.RelatedFeedPostType filter, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element. The feed element must be a question.

filter

Type: [ConnectApi.RelatedFeedPostType](#)

Specifies the type of related post. Values are:

- `Answered`—Related questions that have at least one answer.

- `BestAnswer`—Related questions that have a best answer.
- `Generic`—All types of related questions, including answered, with a best answer, and unanswered.
- `Unanswered`—Related questions that don't have answers.

`Generic` is the default value.

maxResults

Type: [Integer](#)

The maximum number of results to return. You can return up to 25 results; 5 is the default.

Return Value

Type: [ConnectApi.RelatedFeedPosts](#)

In version 37.0 and later, related feed posts are questions.

Each related feed post has a score indicating how closely it's related to the context feed post. We return related feed posts sorted by score, with the highest score first.

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`getStream(communityId, streamId)`

Get information about a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream getStream(String communityId, String streamId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

streamId

Type: [String](#)

ID of the Chatter feed stream.

Return Value

Type: [ConnectApi.ChatterStream](#)

getStreams (communityId)

Get the Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

getStreams (communityId, sortParam)

Get and sort the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId,  
ConnectApi.SortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

sortParam

Type: `ConnectApi.SortOrder`

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams (communityId, pageParam, pageSize)

Get a page of Chatter feed streams for the context user.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: `Integer`

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: `ConnectApi.ChatterStreamPage`

getStreams (communityId, pageParam, pageSize, sortParam)

Get a sorted page of Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage getStreams(String communityId, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam

Type: [ConnectApi.SortOrder](#)

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

getSupportedEmojis ()

Get supported emojis for the org.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.SupportedEmojis getSupportedEmojis()
```

Return Value

Type: [ConnectApi.SupportedEmojis](#)

Usage

To get the list, emojis must be enabled in your org.

isCommentEditableByMe (communityId, commentId)

Indicates whether the context user can edit a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isCommentEditableByMe (String communityId,  
String commentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

ID of the comment.

Return Value

Type: [ConnectApi.FeedEntityIsEditable](#)

If the comment doesn't support the `edit` capability, the return value is [ConnectApi.NotFoundException](#).

SEE ALSO:

[Edit a Comment](#)

isFeedElementEditableByMe (communityId, feedElementId)

Indicates whether the context user can edit a feed element. Feed items are the only type of feed element that can be edited.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedEntityIsEditable isFeedElementEditableByMe (String
communityId, String feedElementId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element. Feed items are the only type of feed element that can be edited.

Return Value

Type: [ConnectApi.FeedEntityIsEditable](#)

If the feed element doesn't support the `edit` capability, the return value is [ConnectApi.NotFoundException](#).

SEE ALSO:

[Edit a Feed Element](#)

[Edit a Question Title and Post](#)

isModified (communityId, feedType, subjectId, since)

Returns information about whether a news feed has been updated or changed. Use this method to poll a news feed for updates.

 **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedModifiedInfo isModified(String communityId,  
ConnectApi.FeedType feedType, String subjectId, String since)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Specifies the type of feed. The only supported type is `News`

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

since

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Retrieve this token from the [FeedElementPage.isModifiedToken](#) property.

Return Value

Type: [ConnectApi.FeedModifiedInfo](#)

likeComment (communityId, commentId)

Adds a like to the specified comment for the context user. If the user has already liked this comment, this is a non-operation and returns the existing like.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeComment(String communityId, String commentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

Return Value

Type: [ConnectApi.ChatterLike](#)

likeFeedElement(communityId, feedElementId)

Like a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedElement(String communityId, String feedElementId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

Return Value

Type: [ConnectApi.ChatterLike](#)

If the feed element doesn't support the `ChatterLikes` capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
ConnectApi.ChatterLike chatterLike = ConnectApi.ChatterFeeds.likeFeedElement(null, '0D5D0000000KuGh');
```

likeFeedItem(*communityId*, *feedItemId*)

Adds a like to the specified feed item for the context user. If the user has already liked this feed item, this is a non-operation and returns the existing like.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [likeFeedElement\(*communityId*, *feedElementId*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLike likeFeedItem(String communityId, String feedItemId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

Return Value

Type: [ConnectApi.ChatterLike](#)

postComment(*communityId*, *feedItemId*, *text*)

Adds the specified text as a comment to the feed item, for the context user.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [postCommentToFeedElement\(*communityId*, *feedElementId*, *text*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId, String text)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

text

Type: [String](#)

The text of the comment. Mentions are downgraded to plain text. To include a mention that links to a user, call [postComment\(*communityId*, *feedItemId*, *comment*, *feedItemFileUpload*\)](#) and pass the mention in a `ConnectApi.CommentInput` object.

Return Value

Type: [ConnectApi.Comment](#)

Usage

If hashtags or links are detected in *text*, they are included in the comment as hashtag and link segments. Mentions are not detected in *text* and are not separated out of the text.

Feed items and comments can contain up to 10,000 characters.

postComment(*communityId*, *feedItemId*, *comment*, *feedItemFileUpload*)

Adds a comment to the feed item from the context user. Use this method to use rich text, including mentions, and to attach a file to a comment.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [postCommentToFeedElement\(*communityId*, *feedElementId*, *comment*, *feedElementFileUpload*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postComment(String communityId, String feedItemId,
ConnectApi.CommentInput comment, ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: `String`

The ID for a feed item.

comment

Type: `ConnectApi.CommentInput`

In the `CommentInput` object, specify rich text, including @mentions. Optionally, in the `CommentInput.attachment` property, specify an existing file or a new file

feedItemFileUpload

Type: `ConnectApi.BinaryInput`

If you specify a `NewFileAttachmentInput` object in the `CommentInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.Comment`

Usage

Feed items and comments can contain up to 10,000 characters.

Sample: Posting a Comment with a New File Attachment

To post a comment and upload and attach a new file to the comment, create a `ConnectApi.CommentInput` object and a `ConnectApi.BinaryInput` object to pass to the `ConnectApi.ChatterFeeds.postComment` method.

```
String communityId = null;
String feedItemId = '0D5D0000000Kcd1';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Comment Text Body';

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.NewFileAttachmentInput attachmentInput = new ConnectApi.NewFileAttachmentInput();
attachmentInput.description = 'The description of the file';
attachmentInput.title = 'contentFile.txt';
input.attachment = attachmentInput;

String fileContents = 'This is the content of the file.';
Blob fileBlob = Blob.valueOf(fileContents);
ConnectApi.BinaryInput binaryInput = new ConnectApi.BinaryInput(fileBlob, 'text/plain',
'contentFile.txt');
```

```
ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postComment(communityId, feedItemId,
    input, binaryInput);
```

postCommentToFeedElement(communityId, feedElementId, text)

Post a plain text comment to a feed element.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String
    feedElementId, String text)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

text

Type: [String](#)

Text of the comment. A comment can contain up to 10,000 characters.

Return Value

Type: [ConnectApi.Comment](#)

If the feed element doesn't support the `Comments` capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
ConnectApi.Comment comment = ConnectApi.ChatterFeeds.postCommentToFeedElement(null,
    '0D5D0000000KuGh', 'I agree with the proposal.');
```

postCommentToFeedElement(communityId, feedElementId, comment, feedElementFileUpload)

Post a comment to a feed element. Use this method to post rich text, including mentions, and to attach a file. A comment can contain up to 10,000 characters.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment postCommentToFeedElement(String communityId, String
feedElementId, ConnectApi.CommentInput comment, ConnectApi.BinaryInput
feedElementFileUpload)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedElementId*Type: [String](#)

The ID for a feed element.

*comment*Type: [ConnectApi.CommentInput](#)

The comment body, including text and mentions, and capabilities, such as information about an attached file.

*feedElementFileUpload*Type: [ConnectApi.BinaryInput](#)A new binary file to attach to the comment, or `null`. If you specify a binary file, specify the title and description of the file in the *comment* parameter.

Return Value

Type: [ConnectApi.Comment](#)If the feed element doesn't support the `Comments` capability, the return value is [ConnectApi.NotFoundException](#).

Example for Posting a Comment with Mentions

You can post comments with mentions two ways. Use the [ConnectApiHelper repository on GitHub](#) to write a single line of code, or use this method example.

```
String communityId = null;
String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
```

```

textSegmentInput.text = 'Does anyone in this group have an idea? ';
messageBodyInput.messageSegments.add(textSegmentInput);

mentionSegmentInput.id = '005D00000000oOT';
messageBodyInput.messageSegments.add(mentionSegmentInput);

commentInput.body = messageBodyInput;

ConnectApi.Comment commentRep = ConnectApi.ChatterFeeds.postCommentToFeedElement (communityId,
    feedElementId, commentInput, null);

```

Example for Posting a Comment with an Existing File

```

String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput ();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput ();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput ();

textSegmentInput.text = 'I attached this file from Salesforce Files.';

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput> ();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput ();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
ConnectApi.ContentCapabilityInput ();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.contentDocumentId = '069D00000001rNJ';

commentInput.capabilities = commentCapabilitiesInput;

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement (Network.getNetworkId(), feedElementId,
commentInput, null);

```

Example for Posting a Comment with a New File

```

String feedElementId = '0D5D0000000KtW3';

ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput ();

ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput ();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput ();

textSegmentInput.text = 'Enjoy this new file.';

```

```

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
commentInput.body = messageBodyInput;

ConnectApi.CommentCapabilitiesInput commentCapabilitiesInput = new
ConnectApi.CommentCapabilitiesInput();
ConnectApi.ContentCapabilityInput contentCapabilityInput = new
ConnectApi.ContentCapabilityInput();

commentCapabilitiesInput.content = contentCapabilityInput;
contentCapabilityInput.title = 'Title';

commentInput.capabilities = commentCapabilitiesInput;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');

ConnectApi.Comment commentRep =
ConnectApi.ChatterFeeds.postCommentToFeedElement(Network.getNetworkId(), feedElementId,
commentInput, binInput);

```

Example for Posting a Rich-Text Comment with an Inline Image

You can post rich-text comments with inline images and mentions two ways. Use the [ConnectApiHelper repository on GitHub](#) to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce.

```

String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String imageId = '069R00000000IgQ';
String mentionedUserId = '005R0000000DiMz';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();

```

```

mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);

```

Example for Posting a Rich-Text Comment with a Code Block

```

String communityId = null;
String feedElementId = '0D5R0000000SBEr';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';

ConnectApi.CommentInput input = new ConnectApi.CommentInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postCommentToFeedElement(communityId, feedElementId, input, null);

```

postFeedElement(communityId, subjectId, feedElementType, text)

Posts a feed element with plain text from the context user.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String text)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string `me` to indicate the context user.

feedElementType

Type: [ConnectApi.FeedElementType](#)

The only possible value is `FeedItem`.

text

Type: [String](#)

The text of the feed element. A feed element can contain up to 10,000 characters.

Return Value

Type: [ConnectApi.FeedElement](#)

Example

```
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), '0F9d000000TreH',
ConnectApi.FeedElementType.FeedItem, 'On vacation this week.');
```

postFeedElement(communityId, feedElement, feedElementFileUpload)

Posts a feed element from the context user. Use this method to post rich text, including mentions and hashtag topics, to attach a file to a feed element, and to associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

31.0–35.0

! **Important:** In version 36.0 and later, this method is no longer available because you can't create a feed post and upload a binary file in the same call. Upload files to Salesforce first, and then use `postFeedElement(communityId, feedElement)` to create the feed post and attach the files.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement, ConnectApi.BinaryInput feedElementFileUpload)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedElement

Type: `ConnectApi.FeedElementInput`

Specify rich text, including mentions. Optionally, specify a link, a poll, an existing file, or a new file.

feedElementFileUpload

Type: `ConnectApi.BinaryInput`

Specify the new binary file to attach to the post only if you also specify a `NewFileAttachmentInput` object in the *feedElement* parameter. Otherwise, pass `null`.

Return Value

Type: `ConnectApi.FeedElement`

Example for Posting a Feed Element with a New (Binary) File

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = 'me';

ConnectApi.ContentCapabilityInput contentInput = new ConnectApi.ContentCapabilityInput();
contentInput.title = 'Title';

ConnectApi.FeedElementCapabilitiesInput capabilities = new
ConnectApi.FeedElementCapabilitiesInput();
capabilities.content = contentInput;

input.capabilities = capabilities;

String text = 'These are the contents of the new file.';
Blob myBlob = Blob.valueOf(text);
ConnectApi.BinaryInput binInput = new ConnectApi.BinaryInput(myBlob, 'text/plain',
'fileName');
```

```
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), input, binInput);
```

postFeedElement(communityId, feedElement)

Posts a feed element from the context user. Use this method to post rich text, including mentions and hashtag topics, to attach already uploaded files to a feed element, and to associate action link groups with a feed element. You can also use this method to share a feed element and add a comment.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement postFeedElement(String communityId,
ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElement

Type: [ConnectApi.FeedElementInput](#)

Specify rich text, including mentions. Optionally, specify a link, a poll, or up to 10 existing files.

Return Value

Type: [ConnectApi.FeedElement](#)

Example for Posting a Feed Element with a Mention

You can post feed elements with mentions two ways. Use the [ConnectApiHelper repository on GitHub](#) to write a single line of code, or use this method example.

```
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
ConnectApi.MentionSegmentInput mentionSegmentInput = new ConnectApi.MentionSegmentInput();
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

mentionSegmentInput.id = '005RR000000Dme9';
messageBodyInput.messageSegments.add(mentionSegmentInput);
```

```

textSegmentInput.text = 'Could you take a look?';
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
feedItemInput.feedElementType = ConnectApi.FeedElementType.FeedItem;
feedItemInput.subjectId = '0F9RR0000004CPw';

ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput, null);

```

Example for Posting a Feed Element with Existing Content

```

// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';

ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Would you please review these docs?';

// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

// The FeedElementCapabilitiesInput object holds the capabilities of the feed item.
// For this feed item, we define a files capability to hold the file(s).

List<String> fileIds = new List<String>();
fileIds.add('069xx00000000QO');
fileIds.add('069xx00000000QT');
fileIds.add('069xx00000000Qn');
fileIds.add('069xx00000000Qi');
fileIds.add('069xx00000000Qd');

ConnectApi.FilesCapabilityInput filesInput = new ConnectApi.FilesCapabilityInput();
filesInput.items = new List<ConnectApi.FileIdInput>();

for (String fileId : fileIds) {
    ConnectApi.FileIdInput idInput = new ConnectApi.FileIdInput();
    idInput.id = fileId;
    filesInput.items.add(idInput);
}

ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.files = filesInput;

feedItemInput.capabilities = feedElementCapabilitiesInput;

// Post the feed item.
ConnectApi.FeedElement feedElement =
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);

```

Example for Posting a Rich-Text Feed Element with an Inline Image

You can post rich-text feed elements with inline images and mentions two ways. Use the [ConnectApiHelper repository on GitHub](#) to write a single line of code, or use this method example. In this example, the image file is existing content that has already been uploaded to Salesforce. The post also includes text and a mention.

```
String communityId = null;
String imageId = '069D00000001INA';
String mentionedUserId = '005D0000001QNpr';
String targetUserOrGroupOrRecordId = '005D0000001Gif0';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;
ConnectApi.InlineImageSegmentInput inlineImageSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hello ';
messageInput.messageSegments.add(textSegment);

mentionSegment = new ConnectApi.MentionSegmentInput();
mentionSegment.id = mentionedUserId;
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '!';
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Bold;
messageInput.messageSegments.add(markupEndSegment);

inlineImageSegment = new ConnectApi.InlineImageSegmentInput();
inlineImageSegment.altText = 'image one';
inlineImageSegment.fileId = imageId;
messageInput.messageSegments.add(inlineImageSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input, null);
```

Example for Posting a Rich-Text Feed Element with a Code Block

```
String communityId = null;
String targetUserOrGroupOrRecordId = 'me';
String codeSnippet = '<html>\n\t<body>\n\t\tHello, world!\n\t</body>\n</html>';
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.subjectId = targetUserOrGroupOrRecordId;
input.feedElementType = ConnectApi.FeedElementType.FeedItem;

ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MarkupBeginSegmentInput markupBeginSegment;
ConnectApi.MarkupEndSegmentInput markupEndSegment;

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

markupBeginSegment = new ConnectApi.MarkupBeginSegmentInput();
markupBeginSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupBeginSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = codeSnippet;
messageInput.messageSegments.add(textSegment);

markupEndSegment = new ConnectApi.MarkupEndSegmentInput();
markupEndSegment.markupType = ConnectApi.MarkupType.Code;
messageInput.messageSegments.add(markupEndSegment);

input.body = messageInput;

ConnectApi.ChatterFeeds.postFeedElement(communityId, input);
```

Example for Sharing a Feed Element (in Version 39.0 and Later)

```
// Define the FeedItemInput object to pass to postFeedElement
ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
feedItemInput.subjectId = 'me';
ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();
textSegmentInput.text = 'Look at this post I'm sharing.';
// The MessageBodyInput object holds the text in the post
ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();
messageBodyInput.messageSegments.add(textSegmentInput);
feedItemInput.body = messageBodyInput;

ConnectApi.FeedEntityShareCapabilityInput shareInput = new
ConnectApi.FeedEntityShareCapabilityInput();
shareInput.feedEntityId = '0D5R0000000SEbc';
ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
feedElementCapabilitiesInput.feedEntityShare = shareInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;
// Post the feed item.
```

```
ConnectApi.FeedElement feedElement =  
ConnectApi.ChatterFeeds.postFeedElement(Network.getNetworkId(), feedItemInput);
```

SEE ALSO:

[Define an Action Link and Post with a Feed Element](#)

[Define an Action Link in a Template and Post with a Feed Element](#)

postFeedElementBatch (communityId, feedElements)

Posts a batch of up to 500 feed elements for the cost of one DML statement.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] postFeedElementBatch(String communityId,  
List<ConnectApi.BatchInput> feedElements)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElements

Type: [List<ConnectApi.BatchInput Class>](#)

The list can contain up to 500 `ConnectApi.BatchInput` objects. In the `ConnectApi.BatchInput` constructor, the input object must be a concrete instance of the abstract `ConnectApi.FeedElementInput` class.

Return Value

Type: [ConnectApi.BatchResult\[\]](#)

The `ConnectApi.BatchResult.getResult()` method returns a [ConnectApi.FeedElement](#) object.

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the `ConnectApi.BatchResult` list.

Usage

Use this method to post a list of feed elements efficiently. Create a list containing up to 500 objects and insert them all for the cost of one DML statement.

The `ConnectApi.BatchInput` Class has three constructors, but the `postFeedElementBatch` method only supports the two listed here. It doesn't support multiple binary inputs.

In each constructor, the input object must be an instance of `ConnectApi.FeedElementInput`. Pick a constructor based on whether or not you want to pass a binary input.

- `ConnectApi.BatchInput (Object input)`—No binary input
- `ConnectApi.BatchInput (Object input, ConnectApi.BinaryInput binary)`—One binary input.

Example

This trigger bulk posts to the feeds of newly inserted accounts.

```
trigger postFeedItemToAccount on Account (after insert) {
    Account[] accounts = Trigger.new;

    // Bulk post to the account feeds.

    List<ConnectApi.BatchInput> batchInputs = new List<ConnectApi.BatchInput>();

    for (Account a : accounts) {
        ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();

        input.subjectId = a.id;

        ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
        body.messageSegments = new List<ConnectApi.MessageSegmentInput>();

        ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
        textSegment.text = 'Let\'s win the ' + a.name + ' account.';

        body.messageSegments.add(textSegment);
        input.body = body;

        ConnectApi.BatchInput batchInput = new ConnectApi.BatchInput(input);
        batchInputs.add(batchInput);
    }

    ConnectApi.ChatterFeeds.postFeedElementBatch(Network.getNetworkId(), batchInputs);
}
```

postFeedItem(communityId, feedType, subjectId, text)

Posts a feed item with plain text from the context user.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use `postFeedElement`(communityId, subjectId, feedElementType, text).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, String text)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

Use `Record` to post to a group.

subjectId

Type: [String](#)

The value depends on the *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—The ID of any record with a feed, including groups.
- `UserProfile`—The ID of any user.

text

Type: [String](#)

The text of the feed item. Mentions are downgraded to plain text. To include a mention that links to the user, call the `postFeedItem(communityId, feedType, subjectId, feedItemInput, feedItemFileUpload)` method and pass the mention in a `ConnectApi.FeedItemInput` object.

Return Value

Type: [ConnectApi.FeedItem](#)

 **Note:** Triggers on `FeedItem` objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters.

Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

postFeedItem(*communityId*, *feedType*, *subjectId*, *feedItemInput*, *feedItemFileUpload*)

Posts a feed item to the specified feed from the context user. Use this method to post rich text, including mentions and hashtag topics, and to attach a file to a feed item. You can also use this method to share a feed item and add a comment.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [postFeedElement\(*communityId*, *feedElement*, *feedElementFileUpload*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem postFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, ConnectApi.FeedItemInput feedItemInput,
ConnectApi.BinaryInput feedItemFileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

One of the following:

- [News](#)
- [Record](#)
- [UserProfile](#)

To post a feed item to a group, use `Record` and use a group ID as the *subjectId*.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

feedItemInput

Type: [ConnectApi.FeedItemInput](#)

In the `FeedItemInput` object, specify rich text. Optionally, in the `FeedItemInput.attachment` property, specify a link, a poll, an existing file, or a new file.

feedItemFileUpload

Type: [ConnectApi.BinaryInput](#)

If you specify a [NewFileAttachmentInput](#) object in the `FeedItemInput.attachment` property, specify the new binary file to attach in this argument. Otherwise, do not specify a value.

Return Value

Type: `ConnectApi.FeedItem`

 **Note:** Triggers on `FeedItem` objects run before their attachment and capabilities information is saved, which means that `ConnectApi.FeedItem.attachment` information and `ConnectApi.FeedElement.capabilities` information may not be available in the trigger.

Usage

Feed items and comments can contain up to 10,000 characters. Posts to `ConnectApi.FeedType.UserProfile` in API versions 23.0 and 24.0 created user status updates, not feed items. For posts to the User Profile Feed in those API versions, the character limit is 1,000 characters.

Example for Sharing a Feed Item and Adding a Comment

To share a feed item and add a comment, create a `ConnectApi.FeedItemInput` object containing the comment and the feed item to share, and pass the object to `ConnectApi.ChatterFeeds.postFeedItem` in the `feedItemInput` argument. The message segments in the message body input are used as the comment.

```
ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
input.originalFeedItemId = '0D5D0000000JuAG';

ConnectApi.MessageBodyInput body = new ConnectApi.MessageBodyInput();
List<ConnectApi.MessageSegmentInput> segmentList = new
List<ConnectApi.MessageSegmentInput>();
ConnectApi.TextSegmentInput textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'I hope you enjoy this post I found in another group.';
segmentList.add((ConnectApi.MessageSegmentInput) textSegment);
body.messageSegments = segmentList;
input.body = body;

ConnectApi.ChatterFeeds.postFeedItem(null, ConnectApi.FeedType.UserProfile, 'me', input,
null);
```

Example for Posting a Mention to a User Profile Feed

To post to a user profile feed and include an @mention, call the `ConnectApi.ChatterFeeds.postFeedItem` method.

```
String communityId = null;
ConnectApi.FeedType feedType = ConnectApi.FeedType.UserProfile;

ConnectApi.FeedItemInput input = new ConnectApi.FeedItemInput();
ConnectApi.MessageBodyInput messageInput = new ConnectApi.MessageBodyInput();
ConnectApi.TextSegmentInput textSegment;
ConnectApi.MentionSegmentInput mentionSegment = new ConnectApi.MentionSegmentInput();

messageInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = 'Hey there ';
messageInput.messageSegments.add(textSegment);

mentionSegment.id = '005D0000001LLO1';
```

```
messageInput.messageSegments.add(mentionSegment);

textSegment = new ConnectApi.TextSegmentInput();
textSegment.text = '. How are you?';
messageInput.messageSegments.add(textSegment);

input.body = messageInput;

ConnectApi.FeedItem feedItemRep = ConnectApi.ChatterFeeds.postFeedItem(communityId, feedType,
    'me', input, null);
```

searchFeedElements(communityId, q)

Returns the first page of all the feed elements that match the specified search criteria.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedElements\(communityId, q, result\)](#)

[Testing ConnectApi Code](#)

searchFeedElements (communityId, q, sortParam)

Returns the first page of all the feed elements that match the specified search criteria in the specified order.

API Version

31.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements (String communityId, String q, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

- **MostViewed**—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: `ConnectApi.FeedElementPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedElements\(communityId, q, sortParam, result\)](#)

[Testing ConnectApi Code](#)

searchFeedElements(communityId, q, pageParam, pageSize)

Searches feed elements and returns a specified page and page size of search results.

API Version

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElements(String communityId, String q, String pageParam, Integer pageSize)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

q

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Searches the feed elements for the `Home` feed type and returns a specified page and page size with the specified feed filter in a specified sort order. Each feed element includes no more than the specified number of comments.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. The only valid value is `Home`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

When the *sortParam* is `MostViewed`, you must pass in `null` for the *pageParam*.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

When the *sortParam* is `MostViewed`, the *pageSize* must be a value from 1 to 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.FeedFilter](#)

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedType*Type: `ConnectApi.FeedType`The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.*subjectId*Type: [String](#)If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

*density*Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.*pageSize*Type: [Integer](#)Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedElementsInFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, result\)](#)

[Testing ConnectApi Code](#)

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter)`

Searches the feed elements of the `UserProfile` feed. Use this method to filter the `UserProfile` feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future.

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.*q*Type: [String](#)

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.FeedFilter](#)

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
    ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
    ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
    ConnectApi.FeedSortOrder sortParam, String q, String customFilter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See [Wildcards](#).

customFilter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

    ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
    ConnectApi.FeedFilter filter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter

Type: [ConnectApi.FeedFilter](#)

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`searchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, customFilter)`

Searches the filtered feed elements in a case feed, and returns a specified page and page size in a specified sort order.

API Version

40.0

Available to Guest Users

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String
customFilter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`searchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed elements of a feed filtered by key prefix, and returns a specified page and page size in a specified sort order. Each feed element includes no more than the specified number of comments.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElementPage searchFeedElementsInFilterFeed(String
communityId, String subjectId, String keyPrefix, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedElementPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedItems\(communityId, q, sortParam, result\)](#)

[Testing ConnectApi Code](#)

searchFeedItems(communityId, q, pageParam, pageSize)

Returns a list of all the feed items viewable by the context user that match the specified search criteria.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElements\(communityId, q, pageParam, pageSize\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,  
String pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItems(String communityId, String q,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

Return Value

public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`searchFeedItemsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items for the `Company`, `Home`, and `Moderation` feed types and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

! **Important:** In version 32.0 and later, use `searchFeedElementsInFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, q)`.

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: `Integer`

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedItemsInFeed(communityId, feedType, subjectId, q)`

Searches the feed items for a specified feed type.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElementsInFeed\(`communityId`, `feedType`, `subjectId`, `q`\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If feed type is `UserProfile`, *subjectId* can be any user ID. If *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

```
searchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize,
sortParam, q)
```

Searches the feed items for a specified feed type and user or record, and returns a specified page and page size in a specified sort order.

API Version

28.0–31.0

! **Important:** In version 32.0 and later, use `searchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q)`.

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: `String`

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Specifies the order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.

- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter does not support wildcards. This parameter is required.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedItemsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items for a specified feed type and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElementsInFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
 - `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
 - `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
- Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

`searchFeedItemsInFeed(String, ConnectApi.FeedType, String, Integer, ConnectApi.FeedDensity, String, Integer, ConnectApi.FeedSortOrder, String, Boolean)`

Searches the feed items for a specified feed type and user or record, and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments. Specify whether to return feed items posted by internal (non-community) users only.

API Version

30.0–31.0

Important: In version 32.0 and later, use [searchFeedElementsInFeed\(`communityId`, `feedType`, `subjectId`, `recentCommentCount`, `density`, `pageParam`, `pageSize`, `sortParam`, `q`, `showInternalOnly`\)](#).

Available to Guest Users

31.0 only

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds. Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedItemsInFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly, result\)](#)

[Testing ConnectApi Code](#)

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, q)`

Searches the feed items of a feed filtered by key prefix.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElementsInFilterFeed\(communityId, subjectId, keyPrefix, q\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q)`

Searches the feed items of a feed filtered by key prefix, and returns a specified page and page size in a specified sort order.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElementsInFilterFeed\(communityId, subjectId, keyPrefix, pageParam, pageSize, sortParam, q\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*subjectId*Type: [String](#)The ID of the context user or the alias `me`.*keyPrefix*Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

*pageParam*Type: [String](#)The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.*pageSize*Type: [Integer](#)Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.*q*Type: [String](#)Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.FeedItemPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedItemsInFilterFeed\(communityId, feedType, subjectId, keyPrefix, pageParam, pageSize, sortParam, q, result\)](#)

[Testing ConnectApi Code](#)

`searchFeedItemsInFilterFeed(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q)`

Searches the feed items of a feed filtered by key prefix, and returns a specified page and page size in a specified sort order. Each feed item includes no more than the specified number of comments.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [searchFeedElementsInFilterFeed\(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, q\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItemPage searchFeedItemsInFilterFeed(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity
density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String
q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: `ConnectApi.FeedItemPage`

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchFeedItemsInFilterFeed\(`communityId`, `feedType`, `subjectId`, `keyPrefix`, `recentCommentCount`, `density`, `pageParam`, `pageSize`, `sortParam`, `q`, `result`\)](#)

[Testing ConnectApi Code](#)

searchStreams(`communityId`, `q`)

Search the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchStreams\(`communityId`, `q`, `result`\)](#)

[Testing ConnectApi Code](#)

searchStreams(*communityId*, *q*, *sortParam*)

Search and sort the Chatter feed streams for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q,
ConnectApi.SortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

sortParam

Type: [ConnectApi.SortOrder](#)

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchStreams\(*communityId*, *q*, *sortParam*, *result*\)](#)

[Testing ConnectApi Code](#)

searchStreams(*communityId*, *q*, *pageParam*, *pageSize*)

Search the Chatter feed streams for the context user and return a page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchStreams\(*communityId*, *q*, *pageParam*, *pageSize*, *result*\)](#)

[Testing ConnectApi Code](#)

searchStreams(*communityId*, *q*, *pageParam*, *pageSize*, *sortParam*)

Search the Chatter feed streams for the context user and return a sorted page of results.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStreamPage searchStreams(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.SortOrder sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 to 250. The default size is 25.

sortParam

Type: [ConnectApi.SortOrder](#)

Specifies the sort order. Values are:

- `Ascending`—Items are in ascending alphabetical order (A-Z).
- `Descending`—Items are in descending alphabetical order (Z-A).
- `MostRecentlyViewed`—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

If not specified, default value is `Ascending`.

Return Value

Type: [ConnectApi.ChatterStreamPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchStreams\(communityId, q, pageParam, pageSize, sortParam, result\)](#)

[Testing ConnectApi Code](#)

setFeedCommentStatus(communityId, commentId, status)

Set the status of a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedCommentStatus(String communityId,  
String commentId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

ID of the comment.

status

Type: [ConnectApi.StatusCapabilityInput](#)

A [ConnectApi.StatusCapabilityInput](#) object that includes the status you want to set.

Return Value

Type: [ConnectApi.StatusCapability](#)

If the comment doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

setFeedEntityStatus(*communityId*, *feedElementId*, *status*)

Set the status of a feed post.

API Version

37.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.StatusCapability setFeedEntityStatus(String communityId, String feedElementId, ConnectApi.StatusCapabilityInput status)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

status

Type: [ConnectApi.StatusCapabilityInput](#)

A [ConnectApi.StatusCapabilityInput](#) object that includes the status you want to set.

Return Value

Type: [ConnectApi.StatusCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Usage

Only users with the Can Approve Feed Post and Comment permission can set the status of a feed post or comment.

setIsMutedByMe(*communityId*, *feedElementId*, *isMutedByMe*)

Mute or unmute a feed element.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MuteCapability setIsMutedByMe(String communityId, String
feedElementId, Boolean isMutedByMe)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

isMutedByMe

Type: [Boolean](#)

Indicates whether the feed element is muted for the context user. Default value is `false`.

Return Value

Type: [ConnectApi.MuteCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

setIsReadByMe (communityId, feedElementId, readBy)

Mark a feed element as read for the context user using an input body.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe(String communityId, String
feedElementId, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element to mark as read.

readBy

Type: [ConnectApi.ReadByCapabilityInput](#)

A [ConnectApi.ReadByCapabilityInput](#) body indicating to mark the feed elements as read.

Return Value

Type: [ConnectApi.ReadByCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

setIsReadByMe (communityId, feedElementId, isReadByMe)

Mark a feed element as read for the context user.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ReadByCapability setIsReadByMe (String communityId, String
feedElementId, Boolean isReadByMe)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element to mark as read.

isReadByMe

Type: [Boolean](#)

Specifies to mark the feed element as read (`true`) for the context user.

Return Value

Type: [ConnectApi.ReadByCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

shareFeedElement (communityId, subjectId, feedElementType, originalFeedElementId)

Share the *originalFeedElementId* as the context user.

API Version

31.0–38.0

! **Important:** In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput` to share a feed entity with a feed element.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement shareFeedElement(String communityId, String
subjectId, ConnectApi.FeedElementType feedElementType, String originalFeedElementId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: `String`

The ID of the user or group with whom to share the feed element.

feedElementType

Type: `ConnectApi.FeedElementType`

Values are:

- `Bundle`—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values.
- `FeedItem`—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.
- `Recommendation`—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.

originalFeedElementId

Type: `String`

The ID of the feed element to share.

Return Value

Type: `ConnectApi.FeedElement`

Example

```
ConnectApi.ChatterFeeds.shareFeedElement(null, '0F9RR0000004CPw',
ConnectApi.FeedElementType.FeedItem, '0D5RR0000004Gxc');
```

shareFeedItem(*communityId*, *feedType*, *subjectId*, *originalFeedItemId*)

Share the *originalFeedItemId* to the feed specified by the *feedType*.

API Version

28.0–31.0

 **Important:**

- In version 32.0–38.0, use `shareFeedElement(communityId, subjectId, feedElementType, originalFeedElementId)`.
- In version 39.0 and later, use `postFeedElement(communityId, feedElement)` or `updateFeedElement(communityId, feedElementId, feedElement)` with the `ConnectApi.FeedEntityShareCapabilityInput`.

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem shareFeedItem(String communityId, ConnectApi.FeedType
feedType, String subjectId, String originalFeedItemId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

One of the following:

- `News`
- `Record`
- `UserProfile`

To share a feed item with a group, use `Record` and use a group ID as the *subjectId*.

subjectId

Type: `String`

The value depends on the value of *feedType*:

- `News`—*subjectId* must be the ID of the context user or the keyword `me`.
- `Record`—*subjectId* can be a group ID or the ID of the context user (or `me`).
- `UserProfile`—*subjectId* can be any user ID.

originalFeedItemId

Type: `String`

The ID of the feed item to share.

Return Value

Type: [ConnectApi.FeedItem](#)

Example

To share a feed item with a group, pass in to this method the community ID (or `null`), the feed type `Record`, the group ID, and the ID of the feed item to share.

```
ConnectApi.ChatterFeeds.shareFeedItem(null, ConnectApi.FeedType.Record, '0F9D00000000izf',  
'0D5D00000000JuAG');
```

updateBookmark(communityId, feedItemId, isBookmarkedByCurrentUser)

Bookmarks the specified feed item or removes a bookmark from the specified feed item.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [updateFeedElementBookmarks](#)(communityId, feedElementId, bookmarks), [updateFeedElementBookmarks](#)(communityId, feedElementId, bookmarks), or [updateFeedElementBookmarks](#)(communityId, feedElementId, isBookmarkedByCurrentUser).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedItem updateBookmark(String communityId, String feedItemId,  
Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

isBookmarkedByCurrentUser

Type: [Boolean](#)

—Specifying `true` adds the feed item to the list of bookmarks for the context user. Specify `false` to remove a bookmark.

Return Value

Type: [ConnectApi.FeedItem](#)

updateComment(communityId, commentId, comment)

Edits a comment.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Comment updateComment(String communityId, String commentId,
ConnectApi.CommentInput comment)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

ID of the comment to be edited.

comment

Type: [ConnectApi.CommentInput](#)

Information about the comment to be edited.

Return Value

Type: [ConnectApi.Comment](#)

If the comment doesn't support the `edit` capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
String commentId;
String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.CommentPage commentPage =
ConnectApi.ChatterFeeds.getCommentsForFeedElement(communityId, feedElementId);
```

```

if (commentPage.items.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
commentId = commentPage.items[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isCommentEditableByMe (communityId, commentId);

if (isEditable.isEditableByMe == true){
    ConnectApi.CommentInput commentInput = new ConnectApi.CommentInput ();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput ();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput ();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput> ();

    textSegmentInput.text = 'This is my edited comment.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    commentInput.body = messageBodyInput;

    ConnectApi.Comment editedComment = ConnectApi.ChatterFeeds.updateComment (communityId,
commentId, commentInput);
}

```

updateDirectMessage (communityId, feedElementId, directMessage)

Update the members of a direct message.

API Version

40.0

Requires Chatter

Yes

Signature

```

public static ConnectApi.DirectMessageCapability updateDirectMessage (String communityId,
String feedElementId, ConnectApi.DirectMessageCapabilityInput directMessage)

```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, internal, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

directMessage

Type: [ConnectApi.DirectMessageCapabilityInput](#)

A [ConnectApi.DirectMessageCapabilityInput](#) body that includes the members to add and remove.

Return Value

Type: [ConnectApi.DirectMessageCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

updateFeedElement(*communityId*, *feedElementId*, *feedElement*)

Edits a feed element. Feed items are the only type of feed element that can be edited.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedElement updateFeedElement(String communityId, String
feedElementId, ConnectApi.FeedElementInput feedElement)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element to be edited. Feed items are the only type of feed element that can be edited.

feedElement

Type: [ConnectApi.FeedElementInput](#)

Information about the feed element to be edited. Feed items are the only type of feed element that can be edited.

Return Value

Type: [ConnectApi.FeedElement](#)

If the feed element doesn't support the `edit` capability, the return value is [ConnectApi.NotFoundException](#).

Example for Editing a Feed Post

```
String communityId = Network.getNetworkId();
```

```

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
    ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){
    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

    messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

    textSegmentInput.text = 'This is my edited post.';
    messageBodyInput.messageSegments.add(textSegmentInput);

    feedItemInput.body = messageBodyInput;

    ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}

```

Example for Editing a Question Title and Post

```

String communityId = Network.getNetworkId();

// Get the last feed item created by the context user.
List<FeedItem> feedItems = [SELECT Id FROM FeedItem WHERE CreatedById = :UserInfo.getUserId()
    ORDER BY CreatedDate DESC];
if (feedItems.isEmpty()) {
    // Return null within anonymous apex.
    return null;
}
String feedElementId = feedItems[0].id;

ConnectApi.FeedEntityIsEditable isEditable =
ConnectApi.ChatterFeeds.isFeedElementEditableByMe(communityId, feedElementId);

if (isEditable.isEditableByMe == true){

    ConnectApi.FeedItemInput feedItemInput = new ConnectApi.FeedItemInput();
    ConnectApi.FeedElementCapabilitiesInput feedElementCapabilitiesInput = new
ConnectApi.FeedElementCapabilitiesInput();
    ConnectApi.QuestionAndAnswersCapabilityInput questionAndAnswersCapabilityInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
    ConnectApi.MessageBodyInput messageBodyInput = new ConnectApi.MessageBodyInput();
    ConnectApi.TextSegmentInput textSegmentInput = new ConnectApi.TextSegmentInput();

```

```

messageBodyInput.messageSegments = new List<ConnectApi.MessageSegmentInput>();

textSegmentInput.text = 'This is my edited question.';
messageBodyInput.messageSegments.add(textSegmentInput);

feedItemInput.body = messageBodyInput;
feedItemInput.capabilities = feedElementCapabilitiesInput;

feedElementCapabilitiesInput.questionAndAnswers = questionAndAnswersCapabilityInput;
questionAndAnswersCapabilityInput.questionTitle = 'Where is my edited question?';

ConnectApi.FeedElement editedFeedElement =
ConnectApi.ChatterFeeds.updateFeedElement(communityId, feedElementId, feedItemInput);
}

```

updateFeedElementBookmarks(communityId, feedElementId, bookmarks)

Bookmark or unbookmark a feed element by passing a `ConnectApi.BookmarksCapabilityInput` object.

API Version

32.0

Requires Chatter

Yes

Signature

```

public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String
communityId, String feedElementId, ConnectApi.BookmarksCapabilityInput bookmarks)

```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: `String`

The ID for a feed element.

bookmarks

Type: `ConnectApi.BookmarksCapabilityInput`

Information about a bookmark.

Return Value

Type: `ConnectApi.BookmarksCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

updateFeedElementBookmarks(*communityId*, *feedElementId*, *isBookmarkedByCurrentUser*)

Bookmark or unbookmark a feed element by passing a boolean value.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BookmarksCapability updateFeedElementBookmarks(String communityId, String feedElementId, Boolean isBookmarkedByCurrentUser)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

isBookmarkedByCurrentUser

Type: [Boolean](#)

Specify whether to bookmark the feed element (`true`) or not (`false`).

Return Value

Type: [ConnectApi.BookmarksCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
ConnectApi.BookmarksCapability bookmark =  
ConnectApi.ChatterFeeds.updateFeedElementBookmarks(null, '0D5D0000000KuGh', true);
```

updateFeedElementReadByCapabilityBatch(*communityId*, *feedElementIds*, *readBy*)

Mark multiple feed elements as read by the context user at the same time using an input body.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String
communityId, List<String> feedElementIds, ConnectApi.ReadByCapabilityInput readBy)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementIds

Type: [String](#)

Up to 500 feed element IDs to mark as read.

readBy

Type: [ConnectApi.ReadByCapabilityInput](#)

A [ConnectApi.ReadByCapabilityInput](#) body indicating to mark the feed elements as read.

Return Value

Type: [ConnectApi.BatchResult\[\]](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

The returned objects correspond to each of the input objects and are returned in the same order as the input objects.

The method call fails only if an error occurs that affects the entire operation (such as a parsing failure). If an individual object causes an error, the error is embedded within the [ConnectApi.BatchResult](#) list.

updateFeedElementReadByCapabilityBatch(*communityId*, *feedElementIds*, *isReadByMe*)

Mark multiple feed elements as read by the context user at the same time.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] updateFeedElementReadByCapabilityBatch(String
communityId, List<String> feedElementIds, Boolean isReadByMe)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementIds

Type: [String](#)

Up to 500 feed element IDs to mark as read.

isReadByMe

Type: [Boolean](#)

Specifies to mark the feed element as read (`true`) for the context user.

Return Value

Type: [ConnectApi.BatchResult\[\]](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

updateLikeForComment(*communityId*, *commentId*, *isLikedByCurrentUser*)

Like or unlike a comment.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForComment(String communityId, String
commentId, Boolean isLikedByCurrentUser)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

ID of the comment.

isLikedByCurrentUser

Type: [Boolean](#)

Specifies if the context user likes (`true`) or dislikes (`false`) the comment.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

updateLikeForFeedElement(communityId, feedElementId, isLikedByCurrentUser)

Like or unlike a feed element.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterLikePage updateLikeForFeedElement(String communityId,  
String feedElementId, Boolean isLikedByCurrentUser)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element.

isLikedByCurrentUser

Type: [Boolean](#)

Specifies if the context user likes (`true`) or dislikes (`false`) the feed element.

Return Value

Type: [ConnectApi.ChatterLikePage](#)

If the feed element doesn't support the `ChatterLikes` capability, the return value is [ConnectApi.NotFoundException](#).

updateStream(communityId, streamId, streamInput)

Update a Chatter feed stream.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterStream updateStream(String communityId, String streamId,
ConnectApi.ChatterStreamInput streamInput)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

streamId

Type: [String](#)

ID of the Chatter feed stream.

streamInput

Type: [ConnectApi.ChatterStreamInput](#)

A [ConnectApi.ChatterStreamInput](#) object.

Return Value

Type: [ConnectApi.ChatterStream](#)

voteOnFeedElementPoll(communityId, feedElementId, myChoiceId)

Vote on a poll or change your vote on a poll.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.PollCapability voteOnFeedElementPoll(String communityId, String
feedElementId, String myChoiceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

myChoiceId

Type: [String](#)

The ID of the poll item to vote for. The key prefix for poll items is 09A.

Return Value

Type: [ConnectApi.PollCapability Class](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
ConnectApi.PollCapability poll = ConnectApi.ChatterFeeds.voteOnFeedElementPoll(null,
'0D5D0000000XZaUKAW', '09AD00000000TKMAY');
```

voteOnFeedPoll(communityId, feedItemId, myChoiceId)

Used to vote or to change your vote on an existing feed poll.

API Version

28.0–31.0

 **Important:** In version 32.0 and later, use [voteOnFeedElementPoll](#)(communityId, feedElementId, myChoiceId).

Requires Chatter

Yes

Signature

```
public static ConnectApi.FeedPoll voteOnFeedPoll(String communityId, String feedItemId,
String myChoiceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

Specify the feed item that is associated with the poll.

myChoiceId

Type: [String](#)

Specify the ID of the item in the poll to vote for.

Return Value

Type: [ConnectApi.FeedPoll](#)

ChatterFeeds Test Methods

The following are the test methods for `ChatterFeeds`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestGetFeedElementsFromFeed(*communityId*, *feedType*, *result*)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getFeedElementsFromFeed\(*communityId*, *feedType*\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(*communityId*, *feedType*, *pageParam*, *pageSize*, *sortParam*, *result*)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

The only valid value for this parameter is `Company`.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsFromFeed\(communityId, feedType, pageParam, pageSize, sortParam\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getFeedElementsFromFeed\(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam\)](#)

[Testing ConnectApi Code](#)

`setTestGetFeedElementsFromFeed(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter

Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.

- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsFromFeed\(communityId, feedType, recentCommentCount, density, pageParam, pageSize, sortParam, filter\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.

```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getFeedElementsFromFeed\(communitId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(*communityId*, *feedType*, *subjectId*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *sortParam*, *filter*, *result*)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId

Type: `String`

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount

Type: `Integer`

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

filter

Type: [ConnectApi.FeedFilter](#)

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

customFilter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsFromFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, customFilter\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, result)

Registers a [ConnectApi.FeedElementPage](#) object to be returned when [getFeedElementsFromFeed](#) is called with matching parameters in a test context. Use the get feed method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedElementPage
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

Value must be [ConnectApi.FeedType.Record](#).

subjectId

Type: [String](#)

Any record ID, including a group ID.

*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

*elementsPerBundle*Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

*density*Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: [ConnectApi.FeedSortOrder](#)

Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

*showInternalOnly*Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsFromFeed\(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsFromFeed(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam, showInternalOnly, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsFromFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean showInternalOnly, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

elementsPerBundle

Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

*density*Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

*showInternalOnly*Type: `Boolean`

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

*filter*Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.

- **Unread**—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- **UnsolvedQuestions**—Feed elements that are questions and that don't have a best answer.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

*elementsPerBundle*Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

*density*Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- [AllUpdates](#)—Displays all updates from people and records the user follows and groups the user is a member of.
- [FewerUpdates](#)—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, [currentPageToken](#) or [nextPageToken](#). If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: [ConnectApi.FeedSortOrder](#)

Values are:

- [CreatedDateAsc](#)—Sorts by oldest creation date. This sort order is available only for [DirectMessageModeration](#), [Moderation](#), and [PendingReview](#) feeds.
- [CreatedDateDesc](#)—Sorts by most recent creation date.
- [LastModifiedDateDesc](#)—Sorts by most recent activity.
- [MostViewed](#)—Sorts by most viewed content. This sort order is available only for [Home](#) feeds when the [ConnectApi.FeedFilter](#) is [UnansweredQuestions](#).
- [Relevance](#)—Sorts by most relevant content. This sort order is available only for [Company](#), [Home](#), and [Topics](#) feeds.

If you pass in `null`, the default value [CreatedDateDesc](#) is used.

*showInternalOnly*Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

*customFilter*Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

setTestGetFeedElementsFromFilterFeed(communityId, subjectId, keyPrefix, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `getFeedElementsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeed(String communityId, String subjectId, String keyPrefix, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: `String`

The ID of the context user or the alias `me`.

keyPrefix

Type: `String`

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

*elementsPerBundle*Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

*density*Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: [ConnectApi.FeedSortOrder](#)

Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getFeedElementsFromFilterFeed\(communitiyId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, sortParam\)](#)

[Testing ConnectApi Code](#)

```
setTestGetFeedElementsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix,
recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince,
result)
```

Registers a `ConnectApi.FeedElementPage` object to be returned when the `getFeedElementsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle

Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token defining the modification time stamp of the feed and the sort order.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsFromFilterFeedUpdatedSince\(communityId, subjectId, keyPrefix, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince\)](#)

[Testing ConnectApi Code](#)

`setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedElementPage
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsUpdatedSince\(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

filter

Type: [ConnectApi.FeedFilter](#)

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.

- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

[getFeedElementsUpdatedSince\(communityId, feedType, recentCommentCount, density, pageParam, pageSize, updatedSince, filter\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

One of these values:

- Files
- Groups
- News
- People
- Record

subjectId

Type: [String](#)

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The *updatedSince* parameter doesn't return feed elements that are created in the same second as the call.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,
Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*updatedSince*Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

*showInternalOnly*Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedElementsUpdatedSince\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, updatedSince, showInternalOnly\)](#)

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId

Type: [String](#)

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle

Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token defining the modification time stamp of the feed and the sort order.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

filter

Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, customFilter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

40.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, String customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

*elementsPerBundle*Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

*density*Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- [AllUpdates](#)—Displays all updates from people and records the user follows and groups the user is a member of.
- [FewerUpdates](#)—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*updatedSince*Type: [String](#)

An opaque token defining the modification time stamp of the feed and the sort order.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

*customFilter*Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[Testing ConnectApi Code](#)

```
setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId,
recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince,
showInternalOnly, result)
```

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

31.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: `String`

Any record ID, including a group ID.

recentCommentCount

Type: `Integer`

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle

Type: `Integer`

The maximum number of feed elements per bundle. The default and maximum value is 10.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[Testing ConnectApi Code](#)

setTestGetFeedElementsUpdatedSince(communityId, feedType, subjectId, recentCommentCount, elementsPerBundle, density, pageParam, pageSize, updatedSince, showInternalOnly, filter, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when `getFeedElementsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetFeedElementsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount, Integer
elementsPerBundle, ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
String updatedSince, Boolean showInternalOnly, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle

Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter

Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

String updatedSince, Boolean showInternalOnly, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

elementsPerBundle

Type: [Integer](#)

The maximum number of feed elements per bundle. The default and maximum value is 10.

density

Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. Retrieve this token from the `updatesToken` property of the `ConnectApi.FeedElementPage` response body.

The `updatedSince` parameter doesn't return feed elements that are created in the same second as the call.

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

customFilter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

result

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType feedType, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
 - `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
 - `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
- Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, Integer recentCommentCount, ConnectApi.FeedDensity density, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: `Integer`

The maximum number of comments to return with each feed item. The default value is 3.

*density*Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

*result*Type: `ConnectApi.FeedItemPage`

The object containing test data.

public static Void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam,
ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFeedItemsFromFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam\)](#)

[Testing ConnectApi Code](#)

`setTestGetFeedItemsFromFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, showInternalOnly, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsFromFeed` is called with matching parameters in a test context. Use the `get feed` method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static void setTestGetFeedItemsFromFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, Boolean
showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedType*Type: `ConnectApi.FeedType`The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.*subjectId*Type: [String](#)If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

*density*Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.*pageSize*Type: [Integer](#)Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
 - `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
 - `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.
- Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

showInternalOnly

Type: `Boolean`

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[Testing ConnectApi Code](#)

`setTestGetFeedItemsFromFilterFeed(communityId, subjectId, keyPrefix, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `getFeedItemsFromFilterFeed` method is called in a test context. Use the method with the same parameters or the code throws an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String
subjectId, String keyPrefix, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: `String`

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

result

Type: [ConnectApi.FeedItemPage](#)

The object containing test data.

Return Value

Type: Void

API Version

28.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeed(String communityId, String
subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

[Testing ConnectApi Code](#)

setTestGetFeedItemsFromFilterFeedUpdatedSince(communityId, subjectId, keyPrefix, recentCommentCount, density, pageParam, pageSize, sortParam, updatedSince, result)

Registers a `ConnectApi.FeedItemPage` object to be returned when the `getFeedItemsFromFilterFeedUpdatedSince` method is called in a test context.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsFromFilterFeedUpdatedSince(String communityId,
String subjectId, String keyPrefix, Integer recentCommentCount, ConnectApi.FeedDensity
density, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String
updatedSince, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

updatedSince

Type: [String](#)

An opaque token containing information about the last modified date of the feed. Do not construct this token. To retrieve this token, call `getFeedItemsFromFilterFeed` and take the value from the `updatesToken` property of the `ConnectApi.FeedItemPage` response body.

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

setTestGetFeedItemsUpdatedSince(*communityId*, *feedType*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *updatedSince*, *ConnectApi.FeedItemPage*, *results*)

Registers a `ConnectApi.FeedItemPage` object to be returned when `getFeedItemsUpdatedSince` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, String updatedSince, ConnectApi.FeedItemPage results)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Registers a [ConnectApi.FeedItemPage](#) object to be returned when [getFeedItemsUpdatedSince](#) is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

30.0–31.0

Signature

```
public static Void setTestGetFeedItemsUpdatedSince(String communityId,  
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,  
ConnectApi.FeedDensity density, String pageParam, Integer pageSize, String updatedSince,  
ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: [ConnectApi.FeedType](#)

One of these values:

- Files
- Groups
- News
- People
- Record

subjectId

Type: [String](#)

If *feedType* is `ConnectApi.Record`, *subjectId* can be any record ID, including a group ID. Otherwise, it must be the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

[Testing ConnectApi Code](#)

setTestGetRelatedPosts(communityId, feedElementId, filter, maxResults, result)

Registers a `ConnectApi.RelatedFeedPosts` object to be returned when the matching `ConnectApi.getRelatedPosts(communityId, feedElementId, filter, maxResults)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

37.0

Signature

```
public static Void setTestGetRelatedPosts(String communityId, String feedElementId,
ConnectApi.RelatedFeedPostType filter, Integer maxResults, ConnectApi.RelatedFeedPosts
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

ID of the feed element. The feed element must be a question.

filter

Type: [ConnectApi.RelatedFeedPostType](#)

Specifies the type of related feed post. Values are:

- **Answered**—Related questions that have at least one answer.
- **BestAnswer**—Related questions that have a best answer.
- **Generic**—All types of related questions, including answered, with a best answer, and unanswered.
- **Unanswered**—Related questions that don't have answers.

`Generic` is the default value.

maxResults

Type: [Integer](#)

The maximum number of results to return. You can return up to 25 results; 5 is the default.

result

Type: [ConnectApi.RelatedFeedPosts](#)

The object containing test data.

In version 37.0 and later, related feed posts are questions.

Return Value

Type: Void

setTestSearchFeedElements(*communityId*, *q*, *result*)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchFeedElements\(communityId, q\)](#)

[Testing ConnectApi Code](#)

setTestSearchFeedElements(communityId, q, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q,
ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchFeedElements\(communityId, q, sortParam\)](#)

[Testing ConnectApi Code](#)

setTestSearchFeedElements(communityId, q, pageParam, pageSize, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.

- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for Home feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for Company, Home, and Topics feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchFeedElements\(communityId, q, pageParam, pageSize, sortParam\)](#)

[Testing ConnectApi Code](#)

setTestSearchFeedElements(communityId, q, recentCommentCount, pageParam, pageSize, sortParam, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElements` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElements(String communityId, String q, Integer
recentCommentCount, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `Home`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.

- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values are `Company`, `DirectMessageModeration`, `DirectMessages`, `Home`, `Moderation`, and `PendingReview`.

*recentCommentCount*Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

*density*Type: [ConnectApi.FeedDensity](#)

Specify the amount of content in a feed.

- **AllUpdates**—Displays all updates from people and records the user follows and groups the user is a member of.
- **FewerUpdates**—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: [ConnectApi.FeedSortOrder](#)

Values are:

- **CreatedDateAsc**—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- **CreatedDateDesc**—Sorts by most recent creation date.
- **LastModifiedDateDesc**—Sorts by most recent activity.
- **MostViewed**—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- **Relevance**—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

*q*Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

*filter*Type: [ConnectApi.FeedFilter](#)

Specifies the feed filters.

- **AllQuestions**—Feed elements that are questions.
- **AuthoredBy**—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- **CommunityScoped**—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- **Read**—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.

- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedElementPage
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If feed type is `UserProfile`, *subjectId* can be any user ID. If *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is *Record*, *subjectId* can be any record ID, including a group ID. If *feedType* is *Streams*, *subjectId* must be a stream ID. If *feedType* is *Topics*, *subjectId* must be a topic ID. If *feedType* is *UserProfile*, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias *me*.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Specifies the order of feed items in the feed.

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Search term. Searches keywords in the user or group name. A minimum of one character is required. This parameter does not support wildcards. This parameter is required.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchFeedElementsInFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q\)](#)

[Testing ConnectApi Code](#)

`setTestSearchFeedElementsInFeed(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, filter, result)`

Registers a `ConnectApi.FeedElementPage` object to be returned when `searchFeedElementsInFeed` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

35.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedFilter filter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.UserProfile`.

subjectId

Type: [String](#)

The ID of any user. To specify the context user, use the user ID or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See [Wildcards](#).

filter

Type: `ConnectApi.FeedFilter`

Value must be `ConnectApi.FeedFilter.CommunityScoped`. Filters the feed to include only feed elements that are scoped to communities. Feed elements that are always visible in all communities are filtered out. Currently, feed elements scoped to communities have a User or a Group parent record. However, other parent record types could be scoped to communities in the future.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

ConnectApi.FeedSortOrder sortParam, String q, String customFilter,
ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

The amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

One or more keywords to search for in the feed elements visible to the context user. The search string can contain wildcards and must contain at least two characters that aren't wildcards. See [Wildcards](#).

customFilter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

*q*Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

*showInternalOnly*Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

*result*Type: [ConnectApi.FeedElementPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[searchFeedElementsInFeed\(communityId, feedType, subjectId, recentCommentCount, density, pageParam, pageSize, sortParam, q, showInternalOnly\)](#)

[Testing ConnectApi Code](#)

setTestSearchFeedElementsInFeed(*communityId*, *feedType*, *subjectId*, *recentCommentCount*, *density*, *pageParam*, *pageSize*, *sortParam*, *q*, *showInternalOnly*, *filter*, *result*)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

32.0

Signature

```
public static Void setTestSearchFeedElementsInFeed(String communityId,
ConnectApi.FeedType feedType, String subjectId, Integer recentCommentCount,
ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly,
ConnectApi.FeedFilter filter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

Any record ID, including a group ID.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: `Boolean`

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

filter

Type: `ConnectApi.FeedFilter`

Specifies the feed filters.

- `AllQuestions`—Feed elements that are questions.
- `AuthoredBy`—Feed elements authored by the user profile owner. This value is valid only for the `UserProfile` feed.
- `CommunityScoped`—Feed elements that are scoped to communities. Currently, these feed elements have a `User` or a `Group` parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the `UserProfile` feed.
- `Read`—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the `Record` feed of a group.
- `SolvedQuestions`—Feed elements that are questions and that have a best answer.
- `UnansweredQuestions`—Feed elements that are questions and that don't have any answers.
- `Unread`—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the `Record` feed of a group.
- `UnsolvedQuestions`—Feed elements that are questions and that don't have a best answer.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

ConnectApi.FeedDensity density, String pageParam, Integer pageSize,
ConnectApi.FeedSortOrder sortParam, String q, Boolean showInternalOnly, String
customFilter, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

Value must be `ConnectApi.FeedType.Record`.

subjectId

Type: [String](#)

The ID of a case.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed element. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.

- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed elements from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

cusotmFilter

Type: [String](#)

Custom filter that applies only to the case feed. See [customFeedFilter](#) in the *Metadata API Developer Guide* for supported values.

result

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

Type: Void

setTestSearchFeedElementsInFilterFeed(communityId, subjectId, keyPrefix, q, result)

Registers a `ConnectApi.FeedElementPage` object to be returned when the matching `ConnectApi.searchFeedElementsInFilterFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String subjectId, String keyPrefix, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.FeedElementPage](#)

API Version

31.0

Signature

```
public static Void setTestSearchFeedElementsInFilterFeed(String communityId, String
subjectId, String keyPrefix, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam, String q, ConnectApi.FeedElementPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed elements per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

If you pass in `null`, the default value `CreatedDateDesc` is used.

`q`

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

`result`

Type: `ConnectApi.FeedElementPage`

The object containing test data.

Return Value

```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

recentCommentCount

Type: `Integer`

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[searchFeedItemsInFeed\(`communityId`, `feedType`, `recentCommentCount`, `density`, `pageParam`, `pageSize`, `sortParam`, `q`\)](#)

[Testing ConnectApi Code](#)

`setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, q, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching

`ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType feedType, String subjectId, String q, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

*feedType*Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

*subjectId*Type: `String`

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

*q*Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

*result*Type: `ConnectApi.FeedItemPage`

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[Testing ConnectApi Code](#)

`setTestSearchFeedItemsInFeed(communityId, feedType, subjectId, pageParam, pageSize, sortParam, q, result)`

Registers a `ConnectApi.FeedItemPage` object to be returned when the matching `ConnectApi.searchFeedItemsInFeed` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0–31.0

Signature

```
public static Void setTestSearchFeedItemsInFeed(String communityId, ConnectApi.FeedType
feedType, String subjectId, String pageParam, Integer pageSize, ConnectApi.FeedSortOrder
sortParam, String q, ConnectApi.FeedItemPage result)
```

Parameters

*communityId*Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: `String`

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

pageParam

Type: `String`

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: `String`

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

*pageParam*Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

*pageSize*Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

*sortParam*Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

*q*Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

*result*Type: [ConnectApi.FeedItemPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

feedType, String subjectId, Integer recentCommentCount, ConnectApi.FeedDensity density,
String pageParam, Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q,
Boolean showInternalOnly, ConnectApi.FeedItemPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessages`, `Filter`, `Landing`, and `Streams`.

subjectId

Type: [String](#)

If *feedType* is `Record`, *subjectId* can be any record ID, including a group ID. If *feedType* is `Streams`, *subjectId* must be a stream ID. If *feedType* is `Topics`, *subjectId* must be a topic ID. If *feedType* is `UserProfile`, *subjectId* can be any user ID. If the *feedType* is any other value, *subjectId* must be the ID of the context user or the alias `me`.

recentCommentCount

Type: [Integer](#)

The maximum number of comments to return with each feed item. The default value is 3.

density

Type: `ConnectApi.FeedDensity`

Specify the amount of content in a feed.

- `AllUpdates`—Displays all updates from people and records the user follows and groups the user is a member of.
- `FewerUpdates`—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: [ConnectApi.FeedSortOrder](#)

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

showInternalOnly

Type: [Boolean](#)

Specifies whether to show only feed items from internal (non-community) users (`true`), or not (`false`). The default value is `false`.

result

Type: [ConnectApi.FeedItemPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

ConnectApi.FeedType feedType, String subjectId, String keyPrefix, String pageParam,
Integer pageSize, ConnectApi.FeedSortOrder sortParam, String q, ConnectApi.FeedItemPage
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedType

Type: `ConnectApi.FeedType`

The type of feed. Valid values include every `ConnectApi.FeedType` except `Company`, `DirectMessageModeration`, `DirectMessages`, `Filter`, `Home`, `Landing`, `Moderation`, and `PendingReview`.

subjectId

Type: [String](#)

The ID of the context user or the alias `me`.

keyPrefix

Type: [String](#)

A key prefix that specifies record type. A key prefix is the first three characters in the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.FeedSortOrder`

Values are:

- `CreatedDateAsc`—Sorts by oldest creation date. This sort order is available only for `DirectMessageModeration`, `Moderation`, and `PendingReview` feeds.
- `CreatedDateDesc`—Sorts by most recent creation date.
- `LastModifiedDateDesc`—Sorts by most recent activity.
- `MostViewed`—Sorts by most viewed content. This sort order is available only for `Home` feeds when the `ConnectApi.FeedFilter` is `UnansweredQuestions`.
- `Relevance`—Sorts by most relevant content. This sort order is available only for `Company`, `Home`, and `Topics` feeds.

Sorts the returned feed by the most recently created feed item, or by the most recently modified feed item. If you pass in `null`, the default value `CreatedDateDesc` is used.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.FeedItemPage](#)

Specify the test feed item page.

Return Value

ChatterGroups Class

Information about groups, such as the group's members, photo, and the groups the specified user is a member of. Add members to a group, remove members, and change the group photo.

Namespace

[ConnectApi](#)

ChatterGroups Methods

The following are methods for `ChatterGroups`. All methods are static.

IN THIS SECTION:

[addMember\(communityId, groupId, userId\)](#)

Adds the specified user to the specified group in the specified community as a standard member. To execute this method, the context user must be the group owner or moderator.

[addMemberWithRole\(communityId, groupId, userId, role\)](#)

Adds the specified user with the specified role to the specified group in the specified community. To execute this method, the context user must be the group owner or moderator.

[addRecord\(communityId, groupId, recordId\)](#)

Associates a record with a group.

[createGroup\(communityId, groupInput\)](#)

Creates a group.

[deleteBannerPhoto\(communityId, groupId\)](#)

Delete a group banner photo.

[deleteMember\(communityId, membershipId\)](#)

Deletes the specified group membership.

[deletePhoto\(communityId, groupId\)](#)

Deletes the photo of the specified group.

[getAnnouncements\(communityId, groupId\)](#)

Gets the first page of announcements in a group.

[getAnnouncements\(communityId, groupId, pageParam, pageSize\)](#)

Gets the specified page of announcements in a group. You can also specify the page size.

[getBannerPhoto\(communityId, groupId\)](#)

Get a group banner photo.

[getGroup\(communityId, groupId\)](#)

Returns information about the specified group.

[getGroupBatch\(communityId, groupIds\)](#)

Gets information about the specified list of groups. Returns a list of `BatchResult` objects containing `ConnectApi.ChatterGroup` objects. Returns errors embedded in the results for groups that couldn't be loaded.

[getGroupMembershipRequest\(communityId, requestId\)](#)

Returns information about the specified request to join a private group.

[getGroupMembershipRequests\(communityId, groupId\)](#)

Returns information about every request to join the specified private group.

[getGroupMembershipRequests\(communityId, groupId, status\)](#)

Returns information about every request to join the specified private group that has a specified status.

[getGroups\(communityId\)](#)

Returns the first page of all the groups. The page contains the default number of items.

[getGroups\(communityId, pageParam, pageSize\)](#)

Returns the specified page of information about all groups.

[getGroups\(communityId, pageParam, pageSize, archiveStatus\)](#)

Returns the specified page of information about a set of groups with a specified group archive status.

[getMember\(communityId, membershipId\)](#)

Returns information about the specified group member.

[getMembers\(communityId, groupId\)](#)

Get the first page of information about members of a group. The page contains the default number of items.

[getMembers\(communityId, groupId, pageParam, pageSize\)](#)

Get the specified page of information about members of a group.

[getMembershipBatch\(communityId, membershipIds\)](#)

Gets information about the specified list of group memberships. Returns a list of `BatchResult` objects containing `ConnectApi.GroupMember` objects. Returns errors embedded in the results for group memberships that couldn't be accessed.

[getMyChatterSettings\(communityId, groupId\)](#)

Returns the context user's Chatter settings for the specified group.

[getPhoto\(communityId, groupId\)](#)

Returns information about the photo for the specified group.

[getRecord\(communityId, groupRecordId\)](#)

Returns information about a record associated with a group.

[getRecords\(communityId, groupId\)](#)

Returns the first page of records associated with the specified group. The page contains the default number of items.

[getRecords\(communityId, groupId, pageParam, pageSize\)](#)

Returns the specified page from the list of records associated with a group.

[inviteUsers\(groupId, invite\)](#)

Invite internal and external users to join a group.

[postAnnouncement\(communityId, groupId, announcement\)](#)

Posts an announcement to the group.

[removeRecord\(communityId, groupRecordId\)](#)

Removes the association of a record with a group.

[requestGroupMembership\(communityId, groupId\)](#)

Requests membership in a private group for the context user.

[searchGroups\(communityId, q\)](#)

Returns the first page of groups that match the specified search criteria. The page contains the default number of items.

[searchGroups\(communityId, q, pageParam, pageSize\)](#)

Returns the specified page of groups that match the specified search criteria.

[searchGroups\(communityId, q, archiveStatus, pageParam, pageSize\)](#)

Returns the specified page of groups that match the specified search criteria and that have the specified archive status.

[setBannerPhoto\(communityId, groupId, fileId, versionNumber\)](#)

Sets the group banner photo to an already uploaded file.

[setBannerPhoto\(communityId, groupId, fileUpload\)](#)

Sets the group banner photo to a file that hasn't been uploaded.

[setBannerPhotoWithAttributes\(communityId, groupId, bannerPhoto\)](#)

Sets and crops an already uploaded file as the group banner photo.

[setBannerPhotoWithAttributes\(communityId, groupId, bannerPhoto, fileUpload\)](#)

Sets the group banner photo to a file that hasn't been uploaded and requires cropping.

[setPhoto\(communityId, groupId, fileId, versionNumber\)](#)

Sets the group photo to an already uploaded file.

[setPhoto\(communityId, groupId, fileUpload\)](#)

Sets the group photo to the specified blob..

[setPhotoWithAttributes\(communityId, groupId, photo\)](#)

Sets and crops an already uploaded file as the group photo.

[setPhotoWithAttributes\(communityId, groupId, photo, fileUpload\)](#)

Sets and crops a binary input as the group photo.

[updateGroup\(communityId, groupId, groupInput\)](#)

Update the settings of a group.

[updateGroupMember\(communityId, membershipId, role\)](#)

Updates the specified group membership with the specified role in the specified community. This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

[updateMyChatterSettings\(communityId, groupId, emailFrequency\)](#)

Updates the context user's Chatter settings for the specified group.

[updateRequestStatus\(communityId, requestId, status\)](#)

Updates a request to join a private group.

[updateRequestStatus\(communityId, requestId, status, responseMessage\)](#)

Updates a request to join a private group and optionally provides a message when the request is denied.

addMember(communityId, groupId, userId)

Adds the specified user to the specified group in the specified community as a standard member. To execute this method, the context user must be the group owner or moderator.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMember(String communityId, String groupId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.GroupMember](#)

addMemberWithRole(*communityId*, *groupId*, *userId*, *role*)

Adds the specified user with the specified role to the specified group in the specified community. To execute this method, the context user must be the group owner or moderator.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember addMemberWithRole(String communityId, String groupId, String userId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

userId

Type: [String](#)

The ID for a user.

role

Type: [ConnectApi.GroupMembershipType](#)

The group membership type. One of these values:

- [GroupManager](#)
- [StandardMember](#)

Return Value

Type: [ConnectApi.GroupMember](#)

addRecord(*communityId*, *groupId*, *recordId*)

Associates a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord addRecord(String communityId, String groupId, String recordId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

ID of the group with which to associate the record.

recordId

Type: [String](#)

ID of the record to associate with the group.

Return Value

Type: [ConnectApi.GroupRecord](#)

createGroup(communityId, groupInput)

Creates a group.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail createGroup(String communityId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId

Type: [String](#),

Use either the ID for a community, `internal`, or `null`.

groupInput

Type: [ConnectApi.ChatterGroupInput](#)

The properties of the group.

Return Value

Type: [ConnectApi.ChatterGroupDetail](#)

deleteBannerPhoto(communityId, groupId)

Delete a group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void deleteBannerPhoto(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: `String`

ID of the group.

Return Value

Type: `Void`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`deleteMember`(**`communityId`**, **`membershipId`**)

Deletes the specified group membership.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static Void deleteMember(String communityId, String membershipId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

membershipId

Type: `String`

The ID for a membership.

Return Value

Type: `Void`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

`deletePhoto`(**`communityId`**, **`groupId`**)

Deletes the photo of the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static void deletePhoto(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: Void

Usage

This method is only successful when the context user is the group manager or owner, or has Modify All Data permission.

getAnnouncements(communityId, groupId)

Gets the first page of announcements in a group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: `String`

The ID for a group.

Return Value

Type: `ConnectApi.AnnouncementPage`

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the `ConnectApi.Announcements` class.

`getAnnouncements(communityId, groupId, pageParam, pageSize)`

Gets the specified page of announcements in a group. You can also specify the page size.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.AnnouncementPage getAnnouncements(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

groupId

Type: `String`

The ID for a group.

pageParam

Type: `Integer`

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: `Integer`

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.AnnouncementPage](#)

Usage

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the [ConnectApi.Announcements](#) class.

getBannerPhoto (communityId, groupId)

Get a group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID of the group.

Return Value

Type: [ConnectApi.BannerPhoto](#)

getGroup (communityId, groupId)

Returns information about the specified group.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupDetail getGroup(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.ChatterGroupDetail](#)

getGroupBatch(*communityId*, *groupIds*)

Gets information about the specified list of groups. Returns a list of `BatchResult` objects containing `ConnectApi.ChatterGroup` objects. Returns errors embedded in the results for groups that couldn't be loaded.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getGroupBatch(String communityId, List<String> groupIds)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupIds

Type: [List<String>](#)

A list of up to 500 group IDs.

Return Value

Type: [BatchResult\[\]](#)

The `BatchResult.getResult()` method returns a `ConnectApi.ChatterGroup` object.

Example

```
// Create a list of groups.
ConnectApi.ChatterGroupPage groupPage = ConnectApi.ChatterGroups.getGroups(null);

// Create a list of group IDs.
List<String> groupIds = new List<String>();
for (ConnectApi.ChatterGroup aGroup : groupPage.groups){
    groupIds.add(aGroup.id);
}

// Get info about all the groups in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
groupIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the number of members in each group.
        ConnectApi.ChatterGroup aGroup;
        if(batchResult.getResult() instanceof ConnectApi.ChatterGroup) {
            aGroup = (ConnectApi.ChatterGroup) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(aGroup.memberCount);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

[getMembershipBatch\(communityId, membershipIds\)](#)

getGroupMembershipRequest(communityId, requestId)

Returns information about the specified request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest getGroupMembershipRequest(String communityId, String requestId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

requestId

Type: [String](#)

The ID of a request to join a private group.

Return Value

Type: [ConnectApi.GroupMembershipRequest](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(*communityId*, *groupId*)

Returns information about every request to join the specified private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.GroupMembershipRequests](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroupMembershipRequests(*communityId*, *groupId*, *status*)

Returns information about every request to join the specified private group that has a specified status.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequests getGroupMembershipRequests(String communityId, String groupId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

status

Type: [ConnectApi.GroupMembershipRequestStatus](#)

status—The status of a request to join a private group.

- Accepted
- Declined
- Pending

Return Value

Type: [ConnectApi.GroupMembershipRequests](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

getGroups (communityId)

Returns the first page of all the groups. The page contains the default number of items.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ChatterGroupPage](#)

getGroups (communityId, pageParam, pageSize)

Returns the specified page of information about all groups.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterGroupPage](#)

getGroups(*communityId*, *pageParam*, *pageSize*, *archiveStatus*)

Returns the specified page of information about a set of groups with a specified group archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage getGroups(String communityId, Integer pageParam, Integer pageSize, ConnectApi.GroupArchiveStatus archiveStatus)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

archiveStatus

Type: `ConnectApi.GroupArchiveStatus`

Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

If you pass in `null`, the default value is `All`.

Return Value

Type: `ConnectApi.ChatterGroupPage`

getMember(*communityId*, *membershipId*)

Returns information about the specified group member.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMember getMember(String communityId, String membershipId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

membershipId

Type: `String`

The ID for a membership.

Return Value

Type: `ConnectApi.GroupMember`

getMembers(*communityId*, *groupId*)

Get the first page of information about members of a group. The page contains the default number of items.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.GroupMemberPage](#)

getMembers (communityId, groupId, pageParam, pageSize)

Get the specified page of information about members of a group.

API Version

28.0

Available to Guest Users

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMemberPage getMembers(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.GroupMemberPage](#)

getMembershipBatch(*communityId*, *membershipIds*)

Gets information about the specified list of group memberships. Returns a list of `BatchResult` objects containing `ConnectApi.GroupMember` objects. Returns errors embedded in the results for group memberships that couldn't be accessed.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getMembershipBatch(String communityId,  
List<String> membershipIds)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

membershipIds

Type: [List<String>](#)

A list of up to 500 group membership IDs.

Return Value

Type: [BatchResult\[\]](#)

The `BatchResult` `getResults()` method returns a `ConnectApi.GroupMember` object.

Example

```
// Get members of a group.
ConnectApi.GroupMemberPage membersPage = ConnectApi.ChatterGroups.getMembers(null,
'0F9D00000000oOT');

// Create a list of membership IDs.
List<String> membersList = new List<String>();
for (ConnectApi.GroupMember groupMember : membersPage.members){
    membersList.add(groupMember.id);
}

// Get info about all group memberships in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getMembershipBatch(null,
membersList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the first name of each member.
        ConnectApi.GroupMember groupMember;
        if(batchResult.getResult() instanceof ConnectApi.GroupMember) {
            groupMember = (ConnectApi.GroupMember) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupMember.user.firstName);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

SEE ALSO:

[getGroupBatch\(communityId, groupIds\)](#)

getMyChatterSettings(communityId, groupId)

Returns the context user's Chatter settings for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings getMyChatterSettings(String communityId,  
String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.GroupChatterSettings](#)

getPhoto(communityId, groupId)

Returns information about the photo for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.Photo](#)

getRecord(*communityId*, *groupRecordId*)

Returns information about a record associated with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecord getRecord(String communityId, String groupRecordId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupRecordId

Type: [String](#)

ID of the group record.

Return Value

Type: [ConnectApi.GroupRecord](#)

getRecords(*communityId*, *groupId*)

Returns the first page of records associated with the specified group. The page contains the default number of items.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.GroupRecordPage](#)

getRecords(*communityId*, *groupId*, *pageParam*, *pageSize*)

Returns the specified page from the list of records associated with a group.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupRecordPage getRecords(String communityId, String groupId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.GroupRecordPage](#)

inviteUsers(groupId, invite)

Invite internal and external users to join a group.

API Version

39.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Invitations inviteUsers(String groupId, ConnectApi.InviteInput invite)
```

Parameters

groupId

Type: [String](#)

ID of the group.

invite

Type: [ConnectApi.InviteInput](#)

A [ConnectApi.InviteInput](#) body.

Return Value

Type: [ConnectApi.Invitations](#)

postAnnouncement(communityId, groupId, announcement)

Posts an announcement to the group.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Announcement postAnnouncement(String communityId, String groupId, ConnectApi.AnnouncementInput announcement)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

announcement

Type: [ConnectApi.AnnouncementInput](#)

A [ConnectApi.AnnouncementInput](#) object.

Return Value

Type: [ConnectApi.Announcement](#)

Usage

Use an announcement to highlight information. Users can discuss, like, and post comments on announcements. Deleting the feed post deletes the announcement.

To post an announcement, get information about an announcement, update the expiration date of an announcement, or delete an announcement, use the methods of the [ConnectApi.Announcements](#) class.

removeRecord(*communityId*, *groupRecordId*)

Removes the association of a record with a group.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static Void removeRecord(String communityId, String groupRecordId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupRecordId

Type: [String](#)

ID of the group record.

Return Value

Type: Void

requestGroupMembership(communityId, groupId)

Requests membership in a private group for the context user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest requestGroupMembership(String
communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.GroupMembershipRequest](#)

Sample: Requesting to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.requestGroupMembership` to request to join a private group.

```
String communityId = null;
ID groupId = '0F9x0000000hAZ';

ConnectApi.GroupMembershipRequest membershipRequest =
ConnectApi.ChatterGroups.requestGroupMembership(communityId, groupId);
```

searchGroups(communityId, q)

Returns the first page of groups that match the specified search criteria. The page contains the default number of items.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

Return Value

Type: [ConnectApi.ChatterGroupPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchGroups\(communityId, q, result\)](#)

[Testing ConnectApi Code](#)

`searchGroups(communityId, q, pageParam, pageSize)`

Returns the specified page of groups that match the specified search criteria.

API Version

28.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterGroupPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchGroups\(communityId, q, pageParam, pageSize, result\)](#)

[Testing ConnectApi Code](#)

`searchGroups(communityId, q, archiveStatus, pageParam, pageSize)`

Returns the specified page of groups that match the specified search criteria and that have the specified archive status.

API Version

29.0

Available to Guest Users

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupPage searchGroups(String communityId, String q,
ConnectApi.GroupArchiveStatus archiveStatus, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

archiveStatus

Type: [ConnectApi.GroupArchiveStatus](#)

archiveStatus Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterGroupPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[setTestSearchGroups\(communityId, q, archiveStatus, pageParam, pageSize, result\)](#)

[Testing ConnectApi Code](#)

setBannerPhoto(communityId, groupId, fileId, versionNumber)

Sets the group banner photo to an already uploaded file.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
String fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID of the group.

fileId

Type: [String](#)

The ID of the already uploaded file. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber

Type: [Integer](#)

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

setBannerPhoto(*communityId*, *groupId*, *fileUpload*)

Sets the group banner photo to a file that hasn't been uploaded.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID of the group.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

setBannerPhotoWithAttributes(*communityId*, *groupId*, *bannerPhoto*)

Sets and crops an already uploaded file as the group banner photo.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,  
String groupId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID of the group.

bannerPhoto

Type: [ConnectApi.BannerPhotoInput](#)

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

setBannerPhotoWithAttributes(*communityId*, *groupId*, *bannerPhoto*, *fileUpload*)

Sets the group banner photo to a file that hasn't been uploaded and requires cropping.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,  
String groupId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput  
fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID of the group.

bannerPhoto

Type: [ConnectApi.BannerPhotoInput](#)

A [ConnectApi.BannerPhotoInput](#) object specifying the cropping parameters.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

setPhoto(*communityId*, *groupId*, *fileId*, *versionNumber*)

Sets the group photo to an already uploaded file.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId, String
fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

fileId

Type: [String](#)

ID of a file already uploaded. The key prefix must be 069, and the file must be an image that is smaller than 2 GB.

versionNumber

Type: [Integer](#)

Version number of the existing file. Specify either an existing version number or, to get the latest version, specify `null`.

Return Value

Type: [ConnectApi.Photo](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

Sample: Updating a Group Photo with an Existing File

When a group is created, it doesn't have a group photo. You can set an existing photo that has already been uploaded to Salesforce as the group photo. The key prefix must be 069 and the file size must be less than 2 GB.

```
String communityId = null;
ID groupId = '0F9x0000000hAK';
ID fileId = '069x0000001Ion';

// Set photo
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, fileId,
null);
```

setPhoto(*communityId*, *groupId*, *fileUpload*)

Sets the group photo to the specified blob..

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String groupId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

Sample: Uploading a New File and Using it as a Group Photo

When a group is created, it doesn't have a group photo. You can upload a photo and set it as the group photo.

```
String communityId = null;
ID groupId = '0F9x0000000hAP';
ID photoId = '069x00000001Ioo';

// Set photo
List<ContentVersion> groupPhoto = [Select c.VersionData From ContentVersion c where
ContentDocumentId=:photoId];
ConnectApi.BinaryInput binary = new ConnectApi.BinaryInput(groupPhoto.get(0).VersionData,
'image/png', 'image.png');
ConnectApi.Photo photo = ConnectApi.ChatterGroups.setPhoto(communityId, groupId, binary);
```

setPhotoWithAttributes(*communityId*, *groupId*, *photo*)

Sets and crops an already uploaded file as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

photo

Type: [ConnectApi.PhotoInput](#)

A `ConnectApi.PhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: [ConnectApi.Photo](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

setPhotoWithAttributes(communityId, groupId, photo, fileUpload)

Sets and crops a binary input as the group photo.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String groupId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

photo

Type: [ConnectApi.PhotoInput](#)

A [ConnectApi.PhotoInput](#) object that specifies how to crop the file specified in *fileUpload*.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Photos are processed asynchronously and may not be visible right away.

updateGroup(*communityId*, *groupId*, *groupInput*)

Update the settings of a group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroup(String communityId, String groupId,
ConnectApi.ChatterGroupInput groupInput)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

groupInput

Type: [ConnectApi.ChatterGroupInput](#)

A `ConnectApi.ChatterGroupInput` object.

Return Value

Type: `ConnectApi.ChatterGroup`

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission. Use this method to update any settings in the `ConnectApi.ChatterGroupInput` class. These settings include the group title and text in the “Information” section, whether the group is public or private, and whether the group is archived.

Example

This example archives a group:

```
String groupId = '0F9D0000000qSz';
String communityId = null;

ConnectApi.ChatterGroupInput groupInput = new ConnectApi.ChatterGroupInput();
groupInput.isArchived = true;

ConnectApi.ChatterGroups.updateGroup(communityId, groupId, groupInput);
```

updateGroupMember(communityId, membershipId, role)

Updates the specified group membership with the specified role in the specified community. This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroup updateGroupMember(String communityId, String
membershipId, ConnectApi.GroupMembershipType role)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

membershipId

Type: `String`

The ID for a membership.

role

Type: [ConnectApi.GroupMembershipType](#)

The group membership type. One of these values:

- [GroupManager](#)
- [StandardMember](#)

Return Value

Type: [ConnectApi.ChatterGroup](#)

updateMyChatterSettings(*communityId*, *groupId*, *emailFrequency*)

Updates the context user's Chatter settings for the specified group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupChatterSettings updateMyChatterSettings(String communityId,  
String groupId, ConnectApi.GroupEmailFrequency emailFrequency)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, [internal](#), or [null](#).

groupId

Type: [String](#)

The ID for a group.

emailFrequency

Type: [ConnectApi.GroupEmailFrequency](#)

emailFrequency—Specifies the frequency with which a user receives email.

- [EachPost](#)
- [DailyDigest](#)
- [WeeklyDigest](#)
- [Never](#)
- [UseDefault](#)

The value [UseDefault](#) uses the value set in a call to [updateChatterSettings\(*communityId*, *userId*, *defaultGroupEmailFrequency*\)](#).

Return Value

Type: [ConnectApi.GroupChatterSettings](#)

updateRequestStatus(*communityId*, *requestId*, *status*)

Updates a request to join a private group.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,  
String requestId, ConnectApi.GroupMembershipRequestStatus status)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

requestId

Type: [String](#)

The ID for a request to join a private group.

status

Type: [ConnectApi.GroupMembershipRequestStatus](#)

The status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

Return Value

Type: [ConnectApi.GroupMembershipRequest](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

Sample: Accepting or Declining a Request to Join a Private Group

This sample code calls `ConnectApi.ChatterGroups.updateRequestStatus` and passes it the membership request ID and an `ConnectApi.GroupMembershipRequestStatus.Accepted` status. You can also pass `ConnectApi.GroupMembershipRequestStatus.Declined`.

```
String communityId = null;
ID groupId = '0F9x00000000hAZ';
String requestId = '0I5x000000001snCAA';

ConnectApi.GroupMembershipRequest membershipRequestRep =
ConnectApi.ChatterGroups.updateRequestStatus(communityId, requestId,
ConnectApi.GroupMembershipRequestStatus.Accepted);
```

updateRequestStatus(communityId, requestId, status, responseMessage)

Updates a request to join a private group and optionally provides a message when the request is denied.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.GroupMembershipRequest updateRequestStatus(String communityId,
String requestId, ConnectApi.GroupMembershipRequestStatus status, String responseMessage)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

requestId

Type: [String](#)

The ID for a request to join a private group.

status

Type: `ConnectApi.GroupMembershipRequestStatus`

The status of the request:

- `Accepted`
- `Declined`

The `Pending` value of the enum is not valid in this method.

responseMessage

Type: [String](#)

Provide a message to the user if their membership request is declined. The value of this property is used only when the value of the `status` property is `Declined`.

The maximum length is 756 characters.

Return Value

Type: [ConnectApi.GroupMembershipRequest](#)

Usage

This method is successful only when the context user is the group manager or owner, or has Modify All Data permission.

ChatterGroups Test Methods

The following are the test methods for `ChatterGroups`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestSearchGroups(*communityId*, *q*, *result*)

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

result

Type: [ConnectApi.ChatterGroupPage](#)

The test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

[searchGroups\(communityId, q\)](#)

[Testing ConnectApi Code](#)

setTestSearchGroups(communityId, q, pageParam, pageSize, result)

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.ChatterGroupPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.ChatterGroupPage](#)

The test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

[searchGroups\(communityId, q, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

setTestSearchGroups (communityId, q, archiveStatus, pageParam, pageSize, result)

Registers a `ConnectApi.ChatterGroupPage` object to be returned when the matching `ConnectApi.searchGroups` method is called in a test context. Use the test method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestSearchGroups(String communityId, String q,  
ConnectApi.GroupArchiveStatus, archiveStatus, Integer pageParam, Integer pageSize,  
ConnectApi.ChatterGroupPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#). Can be specified as `null`.

archiveStatus

Type: [ConnectApi.GroupArchiveStatus](#)

archiveStatus Specifies a set of groups based on whether the groups are archived or not.

- `All`—All groups, including groups that are archived and groups that are not archived.
- `Archived`—Only groups that are archived.
- `NotArchived`—Only groups that are not archived.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.ChatterGroupPage](#)

The test `ConnectApi.ChatterGroupPage` object.

Return Value

Type: Void

SEE ALSO:

[searchGroups\(communityId, q, archiveStatus, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

ChatterMessages Class

Access and modify message and conversation data.

Namespace

[ConnectApi](#)

Usage

Use Chatter in Apex to get, send, search, and reply to messages. You can also get and search conversations, mark conversations as read, and get a count of unread messages.

ChatterMessages Methods

The following are methods for `ChatterMessages`. All methods are static.

IN THIS SECTION:

[getConversation\(conversationId\)](#)

Returns a conversation the context user has access to.

[getConversation\(conversationId, pageParam, pageSize\)](#)

Returns a conversation the context user has access to.

[getConversation\(communityId, conversationId\)](#)

Returns a conversation the context user has access to across their available communities.

[getConversation\(communityId, conversationId, pageParam, pageSize\)](#)

Returns a conversation from a specific page with a specific number of results the context user has access to across their available communities.

[getConversations\(\)](#)

Returns the most recent conversations the context user has access to.

[getConversations\(pageParam, pageSize\)](#)

Returns a specific page of conversations the context user has access to.

[getConversations\(communityId\)](#)

Returns the most recent conversations the context user has access to across their available communities.

[getConversations\(communityId, pageParam, pageSize\)](#)

Returns a specific page of conversations with a specific number of results the context user has access to across their available communities.

[getMessage\(messageId\)](#)

Returns a message the context user has access to.

[getMessage\(communityId, messageId\)](#)

Returns a message the context user has access to across their available communities.

[getMessages\(\)](#)

Returns a list of the most recent messages the context user has access to.

[getMessages\(pageParam, pageSize\)](#)

Returns the specified page of messages the context user has access to.

[getMessages\(communityId\)](#)

Returns a list of the most recent messages the context user has access to across their available communities.

[getMessages\(communityId, pageParam, pageSize\)](#)

Returns the specified page of messages with the specified number of results the context user has access to across their available communities.

[getUnreadCount\(\)](#)

Returns the number of conversations the context user has marked unread. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

[getUnreadCount\(communityId\)](#)

Returns the number of conversations the context user has marked unread across their available communities. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

[markConversationRead\(conversationId, read\)](#)

Marks a conversation as read for the context user.

[markConversationRead\(communityId, conversationID, read\)](#)

Marks a conversation as read or unread for the context user across their available communities.

[replyToMessage\(text, inReplyTo\)](#)

Adds the specified text as a response to a previous message the context user has access to.

[replyToMessage\(communityId, text, inReplyTo\)](#)

Adds the specified text as a response to a previous message the context user has access to across their available communities.

[searchConversation\(conversationId, q\)](#)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

[searchConversation\(conversationId, pageParam, pageSize, q\)](#)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

[searchConversation\(communityId, conversationId, q\)](#)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

[searchConversation\(communityId, conversationId, pageParam, pageSize, q\)](#)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

[searchConversations\(q\)](#)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

[searchConversations\(pageParam, pageSize, q\)](#)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

[searchConversations\(communityId, q\)](#)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

[searchConversations\(communityId, pageParam, pageSize, q\)](#)

Returns a specific page of conversations with the specified number of results the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

[searchMessages\(q\)](#)

Returns a page of messages the context user has access to that matches any of the specified criteria.

[searchMessages\(pageParam, pageSize, q\)](#)

Returns a page of messages the context user has access to that matches any of the specified criteria.

[searchMessages\(communityId, q\)](#)

Returns a page of messages the context user has access to that matches any of the specified criteria across their available communities.

[searchMessages\(communityId, pageParam, pageSize, q\)](#)

Returns a specific page of messages with the specified number of results the context user has access to that matches any of the specified criteria across their available communities.

[sendMessage\(text, recipients\)](#)

Sends the specified text to the indicated recipients.

[sendMessage\(communityId, text, recipients\)](#)

Sends the specified text to the indicated recipients across their available communities.

getConversation (conversationId)

Returns a conversation the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId)
```

Parameters

conversationId

Type: [String](#)

Specify the ID for the conversation.

Return Value

Type: [ConnectApi.ChatterConversation](#)

getConversation(conversationId, pageParam, pageSize)

Returns a conversation the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String conversationId,  
String pageParam, Integer pageSize)
```

Parameters

conversationId

Type: [String](#)

Specify the ID for the conversation.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversation](#)

getConversation(communityId, conversationId)

Returns a conversation the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

conversationId

Type: [String](#)

Specify the ID for the conversation.

Return Value

Type: [ConnectApi.ChatterConversation](#)

A Chatter conversation and the related metadata.

getConversation(communityId, conversationId, pageParam, pageSize)

Returns a conversation from a specific page with a specific number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation getConversation(String communityId, String conversationId, String pageParam, String pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

conversationId

Type: [String](#)

Specify the ID for the conversation.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversation](#)

A Chatter conversation and the related metadata.

getConversations ()

Returns the most recent conversations the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations ()
```

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

getConversations (pageParam, pageSize)

Returns a specific page of conversations the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String pageParam,  
Integer pageSize)
```

Parameters

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

getConversations (communityId)

Returns the most recent conversations the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

A list of Chatter conversations on a specific page.

getConversations (communityId, pageParam, pageSize)

Returns a specific page of conversations with a specific number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage getConversations(String communityId,  
String pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

A list of Chatter conversations on a specific page.

getMessage (messageId)

Returns a message the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String messageId)
```

Parameters

*messageId*Type: [String](#)

Specify the ID for the message.

Return Value

Type: [ConnectApi.ChatterMessage](#)**getMessage (communityId, messageId)**

Returns a message the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage getMessage(String communityId, String messageId)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*messageId*Type: [String](#)

Specify the ID for the message.

Return Value

Type: [ConnectApi.ChatterMessage](#)

A Chatter message and all the related metadata.

getMessages ()

Returns a list of the most recent messages the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages ()
```

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

getMessages (pageParam, pageSize)

Returns the specified page of messages the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages (String pageParam, Integer  
pageSize)
```

Parameters

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

getMessages (communityId)

Returns a list of the most recent messages the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages (String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

The Chatter messages on a specific page.

getMessages (communityId, pageParam, pageSize)

Returns the specified page of messages with the specified number of results the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage getMessages (String communityId, String pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

The Chatter messages on a specific page.

getUnreadCount ()

Returns the number of conversations the context user has marked unread. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount ()
```

Return Value

Type: [ConnectApi.UnreadConversationCount](#)

Example

```
ConnectApi.UnreadConversationCount unread = ConnectApi.ChatterMessages.getUnreadCount ();
```

getUnreadCount (communityId)

Returns the number of conversations the context user has marked unread across their available communities. If the number is less than 50, it will return the exact unreadCount, and hasMore = false. If the context user has more than 50, unreadCount = 50 and hasMore = true.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UnreadConversationCount getUnreadCount (String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.UnreadConversationCount](#)

The number of unread messages in a conversation.

markConversationRead(conversationId, read)

Marks a conversation as read for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String conversationId, Boolean read)
```

Parameters

conversationId

Type: [String](#)

Specify the ID for the conversation.

read

Type: [Boolean](#)

Specifies whether the conversation has been read (`true`) or not (`false`).

Return Value

Type: [ConnectApi.ChatterConversationSummary](#)

markConversationRead(communityId, conversationID, read)

Marks a conversation as read or unread for the context user across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationSummary markConversationRead(String
communityId, String conversationID, Boolean read)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

conversationId

Type: [String](#)

Specify the ID for the conversation.

read

Type: [Boolean](#)

Specifies whether the conversation has been read (`true`) or not (`false`).

Return Value

Type: [ConnectApi.ChatterConversationSummary](#)

The summary of a Chatter conversation, including the members of the conversation, Chatter REST API URL, and contents of the latest message.

replyToMessage(text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String text, String inReplyTo)
```

Parameters

text

Type: [String](#)

The text of the message. Cannot be empty or over 10,000 characters.

inReplyTo

Type: [String](#)

Specify the ID of the message that is being responded to.

Return Value

Type: [ConnectApi.ChatterMessage](#)

replyToMessage(communityId, text, inReplyTo)

Adds the specified text as a response to a previous message the context user has access to across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage replyToMessage(String communityId, String text, String inReplyTo)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

text

Type: [String](#)

The text of the message. Cannot be empty or over 10,000 characters.

inReplyTo

Type: [String](#)

Specify the ID of the message that is being responded to.

Return Value

Type: [ConnectApi.ChatterMessage](#)

A Chatter message and all the related metadata.

searchConversation(conversationId, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,  
String q)
```

Parameters

conversationId

Type: [String](#)

Specify the ID for the conversation.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterConversation](#)

searchConversation(conversationId, pageParam, pageSize, q)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String conversationId,  
String pageParam, Integer pageSize, String q)
```

Parameters

conversationId

Type: [String](#)

Specify the ID for the conversation.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversation](#)

searchConversation(*communityId*, *conversationId*, *q*)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,  
String conversationId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

conversationId

Type: [String](#)

Specify the ID for the conversation.

q

Type: [String](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversation](#)

A Chatter conversation and the related metadata.

searchConversation(*communityId*, *conversationId*, *pageParam*, *pageSize*, *q*)

Returns the conversation the context user has access to with a page of messages that matches any of the specified search across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversation searchConversation(String communityId,  
String conversationId, String pageParam, Integer pageSize, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

conversationId

Type: [String](#)

Specify the ID for the conversation.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Specifies the number of feed items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ChatterConversation](#)

A Chatter conversation and the related metadata.

searchConversations (q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String q)
```

Parameters

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

searchConversations (pageParam, pageSize, q)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String pageParam,  
Integer pageSize, String q)
```

Parameters

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

searchConversations(*communityId*, *q*)

Returns a page of conversations the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,  
String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

A list of Chatter conversations on a specific page.

searchConversations(*communityId*, *pageParam*, *pageSize*, *q*)

Returns a specific page of conversations with the specified number of results the context user has access to where member names and messages in the conversations match any of the specified search criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterConversationPage searchConversations(String communityId,
String pageParam, Integer pageSize, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterConversationPage](#)

A list of Chatter conversations on a specific page.

searchMessages(*q*)

Returns a page of messages the context user has access to that matches any of the specified criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String q)
```

Parameters

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

searchMessages (pageParam, pageSize, q)

Returns a page of messages the context user has access to that matches any of the specified criteria.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String pageParam, Integer pageSize, String q)
```

Parameters

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

searchMessages (communityId, q)

Returns a page of messages the context user has access to that matches any of the specified criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

The Chatter messages on a specific page.

searchMessages (communityId, pageParam, pageSize, q)

Returns a specific page of messages with the specified number of results the context user has access to that matches any of the specified criteria across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessagePage searchMessages(String communityId, String
pageParam, Integer pageSize, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.ChatterMessagePage](#)

The Chatter messages on a specific page.

sendMessage(text, recipients)

Sends the specified text to the indicated recipients.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String text, String recipients)
```

Parameters

text

Type: [String](#)

The text of the message. Cannot be empty or over 10,000 characters.

recipients

Type: [String](#)

Up to nine comma-separated IDs of the users receiving the message.

Return Value

Type: [ConnectApi.ChatterMessage](#)

sendMessage(*communityId*, *text*, *recipients*)

Sends the specified text to the indicated recipients across their available communities.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterMessage sendMessage(String communityId, String text,
String recipients)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

text

Type: [String](#)

The text of the message. Cannot be empty or over 10,000 characters.

recipients

Type: [String](#)

Up to nine comma-separated IDs of users to receive the message.

Return Value

Type: [ConnectApi.ChatterMessage](#)

A Chatter message and all the related metadata.

ChatterUsers Class

Access information about users, such as followers, subscriptions, files, and groups.

Namespace

[ConnectApi](#)

ChatterUsers Methods

The following are methods for `ChatterUsers`. All methods are static.

IN THIS SECTION:

[deletePhoto\(*communityId*, *userId*\)](#)

Deletes the specified user's photo.

[follow\(*communityId*, *userId*, *subjectId*\)](#)

Adds the specified *userId* as a follower to the specified *subjectId*.

[getChatterSettings\(*communityId*, *userId*\)](#)

Returns information about the default Chatter settings for the specified user.

[getFollowers\(*communityId*, *userId*\)](#)

Returns the first page of followers for the specified user ID. The page contains the default number of items.

[getFollowers\(*communityId*, *userId*, *pageParam*, *pageSize*\)](#)

Returns the specified page of followers for the specified user ID.

[getFollowings\(*communityId*, *userId*\)](#)

Returns the first page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

[getFollowings\(*communityId*, *userId*, *pageParam*\)](#)

Returns the specified page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

[getFollowings\(*communityId*, *userId*, *pageParam*, *pageSize*\)](#)

Returns the specific page of information about the followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

[getFollowings\(*communityId*, *userId*, *filterType*\)](#)

Returns the first page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

[getFollowings\(*communityId*, *userId*, *filterType*, *pageParam*\)](#)

Returns the specified page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

[getFollowings\(*communityId*, *userId*, *filterType*, *pageParam*, *pageSize*\)](#)

Returns the specified page of information about the specified types of followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

[getGroups\(*communityId*, *userId*\)](#)

Returns the first page of groups the specified user is a member of.

[getGroups\(*communityId*, *userId*, *pageParam*, *pageSize*\)](#)

Returns the specified page of groups the specified user is a member of.

[getPhoto\(*communityId*, *userId*\)](#)

Returns information about the specified user's photo.

[getReputation\(communityId, userId\)](#)

Returns the reputation of the specified user.

[getUser\(communityId, userId\)](#)

Returns information about the specified user.

[getUserBatch\(communityId, userIds\)](#)

Gets information about the specified list of users. Returns a list of `BatchResult` objects containing `ConnectApi.User` objects. Returns errors embedded in the results for those users that couldn't be loaded.

[getUsers\(communityId\)](#)

Returns the first page of users. The page contains the default number of items.

[getUsers\(communityId, pageParam, pageSize\)](#)

Returns the specified page of users.

[searchUserGroups\(communityId, userId, q\)](#)

Returns the first page of groups that match the specified search criteria.

[searchUserGroups\(communityId, userId, q, pageParam, pageSize\)](#)

Returns the specified page of users that matches the specified search criteria.

[searchUsers\(communityId, q\)](#)

Returns the first page of users that match the specified search criteria. The page contains the default number of items.

[searchUsers\(communityId, q, pageParam, pageSize\)](#)

Returns the specified page of users that match the specified search criteria.

[searchUsers\(communityId, q, searchContextId, pageParam, pageSize\)](#)

Returns the specified page of users that match the specified search criteria.

[setPhoto\(communityId, userId, fileId, versionNumber\)](#)

Sets the user photo to be the specified, already uploaded file.

[setPhoto\(communityId, userId, fileUpload\)](#)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

[setPhotoWithAttributes\(communityId, userId, photo\)](#)

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

[setPhotoWithAttributes\(communityId, userId, photo, fileUpload\)](#)

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

[updateChatterSettings\(communityId, userId, defaultGroupEmailFrequency\)](#)

Updates the default Chatter settings for the specified user.

[updateUser\(communityId, userId, userInput\)](#)

Updates the "About Me" section for a user.

deletePhoto(communityId, userId)

Deletes the specified user's photo.

API Version

28.0–34.0

 **Important:** In version 35.0 and later, use `ConnectApi.UserProfiles.deletePhoto(communityId, userId)` on page 1521

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

Return Value

Type: `Void`

follow(communityId, userId, subjectId)

Adds the specified *userId* as a follower to the specified *subjectId*.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Subscription follow(String communityId, String userId, String subjectId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

subjectId

Type: [String](#)

The ID for the subject to follow.

Return Value

Type: [ConnectApi.Subscription](#)

Example

```
ChatterUsers.ConnectApi.Subscription subscriptionToRecord =  
ConnectApi.ChatterUsers.follow(null, 'me', '001RR000002G4Y0');
```

SEE ALSO:

[Unfollow a Record](#)

getChatterSettings (communityId, userId)

Returns information about the default Chatter settings for the specified user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings getChatterSettings(String communityId,  
String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

Return Value

Type: [ConnectApi.UserChatterSettings](#)

getFollowers (communityId, userId)

Returns the first page of followers for the specified user ID. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.FollowerPage](#)

getFollowers(*communityId*, *userId*, *pageParam*, *pageSize*)

Returns the specified page of followers for the specified user ID.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowerPage getFollowers(String communityId, String userId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.FollowerPage](#)

getFollowings(*communityId*, *userId*)

Returns the first page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.FollowingPage](#)

getFollowings(*communityId*, *userId*, *pageParam*)

Returns the specified page of information about the followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, Integer pageParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: [ConnectApi.FollowingPage](#)

getFollowings(*communityId*, *userId*, *pageParam*, *pageSize*)

Returns the specific page of information about the followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.FollowingPage](#)

getFollowings(*communityId*, *userId*, *filterType*)

Returns the first page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, String filterType)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

filterType

Type: [String](#)

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

Return Value

Type: [ConnectApi.FollowingPage](#)

getFollowings(*communityId*, *userId*, *filterType*, *pageParam*)

Returns the specified page of information about the specified types of followers of the specified user. The page contains the default number of items. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, String filterType, Integer pageParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

filterType

Type: [String](#)

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

Return Value

Type: [ConnectApi.FollowingPage](#)

getFollowings(*communityId*, *userId*, *filterType*, *pageParam*, *pageSize*)

Returns the specified page of information about the specified types of followers of the specified user. This is different than `getFollowers`, which returns the users that follow the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.FollowingPage getFollowings(String communityId, String userId, String filterType, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

filterType

Type: [String](#)

Specifies the key prefix to filter the type of objects returned. A key prefix is the first three characters of the object ID, which specifies the object type. For example, User objects have a prefix of 005 and Group objects have a prefix of 0F9.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.FollowingPage](#)

getGroups(*communityId*, *userId*)

Returns the first page of groups the specified user is a member of.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.UserGroupPage](#)

getGroups(*communityId*, *userId*, *pageParam*, *pageSize*)

Returns the specified page of groups the specified user is a member of.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage getGroups(String communityId, String userId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.UserGroupPage](#)

getPhoto(*communityId*, *userId*)

Returns information about the specified user's photo.

API Version

28.0–34.0

 **Important:** In version 35.0 and later, use `ConnectApi.UserProfiles.getPhoto(communityId, userId)` on page 1522.

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for a user.

Return Value

Type: `ConnectApi.Photo`

getReputation(communityId, userId)

Returns the reputation of the specified user.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Reputation getReputation(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

ID of the user.

Return Value

Type: [ConnectApi.Reputation](#)

getUser(*communityId*, *userId*)

Returns information about the specified user.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserSummary getUser(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.UserDetail](#)

Usage

If the user is external, the properties that the `ConnectApi.UserDetail` output class shares with the `ConnectApi.UserSummary` output class can have non-null values. Other properties are always `null`.

`getUserBatch(communityId, userIds)`

Gets information about the specified list of users. Returns a list of `BatchResult` objects containing `ConnectApi.User` objects. Returns errors embedded in the results for those users that couldn't be loaded.

API Version

31.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.BatchResult[] getUserBatch(String communityId, List<String>
userIds)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userIds

Type: `List<String>`

A list of up to 500 user IDs.

Return Value

Type: `BatchResult[]`

The `BatchResult` `getResults()` method returns a `ConnectApi.User` object.

Example

```
// Get users in an organization.
ConnectApi.UserPage userPage = ConnectApi.ChatterUsers.getUsers(null);

// Create a list of user IDs.
List<String> userList = new List<String>();
for (ConnectApi.User user : userPage.users) {
    userList.add(user.id);
}
```

```
}

// Get info about all users in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterUsers.getUserBatch(null, userList);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print each user's username.
        ConnectApi.UserDetail user;
        if (batchResult.getResult() instanceof ConnectApi.UserDetail) {
            user = (ConnectApi.UserDetail) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(user.username);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
}
```

getUsers (communityId)

Returns the first page of users. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.UserPage](#)

getUsers (communityId, pageParam, pageSize)

Returns the specified page of users.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage getUsers(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.UserPage](#)

searchUserGroups (communityId, userId, q)

Returns the first page of groups that match the specified search criteria.

API Version

30.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.UserGroupPage](#)

A paginated list of groups the context user is a member of.

searchUserGroups(*communityId*, *userId*, *q*, *pageParam*, *pageSize*)

Returns the specified page of users that matches the specified search criteria.

API Version

30.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserGroupPage searchUserGroups(String communityId, String
userId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.UserGroupPage](#)

A paginated list of groups the context user is a member of.

searchUsers (communityId, q)

Returns the first page of users that match the specified search criteria. The page contains the default number of items.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers (String communityId, String q)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

Return Value

Type: [ConnectApi.UserPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchUsers\(communityId, q, result\)](#)

[Testing ConnectApi Code](#)

`searchUsers(communityId, q, pageParam, pageSize)`

Returns the specified page of users that match the specified search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.UserPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchUsers\(communityId, q, pageParam, pageSize, result\)](#)

[Testing ConnectApi Code](#)

`searchUsers(communityId, q, searchContextId, pageParam, pageSize)`

Returns the specified page of users that match the specified search criteria.

API Version

28.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserPage searchUsers(String communityId, String q, String searchContextId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

searchContextId

Type: [String](#)

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.UserPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchUsers\(*communityId*, *q*, *searchContextId*, *pageParam*, *pageSize*, *result*\)](#)

[Testing ConnectApi Code](#)

setPhoto(*communityId*, *userId*, *fileId*, *versionNumber*)

Sets the user photo to be the specified, already uploaded file.

API Version

28.0–34.0

 **Important:** In version 35.0 and later, use [ConnectApi.UserProfiles.setPhoto\(*communityId*, *userId*, *fileId*, *versionNumber*\)](#) on page 1527

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

fileId

Type: [String](#)

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber

Type: [Integer](#)

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhoto(*communityId*, *userId*, *fileUpload*)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

API Version

28.0–34.0

 **Important:** In version 35.0 and later, use [ConnectApi.UserProfiles.setPhoto\(*communityId*, *userId*, *fileUpload*\)](#)

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhotoWithAttributes(*communityId*, *userId*, *photo*)

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

API Version

29.0–34.0

Important: In version 35.0 and later, use

[ConnectApi.UserProfiles.setPhotoWithAttributes\(*communityId*, *userId*, *photo*\)](#) on page 1528

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

photo

Type: [ConnectApi.PhotoInput](#)

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhotoWithAttributes(*communityId*, *userId*, *photo*, *fileUpload*)

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

API Version

29.0–34.0

 **Important:** In version 35.0 and later, use [ConnectApi.UserProfiles.setPhotoWithAttributes\(*communityId*, *userId*, *photo*, *fileUpload*\)](#) on page 1529

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

photo

Type: [ConnectApi.PhotoInput](#)

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

updateChatterSettings(communityId, userId, defaultGroupEmailFrequency)

Updates the default Chatter settings for the specified user.

API Version

28.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserChatterSettings updateChatterSettings(String communityId,
String userId, ConnectApi.GroupEmailFrequency defaultGroupEmailFrequency)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

defaultGroupEmailFrequency

Type: [ConnectApi.GroupEmailFrequency](#)

defaultGroupEmailFrequency—Specifies the frequency with which a user receives email. Values:

- `EachPost`
- `DailyDigest`
- `WeeklyDigest`
- `Never`
- `UseDefault`

Don't pass the value `UseDefault` for the *defaultGroupEmailFrequency* parameter because calling `updateChatterSettings` sets the default value.

Return Value

Type: [ConnectApi.UserChatterSettings](#)

updateUser(*communityId*, *userId*, *userInput*)

Updates the “About Me” section for a user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserDetail updateUser(String communityId, String userId,
ConnectApi.UserInput userInput)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

userInput

Type: [ConnectApi.UserInput](#)

Specifies the updated information.

Return Value

Type: [ConnectApi.UserDetail](#)

ChatterUsers Test Methods

The following are the test methods for `ChatterUsers`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestSearchUsers(*communityId*, *q*, *result*)

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, ConnectApi.UserPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

result

Type: [ConnectApi.UserPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchUsers\(communityId, q\)](#)

[Testing ConnectApi Code](#)

setTestSearchUsers(communityId, q, pageParam, pageSize, result)

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.UserPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchUsers\(communityId, q, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

setTestSearchUsers(communityId, q, searchContextId, pageParam, pageSize, result)

Registers a `ConnectApi.UserPage` object to be returned when the matching `ConnectApi.searchUsers` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

28.0

Signature

```
public static Void setTestSearchUsers(String communityId, String q, String searchContextId, Integer pageParam, Integer pageSize, ConnectApi.UserPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

searchContextId

Type: [String](#)

A feed item ID that filters search results for feed @mentions. More useful results are listed first. When you specify this argument, you cannot query more than 500 results and you cannot use wildcards in the search term.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.UserPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchUsers\(communityId, q, searchContextId, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

Communities Class

Access general information about communities in your organization.

Namespace

[ConnectApi](#)

Communities Methods

The following are methods for `Communities`. All methods are static.

IN THIS SECTION:

[getCommunities\(\)](#)

Returns a list of communities the context user has access to.

[getCommunities\(communityStatus\)](#)

Returns a list of communities the context user has access to with the specified status.

[getCommunity\(communityId\)](#)

Returns information about the specific community.

getCommunities()

Returns a list of communities the context user has access to.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities()
```

Return Value

Type: [ConnectApi.CommunityPage](#)

getCommunities (communityStatus)

Returns a list of communities the context user has access to with the specified status.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.CommunityPage getCommunities (ConnectApi.CommunityStatus  
communityStatus)
```

Parameters

communityStatus

Type: [ConnectApi.CommunityStatus](#)

communityStatus—Specifies the status of the community. Values are:

- Live
- Inactive
- UnderConstruction

Return Value

Type: [ConnectApi.CommunityPage](#)

getCommunity (communityId)

Returns information about the specific community.

API Version

28.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Community getCommunity(String communityId)
```

Parameters

communityId

Type: [String](#)

Specify an ID for *communityId*. You cannot specify `null` or `'internal'`.

Return Value

Type: [ConnectApi.Community](#)

CommunityModeration Class

Access information about flagged feed items and comments in a community. Add and remove flags from comments and feed items. To view a feed containing all flagged feed items, pass `ConnectApi.FeedType.Moderation` to the `ConnectApi.ChatterFeeds.getFeedElementsFromFeed` method.

Namespace

[ConnectApi](#)

CommunityModeration Methods

The following are methods for `CommunityModeration`. All methods are static.

IN THIS SECTION:

[addFlagToComment\(communityId, commentId\)](#)

Add a moderation flag to a comment.

[addFlagToComment\(communityId, commentId, visibility\)](#)

Add a moderation flag of the specified visibility to a comment.

[addFlagToComment\(communityId, commentId, type\)](#)

Add a moderation flag of the specified type to a comment.

[addFlagToComment\(communityId, commentId, note\)](#)

Add a moderation flag with a note to a comment.

[addFlagToComment\(communityId, commentId, type, note\)](#)

Add a moderation flag of the specified type with a note to a comment.

[addFlagToComment\(communityId, commentId, type, visibility\)](#)

Add a moderation flag of the specified type and visibility to a comment.

[addFlagToComment\(communityId, commentId, visibility, note\)](#)

Add a moderation flag of the specified visibility with a note to a comment.

[addFlagToComment\(communityId, commentId, type, visibility, note\)](#)

Add a moderation flag of the specified type and visibility with a note to a comment.

[addFlagToFeedElement\(communityId, feedElementId\)](#)

Add a moderation flag to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, visibility\)](#)

Add a moderation flag of the specified visibility to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, type\)](#)

Add a moderation flag of the specified type to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, note\)](#)

Add a moderation flag with a note to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, type, note\)](#)

Add a moderation flag of the specified type with a note to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, type, visibility\)](#)

Add a moderation flag of the specified type and visibility to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, visibility, note\)](#)

Add a moderation flag of the specified visibility with a note to a feed element.

[addFlagToFeedElement\(communityId, feedElementId, type, visibility, note\)](#)

Add a moderation flag of the specified type and visibility with a note to a feed element.

[addFlagToFeedItem\(communityId, feedItemId\)](#)

Add a moderation flag to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

[addFlagToFeedItem\(communityId, feedItemId, visibility\)](#)

Add a moderation flag with specified visibility to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

[getFlagsOnComment\(communityId, commentId\)](#)

Get the moderation flags on a comment. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

[getFlagsOnComment\(communityId, commentId, visibility\)](#)

Get the moderation flags with specified visibility on a comment. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

[getFlagsOnComment\(communityId, commentId, pageSize, pageParam\)](#)

Get a page of moderation flags on a comment. To get the flags, the context user must have the `Moderate Communities Feeds` permission.

[getFlagsOnComment\(communityId, commentId, visibility, pageSize, pageParam\)](#)

Get a page of moderation flags with specified visibility on a comment. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedElement\(communityId, feedElementId\)](#)

Get the moderation flags on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedElement\(communityId, feedElementId, visibility\)](#)

Get the moderation flags with specified visibility on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedElement\(communityId, feedElementId, pageParam, pageSize\)](#)

Get a page of moderation flags on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedElement\(communityId, feedElementId, visibility, pageSize, pageParam\)](#)

Get a page of moderation flags with specified visibility on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedItem\(communityId, feedItemId\)](#)

Get the moderation flags on a feed item. To get the flags, the context user must have the Moderate Communities Feeds permission.

[getFlagsOnFeedItem\(communityId, feedItemId, visibility\)](#)

Get the moderation flags with specified visibility on a feed item. To get the flags, the context user must have the Moderate Communities Feeds permission.

[removeFlagFromComment\(communityId, commentId, userId\)](#)

Remove a moderation flag from a comment. To remove a flag from a comment the context user must have added the flag or must have the Moderate Communities Feeds permission.

[removeFlagFromFeedElement\(communityId, feedElementId, userId\)](#)

Remove a moderation flag from a feed element. To remove a flag from a feed element, the context user must have added the flag or must have the Moderate Communities Feeds permission.

[removeFlagsOnFeedItem\(communityId, feedItemId, userId\)](#)

Remove a moderation flag from a feed item. To remove a flag from a feed item, the context user must have added the flag or must have the Moderate Communities Feeds permission.

addFlagToComment (communityId, commentId)

Add a moderation flag to a comment.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(*communityId*, *commentId*, *visibility*)

Add a moderation flag of the specified visibility to a comment.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(*communityId*, *commentId*, *type*)

Add a moderation flag of the specified type to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

type

Type: [ConnectApi.CommunityFlagType](#)

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(*communityId*, *commentId*, *note*)

Add a moderation flag with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

addFlagToComment(*communityId*, *commentId*, *type*, *note*)

Add a moderation flag of the specified type with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

type

Type: [ConnectApi.CommunityFlagType](#)

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, type, visibility)`

Add a moderation flag of the specified type and visibility to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility
visibility)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

commentId

Type: `String`

The ID for a comment.

type

Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility

Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationFlags](#)

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToComment(communityId, commentId, type, visibility, note)`

Add a moderation flag of the specified type and visibility with a note to a comment.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToComment(String communityId, String
commentId, ConnectApi.CommunityFlagType type, ConnectApi.CommunityFlagVisibility
visibility, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: `String`

The ID for a comment.

type

Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility

Type: `ConnectApi.CommunityFlagVisibility`

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note

Type: `String`

A note of up to 4,000 characters about the flag.

Return Value

Type: `ConnectApi.ModerationFlags`

Usage

To add a flag to a comment, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement` (`communityId`, `feedElementId`)

Add a moderation flag to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,  
String feedElementId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

Return Value

Type: [ConnectApi.ModerationCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(*communityId*, *feedElementId*, *visibility*)

Add a moderation flag of the specified visibility to a feed element.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.

- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationCapability`

If the feed element doesn't support this capability, the return value is `ConnectApi.NotFoundException`.

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement`(`communityId`, `feedElementId`, `type`)

Add a moderation flag of the specified type to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: `String`

The ID for a feed element.

type

Type: `ConnectApi.CommunityFlagType`

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

Return Value

Type: `ConnectApi.ModerationCapability`

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(*communityId*, *feedElementId*, *note*)

Add a moderation flag with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,  
String feedElementId, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationCapability](#)

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedElement(*communityId*, *feedElementId*, *type*, *note*)

Add a moderation flag of the specified type with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,  
String feedElementId, ConnectApi.CommunityFlagType type, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

type

Type: [ConnectApi.CommunityFlagType](#)

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationCapability](#)

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId, type, visibility)`

Add a moderation flag of the specified type and visibility to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,  
String feedElementId, ConnectApi.CommunityFlagType type,  
ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

type

Type: [ConnectApi.CommunityFlagType](#)

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: [ConnectApi.ModerationCapability](#)

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId, visibility, note)`

Add a moderation flag of the specified visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationCapability](#)

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

`addFlagToFeedElement(communityId, feedElementId, type, visibility, note)`

Add a moderation flag of the specified type and visibility with a note to a feed element.

API Version

38.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability addFlagToFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagType type,
ConnectApi.CommunityFlagVisibility visibility, String note)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

type

Type: [ConnectApi.CommunityFlagType](#)

Specifies the type of moderation flag.

- `FlagAsInappropriate`—Flag for inappropriate content.
- `FlagAsSpam`—Flag for spam.

If a type isn't specified, it defaults to `FlagAsInappropriate`.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

note

Type: [String](#)

A note of up to 4,000 characters about the flag.

Return Value

Type: [ConnectApi.ModerationCapability](#)

Usage

To add a flag to a feed element, `Allow members to flag content` must be selected for a community.

addFlagToFeedItem(*communityId*, *feedItemId*)

Add a moderation flag to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [addFlagToFeedElement\(*communityId*, *feedElementId*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

Return Value

Type: [ConnectApi.ModerationFlags](#)

addFlagToFeedItem(communityId, feedItemId, visibility)

Add a moderation flag with specified visibility to a feed item. To add a flag to a feed item, `Allow members to flag content` must be selected for a community.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [addFlagToFeedElement\(communityId, feedElementId, visibility\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags addFlagToFeedItem(String communityId, String feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: `ConnectApi.ModerationFlags`

`getFlagsOnComment(communityId, commentId)`

Get the moderation flags on a comment. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

commentId

Type: `String`

The ID for a comment.

Return Value

Type: `ConnectApi.ModerationFlags`

`getFlagsOnComment(communityId, commentId, visibility)`

Get the moderation flags with specified visibility on a comment. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

30.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String
commentId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: [ConnectApi.ModerationFlags](#)

getFlagsOnComment(communityId, commentId, pageSize, pageParam)

Get a page of moderation flags on a comment. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String
commentId, Integer pageSize, String pageParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: [ConnectApi.ModerationFlags](#)

`getFlagsOnComment(communityId, commentId, visibility, pageSize, pageParam)`

Get a page of moderation flags with specified visibility on a comment. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnComment(String communityId, String commentId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize, String pageParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

*pageSize*Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

*pageParam*Type: [String](#)The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: [ConnectApi.ModerationFlags](#)**getFlagsOnFeedElement(*communityId*, *feedElementId*)**

Get the moderation flags on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedElementId*Type: [String](#)

The ID for a feed element.

Return Value

Type: [ConnectApi.ModerationCapability Class](#)If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getFlagsOnFeedElement(*communityId*, *feedElementId*, *visibility*)

Get the moderation flags with specified visibility on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types. One of these values:

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: [ConnectApi.ModerationCapability](#) Class

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getFlagsOnFeedElement(*communityId*, *feedElementId*, *pageParam*, *pageSize*)

Get a page of moderation flags on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, String pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

Return Value

Type: [ConnectApi.ModerationCapability Class](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getFlagsOnFeedElement(communityId, feedElementId, visibility, pageSize, pageParam)

Get a page of moderation flags with specified visibility on a feed element. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

40.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationCapability getFlagsOnFeedElement(String communityId,
String feedElementId, ConnectApi.CommunityFlagVisibility visibility, Integer pageSize,
String pageParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

visibility

Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. The default size is 0.

pageParam

Type: [String](#)

The page token to use to view the page. Page tokens are returned as part of the response class, for example, `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

Return Value

Type: [ConnectApi.ModerationCapability Class](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

getFlagsOnFeedItem(*communityId*, *feedItemId*)

Get the moderation flags on a feed item. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [getFlagsOnFeedElement\(*communityId*, *feedElementId*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String feedItemId)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedItemId*Type: [String](#)

The ID for a feed item.

Return Value

Type: [ConnectApi.ModerationFlags](#)**getFlagsOnFeedItem(*communityId*, *feedItemId*, *visibility*)**

Get the moderation flags with specified visibility on a feed item. To get the flags, the context user must have the Moderate Communities Feeds permission.

API Version

30.0–31.0

 **Important:** In version 32.0 and later, use [getFlagsOnFeedElement\(*communityId*, *feedElementId*, *visibility*\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags getFlagsOnFeedItem(String communityId, String
feedItemId, ConnectApi.CommunityFlagVisibility visibility)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*feedItemId*Type: [String](#)

The ID for a feed item.

*visibility*Type: [ConnectApi.CommunityFlagVisibility](#)

Specifies the visibility behavior of a flag for various user types.

- `ModeratorsOnly`—The flag is visible only to users with moderation permissions on the flagged element or item.
- `SelfAndModerators`—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.

Return Value

Type: [ConnectApi.ModerationFlags](#)

removeFlagFromComment(*communityId*, *commentId*, *userId*)

Remove a moderation flag from a comment. To remove a flag from a comment the context user must have added the flag or must have the Moderate Communities Feeds permission.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagFromComment(String communityId,  
String commentId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

commentId

Type: [String](#)

The ID for a comment.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: Void

removeFlagFromFeedElement(*communityId*, *feedElementId*, *userId*)

Remove a moderation flag from a feed element. To remove a flag from a feed element, the context user must have added the flag or must have the Moderate Communities Feeds permission.

API Version

31.0

Requires Chatter

Yes

Signature

```
public static void removeFlagFromFeedElement(String communityId, String feedElementId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.ModerationCapability Class](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

removeFlagsOnFeedItem(communityId, feedItemId, userId)

Remove a moderation flag from a feed item. To remove a flag from a feed item, the context user must have added the flag or must have the Moderate Communities Feeds permission.

API Version

29.0–31.0

 **Important:** In version 32.0 and later, use [removeFlagFromFeedElement\(communityId, feedElementId, userId\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.ModerationFlags removeFlagsOnFeedItem(String communityId, String feedItemId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedItemId

Type: [String](#)

The ID for a feed item.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: Void

ContentHub Class

Access Files Connect repositories and their files and folders.

Namespace

[ConnectApi](#)

ContentHub Methods

The following are methods for `ContentHub`. All methods are static.

Use `ContentHub` methods to work with Files Connect repositories.

IN THIS SECTION:

[addRepositoryItem\(repositoryId, repositoryFolderId, file\)](#)

Add a repository item.

[addRepositoryItem\(communityId, repositoryId, repositoryFolderId, file\)](#)

Add a repository item in a community.

[addRepositoryItem\(repositoryId, repositoryFolderId, file, fileData\)](#)

Add a repository item, including the binary file.

[addRepositoryItem\(communityId, repositoryId, repositoryFolderId, file, fileData\)](#)

Add a repository item, including the binary file, in a community.

[getAllowedItemTypes\(repositoryId, repositoryFolderId\)](#)

Get the item types that the context user is allowed to create in the repository folder.

[getAllowedItemTypes\(repositoryId, repositoryFolderId, filter\)](#)

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

[getAllowedItemTypes\(communityId, repositoryId, repositoryFolderId\)](#)

Get the item types that the context user is allowed to create in the repository folder in a community.

[getAllowedItemTypes\(communityId, repositoryId, repositoryFolderId, filter\)](#)

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in a community.

[getFilePreview\(repositoryId, repositoryFileId, formatType\)](#)

Get a repository file preview.

[getFilePreview\(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber\)](#)

Get a page or page range of a repository file preview.

[getFilePreview\(communityId, repositoryId, repositoryFileId, formatType\)](#)

Get a repository file preview in a community.

[getFilePreview\(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber\)](#)

Get a page or page range of a repository file preview in a community.

[getItemType\(repositoryId, repositoryItemId\)](#)

Get information about an item type associated with a repository.

[getItemType\(communityId, repositoryId, repositoryItemId\)](#)

Get information about an item type associated with a repository in a community.

[getPreviews\(repositoryId, repositoryFileId\)](#)

Get information about a repository file's supported previews.

[getPreviews\(communityId, repositoryId, repositoryFileId\)](#)

Get information about a repository file's supported previews in a community.

[getRepositories\(\)](#)

Get a list of repositories.

[getRepositories\(communityId\)](#)

Get a list of repositories in a community.

[getRepositories\(pageParam, pageSize\)](#)

Get a page of repositories.

[getRepositories\(communityId, pageParam, pageSize\)](#)

Get a page of repositories in a community.

[getRepository\(repositoryId\)](#)

Get a repository.

[getRepository\(communityId, repositoryId\)](#)

Get a repository in a community.

[getRepositoryFile\(repositoryId, repositoryFileId\)](#)

Get a repository file.

[getRepositoryFile\(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo\)](#)

Get a repository file with or without permissions information.

[getRepositoryFile\(communityId, repositoryId, repositoryFileId\)](#)

Get a repository file in a community.

[getRepositoryFile\(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo\)](#)

Get a repository file with or without permissions information in a community.

[getRepositoryFolder\(repositoryId, repositoryFolderId\)](#)

Get a repository folder.

[getRepositoryFolder\(communityId, repositoryId, repositoryFolderId\)](#)

Get a repository folder in a community.

[getRepositoryFolderItems\(repositoryId, repositoryFolderId\)](#)

Get repository folder items.

[getRepositoryFolderItems\(communityId, repositoryId, repositoryFolderId\)](#)

Get repository folder items in a community.

[getRepositoryFolderItems\(repositoryId, repositoryFolderId, pageParam, pageSize\)](#)

Get a page of repository folder items.

[getRepositoryFolderItems\(communityId, repositoryId, repositoryFolderId, pageParam, pageSize\)](#)

Get a page of repository folder items in a community.

[updateRepositoryFile\(repositoryId, repositoryFileId, file\)](#)

Update the metadata of a repository file.

[updateRepositoryFile\(repositoryId, repositoryFileId, file, fileData\)](#)

Update the content of a repository file.

[updateRepositoryFile\(communityId, repositoryId, repositoryFileId, file\)](#)

Update the metadata of a repository file in a community.

[updateRepositoryFile\(communityId, repositoryId, repositoryFileId, file, fileData\)](#)

Update the content of a repository file in a community.

addRepositoryItem(repositoryId, repositoryFolderId, file)

Add a repository item.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,  
String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

Return Value

Type: [ConnectApi.RepositoryFolderItem](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file without binary content (metadata only) in a repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFolderId =
'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWs';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = 'new folder item name.txt';
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \\\'\'{0}\\\'\'', name: \\\'\'{1}\\\'\'', description:
\\\'\'{2}\\\'\' \n external URL: \\\'\'{3}\\\'\'', download URL: \\\'\'{4}\\\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));
```

SEE ALSO:

[setTestAddRepositoryItem\(repositoryId, repositoryFolderId, file, result\)](#)

[Testing ConnectApi Code](#)

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)

Add a repository item in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,  
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

Return Value

Type: [ConnectApi.RepositoryFolderItem](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestAddRepositoryItem\(communityId, repositoryId, repositoryFolderId, file, result\)](#)

[Testing ConnectApi Code](#)

addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItem addRepositoryItem(String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

Return Value

Type: [ConnectApi.RepositoryFolderItem](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example creates a file with binary content and metadata in a repository folder. After the file is created, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFolderId =
'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWS';

final ConnectApi.ContentHubItemInput newItem = new ConnectApi.ContentHubItemInput();
newItem.itemTypeId = 'document'; //see getActionTypes for any file item types available
for creation/update
newItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final String newFileName = 'new folder item name.txt';
```

```

final ConnectApi.ContentHubFieldValueInput fieldValueInput = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInput.name = 'name';
fieldValueInput.value = newFileName;
newItem.fields.add(fieldValueInput);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputDesc.name = 'description';
fieldValueInputDesc.value = 'It does describe it';
newItem.fields.add(fieldValueInputDesc);

//Binary content
final Blob newFileBlob = Blob.valueOf('awesome content for brand new file');
final String newFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(newFileBlob,
newFileMimeType, newFileName);

final ConnectApi.RepositoryFolderItem newFolderItem =
ConnectApi.ContentHub.addRepositoryItem(gDriveRepositoryId, gDriveFolderId, newItem,
fileBinaryInput);
final ConnectApi.RepositoryFileSummary newFile = newFolderItem.file;
System.debug(String.format('New file - id: \\\'\'{0}\\\'\'', name: \\\'\'{1}\\\'\'', description:
\\\'\'{2}\\\'\' \n external URL: \\\'\'{3}\\\'\'', download URL: \\\'\'{4}\\\'\'', new String[]{
newFile.id, newFile.name, newFile.description, newFile.externalDocumentUrl,
newFile.downloadUrl}));

```

SEE ALSO:

[setTestAddRepositoryItem\(repositoryId, repositoryFolderId, file, fileData, result\)](#)
[Testing ConnectApi Code](#)

addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)

Add a repository item, including the binary file, in a community.

API Version

39.0

Requires Chatter

No

Signature

```

public static ConnectApi.RepositoryFolderItem addRepositoryItem(String communityId,
String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)

```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

Return Value

Type: [ConnectApi.RepositoryFolderItem](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestAddRepositoryItem\(communityId, repositoryId, repositoryFolderId, file, fileData, result\)](#)

[Testing ConnectApi Code](#)

getAllowedItemTypes(repositoryId, repositoryFolderId)

Get the item types that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAlloweItemTypes(String repositoryId, String repositoryFolderId)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

Return Value

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetAllowedItemTypes\(repositoryId, repositoryFolderId, result\)](#)

[Testing ConnectApi Code](#)

getAllowedItemTypes(repositoryId, repositoryFolderId, filter)

Get the item types, filtered by type, that the context user is allowed to create in the repository folder.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

filter

Type: [ConnectApi.ContentHubItemType](#)

Specifies the item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getAllowedItemTypes(repositoryId, repositoryFolderId, ConnectApi.ContentHubItemType.FilesOnly)` to get the first `ConnectApi.ContentHubItemTypeSummary.id` of a file. The context user can create allowed files in a repository folder in the external system.

```
final ConnectApi.ContentHubAllowedItemTypeCollection allowedItemTypesColl =
ConnectApi.ContentHub.getAllowedItemTypes(repositoryId, repositoryFolderId,
ConnectApi.ContentHubItemType.FilesOnly);
final List<ConnectApi.ContentHubItemTypeSummary> allowedItemTypes =
allowedItemTypesColl.allowedItemTypes;
string allowedFileItemId = null;
if(allowedItemTypes.size() > 0){
    ConnectApi.ContentHubItemTypeSummary allowedItemTypeSummary = allowedItemTypes.get(0);

    allowedFileItemId = allowedItemTypeSummary.id;
}
```

SEE ALSO:

[setTestGetAllowedItemTypes\(repositoryId, repositoryFolderId, filter, result\)](#)

[Testing ConnectApi Code](#)

`getAllowedItemTypes(communityId, repositoryId, repositoryFolderId)`

Get the item types that the context user is allowed to create in the repository folder in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes (String communityId, String repositoryId, String repositoryFolderId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

Return Value

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetAllowedItemTypes\(communityId, repositoryId, repositoryFolderId, result\)](#)

[Testing ConnectApi Code](#)

getAllowedItemTypes (communityId, repositoryId, repositoryFolderId, filter)

Get the item types, filtered by type, that the context user is allowed to create in the repository folder in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubAllowedItemTypeCollection getAllowedItemTypes (String communityId, String repositoryId, String repositoryFolderId, ConnectApi.ConnectContentHubItemType filter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

filter

Type: [ConnectApi.ContentHubItemType](#)

Specifies the item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

Return Value

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetAllowedItemTypes\(communityId, repositoryId, repositoryFolderId, filter, result\)](#)

[Testing ConnectApi Code](#)

getFilePreview(repositoryId, repositoryFileId, formatType)

Get a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

*repositoryId*Type: [String](#)

The ID of the repository.

*repositoryFileId*Type: [String](#)

The ID of the repository file.

*formatType*Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

Return Value

Type: [ConnectApi.FilePreview](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example calls `getFilePreview(repositoryId, repositoryFileId, ConnectApi.FilePreviewFormat.Thumbnail)` to get the thumbnail format preview along with its respective URL and number of thumbnail renditions. For each thumbnail format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFileId =
'document:1-zcAlBaeoQbo2_yNFihCcK6QJTPmOke-kHFC4TYg3rk'; final ConnectApi.FilePreview
filePreview =
ConnectApi.ContentHub.getFilePreview(gDriveRepositoryId, gDriveFileId,
ConnectApi.FilePreviewFormat.Thumbnail); System.debug(String.format('Preview - URL:
\\\'{0}\'', format: '\\\'{1}\'', nbr of
renditions for this format: {2}', new String[]{ filePreview.url,
filePreview.format.name(), String.valueOf(filePreview.previewUrls.size())}); for (ConnectApi.FilePreviewUrl
filePreviewUrl : filePreview.previewUrls) {
```

```
System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);  
}
```

SEE ALSO:

[setTestGetFilePreview\(repositoryId, repositoryFileId, formatType, result\)](#)

[Testing ConnectApi Code](#)

getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)

Get a page or page range of a repository file preview.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String repositoryId, String  
repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber,  
Integer endPageNumber)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

formatType

Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

startPageNumber

Type: [Integer](#)

The starting page number in the range of file preview URLs.

endPageNumber

Type: [Integer](#)

The ending page number in the range of file preview URLs.

Return Value

Type: [ConnectApi.FilePreview](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetFilePreview\(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result\)](#)

[Testing ConnectApi Code](#)

`getFilePreview`(communityId, repositoryId, repositoryFileId, formatType)

Get a repository file preview in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

formatType

Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

Return Value

Type: [ConnectApi.FilePreview](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetFilePreview\(communityId, repositoryId, repositoryFileId, formatType, result\)](#)

[Testing ConnectApi Code](#)

`getFilePreview(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)`

Get a page or page range of a repository file preview in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreview getFilePreview(String communityId, String repositoryId, String repositoryFileId, ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

formatType

Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

startPageNumber

Type: [Integer](#)

The starting page number in the range of file preview URLs.

endPageNumber

Type: [Integer](#)

The ending page number in the range of file preview URLs.

Return Value

Type: [ConnectApi.FilePreview](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetFilePreview\(communityId, repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber, result\)](#)

[Testing ConnectApi Code](#)

getItemType(repositoryId, repositoryItemId)

Get information about an item type associated with a repository.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String repositoryId,  
String repositoryItemId)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryItemId

Type: [String](#)

The ID of the repository item type.

Return Value

Type: [ConnectApi.ContentHubItemTypeDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetItemType\(repositoryId, repositoryItemId, result\)](#)

[Testing ConnectApi Code](#)

getItemType(communityId, repositoryId, repositoryItemId)

Get information about an item type associated with a repository in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubItemTypeDetail getItemType(String communityId, String  
repositoryId, String repositoryItemId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryItemTypeId

Type: [String](#)

The ID of the repository item type.

Return Value

Type: [ConnectApi.ContentHubItemTypeDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetItemType\(communityId, repositoryId, repositoryItemTypeId, result\)](#)

[Testing ConnectApi Code](#)

getPreviews(repositoryId, repositoryFileId)

Get information about a repository file's supported previews.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String repositoryId, String repositoryFileId)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

Return Value

Type: [ConnectApi.FilePreviewCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all supported preview formats and their respective URLs and number of renditions. For each supported preview format, we show every rendition URL available.

```
final String gDriveRepositoryId = '0XCxx00000000DGAY', gDriveFileId =
'document:1-zcA1BaeoQbo2_yNFiHCcK6QJTPmOke-kHFC4TYg3rk';
final ConnectApi.FilePreviewCollection previewsCollection =
ConnectApi.ContentHub.getPreviews(gDriveRepositoryId, gDriveFileId);
for(ConnectApi.FilePreview filePreview : previewsCollection.previews){
    System.debug(String.format('Preview - URL: \\\'\'{0}\'\'', format: \\\'\'{1}\'\'', nbr of
renditions for this format: {2}'), new String[]{ filePreview.url,
filePreview.format.name(),String.valueOf(filePreview.previewUrls.size())});
    for(ConnectApi.FilePreviewUrl filePreviewUrl : filePreview.previewUrls){
        System.debug('-----> Rendition URL: ' + filePreviewUrl.previewUrl);
    }
}
```

SEE ALSO:

[setTestGetPreviews\(repositoryId, repositoryFileId, result\)](#)

[Testing ConnectApi Code](#)

getPreviews([communityId](#), [repositoryId](#), [repositoryFileId](#))

Get information about a repository file's supported previews in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.FilePreviewCollection getPreviews(String communityId, String repositoryId, String repositoryFileId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

Return Value

Type: [ConnectApi.FilePreviewCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetPreviews\(communityId, repositoryId, repositoryFileId, result\)](#)

[Testing ConnectApi Code](#)

getRepositories()

Get a list of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories()
```

Return Value

Type: [ConnectApi.ContentHubRepositoryCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets all repositories and gets the first SharePoint online repository found.

```
final String sharePointOnlineProviderType = 'ContentHubSharepointOffice365';
final ConnectApi.ContentHubRepositoryCollection repositoryCollection =
ConnectApi.ContentHub.getRepositories();
ConnectApi.ContentHubRepository sharePointOnlineRepository = null;
for(ConnectApi.ContentHubRepository repository : repositoryCollection.repositories){
    if(sharePointOnlineProviderType.equalsIgnoreCase(repository.providerType.type)){
        sharePointOnlineRepository = repository;
        break;
    }
}
```

SEE ALSO:

[setTestGetRepositories\(result\)](#)

[Testing ConnectApi Code](#)

getRepositories (communityId)

Get a list of repositories in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(String
communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ContentHubRepositoryCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[Testing ConnectApi Code](#)

getRepositories (pageParam, pageSize)

Get a page of repositories.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ContentHubRepositoryCollection getRepositories(Integer pageParam, Integer pageSize)
```

Parameters

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

Return Value

Type: [ConnectApi.ContentHubRepositoryCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

getRepositoryFile(repositoryId, repositoryFileId)

Get a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,  
String repositoryFileId)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFileId =
'file:0B01TyslKmM3sTmxKNjVJbWZja00';
final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId);
System.debug(String.format('File - name: \\\'\'{0}\'\'', size: {1}, external URL: \\\'\'{2}\'\'',
download URL: \\\'\'{3}\'\'',
new String[]{ file.name, String.valueOf(file.contentSize), file.externalDocumentUrl,
file.downloadUrl}));
```

SEE ALSO:

[setTestGetRepositoryFile\(repositoryId, repositoryFileId, result\)](#)

[Testing ConnectApi Code](#)

getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)

Get a repository file with or without permissions information.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail getRepositoryFile(String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

includeExternalFilePermissionsInfo

Type: [Boolean](#)

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFileId =
'file:0B01TyslKmM3sTmxKNjVJbWZja00';

final ConnectApi.RepositoryFileDetail file =
ConnectApi.ContentHub.getRepositoryFile(gDriveRepositoryId, gDriveFileId, true);
System.debug(String.format('File - name: \\\'\'{0}\'\'', size: {1}, external URL: \\\'\'{2}\'\'',
  download URL: \\\'\'{3}\'\'', new String[]{ file.name, String.valueOf(file.contentSize),
file.externalDocumentUrl, file.downloadUrl}));
final ConnectApi.ExternalFilePermissionInformation externalFilePermInfo =
file.externalFilePermissionInformation;

//permission types
final List<ConnectApi.ContentHubPermissionType> permissionTypes =
externalFilePermInfo.externalFilePermissionTypes;
for(ConnectApi.ContentHubPermissionType permissionType : permissionTypes){
  System.debug(String.format('Permission type - id: \\\'\'{0}\'\'', label: \\\'\'{1}\'\'', new
String[]{ permissionType.id, permissionType.label}));
}

//permission groups
final List<ConnectApi.RepositoryGroupSummary> groups =
externalFilePermInfo.repositoryPublicGroups;
for(ConnectApi.RepositoryGroupSummary ggroup : groups){
  System.debug(String.format('Group - id: \\\'\'{0}\'\'', name: \\\'\'{1}\'\'', type:
\\\'\'{2}\'\'', new String[]{ ggroup.id, ggroup.name, ggroup.type.name()}));
}
```

SEE ALSO:

[Testing ConnectApi Code](#)

`getRepositoryFolderItems(repositoryId, repositoryFolderId)`

Get repository folder items.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFolderItemsCollection getRepositoryFolderItems(String repositoryId, String repositoryFolderId)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

Return Value

Type: [ConnectApi.RepositoryFolderItemsCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example gets the collection of items in a repository folder. For files, we show the file's name, size, external URL, and download URL. For folders, we show the folder's name, description, and external URL.

```
final String gDriveRepositoryId = '0XCxx00000000ODGAY', gDriveFolderId =
'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWs';
final ConnectApi.RepositoryFolderItemsCollection folderItemsColl =
ConnectApi.ContentHub.getRepositoryFolderItems(gDriveRepositoryId,gDriveFolderId);
final List<ConnectApi.RepositoryFolderItem> folderItems = folderItemsColl.items;
System.debug('Number of items in repository folder: ' + folderItems.size());
for(ConnectApi.RepositoryFolderItem item : folderItems){
    ConnectApi.RepositoryFileSummary fileSummary = item.file;
    if(fileSummary != null){
        System.debug(String.format('File item - name: \\\'{0}\\\'' , size: {1}, external URL:
\\\'{2}\\\'' , download URL: \\\'{3}\\\'' , new String[]{ fileSummary.name,
String.valueOf(fileSummary.contentSize), fileSummary.externalDocumentUrl,
fileSummary.downloadUrl));
    }else{
        ConnectApi.RepositoryFolderSummary folderSummary = item.folder;
        System.debug(String.format('Folder item - name: \\\'{0}\\\'' , description:
\\\'{1}\\\'' , new String[]{ folderSummary.name, folderSummary.description});
    }
}
```

SEE ALSO:

[Testing ConnectApi Code](#)

updateRepositoryFile(repositoryId, repositoryFileId, file)

Update the metadata of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,  
String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

*repositoryId*Type: [String](#)

The ID of the repository.

*repositoryFileId*Type: [String](#)

The ID of the repository file.

*file*Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the metadata of a file in a repository. After the file is updated, we show the file's ID, name, description, external URL, download URL.

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFolderId =  
'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =  
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';  
  
final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();  
updatedItem.itemTypeId = 'document'; //see getAllowTypes for any file item types available  
for creation/update  
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();  
  
//Metadata: name field  
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
```

```

ConnectApi.ContentHubFieldValueInput ();
fieldValueInputName.name = 'name';
fieldValueInputName.value = 'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputNameDesc = new
ConnectApi.ContentHubFieldValueInput ();
fieldValueInputNameDesc.name = 'description';
fieldValueInputNameDesc.value = 'that updates the former description';
updatedItem.fields.add(fieldValueInputNameDesc);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
System.debug(String.format('Updated file - id: \\\'{0}\\', name: \\\'{1}\\', description:
\\\'{2}\\',\n external URL: \\\'{3}\\', download URL: \\\'{4}\\', new String[]{
updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,
updatedFile.downloadUrl}));

```

SEE ALSO:

[setTestUpdateRepositoryFile\(communityId, repositoryId, repositoryFileId, file, fileData, result\)](#)

[Testing ConnectApi Code](#)

updateRepositoryFile(repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file.

API Version

39.0

Requires Chatter

No

Signature

```

public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData)

```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

*file*Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

*fileData*Type: [ConnectApi.BinaryInput](#)

The binary file.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Example

This example updates the content and metadata of a file in a repository. After the file is updated, we show the file's ID, name, description, external URL, and download URL.

```
final String gDriveRepositoryId = '0XCxx0000000ODGAY', gDriveFolderId =
'folder:0B01Tys1KmM3sSVJ2bjIzTGFqSWs', gDriveFileId =
'document:1q9OatVpcyYBK-JWzp_PhR75ulQghwFP15zhkamKrRcQ';

final ConnectApi.ContentHubItemInput updatedItem = new ConnectApi.ContentHubItemInput();
updatedItem.itemTypeId = 'document'; //see getAllowedTypes for any file item types available
for creation/update
updatedItem.fields = new List<ConnectApi.ContentHubFieldValueInput>();

//Metadata: name field
final ConnectApi.ContentHubFieldValueInput fieldValueInputName = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputName.name = 'name';
fieldValueInputName.value = 'updated file name.txt';
updatedItem.fields.add(fieldValueInputName);

//Metadata: description field
final ConnectApi.ContentHubFieldValueInput fieldValueInputNameDesc = new
ConnectApi.ContentHubFieldValueInput();
fieldValueInputNameDesc.name = 'description';
fieldValueInputNameDesc.value = 'that updates the former description';
updatedItem.fields.add(fieldValueInputNameDesc);

//Binary content
final Blob updatedFileBlob = Blob.valueOf('even more awesome content for updated file');
final String updatedFileMimeType = 'text/plain';
final ConnectApi.BinaryInput fileBinaryInput = new ConnectApi.BinaryInput(updatedFileBlob,
updatedFileMimeType, updatedFileName);

final ConnectApi.RepositoryFileDetail updatedFile =
ConnectApi.ContentHub.updateRepositoryFile(gDriveRepositoryId, gDriveFileId, updatedItem);
```

```
System.debug(String.format('Updated file - id: \\\'\'{0}\'\'', name: \\\'\'{1}\'\'', description: \\\'\'{2}\'\'',\n external URL: \\\'\'{3}\'\'', download URL: \\\'\'{4}\'\'', new String[]{\n updatedFile.id, updatedFile.name, updatedFile.description, updatedFile.externalDocumentUrl,\n updatedFile.downloadUrl}));
```

SEE ALSO:

[Testing ConnectApi Code](#)

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file)

Update the metadata of a repository file in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,\n String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[Testing ConnectApi Code](#)

updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)

Update the content of a repository file in a community.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.RepositoryFileDetail updateRepositoryFile(String communityId,
String repositoryId, String repositoryFileId, ConnectApi.ContentHubItemInput file,
ConnectApi.BinaryInput fileData)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

Return Value

Type: [ConnectApi.RepositoryFileDetail](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

ContentHub Test Methods

The following are the test methods for `ContentHub`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, result)

Registers a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.RepositoryFolderItem result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

result

Type: [ConnectApi.RepositoryFolderItem](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[addRepositoryItem\(repositoryId, repositoryFolderId, file\)](#)

[Testing ConnectApi Code](#)

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, result)

Registers a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file,
ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

result

Type: [ConnectApi.RepositoryFolderItem](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[addRepositoryItem\(communityId, repositoryId, repositoryFolderId, file\)](#)

[Testing ConnectApi Code](#)

setTestAddRepositoryItem(repositoryId, repositoryFolderId, file, fileData, result)

Registers a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

result

Type: [ConnectApi.RepositoryFolderItem](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[addRepositoryItem\(repositoryId, repositoryFolderId, file, fileData\)](#)

[Testing ConnectApi Code](#)

setTestAddRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData, result)

Registers a `ConnectApi.RepositoryFolderItem` object to be returned when the matching `addRepositoryItem(communityId, repositoryId, repositoryFolderId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestAddRepositoryItem(String communityId, String repositoryId,
String repositoryFolderId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData, ConnectApi.RepositoryFolderItem result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

result

Type: [ConnectApi.RepositoryFolderItem](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[addRepositoryItem\(repositoryId, repositoryFolderId, file, fileData\)](#)

[Testing ConnectApi Code](#)

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, result)

Registers a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

result

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getAllowedItemTypes\(repositoryId, repositoryFolderId\)](#)

[Testing ConnectApi Code](#)

setTestGetAllowedItemTypes(repositoryId, repositoryFolderId, filter, result)

Registers a `ConnectApi.ContentHubAllowedItemTypeCollection` object to be returned when the matching `getAllowedItemTypes(repositoryId, repositoryFolderId, filter)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static void setTestGetAllowedItemTypes(String repositoryId, String repositoryFolderId, ConnectApi.ContentHubItemType filter, ConnectApi.ContentHubAllowedItemTypeCollection result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

filter

Type: [ConnectApi.ContentHubItemType](#)

Specifies the item types. Values are:

- `Any`—Includes files and folders.
- `FilesOnly`—Includes files only.
- `FoldersOnly`—Includes folders only.

result

Type: [ConnectApi.ContentHubAllowedItemTypeCollection](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getAllowedItemTypes\(repositoryId, repositoryFolderId, filter\)](#)

[Testing ConnectApi Code](#)

`setTestGetFilePreview(repositoryId, repositoryFileId, formatType, result)`

Registers a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, ConnectApi.FilePreview result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

formatType

Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

result

Type: [ConnectApi.FilePreview](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getFilePreview\(repositoryId, repositoryFileId, formatType\)](#)

[Testing ConnectApi Code](#)

```
setTestGetFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber,
endPageNumber, result)
```

Registers a `ConnectApi.FilePreview` object to be returned when the matching `getFilePreview(repositoryId, repositoryFileId, formatType, startPageNumber, endPageNumber)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetFilePreview(String repositoryId, String repositoryFileId,
ConnectApi.FilePreviewFormat formatType, Integer startPageNumber, Integer endPageNumber,
ConnectApi.FilePreview result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

formatType

Type: [ConnectApi.FilePreviewFormat](#)

Specifies the format of the file preview. Values are:

- Pdf—Preview format is PDF.
- Svg—Preview format is compressed SVG.
- Thumbnail—Preview format is 240 x 180 PNG.
- ThumbnailBig—Preview format is 720 x 480 PNG.
- ThumbnailTiny—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

startPageNumber

Type: [Integer](#)

The starting page number in the range of file preview URLs.

endPageNumber

Type: [Integer](#)

The ending page number in the range of file preview URLs.

result

Type: [ConnectApi.FilePreview](#)

The object containing test data.

Return Value

```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: `String`

The ID of the repository.

repositoryFileId

Type: `String`

The ID of the repository file.

formatType

Type: `ConnectApi.FilePreviewFormat`

Specifies the format of the file preview. Values are:

- `Pdf`—Preview format is PDF.
- `svg`—Preview format is compressed SVG.
- `Thumbnail`—Preview format is 240 x 180 PNG.
- `ThumbnailBig`—Preview format is 720 x 480 PNG.
- `ThumbnailTiny`—Preview format is 120 x 90 PNG.

PDF previews are available for files of type DOC, DOCX, PPT, PPTX, TEXT, XLS, and XLSX. SVG files are generated on demand.

result

Type: `ConnectApi.FilePreview`

The object containing test data.

Return Value

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

result

Type: [ConnectApi.ContentHubRepository](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepository\(communityId, repositoryId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFile(repositoryId, repositoryFileId, result)

Registers a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
ConnectApi.RepositoryFileDetail result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

result

Type: [ConnectApi.RepositoryFileDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFile\(repositoryId, repositoryFileId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)

Registers a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String repositoryId, String repositoryFileId,
Boolean includeExternalFilePermissionsInfo, ConnectApi.RepositoryFileDetail result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

includeExternalFilePermissionsInfo

Type: [Boolean](#)

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

result

Type: [ConnectApi.RepositoryFileDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFile\(repositoryId, repositoryFileId, includeExternalFilePermissionsInfo\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, result)

Registers a [ConnectApi.RepositoryFileDetail](#) object to be returned when the matching [getRepositoryFile\(communityId, repositoryId, repositoryFileId\)](#) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String communityId, String repositoryId,
String repositoryFileId, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

result

Type: [ConnectApi.RepositoryFileDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFile\(communityId, repositoryId, repositoryFileId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo, result)

Registers a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `getRepositoryFile(communityId, repositoryId, repositoryFileId, includeExternalFilePermissionsInfo)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFile(String communityId, String repositoryId,
String repositoryFileId, Boolean includeExternalFilePermissionsInfo,
ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

includeExternalFilePermissionsInfo

Type: [Boolean](#)

Specifies whether to include permission information, such as whether the file is shared and what are the available permission types.

Managing external file permissions is supported for Google Drive, SharePoint Online, and OneDrive for Business.

result

Type: [ConnectApi.RepositoryFileDetail](#)

The object containing test data.

Return Value

[Testing ConnectApi Code](#)

setTestGetRepositoryFolder(repositoryId, repositoryFolderId, result)

Registers a `ConnectApi.RepositoryFolderDetail` object to be returned when the matching `getRepositoryFolder(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

result

Type: [ConnectApi.RepositoryFolderDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFolder\(repositoryId, repositoryFolderId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFolder(communityId, repositoryId, repositoryFolderId, result)

Registers a [ConnectApi.RepositoryFolderDetail](#) object to be returned when the matching [getRepositoryFolder\(communityId, repositoryId, repositoryFolderId\)](#) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolder(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderDetail result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

result

Type: [ConnectApi.RepositoryFolderDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFolder\(repositoryId, repositoryFolderId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFolderItems(repositoryId, repositoryFolderId, result)

Registers a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolderItems(String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

result

Type: [ConnectApi.RepositoryFolderItemsCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFolderItems\(repositoryId, repositoryFolderId\)](#)

setTestGetRepositoryFolderItems (communityId, repositoryId, repositoryFolderId, result)

Registers a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems (communityId, repositoryId, repositoryFolderId)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

result

Type: [ConnectApi.RepositoryFolderItemsCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFolderItems \(communityId, repositoryId, repositoryFolderId\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFolderItems (repositoryId, repositoryFolderId, pageParam, pageSize, result)

Registers a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems (repositoryId, repositoryFolderId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestGetRepositoryFolderItems(String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result

Type: [ConnectApi.RepositoryFolderItemsCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRepositoryFolderItems\(repositoryId, repositoryFolderId, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

setTestGetRepositoryFolderItems(*communityId*, *repositoryId*, *repositoryFolderId*, *pageParam*, *pageSize*, *result*)

Registers a `ConnectApi.RepositoryFolderItemsCollection` object to be returned when the matching `getRepositoryFolderItems(communityId, repositoryId, repositoryFolderId, pageParam, pageSize)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static void setTestGetRepositoryFolderItems(String communityId, String repositoryId, String repositoryFolderId, Integer pageParam, Integer pageSize, ConnectApi.RepositoryFolderItemsCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFolderId

Type: [String](#)

The ID of the repository folder.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default page size is 25.

result

Type: [ConnectApi.RepositoryFolderItemsCollection](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getRepositoryFolderItems\(communityId, repositoryId, repositoryFolderId, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

setTestUpdateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData, result)

Registers a `ConnectApi.RepositoryFileDetail` object to be returned when the matching `updateRepositoryFile(communityId, repositoryId, repositoryFileId, file, fileData)` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

40.0

Signature

```
public static Void setTestUpdateRepositoryFile(String communityId, String repositoryId,
String repositoryFileId, ConnectApi.ContentHubItemInput file, ConnectApi.BinaryInput
fileData, ConnectApi.RepositoryFileDetail result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

repositoryId

Type: [String](#)

The ID of the repository.

repositoryFileId

Type: [String](#)

The ID of the repository file.

file

Type: [ConnectApi.ContentHubItemInput](#)

The item type ID and fields of the item type.

fileData

Type: [ConnectApi.BinaryInput](#)

The binary file.

result

Type: [ConnectApi.RepositoryFileDetail](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[updateRepositoryFile\(repositoryId, repositoryFileId, file\)](#)

[Testing ConnectApi Code](#)

Datacloud Class

Purchase Data.com contact or company records, and retrieve purchase information.

Namespace

[ConnectApi](#)

IN THIS SECTION:

[Datacloud Methods](#)

Datacloud Methods

The following are methods for `Datacloud`. All methods are static.

IN THIS SECTION:

[getCompaniesFromOrder\(orderId, pageSize, page\)](#)

Retrieves a list of purchased company records for an order.

[getCompany\(companyId\)](#)

Retrieves a company record from an identification number.

[getContact\(contactId\)](#)

Retrieves a contact record from an identification number.

[getContactsFromOrder\(orderId, page, pageSize\)](#)

Retrieves a list of purchased contacts for an order.

[getOrder\(orderId\)](#)

Retrieves purchased records for an order.

[getUsage\(userId\)](#)

Retrieves purchase usage information for a specific user.

[postOrder\(orderInput\)](#)

Purchase records that are listed in an input file.

getCompaniesFromOrder (orderId, pageSize, page)

Retrieves a list of purchased company records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompanies getCompaniesFromOrder(String orderId, String
pageSize, String page)
```

Parameters

orderId

Type: [String](#)

A unique number that identifies an order.

page

Type: [String](#)

The number of the page that you want returned.

pageSize

Type: [String](#)

The number of companies to show on a page. The default *pageSize* is 25.

Return Value

Type: [ConnectApi.DatacloudCompanies](#)

getCompany (companyId)

Retrieves a company record from an identification number.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudCompany getCompany(String companyId)
```

Parameters

companyId

Type: [String](#)

A numeric identifier for a company in the Data.com database.

Return Value

Type: [ConnectApi.DatacloudCompany](#)

Example

```
ConnectApi.DatacloudCompany DatacloudCompanyRep = ConnectApi.Datacloud.getCompany(companyId);
```

getContact (contactId)

Retrieves a contact record from an identification number.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContact getContact(String contactId)
```

Parameters

contactId

Type: [String](#)

A unique numeric string that identifies a contact in the Data.com database.

Return Value

Type: [ConnectApi.DatacloudContact](#)

Example

```
ConnectApi.DatacloudContact DatacloudContactRep = ConnectApi.Datacloud.getContact(contactId);
```

getContactsFromOrder (orderId, page, pageSize)

Retrieves a list of purchased contacts for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudContacts getContactsFromOrder(String orderId, String page, String pageSize)
```

Parameters

orderId

Type: [String](#)

A unique number that's associated with an order.

page

Type: [String](#)

The number of the page that you want returned.

pageSize

Type: [String](#)

The number of contacts to show on a page. The default *pageSize* is 25.

Return Value

Type: [ConnectApi.DatacloudContacts](#)

getOrder (orderId)

Retrieves purchased records for an order.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder getOrder(String orderId)
```

Parameters

orderId

Type: [String](#)

A unique number that identifies an order.

Return Value

Type: [ConnectApi.DatacloudOrder](#)

Example

```
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.getOrder(orderId);
```

getUsage (userId)

Retrieves purchase usage information for a specific user.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudPurchaseUsage getUsage(String userId)
```

Parameters

userId

Type: [String](#)

A unique number that identifies a single user.

Return Value

Type: [ConnectApi.DatacloudPurchaseUsage](#)

Example

```
ConnectApi.DatacloudPurchaseUsage datacloudPurchaseUsageRep =
ConnectApi.Datacloud.getUsage (userId);
```

postOrder (orderInput)

Purchase records that are listed in an input file.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.DatacloudOrder postOrder (ConnectApi.DatacloudOrderInput
orderInput)
```

Parameters

orderInput

Type: [ConnectApi.DatacloudOrderInput](#)

A list that contains IDs for the contacts or companies that you want to see.

Return Value

Type: [ConnectApi.DatacloudOrder](#)

Example

```
ConnectApi.DatacloudOrderInput inputOrder=new ConnectApi.DatacloudOrderInput ();
List<String> ids=new List<String> ();
ids.add ('1234');
inputOrder.companyIds=ids;
ConnectApi.DatacloudOrder datacloudOrderRep = ConnectApi.Datacloud.postOrder (inputOrder);
```

EmailMergeFieldService Class

Extract a list of merge fields for an object. A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Namespace

[ConnectApi](#)

EmailMergeFieldService Methods

The following are methods for `EmailMergeFieldService`. All methods are static.

IN THIS SECTION:

[getMergeFields\(objectApiNames\)](#)

Extract the merge fields for a specific object.

getMergeFields (objectApiNames)

Extract the merge fields for a specific object.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.EmailMergeFieldInfo getMergeFields (List<String> objectApiNames)
```

Parameters

objectApiNames

Type: [List<String>](#)

The API names for the objects being referenced.

Return Value

Type: [ConnectApi.EmailMergeFieldInfo](#)

ExternalEmailServices Class

Access information about integration with external email services, such as sending email within Salesforce through an external email account.

Namespace

[ConnectApi](#)

External Email Services Methods

The following are methods for `ExternalEmailService`. All methods are static.

IN THIS SECTION:

[getUserOauthInfo\(landingPage\)](#)

Get information about whether an external email service has been authorized to send email on behalf of a user.

getUserOauthInfo (landingPage)

Get information about whether an external email service has been authorized to send email on behalf of a user.

API Version

37.0

Requires Chatter

No

Signature

```
public static getUserOauthInfo (String landingPage)
```

Parameters

*landingPage*Type: [String](#)

The landing page that the user starts on when they are finished with the OAuth authorization process.

Return Value

Type: [UserOauthInfo](#)

SEE ALSO:

[Testing ConnectApi Code](#)

Knowledge Class

Access information about trending articles in communities.

Namespace

[ConnectApi](#)

Knowledge Methods

The following are methods for `Knowledge`. All methods are static.

IN THIS SECTION:

[getTrendingArticles\(communityId, maxResults\)](#)

Get trending articles for a community.

[getTrendingArticlesForTopic\(communityId, topicId, maxResults\)](#)

Get the trending articles for a topic in a community.

getTrendingArticles (communityId, maxResults)

Get trending articles for a community.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection getTrendingArticles (String
communityId, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

maxResults

Type: [Integer](#)

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: [ConnectApi.KnowledgeArticleVersionCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetTrendingArticles\(communityId, maxResults, result\)](#)

[Testing ConnectApi Code](#)

getTrendingArticlesForTopic (communityId, topicId, maxResults)

Get the trending articles for a topic in a community.

API Version

36.0

Available to Guest Users

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.KnowledgeArticleVersionCollection  
getTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

ID of the topic.

maxResults

Type: [Integer](#)

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

Return Value

Type: [ConnectApi.KnowledgeArticleVersionCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetTrendingArticlesForTopic\(communityId, topicId, maxResults, result\)](#)

[Testing ConnectApi Code](#)

Knowledge Test Methods

The following are the test methods for `Knowledge`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestGetTrendingArticles(*communityId*, *maxResults*, *result*)

Registers a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticles` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static Void setTestGetTrendingArticles(String communityId, Integer maxResults,
ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

maxResults

Type: [Integer](#)

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result

Type: [ConnectApi.KnowledgeArticleVersionCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getTrendingArticles\(*communityId*, *maxResults*\)](#)

[Testing ConnectApi Code](#)

setTestGetTrendingArticlesForTopic(*communityId*, *topicId*, *maxResults*, *result*)

Registers a `ConnectApi.KnowledgeVersionArticleCollection` object to be returned when the matching `ConnectApi.getTrendingArticlesForTopic` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

36.0

Signature

```
public static void setTestGetTrendingArticlesForTopic(String communityId, String topicId, Integer maxResults, ConnectApi.KnowledgeArticleVersionCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

ID of the topic.

maxResults

Type: [Integer](#)

The maximum number of articles returned. Values can be from 0 to 25. Default is 5.

result

Type: [ConnectApi.KnowledgeArticleVersionCollection](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getTrendingArticlesForTopic\(communityId, topicId, maxResults\)](#)

[Testing ConnectApi Code](#)

ManagedTopics Class

Access information about managed topics in a community. Create, delete, and reorder managed topics.

Namespace

[ConnectApi](#)

ManagedTopics Methods

The following are methods for `ManagedTopics`. All methods are static.

IN THIS SECTION:

[createManagedTopic\(communityId, recordId, managedTopicType\)](#)

Creates a managed topic of a specific type for the specified community.

[createManagedTopic\(communityId, recordId, managedTopicType, parentId\)](#)

Creates a child managed topic for a community.

[createManagedTopicByName\(communityId, name, managedTopicType\)](#)

Creates a managed topic of a specific type by name for the specified community.

[createManagedTopicByName\(communityId, name, managedTopicType, parentId\)](#)

Creates a child managed topic by name for a community.

[deleteManagedTopic\(communityId, managedTopicId\)](#)

Deletes a managed topic from the specified community.

[getManagedTopic\(communityId, managedTopicId\)](#)

Returns information about a managed topic in a community.

[getManagedTopic\(communityId, managedTopicId, depth\)](#)

Returns information about a managed topic, including its parent and children managed topics, in a community.

[getManagedTopics\(communityId\)](#)

Returns the managed topics for the community.

[getManagedTopics\(communityId, managedTopicType\)](#)

Returns managed topics of a specified type for the community.

[getManagedTopics\(communityId, managedTopicType, depth\)](#)

Returns managed topics of a specified type, including their parent and children managed topics, in a community.

[getManagedTopics\(communityId, managedTopicType, recordId, depth\)](#)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with a given topic in a community.

[getManagedTopics\(communityId, managedTopicType, recordIds, depth\)](#)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with topics in a community.

[reorderManagedTopics\(communityId, managedTopicPositionCollection\)](#)

Reorders the relative positions of managed topics in a community.

createManagedTopic(communityId, recordId, managedTopicType)

Creates a managed topic of a specific type for the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

ID of the topic.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specify the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

Return Value

Type: [ConnectApi.ManagedTopic](#)

Usage

Only community managers (users with the `Create and Set Up Communities` or `Manage Communities` permission) can create managed topics.

`createManagedTopic`(`communityId`, `recordId`, `managedTopicType`, `parentId`)

Creates a child managed topic for a community.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopic(String communityId, String recordId, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

ID of the topic.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specify `Navigation1` for the type of managed topic to create a child managed topic.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigation1` topic.

You can create up to 25 managed topics per `managedTopicType`.

parentId

Type: [String](#)

ID of the parent managed topic.

You can create up to three levels (parent, direct children, and their children) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: [ConnectApi.ManagedTopic](#)

Usage

Only community managers (users with the `Create and Set Up Communities` or `Manage Communities` permission) can create managed topics.

`createManagedTopicByName (communityId, name, managedTopicType)`

Creates a managed topic of a specific type by name for the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName (String communityId,  
String name, ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

name

Type: [String](#)

Name of the topic.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specify the type of managed topic.

- **Featured**—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- **Navigational**—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a **Featured** topic and a **Navigational** topic.

You can create up to 25 managed topics per `managedTopicType`.

Return Value

Type: [ConnectApi.ManagedTopic](#)

Usage

Only community managers (users with the Create and Set Up Communities or Manage Communities permission) can create managed topics.

`createManagedTopicByName (communityId, name, managedTopicType, parentId)`

Creates a child managed topic by name for a community.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic createManagedTopicByName(String communityId,
String name, ConnectApi.ManagedTopicType managedTopicType, String parentId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

name

Type: [String](#)

Name of the topic.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specify `Navigational` for the type of managed topic to create a child managed topic.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

You can create up to 25 managed topics per `managedTopicType`.

parentId

Type: [String](#)

ID of the parent managed topic.

You can create up to three levels (parent, direct children, and their children) of managed topics and up to 10 children managed topics per managed topic.

Return Value

Type: [ConnectApi.ManagedTopic](#)

Usage

Only community managers (users with the `Create and Set Up Communities` or `Manage Communities` permission) can create managed topics.

`deleteManagedTopic`(`communityId`, `managedTopicId`)

Deletes a managed topic from the specified community.

API Version

32.0

Requires Chatter

No

Signature

```
public static deleteManagedTopic(String communityId, String managedTopicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicId

Type: [String](#)

ID of managed topic.

Return Value

Type: Void

Usage

Only community managers (users with the Create and Set Up Communities or Manage Communities permission) can delete managed topics.

getManagedTopic (communityId, managedTopicId)

Returns information about a managed topic in a community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicId

Type: [String](#)

ID of managed topic.

Return Value

Type: [ConnectApi.ManagedTopic](#)

getManagedTopic (communityId, managedTopicId, depth)

Returns information about a managed topic, including its parent and children managed topics, in a community.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopic getManagedTopic(String communityId, String managedTopicId, Integer depth)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicId

Type: [String](#)

ID of managed topic.

depth

Type: [Integer](#)

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If `depth` isn't specified, it defaults to 1.

Return Value

Type: [ConnectApi.ManagedTopic](#)

getManagedTopics (communityId)

Returns the managed topics for the community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics (String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ManagedTopicCollection](#)

getManagedTopics (communityId, managedTopicType)

Returns managed topics of a specified type for the community.

API Version

32.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics (String communityId,  
ConnectApi.ManagedTopicType managedTopicType)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specifies the type of managed topic.

- **Featured**—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- **Navigational**—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a **Featured** topic and a **Navigational** topic.

Return Value

Type: [ConnectApi.ManagedTopicCollection](#)

getManagedTopics (communityId, managedTopicType, depth)

Returns managed topics of a specified type, including their parent and children managed topics, in a community.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics (String communityId,
ConnectApi.ManagedTopicType managedTopicType, Integer depth)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specifies the type of managed topic.

- **Featured**—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- **Navigational**—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a **Featured** topic and a **Navigational** topic.

depth

Type: [Integer](#)

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If `depth` isn't specified, it defaults to 1.

Return Value

Type: [ConnectApi.ManagedTopicCollection](#)

getManagedTopics (communityId, managedTopicType, recordId, depth)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with a given topic in a community.

API Version

35.0–37.0

 **Important:** In version 38.0 and later, use `getManagedTopics (communityId, managedTopicType, recordIds, depth)`.

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics (String communityId,
ConnectApi.ManagedTopicType managedTopicType, String recordId, Integer depth)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specifies the type of managed topic.

- **Featured**—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- **Navigational**—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a **Featured** topic and a **Navigational** topic.

recordId

Type: [String](#)

ID of the topic associated with the managed topics.

depth

Type: [Integer](#)

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If `depth` isn't specified, it defaults to 1.

Return Value

Type: [ConnectApi.ManagedTopicCollection](#)

getManagedTopics(communityId, managedTopicType, recordIds, depth)

Returns managed topics of a specified type, including their parent and children managed topics, that are associated with topics in a community.

API Version

38.0

Available to Guest Users

38.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection getManagedTopics(String communityId,
ConnectApi.ManagedTopicType managedTopicType, List<String> recordIds, Integer depth)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

managedTopicType

Type: [ConnectApi.ManagedTopicType](#)

Specifies the type of managed topic.

- `Featured`—Topics that are featured, for example, on the community home page, but don't provide overall navigation.
- `Navigational`—Topics that display in a navigational menu in the community.

A topic can be associated with up to two managed topic types, so a topic can be both a `Featured` topic and a `Navigational` topic.

recordIds

Type: [List<String>](#)

A list of up to 100 topic IDs associated with the managed topics.

If you list more than 10 topic IDs, you can't specify 2 or 3 for *depth*.

depth

Type: [Integer](#)

Specify an integer 1–3. If you specify 1, the `children` property of the `ConnectApi.ManagedTopic` output class is `null`. If you specify 2, the `children` property of the `ConnectApi.ManagedTopic` output class contains the direct children

managed topics, if any, of the managed topic. If you specify 3, you get the direct children managed topics and their children managed topics if there are any. If depth isn't specified, it defaults to 1.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

reorderManagedTopics (communityId, managedTopicPositionCollection)

Reorders the relative positions of managed topics in a community.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.ManagedTopicCollection reorderManagedTopics (String communityId,
ConnectApi.ManagedTopicPositionCollectionInput managedTopicPositionCollection)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

managedTopicPositionCollection

Type: `ConnectApi.ManagedTopicPositionCollectionInput`

A collection of relative positions of managed topics. This collection can include `Featured` and `Navigational` managed topics and doesn't have to include all managed topics.

Return Value

Type: `ConnectApi.ManagedTopicCollection`

Usage

Only community managers (users with the `Create and Set Up Communities` or `Manage Communities` permission) can reorder managed topics.

You can reorder parent managed topics or children managed topics with the same parent. If you don't include all managed topics in the `ConnectApi.ManagedTopicPositionCollectionInput`, the managed topics are reordered by respecting the positions indicated in the `ConnectApi.ManagedTopicPositionCollectionInput` and then by pushing down any managed topics that aren't included in the `ConnectApi.ManagedTopicPositionCollectionInput` to the next available position.

Example

If you have these managed topics:

Managed Topic	Position
ManagedTopicA	0
ManagedTopicB	1
ManagedTopicC	2
ManagedTopicD	3
ManagedTopicE	4

And you reorder managed topics by including this information in `ConnectApi.ManagedTopicPositionCollectionInput`:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicE	2

The result is:

Managed Topic	Position
ManagedTopicD	0
ManagedTopicA	1
ManagedTopicE	2
ManagedTopicB	3
ManagedTopicC	4

Mentions Class

Access information about mentions. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

Namespace

[ConnectApi](#)

Mentions Methods

The following are methods for `Mentions`. All methods are static.

IN THIS SECTION:

[getMentionCompletions\(communityId, q, contextId\)](#)

Returns the first page of possible users and groups to mention in a feed item body or comment body. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

[getMentionCompletions\(communityId, q, contextId, type, pageParam, pageSize\)](#)

Returns the specified page number of mention proposals of the specified mention completion type: All, User, or Group. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

[getMentionValidations\(communityId, parentId, recordIds, visibility\)](#)

Information about whether the specified mentions are valid for the context user.

getMentionCompletions(communityId, q, contextId)

Returns the first page of possible users and groups to mention in a feed item body or comment body. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.MentionCompletionPage getMentionCompletions (String communityId,
String q, String contextId)
```

Parameters

*communityId*Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

*q*Type: [String](#)

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

*contextId*Type: [String](#)

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

Return Value

Type: [ConnectApi.MentionCompletionPage](#)

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetMentionCompletions\(communityId, q, contextId, result\)](#)

[Testing ConnectApi Code](#)

getMentionCompletions(communityId, q, contextId, type, pageParam, pageSize)

Returns the specified page number of mention proposals of the specified mention completion type: All, User, or Group. A mention is an "@" character followed by a user or group name. When a user or group is mentioned, they receive a notification.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionCompletions (String communityId, String q,
String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer
pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId

Type: [String](#)

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type

Type: [ConnectApi.MentionCompletionType](#)

Specifies the type of mention completion:

- `All`—All mention completions, regardless of the type of record to which the mention refers.

- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam

Type: [String](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [String](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.MentionCompletionPage](#)

Usage

Call this method to generate a page of proposed mentions that a user can choose from when they enter characters in a feed item body or a comment body.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetMentionCompletions\(communityId, q, contextId, type, pageParam, pageSize, result\)](#)

[Testing ConnectApi Code](#)

`getMentionValidations(communityId, parentId, recordIds, visibility)`

Information about whether the specified mentions are valid for the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Mentions getMentionValidations(String communityId, String
parentId, List<String> recordIds, ConnectApi.FeedItemVisibilityType visibility)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

parentId

Type: [String](#)

The feed item parent ID.

recordIds

Type: List<[String](#)>

A comma separated list of IDs to be mentioned. The maximum value is 25.

visibility

Type: [ConnectApi.FeedItemVisibilityType](#)

Specifies the type of users who can see a feed item.

- [AllUsers](#)—Visibility is not limited to internal users.
- [InternalUsers](#)—Visibility is limited to internal users.

Return Value

Type: [ConnectApi.MentionValidations](#)

Usage

Call this method to check whether the record IDs returned from a call to `ConnectApi.Mentions.getMentionCompletions` are valid for the context user. For example, the context user can't mention private groups he doesn't belong to. If such a group were included in the list of mention validations, the `ConnectApi.MentionValidations.hasErrors` property would be `true` and the group would have a `ConnectApi.MentionValidation.validationStatus` of `Disallowed`.

Mentions Test Methods

The following are the test methods for `Mentions`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestGetMentionCompletions(*communityId*, *q*, *contextId*, *result*)

Registers a `ConnectApi.MentionCompletionPage` object to be returned when `getMentionCompletions(String, String, String)` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

*q*Type: [String](#)

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

*contextId*Type: [String](#)

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

*result*Type: [ConnectApi.MentionCompletionPage](#)

A [ConnectApi.MentionCompletionPage](#) object containing test data.

Return Value

Type: Void

SEE ALSO:

[getMentionCompletions\(communityId, q, contextId\)](#)

[Testing ConnectApi Code](#)

setTestGetMentionCompletions(communityId, q, contextId, type, pageParam, pageSize, result)

Registers a [ConnectApi.MentionCompletionPage](#) object to be returned when [getMentionCompletions\(String, String, String, ConnectApi.MentionCompletionType, Integer, Integer\)](#) is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetMentionCompletions (String communityId, String q, String contextId, ConnectApi.MentionCompletionType type, Integer pageParam, Integer pageSize, ConnectApi.MentionCompletionPage result)
```

Parameters

*communityId*Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

*q*Type: [String](#)

A search term for matching user and group names. Searching for a group requires a minimum of 2 characters. Searching for a user doesn't require a minimum number of characters. This parameter does not support wildcards.

contextId

Type: [String](#)

A feed item ID (for a mention in a comment) or a feed subject ID (for a mention in a feed item) that narrows search results, with more useful results listed first. Use a group ID for groups that allow customers to ensure mention completion results include customers.

type

Type: [ConnectApi.MentionCompletionType](#)

Specifies the type of mention completion:

- `All`—All mention completions, regardless of the type of record to which the mention refers.
- `Group`—Mention completions for groups.
- `User`—Mention completions for users.

pageParam

Type: [String](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [String](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.MentionCompletionPage](#)

A `ConnectApi.MentionCompletionPage` object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getMentionCompletions\(communityId, q, contextId, type, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

Organization Class

Access information about an organization.

Namespace

[ConnectApi](#)

This is the static method of the `Organization` class:

Organization Methods

The following are methods for `Organization`. All methods are static.

IN THIS SECTION:

[getSettings\(\)](#)

Returns information about the organization and context user, including which features are enabled.

getSettings ()

Returns information about the organization and context user, including which features are enabled.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.OrganizationSettings getSettings()
```

Return Value

Type: [ConnectApi.OrganizationSettings](#)

QuestionAndAnswers Class

Access question and answers suggestions.

Namespace

[ConnectApi](#)

IN THIS SECTION:

[QuestionAndAnswers Methods](#)

QuestionAndAnswers Methods

The following are methods for `QuestionAndAnswers`. All methods are static.

IN THIS SECTION:

[getSuggestions\(communityId, q, subjectId, includeArticles, maxResults\)](#)

Returns question and answers suggestions.

[setTestGetSuggestions\(communityId, q, subjectId, includeArticles, maxResults, result\)](#)

Registers a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. You must use the method with the same parameters or the code throws an exception.

[updateQuestionAndAnswers\(communityId, feedElementId, questionAndAnswersCapability\)](#)

Choose or change the best answer for a question.

getSuggestions(communityId, q, subjectId, includeArticles, maxResults)

Returns question and answers suggestions.

API Version

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.QuestionAndAnswersSuggestions getSuggestions(String communityId,
String q, String subjectId, Boolean includeArticles, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

subjectId

Type: [String](#)

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles

Type: [Boolean](#)

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults

Type: [Integer](#)

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

Return Value

Type: [ConnectApi.QuestionAndAnswersSuggestions](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetSuggestions\(communityId, q, subjectId, includeArticles, maxResults, result\)](#)

[Testing ConnectApi Code](#)

setTestGetSuggestions(communityId, q, subjectId, includeArticles, maxResults, result)

Registers a `ConnectApi.QuestionAndAnswersSuggestions` object to be returned when `getSuggestions` is called with matching parameters in a test context. You must use the method with the same parameters or the code throws an exception.

API Version

32.0

Signature

```
public static Void setTestGetSuggestions(String communityId, String q, String subjectId, Boolean includeArticles, Integer maxResults, ConnectApi.QuestionAndAnswersSuggestions result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Required and cannot be `null`. Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

subjectId

Type: [String](#)

Specify a subject ID to search only questions on that object. If the ID is a topic or a user, the ID is ignored.

includeArticles

Type: [Boolean](#)

Specify `true` to include knowledge articles in the search results. To return only questions, specify `false`.

maxResults

Type: [Integer](#)

The maximum number of results to return for each type of item. Possible values are 1–10. The default value is 5.

result

Type: [ConnectApi.QuestionAndAnswersSuggestions](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getSuggestions\(communityId, q, subjectId, includeArticles, maxResults\)](#)

[Testing ConnectApi Code](#)

updateQuestionAndAnswers (communityId, feedElementId, questionAndAnswersCapability)

Choose or change the best answer for a question.

API Version

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.QuestionAndAnswersCapability updateQuestionAndAnswers(String
communityId, String feedElementId, ConnectApi.QuestionAndAnswersCapabilityInput
questionAndAnswersCapability)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

feedElementId

Type: [String](#)

The ID for a feed element.

questionAndAnswersCapability

Type: [ConnectApi.QuestionAndAnswersCapabilityInput](#)

Specify the best answer (comment ID) for the question.

Return Value

Type: [ConnectApi.QuestionAndAnswersCapability](#)

If the feed element doesn't support this capability, the return value is [ConnectApi.NotFoundException](#).

Example

```
ConnectApi.QuestionAndAnswersCapabilityInput qaInput = new
ConnectApi.QuestionAndAnswersCapabilityInput();
qaInput.bestAnswerId = '0D7D00000001MAKAY';
```

```
ConnectApi.QuestionAndAnswersCapability qa =  
ConnectApi.QuestionAndAnswers.updateQuestionAndAnswers(null, '0D5D0000000XZjJ', qaInput);
```

Recommendations Class

Access information about recommendations and reject recommendations. Also create, delete, get, and update recommendation audiences, recommendation definitions, and scheduled recommendations.

Namespace

[ConnectApi](#)

Recommendations Methods

The following are methods for `Recommendations`. All methods are static.

IN THIS SECTION:

[createRecommendationAudience\(communityId, recommendationAudience\)](#)

Create an audience for a recommendation.

[createRecommendationAudience\(communityId, name\)](#)

Create an audience for a recommendation.

[createRecommendationDefinition\(communityId, recommendationDefinition\)](#)

Create a recommendation definition.

[createRecommendationDefinition\(communityId, name, title, actionUrl, actionUrlName, explanation\)](#)

Create a recommendation definition with the specified parameters.

[createScheduledRecommendation\(communityId, scheduledRecommendation\)](#)

Create a scheduled recommendation.

[createScheduledRecommendation\(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId\)](#)

Create a scheduled recommendation with the specified parameters.

[createScheduledRecommendation\(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel\)](#)

Create a scheduled recommendation with the specified parameters.

[deleteRecommendationAudience\(communityId, recommendationAudienceId\)](#)

Delete a recommendation audience.

[deleteRecommendationDefinition\(communityId, recommendationDefinitionId\)](#)

Delete a recommendation definition.

[deleteRecommendationDefinitionPhoto\(communityId, recommendationDefinitionId\)](#)

Delete a recommendation definition photo.

[deleteScheduledRecommendation\(communityId, scheduledRecommendationId, deleteDefinitionIfLast\)](#)

Delete a scheduled recommendation.

[getRecommendationAudience\(communityId, recommendationAudienceId\)](#)

Get information about a recommendation audience.

[getRecommendationAudienceMembership\(communityId, recommendationAudienceId\)](#)

Get the members of a recommendation audience.

[getRecommendationAudienceMembership\(communityId, recommendationAudienceId, pageParam, pageSize\)](#)

Get a page of recommendation audience members.

[getRecommendationAudiences\(communityId\)](#)

Get recommendation audiences.

[getRecommendationAudiences\(communityId, pageParam, pageSize\)](#)

Get a page of recommendation audiences.

[getRecommendationDefinition\(communityId, recommendationDefinitionId\)](#)

Get a recommendation definition.

[getRecommendationDefinitionPhoto\(communityId, recommendationDefinitionId\)](#)

Get a recommendation definition photo.

[getRecommendationDefinitions\(communityId\)](#)

Get recommendation definitions.

[getRecommendationForUser\(communityId, userId, action, objectId\)](#)

Returns the recommendation for the context user for the specified action and object ID.

[getRecommendationsForUser\(communityId, userId, contextAction, contextObjectId, maxResults\)](#)

Returns the user, group, file, record, custom, and static recommendations for the context user.

[getRecommendationsForUser\(communityId, userId, contextAction, contextObjectId, channel, maxResults\)](#)

Returns the user, group, file, article, record, topic, custom, and static recommendations for the context user.

[getRecommendationsForUser\(communityId, userId, action, contextAction, contextObjectId, maxResults\)](#)

Returns the recommendations for the context user for the specified action.

[getRecommendationsForUser\(communityId, userId, action, contextAction, contextObjectId, channel, maxResults\)](#)

Returns the recommendations for the context user for the specified action.

[getRecommendationsForUser\(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults\)](#)

Returns the recommendations for the context user for the specified action and object category.

[getRecommendationsForUser\(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults\)](#)

Returns the recommendations for the context user for the specified action and object category.

[getScheduledRecommendation\(communityId, scheduledRecommendationId\)](#)

Get a scheduled recommendation.

[getScheduledRecommendations\(communityId\)](#)

Get scheduled recommendations.

[getScheduledRecommendations\(communityId, channel\)](#)

Get scheduled recommendations.

[rejectRecommendationForUser\(communityId, userId, action, objectId\)](#)

Rejects the recommendation for the context user for the specified action and object ID.

[rejectRecommendationForUser\(communityId, userId, action, objectEnum\)](#)

Rejects the static recommendation for the context user.

[updateRecommendationAudience\(communityId, recommendationAudienceId, recommendationAudience\)](#)

Update a recommendation audience.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)`

Update a recommendation definition with the specified parameters.

`updateRecommendationDefinition(communityId, recommendationDefinitionId, recommendationDefinition)`

Update a recommendation definition.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileUpload)`

Update a recommendation definition photo with a file that hasn't been uploaded.

`updateRecommendationDefinitionPhoto(communityId, recommendationDefinitionId, fileId, versionNumber)`

Update a recommendation definition photo with a file that's already uploaded.

`updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo)`

Update a recommendation definition photo with a file that's been uploaded but requires cropping.

`updateRecommendationDefinitionPhotoWithAttributes(communityId, recommendationDefinitionId, photo, fileUpload)`

Update a recommendation definition photo with a file that hasn't been uploaded and requires cropping.

`updateScheduledRecommendation(communityId, scheduledRecommendationId, scheduledRecommendation)`

Update a scheduled recommendation.

`updateScheduledRecommendation(communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)`

Update a scheduled recommendation with the specified parameters.

`createRecommendationAudience(communityId, recommendationAudience)`

Create an audience for a recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String
communityId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

recommendationAudience

Type: `ConnectApi.RecommendationAudienceInput`

A `ConnectApi.RecommendationAudienceInput` object.

Return Value

Type: `ConnectApi.RecommendationAudience`

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

createRecommendationAudience(*communityId*, *name*)

Create an audience for a recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience createRecommendationAudience(String communityId, String name)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

name

Type: [String](#)

The name of the audience.

Return Value

Type: [ConnectApi.RecommendationAudience](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

createRecommendationDefinition(*communityId*, *recommendationDefinition*)

Create a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinition

Type: [ConnectApi.RecommendationDefinitionInput](#)

A `ConnectApi.RecommendationDefinitionInput` object.

Return Value

Type: [ConnectApi.RecommendationDefinition](#)

Usage

Recommendation definitions allow you to create custom recommendations that appear in communities, encouraging users to watch videos, take training and more.

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

These recommendations appear by default on the Customer Service (Napili) template. Specifically, on the community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

```
createRecommendationDefinition(communityId, name, title, actionUrl, actionUrlName, explanation)
```

Create a recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition createRecommendationDefinition(String communityId, String name, String title, String actionUrl, String actionUrlName, String explanation)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

name

Type: [String](#)

The name of the recommendation definition. The name is displayed in Setup.

title

Type: [String](#)

The title of the recommendation definition.

actionUrl

Type: [String](#)

The URL for acting on the recommendation, for example, the URL to join a group.

actionUrlName

Type: [String](#)

The text label for the action URL in the user interface, for example, "Launch."

explanation

Type: [String](#)

The explanation, or body, of the recommendation.

Return Value

Type: [ConnectApi.RecommendationDefinition](#)

Usage

Recommendation definitions allow you to create custom recommendations that appear in communities, encouraging users to watch videos, take training and more.

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

These recommendations appear by default on the Customer Service (Napili) template. Specifically, on the community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

createScheduledRecommendation (communityId, scheduledRecommendation)

Create a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String
communityId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendation

Type: [ConnectApi.ScheduledRecommendationInput](#)

A [ConnectApi.ScheduledRecommendationInput](#) object.

Return Value

Type: [ConnectApi.ScheduledRecommendation](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

```
createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled,
recommendationAudienceId)
```

Create a scheduled recommendation with the specified parameters.

API Version

35.0 only

 **Important:** In version 36.0 and later, use [createScheduledRecommendation](#) ([communityId](#), [recommendationDefinitionId](#), [rank](#), [enabled](#), [recommendationAudienceId](#), [channel](#)).

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String recommendationAudienceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

rank

Type: [Integer](#)

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See [Ranking scheduled recommendations example](#).

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled

Type: [Boolean](#)

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId

Type: [String](#)

ID of the recommendation definition that this scheduled recommendation schedules.

Return Value

Type: [ConnectApi.ScheduledRecommendation](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

createScheduledRecommendation(communityId, recommendationDefinitionId, rank, enabled, recommendationAudienceId, channel)

Create a scheduled recommendation with the specified parameters.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation createScheduledRecommendation(String
communityId, String recommendationDefinitionId, Integer rank, Boolean enabled, String
recommendationAudienceId, ConnectApi.RecommendationChannel channel)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

rank

Type: [Integer](#)

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See [Ranking scheduled recommendations example](#).

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled

Type: [Boolean](#)

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId

Type: [String](#)

ID of the recommendation definition that this scheduled recommendation schedules.

channel

Type: [ConnectApi.RecommendationChannel](#)

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

Use these channel values; you can't rename or create other channels.

Return Value

Type: [ConnectApi.ScheduledRecommendation](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

deleteRecommendationAudience (communityId, recommendationAudienceId)

Delete a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static void deleteRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId

Type: [String](#)

ID of the recommendation audience.

Return Value

Type: `void`

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

deleteRecommendationDefinition(*communityId*, *recommendationDefinitionId*)

Delete a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static void deleteRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

Return Value

Type: Void

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`deleteRecommendationDefinitionPhoto`(**`communityId`**, **`recommendationDefinitionId`**)

Delete a recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static Void deleteRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

Return Value

Type: Void

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`deleteScheduledRecommendation`(**`communityId`**, **`scheduledRecommendationId`**, **`deleteDefinitionIfLast`**)

Delete a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static void deleteScheduledRecommendation(String communityId, String
scheduledRecommendationId, Boolean deleteDefinitionIfLast)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendationId

Type: [String](#)

ID of the scheduled recommendation.

deleteDefinitionIfLast

Type: [Boolean](#)

If `true` and if this is the last scheduled recommendation of a recommendation definition, deletes the recommendation definition. Default is `false`.

Return Value

Type: `Void`

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Deleting a scheduled recommendation is comparable to a deletion in an ordered list. All scheduled recommendations after the deleted scheduled recommendation receive a new, higher rank automatically.

`getRecommendationAudience (communityId, recommendationAudienceId)`

Get information about a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience getRecommendationAudience(String communityId, String recommendationAudienceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId

Type: [String](#)

ID of the recommendation audience.

Return Value

Type: [ConnectApi.RecommendationAudience](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationAudienceMembership(*communityId*, *recommendationAudienceId*)

Get the members of a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId

Type: [String](#)

ID of the recommendation audience.

Return Value

Type: [ConnectApi.UserReferencePage](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationAudienceMembership(*communityId*, *recommendationAudienceId*, *pageParam*, *pageSize*)

Get a page of recommendation audience members.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.UserReferencePage getRecommendationAudienceMembership(String communityId, String recommendationAudienceId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId

Type: [String](#)

ID of the recommendation audience.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of members per page.

Return Value

Type: [ConnectApi.UserReferencePage](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationAudiences (communityId)

Get recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.RecommendationAudiencePage](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationAudiences (communityId, pageParam, pageSize)

Get a page of recommendation audiences.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudiencePage getRecommendationAudiences(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of audiences per page.

Return Value

Type: [ConnectApi.RecommendationAudiencePage](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationDefinition(*communityId*, *recommendationDefinitionId*)

Get a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition getRecommendationDefinition(String communityId, String recommendationDefinitionId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

Return Value

Type: [ConnectApi.RecommendationDefinition](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationDefinitionPhoto(*communityId*, *recommendationDefinitionId*)

Get a recommendation definition photo.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo getRecommendationDefinitionPhoto(String communityId,  
String recommendationDefinitionId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationDefinitions (communityId)

Get recommendation definitions.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinitionPage getRecommendationDefinitions (String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.RecommendationDefinitionPage](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

getRecommendationForUser (communityId, userId, action, objectId)

Returns the recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationForUser (String communityId, String userId, ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId

Type: [String](#)

Specifies the object to take action on.

- If *action* is `follow`, *objectId* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *action* is `join`, *objectId* is a group ID.
- If *action* is `view`, *objectId* is a user ID, file ID, group ID, record ID, custom recommendation ID (version 34.0 and later), the enum `Today` for static recommendations (version 35.0 and later), or an article ID (version 37.0 and later).

Return Value

Type: [ConnectApi.RecommendationCollection](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetRecommendationForUser\(communityId, userId, action, objectId, result\)](#)

[Testing ConnectApi Code](#)

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults)`

Returns the user, group, file, record, custom, and static recommendations for the context user.

API Version

33.0–35.0

 **Important:** In version 36.0 and later, use [getRecommendationsForUser\(communityId, userId, contextAction, contextObjectId, channel, maxResults\)](#).

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String communityId, String userId, ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: [ConnectApi.RecommendationCollection](#)

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `contextAction`, `contextObjectId`, `maxResults`, `result`\)](#)

[Testing ConnectApi Code](#)

`getRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults)`

Returns the user, group, file, article, record, topic, custom, and static recommendations for the context user.

API Version

36.0

Available to Guest Users

38.0

 **Note:** Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

contextAction

Type: [ConnectApi.RecommendationActionType](#)

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: [ConnectApi.RecommendationChannel](#)

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel11`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel12`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel13`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel14`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel15`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.

- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: [ConnectApi.RecommendationCollection](#)

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

[Testing ConnectApi Code](#)

`getRecommendationsForUser(communityId, userId, action, contextAction, contextObjectId, maxResults)`

Returns the recommendations for the context user for the specified action.

API Version

33.0–35.0

! **Important:** In version 36.0 and later, use `getRecommendationsForUser` (`communityId`, `userId`, `action`, `contextAction`, `contextObjectId`, `channel`, `maxResults`).

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: `String`

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use `contextAction` and `contextObjectId` together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

`maxResults`

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: [ConnectApi.RecommendationCollection](#)

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use `contextAction` and `contextObjectId` together. For example, if you just followed Pam, you specify `follow` for `contextAction` and Pam's user ID for `contextObjectId`.

This method only recommends users who are followed by people who follow Pam. In this example, John follows Pam so the method returns a recommendation for you to follow Suzanne since John also follows Suzanne.

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Available to Guest Users

38.0

Note: Only article and file recommendations are available to guest users.

Requires Chatter

Yes

Signature

```
public static ConnectApi.RecommendationCollection getRecommendationsForUser(String
communityId, String userId, ConnectApi.RecommendationActionType action,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is *follow*, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is *view*, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

objectCategory, ConnectApi.RecommendationActionType contextAction, String
contextObjectId, ConnectApi.RecommendationChannel channel, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory

Type: [String](#)

- If *action* is `follow`, *objectCategory* is `users`, `files`, `topics`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0T0` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 37.0 and later).

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: [ConnectApi.RecommendationChannel](#)

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

Return Value

Type: [ConnectApi.RecommendationCollection](#)

Usage

If you want to get recommendations based on a recent action performed, such as following a user, use *contextAction* and *contextObjectId* together. For example, if you just followed Pam, you specify `follow` for *contextAction* and Pam's user ID for *contextObjectId*.

Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

rejectRecommendationForUser(*communityId*, *userId*, *action*, *objectId*)

Rejects the recommendation for the context user for the specified action and object ID.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation. Supported values are:

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId

Type: [String](#)

Specifies the object to take action on.

- If *action* is `follow`, *objectId* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *action* is `join`, *objectId* is a group ID.
- If *action* is `view`, *objectId* is a custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

Return Value

Type: `Void`

rejectRecommendationForUser(*communityId*, *userId*, *action*, *objectEnum*)

Rejects the static recommendation for the context user.

API Version

34.0

Requires Chatter

Yes

Signature

```
public static rejectRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendedObjectType objectEnum)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: [ConnectApi.RecommendationActionType](#)

Specifies the action to take on a recommendation. Supported values are:

- `view`—View a static recommendation.

objectEnum

Type: [ConnectApi.RecommendedObjectType](#)

Specifies the object type to take action on.

- `Today`—Static recommendations that don't have an ID, for example, the Today app recommendation.

Return Value

Type: `Void`

```
updateRecommendationAudience(communityId, recommendationAudienceId,
recommendationAudience)
```

Update a recommendation audience.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationAudience updateRecommendationAudience(String communityId, String recommendationAudienceId, ConnectApi.RecommendationAudienceInput recommendationAudience)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationAudienceId

Type: [String](#)

ID of the recommendation audience.

recommendationAudience

Type: [ConnectApi.RecommendationAudienceInput](#)

A [ConnectApi.RecommendationAudienceInput](#) object.

Return Value

Type: [ConnectApi.RecommendationAudience](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

```
updateRecommendationDefinition(communityId, recommendationDefinitionId, name, title, actionUrl, actionUrlName, explanation)
```

Update a recommendation definition with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, String name, String title, String actionUrl, String actionUrlName, String explanation recommendationDefinition)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

name

Type: [String](#)

The name of the recommendation definition. The name is displayed in Setup.

title

Type: [String](#)

The title of the recommendation definition.

actionUrl

Type: [String](#)

The URL for acting on the recommendation, for example, the URL to join a group.

actionUrlName

Type: [String](#)

The text label for the action URL in the user interface, for example, "Launch."

explanation

Type: [String](#)

The explanation, or body, of the recommendation.

Return Value

Type: [ConnectApi.RecommendationDefinition](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

`updateRecommendationDefinition`(`communityId`, `recommendationDefinitionId`, `recommendationDefinition`)

Update a recommendation definition.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.RecommendationDefinition updateRecommendationDefinition(String communityId, String recommendationDefinitionId, ConnectApi.RecommendationDefinitionInput recommendationDefinition)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

recommendationDefinition

Type: [ConnectApi.RecommendationDefinitionInput](#)

A `ConnectApi.RecommendationDefinitionInput` object containing the properties to update.

Return Value

Type: [ConnectApi.RecommendationDefinition](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhoto(*communityId*, *recommendationDefinitionId*, *fileUpload*)

Update a recommendation definition photo with a file that hasn't been uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId, String recommendationDefinitionId, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhoto(*communityId*, *recommendationDefinitionId*, *fileId*, *versionNumber*)

Update a recommendation definition photo with a file that's already uploaded.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhoto(String communityId,
String recommendationDefinitionId, String fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

fileId

Type: [String](#)

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber

Type: [Integer](#)

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhotoWithAttributes (communityId, recommendationDefinitionId, photo)

Update a recommendation definition photo with a file that's been uploaded but requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

photo

Type: [ConnectApi.PhotoInput](#)

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateRecommendationDefinitionPhotoWithAttributes (communityId, recommendationDefinitionId, photo, fileUpload)

Update a recommendation definition photo with a file that hasn't been uploaded and requires cropping.

API Version

35.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.Photo updateRecommendationDefinitionPhotoWithAttributes(String communityId, String recommendationDefinitionId, ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recommendationDefinitionId

Type: [String](#)

ID of the recommendation definition.

photo

Type: [ConnectApi.PhotoInput](#)

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

updateScheduledRecommendation(*communityId*, *scheduledRecommendationId*, *scheduledRecommendation*)

Update a scheduled recommendation.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String communityId, String scheduledRecommendationId, ConnectApi.ScheduledRecommendationInput scheduledRecommendation)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendationId

Type: [String](#)

ID of the scheduled recommendation.

scheduledRecommendation

Type: [ConnectApi.ScheduledRecommendationInput](#)

A `ConnectApi.ScheduledRecommendationInput` object containing the properties to update.

Return Value

Type: [ConnectApi.ScheduledRecommendation](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

updateScheduledRecommendation (communityId, scheduledRecommendationId, rank, enabled, recommendationAudienceId)

Update a scheduled recommendation with the specified parameters.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.ScheduledRecommendation updateScheduledRecommendation(String
communityId, String scheduledRecommendationId, Integer rank, Boolean enabled, String
recommendationAudienceId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

scheduledRecommendationId

Type: [String](#)

ID of the scheduled recommendation.

rank

Type: [Integer](#)

Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.

Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the `rank`. The `rank` of all the scheduled recommendations after it is pushed down. See [Ranking scheduled recommendations example](#).

If the specified `rank` is larger than the size of the list, the scheduled recommendation is put at the end of the list. The `rank` of the scheduled recommendation is the size of the list, instead of the one specified.

If a `rank` is not specified, the scheduled recommendation is put at the end of the list.

enabled

Type: [Boolean](#)

Indicates whether scheduling is enabled. If `true`, the recommendation is enabled and appears in communities. If `false`, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.

recommendationAudienceId

Type: [String](#)

ID of the recommendation definition that this scheduled recommendation schedules.

Return Value

Type: [ConnectApi.ScheduledRecommendation](#)

Usage

Community managers (users with the Create and Set Up Communities or Manage Communities permission) can access, create, and delete audiences, definitions, and schedules for community recommendations. Users with the Modify All Data permission can also access, create, and delete recommendation audiences, recommendation definitions, and scheduled recommendations.

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

Recommendations Test Methods

The following are the test methods for `Recommendations`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

IN THIS SECTION:

[setTestGetRecommendationForUser\(`communityId`, `userId`, `action`, `objectId`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `contextAction`, `contextObjectId`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `contextAction`, `contextObjectId`, `channel`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `action`, `contextAction`, `contextObjectId`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `action`, `contextAction`, `contextObjectId`, `channel`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `action`, `objectCategory`, `contextAction`, `contextObjectId`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

[setTestGetRecommendationsForUser\(`communityId`, `userId`, `action`, `objectCategory`, `contextAction`, `contextObjectId`, `channel`, `maxResults`, `result`\)](#)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

setTestGetRecommendationForUser(*communityId*, *userId*, *action*, *objectId*, *result*)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0

Requires Chatter

Yes

Signature

```
public static void setTestGetRecommendationForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectId,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectId

Type: [String](#)

Specifies the object to take action on.

- If *action* is `follow`, *objectId* is a user ID, file ID, record ID, or topic ID (version 36.0 and later).
- If *action* is `join`, *objectId* is a group ID.
- If *action* is `view`, *objectId* is a user ID, file ID, group ID, record ID, custom recommendation ID, the enum `Today` for static recommendations, or an article ID (version 37.0 and later).

result

Type: `ConnectApi.RecommendationCollection`

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRecommendationForUser\(communityId, userId, action, objectId\)](#)

[Testing ConnectApi Code](#)

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

 **Important:** In version 36.0 and later, use `setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)`.

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for the context user or the keyword `me`.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is *follow*, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is *view*, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

Type: [ConnectApi.RecommendationCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRecommendationsForUser\(communityId, userId, contextAction, contextObjectId, maxResults\)](#)

[Testing ConnectApi Code](#)

setTestGetRecommendationsForUser(communityId, userId, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

channel

Type: `ConnectApi.RecommendationChannel`

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel11`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel12`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel13`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel14`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel15`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

Type: [ConnectApi.RecommendationCollection](#)

The object containing test data.

Return Value

Type: Void

```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: [ConnectApi.RecommendationActionType](#)

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: `String`

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed.

If you don't want recommendations based on a recent action, specify `null`.

maxResults

Type: `Integer`

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

public static void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, ConnectApi.RecommendationActionType
contextAction, String contextObjectId, ConnectApi.RecommendationChannel channel, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: [ConnectApi.RecommendationChannel](#)

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel1`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel2`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel3`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel4`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel5`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

Type: [ConnectApi.RecommendationCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRecommendationsForUser\(communityId, userId, action, contextAction, contextObjectId, channel, maxResults\)](#)

[Testing ConnectApi Code](#)

`setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults, result)`

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

33.0–35.0

 **Important:** In version 36.0 and later, use `setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)`.

Requires Chatter

Yes

Signature

```
public static void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId, Integer
maxResults, ConnectApi.RecommendationCollection result)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for the context user or the keyword `me`.

action

Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

objectCategory

Type: `String`

- If *action* is `follow`, *objectCategory* is `users`, `files`, or `records`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, or `apps`.

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `ORD` (custom recommendations), `T` (static recommendations), or `001` (accounts), for example.

contextAction

Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

contextObjectId

Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is follow, *contextObjectId* is a user ID, file ID, or record ID.
- If *contextAction* is view, *contextObjectId* is a user ID, file ID, group ID, or record ID.

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

Type: [ConnectApi.RecommendationCollection](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRecommendationsForUser\(communityId, userId, action, objectCategory, contextAction, contextObjectId, maxResults\)](#)

[Testing ConnectApi Code](#)

setTestGetRecommendationsForUser(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults, result)

Registers a `ConnectApi.RecommendationCollection` object to be returned when `getRecommendationsForUser` is called with matching parameters in a test context. Use the method with the same parameters or the code throws an exception.

API Version

36.0

Requires Chatter

Yes

Signature

```
public static Void setTestGetRecommendationsForUser(String communityId, String userId,
ConnectApi.RecommendationActionType action, String objectCategory,
ConnectApi.RecommendationActionType contextAction, String contextObjectId,
ConnectApi.RecommendationChannel channel, Integer maxResults,
ConnectApi.RecommendationCollection result)
```

Parameters

*communityId*Type: [String](#)Use either the ID for a community, `internal`, or `null`.*userId*Type: [String](#)The ID for the context user or the keyword `me`.*action*Type: `ConnectApi.RecommendationActionType`

Specifies the action to take on a recommendation.

- `follow`—Follow a file, record, topic, or user.
- `join`—Join a group.
- `view`—View a file, group, article, record, user, custom, or static recommendation.

*objectCategory*Type: [String](#)

- If *action* is `follow`, *objectCategory* is `users`, `files`, `records`, or `topics`.
- If *action* is `join`, *objectCategory* is `groups`.
- If *action* is `view`, *objectCategory* is `users`, `files`, `groups`, `records`, `custom`, `apps`, or `articles` (version 37.0 and later).

You can also specify a key prefix, the first three characters of the object ID, as the *objectCategory*. Valid values are:

- If *action* is `follow`, *objectCategory* is `005` (users), `069` (files), `0T0` (topics), or `001` (accounts), for example.
- If *action* is `join`, *objectCategory* is `0F9` (groups).
- If *action* is `view`, *objectCategory* is `005` (users), `069` (files), `0F9` (groups), `0RD` (custom recommendations), `T` (static recommendations), `001` (accounts), or `kA0` (articles), for example, (version 37.0 and later).

*contextAction*Type: `ConnectApi.RecommendationActionType`

Action that the context user just performed. Supported values are:

- `follow`
- `view`

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.*contextObjectId*Type: [String](#)

ID of the object that the context user just performed an action on.

- If *contextAction* is `follow`, *contextObjectId* is a user ID, file ID, record ID, or topic ID.
- If *contextAction* is `view`, *contextObjectId* is a user ID, file ID, group ID, record ID, or article ID (version 37.0 and later).

Use *contextAction* and *contextObjectId* together to get new recommendations based on the action just performed. If you don't want recommendations based on a recent action, specify `null`.

channel

Type: [ConnectApi.RecommendationChannel](#)

Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are:

- `CustomChannel11`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear.
- `CustomChannel12`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel13`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel14`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `CustomChannel15`—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels.
- `DefaultChannel1`—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.

maxResults

Type: [Integer](#)

Maximum number of recommendation results; default is 10. Values must be from 1 to 99.

result

Type: [ConnectApi.RecommendationCollection](#)

The object containing test data.

Return Value

Type: Void

[getRecommendationsForUser\(communityId, userId, action, objectCategory, contextAction, contextObjectId, channel, maxResults\)](#)

[Testing ConnectApi Code](#)

Records Class

Access information about record motifs, which are small icons used to distinguish record types in the Salesforce UI.

Namespace

[ConnectApi](#)

Records Methods

The following are methods for `Records`. All methods are static.

IN THIS SECTION:

[getMotif\(*communityId*, *idOrPrefix*\)](#)

Returns a `Motif` object that contains the URLs for a set of small, medium, and large motif icons for the specified record. It can also contain a base color for the record.

[getMotifBatch\(*communityId*, *idOrPrefixList*\)](#)

Gets a motif for the specified list of objects. Returns a list of `BatchResult` objects containing `ConnectApi.Motif` objects. Returns errors embedded in the results for those users that couldn't be loaded.

getMotif(*communityId*, *idOrPrefix*)

Returns a `Motif` object that contains the URLs for a set of small, medium, and large motif icons for the specified record. It can also contain a base color for the record.

API Version

28.0

Requires Chatter

No

Signature

```
public static ConnectApi.Motif getMotif(String communityId, String idOrPrefix)
```

Parameters

*communityId*Type: `String`Use either the ID for a community, `internal`, or `null`.*idOrPrefix*Type: `String`

An ID or key prefix.

Return Value

Type: `ConnectApi.Motif`

Usage

Each Salesforce record type has its own set of motif icons. See [ConnectApi.Motif](#).

getMotifBatch(*communityId*, *idOrPrefixList*)

Gets a motif for the specified list of objects. Returns a list of `BatchResult` objects containing `ConnectApi.Motif` objects. Returns errors embedded in the results for those users that couldn't be loaded.

API Version

31.0

Requires Chatter

No

Signature

```
public static ConnectApi.BatchResult[] getMotifBatch(String communityId, List<String> idOrPrefixList)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

idOrPrefixList

Type: [List<String>](#)

A list of object IDs or prefixes.

Return Value

Type: [BatchResult\[\]](#)

The `BatchResult.getResults()` method returns a `ConnectApi.Motif` object.

Example

```
String communityId = null;
List<String> prefixIds = new List<String> { '001', '01Z', '069' };

// Get info about the motifs of all records in the list.
ConnectApi.BatchResult[] batchResults = ConnectApi.Records.getMotifBatch(communityId,
prefixIds);

for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the color of each motif.
        ConnectApi.Motif motif;
        if (batchResult.getResult() instanceof ConnectApi.Motif) {
            motif = (ConnectApi.Motif) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(motif.color);
    }

        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

```
}  
}
```

SalesforceInbox Class

Access information about Automated Activity Capture, which is available in Einstein and Salesforce Inbox.

Namespace

[ConnectApi](#)

SalesforceInbox Methods

The following are methods for `SalesforceInbox`. All methods are static.

IN THIS SECTION:

[shareActivity\(activityId, sharingInfo\)](#)

Share specific emails or events with certain groups of users.

shareActivity(activityId, sharingInfo)

Share specific emails or events with certain groups of users.

API Version

39.0

Requires Chatter

No

Signature

```
public static ConnectApi.ActivitySharingResult shareActivity(String activityId,  
ConnectApi.ActivitySharingInput sharingInfo)
```

Parameters

activityId

Type: [String](#)

The ID of the activity.

sharingInfo

Type: [ConnectApi.ActivitySharingInput](#)

A `ConnectApi.ActivitySharingInput` object.

Return Value

Type: [ConnectApi.ActivitySharingResult](#)

Usage

This method is a feature of both Sales Cloud Einstein and Inbox. It lets users connect their email and calendar to Salesforce. Then, their emails and events are automatically added to related Salesforce records. Users can specify who their individual emails and events are shared with.

Topics Class

Access information about topics, such as their descriptions, the number of people talking about them, related topics, and information about groups contributing to the topic. Update a topic's name or description, merge topics, and add and remove topics from records and feed items.

Namespace

[ConnectApi](#)

Topics Methods

The following are methods for `Topics`. All methods are static.

IN THIS SECTION:

[assignTopic\(`communityId`, `recordId`, `topicId`\)](#)

Assigns the specified topic to the specified record or feed item. Only users with the Assign Topics permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

[assignTopicByName\(`communityId`, `recordId`, `topicName`\)](#)

Assigns the specified topic to the specified record or feed item. Only users with the Assign Topics permission can add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

[createTopic\(`communityId`, `name`, `description`\)](#)

Creates a topic. Only users with the Create Topics permission can create a topic.

[createTopicDataCategoryRules\(`communityId`, `dataCategoryGroup`, `dataCategory`, `topicNames`\)](#)

Create topic and article assignment rules by data category.

[deleteTopic\(`communityId`, `topicId`\)](#)

Deletes the specified topic. Only users with the Delete Topics or Modify All Data permission can delete topics.

[getGroupsRecentlyTalkingAboutTopic\(`communityId`, `topicId`\)](#)

Returns information about the five groups that most recently contributed to the specified topic.

[getRecentlyTalkingAboutTopicsForGroup\(`communityId`, `groupId`\)](#)

Returns up to five topics most recently used in the specified group.

[getRecentlyTalkingAboutTopicsForUser\(`communityId`, `userId`\)](#)

Topics recently used by the specified user. Get up to five topics most recently used by the specified user.

[getRelatedTopics\(`communityId`, `topicId`\)](#)

List of five topics most closely related to the specified topic.

[getTopic\(`communityId`, `topicId`\)](#)

Returns information about the specified topic.

[getTopicDataCategoryRules\(communityId, dataCategoryGroup, dataCategory\)](#)

Get topic and article assignment rules by data category.

[getTopics\(communityId, recordId\)](#)

Returns the first page of topics assigned to the specified record or feed item. Administrators must enable topics for objects before users can add topics to records of that object type.

[getTopics\(communityId\)](#)

Returns the first page of topics for the organization.

[getTopics\(communityId, sortParam\)](#)

Returns the first page of topics for the organization in the specified order.

[getTopics\(communityId, pageParam, pageSize\)](#)

Returns the topics for the specified page.

[getTopics\(communityId, pageParam, pageSize, sortParam\)](#)

Returns the topics for the specified page in the specified order.

[getTopics\(communityId, q, sortParam\)](#)

Returns the topics that match the specified search criteria in the specified order.

[getTopics\(communityId, q, pageParam, pageSize\)](#)

Returns the topics that match the specified search criteria for the specified page.

[getTopics\(communityId, q, pageParam, pageSize, sortParam\)](#)

Returns the topics that match the specified search criteria for the specified page in the specified order.

[getTopics\(communityId, q, exactMatch\)](#)

Returns the topic that matches the exact, case-insensitive name.

[getTopicsOrFallBackToRenamedTopics\(communityId, q, exactMatch, fallBackToRenamedTopics\)](#)

If there isn't an exact match, returns the most recent renamed topic match.

[getTopicSuggestions\(communityId, recordId, maxResults\)](#)

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

[getTopicSuggestions\(communityId, recordId\)](#)

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

[getTopicSuggestionsForText\(communityId, text, maxResults\)](#)

Returns suggested topics for the specified string of text.

[getTopicSuggestionsForText\(communityId, text\)](#)

Returns suggested topics for the specified string of text.

[getTrendingTopics\(communityId\)](#)

List of the top five trending topics for the organization.

[getTrendingTopics\(communityId, maxResults\)](#)

List of the top five trending topics for the organization.

[mergeTopics\(communityId, topicId, idsToMerge\)](#)

Merges up to five secondary topics with the specified primary topic.

[reassignTopicDataCategoryRules\(communityId, dataCategoryGroup, dataCategory, topicNames\)](#)

Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

[reassignTopicsByName\(*communityId*, *recordId*, *topicNames*\)](#)

Reassigns all the topics on a record or feed item, that is, removes all the assigned topics on a record or feed item and adds topics. Optionally, provides a list of suggested topics to assign to a record or feed item to improve future topic suggestions. Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

[unassignTopic\(*communityId*, *recordId*, *topicId*\)](#)

Removes the specified topic from the specified record or feed item. Only users with the Assign Topics permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

[updateTopic\(*communityId*, *topicId*, *topic*\)](#)

Updates the description or name of the specified topic or merges up to five secondary topics with the specified primary topic.

[updateTopicsForArticlesInDataCategory\(*communityId*, *dataCategoryGroup*, *dataCategory*, *articleTopicAssignmentJob*\)](#)

Assign topics to articles and unassign topics from articles in a data category.

assignTopic(*communityId*, *recordId*, *topicId*)

Assigns the specified topic to the specified record or feed item. Only users with the Assign Topics permission can add existing topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopic(String communityId, String recordId, String topicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: [ConnectApi.Topic](#)

assignTopicByName(*communityId*, *recordId*, *topicName*)

Assigns the specified topic to the specified record or feed item. Only users with the Assign Topics permission can add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic assignTopicByName(String communityId, String recordId, String topicName)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID of the record or feed item to which to assign the topic.

topicName

Type: [String](#)

The name of a new or existing topic.

Return Value

Type: [ConnectApi.Topic](#)

createTopic(*communityId*, *name*, *description*)

Creates a topic. Only users with the Create Topics permission can create a topic.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic createTopic(String communityId, String name, String description)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

name

Type: [String](#)

The name of the topic.

description

Type: [String](#)

The description of the topic.

Return Value

Type: [ConnectApi.Topic](#)

```
createTopicDataCategoryRules(communityId, dataCategoryGroup, dataCategory, topicNames)
```

Create topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage createTopicDataCategoryRules(String communityId, String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

dataCategoryGroup

Type: [String](#)

The data category group used by articles.

dataCategory

Type: [String](#)

The data category used by articles.

topicNames

Type: [ConnectApi.TopicNamesInput](#)

A [ConnectApi.TopicNamesInput](#) object with the names of topics to assign to articles in a data category.

Return Value

Type: [ConnectApi.TopicPage](#)

deleteTopic(*communityId*, *topicId*)

Deletes the specified topic. Only users with the Delete Topics or Modify All Data permission can delete topics.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void deleteTopic(String communityId, String topicId)
```

Parameters

communityId

Type: [String](#),

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: Void

Usage

Topic deletion is asynchronous. If a topic is requested before the deletion completes, the response is 200: Successful and the `isBeingDeleted` property of `ConnectApi.Topic` is `true` in version 33.0 and later. If a topic is requested after the deletion completes, the response is 404: NOT_FOUND.

getGroupsRecentlyTalkingAboutTopic(*communityId*, *topicId*)

Returns information about the five groups that most recently contributed to the specified topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.ChatterGroupSummaryPage  
getGroupsRecentlyTalkingAboutTopic(String communityId, String topicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: [ConnectApi.ChatterGroupSummaryPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetGroupsRecentlyTalkingAboutTopic\(*communityId*, *topicId*, *result*\)](#)

[Testing ConnectApi Code](#)

getRecentlyTalkingAboutTopicsForGroup(*communityId*, *groupId*)

Returns up to five topics most recently used in the specified group.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForGroup(String communityId, String groupId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

Return Value

Type: [ConnectApi.TopicPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetRecentlyTalkingAboutTopicsForGroup\(communityId, groupId, result\)](#)

[Testing ConnectApi Code](#)

getRecentlyTalkingAboutTopicsForUser(communityId, userId)

Topics recently used by the specified user. Get up to five topics most recently used by the specified user.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.TopicPage getRecentlyTalkingAboutTopicsForUser (String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.TopicPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetRecentlyTalkingAboutTopicsForUser\(communityId, userId, result\)](#)

[Testing ConnectApi Code](#)

getRelatedTopics (communityId, topicId)

List of five topics most closely related to the specified topic.

Two topics that are assigned to the same feed item at least three times are related.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getRelatedTopics(String communityId, String topicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: [ConnectApi.TopicPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetRelatedTopics\(communityId, topicId, result\)](#)

[Testing ConnectApi Code](#)

getTopic(communityId, topicId)

Returns information about the specified topic.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic getTopic(String communityId, String topicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: [ConnectApi.Topic](#)

getTopicDataCategoryRules (communityId, dataCategoryGroup, dataCategory)

Get topic and article assignment rules by data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicDataCategoryRules(String communityId, String dataCategoryGroup, String dataCategory)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

dataCategoryGroup

Type: [String](#)

The data category group used by articles.

dataCategory

Type: [String](#)

The data category used by articles.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics (communityId, recordId)

Returns the first page of topics assigned to the specified record or feed item. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String recordId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics (communityId)

Returns the first page of topics for the organization.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics (communityId, sortParam)

Returns the first page of topics for the organization in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, ConnectApi.TopicSort  
sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

sortParam

Type: [ConnectApi.TopicSort](#)

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *pageParam*, *pageSize*)

Returns the topics for the specified page.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *pageParam*, *pageSize*, *sortParam*)

Returns the topics for the specified page in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *q*, *sortParam*)

Returns the topics that match the specified search criteria in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q,
ConnectApi.TopicSort sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Specifies the string to search. The string must contain at least two characters, not including wildcards.

sortParam

Type: [ConnectApi.TopicSort](#)

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *q*, *pageParam*, *pageSize*)

Returns the topics that match the specified search criteria for the specified page.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer
pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *q*, *pageParam*, *pageSize*, *sortParam*)

Returns the topics that match the specified search criteria for the specified page in the specified order.

API Version

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Integer pageParam, Integer pageSize, ConnectApi.TopicSort sortParam)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Specifies the string to search. The string must contain at least two characters, not including wildcards.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

sortParam

Type: `ConnectApi.TopicSort`

Values are:

- `popularDesc`—Sorts topics by popularity with the most popular first. This value is the default.
- `alphaAsc`—Sorts topics alphabetically.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopics(*communityId*, *q*, *exactMatch*)

Returns the topic that matches the exact, case-insensitive name.

API Version

33.0

Available to Guest Users

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopics(String communityId, String q, Boolean exactMatch)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch

Type: [Boolean](#)

Specify `true` to find a topic by its exact, case-insensitive name.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopicsOrFallbackToRenamedTopics(*communityId*, *q*, *exactMatch*, *fallbackToRenamedTopics*)

If there isn't an exact match, returns the most recent renamed topic match.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTopicsOrFallbackToRenamedTopics(String communityId,
String q, Boolean exactMatch, Boolean fallbackToRenamedTopics)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

q

Type: [String](#)

Specifies the string to search. The string must contain at least two characters, not including wildcards.

exactMatch

Type: [Boolean](#)

Specify `true` to find a topic by its exact, case-insensitive name or to find the most recent renamed topic match if there isn't an exact match.

fallbackToRenamedTopics

Type: [Boolean](#)

Specify `true` and if there isn't an exact match, the most recent renamed topic match is returned. If there are multiple renamed topic matches, only the most recent is returned. If there are no renamed topic matches, an empty collection is returned.

Return Value

Type: [ConnectApi.TopicPage](#)

getTopicSuggestions(*communityId*, *recordId*, *maxResults*)

Returns suggested topics for the specified record or feed item. Administrators must enable topics for objects before users can see suggested topics for records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicSuggestionPage getTopicSuggestions(String communityId,  
String recordId, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

maxResults

Type: [Integer](#)

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: [ConnectApi.TopicSuggestionPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetTopicSuggestions\(*communityId*, *recordId*, *maxResults*, *result*\)](#)

29.0

Available to Guest Users

32.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage getTrendingTopics(String communityId, Integer maxResults)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

maxResults

Type: [Integer](#)

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

Return Value

Type: [ConnectApi.TopicPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestGetTrendingTopics\(communityId, maxResults, result\)](#)

[Testing ConnectApi Code](#)

mergeTopics (communityId, topicId, idsToMerge)

Merges up to five secondary topics with the specified primary topic.

API Version

33.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic mergeTopics(String communityId, String topicId,  
List<String> idsToMerge)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for the primary topic for the merge. If this topic is a managed topic, it retains its topic type, topic images, and children topics.

idsToMerge

Type: [List<String>](#)

A list of up to five comma-separated secondary topic IDs to merge with the primary topic. If any of these secondary topics are managed topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic.

Return Value

Type: [ConnectApi.Topic](#)

Usage

Only users with the Delete Topics or Modify All Data permission can merge topics.

reassignTopicDataCategoryRules(*communityId*, *dataCategoryGroup*, *dataCategory*, *topicNames*)

Reassign topic and article assignment rules by data category by deleting the existing rules and creating new rules.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicDataCategoryRules(String communityId,
String dataCategoryGroup, String dataCategory, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

dataCategoryGroup

Type: [String](#)

The data category group used by articles.

dataCategory

Type: [String](#)

The data category used by articles.

topicNames

Type: [ConnectApi.TopicNamesInput](#)

A `ConnectApi.TopicNamesInput` object with the names of topics to reassign to articles in a data category.

Return Value

Type: [ConnectApi.TopicPage](#)

reassignTopicsByName(*communityId*, *recordId*, *topicNames*)

Reassigns all the topics on a record or feed item, that is, removes all the assigned topics on a record or feed item and adds topics. Optionally, provides a list of suggested topics to assign to a record or feed item to improve future topic suggestions. Only users with the Assign Topics permission can remove topics from records or feed items and add existing topics to records or feed items. Only users with the Create Topics permission can add new topics to records or feed items. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage reassignTopicsByName(String communityId, String recordId, ConnectApi.TopicNamesInput topicNames)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID of the record or feed item to which to assign the topic.

topicNames

Type: [ConnectApi.TopicNamesInput](#)

A list of topics to replace the currently assigned topics. Optionally, a list of suggested topics to assign to improve future topic suggestions.

Return Value

Type: [ConnectApi.TopicPage](#)

unassignTopic(*communityId*, *recordId*, *topicId*)

Removes the specified topic from the specified record or feed item. Only users with the Assign Topics permission can remove topics from feed items or records. Administrators must enable topics for objects before users can add topics to records of that object type.

API Version

29.0

Requires Chatter

No

Signature

```
public static Void unassignTopic(String communityId, String recordId, String topicId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: Void

updateTopic(*communityId*, *topicId*, *topic*)

Updates the description or name of the specified topic or merges up to five secondary topics with the specified primary topic.

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Topic updateTopic(String communityId, String topicId,
ConnectApi.TopicInput topic)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

topic

Type: [ConnectApi.TopicInput](#)

A [ConnectApi.TopicInput](#) object containing the name and description of the topic or up to five comma-separated secondary topic IDs to merge with the primary topic.

Return Value

Type: [ConnectApi.Topic](#)

Usage

Only users with the Edit Topics or Modify All Data permission can update topic names and descriptions. Only users with the Delete Topics or Modify All Data permission can merge topics.

updateTopicsForArticlesInDataCategory (communityId, dataCategoryGroup, dataCategory, articleTopicAssignmentJob)

Assign topics to articles and unassign topics from articles in a data category.

API Version

40.0

Requires Chatter

No

Signature

```
public static ConnectApi.TopicPage updateTopicsForArticlesInDataCategory(String
communityId, String dataCategoryGroup, String dataCategory,
ConnectApi.ArticleTopicAssignmentJobInput articleTopicAssignmentJob)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

dataCategoryGroup

Type: [String](#)

The data category group used by articles.

dataCategory

Type: [String](#)

The data category used by articles.

articleTopicAssignmentJob

Type: [ConnectApi.ArticleTopicAssignmentJobInput](#)

A [ConnectApi.ArticleTopicAssignmentJobInput](#) object that indicates the operation to take on which topics.

Return Value

Type: [ConnectApi.TopicPage](#)

Topics Test Methods

The following are the test methods for `Topics`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestGetGroupsRecentlyTalkingAboutTopic(*communityId*, *topicId*, *result*)

Registers a `ConnectApi.ChatterGroupSummaryPage` object to be returned when `ConnectApi.getGroupsRecentlyTalkingAboutTopic` is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetGroupsRecentlyTalkingAboutTopic(String communityId, String
topicId, ConnectApi.ChatterGroupSummaryPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

result

Type: [ConnectApi.ChatterGroupSummaryPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getGroupsRecentlyTalkingAboutTopic\(*communityId*, *topicId*\)](#)

[Testing ConnectApi Code](#)

setTestGetRecentlyTalkingAboutTopicsForGroup(*communityId*, *groupId*, *result*)

Registers a `ConnectApi.TopicPage` object to be returned when the `ConnectApi.getRecentlyTalkingAboutTopicsForGroup` method is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForGroup(String communityId,
String groupId, ConnectApi.TopicPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

groupId

Type: [String](#)

The ID for a group.

result

Type: [ConnectApi.TopicPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRecentlyTalkingAboutTopicsForGroup\(communityId, groupId\)](#)

[Testing ConnectApi Code](#)

setTestGetRecentlyTalkingAboutTopicsForUser(communityId, userId, result)

Creates a topics page to use for testing. After you create the page, use the matching

`ConnectApi.getRecentlyTalkingAboutTopicsForUser` method to access the test page and run your tests. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetRecentlyTalkingAboutTopicsForUser(String communityId,  
String userId, ConnectApi.TopicPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

result

Type: [ConnectApi.TopicPage](#)

Specify the test topics page.

Return Value

Type: Void

SEE ALSO:

[getRecentlyTalkingAboutTopicsForUser\(communityId, userId\)](#)

[Testing ConnectApi Code](#)

setTestGetRelatedTopics (communityId, topicId, result)

Registers a `ConnectApi.TopicPage` object to be returned when the `ConnectApi.getRelatedTopics` method is called in a test context.

API Version

29.0

Signature

```
public static Void setTestGetRelatedTopics(String communityId, String topicId,
ConnectApi.TopicPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

topicId

Type: [String](#)

The ID for a topic.

result

Type: [ConnectApi.TopicPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getRelatedTopics\(communityId, topicId\)](#)

[Testing ConnectApi Code](#)

setTestGetTopicSuggestions (communityId, recordId, maxResults, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId, Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

maxResults

Type: [Integer](#)

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result

Type: [ConnectApi.TopicSuggestionPage](#)

Specify the test topic suggestions page.

Return Value

Type: Void

SEE ALSO:

[getTopicSuggestions\(communityId, recordId, maxResults\)](#)

[Testing ConnectApi Code](#)

setTestGetTopicSuggestions(communityId, recordId, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestions` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestions(String communityId, String recordId, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

recordId

Type: [String](#)

The ID for a record or feed item.

result

Type: [ConnectApi.TopicSuggestionPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getTopicSuggestions\(communityId, recordId\)](#)

[Testing ConnectApi Code](#)

setTestGetTopicSuggestionsForText(communityId, text, maxResults, result)

Registers a `ConnectApi.TopicSuggestionPage` object to be returned when the matching `ConnectApi.getTopicSuggestionsForText` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text, Integer maxResults, ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

text

Type: [String](#)

String of text.

maxResults

Type: [Integer](#)

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result

Type: [ConnectApi.TopicSuggestionPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getTopicSuggestionsForText\(communityId, text, maxResults\)](#)

[Testing ConnectApi Code](#)

setTestGetTopicSuggestionsForText(communityId, text, result)

Registers a [ConnectApi.TopicSuggestionPage](#) object to be returned when the matching [ConnectApi.getTopicSuggestionsForText](#) method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTopicSuggestionsForText(String communityId, String text,
ConnectApi.TopicSuggestionPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

text

Type: [String](#)

String of text.

result

Type: [ConnectApi.TopicSuggestionPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getTopicSuggestionsForText\(communityId, text\)](#)

[Testing ConnectApi Code](#)

setTestGetTrendingTopics (communityId, result)

Registers a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static Void setTestGetTrendingTopics(String communityId, ConnectApi.TopicPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

result

Type: [ConnectApi.TopicPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[getTrendingTopics\(communityId\)](#)

[Testing ConnectApi Code](#)

setTestGetTrendingTopics (communityId, maxResults, result)

Registers a `ConnectApi.TopicPage` object to be returned when the matching `ConnectApi.getTrendingTopics` method is called in a test context. Use the method with the same parameters or you receive an exception.

API Version

29.0

Signature

```
public static void setTestGetTrendingTopics(String communityId, Integer maxResults,
ConnectApi.TopicPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

maxResults

Type: [Integer](#)

Maximum number of topic suggestions that get returned. The default is 5. Value must be greater than 0 and less than or equal to 25.

result

Type: [ConnectApi.TopicPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[getTrendingTopics\(communityId, maxResults\)](#)

[Testing ConnectApi Code](#)

UserProfiles Class

Access user profile data. The user profile data populates the profile page (also called the Chatter profile page). This data includes user information (such as address, manager, and phone number), some user capabilities (permissions), and a set of subtab apps, which are custom tabs on the profile page.

Namespace

[ConnectApi](#)

UserProfiles Methods

The following are methods for `UserProfiles`. All methods are static.

IN THIS SECTION:

[deleteBannerPhoto\(communityId, userId\)](#)

Delete a user banner photo.

[deletePhoto\(communityId, userId\)](#)

Deletes the specified user's photo.

[getBannerPhoto\(communityId, userId\)](#)

Get a user banner photo.

[getPhoto\(communityId, userId\)](#)

Returns information about the specified user's photo.

[getUserProfile\(communityId, userId\)](#)

Returns the user profile of the context user.

[setBannerPhoto\(communityId, userId, fileId, versionNumber\)](#)

Set the user banner photo to an already uploaded file.

[setBannerPhoto\(communityId, userId, fileUpload\)](#)

Set the user banner photo to a file that hasn't been uploaded.

[setBannerPhotoWithAttributes\(communityId, userId, bannerPhoto\)](#)

Set and crop an already uploaded file as the user banner photo.

[setBannerPhotoWithAttributes\(communityId, userId, bannerPhoto, fileUpload\)](#)

Set the user banner photo to a file that hasn't been uploaded and requires cropping.

[setPhoto\(communityId, userId, fileId, versionNumber\)](#)

Sets the user photo to be the specified, already uploaded file.

[setPhoto\(communityId, userId, fileUpload\)](#)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

[setPhotoWithAttributes\(communityId, userId, photo\)](#)

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

[setPhotoWithAttributes\(communityId, userId, photo, fileUpload\)](#)

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

deleteBannerPhoto (communityId, userId)

Delete a user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static void deleteBannerPhoto(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

ID of the user.

Return Value

Type: Void

deletePhoto(*communityId*, *userId*)

Deletes the specified user's photo.

API Version

35.0

Requires Chatter

No

Signature

```
public static Void deletePhoto(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

Return Value

Type: Void

getBannerPhoto(*communityId*, *userId*)

Get a user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto getBannerPhoto(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

ID of the user.

Return Value

Type: [ConnectApi.BannerPhoto](#)

getPhoto(*communityId*, *userId*)

Returns information about the specified user's photo.

API Version

35.0

Available to Guest Users

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo getPhoto(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.Photo](#)

SEE ALSO:

[Methods Available to Communities Guest Users](#)

getUserProfile(*communityId*, *userId*)

Returns the user profile of the context user.

API Version

29.0

Requires Chatter

Yes

Signature

```
public static ConnectApi.UserProfile getUserProfile(String communityId, String userId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for a user.

Return Value

Type: [ConnectApi.UserProfile](#)

setBannerPhoto(*communityId*, *userId*, *fileId*, *versionNumber*)

Set the user banner photo to an already uploaded file.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
String fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

ID of the user.

fileId

Type: [String](#)

ID of the already uploaded file to use as the user banner. The key prefix must be 069, and the image must be smaller than 8 MB.

versionNumber

Type: [Integer](#)

Version number of the file. Specify an existing version number or, to get the latest version, specify `null`.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setBannerPhoto (communityId, userId, fileUpload)

Set the user banner photo to a file that hasn't been uploaded.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

ID of the user.

fileUpload

Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: `ConnectApi.BannerPhoto`

Usage

Photos are processed asynchronously and may not be visible right away.

`setBannerPhotoWithAttributes`(`communityId`, `userId`, `bannerPhoto`)

Set and crop an already uploaded file as the user banner photo.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,  
String userId, ConnectApi.BannerPhotoInput bannerPhoto)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

ID of the user.

bannerPhoto

Type: `ConnectApi.BannerPhotoInput`

A `ConnectApi.BannerPhotoInput` object that specifies the ID and version of the file, and how to crop the file.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setBannerPhotoWithAttributes(*communityId*, *userId*, *bannerPhoto*, *fileUpload*)

Set the user banner photo to a file that hasn't been uploaded and requires cropping.

API Version

36.0

Requires Chatter

No

Signature

```
public static ConnectApi.BannerPhoto setBannerPhotoWithAttributes(String communityId,  
String userId, ConnectApi.BannerPhotoInput bannerPhoto, ConnectApi.BinaryInput  
fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

ID of the user.

bannerPhoto

Type: [ConnectApi.BannerPhotoInput](#)

A `ConnectApi.BannerPhotoInput` object specifying the cropping parameters.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.BannerPhoto](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhoto(*communityId*, *userId*, *fileId*, *versionNumber*)

Sets the user photo to be the specified, already uploaded file.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId, String
fileId, Integer versionNumber)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

fileId

Type: [String](#)

ID of a file already uploaded. The file must be an image, and be smaller than 2 GB.

versionNumber

Type: [Integer](#)

Version number of the existing file. Specify either an existing version number, or `null` to get the latest version.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhoto(*communityId*, *userId*, *fileUpload*)

Sets the provided blob to be the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhoto(String communityId, String userId,
ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: [String](#)

The ID for the context user or the keyword `me`.

fileUpload

Type: [ConnectApi.BinaryInput](#)

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

setPhotoWithAttributes(*communityId*, *userId*, *photo*)

Sets and crops the existing file as the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for the context user or the keyword `me`.

photo

Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the file ID, version number, and cropping parameters.

Return Value

Type: `ConnectApi.Photo`

Usage

Photos are processed asynchronously and may not be visible right away.

`setPhotoWithAttributes`(`communityId`, `userId`, `photo`, `fileUpload`)

Sets and crops the provided blob as the photo for the specified user. The content type must be usable as an image.

API Version

35.0

Requires Chatter

No

Signature

```
public static ConnectApi.Photo setPhotoWithAttributes(String communityId, String userId,
ConnectApi.PhotoInput photo, ConnectApi.BinaryInput fileUpload)
```

Parameters

communityId

Type: `String`

Use either the ID for a community, `internal`, or `null`.

userId

Type: `String`

The ID for the context user or the keyword `me`.

photo

Type: `ConnectApi.PhotoInput`

A `ConnectApi.PhotoInput` object specifying the cropping parameters.

fileUpload

Type: `ConnectApi.BinaryInput`

A file to use as the photo. The content type must be usable as an image.

Return Value

Type: [ConnectApi.Photo](#)

Usage

Photos are processed asynchronously and may not be visible right away.

Wave Class

Send a query string to Wave Analytics and get the results as JSON.

Namespace

[ConnectApi](#)

Usage

The Wave class is part of the Wave Analytics Apex SDK. Use the `executeQuery` method to pass a SAQL query from an Apex page to Wave, and get a response in the form of JSON.

This example will send 'your SAQL query' to Wave:

```
String query = '[your SAQL query]';
ConnectApi.LiteralJson result = ConnectApi.Wave.executeQuery(query);
String response = result.json;
```

Also refer to the classes in the `wave` namespace.

Wave Methods

The following are methods for `wave`. All methods are static.

IN THIS SECTION:

[executeQuery\(query\)](#)

Send a SAQL query string to Wave Analytics, and get a response in the form of JSON.

executeQuery (query)

Send a SAQL query string to Wave Analytics, and get a response in the form of JSON.

API Version

40.0

Requires Chatter

No

Signature

```
public ConnectApi.LiteralJson ConnectApi.Wave.executeQuery(String query)
```

Parameters

query

Type: [String](#)

The SAQL query to send to Wave.

Return Value

Type: [LiteralJson](#)

Zones Class

Access information about Chatter Answers zones in your organization. Zones organize questions into logical groups, with each zone having its own focus and unique questions.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

Namespace

[ConnectApi](#)

Zones Methods

The following are methods for `zones`. All methods are static.

IN THIS SECTION:

[getZone\(communityId, zoneId\)](#)

Returns a specific zone based on the zone ID.

[getZones\(communityId\)](#)

Returns a paginated list of zones.

[getZones\(communityId, pageParam, pageSize\)](#)

Returns a paginated list of zones with the specified page and page size.

[searchInZone\(communityId, zoneId, q, filter\)](#)

Search a zone by keyword. Specify whether to search articles or questions.

[searchInZone\(communityId, zoneId, q, filter, pageParam, pageSize\)](#)

Search a zone by keyword. Specify whether to search articles or questions and specify the page of information to view and the page size.

[searchInZone\(communityId, zoneId, q, filter, language\)](#)

Search a zone by keyword. Specify the language of the results and specify whether to search articles or questions.

getZone (communityId, zoneId)

Returns a specific zone based on the zone ID.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

```
public static ConnectApi.Zone getZone(String communityId, String zoneId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

The ID of a zone.

Return Value

Type: [ConnectApi.Zone](#)

getZones (communityId)

Returns a paginated list of zones.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

API Version

29.0

No

Signature

```
public static ConnectApi.ZonePage getZones(String communityId)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

Return Value

Type: [ConnectApi.ZonePage](#)

getZones (communityId, pageParam, pageSize)

Returns a paginated list of zones with the specified page and page size.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

API Version

29.0

Requires Chatter

No

Signature

```
public static ConnectApi.Zone getZones(String communityId, Integer pageParam, Integer pageSize)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

pageParam

Type: [Integer](#)

Specifies the number of the page you want returned. Starts at 0. If you pass in `null` or 0, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

Return Value

Type: [ConnectApi.ZonePage](#)

searchInZone(communityId, zoneId, q, filter)

Search a zone by keyword. Specify whether to search articles or questions.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

No

Signature

```
public static ConnectApi.ZoneSearchPage searchInZone(String communityId, String zoneId, String q, ConnectApi.ZoneSearchResultType filter)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

zoneId—The ID of a zone.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.ZoneSearchResultType](#)

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

Return Value

Type: [ConnectApi.ZoneSearchPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

SEE ALSO:

[setTestSearchInZone\(communityId, zoneId, q, filter, result\)](#)

[Testing ConnectApi Code](#)

searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)

Search a zone by keyword. Specify whether to search articles or questions and specify the page of information to view and the page size.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

zoneId—The ID of a zone.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.ZoneSearchResultType](#)

A [ZoneSearchResultType](#) enum value. One of the following:

- [Article](#)—Search results contain only articles.
- [Question](#)—Search results contain only questions.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as [currentPageToken](#) or [nextPageToken](#). If you pass in [null](#), the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in [null](#), the default size is 25.

Return Value

Type: [ConnectApi.ZoneSearchPage](#)

Usage

To test code that uses this method, use the matching set test method (prefix the method name with `setTest`). Use the set test method with the same parameters or the code throws an exception.

Zones Test Methods

The following are the test methods for `Zones`. All methods are static.

For information about using these methods to test your `ConnectApi` code, see [Testing ConnectApi Code](#).

setTestSearchInZone(communityId, zoneId, q, filter, result)

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter)` is called in a test context.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, ConnectApi.ZoneSearchPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

zoneId—The ID of a zone.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.ZoneSearchResultType](#)

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

result

Type: [ConnectApi.ZoneSearchPage](#)

The object containing test data.

Return Value

Type: `Void`

SEE ALSO:

[searchInZone\(communityId, zoneId, q, filter\)](#)

[Testing ConnectApi Code](#)

setTestSearchInZone(communityId, zoneId, q, filter, pageParam, pageSize, result)

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, pageParam, pageSize)` is called in a test context.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. You have until the Spring '18 release to complete your transition to Chatter Questions. For more information, see [Chatter Answers to Retire in Spring '18](#).

API Version

29.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String pageParam, Integer pageSize,
ConnectApi.ZoneSearchPage result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

zoneId—The ID of a zone.

q

Type: [String](#)

q—Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.ZoneSearchResultType](#)

A `ZoneSearchResultType` enum value. One of the following:

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

pageParam

Type: [String](#)

Specifies the page token to be used to view a page of information. Page tokens are returned as part of the response class, such as `currentPageToken` or `nextPageToken`. If you pass in `null`, the first page is returned.

pageSize

Type: [Integer](#)

Specifies the number of items per page. Valid values are from 1 through 100. If you pass in `null`, the default size is 25.

result

Type: [ConnectApi.ZoneSearchPage](#)

The object containing test data.

Return Value

Type: Void

SEE ALSO:

[searchInZone\(communityId, zoneId, q, filter, pageParam, pageSize\)](#)

[Testing ConnectApi Code](#)

setTestSearchInZone(communityId, zoneId, q, filter, language, result)

Registers a `ConnectApi.ZoneSearchPage` object to be returned when `searchInZone(communityId, zoneId, q, filter, language)` is called in a test context.

 **Note:** With the Spring '18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers won't be able to post, answer, comment, or view any of the existing Chatter Answers data. API Version

36.0

Signature

```
public static Void setTestSearchInZone(String communityId, String zoneId, String q,
ConnectApi.ZoneSearchResultType filter, String language, ConnectApi.ZoneSearchPage
result)
```

Parameters

communityId

Type: [String](#)

Use either the ID for a community, `internal`, or `null`.

zoneId

Type: [String](#)

The ID of a zone.

q

Type: [String](#)

Specifies the string to search. The search string must contain at least two characters, not including wildcards. See [Wildcards](#).

filter

Type: [ConnectApi.ZoneSearchResultType](#)

- `Article`—Search results contain only articles.
- `Question`—Search results contain only questions.

language

Type: [String](#)

The language of the articles or questions. The value must be a Salesforce supported locale code. In an `<apex:page>`, the default value is the language of the page. Otherwise, the default value is the user's locale.

result

Type: [ConnectApi.ZoneSearchPage](#)

The object containing test data.

Return Value

Type: Void

[searchInZone\(communityId, zoneId, q, filter, language\)](#)

[Testing ConnectApi Code](#)

ConnectApi Input Classes

Some `ConnectApi` methods take arguments that are instances of `ConnectApi` input classes.

Input classes are concrete unless marked abstract in this documentation. Concrete input classes have public constructors that have no parameters.

Some methods have parameters that are typed with an abstract class. You must pass in an instance of a concrete child class for these parameters.

Most input class properties can be set. Read-only properties are noted in this documentation.

ConnectApi.ActionLinkDefinitionInput Class

The definition of an action link. An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

Usage

You can use context variables in the `actionUrl`, `headers`, and `requestBody` properties. Use context variables to pass information about the user who executed the action link to your server-side code. Salesforce substitutes the value when the action link is executed.

These are the available context variables:

Context Variable	Description
<code>{!actionLinkId}</code>	The ID of the action link the user executed.
<code>{!actionLinkGroupId}</code>	The ID of the action link group containing the action link the user executed.
<code>{!communityId}</code>	The ID of the community in which the user executed the action link. The value for your internal organization is the empty key <code>"000000000000000000"</code> .
<code>{!communityUrl}</code>	The URL of the community in which the user executed the action link. The value for your internal organization is empty string <code>""</code> .

Context Variable	Description
{!orgId}	The ID of the organization in which the user executed the action link.
{!userId}	The ID of the user that executed the action link.

Property	Type	Description	Required or Optional	Available Version
actionType	ConnectApi.ActionLinkType	<p>Defines the type of action link. Values are:</p> <ul style="list-style-type: none"> Api—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server. ApiAsync—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete. Download—The action link downloads a file from the action URL. Ui—The action link takes the user to a Web page at the action URL. <p>Use <code>Ui</code> if you need to load a page before the user performs an action, for example, to have the user provide input or view something before the action happens.</p> <p> Note: Invoking <code>ApiAsync</code> action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the Chatter REST API Developer Guide for more information.</p>	<p>Required</p> <p>Can be defined in an action link template.</p>	33.0

Property	Type	Description	Required or Optional	Available Version
<code>actionUrl</code>	String	<p>The action link URL. For example, a <code>Ui</code> action link URL is a Web page. A <code>Download</code> action link URL is a link to the file to download. <code>Ui</code> and <code>Download</code> action link URLs are provided to clients. An <code>Api</code> or <code>ApiAsync</code> action link URL is a REST resource. <code>Api</code> and <code>ApiAsync</code> action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code>.</p> <p> Tip: To avoid issues due to upgrades or changing functionality in your API, we recommend using a versioned API for <code>actionUrl</code>, for example, <code>https://www.example.com/api/v1/exampleResource</code>. If your API isn't versioned, you can use the <code>expirationDate</code> property of the <code>ConnectApi.ActionLinkGroupDefinitionInput</code> class to avoid issues due to upgrades or changing functionality in your API.</p>	<p>Required</p> <p>Can be defined in an action link template.</p>	33.0
<code>excludedUserId</code>	String	ID of a single user to exclude from performing the action. If you specify an <code>excludedUserId</code> , you can't specify a <code>userId</code> .	<p>Optional</p> <p>Can be defined in an action link template using the <code>UserVisibility</code> and <code>CustomUserAlias</code> fields.</p>	33.0
<code>groupDefault</code>	Boolean	<code>true</code> if this action is the default action link in the action link group; <code>false</code> otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	<p>Optional</p> <p>Can be defined in an action link template.</p>	33.0
<code>headers</code>	List<ConnectApi.RequestHeaderInput>	<p>The request headers for the <code>Api</code> and <code>ApiAsync</code> action link types.</p> <p>See Action Links Overview, Authentication, and Security.</p>	<p>Optional</p> <p>Can be defined in an action link template.</p>	33.0

Property	Type	Description	Required or Optional	Available Version
labelKey	String	<p>Key for the set of labels to show in the user interface. A set includes labels for these states: <code>NewStatus</code>, <code>PendingStatus</code>, <code>SuccessStatus</code>, <code>FailedStatus</code>. For example, if you use the <code>Approve</code> key, you get these labels: <code>Approve</code>, <code>Pending</code>, <code>Approved</code>, <code>Failed</code>.</p> <p>For a complete list of keys and labels, see Action Links Labels.</p> <p>If none of the predefined labels work for your action link, use a custom label. To use a custom label, create an action link template. See Create Action Link Templates.</p>	<p>Required</p> <p>Can be defined in an action link template.</p>	33.0
method	ConnectApi.HttpRequestMethod	<p>One of these HTTP methods:</p> <ul style="list-style-type: none"> <code>HttpDelete</code>—Returns HTTP 204 on success. Response body or output class is empty. <code>HttpGet</code>—Returns HTTP 200 on success. <code>HttpHead</code>—Returns HTTP 200 on success. Response body or output class is empty. <code>HttpPatch</code>—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. <code>HttpPost</code>—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. <code>HttpPut</code>—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty. 	<p>Required</p> <p>Can be defined in an action link template.</p>	33.0
requestBody	String	<p>The request body for <code>Api</code> action links.</p> <p> Note: Escape quotation mark characters in the <code>requestBody</code> value.</p>	<p>Optional</p> <p>Can be defined in an action link template.</p>	33.0
requiresConfirmation	Boolean	<p><code>true</code> to require the user to confirm the action; <code>false</code> otherwise.</p>	<p>Required</p> <p>Can be defined in an action link template.</p>	33.0

Property	Type	Description	Required or Optional	Available Version
<code>userId</code>	String	The ID of the user who can execute the action. If not specified or <code>null</code> , any user can execute the action. If you specify a <code>userId</code> , you can't specify an <code>excludedUserId</code> .	Optional Can be defined in an action link template using the <code>User Visibility</code> and <code>Custom User Alias</code> fields.	33.0

SEE ALSO:

[ConnectApi.ActionLinkGroupDefinitionInput Class](#)

ConnectApi.ActionLinkGroupDefinitionInput Class

The definition of an action link group. All action links must belong to a group. Action links in a group are mutually exclusive and share some properties. Define stand-alone actions in their own action group.

Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property	Type	Description	Required or Optional	Available Version
<code>actionLinks</code>	List<ConnectApi.ActionLinkDefinitionInput>	The action links that make up this group. Within an action link group, action links are displayed in the order listed in the <code>actionLinks</code> property of the <code>ConnectApi.ActionLinkGroupDefinitionInput</code> class. Within a feed item, action link groups are displayed in the order specified in the <code>actionLinkGroupIds</code> property of the <code>ConnectApi.AssociatedActionsCapabilityInput</code> class. You can create up to three action links in a <code>Primary</code> group and up to four in an <code>Overflow</code> group.	Required to instantiate this action link group without a template. To instantiate from a template, don't specify a value.	33.0

Property	Type	Description	Required or Optional	Available Version
category	ConnectApi.PlatformActionGroupCategory	<p>Indicates the priority and relative locations of action links in an associated feed item. Values are:</p> <ul style="list-style-type: none"> <code>Primary</code>—The action link group is displayed in the body of the feed element. <code>Overflow</code>—The action link group is displayed in the overflow menu of the feed element. 	<p>Required to instantiate this action link group without a template.</p> <p>To instantiate from a template, don't specify a value.</p>	33.0
executionsAllowed	ConnectApi.ActionLinkExecutionsAllowed	<p>Defines the number of times an action link can be executed. Values are:</p> <ul style="list-style-type: none"> <code>Once</code>—An action link can be executed only once across all users. <code>OncePerUser</code>—An action link can be executed only once for each user. <code>Unlimited</code>—An action link can be executed an unlimited number of times by each user. If the action link's <code>actionType</code> is <code>Api</code> or <code>ApiAsync</code>, you can't use this value. 	<p>Required to instantiate this action link group without a template.</p> <p>To instantiate from a template, don't specify a value.</p>	33.0
expirationDate	Datetime	<p>ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action link group is removed from associated feed items and can no longer be executed. The <code>expirationDate</code> must be within one year of the creation date.</p> <p>If the action link group definition includes an OAuth token, it is a good idea to set the expiration date of the action link group to the same value as the expiration date of the OAuth token so that users can't execute the action link and get an OAuth error.</p> <p>To set a date when instantiating from a template, see Set the Action Link Group Expiration Time.</p>	<p>Required to instantiate this action link group without a template.</p> <p>Optional to instantiate from a template.</p>	33.0

Property	Type	Description	Required or Optional	Available Version
templateBindings	List<ConnectApi.ActionLinkTemplateBindingInput>	A collection of key-value pairs to fill in binding variable values or a custom user alias from an action link template. To instantiate this action link group from an action link template that uses binding variables, you must provide values for all the variables. See Define Binding Variables .	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template that uses binding variables.	33.0
templateId	String	The ID of the action link group template from which to instantiate this action link group.	To instantiate without a template, don't specify a value. Required to instantiate this action link group from a template.	33.0

SEE ALSO:

[Define an Action Link and Post with a Feed Element](#)

[Define an Action Link in a Template and Post with a Feed Element](#)

[createActionLinkGroupDefinition\(communityId, actionLinkGroup\)](#)

ConnectApi.ActionLinkTemplateBindingInput

A key-value pair to fill in a binding variable value from an action link template.

Property	Type	Description	Required or Optional	Available Version
key	String	The name of the binding variable key specified in the action link template in Setup. For example, if the binding variable in the template is <code>{!Binding.firstName}</code> , the key is <code>firstName</code>	Required	33.0
value	String	The value of the binding variable key. For example, if the key is <code>firstName</code> , this value could be <code>Joan</code> .	Required	33.0

SEE ALSO:

[ConnectApi.ActionLinkGroupDefinitionInput Class](#)

ConnectApi.ActivitySharingInput

Defines who a captured email or event is shared with.

Property	Type	Description	Required or Optional	Available Version
groupsToShareWith	List<String>	List of IDs for the groups that you share the activity with. Valid only if <code>sharingType</code> is <code>MyGroups</code> .	Optional	39.0
sharingType	ConnectApi.ActivitySharingType	Type of sharing operation. Values are: <ul style="list-style-type: none"> <code>Everyone</code>—The activity is shared with everyone. <code>MyGroups</code>—The activity is shared only with a selection of the context user's groups. <code>OnlyMe</code>—The activity is private. 	Required	39.0

ConnectApi.AlternativeInput (Pilot)

Alternative representation for an extension on a feed element.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property	Type	Description	Required or Optional	Available Version
textRepresentation	String	Text representation of the extension.	Required	40.0
thumbnailUrl	String	Thumbnail URL for the extension.	Optional	40.0
title	String	Title of the extension.	Optional	40.0

ConnectApi.AnnouncementInput Class

An announcement.

Property	Type	Description	Required or Optional	Available
body	ConnectApi.MessageBodyInput Class	Text of the announcement.	Required for creating an announcement if <code>feedItemId</code> isn't specified	31.0

Property	Type	Description	Required or Optional	Available
			Don't specify for updating an announcement.	
<code>expirationDate</code>	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the <code>expirationDate</code> . However, you can use the time value to create your own display logic in your own UI.	Required for creating an announcement Optional for updating an announcement	31.0
<code>feedItemId</code>	String	ID of an <code>AdvancedTextPost</code> feed item that is the body of the announcement.	Required for creating an announcement if <code>body</code> isn't specified Don't specify for updating an announcement.	36.0
<code>isArchived</code>	Boolean	Specifies whether the announcement is archived.	Optional	36.0
<code>parentId</code>	String	ID of the parent entity for the announcement, that is, a group ID when the announcement appears in a group.	Required for creating an announcement if <code>feedItemId</code> isn't specified Don't specify for updating an announcement.	36.0
<code>sendEmails</code>	Boolean	Specifies whether the announcement is sent as an email to all group members regardless of their email setting for the group. If Chatter emails aren't enabled for the organization, announcement emails aren't sent. Default value is <code>false</code> .	Optional for creating an announcement Don't specify for updating an announcement	36.0

SEE ALSO:

[postAnnouncement\(communityId, groupId, announcement\)](#)

ConnectApi.ArticleTopicAssignmentJobInput

An article and topic assignment job.

Property	Type	Description	Required or Optional	Available Version
operation	ConnectApi.ArticleTopicJobType	Specifies the type of operation to perform on articles and topics. Values are: <ul style="list-style-type: none"> AssignTopicsToArticle—Assign topics to articles in a data category. UnassignTopicsFromArticle—Unassign topics from articles in a data category. 	Required	40.0
topicNames	ConnectApi.TopicNamesInput	List of topic names to assign to or unassign from articles.	Required	40.0

ConnectApi.AssociatedActionsCapabilityInput Class

A list of action link groups to associate with a feed element. To associate an action link group with a feed element, the call must be made from the Apex namespace that created the action link definition. In addition, the user making the call must have created the definition or have View All Data permission.

An action link is a button on a feed element. Clicking an action link can take a user to a Web page, initiate a file download, or invoke an API call to Salesforce or to an external server. An action link includes a URL and an HTTP method, and can include a request body and header information, such as an OAuth token for authentication. Use action links to integrate Salesforce and third-party services into the feed so that users can take action to drive productivity and accelerate innovation.

Property	Type	Description	Required or Optional	Available Version
actionLinkGroupIds	List<String>	The action link group IDs to associate with the feed element. Associate one <code>Primary</code> and up to 10 total action link groups to a feed item. Action link groups are returned in the order specified in this property. An action link group ID is returned from a call to ConnectApi.ActionLinks.createActionLinkGroupDefinition(<code>communityId</code>, <code>actionLinkGroup</code>) .	Required	33.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.AudienceCriteriaInput

Recommendation audience criteria type.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- [ConnectApi.CustomListAudienceCriteriaInput](#)
- [ConnectApi.NewUserAudienceCriteriaInput](#)

Property	Type	Description	Required or Optional	Available Version
type	ConnectApi.RecommendationAudienceCriteriaType	Specifies the recommendation audience criteria type. One of these values: <ul style="list-style-type: none"> • <code>CustomList</code>—A custom list of users makes up the audience. • <code>MaxDaysInCommunity</code>—New community members make up the audience. 	Optional If not specified, defaults to <code>CustomList</code> .	36.0

SEE ALSO:

[ConnectApi.RecommendationAudienceInput](#)

ConnectApi.BannerPhotoInput

A banner photo.

Property	Type	Description	Required or Optional	Available Version
cropHeight	Integer	Height of the crop rectangle in pixels.	Optional	36.0
cropWidth	Integer	Width of the crop rectangle in pixels.	Optional	36.0
cropX	Integer	X position of the crop rectangle from the left edge of the image in pixels. Top left is position (0,0).	Optional	36.0
cropY	Integer	Y position of the crop rectangle from the top edge of the image in pixels. Top left is position (0,0).	Optional	36.0
fileId	String	ID of an existing file. The key prefix must be 069, and the file size must be less than 8 MB.  Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	Required	36.0
versionNumber	Integer	Version number of an existing file. If not provided, the latest version is used.	Optional	36.0

ConnectApi.BinaryInput Class

Create a `ConnectApi.BinaryInput` object to attach files to feed items and comments and to add repository files.

The constructor is:

```
ConnectApi.BinaryInput(blob, contentType, filename)
```

The constructor takes these arguments:

Argument	Type	Description	Available Version
<code>blob</code>	Blob	Contents of the file to be used for input	28.0
<code>contentType</code>	String	MIME type description of the content, such as <code>image/jpeg</code>	28.0
<code>filename</code>	String	File name with the file extension, such as <code>UserPhoto.jpg</code>	28.0

SEE ALSO:

[Post a Feed Element with a New File \(Binary\) Attachment](#)

[Post a Comment with a New File](#)

[ConnectApi.BatchInput Class](#)

ConnectApi.BatchInput Class

Construct a set of inputs to be passed into a method at the same time.

Use this constructor when there isn't a binary input:

```
ConnectApi.BatchInput(Object input)
```

Use this constructor to pass one binary input:

```
ConnectApi.BatchInput(Object input, ConnectApi.BinaryInput binary)
```

Use this constructor to pass multiple binary inputs:

```
ConnectApi.BatchInput(Object input, List<ConnectApi.BinaryInput> binaries)
```

The constructors takes these parameters:

Argument	Type	Description	Available Version
<code>input</code>	Object	An individual input object to be used in the batch operation. For example, for <code>postFeedElementBatch()</code> , this should be <code>ConnectApi.FeedElementInput</code> .	32.0
<code>binary</code>	ConnectApi.BinaryInput	A binary file to associate with the input object.	32.0

Argument	Type	Description	Available Version
<code>binaries</code>	<code>List<ConnectApi.BinaryInput></code>	A list of binary files to associate with the input object.	32.0

SEE ALSO:

[Post a Batch of Feed Elements](#)

[Post a Batch of Feed Elements with New \(Binary\) Files](#)

ConnectApi.BookmarksCapabilityInput

Create or update a bookmark on a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
<code>isBookmarkedByCurrentUser</code>	<code>Boolean</code>	Specifies if the feed element should be bookmarked for the user (<code>true</code>) or not (<code>false</code>).	No	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.CanvasAttachmentInput Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.CanvasCapabilityInput](#).

Used to attach a canvas app to a feed item.

Subclass of [ConnectApi.FeedItemAttachmentInput Class](#)

Property	Type	Description	Available Version
<code>description</code>	<code>String</code>	Optional. The description of the canvas app.	29.0–31.0
<code>developerName</code>	<code>String</code>	The developer name (API name) of the canvas app	29.0–31.0
<code>height</code>	<code>String</code>	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
<code>namespacePrefix</code>	<code>String</code>	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
<code>parameters</code>	<code>String</code>	Optional. Parameters passed to the canvas app in JSON format. Example: <pre>{ 'isUpdated'='true' }</pre>	29.0–31.0

Property	Type	Description	Available Version
thumbnailUrl	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
title	String	The title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CanvasCapabilityInput

Create or update a canvas app associated with a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
description	String	A description of the canvas app. The maximum size is 255 characters.	Optional	32.0
developerName	String	The API name (developer name) of the connected app.	Required	32.0
height	String	The height of the canvas app in pixels.	Optional	32.0
namespacePrefix	String	A unique namespace prefix for the canvas app.	Optional	32.0
parameters	String	JSON parameters passed to the canvas app.	Optional	32.0
thumbnailUrl	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	Optional	32.0
title	String	A title for the canvas link.	Required	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.ChatterStreamInput

A Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
description	String	Description of the stream, up to 1,000 characters.	Optional	39.0
name	String	Name of the stream, up to 120 characters.	Required when creating a stream Optional when updating a stream	39.0

Property	Type	Description	Required or Optional	Available Version
subscriptionsToAdd	List<ConnectApi.StreamSubscriptionInput>	List of up to 25 entities whose feeds are included in the stream. Adding an entity that is already added results in no operation. Including the same entity in <code>subscriptionsToAdd</code> and <code>subscriptionsToRemove</code> results in no operation.	Optional	39.0
subscriptionsToRemove	List<ConnectApi.StreamSubscriptionInput>	List of entities whose feeds are removed from the stream. Removing an entity that is already removed results in no operation. Including the same entity in <code>subscriptionsToAdd</code> and <code>subscriptionsToRemove</code> results in no operation.	Optional when updating a stream Not supported when creating a stream	39.0

ConnectApi.ChatterGroupInput Class

Property	Type	Description	Available
announcement	String	The 18-character ID of an announcement. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
canHaveChatterGuests	Boolean	<code>true</code> if this group allows Chatter customers, <code>false</code> otherwise. After this property is set to <code>true</code> , it cannot be set to <code>false</code> .	29.0
description	String	The "Description" section of the group	29.0
information	ConnectApi.GroupInformationInput	The "Information" section of a group. In the Web UI, this section is above the "Description" section. If the group is private, this section is visible only to members.	28.0
isArchived	Boolean	<code>true</code> if the group is archived, <code>false</code> otherwise. Defaults to <code>false</code> .	29.0
isAutoArchiveDisabled	Boolean	<code>true</code> if automatic archiving is turned off for the group, <code>false</code> otherwise. Defaults to <code>false</code> .	29.0
name	String	The name of the group	29.0
owner	String	The ID of the group owner. This property is available for PATCH requests only.	29.0

Property	Type	Description	Available
visibility	ConnectApi.GroupVisibilityType	Specifies the group visibility type. <ul style="list-style-type: none"> • <code>PrivateAccess</code>—Only members of the group can see posts to this group. • <code>PublicAccess</code>—All users within the community can see posts to this group. • <code>Unlisted</code>—Reserved for future use. 	29.0

SEE ALSO:

[createGroup\(communityId, groupInput\)](#)

[updateGroup\(communityId, groupId, groupInput\)](#)

ConnectApi.CommentInput Class

Used to add rich comments, for example, comments that include @mentions or attachments.

Property	Type	Description	Available Version
attachment	ConnectApi.FeedItemAttachmentInputClass	Optional. Specifies an attachment for the comment. Valid values are: <ul style="list-style-type: none"> • <code>ContentAttachmentInput</code> • <code>NewFileAttachmentInput</code> <p><code>LinkAttachmentInput</code> is not permitted for comments.</p> <p> Important: As of version 32.0, use the <code>capabilities</code> property.</p>	28.0–31.0
body	ConnectApi.MessageBodyInputClass	Description of message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a <code>describeSObjects()</code> call on the <code>FeedItem</code> or <code>FeedComment</code> object and look at the length of the <code>Body</code> or <code>CommentBody</code> field to determine the maximum number of allowed characters. <p>To edit this property in a comment, use <code>updateComment(communityId, commentId, comment)</code>. Editing comments is supported in version 34.0 and later.</p> <p>Rich text and inline images are supported in comment bodies in version 35.0 and later.</p>	28.0

Property	Type	Description	Available Version
capabilities	ConnectApi.CommentCapabilitiesInput	Optional. Specifies any capabilities for the comment, such as a file attachment.	32.0

SEE ALSO:

[Post a Comment with a Mention](#)

[Post a Comment with a New File](#)

[Post a Comment with an Existing File](#)

[Post a Rich-Text Comment with Inline Image](#)

[Post a Rich-Text Feed Comment with a Code Block](#)

[Edit a Comment](#)

[postCommentToFeedElement\(communityId, feedElementId, comment, feedElementFileUpload\)](#)

ConnectApi.CommentCapabilitiesInput

A container for all capabilities that can be included with a comment.

Property	Type	Description	Required or Optional	Available Version
content	ConnectApi.ContentCapabilityInput	Describes content added to this comment.	Optional	32.0

SEE ALSO:

[ConnectApi.CommentInput Class](#)

ConnectApi.ContentAttachmentInput Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.ContentCapabilityInput](#).

Used to attach existing content to a comment or feed item.

Subclass of [ConnectApi.FeedItemAttachmentInput Class](#)

Property	Type	Description	Available Version
contentDocumentId	String	ID of the existing content.	28.0–31.0

ConnectApi.ContentCapabilityInput

Attach or update a file on a comment. Use this class to attach a new file or update a file that has already been uploaded to Salesforce.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

To attach or remove files from a feed post (instead of a comment) in version 36.0 and later, use [ConnectApi.FilesCapabilityInput](#).

Property	Type	Description	Required or Optional	Available Version
content DocumentId	String	ID of the existing content.	Required for existing content	32.0
description	String	Description of the file to be uploaded.	Optional	32.0
sharingOption	ConnectApi.FileSharingOption	Sharing option of the file. Values are: <ul style="list-style-type: none"> Allowed—Resharing of the file is allowed. Restricted—Resharing of the file is restricted. 	Optional	35.0
title	String	Title of the file. This value is used as the file name for new content. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	Required for new content	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.ContentHubFieldValueInput

The fields of the item type.

Property	Type	Description	Required or Optional	Available Version
name	String	Name of the item field.	Required	39.0
value	String	Value of the item field.	Required	39.0

SEE ALSO:

[ConnectApi.ContentHubItemInput](#)

ConnectApi.ContentHubItemInput

The item type ID and fields of the item type.

Property	Type	Description	Required or Optional	Available Version
fields	List<ConnectApi.ContentHub	List of fields for the item to be created.	Required to create a SharePoint file in a repository because	39.0

Property	Type	Description	Required or Optional	Available Version
	FieldValueInput >		the file name is required; otherwise optional	
<code>itemTypeId</code>	String	ID of the item type.	Required to create a file in a repository	39.0

ConnectApi.CustomListAudienceCriteriaInput

The criteria for the custom list type of recommendation audience.

Subclass of [ConnectApi.AudienceCriteriaInput](#).

Property	Type	Description	Required or Optional	Available Version
<code>memberOperationType</code>	ConnectApi.RecommendationAudienceMemberOperationType	The operation to carry out on the audience members. Values are: <ul style="list-style-type: none"> <code>Add</code>—Adds specified members to the audience. <code>Remove</code>—Removes specified members from the audience. 	Required to update a recommendation audience Don't use or specify <code>null</code> to create a recommendation audience	36.0
<code>members</code>	List<String>	A collection of user IDs. When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each community can have up to 100 audiences.	Required to update a recommendation audience Don't use or specify <code>null</code> to create a recommendation audience	36.0

ConnectApi.DatacloudOrderInput Class

Input representation for a Datacloud order to purchase contacts or companies and retrieve purchase information.

Property	Type	Description	Required or Optional	Available Version
<code>companyIds</code>	String	A comma-separated list of identification numbers for the companies to be purchased. You can't include any contact IDs or your purchase fails.	Required to purchase companies	32.0

Property	Type	Description	Required or Optional	Available Version
contactIds	String	A comma-separated list of identification numbers for the contacts to be purchased. You can't include any company IDs or your purchase fails.	Required to purchase contacts	32.0
userType	ConnectDatacloudUserTypeEnum	Indicates the Data.com user type to be used. There are two user types. <ul style="list-style-type: none"> • <code>Monthly</code> (default) • <code>Listpool</code> 	Optional	32.0

SEE ALSO:

[postOrder\(orderInput\)](#)

ConnectApi.DirectMessageCapabilityInput

Create or update the members of a direct message.

Property	Type	Description	Required or Optional	Available Version
membersToAdd	List<String>	List of user IDs for members to include in the direct message.	Required when creating a direct message (POST) Optional when updating a direct message (PATCH)	39.0
membersToRemove	List<String>	List of user IDs for members to remove from the direct message.	Optional when updating a direct message (PATCH) Not supported when creating a direct message (POST)	40.0

Property	Type	Description	Required or Optional	Available Version
subject	String	Subject of the direct message.	Optional when creating a direct message (POST) Not supported when updating a direct message (PATCH)	39.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.ExtensionInput (Pilot)

An extension.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property	Type	Description	Required or Optional	Available Version
alternativeRepresentation	ConnectApi.AlternativeInput (Pilot)	Alternative representation of the extension.	Required	40.0
extensionId	String	ID of the extension.	Required	40.0
payload	String	Payload associated with the extension.	Required	40.0
payloadVersion	String	Payload version that identifies the structure of the payload associated with the extension.	Optional	40.0

SEE ALSO:

[ConnectApi.ExtensionsCapabilityInput \(Pilot\)](#)

ConnectApi.ExtensionsCapabilityInput (Pilot)

Create one or more extensions to associate with a feed element.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
itemsToAdd	List<ConnectApi.ExtensionInput>	List of extensions to associate with the feed element.	Required	40.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.FeedElementCapabilitiesInput

A container for all capabilities that can be included when creating a feed element.

Property	Type	Description	Required or Optional	Available Version
associatedActions	ConnectApi.AssociatedActionsCapabilityInputClass	Describes actions added to the feed element.	Optional	33.0
bookmarks	ConnectApi.BookmarksCapabilityInput	Describes bookmarks added to the feed element.	Optional	32.0
canvas	ConnectApi.CanvasCapabilityInput	Describes a canvas app added to the feed element.	Optional	32.0
content	ConnectApi.ContentCapabilityInput	Describes content added to the feed element.  Important: This class isn't available for feed posts in version 36.0 and later. In version 36.0 and later, use ConnectApi.FilesCapabilityInput .	Optional	32.0–35.0
directMessage	ConnectApi.DirectMessageCapabilityInput	Describes the direct message.	Optional	39.0
extensions	ConnectApi.ExtensionsCapabilityInput (Pilot)	Describes the extensions associated with the feed element.  Note: We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Property	Type	Description	Required or Optional	Available Version
		general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.		
feedEntityShare	ConnectApi.FeedEntityShareCapabilityInput	Describes the feed entity shared with the feed element.	Optional	39.0
files	ConnectApi.FilesCapabilityInput	Describes files attached to the feed element.	Optional	36.0
link	ConnectApi.LinkCapabilityInput	Describes a link added to the feed element.	Optional	32.0
poll	ConnectApi.PollCapabilityInput	Describes a poll added to the feed element.	Optional	32.0
questionAndAnswers	ConnectApi.QuestionAndAnswersCapabilityInput	Describes a question and answer capability added to the feed element.	Optional	32.0
topics	ConnectApi.TopicsCapabilityInput	Describes topics assigned to the feed element.	Optional	38.0

SEE ALSO:

[ConnectApi.FeedElementInput Class](#)

ConnectApi.FeedElementCapabilityInput Class

A feed element capability.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

This class is a superclass of:

- [ConnectApi.AssociatedActionsCapabilityInput](#)
- [ConnectApi.BookmarksCapabilityInput](#)

- [ConnectApi.TopicsCapabilityInput](#)

ConnectApi.FeedElementInput Class

Feed elements are the top-level items that a feed contains. Feeds are feed element containers.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass of [ConnectApi.FeedItemInput Class](#).

Property	Type	Description	Required or Optional	Available Version
capabilities	ConnectApi.FeedElementCapabilitiesInput	The capabilities that define auxiliary information on this feed element.	Optional	31.0
feedElementType	ConnectApi.FeedElementType	The type of feed element this input represents.	Required	31.0

Property	Type	Description	Required or Optional	Available Version
subjectId	String	The ID of the parent this feed element is being posted to. This value can be the ID of a user, group, or record, or the string <code>me</code> to indicate the context user.	Required	31.0

SEE ALSO:

ConnectApi.FeedItemAttachmentInput Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.FeedElementCapabilityInput Class](#).

Used to attach a file to a feed item.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- [ConnectApi.CanvasAttachmentInput Class](#)
- [ConnectApi.ContentAttachmentInput Class](#)
- [ConnectApi.LinkAttachmentInput Class](#)

- [ConnectApi.NewFileAttachmentInput Class](#)
- [ConnectApi.PollAttachmentInput Class](#)

ConnectApi.FeedItemInput Class

Used to create rich feed items, for example, feed items that include @mentions or files.

Subclass of [ConnectApi.FeedElementInput Class](#) as of version 31.0.

Property	Type	Description	Required or Optional	Available Version
attachment	ConnectApi.FeedItemAttachmentInput Class	Specifies the attachment for the feed item. The feed item type is inferred based on the provided attachment.  Important: As of API version 32.0, use the inherited <code>capabilities</code> property.	Optional	28.0–31.0
body	ConnectApi.MessageBodyInput Class	Message body. The body can contain up to 10,000 characters and 25 mentions. Because the character limit can change, clients should make a <code>describeObjects()</code> call on the <code>FeedItem</code> or <code>FeedComment</code> object and look at the length of the <code>Body</code> or <code>CommentBody</code> field to determine the maximum number of allowed characters. If you specify <code>originalFeedElementId</code> to share a feed item, use the <code>body</code> property to add the first comment to the feed item. To edit this property in a feed item, use <code>updateFeedElement(communityId, feedElementId, feedElement)</code> . Editing feed posts is supported in version 34.0 and later.	Required unless the feed item has a link capability or a content capability.	28.0
isBookmarkedByCurrentUser	Boolean	Specifies if the new feed item should be bookmarked for the user (<code>true</code>) or not (<code>false</code>).  Important: As of API version 32.0, use the <code>capabilities.bookmarks.isBookmarkedByCurrentUser</code> property.	Optional	28.0–31.0
originalFeedElementId	String	To share a feed element, specify its 18-character ID.  Important: As of API version 39.0, use the <code>capabilities.feedEntityShare.feedEntityId</code> property.	Optional	31.0–38.0
originalFeedItemId	String	To share a feed item, specify its 18-character ID.  Important: In API version 32.0–38.0, use the <code>originalFeedElementId</code> property. In API version 39.0 and later, use the	Optional	28.0–31.0

Property	Type	Description	Required or Optional	Available Version
		<code>capabilities.feedEntity</code> <code>Share.feedEntityId</code> property.		
<code>visibility</code>	ConnectApi.FeedItemVisibilityType Enum	Specifies the type of users who can see a feed item. <ul style="list-style-type: none"> • <code>AllUsers</code>—Visibility is not limited to internal users. • <code>InternalUsers</code>—Visibility is limited to internal users. Default values: <ul style="list-style-type: none"> • For external users, the default value is <code>AllUsers</code>. External users must use this value to see their posts. • For internal users, the default value is <code>InternalUsers</code>. Internal users can accept this value or use the value <code>AllUsers</code> to allow external users to see their posts. If the parent of the feed item is a user, group, or direct message, the <code>visibility</code> of the feed item must be <code>AllUsers</code> .	Optional	28.0

ConnectApi.FileIdInput

Attach a file that has already been uploaded or remove a file from a feed element.

Property	Type	Description	Required or Optional	Available Version
<code>id</code>	String	ID of a file that has already been uploaded.	Required	36.0
<code>operationType</code>	ConnectApi.OperationType	Specifies the operation to carry out on the file. Values are: <ul style="list-style-type: none"> • <code>Add</code>—Adds the file to the feed element. • <code>Remove</code>—Removes the file from the feed element. Remove operations are processed before Add operations. Adding content that is already added and removing content that is already removed result in no operation.	Optional If not specified, defaults to <code>Add</code> .	36.0

SEE ALSO:

[ConnectApi.FilesCapabilityInput](#)

ConnectApi.FilesCapabilityInput

Attach up to 10 files that have already been uploaded or remove one or more files from a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
items	List< ConnectApi.FileIdInput >	List of file IDs and operations to be carried out on those files.	Required	36.0

SEE ALSO:

ConnectApi.GroupInformationInput Class

Property	Type	Description	Available Version
text	String	The text in the “Information” section of a group.	28.0
title	String	The title of the “Information” section of a group.	28.0

SEE ALSO:

[ConnectApi.ChatterGroupInput Class](#)

ConnectApi.HashtagSegmentInput Class

Used to include a hashtag in a feed item or comment.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Available Version
tag	String	Text of the hash tag without the # (hash tag) prefix	28.0

 **Note:** Closing square brackets (]) are not supported in hash tag text. If the text contains a closing square bracket (]), the hash tag ends at the bracket.

SEE ALSO:

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.InlineImageSegmentInput

An inline image segment.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Required or Optional	Available Version
altText	String	Alt text for the inline image.	Optional If not specified, the title of the inline image file is used as the alt text.	35.0
fileId	String	ID of the inline image file.	Required	35.0

SEE ALSO:

[Post a Rich-Text Feed Element with Inline Image](#)

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.InviteInput

An invitation.

Property	Type	Description	Required or Optional	Available Version
invitees	List<String>	List of email addresses to send the invitation to.	Required	39.0
message	String	Message to include in the invitation.	Optional	39.0

ConnectApi.LinkAttachmentInput Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.LinkCapabilityInput](#).

Used as part of a feed item attachment, to add links.

Subclass of [ConnectApi.FeedItemAttachmentInput Class](#)

Property	Type	Description	Available Version
url	String	URL to be used for the link	28.0–31.0
urlName	String	Title of the link	28.0–31.0

ConnectApi.LinkCapabilityInput

Create or update a link on a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
url	String	Link URL. The URL can be to an external site.	Required	32.0
urlName	String	Description of the link.	Optional	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.LinkSegmentInput Class

Used to include a link segment in a feed item or comment.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Available Version
url	String	URL to be used for the link	28.0

SEE ALSO:

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.ManagedTopicPositionCollectionInput Class

A collection of relative positions of managed topics.

Property	Type	Description	Required or Optional	Available Version
managedTopicPositions	List<ConnectApi.ManagedTopicPositionInput>	<p>List of relative positions of managed topics. This list can include <code>Featured</code> and <code>Navigational</code> managed topics and doesn't need to include all managed topics.</p> <p>For more information about reordering managed topics, see the example in reorderManagedTopics(communitId, managedTopicPositionCollection).</p>	Required	32.0

ConnectApi.ManagedTopicPositionInput Class

Relative position of a managed topic.

Property	Type	Description	Required or Optional	Available Version
managedTopicId	String	ID of existing managed topic.	Required	32.0

Property	Type	Description	Required or Optional	Available Version
<code>position</code>	Integer	Relative position of the managed topic, indicated by zero-indexed, ascending whole numbers.	Required	32.0

SEE ALSO:

[ConnectApi.ManagedTopicPositionCollectionInput Class](#)

ConnectApi.MarkupBeginSegmentInput

The beginning tag for rich text markup.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Required or Optional	Available Version
<code>markupType</code>	ConnectApi.MarkupType	<p>Specifies the type of rich text markup.</p> <ul style="list-style-type: none"> • <code>Bold</code>—Bold tag. • <code>Code</code>—Code tag. • <code>Italic</code>—Italic tag. • <code>ListItem</code>—List item tag. • <code>OrderedList</code>—Ordered list tag. • <code>Paragraph</code>—Paragraph tag. • <code>Strikethrough</code>—Strikethrough tag. • <code>Underline</code>—Underline tag. • <code>UnorderedList</code>—Unordered list tag. <p>Markup segments with a <code>markupType</code> of <code>Code</code> can include only text segments.</p>	Required	35.0

SEE ALSO:

[Post a Rich-Text Feed Element with Inline Image](#)

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.MarkupEndSegmentInput

The end tag for rich text markup.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Required or Optional	Available Version
markupType	ConnectApi.MarkupType	Specifies the type of rich text markup. <ul style="list-style-type: none"> • Bold—Bold tag. • Code—Code tag. • Italic—Italic tag. • ListItem—List item tag. • OrderedList—Ordered list tag. • Paragraph—Paragraph tag. • Strikethrough—Strikethrough tag. • Underline—Underline tag. • UnorderedList—Unordered list tag. 	Required	35.0

SEE ALSO:

[Post a Rich-Text Feed Element with Inline Image](#)

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.MentionSegmentInput Class

Include an @mention of a user or group in a feed post or comment. When creating a feed post or comment, you can include up to 25 mentions.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Available Version
id	String	ID of the user or group to mention. To mention a user, use either <code>id</code> or <code>username</code> . You can't include both. To mention a group, you must use <code>id</code> .	28.0 Groups are available in 29.0.
username	String	User name of the user to mention. To mention a user, use either <code>id</code> or <code>username</code> . You can't include both.	38.0

SEE ALSO:

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.MessageBodyInput Class

Used to add rich messages to feed items and comments.

Property	Type	Description	Available Version
messageSegments	List<ConnectApi.MessageSegmentInput Class>	List of message segments contained in the body	28.0

SEE ALSO:

- [ConnectApi.FeedItemInput Class](#)
- [ConnectApi.CommentInput Class](#)
- [ConnectApi.AnnouncementInput Class](#)

ConnectApi.MessageSegmentInput Class

Used to add rich message segments to feed items and comments.

This class is abstract and has no public constructor. You can make an instance only of a subclass.

Superclass for:

- [ConnectApi.HashtagSegmentInput Class](#)
- [ConnectApi.InlineImageSegmentInput](#)
- [ConnectApi.LinkSegmentInput Class](#)
- [ConnectApi.MarkupBeginSegmentInput](#)
- [ConnectApi.MarkupEndSegmentInput](#)
- [ConnectApi.MentionSegmentInput Class](#)
- [ConnectApi.TextSegmentInput Class](#)

Use the [ConnectApiHelper repository on GitHub](#) to simplify many of the tasks accomplished with `ConnectApi.MessageSegmentInput`, such as posting with inline images, rich text, and mentions.

SEE ALSO:

- [Edit a Comment](#)
- [Edit a Feed Element](#)
- [Edit a Question Title and Post](#)
- [Post a Rich-Text Feed Element with Inline Image](#)
- [ConnectApi.MessageBodyInput Class](#)

ConnectApi.MuteCapabilityInput

Mute or unmute a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
<code>isMutedByMe</code>	Boolean	Indicates whether the feed element is muted for the context user. Default value is <code>false</code> .	Required	35.0

SEE ALSO:

[setIsMutedByMe\(`communityId`, `feedElementId`, `isMutedByMe`\)](#)

ConnectApi.NewFileAttachmentInput Class

! **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.ContentCapabilityInput](#).

Describes a new file to be attached to a feed item. The actual binary file, that is the attachment, is provided as part of the [BinaryInput](#) in the method that takes this attachment input, such as `postFeedItem` or `postComment`.

Subclass of [ConnectApi.FeedItemAttachmentInput Class](#)

Property	Type	Description	Available Version
<code>description</code>	String	Description of the file to be uploaded.	28.0–31.0
<code>title</code>	String	The title of the file. This value is required and is also used as the file name. For example, if the title is My Title, and the file is a .txt file, the file name is My Title.txt.	28.0–31.0

ConnectApi.NewUserAudienceCriteriaInput

The criteria for the new members type of recommendation audience.

Subclass of [ConnectApi.AudienceCriteriaInput](#).

Property	Type	Description	Required or Optional	Available Version
<code>value</code>	Double	The maximum number of days since a user became a community member. For example, if you specify <code>30</code> , anyone who became a community member in the last 30 days is included in the new members audience.	Required	36.0

ConnectApi.PhotoInput Class

Use to specify how crop a photo. Use to specify an existing file (a file that has already been uploaded).

Property	Type	Description	Available version
<code>cropSize</code>	Integer	The length, in pixels, of any edge of the crop square.	29.0

Property	Type	Description	Available version
cropX	Integer	The position X, in pixels, from the left edge of the image to the start of the crop square. Top left is position (0,0).	29.0
cropY	Integer	The position Y, in pixels, from the top edge of the image to the start of the crop square. Top left is position (0,0).	29.0
fileId	String	18 character ID of an existing file. The key prefix must be 069 and the file size must be less than 2 GB.  Note: Images uploaded on the Group page and on the User page don't have file IDs and therefore can't be used.	25.0
versionNumber	Integer	Version number of the existing content. If not provided, the latest version is used.	25.0

[setPhotoWithAttributes\(communityId, userId, photo, fileUpload\)](#)

ConnectApi.PollAttachmentInput Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, use [ConnectApi.PollCapabilityInput](#).

Used to attach a poll to a feed item.

Subclass of [ConnectApi.FeedItemAttachmentInput Class](#)

Property	Type	Description	Available Version
pollChoices	List<String>	The text labels for the poll items. Polls must contain between 2 to 10 poll choices.	28.0–31.0

ConnectApi.PollCapabilityInput

Create, update, or vote on a poll on a feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
choices	List<String>	The choices used to create a new poll. You must specify 2–10 poll choices for each poll.	Required for creating a poll	32.0

Property	Type	Description	Required or Optional	Available Version
myChoiceId	String	ID of an existing choice on the feed poll. Used to vote on an existing poll.	Required for voting on a poll	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.QuestionAndAnswersCapabilityInput

Create or edit a question feed element or set the best answer of the existing question feed element.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
bestAnswerId	String	A comment ID to use as a best answer for a question feed element. The best answer comment must already exist on the question feed element.	Required to update a feed element. Not supported when posting a feed element.	32.0
questionTitle	String	Title for a question feed element. To edit the title of a question, use updateFeedElement (communityId, feedElementId, feedElement) . Editing question titles is supported in version 34.0 and later.	Required to post a feed element. Not supported when updating a feed element.	32.0

SEE ALSO:

[Edit a Question Title and Post](#)

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.ReadByCapabilityInput

Mark feed elements as read by the context user.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
isReadByMe	Boolean	Specifies to mark the feed element as read (<code>true</code>) for the context user.	Required	40.0

Property	Type	Description	Required or Optional	Available Version
lastReadDateByMe	Datetime	Specifies the last date when the feed element is marked as read for the context user. If you don't specify a date or you specify a future date, the current system date is used.	Optional	40.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.RecommendationAudienceInput

A recommendation audience.

Property	Type	Description	Required or Optional	Available Version
criteria	ConnectApi.AudienceCriteriaInput	The criteria for the recommendation audience type.	Optional If not specified when creating a recommendation audience, the audience criteria type defaults to custom list.	36.0
memberOperation Type	ConnectApi.RecommendationAudienceMemberOperationType	<p> Important: This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput.</p> <p>The operation to carry out on the audience members.</p> <ul style="list-style-type: none"> <code>Add</code>—Adds specified members to the audience. <code>Remove</code>—Removes specified members from the audience. 	Required to update a recommendation audience Don't use or specify <code>null</code> to create a recommendation audience	35.0 only
members	List<String>	<p> Important: This property is available only in version 35.0. In version 36.0 and later, use ConnectApi.CustomListAudienceCriteriaInput.</p> <p>A collection of user IDs.</p>	Required to update a recommendation audience Don't use or specify <code>null</code> to create a recommendation audience	35.0 only

Property	Type	Description	Required or Optional	Available Version
		When updating an audience, you can include up to 100 members. An audience can have up to 100,000 members, and each community can have up to 100 audiences.		
name	String	The unique name of the recommendation audience.	Optional to update a recommendation audience Required to create a recommendation audience	35.0

SEE ALSO:

[createRecommendationAudience\(communityId, recommendationAudience\)](#)

ConnectApi.RecommendationDefinitionInput

A recommendation definition.

Property	Type	Description	Required or Optional	Available Version
actionUrl	String	The URL for acting on the recommendation, for example, the URL to join a group.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
actionUrlName	String	The text label for the action URL in the user interface, for example, "Launch."	Required to create a recommendation definition Optional to update a recommendation definition	35.0
explanation	String	The explanation, or body, of the recommendation.	Required to create a recommendation definition Optional to update a recommendation definition	35.0

Property	Type	Description	Required or Optional	Available Version
name	String	The name of the recommendation definition. The name is displayed in Setup.	Required to create a recommendation definition Optional to update a recommendation definition	35.0
title	String	The title of the recommendation definition.	Optional	35.0

SEE ALSO:

[createRecommendationDefinition\(communityId, recommendationDefinition\)](#)

ConnectApi.RequestHeaderInput Class

An HTTP request header name and value pair.

Property	Type	Description	Required or Optional	Available Version
name	String	The name of the request header.	Required	33.0
value	String	The value of the request header.	Required	33.0

SEE ALSO:

[Define an Action Link and Post with a Feed Element](#)

ConnectApi.ScheduledRecommendationInput

A scheduled recommendation.

Property	Type	Description	Required or Optional	Available Version
channel	ConnectApi.RecommendationChannel	Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are: <ul style="list-style-type: none"> <code>CustomChannel1</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can 	Optional for creating a scheduled recommendation If not specified, defaults to <code>DefaultChannel</code> . Don't use when updating a scheduled recommendation	36.0

Property	Type	Description	Required or Optional	Available Version
		<p>use Community Builder to determine where recommendations appear.</p> <ul style="list-style-type: none"> • <code>CustomChannel12</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>CustomChannel13</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>CustomChannel14</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>CustomChannel15</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>DefaultChannel1</code>—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template. <p>Use these channel values; you can't rename or create other channels.</p>		
<code>enabled</code>	Boolean	<p>Indicates whether scheduling is enabled. If <code>true</code>, the recommendation is enabled and appears in communities. If <code>false</code>, recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.</p>	Optional	35.0

Property	Type	Description	Required or Optional	Available Version
rank	Integer	<p>Relative rank of the scheduled recommendation indicated by ascending whole numbers starting with 1.</p> <p>Setting the rank is comparable to an insertion into an ordered list. The scheduled recommendation is inserted into the position specified by the <code>rank</code>. The <code>rank</code> of all the scheduled recommendations after it is pushed down. See Ranking scheduled recommendations example.</p> <p>If the specified <code>rank</code> is larger than the size of the list, the scheduled recommendation is put at the end of the list. The <code>rank</code> of the scheduled recommendation is the size of the list, instead of the one specified.</p> <p>If a <code>rank</code> is not specified, the scheduled recommendation is put at the end of the list.</p>	Optional	35.0
recommendation AudienceId	String	ID of the audience for this scheduled recommendation. When updating a scheduled recommendation, specify <code>ALL</code> to remove the association between a recommendation audience and a scheduled recommendation.	Optional	35.0
recommendation DefinitionId	String	ID of the recommendation definition that this scheduled recommendation schedules.	<p>Required to create a scheduled recommendation</p> <p>You can't specify a <code>recommendationDefinitionId</code> when updating an existing scheduled recommendation.</p>	35.0

Ranking scheduled recommendations example

If you have these scheduled recommendations:

Scheduled Recommendations	Rank
ScheduledRecommendationA	1
ScheduledRecommendationB	2

Scheduled Recommendations	Rank
ScheduledRecommendationC	3

And you include this information in the Scheduled Recommendation Input:

Scheduled Recommendation	Rank
ScheduledRecommendationD	2

The result is:

Scheduled Recommendation	Rank
ScheduledRecommendationA	1
ScheduledRecommendationD	2
ScheduledRecommendationB	3
ScheduledRecommendationC	4

SEE ALSO:

[createScheduledRecommendation\(communityId, scheduledRecommendation\)](#)

ConnectApi.StatusCapabilityInput

Change the status of a feed post or comment.

This class is a subclass of [ConnectApi.FeedElementCapabilityInput Class](#).

Property	Type	Description	Required or Optional	Available Version
feedEntityStatus	ConnectApi.FeedEntityStatus	Specifies the status of the feed post or comment. Values are: <ul style="list-style-type: none"> <code>PendingReview</code>—The feed post or comment isn't approved yet and therefore isn't published or visible. <code>Published</code>—The feed post or comment is approved and visible. 	Required	37.0

ConnectApi.StreamSubscriptionInput

An entity to subscribe to for a Chatter feed stream.

Property	Type	Description	Required or Optional	Available Version
<code>entityId</code>	String	The ID of any feed-enabled entity, such as a group, record, or user, that the context user can access. When subscribed, the entity's feed is included in the feed stream.	Required	39.0

SEE ALSO:

[ConnectApi.ChatterStreamInput](#)

ConnectApi.TextSegmentInput Class

Used to include a text segment in a feed item or comment.

Subclass of [ConnectApi.MessageSegmentInput Class](#)

Property	Type	Description	Available Version
<code>text</code>	String	Plain text for this segment. If hashtags or links are detected in <code>text</code> , they are included in the comment as hashtag and link segments. Mentions are not detected in <code>text</code> and are not separated out of the text. Mentions require ConnectApi.MentionSegmentInput Class .	28.0

SEE ALSO:

[Edit a Comment](#)

[Edit a Feed Element](#)

[Edit a Question Title and Post](#)

[Post a Rich-Text Feed Element with Inline Image](#)

[ConnectApi.MessageBodyInput Class](#)

ConnectApi.TopicInput Class

Update a topic's name or description or merge topics.

Property	Type	Description	Available Version
<code>description</code>	String	Description of the topic	29.0
<code>idsToMerge</code>	List<String>	List of up to five secondary topic IDs to merge with the primary topic If any of these secondary topics are managed topics, they lose their topic type, topic images, and children topics. Their feed items are reassigned to the primary topic.	33.0

Property	Type	Description	Available Version
name	String	Name of the topic Use this property to change only the capitalization and spacing of the topic name.	29.0

SEE ALSO:

[updateTopic\(communityId, topicId, topic\)](#)

ConnectApi.TopicNamesInput

A list of topic names to replace currently assigned topics. Also a list of suggested topics to assign.

Property	Type	Description	Required or Optional	Available Version
topicNames	List<String>	A list of up to 10 topic names for a feed item or 100 topic names for a record.	Required	35.0
topicSuggestions	List<String>	A list of suggested topics to assign to a record or feed item to improve future topic suggestions.	Optional	37.0

SEE ALSO:

[reassignTopicsByName\(communityId, recordId, topicNames\)](#)

[ConnectApi.ArticleTopicAssignmentJobInput](#)

ConnectApi.TopicsCapabilityInput

Assign topics to a feed element.

Property	Type	Description	Required or Optional	Available Version
contextTopic Name	String	Name of the parent topic in the community to which the feed element belongs.	Optional	38.0
topics	List<String>	List of topics to assign to the feed element.	Required	38.0

SEE ALSO:

[ConnectApi.FeedElementCapabilitiesInput](#)

ConnectApi.UserInput Class

Used to update a user.

Property	Type	Description	Available Version
aboutMe	String	The aboutMe property of a <code>ConnectApi.UserDetail</code> output object. This property populates the “About Me” section of the user profile, which is visible to all members of a community or organization.	29.0

SEE ALSO:

[updateUser\(communityId, userId, userInput\)](#)

ConnectApi Output Classes

Most `ConnectApi` methods return instances of `ConnectApi` output classes.

All properties are read-only, except for instances of output classes created within test code.

All output classes are concrete unless marked abstract in this documentation.

All concrete output classes have no-argument constructors that you can invoke only from test code. See [Testing ConnectApi Code](#).

ConnectApi.AbstractContentHubItemType

An item type associated with a repository folder.

This class is abstract.

Superclass of:

- [ConnectApi.ContentHubItemTypeDetail](#)
- [ConnectApi.ContentHubItemTypeSummary](#)

Property Name	Type	Description	Available Version
contentStreamSupport	<code>ConnectApi.ContentHubStreamSupport</code>	Specifies support for content streaming. Values are: <ul style="list-style-type: none"> • <code>ContentStreamAllowed</code> • <code>ContentStreamNotAllowed</code> • <code>ContentStreamRequired</code> 	39.0
description	String	Description of the item type.	39.0
displayName	String	Display name of the item type.	39.0
id	String	ID of the item type.	39.0
isVersionable	Boolean	Indicates whether the item type can have versions.	39.0
url	String	URL to the detailed information of the item type.	39.0

ConnectApi.AbstractDirectoryEntrySummary

A directory entry with summary information.

This class is abstract.

Superclass of:

- [ConnectApi.RepositoryGroupSummary](#)
- [ConnectApi.RepositoryUserSummary](#)

Property Name	Type	Description	Available Version
domain	String	Domain of the directory entry.	39.0
email	String	Email of the directory entry.	39.0
id	String	ID of the directory entry.	39.0
type	ConnectApi. ContentHub DirectoryEntry Type	Type of directory entry. Values are: <ul style="list-style-type: none"> • GroupEntry • UserEntry 	39.0

ConnectApi.AbstractExtensionInformation (Pilot)

Extension information.

-  **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

This class is abstract.

Superclass of [ConnectApi.LightningExtensionInformation \(Pilot\)](#)

Property Name	Type	Description	Available Version
extension InformationType	ConnectApi. ExtensionInformation Type	Specifies the information type of the extension. Values are: <ul style="list-style-type: none"> • Lightning 	40.0

ConnectApi.AbstractMessageBody Class

This class is abstract.

Superclass of:

- [ConnectApi.FeedBody Class](#)
- [ConnectApi.MessageBody Class](#)

Name	Type	Description	Available Version
isRichText	Boolean	Indicates whether the body is rich text.	35.0
messageSegments	List<ConnectApi. MessageSegment>	List of message segments	28.0

Name	Type	Description	Available Version
text	String	Display-ready text. Use this text if you don't want to process the message segments.	28.0

ConnectApi.AbstractRecommendation Class

A recommendation.

This class is abstract.

Superclass of:

- [ConnectApi.EntityRecommendation Class](#)
- [ConnectApi.NonEntityRecommendation Class](#)

ConnectApi.NonEntityRecommendation Class isn't used in version 34.0 and later. In version 34.0 and later, [ConnectApi.EntityRecommendation Class](#) is used for all recommendations.

Property Name	Type	Description	Available Version
explanation	ConnectApi.RecommendationExplanation	The recommendation explanation.	32.0
platformActionGroup	ConnectApi.PlatformActionGroup	A platform action group instance with state appropriate for the context user.	34.0
recommendationType	ConnectApi.RecommendationType	Specifies the type of record being recommended.	32.0
url	String	URL for the recommendation.	34.0

SEE ALSO:

[ConnectApi.RecommendationsCapability](#)

[ConnectApi.RecommendationCollection Class](#)

ConnectApi.AbstractRecommendationExplanation Class

Explanation for a recommendation.

This class is abstract.

Superclass of [ConnectApi.RecommendationExplanation Class](#).

Property Name	Type	Description	Available Version
summary	String	Summary explanation for recommendation.	32.0

Property Name	Type	Description	Available Version
type	ConnectApi.RecommendationExplanationType	<p>Indicates the reason for the recommendation.</p> <ul style="list-style-type: none"> • <code>ArticleHasRelatedContent</code>—Articles with related content to a context article. • <code>ArticleViewedTogether</code>—Articles often viewed together with the article that the context user just viewed. • <code>ArticleViewedTogetherWithViewers</code>—Articles often viewed together with other records that the context user views. • <code>Custom</code>—Custom recommendations. • <code>FilePopular</code>—Files with many followers or views. • <code>FileViewedTogether</code>—Files often viewed at the same time as other files that the context user views. • <code>FollowedTogetherWithFollowees</code>—Users often followed together with other records that the context user follows. • <code>GroupMembersFollowed</code>—Groups with members that the context user follows. • <code>GroupNew</code>—Recently created groups. • <code>GroupPopular</code>—Groups with many active members. • <code>ItemViewedTogether</code>—Records often viewed at the same time as other records that the context user views. • <code>PopularApp</code>—Applications that are popular. • <code>RecordOwned</code>—Records that are owned by the context user. • <code>RecordParentOfFollowed</code>—Parent records of records that the context user follows. • <code>RecordViewed</code>—Records that the context user recently viewed. • <code>TopicFollowedTogether</code>—Topics often followed together with the record that the context user just followed. • <code>TopicFollowedTogetherWithFollowees</code>—Topics often followed together with other records that the context user follows. • <code>TopicPopularFollowed</code>—Topics with many followers. 	32.0

Property Name	Type	Description	Available Version
		<ul style="list-style-type: none"> • <code>TopicPopularLiked</code>—Topics on posts that have many likes. • <code>UserDirectReport</code>—Users who report to the context user. • <code>UserFollowedTogether</code>—Users often followed together with the record that the context user just followed. • <code>UserFollowsSameUsers</code>—Users who follow the same users as the context user. • <code>UserManager</code>—The context user’s manager. • <code>UserNew</code>—Recently created users. • <code>UserPeer</code>—Users who report to the same manager as the context user. • <code>UserPopular</code>—Users with many followers. • <code>UserViewingSameRecords</code>—Users who view the same records as the context user. 	

ConnectApi.AbstractRecordField Class

This class is abstract.

Superclass of:

- [ConnectApi.BlankRecordField Class](#)
- [ConnectApi.LabeledRecordField Class](#)

A field on a record object.

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

 **Important:** The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
type	String	The type of the field. One of these values: <ul style="list-style-type: none"> • Address • Blank • Boolean • Compound • CreatedBy • Date • DateTime • Email • LastModifiedBy • Location • Name • Number • Percent • Phone • Picklist • Reference • Text • Time 	29.0

SEE ALSO:

[ConnectApi.RecordViewSection Class](#)

ConnectApi.AbstractRecordView Class

This class is abstract.

Subclass of [ConnectApi.ActorWithId Class](#)

Superclass of:

- [ConnectApi.RecordSummary Class](#)
- [ConnectApi.RecordView Class](#)

A view of any record in the organization, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, is not available for the record type.

Name	Type	Description	Available Version
name	String	The localized name of the record.	29.0

ConnectApi.AbstractRepositoryFile

A repository file.

This class is abstract.

Subclass of [ConnectApi.AbstractRepositoryItem](#).

Superclass of:

- [ConnectApi.RepositoryFileDetail](#)
- [ConnectApi.RepositoryFileSummary](#)

Property Name	Type	Description	Available Version
checkinComment	String	Checkin comment of the file.	39.0
contentSize	Integer	Length in bytes of the content of the file.	39.0
downloadUrl	String	URL to the repository file content.	39.0
external ContentUrl	String	URL of this file's content in the external system.	39.0
external DocumentUrl	String	URL of this file in the external system.	39.0
external FilePermission Information	ConnectApi. ExternalFile PermissionInformation	External file permission information, such as available groups, available permission types, and current sharing status, or <code>null</code> if <code>includeExternalFilePermissionsInfo</code> is <code>false</code> .	39.0
mimeType	String	Mime type of the file.	39.0
previewUrl Thumbnail	String	URL to the thumbnail preview (240 x 180 PNG).	39.0
previewUrl ThumbnailBig	String	URL to the big thumbnail preview (720 x 480 PNG).	39.0
previewUrl ThumbnailTiny	String	URL to the tiny thumbnail preview (120 x 90 PNG).	39.0
previewsUrl	String	URL to the previews.	39.0
title	String	Title of the file.	39.0
versionId	String	ID of the file version in the external system.	39.0

ConnectApi.AbstractRepositoryFolder

A repository folder.

This class is abstract.

Subclass of [ConnectApi.AbstractRepositoryItem](#).

Superclass of:

- [ConnectApi.RepositoryFolderDetail](#)
- [ConnectApi.RepositoryFolderSummary](#)

Property Name	Type	Description	Available Version
externalFolderUrl	String	URL of this folder in the external system.	39.0
folderItemsUrl	String	URL that lists the files and folders in this folder.	39.0
path	String	Absolute path of the folder in the external system.	39.0

ConnectApi.AbstractRepositoryItem

A repository item.

This class is abstract.

Superclass of:

- [ConnectApi.AbstractRepositoryFile](#)
- [ConnectApi.AbstractRepositoryFolder](#)

Property Name	Type	Description	Available Version
createdBy	String	Name of the user who created the item.	39.0
createdDate	Datetime	Date the item was created.	39.0
description	String	Description of the Item.	39.0
id	String	ID of the item.	39.0
itemTypeUrl	String	URL to the item type information.	39.0
modifiedBy	String	Name of the user who last modified the item.	39.0
modifiedDate	Datetime	Date the item was last modified.	39.0
motif	ConnectApi.Motif	Motif of the item.	39.0
name	String	Name of the item.	39.0
repository	ConnectApi.Reference	Item external repository.	39.0
type	String	Item type, file or folder.	39.0
url	String	The URL to the item.	39.0

ConnectApi.ActionLinkDefinition Class

The definition of an action link. Action link definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
actionUrl	String	The action link URL. For example, a <code>Ui</code> action link URL is a Web page. A <code>Download</code> action link URL is	33.0

Property Name	Type	Description	Available Version
		a link to the file to download. <code>Ui</code> and <code>Download</code> action link URLs are provided to clients. An <code>Api</code> or <code>ApiAsync</code> action link URL is a REST resource. <code>Api</code> and <code>ApiAsync</code> action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code> .	
<code>createdDate</code>	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
<code>excludedUserId</code>	String	ID of a single user to exclude from performing the action. If you specify an <code>excludedUserId</code> , you can't specify a <code>userId</code> .	33.0
<code>groupDefault</code>	Boolean	<code>true</code> if this action is the default action link in the action link group; <code>false</code> otherwise. There can be only one default action link per action link group. The default action link gets distinct styling in the Salesforce UI.	33.0
<code>headers</code>	List<ConnectApi.RequestHeader>	The request headers for the <code>Api</code> and <code>ApiAsync</code> action link types.	33.0
<code>id</code>	String	The 18-character ID for the action link definition.	33.0
<code>label</code>	String	<p>A custom label to display on the action link button. A <code>label</code> value can be set only in an action link template.</p> <p>Action links have four statuses: <code>NewStatus</code>, <code>PendingStatus</code>, <code>SuccessStatus</code>, and <code>FailedStatus</code>. These strings are appended to the label for each status:</p> <ul style="list-style-type: none"> <code>label</code> <code>label Pending</code> <code>label Success</code> <code>label Failed</code> <p>For example, if the value of <code>label</code> is "See Example," the values of the four action link states are: See Example, See Example Pending, See Example Success, and See Example Failed.</p> <p>An action link can use either <code>label</code> or <code>labelKey</code> to generate label names, it can't use both. If <code>label</code> has a value, the value of <code>labelKey</code> is <code>None</code>. If <code>labelKey</code> has a value other than <code>None</code>, the value of <code>label</code> is <code>null</code>.</p>	34.0
<code>labelKey</code>	String	Key for the set of labels to show in the user interface. A set includes labels for these states: <code>NewStatus</code> , <code>PendingStatus</code> , <code>SuccessStatus</code> , <code>FailedStatus</code> . For	33.0

Property Name	Type	Description	Available Version
		<p>example, if you use the <code>Approve</code> key, you get these labels: <code>Approve</code>, <code>Pending</code>, <code>Approved</code>, <code>Failed</code>.</p> <p>For a complete list of label keys, see Action Links Labels.</p>	
<code>method</code>	ConnectApi.HttpRequestMethod	<p>The HTTP method. One of these values:</p> <ul style="list-style-type: none"> <code>HttpDelete</code>—Returns HTTP 204 on success. Response body or output class is empty. <code>HttpGet</code>—Returns HTTP 200 on success. <code>HttpHead</code>—Returns HTTP 200 on success. Response body or output class is empty. <code>HttpPatch</code>—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. <code>HttpPost</code>—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. <code>HttpPut</code>—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty. 	33.0
<code>modifiedDate</code>	Datetime	An ISO 8601 format date string, for example, <code>2011-02-25T18:24:31.000Z</code> .	33.0
<code>requestBody</code>	String	<p>The request body for <code>Api</code> and <code>ApiAsync</code> action link types.</p> <p> Note: Escape quotation mark characters in the <code>requestBody</code> value.</p>	33.0
<code>requiresConfirmation</code>	Boolean	<code>true</code> to require the user to confirm the action; <code>false</code> otherwise.	33.0
<code>templateId</code>	String	The ID of the action link template from which to instantiate this action link. If the action link isn't associated with a template, the value is <code>null</code> .	33.0
<code>type</code>	ConnectApi.ActionLinkType	<p>Defines the type of action link. Values are:</p> <ul style="list-style-type: none"> <code>Api</code>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server. <code>ApiAsync</code>—The action link calls an asynchronous API at the action URL. The action 	33.0

Property Name	Type	Description	Available Version
		<p>remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete.</p> <ul style="list-style-type: none"> • <code>Download</code>—The action link downloads a file from the action URL. • <code>Ui</code>—The action link takes the user to a Web page at the action URL. <p> Note: Invoking <code>ApiAsync</code> action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the Chatter REST API Developer Guide for more information.</p>	
<code>userId</code>	<code>String</code>	The ID of the user who can execute the action. If not specified or <code>null</code> , any user can execute the action. If you specify a <code>userId</code> , you can't specify an <code>excludedUserId</code> .	33.0

SEE ALSO:

[ConnectApi.ActionLinkGroupDefinition Class](#)

ConnectApi.ActionLinkDiagnosticInfo Class

Any diagnostic information that may exist for an executed action link. Diagnostic info is provided only for users who can access the action link.

Property Name	Type	Description	Available Version
<code>diagnosticInfo</code>	<code>String</code>	Any diagnostic information returned when an action link is executed. Diagnostic information is provided only for users who can access the action link.	33.0
<code>url</code>	<code>String</code>	The URL for this action link diagnostic information.	33.0

ConnectApi.ActionLinkGroupDefinition Class

The definition of an action link group. Information in the action link group definition can be sensitive to a third party (for example, OAuth bearer token headers). For this reason, only calls made from the Apex namespace that created the action link group definition can read, modify, or delete the definition. In addition, the user making the call must have created the definition or have View All Data permission.

Property Name	Type	Description	Available Version
actionLinks	List<ConnectApi.ActionLinkDefinition>	A collection of action link definitions that make up the action link group. Within an action link group, action links are displayed in the order listed in the actionLinks property of the ConnectApi.ActionLinkGroupDefinitionInput class. Within a feed item, action link groups are displayed in the order specified in the actionLinkGroupIds property of the ConnectApi.AssociatedActionsCapabilityInput class.	33.0
category	ConnectApi.PlatformActionGroupCategory	Indicates the priority and location of the action links. Values are: <ul style="list-style-type: none"> Primary—The action link group is displayed in the body of the feed element. Overflow—The action link group is displayed in the overflow menu of the feed element. 	33.0
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
executionsAllowed	ConnectApi.ActionLinkExecutionsAllowed	Defines the number of times an action link can be executed. Values are: <ul style="list-style-type: none"> Once—An action link can be executed only once across all users. OncePerUser—An action link can be executed only once for each user. Unlimited—An action link can be executed an unlimited number of times by each user. If the action link's actionType is Api or ApiAsync, you can't use this value. 	33.0
expirationDate	Datetime	ISO 8601 date string, for example, 2011-02-25T18:24:31.000Z, that represents the date and time this action group expires and can no longer be executed. If the value is null, there isn't an expiration date.	33.0
id	String	18-character ID of the action link group definition.	33.0
modifiedDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	33.0
templateId	String	The ID of the action link group template from which to instantiate this action link group, or null if this group isn't associated with a template.	33.0
url	String	The URL for this action link group definition.	33.0

ConnectApi.ActivitySharingResult

The results of sharing a captured email or event.

Property Name	Type	Description	Available Version
success	Boolean	Whether the share operation succeeded or not.	39.0

ConnectApi.Actor Class

This class is abstract.

Superclass of:

- [ConnectApi.ActorWithId Class](#)
- [ConnectApi.RecommendedObject](#)
- [ConnectApi.UnauthenticatedUser Class](#)

Name	Type	Description	Available Version
name	String	Name of the actor, such as the group name.	28.0
type	String	One of the following: <ul style="list-style-type: none"> • file • group • recommendedObject (version 34.0 and later) • unauthenticateduser • user • <i>record type name</i>—the name of the record type, such as myCustomObject__c or Account 	28.0

ConnectApi.ActorWithId Class

This class is abstract.

Subclass of: [ConnectApi.Actor Class](#)

Superclass of:

- [ConnectApi.AbstractRecordView Class](#)

- [ConnectApi.ArticleSummary](#)
- [ConnectApi.ChatterGroup Class](#)
- [ConnectApi.ContentHubRepository](#)
- [ConnectApi.File Class](#)
- [ConnectApi.RelatedFeedPost](#)
- [ConnectApi.User Class](#)

Name	Type	Description	Available Version
id	String	Actor's 18-character ID	28.0
motif	ConnectApi.Motif	An icon that identifies the actor as a user, group, file, or custom object. The icon isn't the user or group photo, and it isn't a preview of the file. The motif can also contain the object's base color.	28.0
mySubscription	ConnectApi.Reference	If the context user is following the item, this contains information about the subscription, else returns <code>null</code> .	28.0
url	String	Chatter REST API URL for the resource	28.0

ConnectApi.Address Class

Name	Type	Description	Available Version
city	String	Name of the city	28.0
country	String	Name of the country	28.0
formattedAddress	String	Formatted address per the locale of the context user	28.0
state	String	Name of the state, province, or so on	28.0
street	String	Street number	28.0
zip	String	Zip or postal code	28.0

SEE ALSO:

- [ConnectApi.DatacloudCompany Class](#)
- [ConnectApi.DatacloudContact](#)
- [ConnectApi.UserDetail Class](#)

ConnectApi.Alternative (Pilot)

Alternative representation for an extension on a feed element.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property Name	Type	Description	Available Version
textRepresentation	String	Text representation of the extension.	40.0
thumbnailUrl	String	Thumbnail URL for the extension.	40.0
title	String	Title of the extension.	40.0

ConnectApi.Announcement

An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.

Name	Type	Description	Available Version
expirationDate	Datetime	The Salesforce UI displays an announcement until 11:59 p.m. on this date unless another announcement is posted first. The Salesforce UI ignores the time value in the <code>expirationDate</code> . However, you can use the time value to create your own display logic in your own UI.	31.0
feedElement	ConnectApi.FeedElement Class	The feed element that contains the body of the announcement and its associated comments, likes, and so on.	31.0
id	String	18-character ID of the announcement.	31.0
isArchived	Boolean	Specifies whether the announcement is archived.	36.0
sendEmails	Boolean	Specifies whether the announcement is sent as an email to all group members.	36.0
url	String	The URL to the announcement.	33.0

SEE ALSO:

[ConnectApi.AnnouncementPage](#)

[ConnectApi.ChatterGroup Class](#)

ConnectApi.AnnouncementPage

A collection of announcements.

Name	Type	Description	Available Version
announcements	List<ConnectApi. Announcement>	A collection of ConnectApi.Announcement objects.	31.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	31.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a ConnectApi.NotFoundException error is returned.	31.0
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	31.0

ConnectApi.ApprovalAttachment Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.ApprovalCapability Class](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Name	Type	Description	Available Version
id	String	A work item ID.	28.0–31.0
postTemplateFields	List <ConnectApi. ApprovalPost TemplateField>	Collection of approval post template fields	28.0–31.0
process InstanceStepId	String	An approval step ID.	30.0–31.0
status	ConnectApi. WorkflowProcess Status Enum	Specifies the status of a workflow process. <ul style="list-style-type: none"> • Approved • Fault • Held • NoResponse • Pending • Reassigned • Rejected • Removed • Started 	28.0–31.0

ConnectApi.ApprovalCapability Class

If a feed element has this capability, it includes information about an approval.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
id	String	The work item ID. The work item ID is <code>null</code> if there isn't a pending work item associated with the approval record.	32.0
postTemplate Fields	List< ConnectApi.ApprovalPostTemplateField >	The details of the approval post template field.	32.0
processInstance StepId	String	The process instance step ID. The associated record represents one step in an approval process.	32.0
status	ConnectApi.WorkflowProcessStatus	The status of the approval.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.ApprovalPostTemplateField Class

Name	Type	Description	Available Version
displayName	String	The field name	28.0
displayValue	String	The field value or <code>null</code> if the field is set to <code>null</code> .	28.0
record	ConnectApi.Reference	A record ID If no record exists or if the reference is <code>null</code> , this value is <code>null</code> .	28.0

SEE ALSO:

[ConnectApi.ApprovalCapability Class](#)

ConnectApi.ArticleItem Class

Article item in question and answers suggestions.

Property Name	Type	Description	Available Version
id	String	Id of the article.	32.0
rating	Double	The rating of the article.	32.0
title	String	Title of the article.	32.0
urlLink	String	Link URL of the article.	32.0

Property Name	Type	Description	Available Version
viewCount	Integer	Number of votes given to the article.	32.0

SEE ALSO:

[ConnectApi.QuestionAndAnswersSuggestions Class](#)

ConnectApi.ArticleSummary

A knowledge article summary.

Subclass of [ConnectApi.ActorWithId Class](#)

Property Name	Type	Description	Available Version
articleType	String	Type of the knowledge article.	37.0
knowledgeArticleVersionId	String	ID of the knowledge article version.	39.0
lastPublishedDate	Datetime	Last published date of the knowledge article.	37.0
rating	Double	The rating of the article.	37.0
summary	String	Summary of the knowledge article contents.	37.0
title	String	Title of the knowledge article.	37.0
urlName	String	URL name of the knowledge article.	37.0
viewCount	Integer	Number of times the knowledge article has been viewed.	38.0

ConnectApi.AssociatedActionsCapability Class

If a feed element has this capability, it has platform actions associated with it.

Property Name	Type	Description	Available Version
platformActionGroups	List< ConnectApi.PlatformActionGroup >	The platform action groups associated with a feed element. Platform action groups are returned in the order specified in the <code>ConnectApi.AssociatedActionsCapabilityInput</code> class.	33.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.AudienceCriteria

Recommendation audience criteria.

This class is abstract.

This class is a superclass of:

- [ConnectApi.CustomListAudienceCriteria](#)
- [ConnectApi.NewUserAudienceCriteria](#)

Property Name	Type	Description	Available Version
type	ConnectApi.RecommendationAudienceCriteriaType	Specifies the recommendation audience criteria type. One of these values: <ul style="list-style-type: none"> • <code>CustomList</code>—A custom list of users makes up the audience. • <code>MaxDaysInCommunity</code>—New community members make up the audience. 	36.0

SEE ALSO:

[ConnectApi.RecommendationAudience](#)

ConnectApi.BannerCapability Class

If a feed element has this capability, it has a banner motif and style.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
motif	ConnectApi.Motif	A banner motif.	31.0
style	ConnectApi.BannerStyle	Decorates a feed item with a color and set of icons. Possible value: <ul style="list-style-type: none"> • <code>Announcement</code>—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement. 	31.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.BannerPhoto

A banner photo.

Property Name	Type	Description	Available Version
bannerPhotoUrl	String	URL to the banner photo in a large format. This URL is available only to authenticated users.	36.0

Property Name	Type	Description	Available Version
bannerPhotoVersionId	String	18-character version ID of the banner photo.	36.0
url	String	URL to the banner photo.	36.0

SEE ALSO:

[ConnectApi.ChatterGroup Class](#)

[ConnectApi.UserDetail Class](#)

ConnectApi.BasicTemplateAttachment Class

! **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.EnhancedLinkCapability](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Attachments in feed items with type `BasicTemplate` return objects of this type.

Property	Type	Description	Available Version
description	String	An optional description with a 500 character limit.	28.0–31.0
icon	ConnectApi.Icon	An optional icon.	28.0–31.0
linkRecordId	String	If <code>linkURL</code> refers to a Salesforce record, <code>linkRecordId</code> contains the ID of the record.	28.0–31.0
linkUrl	String	An optional URL to a detail page if there is more content that can't be displayed inline. Do not specify <code>linkUrl</code> unless you specify a <code>title</code> .	28.0–31.0
title	String	An optional title to the detail page. If <code>linkUrl</code> is specified, the title links to <code>linkUrl</code> .	28.0–31.0

ConnectApi.BatchResult

The result of an operation returned by a batch method.

Namespace

[ConnectApi](#)

Usage

Calls to batch methods return a list of `BatchResult` objects. Each element in the `BatchResult` list corresponds to the strings in the list parameter passed to the batch method. The first element in the `BatchResult` list matches the first string passed in the list parameter, the second element corresponds with the second string, and so on. If only one string is passed, the `BatchResult` list contains a single element.

Example

The following example shows how to obtain and iterate through the returned `ConnectApi.BatchResult` objects. The code adds two group IDs to a list. One of group IDs is incorrect, which causes a failure when the code calls the batch method. After it calls the batch method, it iterates through the results to determine whether the operation was successful or not for each group ID in the list. The code writes the ID of every group that was processed successfully to the debug log. The code writes an error message for every failed group.

This example generates one successful operation and one failure.

```
List<String> myList = new List<String>();
// Add one correct group ID.
myList.add('0F9D00000000oOT');
// Add one incorrect group ID.
myList.add('0F9D00000000izf');

ConnectApi.BatchResult[] batchResults = ConnectApi.ChatterGroups.getGroupBatch(null,
myList);

// Iterate through each returned result.
for (ConnectApi.BatchResult batchResult : batchResults) {
    if (batchResult.isSuccess()) {
        // Operation was successful.
        // Print the group ID.
        ConnectApi.ChatterGroupSummary groupSummary;
        if (batchResult.getResult() instanceof ConnectApi.ChatterGroupSummary) {
            groupSummary = (ConnectApi.ChatterGroupSummary) batchResult.getResult();
        }
        System.debug('SUCCESS');
        System.debug(groupSummary.id);
    }
    else {
        // Operation failed. Print errors.
        System.debug('FAILURE');
        System.debug(batchResult.getErrorMessage());
    }
}
```

IN THIS SECTION:

[BatchResult Methods](#)

BatchResult Methods

The following are instance methods for `BatchResult`.

IN THIS SECTION:

[getError\(\)](#)

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

[getErrorMessage\(\)](#)

Returns a `String` that contains an error message.

`getErrorTypeName()`

Returns a `String` that contains the name of the error type.

`getResult()`

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to `BatchResult.getResult()` returns a `ConnectApi.GroupMembership` object.

`isSuccess()`

Returns a `Boolean` that is set to `true` if the batch operation was successful for this object, `false` otherwise.

`getError()`

If an error occurred, returns a `ConnectApi.ConnectApiException` object providing the error code and description.

Signature

```
public ConnectApi.ConnectApiException getError()
```

Return Value

Type: `ConnectApi.ConnectApiException`

`getErrorMessage()`

Returns a `String` that contains an error message.

Signature

```
public String getErrorMessage()
```

Return Value

Type: `String`

Usage

The error message doesn't make a round trip through a Visualforce view state, because exceptions can't be serialized.

`getErrorTypeName()`

Returns a `String` that contains the name of the error type.

Signature

```
public String getErrorTypeName()
```

Return Value

Type: `String`

getResult()

Returns an object that contains the results of the batch operation. The object is typed according to the batch method. For example, if you call `getMembershipBatch()`, a successful call to `BatchResult.getResult()` returns a `ConnectApi.GroupMembership` object.

Signature

```
public Object getResult()
```

Return Value

Type: `Object`

isSuccess()

Returns a Boolean that is set to `true` if the batch operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: `Boolean`

ConnectApi.BlankRecordField Class

Subclass of [ConnectApi.AbstractRecordField Class](#)

A record field displayed as a place holder in a grid of fields.

ConnectApi.BookmarksCapability Class

If a feed element has this capability, the context user can bookmark it.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
<code>isBookmarkedByCurrentUser</code>	<code>Boolean</code>	Indicates whether the feed element has been bookmarked by the context user (<code>true</code>) or not (<code>false</code>).	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.BundleCapability Class

If a feed element has this capability, it has a container of feed elements called a *bundle*.

This class is abstract.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Superclass of:

- [ConnectApi.GenericBundleCapability Class](#)
- [ConnectApi.TrackedChangeBundleCapability](#)

Property Name	Type	Description	Available Version
bundleType	ConnectApi.BundleType	Defines this feed element's bundle type. The bundle type determines what additional information appears in the bundle.	31.0
page	ConnectApi.FeedElementPage	A collection of feed elements.	31.0
totalElements	Integer	The total number of feed elements that this bundle aggregates.	31.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.CanvasCapability Class

If a feed element has this capability, it renders a canvas app.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
description	String	A description of the canvas app. The maximum size is 255 characters.	32.0
developerName	String	The API name (developer name) of the connected app.	32.0
height	String	The height of the canvas app in pixels.	32.0
icon	ConnectApi.Icon	The icon for the canvas app.	32.0
namespacePrefix	String	A unique namespace prefix for the canvas app.	32.0
parameters	String	JSON parameters passed to the canvas app.	32.0
thumbnailUrl	String	A thumbnail URL to a preview image. The maximum thumbnail size is 120 pixels by 120 pixels.	32.0
title	String	A title for the canvas link.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.CanvasTemplateAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.CanvasCapability Class](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Objects of this type are returned by attachments in feed items with type `CanvasPost`.

Property	Type	Description	Available Version
<code>description</code>	String	Optional. Description of the canvas app. The maximum length of this field is 500 characters.	29.0–31.0
<code>developerName</code>	String	Specifies the developer name (API name) of the canvas app.	29.0–31.0
<code>height</code>	String	Optional. The height of the canvas app in pixels. Default height is 200 pixels.	29.0–31.0
<code>icon</code>	ConnectApi.Icon	The canvas app icon.	29.0–31.0
<code>namespacePrefix</code>	String	Optional. The namespace prefix of the Developer Edition organization in which the canvas app was created.	29.0–31.0
<code>parameters</code>	String	Optional. Parameters passed to the canvas app in JSON format. Example: <pre>{ 'isUpdated'='true' }</pre>	29.0–31.0
<code>thumbnailUrl</code>	String	Optional. A URL to a thumbnail image for the canvas app. Maximum dimensions are 120x120 pixels.	29.0–31.0
<code>title</code>	String	Specifies the title of the link used to call the canvas app.	29.0–31.0

ConnectApi.CaseComment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.CaseCommentCapability Class](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Objects of this type are returned by attachments in feed items with type `CaseCommentPost`.

Name	Type	Description	Available Version
<code>actorType</code>	ConnectApi.CaseActorTypeEnum	Specifies the type of user who made the comment. <ul style="list-style-type: none"> <code>Customer</code>—if a Chatter customer made the comment <code>CustomerService</code>—if a service representative made the comment 	28.0–31.0
<code>createdBy</code>	ConnectApi.UserSummary	Comment's creator	28.0–31.0
<code>createdDate</code>	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0–31.0

Name	Type	Description	Available Version
id	String	Comment's 18-character ID	28.0–31.0
published	Boolean	Specifies whether the comment has been published	28.0–31.0
text	String	Comment's text	28.0–31.0

ConnectApi.CaseCommentCapability Class

If a feed element has this capability, it has a case comment on the case feed.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
actorType	ConnectApi.CaseActorType	Specifies the type of user who made the comment.	32.0
createdBy	ConnectApi.Actor	Information about the user who created the comment.	32.0
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	32.0
eventType	ConnectApi.CaseCommentEventType	Specifies an event type for a comment in the case feed.	32.0
id	String	18-character ID of case comment.	32.0
published	Boolean	Specifies whether the comment has been published.	32.0
text	String	Text of the case comment.	32.0

This class is abstract.

Subclass of [ConnectApi.ActorWithId Class](#)

Superclass of:

- [ConnectApi.ChatterGroupDetail Class](#)
- [ConnectApi.ChatterGroupSummary Class](#)

Name	Type	Description	Available Version
additional Label	String	An extra label for the group, for example, "Archived," "Private," or "Private With Customers." If there isn't an extra label, the value is <code>null</code> .	30.0
announcement	ConnectApi.Announcement	The current announcement for this group. An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.	31.0
bannerPhoto	ConnectApi.BannerPhoto	The banner photo for the group.	36.0
canHave ChatterGuests	Boolean	<code>true</code> if this group allows Chatter guests.	28.0
community	ConnectApi.Reference	Information about the community the group is in.	28.0
description	String	Group's description.	28.0
emailTo ChatterAddress	String	Group's email address for posting to this group by email. Returns <code>null</code> if Chatter emails and posting to Chatter by email aren't both enabled in your organization.	30.0

Name	Type	Description	Available Version
isArchived	Boolean	Specifies whether the group is archived (<code>true</code>) or not (<code>false</code>).	29.0
isAutoArchiveDisabled	Boolean	Specifies whether automatic archiving is disabled for the group (<code>true</code>) or not (<code>false</code>).	29.0
isBroadcast	Boolean	Specifies whether the group is a broadcast group (<code>true</code>) or not (<code>false</code>). In a broadcast group, only group owners and managers can post to the group.	36.0
lastFeedElementPostDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed element posted to the group.	31.0
lastFeedItemPostDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, of the most recent feed item posted to the group. Use <code>lastFeedElementPosted</code> .	28.0–30.0
memberCount	Integer	Total number of group members.	28.0
myRole	ConnectApi.GroupMembershipType Enum	Specifies the type of membership the user has with the group, such as group owner, manager, or member. <ul style="list-style-type: none"> GroupOwner GroupManager NotAMember NotAMemberPrivateRequested StandardMember 	28.0
mySubscription	ConnectApi.Reference	If the context user is a member of this group, contains information about that subscription; otherwise, returns <code>null</code> .	28.0
name	String	Name of the group.	28.0
owner	ConnectApi.UserSummary	Information about the owner of the group.	28.0
photo	ConnectApi.Photo	Information about the group photo.	28.0
visibility	ConnectApi.GroupVisibilityType Enum	Specifies the group visibility type. Valid values are: <ul style="list-style-type: none"> PrivateAccess—Only members of the group can see posts to this group. PublicAccess—All users within the community can see posts to this group. Unlisted—Reserved for future use. 	28.0

ConnectApi.ChatterGroupDetail Class

Subclass of [ConnectApi.ChatterGroup Class](#)

Name	Type	Description	Available Version
fileCount	Integer	The number of files posted to the group.	28.0
information	ConnectApi.GroupInformation	Describes the Information section of the group. In the Web UI, this section is above the Description section. If the group is private, this section is visible only to members. If the context user is not a member of the group or does not have Modify All Data or View All Data permission, this value is <code>null</code> .	28.0
pendingRequests	Integer	The number of requests to join a group that are in a pending state.	29.0

thumb720By480RenditionStatus	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: <ul style="list-style-type: none"> Processing—Image is being rendered. Failed—Rendering process failed. Success—Rendering process was successful. Na—Rendering is not available for this image. 	30.0–31.0
title	String	Title of the file	28.0–31.0
versionId	String	18-character ID for this version of the content	28.0–31.0

ConnectApi.ContentCapability

If a comment has this capability, it has a file attachment.

Subclass of [ConnectApi.FeedElementCapability Class](#).

For files attached to a feed post (instead of a comment) in version 36.0 and later, use [ConnectApi.FilesCapability](#).

If content is deleted from a feed element after it's posted or if the access to the content is changed to private, the `ConnectApi.ContentCapability` exists, however most of its properties are null.

Property Name	Type	Description	Available Version
checksum	String	MD5 checksum for the file.	32.0
contentUrl	String	URL of the content for links and Google docs.	32.0
description	String	Description of the attachment.	32.0
downloadUrl	String	URL to the content.	32.0
fileExtension	String	Extension of the file.	32.0
fileSize	String	Size of the file in bytes. If size cannot be determined, returns <code>Unknown</code> .	32.0
fileType	String	Type of file.	32.0
hasPdfPreview	Boolean	<code>true</code> if the file has a PDF preview available, <code>false</code> otherwise.	32.0
id	String	18-character ID of the content.	32.0

Property Name	Type	Description	Available Version
<code>isInMyFileSync</code>	Boolean	<code>true</code> if the file is synced with Salesforce Files Sync; <code>false</code> otherwise.	32.0
<code>mimeType</code>	String	MIME type of the file.	32.0
<code>renditionUrl</code>	String	URL to the rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
<code>renditionUrl240By180</code>	String	URL to the 240x180 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
<code>renditionUrl720By480</code>	String	URL to the 720x480 size rendition resource for the file. Renditions are processed asynchronously and may not be available immediately after the file has been uploaded.	32.0
<code>sharingOption</code>	ConnectApi.FileSharingOption	Sharing option of the file. Values are: <ul style="list-style-type: none"> <code>Allowed</code>—Resharing of the file is allowed. <code>Restricted</code>—Resharing of the file is restricted. 	35.0
<code>textPreview</code>	String	Text preview of the file if available, <code>null</code> otherwise. The maximum number of characters is 200.	32.0
<code>thumb120By90RenditionStatus</code>	String	The status of the rendering of the 120x90 pixel sized preview image of the file. Should be either <code>Processing</code> , <code>Failed</code> , <code>Success</code> , or <code>Na</code> if unavailable.	32.0
<code>thumb240By180RenditionStatus</code>	String	The status of the rendering of the 240x180 pixel sized preview image of the file. Should be either <code>Processing</code> , <code>Failed</code> , <code>Success</code> , or <code>Na</code> if unavailable.	32.0
<code>thumb720By480RenditionStatus</code>	String	The status of the rendering of the 720x480 pixel sized preview image of the file. Should be either <code>Processing</code> , <code>Failed</code> , <code>Success</code> , or <code>Na</code> if unavailable.	32.0
<code>title</code>	String	Title of the file.	32.0
<code>versionId</code>	String	Version ID of the file.	32.0

ConnectApi.ContentHubAllowedItemTypeCollection

The item types that the context user is allowed to create in a repository folder.

Property Name	Type	Description	Available Version
allowedItemTypes	List< ConnectApi.ContentHub.ItemTypeSummary >	A collection of item types that the context user is allowed to create in a repository folder.	39.0

ConnectApi.ContentHubFieldDefinition

A field definition.

Property Name	Type	Description	Available Version
displayName	String	Label or caption of this field.	39.0
isMandatory	Boolean	Specifies whether this field is mandatory for the item type.	39.0
maxLength	Integer	Maximum length of the value of this field.	39.0
name	String	Name of the field.	39.0
type	ConnectApi.ContentHub.VariableType	Specifies the data type of the value of the field. Values are: <ul style="list-style-type: none"> • BooleanType • DateTimeType • DecimalType • HtmlType • IdType • IntegerType • StringType • UriType • XmlType 	39.0

SEE ALSO:

[ConnectApi.ContentHubItemTypeDetail](#)

ConnectApi.ContentHubItemTypeDetail

The details of an item type associated with a repository folder.

Subclass of [ConnectApi.AbstractContentHubItemType](#)

Property Name	Type	Description	Available Version
fields	List< ConnectApi.ContentHub.FieldDefinition >	A list of fields that the context user is allowed to set in the metadata of this item type.	39.0

ConnectApi.ContentHubItemTypeSummary

The summary of an item type associated with a repository folder.

Subclass of [ConnectApi.AbstractContentHubItemType](#)

No additional properties.

SEE ALSO:

[ConnectApi.ContentHubAllowedItemTypeCollection](#)

ConnectApi.ContentHubPermissionType

A permission type.

Property Name	Type	Description	Available Version
id	String	Internal ID of the permission type in the repository.	39.0
label	String	Label as returned by the repository.	39.0

SEE ALSO:

[ConnectApi.ExternalFilePermissionInformation](#)

ConnectApi.ContentHubProviderType

The type of repository.

Property Name	Type	Description	Available Version
label	String	Localized label of the provider type.	39.0
type	String	Provider type. One of these values: <ul style="list-style-type: none"> • ContentHubBox • ContentHubGDrive • ContentHubSharepoint • ContentHubSharepointOffice365 • ContentHubSharepointOneDrive • SimpleUrl 	39.0

[ConnectApi.ContentHubRepository](#)

ConnectApi.ContentHubRepository

A repository.

Subclass of [ConnectApi.ActorWithId Class](#)

Property Name	Type	Description	Available Version
authentication	ConnectApi.ContentHubRepositoryAuthentication	Repository authentication information.	40.0
features	ConnectApi.ContentHubRepositoryFeatures	Repository features.	39.0
label	String	Repository label.	39.0
name	String	Repository name.	39.0
providerType	ConnectApi.ContentHubProviderType	Repository provider type.	39.0
rootFolderItemsUrl	String	URL to the list of items in the repository root folder.	39.0

SEE ALSO:

[ConnectApi.ContentHubRepositoryCollection](#)

ConnectApi.ContentHubRepositoryAuthentication

Authentication information for a repository.

Property Name	Type	Description	Available Version
authFlowUrl	String	Depends on the <code>authProtocol</code> . <ul style="list-style-type: none"> <code>NoAuthentication</code>—<code>null</code>. <code>Oauth</code>—URL to start the OAuth flow. <code>Password</code>—URL to the authentication settings for external systems. 	40.0
authProtocol	ConnectApi.ContentHubAuthenticationProtocol	Specifies the authentication protocol used for the repository. Values are: <ul style="list-style-type: none"> <code>NoAuthentication</code>—Repository doesn't require authentication. <code>Oauth</code>—Repository uses OAuth authentication protocol. <code>Password</code>—Repository uses user name and password authentication protocol. 	40.0

Property Name	Type	Description	Available Version
<code>userHasAuthSettings</code>	Boolean	Specifies whether the user has credentials or the administrator configured the external data source to use the same set of credentials for every user (<code>true</code>). Otherwise, <code>false</code> .	40.0

SEE ALSO:

[ConnectApi.ContentHubRepository](#)

ConnectApi.ContentHubRepositoryCollection

A collection of repositories.

Property Name	Type	Description	Available Version
<code>currentPageUrl</code>	String	URL to the current page of repositories.	39.0
<code>nextPageUrl</code>	String	URL to the next page of repositories.	39.0
<code>previousPageUrl</code>	String	URL to the previous page of repositories.	39.0
<code>repositories</code>	List<ConnectApi.ContentHubRepository>	Collection of repositories.	39.0

ConnectApi.ContentHubRepositoryFeatures

The features of a repository.

Property Name	Type	Description	Available Version
<code>canBrowse</code>	Boolean	Specifies whether the repository's folder hierarchy can be browsed (<code>true</code>) or not (<code>false</code>).	39.0
<code>canSearch</code>	Boolean	Specifies whether the repository can be searched (<code>true</code>) or not (<code>false</code>).	39.0

ConnectApi.ContentImageFileDetails

Image file details.

Property Name	Type	Description	Available Version
<code>height</code>	Integer	Image's height in pixels.	40.0
<code>imageFormat</code>	String	Image's format.	40.0

Property Name	Type	Description	Available Version
orientation	String	Image's EXIF orientation value, if present.	40.0
width	Integer	Image's width in pixels.	40.0

ConnectApi.CurrencyRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field containing a currency value.

ConnectApi.CustomListAudienceCriteria

The criteria for the custom list type of recommendation audience.

Subclass of [ConnectApi.AudienceCriteria](#).

Property Name	Type	Description	Available Version
memberCount	Integer	Total number of members in the recommendation audience.	36.0
members	ConnectApi.UserReferencePage	The members of the recommendation audience.	36.0

ConnectApi.DashboardComponentAttachment Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.DashboardComponent SnapshotCapability](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Objects of this type are returned as attachments in feed items with type `DashboardSnapshot`.

Name	Type	Description	Available Version
componentId	String	Component's 18-character ID	28.0–31.0
componentName	String	Name of the component. If no name is saved with the component, returns the localized string, "Untitled Component."	28.0–31.0
dashboardBodyText	String	Text displayed next to the actor in the body of a feed item. This is used instead of the default body text. If no text is specified, and there is no default body text, returns null.	28.0–31.0
dashboardId	String	Dashboard's 18-character ID	28.0–31.0
dashboardName	String	Name of the dashboard.	28.0–31.0
fullSizeImageUrl	String	URL of the full-sized dashboard image	28.0–31.0
lastRefreshDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, specifying when this dashboard was last refreshed.	28.0–31.0

Name	Type	Description	Available Version
lastRefreshDate DisplayText	String	The text of the last refresh date to be displayed, such as, "Last refreshed on October 31, 2011."	28.0–31.0
runningUser	ConnectApi.User Summary	The user running the dashboard.	28.0–31.0
thumbnailUrl	String	URL of the thumbnail-sized dashboard image.	28.0–31.0

ConnectApi.DashboardComponentSnapshotCapability

If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.

Subclass of [ConnectApi.FeedElementCapability](#) Class.

Property Name	Type	Description	Available Version
dashboardComponent Snapshot	ConnectApi.DashboardComponent Snapshot	The dashboard component snapshot.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities](#) Class

ConnectApi.DashboardComponentSnapshot

Represents both dashboard component snapshots and alerts you receive when a dashboard component value crosses a threshold.

Property Name	Type	Description	Available Version
componentId	String	18-character ID of the dashboard component.	32.0
componentName	String	The dashboard component name.	32.0
dashboardBodyText	String	Display this text next to the actor in the feed element. Use this text in place of the default body text.	32.0
dashboardId	String	18-character ID of the dashboard.	32.0
dashboardName	String	The name of the dashboard.	32.0
fullSizeImageUrl	String	The source URL to retrieve the full-size image of a snapshot. Access this URL with OAuth credentials.	32.0
lastRefreshDate	Datetime	ISO-8601 formatted date specifying when this dashboard component was last refreshed.	32.0
lastRefresh DateDisplayText	String	Display text for the last refresh date, for example, "Last Refreshed on October 31, 2013."	32.0

Property Name	Type	Description	Available Version
runningUser	ConnectApi.UserSummary	The running user of the dashboard at the time the snapshot was posted. This value may be <code>null</code> . Each dashboard has a running user, whose security settings determine which data to display in a dashboard.	32.0
thumbnailUrl	String	The source URL to retrieve the thumbnail image of a snapshot. Access this URL with OAuth credentials.	32.0

[ConnectApi.DashboardComponentSnapshotCapability](#)

[ConnectApi.DatacloudCompanies Class](#)

ConnectApi.DatacloudCompany Class

Information about a Data.com company.

All company information is visible for companies that you purchased and own. If you haven't purchased a company, some of the fields are hidden. Hidden fields are fully or partially hidden by asterisks "****."

Property Name	Type	Description	Available Version
activeContacts	Integer	The number of active Data.com contacts who work in the company.	32.0
address	ConnectApi.Address	The postal address for the company. This is typically a physical address that can include the city, state, street, and postal code.	32.0
annualRevenue	Double	The amount of money that the company makes in one year. Annual revenue is measured in US dollars.	32.0
companyId	String	A unique numerical identifier for the company. This is the Data.com identifier for a company.	32.0
description	String	A brief synopsis of the company that provides a general overview of the company and what it does.	32.0
dunsNumber	String	A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.	32.0
industry	String	A description of the type of industry such as "Telecommunications," "Agriculture," or "Electronics."	32.0
isInactive	Boolean	Indicates whether this company is active (true) or not (false). Inactive companies have out-of-date information in Data.com.	32.0

Property Name	Type	Description	Available Version
isOwned	Boolean	<ul style="list-style-type: none"> • True: You or your organization owns this company. • False: Neither you nor your organization owns this company. 	32.0
naicsCode	String	North American Industry Classification System (NAICS) codes were created to provide more details about a business's service orientation. The code descriptions are focused on what a business does.	32.0
naicsDescription	String	A description of the NAICS classification.	32.0
name	String	The name of the company.	32.0
numberOfEmployees	Integer	The number of employees who are working for the company.	32.0
ownership	String	The type of ownership of the company: <ul style="list-style-type: none"> • Public • Private • Government • Other 	32.0
phoneNumbers	ConnectApi.PhoneNumber	The list of telephone numbers for the company, including the type. Here are some possible types of telephone numbers. <ul style="list-style-type: none"> • Mobile • Work • Fax 	32.0
sic	String	Standard Industrial Codes (SIC) is a numbering convention that indicates what type of service a business provides. It's a four-digit value.	32.0
sicDescription	String	A description of the SIC classification.	32.0
site	String	Company's site. For example, HQ, Single Location, or Branch. An organization status of the company. <ul style="list-style-type: none"> • Branch: a secondary location to a headquarter location. • Headquarter: the parent company has branches or subsidiaries. • Single Location: a single business with no subsidiaries or branches. 	32.0

Property Name	Type	Description	Available Version
tickerSymbol	String	The symbol that uniquely identifies companies that are traded on public stock exchanges.	32.0
tradeStyle	String	A legal name under which a company conducts business.	32.0
updatedAtDate	Datetime	The date of the most recent change to this company's information.	32.0
website	String	The standard URL for the company's home page.	32.0
yearStarted	String	The year when the company was founded.	32.0

ConnectApi.DatacloudCompanies Class

Lists all companies that were purchased in a specific order, page URLs, and the number of companies in the order.

Property Name	Type	Description	Available Version
companies	ConnectApi.DatacloudCompany	A detailed list of companies that were part of a single order.	32.0
currentPageUrl	String	The URL for the current page of a list of companies.	32.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	32.0
previousPageUrl	String	The URL to the previous page of companies that were viewed before the current page. If this value is <code>null</code> , there's no previous page.	32.0
total	Integer	The number of companies in the order. You can calculate the number of pages to display by dividing this number by your page size. The default page size is 25.	32.0

ConnectApi.DatacloudContact

Information about a Data.com contact.

All contact information is visible for contacts that you purchased. If you have not purchased a contact, some of the fields will be hidden. Hidden fields are fully or partially hidden by asterisks "****".

Property Name	Type	Description	Available Version
address	ConnectApi.Address	The contact's business address.	32.0
companyId	String	A unique numerical identifier for the company where the contact works. This is the Data.com identifier for a company.	32.0
companyName	String	The company name where the contact works.	32.0
contactId	String	A unique numerical identifier for the contact. This is the Data.com identifier for a contact.	32.0
department	String	The department in the company where the contact works. Here are some possible departments. <ul style="list-style-type: none"> • Engineering • IT • Marketing • Sales 	32.0
email	String	The most current business email address for the contact.	32.0
firstName	String	The first name of the contact.	32.0
isInactive	Boolean	Whether this contact is active (true) or not (false). Inactive contacts have out-of-date information in Data.com.	32.0
isOwned	Boolean	Whether this contact is owned (true) or not (false).	32.0
lastName	String	The last name of the contact.	32.0
level	String	A human resource label that designates a person's level in the company. Here are some possible levels. <ul style="list-style-type: none"> • C-Level • Director • Manager • Staff 	32.0
phoneNumbers	ConnectApi.PhoneNumber	Telephone numbers for the contact, which can include direct-dial business telephone numbers, mobile telephone numbers, and business headquarters telephone numbers. The type of telephone number is also indicated.	32.0
title	String	The title of the contact, such as CEO or Vice President.	32.0

Property Name	Type	Description	Available Version
updatedAtDate	Datetime	The date of the most recent change to this contact's information.	32.0

SEE ALSO:

[ConnectApi.DatacloudContacts](#)

ConnectApi.DatacloudContacts

Lists all contacts that were purchased in the specific order, page URLs, and the number of contacts in the order.

Property Name	Type	Description	Available Version
contacts	List<ConnectApi.DatacloudContact>	A detailed list of purchased contacts.	32.0
currentPageUrl	String	URL to the current page of contacts.	32.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	32.0
previousPageUrl	String	URL to the previous page of contacts. This value is null if there is no previous page.	32.0
total	Integer	Number of contacts that are associated with this order. Can be greater than the number of contacts that are shown on a single page.	32.0

ConnectApi.DatacloudOrder Class

Represents a Datacloud order.

Property Name	Type	Description	Available Version
entityUrl	String	URL to a list of contacts or companies that were purchased with this order.	32.0
id	String	Unique number that's used to track your order information.	32.0
purchaseCount	Integer	Number of contacts or companies that were purchased for this order.	32.0
purchaseDate	Datetime	Purchase date for this order.	32.0
url	String	GET request URL for this order.	32.0

ConnectApi.DatacloudPurchaseUsage Class

Information about Data.com point usage for monthly and list pool users.

Property Name	Type	Description	Available Version
<code>listpoolCreditsAvailable</code>	Integer	The points or credits that are available in a pool of credits for your organization. This pool of credits can be used by any List Pool User in your organization.	32.0
<code>listpoolCreditsUsed</code>	Integer	The points or credits that have been used from a pool of credits that are used by List Pool Users to purchase records.	32.0
<code>monthlyCreditsAvailable</code>	Integer	The total credits that are assigned to a Monthly User. Unused credits expire at the end of each month.	32.0
<code>monthlyCreditsUsed</code>	Integer	The credits that are used by a Monthly User for the current month.	32.0

ConnectApi.DateRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field containing a date.

Name	Type	Description	Available Version
<code>dateValue</code>	Datetime	A date that a machine can read. Ignore the trailing <code>00:00:00.000Z</code> characters.	29.0

ConnectApi.DigestJob

Represents a successfully enqueued API digest job request.

Property Name	Type	Description	Available Version
<code>period</code>	ConnectApi.DigestPeriod	Specifies the period of time that is included in a Chatter email digest. Values are: <ul style="list-style-type: none"> <code>DailyDigest</code>—The email includes up to the 50 latest posts from the previous day. <code>WeeklyDigest</code>—The email includes up to the 50 latest posts from the previous week. 	37.0

ConnectApi.DirectMessageCapability

If a feed element has this capability, it's a direct message.

Property Name	Type	Description	Available Version
memberChanges	ConnectApi.DirectMessageMemberActivityPage	Member activities of the direct message, with the most recent activity first.	40.0
members	ConnectApi.DirectMessageMemberPage	Members included in the direct message.	39.0
originalMembers	ConnectApi.DirectMessageMemberPage	Original members of the direct message.	40.0
subject	String	Subject of the direct message.	39.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.DirectMessageMemberActivity

Direct message member activity.

Property Name	Type	Description	Available Version
activityDate	Datetime	Direct message member activity date.	40.0
actor	ConnectApi.UserSummary	User who changed the direct message membership.	40.0
membersAdded	ConnectApi.DirectMessageMemberPage	Members added to the direct message as part of the activity.	40.0
membersRemoved	ConnectApi.DirectMessageMemberPage	Members removed from the direct message as part of the activity.	40.0

SEE ALSO:

[ConnectApi.DirectMessageMemberActivityPage](#)

ConnectApi.DirectMessageMemberActivityPage

A page of direct message member activities.

Property Name	Type	Description	Available Version
activities	List<ConnectApi.DirectMessageMemberActivity>	Collection of direct message member activities.	40.0

Property Name	Type	Description	Available Version
<code>currentPageToken</code>	String	Token identifying the current page.	40.0
<code>currentPageUrl</code>	String	Chatter REST API URL identifying the current page.	40.0
<code>nextPageToken</code>	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	40.0
<code>nextPageUrl</code>	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	40.0

SEE ALSO:

[ConnectApi.DirectMessageCapability](#)

ConnectApi.DirectMessageMemberPage

A collection of direct message members.

Property Name	Type	Description	Available Version
<code>currentPageToken</code>	String	Page token to access the current page of direct message members.	39.0
<code>currentPageUrl</code>	String	URL to the current page of direct message members.	39.0
<code>nextPageToken</code>	String	Page token to access the next page of direct message members.	39.0
<code>nextPageUrl</code>	String	URL to the next page of direct message members.	39.0
<code>users</code>	List<ConnectApi.UserSummary>	Collection of direct message members.	39.0

SEE ALSO:

[ConnectApi.DirectMessageCapability](#)

[ConnectApi.DirectMessageMemberActivity](#)

ConnectApi.EditCapability

If a feed element or comment has this capability, users who have permission can edit it.

Property Name	Type	Description	Available Version
<code>isEditRestricted</code>	Boolean	Specifies whether editing this feed element or comment is restricted. If <code>true</code> , the context user can't edit this feed element or comment. If <code>false</code> , the context user may or may not have permission to edit this feed element or comment. To determine if the context user can edit a feed element or comment, use the isFeedElementEditableByMe (communityId, feedElementId) or isCommentEditableByMe (communityId, commentId) method.	34.0
<code>isEditableByMeUrl</code>	String	The URL to check if the context user is able to edit this feed element or comment.	34.0
<code>lastEditedBy</code>	ConnectApi.Actor	Who last edited this feed element or comment.	34.0
<code>lastEditedDate</code>	Datetime	The most recent edit date of this feed element or comment.	34.0
<code>latestRevision</code>	Integer	The most recent revision of this feed element or comment.	34.0
<code>relativeLastEditedDate</code>	String	Relative last edited date, for example, "2h ago."	34.0

SEE ALSO:

[ConnectApi.CommentCapabilities Class](#)

ConnectApi.EmailAddress

An email address.

Name	Type	Description	Available Version
<code>displayName</code>	String	The display name for the email address.	29.0
<code>emailAddress</code>	String	The email address.	29.0
<code>relatedRecord</code>	ConnectApi.RecordSummary Class	The summary of a related record, for example, a contact or user summary.	36.0

SEE ALSO:

[ConnectApi.EmailMessageCapability](#)

ConnectApi.EmailAttachment

An email attachment in an email message.

Property Name	Type	Description	Available Version
attachment	ConnectApi.RecordSummary	Record summary of the attachment.	36.0
contentType	String	Type of attachment.	36.0
fileName	String	Name of the attachment.	36.0

SEE ALSO:

[ConnectApi.EmailMessageCapability](#)

ConnectApi.EmailMergeFieldInfo

The map for objects and their merge fields.

Property Name	Type	Description	Available Version
entityToMergeFieldsMap	Map<String, ConnectApi.EmailMergeFieldCollectionInfo>	Map for multiple objects and their merge field collections.	39.0

ConnectApi.EmailMergeFieldCollectionInfo

The merge fields for an object.

Property Name	Type	Description	Available Version
mergeFields	List<String>	List of merge fields for a single object.	39.0

SEE ALSO:

[ConnectApi.EmailMergeFieldInfo](#)

ConnectApi.EmailMessage Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.EmailMessageCapability](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

An email message from a case.

Name	Type	Description	Available Version
direction	ConnectApi.EmailMessageDirectionEnum	The direction of the email message. <ul style="list-style-type: none"> Inbound—An inbound message (sent by a customer). Outbound—An outbound message (sent to a customer by a support agent). 	29.0–31.0
emailMessageId	String	The ID of the email message.	29.0–31.0
subject	String	The subject of the email message.	29.0–31.0
textBody	String	The body of the email message.	29.0–31.0
toAddresses	List<ConnectApi.EmailAddress>	A list of email addresses to send the message to.	29.0–31.0

ConnectApi.EmailMessageCapability

If a feed element has this capability, it has an email message from a case.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
attachments	List<ConnectApi.EmailAttachment>	The attachments in the email message.	36.0
bccAddresses	List<ConnectApi.EmailAddress>	The BCC addresses for the email message.	36.0
body	String	The body of the email message.	36.0
ccAddresses	List<ConnectApi.EmailAddress>	The CC addresses for the email message.	36.0
direction	ConnectApi.EmailMessageDirectionEnum	The direction of the email message. Values are: <ul style="list-style-type: none"> Inbound—An inbound message (sent by a customer). Outbound—An outbound message (sent to a customer by a support agent). 	32.0
emailMessageId	String	The ID of the email message.	32.0
fromAddress	ConnectApi.EmailAddress	The From address for the email message.	36.0
isRichText	Boolean	Indicates whether the body of the email message is in rich text format.	36.0
subject	String	The subject of the email message.	32.0

Property Name	Type	Description	Available Version
textBody	String	The body of the email message.  Important: In version 36.0 and later, use the body property.	32.0–35.0
toAddresses	List<ConnectApi.EmailAddress>	The To addresses of the email message.	32.0
totalAttachments	Integer	The total number of attachments in the email message.	38.0

ConnectApi.Emoji

An emoji.

Property Name	Type	Description	Available Version
category	String	Emoji category.	39.0
shortcut	String	Emoji shortcut.	39.0
unicodeCharacter	String	Emoji's unicode character.	39.0

SEE ALSO:

[ConnectApi.EmojiCollection](#)

ConnectApi.EmojiCollection

A collection of emojis.

Property Name	Type	Description	Available Version
emojis	List<ConnectApi.Emoji>	A collection of emojis.	39.0

SEE ALSO:

[ConnectApi.SupportedEmojis](#)

ConnectApi.EnhancedLinkCapability

If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
description	String	A description with a 500 character limit.	32.0
icon	ConnectApi.Icon	A icon.	32.0
linkRecordId	String	A ID associated with the link if the link URL refers to a Salesforce record.	32.0
linkUrl	String	A link URL to a detail page if available content can't display inline.	32.0
title	String	A title to a detail page.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.EntityLabel

An entity's label.

Property Name	Type	Description	Available Version
label	String	Localized singular label of the entity.	40.0
labelPlural	String	Localized plural label of the entity.	40.0

SEE ALSO:

[ConnectApi.RecordSummary Class](#)

ConnectApi.EntityLinkSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

Name	Type	Description	Available Version
motif	ConnectApi.Motif Class	A set of small, medium, and large icons that indicate whether the entity is a file, group, record, or user. The motif can also contain the object's base color.	28.0
reference	ConnectApi.Reference	A reference to the link object if applicable, otherwise, null.	28.0

ConnectApi.EntityRecommendation Class

Represents a recommendation, including file, group, record, topic, user, and custom recommendations.

Subclass of [ConnectApi.AbstractRecommendation Class](#).

Property Name	Type	Description	Available Version
<code>actOnUrl</code>	String	For user, file, group, topic, and record <code>entity</code> types, use this Chatter REST URL with a POST request to take action on the recommendation. For <code>ConnectApi.RecommendedObject</code> <code>entity</code> types, such as custom recommendations, use the <code>actOnUrl</code> property of the ConnectApi.PlatformAction Class to take action on the recommendation.	32.0
<code>action</code>	ConnectApi.Recommendation.ActionType	Specifies the action to take on a recommendation. <ul style="list-style-type: none"> <code>follow</code>—Follow a file, record, topic, or user. <code>join</code>—Join a group. <code>view</code>—View a file, group, article, record, user, custom, or static recommendation. 	32.0
<code>entity</code>	ConnectApi.Actor	The entity with which the receiver is recommended to take action.	32.0

ConnectApi.Extension (Pilot)

An extension.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property Name	Type	Description	Available Version
<code>alternativeRepresentation</code>	ConnectApi.Alternative (Pilot)	Alternative representation of the extension.	40.0
<code>extensionId</code>	String	ID of the extension.	40.0
<code>payload</code>	String	Payload associated with the extension.	40.0
<code>payloadVersion</code>	String	Payload version that identifies the structure of the payload associated with the extension.	40.0

SEE ALSO:

[ConnectApi.ExtensionsCapability \(Pilot\)](#)

ConnectApi.ExtensionDefinition (Pilot)

An extension's definition.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property Name	Type	Description	Available Version
canAccess	Boolean	Indicates whether users can access the extension when it's associated with a feed element.	40.0
canCreate	Boolean	Indicates whether users can create a feed element with the extension in the org.	40.0
createdDate	Datetime	Date when the extension was created.	40.0
description	String	Description of the extension.	40.0
iconUrl	String	URL to the icon for the extension.	40.0
id	String	ID of the extension.	40.0
information Collection	List<ConnectApi. AbstractExtension Information>	Collection of extension information.	40.0
isEnabled InCommunity	Boolean	Indicates whether the extension is enabled in communities.	40.0
isEnabled InLightningPublisher	Boolean	Indicates whether the extension is enabled in the Lightning publisher.	40.0
name	String	Name of the extension.	40.0

SEE ALSO:

[ConnectApi.ExtensionDefinitions \(Pilot\)](#)

ConnectApi.ExtensionDefinitions (Pilot)

A collection of extension definitions.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	40.0
extension Definitions	List<ConnectApi. ExtensionDefinition>	Collection of extension definitions.	40.0

Property Name	Type	Description	Available Version
nextPageToken	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	40.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	40.0
total	Integer	Total number of extensions returned.	40.0

ConnectApi.ExtensionsCapability (Pilot)

If a feed element has this capability, it has one or more extension attachments.

-  **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property	Type	Description	Available Version
activityReminderNotificationsEnabled	Boolean	Reserved for future use.	37.0
chatter	Boolean	Indicates whether Chatter is enabled for an organization	28.0
chatterActivity	Boolean	Indicates whether the user details include information about Chatter activity	28.0
chatterAnswers	Boolean	Indicates whether Chatter Answers is enabled	29.0
chatterGlobalInfluence	Boolean	Indicates whether the user details include global Chatter activity	28.0
chatterGroupRecords	Boolean	Specifies whether Chatter groups can have records associated with them	30.0
chatterGroupRecordSharing	Boolean	Specifies whether Chatter records are implicitly shared among group members when records are added to groups	30.0

Property	Type	Description	Available Version
<code>chatterMessages</code>	Boolean	Indicates whether Chatter messages are enabled for the organization	28.0
<code>chatterTopics</code>	Boolean	Indicates whether Chatter topics are enabled	28.0
<code>communitiesEnabled</code>	Boolean	Indicates whether Salesforce Communities is enabled.	31.0
<code>communityModeration</code>	Boolean	Specifies whether community moderation is enabled.	29.0
<code>communityReputation</code>	Boolean	Specifies whether reputation is enabled for communities in the organization.	32.0
<code>dashboardComponentSnapshots</code>	Boolean	Indicates whether the user can post dashboard component snapshots	28.0
<code>defaultCurrencyIsoCode</code>	String	The ISO code of the default currency. Applicable only when <code>multiCurrency</code> is false.	28.0
<code>feedPolling</code>	Boolean	Reserved for future use.	28.0
<code>feedStreamEnabled</code>	Boolean	Indicates whether Chatter feed streams are enabled for the org.	39.0
<code>files</code>	Boolean	Indicates whether files can act as resources for Chatter API	28.0
<code>filesOnComments</code>	Boolean	Indicates whether files can be attached to comments	28.0
<code>groupsCanFollow</code>	Boolean	Reserved for future use	28.0–29.0
<code>ideas</code>	Boolean	Indicates whether Ideas is enabled	29.0
<code>managedTopicsEnabled</code>	Boolean	Indicates access to the community home feed and the managed topic feed.	32.0
<code>maxEntitySubscriptionsPerStream</code>	Integer	Specifies the maximum number of feed-enabled entities that can be subscribed to in a Chatter stream.	39.0
<code>maxFilesPerFeedItem</code>	Integer	Specifies the maximum number of files that can be added to a feed item.	36.0
<code>maxStreamsPerPerson</code>	Integer	Specifies the maximum number of Chatter streams that a user can have.	39.0
<code>mobileNotificationsEnabled</code>	Boolean	Reserved for future use	29.0

Property	Type	Description	Available Version
multiCurrency	Boolean	Indicates whether the user's organization uses multiple currencies (<code>true</code>) or not (<code>false</code>). When <code>false</code> , the <code>defaultCurrencyIsoCode</code> indicates the ISO code of the default currency.	28.0
offlineEditEnabled	Boolean	Specifies whether the offline object permissions are enabled for Salesforce1 downloadable app mobile clients.	37.0
publisherActions	Boolean	Indicates whether actions in the publisher are enabled	28.0
storeDataOnDevicesEnabled	Boolean	Indicates whether the Salesforce1 downloadable apps can use secure, persistent storage on mobile devices to cache data.	30.0
thanksAllowed	Boolean	Reserved for future use	28.0
trendingTopics	Boolean	Indicates whether trending topics are enabled	28.0
viralInvitesAllowed	Boolean	Indicates whether existing Chatter users can invite people in their company to use Chatter	28.0
wave	Boolean	Indicates whether Wave is enabled	36.0

ConnectApi.Feed Class

Name	Type	Description	Available Version
feedElementPostUrl	String	Chatter REST API URL for posting feed elements to this subject.	31.0
feedElements	ConnectApi.FeedElementPage	Page of feed elements for the feed specified in <code>redirectedFeedType</code> . Otherwise, <code>null</code> .	40.0
feedElementsUrl	String	Chatter REST API URL of feed elements.	31.0
feedItemsUrl	String	Chatter REST API URL of feed items.	28.0–31.0
isModifiedUrl	String	A Chatter REST API URL with a <code>since</code> request parameter that contains an opaque token that describes when the feed was last modified. Returns <code>null</code> if the feed isn't a news feed. Use this URL to poll a news feed for updates.	28.0
		 Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	

Name	Type	Description	Available Version
redirected FeedType	ConnectApi.FeedType	Specifies which feed is returned if <code>pageSize</code> is specified. Otherwise, <code>null</code> .	40.0
respectsMute	Boolean	Indicates whether the feed respects the mute feature. If <code>true</code> , the feed shows the ability to mute or unmute each element, depending on the value of <code>isMutedByMe</code> ; <code>null</code> if the mute feature is disabled for the organization.	35.0

ConnectApi.FeedBody Class

Subclass of [ConnectApi.AbstractMessageBody Class](#)

No additional properties.

SEE ALSO:

[ConnectApi.Comment Class](#)

[ConnectApi.FeedElement Class](#)

[ConnectApi.FeedEntitySummary](#)

ConnectApi.FeedDirectory Class

A directory of feeds and favorites.

Name	Type	Description	Available Version
favorites	List<ConnectApi.FeedFavorite>	A list of feed favorites	30.0
feeds	List<ConnectApi.FeedDirectoryItem>	A list of feeds	30.0

ConnectApi.FeedDirectoryItem Class

The definition of a feed.

Name	Type	Description	Available Version
feedElementsUrl	String	Chatter REST API resource URL for the feed elements.	
feedItemsUrl	String	Chatter REST API resource URL for the feed items of a specific feed.	30.0–31.0
feedType	ConnectApi.FeedTypeEnum	The feed type. One of these values: <ul style="list-style-type: none"> <code>Bookmarks</code>—Contains all feed items saved as bookmarks by the context user. 	30.0

Name	Type	Description	Available Version
		<ul style="list-style-type: none"> • Company—Contains all feed items except feed items of type <code>TrackedChange</code>. To see the feed item, the user must have sharing access to its parent. • DirectMessageModeration—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Communities Chatter Messages permissions. • DirectMessages—Contains all feed items of the context user's direct messages. • Files—Contains all feed items that contain files posted by people or groups that the context user follows. • Filter—Contains the news feed filtered to contain feed items whose parent is a specified object type. • Groups—Contains all feed items from all groups the context user either owns or is a member of. • Home—Contains all feed items associated with any managed topic in a community. • Landing—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • Moderation—Contains all feed items that are flagged for moderation, except direct messages. The Communities Moderation feed is available only to users with Moderate Community Feeds permissions. • Mute—Contains all feed items that the context user muted. • News—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Also contains all updates for records whose parent is the context user and every feed item and comment that mentions the context user or that mentions a group the context user is a member of. • PendingReview—Contains all feed items and comments that are pending review. • People—Contains all feed items posted by all people the context user follows. • Record—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. 	

Name	Type	Description	Available Version
		<ul style="list-style-type: none"> <code>Streams</code>—Contains all feed items for any combination of up to 25 feed-enabled entities, such as people, groups, and records, that the context user subscribes to in a stream. <code>To</code>—Contains all feed items with mentions of the context user, feed items the context user commented on, and feed items created by the context user that are commented on. <code>Topics</code>—Contains all feed items that include the specified topic. <code>UserProfile</code>—Contains feed items created when a user changes records that can be tracked in a feed, feed items whose parent is the user, and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed. 	
<code>feedUrl</code>	String	Chatter REST API resource URL for a specific feed	30.0
<code>keyPrefix</code>	String	<p>A <i>key prefix</i> is the first three characters of a record ID, which specifies the entity type.</p> <p>For filter feeds, this value is the key prefix associated with the entity type used to filter this feed. All feed items in this feed have a parent whose entity type matches this key prefix value. For non-filter feeds, this value is <code>null</code>.</p>	30.0
<code>label</code>	String	Localized label of the feed	30.0

ConnectApi.FeedElementCapabilities Class

A container for all capabilities that can be included with a feed element.

Property Name	Type	Description	Available Version
approval	ConnectApi.ApprovalCapability Class	If a feed element has this capability, it includes information about an approval.	32.0
associatedActions	ConnectApi.AssociatedActionsCapability Class	If a feed element has this capability, it has platform actions associated with it.	33.0
banner	ConnectApi.BannerCapability Class	If a feed element has this capability, it has a banner motif and style.	31.0
bookmarks	ConnectApi.BookmarksCapability Class	If a feed element has this capability, the context user can bookmark it.	31.0
bundle	ConnectApi.BundleCapability Class	If a feed element has this capability, it has a container of feed elements called a <i>bundle</i> .	31.0
canvas	ConnectApi.CanvasCapability Class	If a feed element has this capability, it renders a canvas app.	32.0
caseComment	ConnectApi.CaseCommentCapability Class	If a feed element has this capability, it has a case comment on the case feed.	32.0
chatterLikes	ConnectApi.ChatterLikesCapability Class	If a feed element has this capability, the context user can like it. Exposes information about existing likes.	31.0
comments	ConnectApi.CommentsCapability Class	If a feed element has this capability, the context user can add a comment to it.	31.0

Property Name	Type	Description	Available Version
content	ConnectApi.ContentCapability	<p>If a comment has this capability, it has a file attachment.</p> <p>Most <code>ConnectApi.ContentCapability</code> properties are null if the content has been deleted from the feed element or if the access has changed to private.</p> <p> Important: In version 36.0 and later, use the <code>files</code> property.</p>	32.0–35.0
dashboardComponentSnapshot	ConnectApi.DashboardComponentSnapshotCapability	If a feed element has this capability, it has a dashboard component snapshot. A snapshot is a static image of a dashboard component at a specific point in time.	32.0
directMessage	ConnectApi.DirectMessageCapability	If a feed element has this capability, it's a direct message.	39.0
edit	ConnectApi.EditCapability	If a feed element has this capability, users who have permission can edit it.	34.0
emailMessage	ConnectApi.EmailMessageCapability	If a feed element has this capability, it has an email message from a case.	32.0
enhancedLink	ConnectApi.EnhancedLinkCapability	If a feed element has this capability, it has a link that may contain supplemental information like an icon, a title, and a description.	32.0
extensions	ConnectApi.ExtensionsCapability (Pilot)	<p>If a feed element has this capability, it has one or more extension attachments.</p> <p> Note: We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.</p>	40.0
feedEntityShare	ConnectApi.FeedEntityShareCapability	If a feed element has this capability, a feed entity is shared with it.	39.0

Property Name	Type	Description	Available Version
files	ConnectApi.FilesCapability	If a feed element has this capability, it has one or more file attachments.	36.0
interactions	ConnectApi.InteractionsCapability	If a feed element has this capability, it has information about user interactions.	37.0
link	ConnectApi.LinkCapability	If a feed element has this capability, it has a link.	32.0
moderation	ConnectApi.ModerationCapability Class	If a feed element has this capability, users in a community can flag it for moderation.	31.0
mute	ConnectApi.MuteCapability	If a feed element has this capability, users can mute it.	35.0
origin	ConnectApi.OriginCapability	If a feed element has this capability, it was created by a feed action.	33.0
poll	ConnectApi.PollCapability Class	If a feed element has this capability, it includes a poll.	31.0
questionAndAnswers	ConnectApi.QuestionAndAnswersCapability Class	If a feed element has this capability, it has a question and comments on the feed element are answers to the question.	31.0
readBy	ConnectApi.ReadByCapability	If a feed element has this capability, the context user can mark it as read.	40.0
recommendations	ConnectApi.RecommendationsCapability	If a feed element has this capability, it has a recommendation.	32.0
recordSnapshot	ConnectApi.RecordSnapshotCapability	If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.	32.0
socialPost	ConnectApi.SocialPostCapability	If a feed element has this capability, it can interact with a social post on a social network.	36.0
status	ConnectApi.StatusCapability	If a feed post or comment has this capability, it has a status that determines its visibility.	37.0
topics	ConnectApi.TopicsCapability Class	If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.	31.0

Property Name	Type	Description	Available Version
trackedChanges	ConnectApi.TrackedChangesCapability	If a feed element has this capability, it contains all changes to a record for a single tracked change event.	32.0

SEE ALSO:

[ConnectApi.FeedElement Class](#)

[ConnectApi.FeedItemSummary](#)

ConnectApi.FeedElementCapability Class

A feed element capability, which defines the characteristics of a feed element.

In API version 30.0 and earlier, most feed items can have comments, likes, topics, and so on. In version 31.0 and later, every feed item (and feed element) can have a unique set of *capabilities*. If a capability property exists on a feed element, that capability is available, even if the capability property doesn't have a value. For example, if the `ChatterLikes` capability property exists on a feed element (with or without a value), the context user can like that feed element. If the capability property doesn't exist, it isn't possible to like that feed element. A capability can also contain associated data. For example, the `Moderation` capability contains data about moderation flags.

This class is abstract.

This class is a superclass of:

This class doesn't have any properties.

ConnectApi.FeedElementPage

A paged collection of `ConnectApi.FeedElement` objects.

Property Name	Type	Description	Available Version
<code>currentPageToken</code>	String	Token identifying the current page.	31.0
<code>currentPageUrl</code>	String	Chatter REST API URL identifying the current page.	31.0
<code>elements</code>	List<ConnectApi.FeedElement Class>	Collection of feed elements.	31.0
<code>isModifiedToken</code>	String	<p>An opaque polling token to use in the <code>since</code> parameter of the <code>ChatterFeeds.isModified</code> method. The token describes when the feed was last modified.</p> <p> Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.</p>	31.0
<code>isModifiedUrl</code>	String	<p>A Chatter REST API URL with a <code>since</code> request parameter that contains an opaque token that describes when the feed was last modified. Returns <code>null</code> if the feed isn't a news feed. Use this URL to poll a news feed for updates.</p> <p> Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.</p>	31.0
<code>nextPageToken</code>	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	31.0

Property Name	Type	Description	Available Version
<code>nextPageUrl</code>	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	31.0
<code>updatesToken</code>	String	A token to use in a request to the <code>ConnectApi.ChatterFeeds.getFeedElementsUpdatedSince</code> method.	31.0
<code>updatesUrl</code>	String	A Chatter REST API feed resource containing the feed elements that have been updated since the feed was refreshed. If the feed doesn't support this feature, the value is <code>null</code> .	31.0

ConnectApi.FeedEntityIsEditable

Indicates if the context user can edit a feed element or comment.

Property Name	Type	Description	Available Version
areAttachmentsEditableByMe	Boolean	<code>true</code> if the context user can add and remove attachments on the feed element or comment, <code>false</code> otherwise.	36.0
feedEntityUrl	String	URL of the feed element or comment.	34.0
isEditableByMe	Boolean	<code>true</code> if the context user can edit the feed element or comment, <code>false</code> otherwise.	34.0

ConnectApi.FeedEntityNotAvailableSummary

A summary when the feed entity isn't available.

This output class is a subclass of [ConnectApi.FeedEntitySummary](#) and has no properties.

ConnectApi.FeedEntityShareCapability

If a feed element has this capability, a feed entity is shared with it.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
feedEntity	ConnectApi.FeedEntitySummary	The summary of the feed entity that is shared with the feed element.	39.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.FeedEntitySummary

The summary of a feed entity that is shared with a feed element.

This class is abstract.

Superclass of:

- [ConnectApi.FeedItemSummary](#)
- [ConnectApi.FeedEntityNotAvailableSummary](#)

Property Name	Type	Description	Available Version
actor	ConnectApi.Actor	Entity that created the feed entity.	39.0
body	ConnectApi.FeedBody	Information about the feed entity.	39.0
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z, when the entity was created.	39.0

Property Name	Type	Description	Available Version
feedElementType	ConnectApi.FeedElementType	Type of feed entity. <ul style="list-style-type: none"> Bundle—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. FeedItem—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values. Recommendation—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user. 	39.0
id	String	18-character ID of the feed entity.	39.0
isEntityAvailable	Boolean	Specifies whether the entity is available. If false , either the user doesn't have access to the entity or the entity was deleted.	39.0
parent	ConnectApi.ActorWithId	Parent of the feed entity.	39.0
relativeCreatedDate	String	Relative created date, for example, "2h ago."	39.0
url	String	URL to the feed entity.	39.0

ConnectApi.FeedFavorite Class

Name	Type	Description	Available Version
community	ConnectApi.Reference	Information about the community that contains the favorite	28.0
createdBy	ConnectApi.UserSummary	Favorite's creator	28.0
feedUrl	String	Chatter REST API URL identifying the feed item for this favorite	28.0
id	String	Favorite's 18-character ID	28.0

Name	Type	Description	Available Version
lastViewDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
name	String	Favorite's name	28.0
searchText	String	If the favorite is from a search, contains the search text, otherwise, an empty string	28.0
target	ConnectApi.Reference	A reference to the topic if applicable, <code>null</code> otherwise	28.0
type	ConnectApi.FeedFavoriteType Enum	An empty string or one of the following values: <ul style="list-style-type: none"> <code>ListView</code> <code>Search</code> <code>Topic</code> 	28.0
url	String	Chatter REST API URL to this favorite	28.0
user	ConnectApi.UserSummary	Information about the user who saved this favorite	28.0

SEE ALSO:

Name	Type	Description	Available Version
favorites	List<ConnectApi.FeedFavorite>	Complete list of favorites	28.0
total	Integer	Total number of favorites	28.0

ConnectApi.FeedItem Class

Subclass of [ConnectApi.FeedElement Class](#) as of 31.0.

Name	Type	Description	Available Version
actor	ConnectApi.Actor	The entity that created the feed item.	28.0
attachment	ConnectApi.FeedItemAttachment	Information about the attachment. If there is no attachment, returns <code>null</code> .	28.0–31.0

 **Important:** As of version 32.0, use the inherited `capabilities` property.

Name	Type	Description	Available Version
canShare	Boolean	Indicates whether the feed item can be shared. If a feed item has multiple file attachments and at least one attachment has been deleted or is inaccessible, the feed item can't be shared. The <code>canShare</code> value is incorrectly set to <code>true</code> in these cases.  Important: As of version 39.0, use the <code>isSharable</code> property.	28.0–38.0
clientInfo	ConnectApi.ClientInfo	Information about the connected app used to authenticate the connection.	28.0
comments	ConnectApi.CommentPage	First page of comments for this feed item.  Important: As of version 32.0, use the inherited <code>capabilities.comments.page</code> property.	28.0–31.0
event	Boolean	<code>true</code> if feed item is created due to an event change, <code>false</code> otherwise	22.0
isBookmarkedByCurrentUser	Boolean	<code>true</code> if the context user has bookmarked this feed item, otherwise, <code>false</code> .  Important: As of version 32.0, use the inherited <code>capabilities.bookmarks.isBookmarkedByCurrentUser</code> property.	28.0–31.0
isDeleteRestricted	Boolean	If this property is <code>true</code> the comment cannot be deleted by the context user. If it is <code>false</code> , it might be possible for the context user to delete the comment, but it is not guaranteed.	28.0
isLikedByCurrentUser	Boolean	<code>true</code> if the context user has liked this feed item, otherwise, <code>false</code>  Important: As of version 32.0, use the inherited <code>capabilities.chatterLikes.isLikedByCurrentUser</code> property.	28.0–31.0
isSharable	Boolean	Indicates whether the feed item can be shared.	39.0
likes	ConnectApi.ChatterLikePage	First page of likes for this feed item.  Important: As of version 32.0, use the inherited	28.0–31.0

Name	Type	Description	Available Version
		capabilities.chatterLikes.page property.	
likesMessage	ConnectApi.MessageBody	A message body that describes who likes the feed item.  Important: As of version 32.0, use the inherited capabilities.chatterLikes.likesMessage property.	28.0–31.0
moderationFlags	ConnectApi.ModerationFlags	Information about the moderation flags on a feed item. If <code>ConnectApi.Features.communityModeration</code> is <code>false</code> , this property is <code>null</code> .  Important: As of version 31.0, use the inherited capabilities.moderation.moderationFlags property.	29.0–30.0
myLike	ConnectApi.Reference	If the context user has liked the feed item, this property is a reference to the specific like, otherwise, <code>null</code> .  Important: As of version 32.0, use the inherited capabilities.chatterLikes.myLike property.	28.0–31.0
originalFeedItem	ConnectApi.Reference	A reference to the original feed item if this feed item is a shared feed item, otherwise, <code>null</code> .	28.0
originalFeedItemActor	ConnectApi.Actor	If this feed item is a shared feed item, returns information about the original poster of the feed item, otherwise, returns <code>null</code> .	28.0
photoUrl	String	URL of the photo associated with the feed item	28.0
preamble	ConnectApi.MessageBody	A collection of message segments, including the unformatted text of the message that you can use as the title of a feed item. Message segments include name, link, and motif icon information for the actor that created the feed item.  Important: For API versions 29.0 and 30.0, use the <code>ConnectApi.FeedItem.preamble.text</code> property as the default case to render text. For API versions 31.0 and later, use the	28.0–30.0

Name	Type	Description	Available Version
		ConnectApi.FeedElement.header.text property as the default case to render text.	
topics	ConnectApi.FeedItemTopicPage	Topics for this feed item.  Important: As of version 31.0, use the inherited <code>capabilities.topics.items</code> property.	28.0–31.0
type	ConnectApi.FeedItemType	Specifies the type of feed item, such as a content post or a text post.  Important: As of API version 32.0, use the <code>capabilities</code> property to determine what can be done with a feed item. See Capabilities . One of these values: <ul style="list-style-type: none"> • <code>ActivityEvent</code>—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • <code>AdvancedTextPost</code>—A feed item with advanced text formatting, such as a group announcement post. • <code>ApprovalPost</code>—Feed item with an approval capability. Approvers can act on the feed item parent. • <code>AttachArticleEvent</code>—Feed item generated when an article is attached to a case in Case Feed. • <code>BasicTemplateFeedItem</code>—Feed item with an enhanced link capability. • <code>CallLogPost</code>—Feed item generated when a call log is saved to a case in Case Feed. • <code>CanvasPost</code>—Feed item generated by a canvas app in the publisher or from Chatter REST API or Chatter in Apex. The post itself is a link to a canvas app. • <code>CaseCommentPost</code>—Feed item generated when a case comment is saved in Case Feed. • <code>ChangeStatusPost</code>—Feed item generated when the status of a case is changed in Case Feed. 	28.0

Name	Type	Description	Available Version
		<ul style="list-style-type: none"> • <code>ChatTranscriptionPost</code>—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • <code>CollaborationGroupCreated</code>—Feed item generated when a new public group is created. Contains a link to the new group. • <code>CollaborationGroupUnarchived</code>—Deprecated. Feed item generated when an archived group is activated. • <code>ContentPost</code>—Feed item with a content capability. • <code>CreateRecordEvent</code>—Feed item that describes a record created in the publisher. • <code>DashboardComponentAlert</code>—Feed item with a dashboard alert. • <code>DashboardComponentSnapshot</code>—Feed item with a dashboard component snapshot capability. • <code>EmailMessageEvent</code>—Feed item generated when an email is sent from a case in Case Feed. • <code>FacebookPost</code>—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • <code>LinkPost</code>—Feed item with a link capability. • <code>MilestoneEvent</code>—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • <code>PollPost</code>—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • <code>ProfileSkillPost</code>—Feed item generated when a skill is added to a user's profile. • <code>QuestionPost</code>—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • <code>ReplyPost</code>—Feed item generated by a Chatter Answers reply. • <code>RypplePost</code>—Feed item generated when a user posts thanks. 	

Name	Type	Description	Available Version
		<ul style="list-style-type: none"> <code>SocialPost</code>—Feed item generated when a social post is created from a case in Case Feed. <code>TextPost</code>—Feed item containing text only. <code>TrackedChange</code>—Feed item created when one or more fields on a record have been changed. <code>UserStatus</code>—Deprecated. A user's post to their own profile. 	
<code>visibility</code>	<code>ConnectApi.FeedItemVisibilityType</code>	Specifies the type of users who can see a feed item. <ul style="list-style-type: none"> <code>AllUsers</code>—Visibility is not limited to internal users. <code>InternalUsers</code>—Visibility is limited to internal users. 	28.0

ConnectApi.FeedItemAttachment Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.FeedElementCapability Class](#) is used.

This class is abstract.

Subclasses:

- [ConnectApi.ApprovalAttachment Class](#)
- [ConnectApi.BasicTemplateAttachment Class](#)
- [ConnectApi.CanvasTemplateAttachment Class](#)
- [ConnectApi.EmailMessage Class](#)
- [ConnectApi.CaseComment Class](#)
- [ConnectApi.ContentAttachment Class](#)
- [ConnectApi.DashboardComponentAttachment Class](#)
- [ConnectApi.FeedPoll Class](#)
- [ConnectApi.LinkAttachment Class](#)
- [ConnectApi.RecordSnapshotAttachment Class](#)
- [ConnectApi.TrackedChangeAttachment Class](#)

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

 **Important:** The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

ConnectApi.FeedItemPage Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.FeedElementPage](#) is used.

A paged collection of `ConnectApi.FeedItem` objects.

Name	Type	Description	Available Version
<code>currentPageToken</code>	String	Token identifying the current page.	28.0–31.0
<code>currentPageUrl</code>	String	Chatter REST API URL identifying the current page.	28.0–31.0
<code>isModifiedToken</code>	String	An opaque polling token to use in the <code>since</code> parameter of the <code>ChatterFeeds.isModified</code> method. The token describes when the feed was last modified.  Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
<code>isModifiedUrl</code>	String	A Chatter REST API URL with a <code>since</code> request parameter that contains an opaque token that describes when the feed was last modified. Returns <code>null</code> if the feed isn't a news feed. Use this URL to poll a news feed for updates.  Important: This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.	28.0–31.0
<code>items</code>	List<ConnectApi.FeedItem>	List of feed items	28.0–31.0
<code>nextPageToken</code>	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	28.0–31.0
<code>nextPageUrl</code>	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	28.0–31.0
<code>updatesToken</code>	String	Token to use in an <code>updatedSince</code> parameter, or <code>null</code> if not available.	30.0–31.0
<code>updatesUrl</code>	String	A Chatter REST API resource with a query string containing the value of the <code>updatesToken</code> property. The resource returns the feed items that have been updated since the last request. Use the URL as it is—do not modify it. Property is <code>null</code> if not available.	30.0–31.0

ConnectApi.FeedItemSummary

A feed item summary.

Subclass of [ConnectApi.FeedEntitySummary](#).

Property Name	Type	Description	Available Version
capabilities	ConnectApi.FeedElementCapabilities	Container for all capabilities that can be included with a feed item.	39.0
header	ConnectApi.MessageBody	Title of the post. This property contains renderable plain text for all the message segments. If a client doesn't know how to render a feed element type, it should render this text.	39.0
modifiedDate	Datetime	When the feed item was modified in the form of an ISO8601 date string, for example, 2011-02-25T18:24:31.000Z.	39.0
originalFeedItem	ConnectApi.Reference	Reference to the original feed item if this feed item is a shared feed item; otherwise, <code>null</code> .	39.0
originalFeedItemActor	ConnectApi.Actor	If this feed item is a shared feed item, information about the original poster of the feed item; otherwise, <code>null</code> .	39.0
photoUrl	String	URL of the photo associated with the feed item.	39.0
visibility	ConnectApi.FeedItemVisibility	Specifies who can see a feed item. <ul style="list-style-type: none"> <code>AllUsers</code>—Visibility is not limited to internal users. <code>InternalUsers</code>—Visibility is limited to internal users. 	39.0

ConnectApi.FeedItemTopicPage Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.TopicsCapability Class](#) is used.

Name	Type	Description	Available Version
canAssignTopics	Boolean	<code>true</code> if a topic can be assigned to the feed item, <code>false</code> otherwise	28.0–31.0
topics	List<ConnectApi.Topic>	List of topics	28.0–31.0

ConnectApi.FeedModifiedInfo Class

 **Important:** This feature is available through a Feed Polling pilot program. This pilot program is closed and not accepting new participants.

Name	Type	Description	Available Version
<code>isModified</code>	Boolean	<code>true</code> if the news feed has been modified since the last time it was polled; <code>false</code> otherwise. Returns <code>null</code> if the feed is not a news feed.	28.0
<code>isModifiedToken</code>	String	An opaque polling token to use in the <code>since</code> parameter of the <code>ChatterFeeds.isModified</code> method. The token describes when the feed was last modified.	28.0
<code>nextPollUrl</code>	String	A Chatter REST API URL with a <code>since</code> request parameter that contains an opaque token that describes when the feed was last modified. Returns <code>null</code> if the feed isn't a news feed. Use this URL to poll a news feed for updates.	28.0

ConnectApi.FeedPoll Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.PollCapability Class](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

This object is returned as the attachment of `ConnectApi.FeedItem` objects where the `type` property is `PollPost`.

Name	Type	Description	Available Version
<code>choices</code>	List<ConnectApi.FeedPollChoice>	List of choices for poll.	28.0–31.0
<code>myChoiceId</code>	String	ID of the poll choice that the context user has voted for in this poll. Returns <code>null</code> if the context user hasn't voted.	28.0–31.0
<code>totalVoteCount</code>	Integer	Total number of votes cast on the feed poll item.	28.0–31.0

ConnectApi.FeedPollChoice Class

Name	Type	Description	Available Version
<code>id</code>	String	Poll choice ID	28.0
<code>position</code>	Integer	The location in the poll where this poll choice exists. The first poll choice starts at 1.	28.0
<code>text</code>	String	Label text associated with the poll choice	28.0
<code>voteCount</code>	Integer	Total number of votes for this poll choice	28.0

Name	Type	Description	Available Version
voteCountRatio	Double	The ratio of total number of votes for this poll choice to all votes cast in the poll. Multiply the ratio by 100 to get the percentage of votes cast for this poll choice.	28.0

SEE ALSO:

[ConnectApi.PollCapability Class](#)

Subclass of [ConnectApi.MessageSegment Class](#)

No additional properties.

ConnectApi.FieldChangeValueSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

Name	Type	Description	Available Version
valueType	ConnectApi. FieldChange ValueType Enum	Specifies the value type of a field change: <ul style="list-style-type: none"> NewValue—A new value OldValue—An old value 	28.0
url	String	URL value if the field change is to a URL field (such as a web address)	28.0

ConnectApi.File Class

This class is abstract.

Subclass of [ConnectApi.ActorWithId Class](#)

Superclass of [ConnectApi.FileSummary Class](#)

Name	Type	Description	Available Version
checksum	String	MD5 checksum for the file	28.0

Name	Type	Description	Available Version
content ModifiedDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. File-specific modified date, which is updated only for direct file operations, such as rename. Modifications to the file from outside of Salesforce can update this date.	32.0
contentSize	Integer	Size of the file in bytes	28.0
contentUrl	String	If the file is a link, returns the URL, otherwise, the string "null"	28.0
description	String	Description of the file	28.0
downloadUrl	String	URL to the file, that can be used for downloading the file	28.0
fileExtension	String	Extension of the file	28.0
fileType	String	Type of file, such as PDF, PowerPoint	28.0
flashRendition Status	String	Specifies if a flash preview version of the file has been rendered	28.0
isInMyFileSync	Boolean	<code>true</code> if the file is synced with Salesforce Files Sync; <code>false</code> otherwise.	28.0
isMajorVersion	Boolean	<code>true</code> if the file is a major version; <code>false</code> if the file is a minor version. Major versions can't be replaced.	31.0
contentType	String	File's MIME type	28.0
moderationFlags	ConnectApi.ModerationFlags	Information about the moderation flags on a file. If <code>ConnectApi.Features.communityModeration</code> is <code>false</code> , this property is <code>null</code> .	30.0
modifiedDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z. Modifications to the file from within Salesforce update this date.	28.0
name	String	Name of the file	28.0
origin	String	Specifies the file source. Valid values are: <ul style="list-style-type: none"> <code>Chatter</code>—file came from Chatter <code>Content</code>—file came from content 	28.0
owner	ConnectApi.UserSummary	File's owner	28.0
pdfRendition Status	String	Specifies if a PDF preview version of the file has been rendered	28.0
publishStatus	ConnectApi.FilePublishStatus	Specifies the publish status of the file. <ul style="list-style-type: none"> <code>PendingAccess</code>—File is pending publishing. <code>PrivateAccess</code>—File is private. <code>PublicAccess</code>—File is public. 	28.0

Name	Type	Description	Available Version
renditionUrl	String	URL to the rendition for the file	28.0
renditionUrl 240By180	String	URL to the 240 x 180 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
renditionUrl 720By480	String	URL to the 720 x 480 rendition resource for the file. For shared files, renditions process asynchronously after upload. For private files, renditions process when the first file preview is requested, and aren't available immediately after the file is uploaded.	29.0
sharingOption	ConnectApi. FileSharingOption	Sharing option of the file. Values are: <ul style="list-style-type: none"> Allowed—Resharing of the file is allowed. Restricted—Resharing of the file is restricted. 	35.0
sharingRole	ConnectApi. FileSharingType	Specifies the sharing role of the file: <ul style="list-style-type: none"> Admin—Owner permission, but doesn't own the file. Collaborator—Viewer permission, and can edit, change permissions, and upload a new version of a file. Owner—Collaborator permission, and can make a file private, and delete a file. Viewer—Can view, download, and share a file. WorkspaceManaged—Permission controlled by the library. 	28.0
textPreview	String	Text preview of the file if available; null otherwise.	30.0
thumb120By90 RenditionStatus	String	Specifies the rendering status of the 120 x 90 preview image of the file. One of these values: <ul style="list-style-type: none"> Processing—Image is being rendered. Failed—Rendering process failed. Success—Rendering process was successful. Na—Rendering is not available for this image. 	28.0
thumb240By180 RenditionStatus	String	Specifies the rendering status of the 240 x 180 preview image of the file. One of these values: <ul style="list-style-type: none"> Processing—Image is being rendered. Failed—Rendering process failed. Success—Rendering process was successful. Na—Rendering is not available for this image. 	28.0

Name	Type	Description	Available Version
<code>thumb720By480RenditionStatus</code>	String	Specifies the rendering status of the 720 x 480 preview image of the file. One of these values: <ul style="list-style-type: none"> <code>Processing</code>—Image is being rendered. <code>Failed</code>—Rendering process failed. <code>Success</code>—Rendering process was successful. <code>Na</code>—Rendering is not available for this image. 	28.0
<code>title</code>	String	Title of the file	28.0
<code>versionNumber</code>	String	File's version number	28.0

ConnectApi.FilePreview

A file preview.

Property Name	Type	Description	Available Version
<code>format</code>	ConnectApi.FilePreviewFormat	The format of the preview. Values are: <ul style="list-style-type: none"> <code>Pdf</code>—Preview format is PDF. <code>Svg</code>—Preview format is compressed SVG. <code>Thumbnail</code>—Preview format is 240 x 180 PNG. <code>ThumbnailBig</code>—Preview format is 720 x 480 PNG. <code>ThumbnailTiny</code>—Preview format is 120 x 90 PNG. 	39.0
<code>previewUrlCount</code>	Integer	The total number of preview URLs for this preview format.	39.0
<code>previewUrls</code>	List<ConnectApi.FilePreviewUrl>	A list of file preview URLs.	39.0
<code>status</code>	ConnectApi.FilePreviewStatus	The availability status of the preview. Values are: <ul style="list-style-type: none"> <code>Available</code>—Preview is available. <code>InProgress</code>—Preview is being processed. <code>NotAvailable</code>—Preview is unavailable. <code>NotScheduled</code>—Generation of the preview isn't scheduled yet. 	39.0
<code>url</code>	String	The URL for the file preview.	39.0

SEE ALSO:

[ConnectApi.FilePreviewCollection](#)

ConnectApi.FilePreviewCollection

A collection of file previews.

Property Name	Type	Description	Available Version
fileId	String	ID of the file.	39.0
previews	List<ConnectApi.FilePreview>	Previews supported for the file.	39.0
url	String	URL to the current page of file previews.	39.0
versionNumber	String	Version number of the file.	40.0

SEE ALSO:

[ConnectApi.InlineImageSegment](#)

ConnectApi.FilePreviewUrl

A URL to a file preview.

Property Name	Type	Description	Available Version
pageNumber	Integer	Preview page number starting from zero, or <code>null</code> for PDF files.	39.0
previewUrl	String	File preview URL.	39.0

SEE ALSO:

[ConnectApi.FilePreview](#)

ConnectApi.FilesCapability

If a feed element has this capability, it has one or more file attachments.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
items	List<ConnectApi.Content>	Collection of files.	36.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.FileSummary Class

Subclass of [ConnectApi.File Class](#)

This class represents a summary description of a file.

ConnectApi.FollowerPage Class

Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	28.0
followers	List<ConnectApi.Subscription>	List of subscriptions	28.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	28.0
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
total	Integer	Total number of followers across all pages	28.0

ConnectApi.FollowingCounts Class

Name	Type	Description	Available Version
people	Integer	Number of people user is following	28.0
records	Integer	Number of records user is following Topics are a type of record that can be followed as of version 29.0.	28.0
total	Integer	Total number of items user is following	28.0

currentPageUrl	String	Chatter REST API URL identifying the current page.	28.0
following	List<ConnectApi.Subscription>	List of subscriptions	28.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a	28.0

Name	Type	Description	Available Version
		<code>ConnectApi.NotFoundException</code> error is returned.	
<code>previousPageUrl</code>	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
<code>total</code>	Integer	Total number of records being followed across all pages	28.0

ConnectApi.GenericBundleCapability Class

If a feed element has this capability, the feed element has a group of other feed elements condensed into one feed element. This group is called a *bundle*.

Subclass of [ConnectApi.BundleCapability Class](#).

ConnectApi.GenericFeedElement Class

A concrete implementation of the abstract `ConnectApi.FeedElement` class.

Subclass of [ConnectApi.FeedElement Class](#)

ConnectApi.GlobalInfluence Class

Name	Type	Description	Available Version
<code>percentile</code>	String	Percentile value for the user's influence rank within the organization or community	28.0
<code>rank</code>	Integer	Number indicating the user's influence rank, relative to all other users within the organization or community	28.0

SEE ALSO:

[ConnectApi.UserDetail Class](#)

ConnectApi.GroupChatterSettings Class

A user's Chatter settings for a specific group.

Name	Type	Description	Available Version
<code>emailFrequency</code>	<code>ConnectApi.GroupEmailFrequency Enum</code>	The frequency with which a group member receives email from a group.	28.0

ConnectApi.GroupInformation Class

Describes the Information section of the group. In the Web UI, this section is above the Description section. If the group is private, this section is visible only to members.

Name	Type	Description	Available Version
text	String	The text of the "Information" section of the group.	28.0
title	String	The title of the "Information" section of the group.	28.0

SEE ALSO:

[ConnectApi.ChatterGroupDetail Class](#)

ConnectApi.GroupMember Class

Name	Type	Description	Available Version
id	String	User's 18-character ID	28.0
lastFeed AccessDate	Datetime	The date and time at which the group member last accessed the group feed.	31.0
role	ConnectApi. GroupMembership Type Enum	Specifies the type of membership the user has with the group, such as group owner, manager, or member. <ul style="list-style-type: none"> GroupOwner GroupManager NotAMember NotAMemberPrivateRequested StandardMember 	28.0
url	String	Chatter REST API URL to this membership	28.0
user	ConnectApi.User Summary	Information about the user who is subscribed to this group	28.0

SEE ALSO:

[ConnectApi.GroupMemberPage Class](#)

ConnectApi.GroupMemberPage Class

Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	28.0
members	List<ConnectApi. GroupMember>	List of group members	28.0

Name	Type	Description	Available Version
myMembership	ConnectApi.Reference	If the context user is a member of this group, returns information about that membership, otherwise, <code>null</code> .	28.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	28.0
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
totalMemberCount	Integer	Total number of group members across all pages	28.0

ConnectApi.GroupMembershipRequest Class

Name	Type	Description	Available Version
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
id	String	ID for the group membership request object	28.0
lastUpdateDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	28.0
requestedGroup	ConnectApi.Reference	Information about the group the context user is requesting to join.	28.0
responseMessage	String	A message for the user if their membership request is declined. The value of this property is used only when the value of the <code>status</code> property is <code>Declined</code> . The maximum length is 756 characters.	28.0
status	ConnectApi.GroupMembershipRequestStatusEnum	The status of a request to join a private group. Values are: <ul style="list-style-type: none"> Accepted Declined Pending 	28.0
url	String	URL of the group membership request object.	28.0
user	ConnectApi.UserSummary	Information about the user requesting membership in a group.	28.0

ConnectApi.InlineImageSegment

An inline image in the feed body.

Subclass of [ConnectApi.MessageSegment Class](#)

Property Name	Type	Description	Available Version
altText	String	Alt text for the inline image.	35.0
contentSize	Integer	Size of the file in bytes.	35.0
fileExtension	String	Extension of the file, such as gif.	37.0
thumbnails	ConnectApi.FilePreviewCollection	Information about the available thumbnails for the image.	35.0

Property Name	Type	Description	Available Version
url	String	The URL to the latest version of the inline image.	35.0

ConnectApi.InteractionsCapability

If a feed element has this capability, it has information about user interactions.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
count	Long	The number of individual views, likes, and comments on a feed post.	37.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

[ConnectApi.RelatedQuestion](#)

ConnectApi.Invitation

An invitation.

Property Name	Type	Description	Available Version
email	String	Email address of the user.	39.0
status	ConnectApi.GroupViralInvitationsStatus	Specifies the status of an invitation to join a group. Values are: <ul style="list-style-type: none"> • <code>ActedUponUser</code>—The user was added to the group. An email was sent asking the user to visit the group. • <code>Invited</code>—An email was sent asking the user to sign up for the org. • <code>MaxedOutUsers</code>—The group has the maximum allowed members. • <code>MultipleError</code>—The user wasn't invited due to multiple errors. • <code>NoActionNeededUser</code>—The user is already a member of the group. • <code>NotVisibleToExternalInviter</code>—The user is not accessible to the user sending the invitation. • <code>Unhandled</code>—The user couldn't be added to the group for an unknown reason. 	39.0

Property Name	Type	Description	Available Version
userId	String	ID of the user.	39.0

SEE ALSO:

[ConnectApi.Invitations](#)

ConnectApi.Invitations

A collection of invitations.

Property Name	Type	Description	Available Version
invitations	List<ConnectApi.Invitation>	Collection of invitations.	39.0

ConnectApi.KnowledgeArticleVersion

A knowledge article version.

Property Name	Type	Description	Available Version
articleType	String	Type of the knowledge article.	36.0
id	String	ID of the knowledge article version.	36.0
knowledgeArticleId	String	ID of the corresponding knowledge article.	36.0
lastPublishedDate	Datetime	Last published date of the knowledge article.	36.0
summary	String	Summary of the knowledge article contents.	36.0
title	String	Title of the knowledge article.	36.0
urlName	String	URL name of the knowledge article.	36.0

SEE ALSO:

ConnectApi.LabeledRecordField Class

This class is abstract.

Subclass of [ConnectApi.AbstractRecordField Class](#)

Superclass of:

- [ConnectApi.CompoundRecordField Class](#)
- [ConnectApi.CurrencyRecordField Class](#)
- [ConnectApi.DateRecordField Class](#)
- [ConnectApi.PercentRecordField Class](#)
- [ConnectApi.PicklistRecordField Class](#)
- [ConnectApi.RecordField Class](#)
- [ConnectApi.ReferenceRecordField Class](#)
- [ConnectApi.ReferenceWithDateRecordField Class](#)

A record field containing a label and a text value.

 **Important:** The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
label	String	A localized string describing the record field.	29.0
text	String	The text value of the record field. All record fields have a text value. To ensure that all clients can consume new content, inspect the record field's <code>type</code> property. If it isn't recognized, render the text value as the default case.	29.0

ConnectApi.LightningExtensionInformation (Pilot)

Lightning extension information.

 **Note:** We provide Extensions to selected customers through a pilot program that requires agreement to specific terms and conditions. Extensions is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Subclass of [ConnectApi.AbstractExtensionInformation \(Pilot\)](#).

Property Name	Type	Description	Available Version
compositionComponent	String	Component to use in compose state.	40.0
headerTextLabel	String	Label for the extension's header.	40.0
hoverTextLabel	String	Label for hovering over the extension.	40.0

Property Name	Type	Description	Available Version
renderComponent	String	Component to use in render or preview state.	40.0

SEE ALSO:

[ConnectApi.ExtensionDefinition \(Pilot\)](#)

ConnectApi.LinkAttachment Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.LinkCapability](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

Name	Type	Description	Available Version
title	String	Title given to the link if available, otherwise, <code>null</code>	28.0–31.0
url	String	The link URL	28.0–31.0

ConnectApi.LinkCapability

If a feed element has this capability, it has a link.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
url	String	Link URL. The URL can be to an external site.	32.0
urlName	String	Description of the link.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.LinkSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

Name	Type	Description	Available Version
url	String	The link URL	28.0

ConnectApi.MaintenanceInfo

Information about the upcoming scheduled maintenance for the organization.

Property Name	Type	Description	Available Version
description	String	Description of the maintenance.	34.0

Property Name	Type	Description	Available Version
maintenanceTitle	String	Title of the maintenance.	34.0
maintenanceType	ConnectApi.MaintenanceType	Specifies the type of maintenance. One of the following: <ul style="list-style-type: none"> Downtime—Downtime maintenance. GenerallyAvailable—Maintenance with generally available mode. MaintenanceWithDowntime—Scheduled maintenance with downtime. ReadOnly—Maintenance with read-only mode. 	34.0
messageEffectiveTime	Datetime	Effective time when users start seeing the maintenance message.	34.0
messageExpirationTime	Datetime	Expiration time of the maintenance message.	34.0
scheduledEndDowntime	Datetime	Scheduled end of downtime. <code>null</code> for <code>GenerallyAvailable</code> and <code>ReadOnly</code> maintenance types.	34.0
scheduledEndMaintenanceTime	Datetime	Scheduled end of maintenance. <code>null</code> for <code>Downtime</code> maintenance type.	34.0
scheduledStartDowntime	Datetime	Scheduled start of downtime. <code>null</code> for <code>GenerallyAvailable</code> and <code>ReadOnly</code> maintenance types.	34.0
scheduledStartMaintenanceTime	Datetime	Scheduled start time of maintenance. <code>null</code> for <code>Downtime</code> maintenance type.	34.0

SEE ALSO:

[ConnectApi.OrganizationSettings Class](#)

ConnectApi.ManagedTopic Class

Represents a managed topic in a community.

Property Name	Type	Description	Available Version
children	List<ConnectApi.ManagedTopic>	Children managed topics of the managed topic; <code>null</code> if the <code>depth</code> request parameter isn't specified or is <code>1</code> .	35.0
id	String	ID of managed topic.	32.0

Property Name	Type	Description	Available Version
managedTopicType	ConnectApi.ManagedTopicType	Type of managed topic. <ul style="list-style-type: none"> Featured—Topics that are featured, for example, on the community home page, but don't provide overall navigation. Navigational—Topics that display in a navigational menu in the community. 	32.0
parent	ConnectApi.ReferenceClass	Parent managed topic of the managed topic.	35.0
topic	ConnectApi.Topic	Information about the topic.	32.0
url	String	Chatter REST API URL to the managed topic.	32.0

SEE ALSO:

[ConnectApi.ManagedTopicCollection Class](#)

ConnectApi.ManagedTopicCollection Class

A collection of managed topics.

Property Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	32.0
managedTopics	List<ConnectApi.ManagedTopic>	List of managed topics.	32.0

ConnectApi.MarkupBeginSegment

The beginning of rich text markup.

Subclass of [ConnectApi.MessageSegment Class](#)

Property Name	Type	Description	Available Version
htmlTag	String	The HTML tag for this markup.	35.0
markupType	ConnectApi.MarkupType	Specifies the type of rich text markup. <ul style="list-style-type: none"> Bold—Bold tag. Code—Code tag. Italic—Italic tag. ListItem—List item tag. OrderedList—Ordered list tag. Paragraph—Paragraph tag. Strikethrough—Strikethrough tag. 	35.0

Property Name	Type	Description	Available Version
		<ul style="list-style-type: none"> Underline—Underline tag. UnorderedList—Unordered list tag. 	

ConnectApi.MarkupEndSegment

The end of rich text markup.

Subclass of [ConnectApi.MessageSegment Class](#)

Property Name	Type	Description	Available Version
htmlTag	String	The HTML tag for this markup.	35.0
markupType	ConnectApi.MarkupType	Specifies the type of rich text markup. <ul style="list-style-type: none"> Bold—Bold tag. Code—Code tag. Italic—Italic tag. ListItem—List item tag. OrderedList—Ordered list tag. Paragraph—Paragraph tag. Strikethrough—Strikethrough tag. Underline—Underline tag. UnorderedList—Unordered list tag. 	35.0

ConnectApi.MentionCompletion Class

Information about a record that could be used to @mention a user or group.

Name	Type	Description	Available Version
additionalLabel	String	An additional label (if one exists) for the record represented by this completion, for example, "(Customer)" or "(Acme Corporation)".	29.0
description	String	A description of the record represented by this completion.	29.0
name	String	The name of the record represented by this completion. The name is localized, if possible.	29.0
outOfOffice	ConnectApi.OutOfOffice (Pilot)	If the record represented by this completion is a user, an additional out-of-office message, if one exists, for the user.  Note: We provide Out of Office to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Pilot programs are subject to change, and we can't guarantee acceptance. Out of Office	40.0

Name	Type	Description	Available Version
		isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.	
photoUrl	String	A URL to the photo or icon of the record represented by this completion.	29.0
recordId	String	The ID of the record represented by this completion.	29.0
userId	ConnectApi.UserId	The ID of the user represented by this completion.	29.0
userType	ConnectApi.UserTypeEnum	If the record represented by this completion is a user, this value is the user type associated with that user; otherwise the value is <code>null</code> . One of these values: <ul style="list-style-type: none"> ChatterGuest—User is an external user in a private group. ChatterOnly—User is a Chatter Free customer. Guest—User is unauthenticated. Internal—User is a standard organization member. Portal—User is an external user in a customer portal, partner portal, or community. System—User is Chatter Expert or a system user. Undefined—User is a user type that is a custom object. 	30.0

SEE ALSO:

[ConnectApi.MentionCompletionPage Class](#)

ConnectApi.MentionCompletionPage Class

A paginated list of Mention Completion response bodies.

Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	29.0
mentionCompletions	List<ConnectApi.MentionCompletion>	A list of mention completion proposals. Use these proposals to build a feed post body.	29.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	29.0

Name	Type	Description	Available Version
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	29.0

ConnectApi.MentionSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

Name	Type	Description	Available Version
accessible	Boolean	Specifies whether the mentioned user or group can see the post in which they are mentioned (<code>true</code>) or not (<code>false</code>).	28.0
name	String	Name of the mentioned user or group	28.0
record	ConnectApi.ActorWithId	Information about the mentioned user or group	29.0
user	ConnectApi.UserSummary	Information about the mentioned user  Important: In versions 29.0 and later, use the <code>record</code> property.	28.0 only In versions before 29.0, if the mention is not a user, the mention is in a ConnectApi.TextSegment object.

ConnectApi.MentionValidation Class

Information about whether a proposed mention is valid for the context user.

Name	Type	Description	Available Version
recordId	String	The ID of the mentioned record.	29.0

Name	Type	Description	Available Version
validationStatus	ConnectApi.MentionValidationStatus Enum	<p>Specifies the type of validation error for a proposed mention, if any.</p> <ul style="list-style-type: none"> • Disallowed—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • Inaccessible—The proposed mention is allowed but the user or record being mentioned isn't notified because they don't have access to the parent record being discussed. • Ok—There is no validation error for this proposed mention. 	29.0

SEE ALSO:

[ConnectApi.MentionValidations Class](#)

ConnectApi.MentionValidations Class

Information about whether a set of mentions is valid for the context user.

Name	Type	Description	Available Version
hasErrors	Boolean	Indicates whether at least one of the proposed mentions has an error (<code>true</code>), or not (<code>false</code>). For example, context users can't mention private groups they don't belong to. If such a group is included in the list of mention validations, <code>hasErrors</code> is <code>true</code> and the group has a <code>validationStatus</code> of <code>Disallowed</code> in its mention validation.	29.0
mentionValidations	List<ConnectApi.MentionValidation>	A list of mention validation information in the same order as the provided record IDs.	29.0

ConnectApi.MessageBody Class

Subclass of [ConnectApi.AbstractMessageBody Class](#)

No additional properties.

SEE ALSO:

- [ConnectApi.ChatterLikesCapability Class](#)
- [ConnectApi.ChatterMessage Class](#)
- [ConnectApi.Comment Class](#)
- [ConnectApi.FeedElement Class](#)
- [ConnectApi.FeedItemSummary](#)

ConnectApi.MessageSegment Class

This class is abstract.

Superclass of:

- [ConnectApi.ComplexSegment Class](#)
- [ConnectApi.EntityLinkSegment Class](#)
- [ConnectApi.FieldChangeSegment Class](#)
- [ConnectApi.FieldChangeNameSegment Class](#)
- [ConnectApi.FieldChangeValueSegment Class](#)
- [ConnectApi.HashtagSegment Class](#)
- [ConnectApi.InlineImageSegment](#)
- [ConnectApi.LinkSegment Class](#)
- [ConnectApi.MarkupBeginSegment](#)
- [ConnectApi.MarkupEndSegment](#)
- [ConnectApi.MentionSegment Class](#)
- [ConnectApi.MoreChangesSegment Class](#)
- [ConnectApi.ResourceLinkSegment Class](#)
- [ConnectApi.TextSegment Class](#)

Message segments in a feed item are typed as `ConnectApi.MessageSegment`. Feed item capabilities are typed as `ConnectApi.FeedItemCapability`. Record fields are typed as `ConnectApi.AbstractRecordField`. These classes are all abstract and have several concrete subclasses. At runtime you can use `instanceof` to check the concrete types of these objects and then safely proceed with the corresponding downcast. When you downcast, you must have a default case that handles unknown subclasses.

 **Important:** The composition of a feed may change between releases. Your code should always be prepared to handle instances of unknown subclasses.

Name	Type	Description	Available Version
<code>text</code>	<code>String</code>	Text-only rendition of this segment. If a client encounters an unknown message segment type, it can render this value.	28.0

Name	Type	Description	Available Version
type	ConnectApi. MessageSegment TypeEnum	The message segment type. One of these values: <ul style="list-style-type: none"> EntityLink FieldChange FieldChangeName FieldChangeValue Hashtag InlineImage Link MarkupBegin MarkupEnd Mention MoreChanges ResourceLink Text 	28.0

SEE ALSO:

[ConnectApi.AbstractMessageBody Class](#)

ConnectApi.ModerationCapability Class

If a feed element has this capability, users in a community can flag it for moderation.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
moderationFlags	ConnectApi.ModerationFlags	The moderation flags for this feed element. Community moderators can view and take action on flagged items.	31.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.ModerationFlagItemDetail

Flag details on a feed item, comment, or file.

Property Name	Type	Description	Available Version
createdBy	String	ID of the user who flagged the item.	40.0
createdDate	Datetime	Date when the item was flagged.	40.0
id	String	ID of the moderation flag.	40.0

Property Name	Type	Description	Available Version
moderationType	ConnectApi.CommunityFlagType	Specifies the type of moderation flag. Values are: <ul style="list-style-type: none"> FlagAsInappropriate—Flag for inappropriate content. FlagAsSpam—Flag for spam. 	40.0
note	String	Note from user who flagged the item.	40.0
visibility	ConnectApi.CommunityFlagVisibility	Specifies the visibility behavior of a flag for various user types. Values are: <ul style="list-style-type: none"> ModeratorsOnly—The flag is visible only to users with moderation permissions on the flagged element or item. SelfAndModerators—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item. 	40.0

SEE ALSO:

[ConnectApi.ModerationFlagsCollection](#)

ConnectApi.ModerationFlags

Information about the moderation flags on a feed item, comment, or file.

Name	Type	Description	Available Version
flagCount	Integer	Number of moderation flags on this feed item, comment, or file. If the context user is not a community moderator, the property is <code>null</code> .	29.0
flagCountByReason	Map<ConnectApi.CommunityFlagReasonType, Integer>	Number of moderation flags categorized by reason. Values for ConnectApi.CommunityFlagReasonType are: <ul style="list-style-type: none"> FlaggedByRule—Moderation rule flagged the item. FlaggedBySystem—Einstein flagged the item. FlaggedByUserAsInappropriate—User flagged the item as inappropriate. FlaggedByUserAsSpam—User flagged the item as spam. 	40.0
flaggedByMe	Boolean	<code>true</code> if the context user flagged the feed item, comment, or file for moderation; <code>false</code> otherwise.	29.0

Name	Type	Description	Available Version
flags	ConnectApi.ModerationFlagsCollection	Collection of flags.	40.0

SEE ALSO:

[ConnectApi.Comment Class](#)

[ConnectApi.File Class](#)

[ConnectApi.ModerationCapability Class](#)

ConnectApi.ModerationFlagsCollection

A collection of flags on a feed item, comment, or file.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	40.0
flags	List<ConnectApi.ModerationFlagItemDetail>	List of flag details.	40.0
nextPageToken	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	40.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	40.0
pageSize	Integer	Number of items per page.	40.0

SEE ALSO:

[ConnectApi.ModerationFlags](#)

ConnectApi.MoreChangesSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

In feed items with a large number of tracked changes, the message is formatted as: "changed A, B, and made X more changes." The `MoreChangesSegment` contains the "X more changes."

Name	Type	Description	Available Version
moreChanges	List<ConnectApi.FieldChangeSegment>	Complete list of tracked changes.	29.0
moreChangesCount	Integer	Number of additional changes	28.0

ConnectApi.Motif Class

The motif properties contain URLs for small, medium, and large icons that indicate the Salesforce record type. Common record types are files, users, and groups, but all record types have a set of motif icons. Custom object records use their tab style icon. All icons are available to unauthenticated users so that, for example, you can display the motif icons in an email. The motif can also contain the record type's base color.

 **Note:** The motif images are icons, not user uploaded images or photos. For example, every user has the same set of motif icons.

Custom object records use their tab style icon, for example, the following custom object uses the “boat” tab style:

```
"motif": {
  "color": "8C004C",
  "largeIconUrl": "/img/icon/custom51_100/boat64.png",
  "mediumIconUrl": "/img/icon/custom51_100/boat32.png",
  "smallIconUrl": "/img/icon/custom51_100/boat16.png",
  "svgIconUrl": null
},
```

Users use the following icons:

```
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/icon/profile64.png",
  "mediumIconUrl": "/img/icon/profile32.png",
  "smallIconUrl": "/img/icon/profile16.png",
  "svgIconUrl": null
},
```

Groups use the following icons:

```
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/icon/groups64.png",
  "mediumIconUrl": "/img/icon/groups32.png",
  "smallIconUrl": "/img/icon/groups16.png",
  "svgIconUrl": null
},
```

Files use the following icons:

```
"motif": {
  "color": "1797C0",
  "largeIconUrl": "/img/content/content64.png",
  "mediumIconUrl": "/img/content/content32.png",
  "smallIconUrl": "/img/icon/files16.png",
```

```
"svgIconUrl": null
},
```

 **Note:** To view the icons in the previous examples, preface the URL with `https://instance_name`. For example, `https://instance_name/img/icon/profile64.png`.

Name	Type	Description	Available Version
color	String	A hex value representing the base color of the record type, or <code>null</code> .	29.0
largeIconUrl	String	A large icon indicating the record type.	28.0
mediumIconUrl	String	A medium icon indicating the record type.	28.0
smallIconUrl	String	A small icon indicating the record type.	28.0
svgIconUrl	String	An icon in SVG format indicating the record type, or <code>null</code> if the icon doesn't exist.	34.0

ConnectApi.MuteCapability

If a feed element has this capability, users can mute it. Muted feed elements are visible in the muted feed, and invisible in all other feeds that respect mute.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
isMutedByMe	Boolean	Indicates whether the context user muted the feed element.	35.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.NewUserAudienceCriteria

The criteria for the new members type of recommendation audience.

Subclass of [ConnectApi.AudienceCriteria](#).

Property Name	Type	Description	Available Version
maxDaysInCommunity	Double	The maximum number of days since a user became a community member.	36.0

ConnectApi.NonEntityRecommendation Class

Represents a recommendation for a non-Salesforce entity, such as an application.

Subclass of [ConnectApi.AbstractRecommendation Class](#).

ConnectApi.NonEntityRecommendation Class isn't used in version 34.0 and later. In version 34.0 and later, [ConnectApi.EntityRecommendation Class](#) is used for all recommendations.

Property Name	Type	Description	Available Version
displayLabel	String	Localized label of the non-entity object.	32.0
motif	ConnectApi.Motif	Motif for the non-entity object.	32.0

ConnectApi.OauthProviderInfo

Name	Type	Description	Available Version
authorizationUrl	String	The URL used for authorization.	37.0
name	String	The name of the OAuth service provider.	37.0

SEE ALSO:

[ConnectApi.UserOauthInfo](#)

ConnectApi.OrganizationSettings Class

Name	Type	Description	Available Version
accessTimeout	Integer	Amount of time after which the system prompts users who have been inactive to log out or continue working	28.0
features	ConnectApi.Features	Information about features available in the organization	28.0
maintenanceInfo	List<ConnectApi.MaintenanceInfo>	Information about a list of upcoming scheduled maintenances for the organization.	34.0
name	String	Organization name	28.0
orgId	String	18-character ID for the organization	28.0
userSettings	ConnectApi.UserSettings	Information about the organization permissions for the user	28.0

ConnectApi.OriginCapability

If a feed element has this capability, it was created by a feed action.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
actor	ConnectApi.User Summary Class	The user who executed the feed action.	33.0

Property Name	Type	Description	Available Version
originRecord	ConnectApi.Reference Class	A reference to the feed element containing the feed action.	33.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.OutOfOffice (Pilot)

User's out-of-office message.

 **Note:** We provide Out of Office to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Pilot programs are subject to change, and we can't guarantee acceptance. Out of Office isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Property Name	Type	Description	Available Version
message	String	Out-of-office message for the user.	40.0

SEE ALSO:

[ConnectApi.User Class](#)

[ConnectApi.MentionCompletion Class](#)

ConnectApi.PercentRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field containing a percentage value.

Name	Type	Description	Available Version
value	Double	The value of the percentage.	29.0

ConnectApi.PhoneNumber Class

A phone number.

Name	Type	Description	Available Version
label	String	A localized string indicating the phone type	30.0
phoneNumber	String	Phone number	28.0
phoneType	String	Phone type. Values are: <ul style="list-style-type: none"> • Fax • Mobile 	30.0

Name	Type	Description	Available Version
		<ul style="list-style-type: none"> Work <p>These values are not localized.</p>	
type	String	<p> Note: This property is not available after version 29.0. Use the <code>phoneType</code> property instead.</p> <p>Values are:</p> <ul style="list-style-type: none"> Fax Mobile Work <p>These values are not localized.</p>	28.0–29.0

SEE ALSO:

[ConnectApi.DatacloudCompany Class](#)

[ConnectApi.DatacloudContact](#)

[ConnectApi.UserDetail Class](#)

ConnectApi.Photo Class

Name	Type	Description	Available Version
fullEmailPhotoUrl	String	A temporary URL to the large profile picture. The URL expires after 30 days and is available to unauthenticated users.	28.0
largePhotoUrl	String	URL to the large profile picture. The default width is 200 pixels, and the height is scaled so the original image proportions are maintained.	28.0
mediumPhotoUrl	String	URL to the medium profile picture. The default width is 160 pixels, and the height is scaled so the original image proportions are maintained.	37.0
photoVersionId	String	18-character ID to that version of the photo	28.0
smallPhotoUrl	String	URL to the small profile picture. The default size is 64x64 pixels.	28.0
standardEmailPhotoUrl	String	A temporary URL to the small profile. The URL expires after 30 days and is available to unauthenticated users.	28.0

Name	Type	Description	Available Version
<code>url</code>	String	A resource that returns a Photo object: for example, <code>/services/data/v40.0/chatter/users/005D0000001LL80IAW/photo</code>	28.0

SEE ALSO:

[ConnectApi.ChatterGroup Class](#)

[ConnectApi.RecommendationDefinition](#)

[ConnectApi.User Class](#)

ConnectApi.PicklistRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field containing an enumerated value.

ConnectApi.PlatformAction Class

A platform action instance with state information for the context user.

Property Name	Type	Description	Available Version
<code>actionUrl</code>	String	For action links of subtype <code>Ui</code> or <code>Download</code> , direct the user to download or visit the UI from this link. Salesforce issues a Javascript redirect for the link in this format: <code>/action-link-redirect/communityId /actionLinkId?_bearer=bearerToken</code> For <code>Api</code> action links and for all platform actions, this value is <code>null</code> and Salesforce handles the call.	33.0
<code>apiName</code>	String	The API name. The value may be <code>null</code> .	33.0
<code>confirmationMessage</code>	String	If this action requires a confirmation and has a status of <code>NewStatus</code> , this is a default localized message that should be shown to an end user prior to invoking the action. Otherwise, this is <code>null</code> .	33.0
<code>executingUser</code>	ConnectApi.User Summary Class	The user who initiated execution of this platform action.	33.0
<code>groupDefault</code>	Boolean	<code>true</code> if this platform action is the default or primary platform action in the platform action group; <code>false</code> otherwise. There can be only one default platform action per platform action group.	33.0
<code>iconUrl</code>	String	The URL of the icon for the platform action. This value may be <code>null</code> .	33.0

Property Name	Type	Description	Available Version
id	String	The ID for the platform action. If the type is <code>QuickAction</code> and the subtype is <code>Create</code> , this value is <code>null</code> .	33.0
label	String	The localized label for this platform action.	33.0
modifiedDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	33.0
platformAction Group	ConnectApi. Reference Class	A reference to the platform action group containing this platform action.	33.0
status	ConnectApi. PlatformAction Status	The execution status of the platform action. Values are: <ul style="list-style-type: none"> • <code>FailedStatus</code>—The action link execution failed. • <code>NewStatus</code>—The action link is ready to be executed. Available for <code>Download</code> and <code>Ui</code> action links only. • <code>PendingStatus</code>—The action link is executing. Choosing this value triggers the API call for <code>Api</code> and <code>ApiAsync</code> action links. • <code>SuccessfulStatus</code>—The action link executed successfully. 	33.0
subtype	String	The subtype of a platform action or <code>null</code> . If the <code>type</code> property is <code>ActionLink</code> , possible values are: <ul style="list-style-type: none"> • <code>Api</code>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server. • <code>ApiAsync</code>—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete. • <code>Download</code>—The action link downloads a file from the action URL. • <code>Ui</code>—The action link takes the user to a Web page at the action URL. 	33.0

Property Name	Type	Description	Available Version
		 Note: Invoking <code>ApiAsync</code> action links from an app requires a call to set the status. However, there isn't currently a way to set the status of an action link using Apex. To set the status, use Chatter REST API. See the Action Link resource in the Chatter REST API Developer Guide for more information.	
<code>type</code>	<code>ConnectApi.PlatformActionType</code>	The type of platform action. Values are: <ul style="list-style-type: none"> <code>ActionLink</code>—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI. <code>CustomButton</code>—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. <code>InvocableAction</code> <code>ProductivityAction</code>—Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions. <code>QuickAction</code>—A global or object-specific action. <code>StandardButton</code>—A predefined Salesforce button such as New, Edit, and Delete. 	33.0
<code>url</code>	<code>String</code>	The URL for this platform action. If the <code>type</code> is <code>QuickAction</code> and the <code>subtype</code> is <code>Create</code> , this value is <code>null</code> .	33.0

SEE ALSO:

[ConnectApi.PlatformActionGroup Class](#)

ConnectApi.PlatformActionGroup Class

A platform action group instance with state appropriate for the context user.

Action link groups are one type of platform action group and are therefore represented as `ConnectApi.PlatformActionGroup` output classes.

Property Name	Type	Description	Available Version
category	ConnectApi.PlatformActionGroupCategory	Indicates the priority and relative locations of platform actions. Values are: <ul style="list-style-type: none"> Primary—The action link group is displayed in the body of the feed element. Overflow—The action link group is displayed in the overflow menu of the feed element. 	33.0
id	String	The 18-character ID or an opaque string ID of the platform action group. If the ConnectApi.PlatformAction type is QuickAction and the subtype is Create , this value is null.	33.0
modifiedDate	Datetime	ISO 8601 date string, for example, 2014-02-25T18:24:31.000Z.	33.0
platformActions	List<ConnectApi.PlatformAction>	The platform action instances for this group. Within an action link group, action links are displayed in the order listed in the actionLinks property of the ConnectApi.ActionLinkGroupDefinitionInput class. Within a feed item, action link groups are displayed in the order specified in the actionLinkGroupIds property of the ConnectApi.AssociatedActionsCapabilityInput class.	33.0
url	String	The URL for this platform action group. If the ConnectApi.PlatformAction type is QuickAction and the subtype is Create , this value is null.	33.0

SEE ALSO:

[ConnectApi.AbstractRecommendation Class](#)

[ConnectApi.AssociatedActionsCapability Class](#)

ConnectApi.PollCapability Class

If a feed element has this capability, it includes a poll.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
choices	List<ConnectApi.FeedPollChoice>	Collection of poll choices that make up the poll.	32.0

Property Name	Type	Description	Available Version
myChoiceId	String	18-character ID of the poll choice that the context user has voted for in this poll. Returns <code>null</code> if the context user has not voted.	32.0
totalVoteCount	Integer	Total number of votes cast on the feed poll element.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.QuestionAndAnswersCapability Class

If a feed element has this capability, it has a question and comments on the feed element are answers to the question.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
bestAnswer	ConnectApi.Comment	Comment selected as the best answer for the question.	32.0
bestAnswerSelectedBy	ConnectApi.UserSummary	User who selected the best answer for the question.	32.0
canCurrentUserSelectOrRemoveBestAnswer	Boolean	Indicates whether the context user can select or remove a best answer (<code>true</code>) or not (<code>false</code>).	32.0
escalatedCase	ConnectApi.Reference	If a question post is escalated, this is the case to which it was escalated.	33.0
questionTitle	String	Title for the question.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.QuestionAndAnswersSuggestions Class

Question and answers suggestions.

Property Name	Type	Description	Available Version
articles	List<ConnectApi.ArticleItem>	List of articles.	32.0
questions	List<ConnectApi.FeedElement>	List of questions.	32.0

ConnectApi.ReadBy

Information about who read the feed element and when.

Property Name	Type	Description	Available Version
lastReadDateByUser	Datetime	When the user last read the feed element.	40.0
user	ConnectApi.UserSummary	Information about the user who read the feed element.	40.0

SEE ALSO:

[ConnectApi.ReadByPage](#)

ConnectApi.ReadByCapability

If a feed element has this capability, the context user can mark it as read.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
isReadByMe	Boolean	Specifies whether the feed element has been read (<code>true</code>) or not (<code>false</code>) by the context user.	40.0
lastReadDateByMe	Datetime	Last date when the feed element was marked read for the context user. Otherwise, <code>null</code> .	40.0
page	ConnectApi.ReadByPage	First page of information about who read the feed element and when.	40.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.ReadByPage

A collection of information about who read the feed element and when.

Property Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	40.0
currentPageUrl	String	Chatter REST API URL identifying the current page. The default is 25 items per page.	40.0
items	List<ConnectApi.ReadBy>	Collection of read-by information, including users and when they last read the feed element.	40.0
nextPageToken	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	40.0

Property Name	Type	Description	Available Version
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	40.0
previousPageToken	String	Reserved for future use.	40.0
previousPageUrl	String	Reserved for future use.	40.0
total	Integer	Total number of users who read the feed element.	40.0

SEE ALSO:

[ConnectApi.ReadByCapability](#)

ConnectApi.RecommendationAudience

A recommendation audience.

Property Name	Type	Description	Available Version
criteria	ConnectApi.AudienceCriteria	The criteria for the recommendation audience type.	36.0
id	String	18-character ID of the recommendation audience.	35.0
memberCount	Integer	 Important: This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria . Number of members in the recommendation audience.	35.0 only
members	ConnectApi.UserReferencePage	 Important: This property is available only in version 35.0. In version 36.0 and later, this property is available in ConnectApi.CustomListAudienceCriteria . Members of the recommendation audience.	35.0 only
modifiedBy	ConnectApi.User	User who last modified the recommendation audience.	36.0
modifiedDate	Datetime	An ISO 8601 format date string, for example, 2011-02-25T18:24:31.000Z.	36.0
name	String	Name of the recommendation audience.	35.0

Property Name	Type	Description	Available Version
url	String	URL for the recommendation audience.	35.0

SEE ALSO:

[ConnectApi.RecommendationAudiencePage](#)

ConnectApi.RecommendationAudiencePage

A list of recommendation audiences.

Property Name	Type	Description	Available Version
audienceCount	Integer	The total number of recommendation audiences.	35.0
currentPageUrl	String	URL to the current page.	35.0
nextPageUrl	String	URL to the next page.	35.0
previousPageUrl	String	URL to the previous page.	35.0
recommendationAudiences	List<ConnectApi.RecommendationAudience>	A list of recommendation audiences.	35.0

ConnectApi.RecommendationsCapability

If a feed element has this capability, it has a recommendation.

Subclass of [ConnectApi.FeedElementCapability](#) Class.

Property Name	Type	Description	Available Version
items	List<ConnectApi.AbstractRecommendation>	A list of recommendations.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities](#) Class

ConnectApi.RecommendationCollection Class

A list of recommendations.

Property Name	Type	Description	Available Version
recommendations	List<ConnectApi.AbstractRecommendation>	Collection of recommendations.	33.0

ConnectApi.RecommendationDefinition

Represents a custom recommendation definition.

Property Name	Type	Description	Available Version
<code>actionUrl</code>	String	The URL for acting on this recommendation.	35.0
<code>actionUrlName</code>	String	The text label for the action URL in the user interface.	35.0
<code>explanation</code>	String	Explanation of the recommendation definition.	35.0
<code>id</code>	String	18-character ID of the recommendation definition.	35.0
<code>name</code>	String	Name of the recommendation definition. The name is displayed in Setup.	35.0
<code>photo</code>	ConnectApi.Photo	Photo of the recommendation definition.	35.0
<code>title</code>	String	Title of the recommendation definition.	35.0
<code>url</code>	String	URL to the Chatter REST API resource for the recommendation definition.	35.0

SEE ALSO:

[ConnectApi.RecommendationDefinitionPage](#)

[ConnectApi.ScheduledRecommendation](#)

ConnectApi.RecommendationDefinitionPage

Represents a list of recommendation definitions.

Property Name	Type	Description	Available Version
<code>recommendationDefinitions</code>	List<ConnectApi.RecommendationDefinition>	A list of recommendation definitions.	35.0
<code>url</code>	String	URL to the Chatter REST API resource for the recommendation definition collection.	35.0

ConnectApi.RecommendationExplanation Class

Explanation for a recommendation.

Subclass of [ConnectApi.AbstractRecommendationExplanation Class](#).

Property Name	Type	Description	Available Version
detailsUrl	String	URL to explanation details or <code>null</code> if the recommendation doesn't have a detailed explanation.	32.0

SEE ALSO:

[ConnectApi.AbstractRecommendation Class](#)

ConnectApi.RecommendedObject

A recommended object, such as a custom or static recommendation.

Subclass of [ConnectApi.Actor Class](#)

Property Name	Type	Description	Available Version
idOrEnum	String	ID of a recommendation definition for a custom recommendation or the enum value <code>Today</code> for static recommendations that don't have an ID (version 35.0 and later).	34.0
motif	ConnectApi.Motif	Motif of the recommended object.	34.0

ConnectApi.RecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A generic record field containing a label and text value.

SEE ALSO:

[ConnectApi.CompoundRecordField Class](#)

ConnectApi.RecordSnapshotAttachment Class

Important: This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.RecordSnapshotCapability](#) is used.

Subclass of [ConnectApi.FeedItemAttachment Class](#)

The fields of a record at the point in time when the record was created.

Name	Type	Description	Available Version
recordView	ConnectApi.RecordView	The representation of the record.	29.0–31.0

ConnectApi.RecordSnapshotCapability

If a feed element has this capability, it contains all the snapshotted fields of a record for a single create record event.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
recordView	ConnectApi.RecordView	A record representation that includes metadata and data so you can display the record easily.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.RecordSummary Class

Subclass of [ConnectApi.AbstractRecordView Class](#)

Property Name	Type	Description	Available Version
entityLabel	ConnectApi.EntityLabel	Label of the record's entity.	40.0

SEE ALSO:

[ConnectApi.EmailAddress](#)

[ConnectApi.EmailAttachment](#)

[ConnectApi.ReferenceWithDateRecordField Class](#)

ConnectApi.RecordSummaryList Class

Summary information about a list of records in the organization including custom objects.

Name	Type	Description	Available Version
records	List<ConnectApi.ActorWithId>	A list of records.	30.0
url	String	The URL to this list of records.	30.0

ConnectApi.RecordView Class

Subclass of [ConnectApi.AbstractRecordView Class](#)

A view of any record in the organization, including a custom object record. This object is used if a specialized object, such as User or ChatterGroup, is not available for the record type. Contains data and metadata so you can render a record with one response.

Name	Type	Description	Available Version
sections	List<ConnectApi.RecordViewSection>	A list of record view sections.	29.0

SEE ALSO:

[ConnectApi.RecordSnapshotCapability](#)

ConnectApi.RecordViewSection Class

A section of record fields and values on a record detail.

Name	Type	Description	Available Version
columnCount	Integer	The number of columns to use to lay out the fields in a record section.	29.0
columnOrder	ConnectApi.RecordColumnOrder Enum	The order of the fields to use in the <code>fields</code> property to lay out the fields in a record section. <ul style="list-style-type: none"> <code>LeftRight</code>—Fields are rendered from left to right. <code>TopDown</code>—Fields are rendered from the top down. 	29.0
fields	ConnectApi.AbstractRecordField	The fields and values for the record contained in this section.	29.0
heading	String	A localized label to display when rendering this section of fields.	29.0
isCollapsible	Boolean	Indicates whether the section can be collapsed to hide all the fields (<code>true</code>) or not (<code>false</code>).	29.0

SEE ALSO:

[ConnectApi.RecordView Class](#)

ConnectApi.Reference Class

Name	Type	Description	Available Version
id	String	The ID of the record being referenced, which could be an 18-character ID or some other string identifier.	28.0
url	String	The URL to the resource endpoint.	28.0

ConnectApi.ReferenceRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field with a label and text value.

Name	Type	Description	Available Version
reference	ConnectApi.RecordSummary	The object referenced by the record field.	29.0

ConnectApi.ReferenceWithDateRecordField Class

Subclass of [ConnectApi.LabeledRecordField Class](#)

A record field containing a referenced object that acted at a specific time, for example, "Created By...".

Name	Type	Description	Available Version
dateValue	Datetime	A time at which the referenced object acted.	29.0
reference	ConnectApi.RecordSummary	The object referenced by the record field.	29.0

ConnectApi.RelatedFeedPost

This class is abstract.

Subclass of: [ConnectApi.ActorWithId Class](#)

Superclass of: [ConnectApi.RelatedQuestion](#)

Property Name	Type	Description	Available Version
score	Double	Score of the related feed post that indicates how closely related it is to the context feed post.	37.0
title	String	Title of the related feed post.	37.0

SEE ALSO:

[ConnectApi.RelatedFeedPosts](#)

ConnectApi.RelatedFeedPosts

A collection of related feed posts.

Property Name	Type	Description	Available Version
relatedFeedPosts	List<ConnectApi.RelatedFeedPost>	Collection of related feed posts.	37.0

ConnectApi.RelatedQuestion

A related question.

Subclass of: [ConnectApi.RelatedFeedPost](#)

Property Name	Type	Description	Available Version
<code>hasBestAnswer</code>	Boolean	Indicates whether the question has a best answer.	37.0
<code>interactions</code>	ConnectApi.InteractionsCapability	The number of individual views, likes, and comments on a question.	38.0

ConnectApi.RepositoryFileDetail

A detailed description of a repository file.

Subclass of [ConnectApi.AbstractRepositoryFile](#)

No additional properties.

ConnectApi.RepositoryFileSummary

A summary of a repository file.

Subclass of [ConnectApi.AbstractRepositoryFile](#)

No additional properties.

SEE ALSO:

[ConnectApi.RepositoryFolderItem](#)

ConnectApi.RepositoryFolderDetail

A detailed description of a repository folder.

Subclass of [ConnectApi.AbstractRepositoryFolder](#)

No additional properties.

ConnectApi.RepositoryFolderItem

A folder item.

Property Name	Type	Description	Available Version
<code>file</code>	ConnectApi.RepositoryFileSummary	If the folder item is a file, the file summary. If the folder item is a folder, <code>null</code> .	39.0
<code>folder</code>	ConnectApi.RepositoryFolderSummary	If the folder item is a folder, the folder summary. If the folder item is a file, <code>null</code> .	39.0

Property Name	Type	Description	Available Version
type	ConnectApi.FolderItemType	Specifies the type of item in a folder. Values are: <ul style="list-style-type: none"> file folder 	39.0

SEE ALSO:

[ConnectApi.RepositoryFolderItemsCollection](#)

ConnectApi.RepositoryFolderItemsCollection

A collection of repository folder items.

Property Name	Type	Description	Available Version
currentPageUrl	String	URL to the current page.	39.0
items	List<ConnectApi.RepositoryFolderItem>	Collection of items in a repository folder.	39.0
nextPageUrl	String	URL to the next page.	39.0
previousPageUrl	String	URL to the previous page.	39.0

ConnectApi.RepositoryFolderSummary

A summary of a repository folder.

Subclass of [ConnectApi.AbstractRepositoryFolder](#)

No additional properties.

SEE ALSO:

[ConnectApi.RepositoryFolderItem](#)

ConnectApi.RepositoryGroupSummary

A group summary.

Subclass of [ConnectApi.AbstractDirectoryEntrySummary](#)

Property Name	Type	Description	Available Version
groupType	ConnectApi.ContentHubGroupType	Specifies the type of group. Values are: <ul style="list-style-type: none"> Everybody—Group is public to everybody. EverybodyInDomain—Group is public to everybody in the same domain. Unknown—Group type is unknown. 	39.0

Property Name	Type	Description	Available Version
name	String	Name of the group.	39.0

SEE ALSO:

[ConnectApi.ExternalFilePermissionInformation](#)

ConnectApi.RepositoryUserSummary

A user summary.

Subclass of [ConnectApi.AbstractDirectoryEntrySummary](#)

Property Name	Type	Description	Available Version
firstName	String	First name of the user.	39.0
lastName	String	Last name of the user.	39.0

ConnectApi.Reputation Class

Reputation for a user.

Property Name	Type	Description	Available Version
reputationLevel	ConnectApi.ReputationLevel	User's reputation level.	32.0
reputationPoints	Double	User's reputation points, which can be earned by performing different activities in the community.	32.0
url	String	A Chatter REST API URL to the reputation.	32.0

SEE ALSO:

[ConnectApi.User Class](#)

ConnectApi.ReputationLevel Class

Reputation level for a user.

Property Name	Type	Description	Available Version
levelImageUrl	String	URL to the reputation level image.	32.0
levelName	String	Name of the reputation level.	32.0

Property Name	Type	Description	Available Version
levelNumber	Integer	Reputation level number, which is the numerical rank of the level, with the lowest level at 1. Administrators define the reputation level point ranges.	32.0

SEE ALSO:

[ConnectApi.Reputation Class](#)

ConnectApi.RequestHeader Class

An HTTP request header name and value pair.

Property Name	Type	Description	Available Version
name	String	The name of the request header.	33.0
value	String	The value of the request header.	33.0

SEE ALSO:

[ConnectApi.ActionLinkDefinition Class](#)

ConnectApi.ResourceLinkSegment Class

Name	Type	Description	Available Version
url	String	URL to a resource not otherwise identified by an ID field, for example, a link to a list of users.	28.0

ConnectApi.ScheduledRecommendation

Represents a scheduled recommendation.

Property Name	Type	Description	Available Version
channel	ConnectApi.RecommendationChannel	Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations. Values are: <ul style="list-style-type: none"> CustomChannel1—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear. CustomChannel2—Custom recommendation channel. Not used by default. 	36.0

Property Name	Type	Description	Available Version
		<p>Work with your community manager to define custom channels.</p> <ul style="list-style-type: none"> • <code>CustomChannel13</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>CustomChannel14</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>CustomChannel15</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. • <code>DefaultChannel1</code>—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template. 	
<code>enabled</code>	Boolean	Indicates whether scheduling is enabled. If <code>true</code> , the recommendation is enabled and appears in communities. If <code>false</code> , recommendations in feeds in the Salesforce1 mobile browser app aren't removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Customer Service (Napili) template, disabled recommendations no longer appear.	35.0
<code>id</code>	String	18-character ID of the scheduled recommendation.	35.0
<code>rank</code>	Integer	The rank determining the order of this scheduled recommendation.	35.0
<code>recommendationAudienceId</code>	String	ID of the audience for the scheduled recommendation.	35.0
<code>recommendationDefinitionRepresentation</code>	ConnectApi.RecommendationDefinition	Recommendation definition that this scheduled recommendation schedules.	35.0

Property Name	Type	Description	Available Version
url	String	URL to the Chatter REST API resource for the scheduled recommendation.	35.0

SEE ALSO:

[ConnectApi.ScheduledRecommendationPage](#)

ConnectApi.ScheduledRecommendationPage

Represents a list of scheduled recommendations.

Property Name	Type	Description	Available Version
scheduledRecommendations	List<ConnectApi.ScheduledRecommendation>	A list of scheduled recommendations.	35.0
url	String	URL to the Chatter REST API resource for the scheduled recommendation collection.	35.0

ConnectApi.SocialAccount

A social account on a social network.

Property Name	Type	Description	Available Version
externalSocialAccountId	String	ID of the external social account, if available.	38.0
handle	String	Social handle, screen name, or alias that identifies this account.	36.0
name	String	Name of the account as defined by the account's owner.	36.0
profileUrl	String	URL to the account's profile.	36.0
socialPersonaId	String	ID of the social persona account, if the external social account ID isn't available.	39.0

SEE ALSO:

[ConnectApi.SocialPostCapability](#)

ConnectApi.SocialPostCapability

If a feed element has this capability, it can interact with a social post on a social network.

Subclass of [ConnectApi.FeedElementCapabilities Class](#).

Property Name	Type	Description	Available Version
author	ConnectApi.SocialAccount	Social account that authored the social post.	36.0
content	String	Content body of the social post.	36.0
deletedBy	ConnectApi.UserSummary Class	User who deleted the social post.	38.0
icon	ConnectApi.Icon Class	Icon of the social network.	36.0
id	String	ID associated with the social post Salesforce record.	36.0
isOutbound	Boolean	If <code>true</code> , the social post originated from the Salesforce application.	36.0
likedBy	String	External social account who liked the social post.	40.0
messageType	ConnectApi.SocialPostMessageType	Message type of the social post. Values are: <ul style="list-style-type: none"> • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet 	38.0
name	String	Title or heading of the social post.	36.0
postUrl	String	External URL to the social post on the social network.	36.0
provider	ConnectApi.SocialNetworkProvider	Social network that this social post belongs to. Values are: <ul style="list-style-type: none"> • Facebook • GooglePlus • Instagram • KakaoTalk • Kik • Klout • Line • LinkedIn • Messenger • Other • Pinterest • QQ • Rypple 	36.0

Property Name	Type	Description	Available Version
		<ul style="list-style-type: none"> • SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube 	
recipient	ConnectApi.SocialAccount	Social account that is the recipient of the social post.	36.0
recipientId	String	ID of the recipient of the social post.	38.0
reviewScale	Double	Review scale of the social post.	40.0
reviewScore	Double	Review score of the social post.	40.0
status	ConnectApi.SocialPostStatus	Status of the social post.	36.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.SocialPostStatus

The status of a social post.

Property Name	Type	Description	Available Version
message	String	Status message.	36.0

Property Name	Type	Description	Available Version
type	ConnectApi.SocialPostStatusType	Status type. Values are: <ul style="list-style-type: none"> • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Pending • Replied • Sent • Unknown 	36.0

SEE ALSO:

[ConnectApi.SocialPostCapability](#)

ConnectApi.Stamp

A user stamp.

Property Name	Type	Description	Available Version
description	String	Description of the stamp.	39.0
id	String	ID of the stamp.	39.0
imageUrl	String	Image URL of the stamp.	39.0
label	String	Label of the stamp.	39.0

SEE ALSO:

[ConnectApi.User Class](#)

ConnectApi.StatusCapability

If a feed post or comment has this capability, it has a status that determines its visibility.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
feedEntityStatus	ConnectApi.FeedEntityStatus	Specifies the status of the feed post or comment. Values are: <ul style="list-style-type: none"> • PendingReview—The feed post or comment isn't approved yet and therefore isn't published or visible. 	37.0

Property Name	Type	Description	Available Version
		<ul style="list-style-type: none"> <code>Published</code>—The feed post or comment is approved and visible. 	
<code>isApprovableByMe</code>	<code>Boolean</code>	Specifies whether the context user can change the status of the feed post or comment.	37.0

SEE ALSO:

[ConnectApi.CommentCapabilities Class](#)

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.Subscription Class

Name	Type	Description	Available Version
<code>community</code>	<code>ConnectApi.Reference</code>	Information about the community in which the subscription exists	28.0
<code>id</code>	<code>String</code>	Subscription's 18-character ID	28.0
<code>subject</code>	<code>ConnectApi.Actor</code>	Information about the parent, that is, the thing or person being followed	28.0
<code>subscriber</code>	<code>ConnectApi.Actor</code>	Information about the subscriber, that is, the person following this item	28.0
<code>url</code>	<code>String</code>	Chatter REST API URL to this specific subscription	28.0

SEE ALSO:

[ConnectApi.FollowerPage Class](#)

[ConnectApi.FollowingPage Class](#)

ConnectApi.SupportedEmojis

A collection of supported emojis.

Property Name	Type	Description	Available Version
<code>supportedEmojis</code>	<code>ConnectApi.EmojiCollection</code>	A collection of supported emojis.	39.0

ConnectApi.TextSegment Class

Subclass of [ConnectApi.MessageSegment Class](#)

No additional properties.

ConnectApi.TimeZone Class

The user's time zone as selected in the user's personal settings in Salesforce. This value does not reflect a device's current location.

Name	Type	Description	Available Version
gmtOffset	Double	Signed offset, in hours, from GMT	30.0
name	String	Display name of this time zone	30.0

SEE ALSO:

[ConnectApi.UserSettings Class](#)

ConnectApi.Topic Class

Name	Type	Description	Available Version
createdDate	Datetime	ISO8601 date string, for example, 2011-02-25T18:24:31.000Z	29.0
description	String	Description of the topic	29.0
id	String	18-character ID	29.0
images	ConnectApi.TopicImages	Images associated with the topic	32.0
isBeingDeleted	Boolean	<code>true</code> if the topic is currently being deleted; <code>false</code> otherwise. After the topic is deleted, when attempting to retrieve the topic, the output is NOT_FOUND.	33.0
name	String	Name of the topic	29.0
nonLocalizedName	String	Non-localized name of the topic	36.0
talkingAbout	Integer	Number of people talking about this topic over the last two months, based on factors such as topic additions and comments on posts with the topic	29.0
url	String	URL to the topic detail page	29.0

SEE ALSO:

[ConnectApi.ManagedTopic Class](#)

[ConnectApi.TopicPage Class](#)

[ConnectApi.TopicEndorsement Class](#)

[ConnectApi.TopicEndorsementCollection Class](#)

[ConnectApi.TopicSuggestion Class](#)

[ConnectApi.TopicsCapability Class](#)

ConnectApi.TopicEndorsement Class

Represents one user endorsing another user for a single topic.

Name	Type	Description	Available Version
endorsee	ConnectApi.User Summary	User being endorsed	30.0
endorsementId	String	18-character ID of the endorsement record	30.0
endorser	ConnectApi.User Summary	User performing the endorsement	30.0
topic	ConnectApi.Topic	Topic the user is being endorsed for	30.0
url	String	URL to the resource for the endorsement record	30.0

ConnectApi.TopicEndorsementCollection Class

A collection of topic endorsement response bodies.

Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	30.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	30.0
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	30.0
topicEndorsements	List<ConnectApi.Topic>	List of topic endorsements	30.0

ConnectApi.TopicImages Class

Images associated with a topic.

Property Name	Type	Description	Available Version
coverImageUrl	String	URL to a topic's cover image, which appears on the topic page. Both topics and managed topics can have cover images.	32.0

Property Name	Type	Description	Available Version
featuredImageUrl	String	URL to a managed topic's featured image, which appears wherever you feature it, for example, on the communities home page.	32.0

SEE ALSO:

[ConnectApi.Topic Class](#)

ConnectApi.TopicPage Class

Name	Type	Description	Available Version
currentPageUrl	String	Chatter REST API URL identifying the current page.	29.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	29.0
topics	List<ConnectApi.Topic>	List of topics	29.0

ConnectApi.TopicsCapability Class

If a feed element has this capability, the context user can add topics to it. Topics help users organize and discover conversations.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
canAssignTopics	Boolean	<code>true</code> if a topic can be assigned to the feed element, <code>false</code> otherwise.	32.0
items	List<ConnectApi.Topic>	A collection of topics associated with this feed element.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.TopicSuggestion Class

Name	Type	Description	Available Version
existingTopic	ConnectApi.Topic	Topic that already exists or <code>null</code> for a new topic	29.0

Name	Type	Description	Available Version
name	String	Topic name	29.0

SEE ALSO:

[ConnectApi.TopicSuggestionPage Class](#)

ConnectApi.TopicSuggestionPage Class

Name	Type	Description	Available Version
TopicSuggestions	List<ConnectApi.TopicSuggestion>	List of topic suggestions	29.0

ConnectApi.TrackedChangeAttachment Class

 **Important:** This class isn't available in version 32.0 and later. In version 32.0 and later, [ConnectApi.TrackedChangesCapability](#) is used.

Name	Type	Description	Available Version
changes	List<ConnectApi.TrackedChangeItem>	A list of tracked changes.	28.0–31.0

ConnectApi.TrackedChangeBundleCapability

If a feed element has this capability, it has a group of other feed elements aggregated into one feed element called a *bundle*. This type of bundle aggregates feed tracked changes.

Subclass of [ConnectApi.BundleCapability Class](#).

Property Name	Type	Description	Available Version
changes	List<ConnectApi.TrackedChangeItem>	Collection of feed tracked changes.	31.0

ConnectApi.TrackedChangeItem Class

Name	Type	Description	Available Version
fieldName	String	The name of the field that was updated.	28.0
newValue	String	The new value of the field or <code>null</code> if the field length is long.	28.0

Name	Type	Description	Available Version
oldValue	String	The old value of the field or <code>null</code> if the field length is long.	28.0

SEE ALSO:

[ConnectApi.TrackedChangesCapability](#)

[ConnectApi.TrackedChangeBundleCapability](#)

ConnectApi.TrackedChangesCapability

If a feed element has this capability, it contains all changes to a record for a single tracked change event.

Subclass of [ConnectApi.FeedElementCapability Class](#).

Property Name	Type	Description	Available Version
changes	List< ConnectApi.TrackedChangeItem >	Collection of feed tracked changes.	32.0

SEE ALSO:

[ConnectApi.FeedElementCapabilities Class](#)

ConnectApi.UnauthenticatedUser Class

Subclass of [ConnectApi.Actor Class](#)

No additional properties.

Instances of this class are used as the actor for feed items and comments posted by Chatter customers.

ConnectApi.UnreadConversationCount Class

Name	Type	Description	Available Version
hasMore	Boolean	Specifies if there are more than 50 unread messages (<code>true</code>) or not (<code>false</code>)	29.0
unreadCount	Integer	The total number of unread messages	29.0

ConnectApi.User Class

This class is abstract.

Subclass of [ConnectApi.ActorWithId Class](#)

Superclass of:

- [ConnectApi.UserDetail Class](#)
- [ConnectApi.UserSummary Class](#)

Name	Type	Description	Available Version
additionalLabel	String	An extra label for the user, for example, "Customer," "Partner," or "Acme Corporation." If the user doesn't have an extra label, the value is <code>null</code> .	30.0
communityNickname	String	User's nickname in the community.	32.0
companyName	String	Name of the company. If your community allows access without logging in, the value is <code>null</code> for guest users.	28.0
displayName	String	User's name that is displayed in the community. If nicknames are enabled, the nickname is displayed. If nicknames aren't enabled, the full name is displayed.	32.0
firstName	String	User's first name. In version 39.0 and later, if nicknames are enabled, <code>firstName</code> is <code>null</code> .	28.0
isChatterGuest	Boolean	<code>true</code> if user is a Chatter customer; <code>false</code> otherwise.	28.0
isInThisCommunity	Boolean	<code>true</code> if user is in the same community as the context user; <code>false</code> otherwise	28.0
lastName	String	User's last name. In version 39.0 and later, if nicknames are enabled, <code>lastName</code> is <code>null</code> .	28.0
outOfOffice	ConnectApi. OutOfOffice (Pilot)	Extra out-of-office message, if one exists, for the user.  Note: We provide Out of Office to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Pilot programs are subject to change, and we can't guarantee acceptance. Out of Office isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.	40.0
photo	ConnectApi.Photo	Information about the user's photos.	28.0
reputation	ConnectApi.Reputation Class	Reputation of the user.	32.0
stamps	List<ConnectApi.Stamp>	Collection of the user's stamps.	39.0

Name	Type	Description	Available Version
title	String	User's title. If your community allows access without logging in, the value is <code>null</code> for guest users.	28.0
userType	ConnectApi.UserType Enum	Specifies the type of user. <ul style="list-style-type: none"> ChatterGuest—User is an external user in a private group. ChatterOnly—User is a Chatter Free customer. Guest—User is unauthenticated. Internal—User is a standard organization member. Portal—User is an external user in a customer portal, partner portal, or community. System—User is Chatter Expert or a system user. Undefined—User is a user type that is a custom object. 	28.0

SEE ALSO:

[ConnectApi.RecommendationAudience](#)

ConnectApi.UserCapabilities Class

The capabilities associated with a user profile.

Name	Type	Description	Available Version
canChat	Boolean	Specifies if the context user can use Chatter Messenger with the subject user (<code>true</code>) or not (<code>false</code>)	29.0
canDirectMessage	Boolean	Specifies if the context user can direct message the subject user (<code>true</code>) or not (<code>false</code>)	29.0
canEdit	Boolean	Specifies if the context user can edit the subject user's account (<code>true</code>) or not (<code>false</code>)	29.0
canFollow	Boolean	Specifies if the context user can follow the subject user's feed (<code>true</code>) or not (<code>false</code>)	29.0
canViewFeed	Boolean	Specifies if the context user can view the feed of the subject user (<code>true</code>) or not (<code>false</code>)	29.0
canViewFullProfile	Boolean	Specifies if the context user can view the full profile of the subject user (<code>true</code>) or only the limited profile (<code>false</code>)	29.0

Name	Type	Description	Available Version
<code>isModerator</code>	Boolean	Specifies if the subject user is a Chatter moderator or admin (<code>true</code>) or not (<code>false</code>)	29.0

SEE ALSO:

[ConnectApi.UserProfile Class](#)

ConnectApi.UserChatterSettings Class

A user's global Chatter settings.

Name	Type	Description	Available Version
<code>defaultGroupEmailFrequency</code>	ConnectApi.GroupEmailFrequency Enum	The default frequency with which a user receives email from a group when they join it.	28.0

ConnectApi.UserDetail Class

Subclass of [ConnectApi.User Class](#)

Details about a user in an organization.

If the context user doesn't have permission to see a property, its value is set to `null`.

Name	Type	Description	Available Version
<code>aboutMe</code>	String	Text from user's profile	28.0
<code>address</code>	ConnectApi.Address	User's address	28.0
<code>bannerPhoto</code>	ConnectApi.BannerPhoto	User's banner photo	36.0
<code>chatterActivity</code>	ConnectApi.ChatterActivity	Chatter activity statistics	28.0
<code>chatterInfluence</code>	ConnectApi.GlobalInfluence	User's influence rank	28.0
<code>email</code>	String	User's email address	28.0
<code>followersCount</code>	Integer	Number of users following this user	28.0
<code>followingCounts</code>	ConnectApi.FollowingCounts	Information about items the user is following	28.0
<code>groupCount</code>	Integer	Number of groups user is following	28.0
<code>hasChatter</code>	Boolean	<code>true</code> if user has access to Chatter; <code>false</code> otherwise	31.0

Name	Type	Description	Available Version
<code>isActive</code>	Boolean	<code>true</code> if user is active; <code>false</code> otherwise	28.0
<code>managerId</code>	String	18-character ID of the user's manager	28.0
<code>managerName</code>	String	Locale-based concatenation of manager's first and last names	28.0
<code>phoneNumbers</code>	List<ConnectApi.PhoneNumber>	Collection of user's phone numbers	28.0
<code>thanksReceived</code>	Integer	The number of times the user has been thanked.	29.0
<code>username</code>	String	Username of the user, such as <i>Admin@mycompany.com</i> .	28.0

SEE ALSO:

[ConnectApi.UserPage Class](#)

[ConnectApi.UserProfile Class](#)

ConnectApi.UserGroupPage Class

A paginated list of groups the context user is a member of.

Name	Type	Description	Available Version
<code>currentPageUrl</code>	String	Chatter REST API URL identifying the current page.	28.0
<code>groups</code>	List<ConnectApi.ChatterGroupSummary>	List of groups	28.0
<code>nextPageUrl</code>	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	28.0
<code>previousPageUrl</code>	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
<code>total</code>	Integer	Total number of groups across all pages	28.0

ConnectApi.UserOauthInfo

Name	Type	Description	Available Version
availableExternalEmailService	Connect.CauthProviderInfo	The available OAuth service provider.	37.0
isAuthenticated	Boolean	Specifies whether the user is authenticated (<code>true</code>) or not (<code>false</code>).	37.0

ConnectApi.UserPage Class

Name	Type	Description	Available Version
currentPageToken	Integer	Token identifying the current page.	28.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	28.0
nextPageToken	Integer	Token identifying the next page, or <code>null</code> if there isn't a next page.	28.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	28.0
previousPageToken	Integer	Token identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
previousPageUrl	String	Chatter REST API URL identifying the previous page, or <code>null</code> if there isn't a previous page.	28.0
users	List<ConnectApi.UserDetail>	List of user detail information. If the context user doesn't have permission to see a property, the property is set to <code>null</code> .	28.0

ConnectApi.UserProfile Class

Details necessary to render a view of a user profile.

Name	Type	Description	Available Version
capabilities	ConnectApi.UserCapabilities	The context user's capabilities specific to the subject user's profile	29.0
id	String	The ID of the user attached to the profile	29.0
tabs	List<ConnectApi.UserProfileTab>	The tabs visible to the context user specific to the subject user's profile	29.0
url	String	The URL of the user's profile	29.0
userDetail	ConnectApi.UserDetail	The details about the user attached to the profile	29.0

ConnectApi.UserProfileTab Class

Information about a profile tab.

Name	Type	Description	Available Version
id	String	The tab's unique identifier or 18-character ID	29.0
isDefault	Boolean	Specifies if the tab appears first when clicking the user profile (true) or not (false)	29.0
tabType	ConnectApi.UserProfileTabType Enum	Specifies the type of tab <ul style="list-style-type: none"> • CustomVisualForce—Tab that displays data from a Visualforce page. • CustomWeb—Tab that displays data from any external Web-based application or Web page. • Element—Tab that displays generic content inline. • Feed—Tab that displays the Chatter feed. • Overview—Tab that displays user details. 	29.0
tabUrl	String	The current tab's content URL (for non built-in tab types)	29.0

SEE ALSO:

[ConnectApi.UserProfile Class](#)

ConnectApi.UserReferencePage

A list of user references.

Property Name	Type	Description	Available Version
currentPageUrl	String	URL to the current page.	35.0
nextPageUrl	String	URL to the next page.	35.0
previousPageUrl	String	URL to the previous page.	35.0
userCount	Integer	Number of users in the collection.	35.0
users	List<ConnectApi.UserReference>	A collection of user references.	35.0

ConnectApi.UserSettings Class

Settings specific to a user.

Property	Type	Description	Available Version
approvalPosts	Boolean	User can approve workflows from Chatter posts.	28.0
canAccess PersonalStreams	Boolean	User can access personal stream feeds.	40.0
canFollow	Boolean	User can follow users and records.	28.0
canModify AllData	Boolean	User has Modify all Data permission.	28.0
canOwnGroups	Boolean	User can own groups.	28.0
canViewAllData	Boolean	User has View all Data permission.	28.0
canViewAllGroups	Boolean	User has View all Groups permission.	28.0
canViewAllUsers	Boolean	User has View all Users permission.	28.0
canViewCommunity Switcher	Boolean	User can see the community switcher menu.	34.0
canViewFull UserProfile	Boolean	User can see other user's Chatter profile.	28.0
canViewPublicFiles	Boolean	User can see all files that are public.	28.0
currencySymbol	String	Currency symbol to use for displaying currency values. Applicable only when the <code>ConnectApi.Features.multiCurrency</code> property is <code>false</code> .	28.0
externalUser	Boolean	User is a Chatter customer.	28.0
fileSyncLimit	Integer	Maximum number of files user can sync.	32.0
fileSync StorageLimit	Integer	Maximum storage for synced files, in megabytes (MB).	29.0
folderSync Limit	Integer	Maximum number of folders user can sync.	32.0
hasAccessTo InternalOrg	Boolean	User is a member of the internal org.	28.0
hasChatter	Boolean	User has access to Chatter.	31.0
hasFileSync	Boolean	User has Sync Files permission.	28.0
hasFileSync ManagedClient AutoUpdate	Boolean	Administrator for the user's org allows file sync clients to update automatically.	34.0

Property	Type	Description	Available Version
hasRestData ApiAccess	Boolean	User has access to REST API.	29.0
timeZone	ConnectApi.TimeZone	The user's time zone as selected in the user's personal settings in Salesforce. This value does not reflect a device's current location.	30.0
userDefault CurrencyIsoCode	String	The ISO code for the default currency. Applicable only when the <code>ConnectApi.Features.multiCurrency</code> property is <code>true</code> .	28.0
userId	String	18-character ID of the user.	28.0
userLocale	String	Locale of user.	28.0

ConnectApi.Zone Class

Information about a Chatter Answers zone.

Name	Type	Description	Available Version
<code>description</code>	String	The description of the zone	29.0
<code>id</code>	String	The zone ID	29.0
<code>isActive</code>	Boolean	Indicates whether or not the zone is active	29.0
<code>isChatterAnswers</code>	Boolean	Indicates whether or not the zone is available for Chatter Answers	29.0
<code>name</code>	String	Name of the zone	29.0
<code>url</code>	String	The URL of the zone	30.0

Name	Type	Description	Available Version
visibility	ConnectApi.ZoneShowIn	Zone visibility type <ul style="list-style-type: none"> Community—Available in a community. Internal—Available internally only. Portal—Available in a portal. 	29.0
visibilityId	String	If the zone is available in a portal or a community, this property contains the ID of the portal or community. If the zone is available to all portals, this property contains the value <code>All</code> .	29.0

SEE ALSO:

[ConnectApi.ZonePage Class](#)

ConnectApi.ZonePage Class

Information about zone pages.

Name	Type	Description	Available Version
zones	List<ConnectApi.Zone>	A list of one or more zones	29.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	29.0
nextPageUrl	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	29.0

ConnectApi.ZoneSearchPage Class

Information about the search results for zones.

Name	Type	Description	Available Version
currentPageToken	String	Token identifying the current page.	29.0
currentPageUrl	String	Chatter REST API URL identifying the current page.	29.0
items	List<ConnectApi.ZoneSearchResult>	List of search results	29.0
nextPageToken	String	Token identifying the next page, or <code>null</code> if there isn't a next page.	29.0

Name	Type	Description	Available Version
<code>nextPageUrl</code>	String	Chatter REST API URL identifying the next page, or <code>null</code> if there isn't a next page. Check whether this value is <code>null</code> before getting another page. If a page doesn't exist, a <code>ConnectApi.NotFoundException</code> error is returned.	29.0

ConnectApi.ZoneSearchResult Class

Information about a specific zone search result.

Name	Type	Description	Available Version
<code>hasBestAnswer</code>	Boolean	Indicates if the search result has a best answer	29.0
<code>id</code>	String	ID of the search result. The search result can be a question or an article.	29.0
<code>title</code>	String	Title of the search result	29.0
<code>type</code>	<code>ConnectApi.ZoneSearchResultType</code> Enum	Specifies the zone search result type <ul style="list-style-type: none"> <code>Article</code>—Search results contain only articles. <code>Question</code>—Search results contain only questions. 	29.0
<code>voteCount</code>	String	Number of votes given to the search result	29.0

ConnectApi Enums

Enums specific to the `ConnectApi` namespace.

`ConnectApi` enums inherit all properties and methods of Apex enums.

Enums are not versioned. Enum values are returned in all API versions. Clients should handle values they don't understand gracefully.

Enum	Description
<code>ConnectApi.ActionLinkExecutionsAllowed</code>	Specifies the number of times an action link can be executed. <ul style="list-style-type: none"> <code>Once</code>—An action link can be executed only once across all users. <code>OncePerUser</code>—An action link can be executed only once for each user.

Enum	Description
	<ul style="list-style-type: none"> Unlimited—An action link can be executed an unlimited number of times by each user. If the action link's <code>actionType</code> is <code>Api</code> or <code>ApiAsync</code>, you can't use this value.
<code>ConnectApi.ActionLinkType</code>	<p>Specifies the type of action link.</p> <ul style="list-style-type: none"> <code>Api</code>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server. <code>ApiAsync</code>—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete. <code>Download</code>—The action link downloads a file from the action URL. <code>Ui</code>—The action link takes the user to a Web page at the action URL.
<code>ConnectApi.ActivitySharingTypeEnum</code>	<p>Specifies the type of sharing operation.</p> <ul style="list-style-type: none"> <code>Everyone</code>—The activity is shared with everyone. <code>MyGroups</code>—The activity is shared only with a selection of the context user's groups. <code>OnlyMe</code>—The activity is private.
<code>ConnectApi.ArticleTopicJobType</code>	<p>Specifies the type of operation to perform on articles and topics.</p> <ul style="list-style-type: none"> <code>AssignTopicsToArticle</code>—Assign topics to articles in a data category. <code>UnassignTopicsFromArticle</code>—Unassign topics from articles in a data category.
<code>ConnectApi.BannerStyle</code>	<p>Decorates a feed item with a color and set of icons.</p> <ul style="list-style-type: none"> <code>Announcement</code>—An announcement displays in a designated location in the Salesforce UI until 11:59 p.m. on its expiration date, unless it's deleted or replaced by another announcement.
<code>ConnectApi.BundleType</code>	<p>Specifies the type of bundle.</p> <ul style="list-style-type: none"> <code>GenericBundle</code>—A bundle that contains no additional information and is just a collection of feed elements. <code>TrackedChanges</code>—A bundle that represents a collection of feed tracked changes. The bundle includes summary information about the feed tracked changes that make up the bundle.
<code>ConnectApi.CaseActorType</code>	<p>Specifies the type of user who made the comment.</p> <ul style="list-style-type: none"> <code>Customer</code>—if a Chatter customer made the comment <code>CustomerService</code>—if a service representative made the comment
<code>ConnectApi.CaseCommentEventType</code>	<p>Specifies the event type of a comment in Case Feed.</p> <ul style="list-style-type: none"> <code>NewInternal</code>—A case comment that has newly been marked Internal Only. <code>NewPublished</code>—A newly published case comment.

Enum	Description
	<ul style="list-style-type: none"> • <code>NewPublishedByCustomer</code>—A case comment by a customer that was newly published. • <code>PublishExisting</code>—An existing case comment that was republished. • <code>PublishExistingByCustomer</code>—An existing case comment by a customer that was republished. • <code>UnpublishExistingByCustomer</code>—An existing case comment by a customer that was unpublished. • <code>UnpublishExsiting</code>—An existing case comment that was unpublished. <p> Note: Unfortunately, this typo is in the code, not the documentation. Use this spelling in your code.</p>
<code>ConnectApi.CommentType</code>	<p>Specifies the type of comment.</p> <ul style="list-style-type: none"> • <code>ContentComment</code>—Comment holds a content capability. • <code>TextComment</code>—Comment contains only text.
<code>ConnectApi.CommunityFlagReasonType</code>	<p>Specifies why a post, comment, or file is flagged.</p> <ul style="list-style-type: none"> • <code>FlaggedByRule</code>—Moderation rule flagged the item. • <code>FlaggedBySystem</code>—Einstein flagged the item. • <code>FlaggedByUserAsInappropriate</code>—User flagged the item as inappropriate. • <code>FlaggedByUserAsSpam</code>—User flagged the item as spam.
<code>ConnectApi.CommunityFlagType</code>	<p>Specifies the type of moderation flag.</p> <ul style="list-style-type: none"> • <code>FlagAsInappropriate</code>—Flag for inappropriate content. • <code>FlagAsSpam</code>—Flag for spam.
<code>ConnectApi.CommunityFlagVisibility</code>	<p>Specifies the visibility behavior of a flag for various user types.</p> <ul style="list-style-type: none"> • <code>ModeratorsOnly</code>—The flag is visible only to users with moderation permissions on the flagged element or item. • <code>SelfAndModerators</code>—The flag is visible to the creator of the flag and to users with moderation permissions on the flagged element or item.
<code>ConnectApi.CommunityStatus</code>	<p>Specifies the status of the community.</p> <ul style="list-style-type: none"> • <code>Live</code> • <code>Inactive</code> • <code>UnderConstruction</code>
<code>ConnectApi.ActivityType</code>	<p>Specifies the type of activity.</p> <ul style="list-style-type: none"> • <code>All</code> • <code>Event</code> • <code>Task</code>

Enum	Description
<code>ConnectApi.ContentHubAuthenticationProtocol</code>	<p>Specifies the authentication protocol used for the repository.</p> <ul style="list-style-type: none"> • <code>NoAuthentication</code>—Repository doesn't require authentication. • <code>Oauth</code>—Repository uses OAuth authentication protocol. • <code>Password</code>—Repository uses user name and password authentication protocol.
<code>ConnectApi.ContentHubDirectoryEntryType</code>	<p>Specifies the type of directory entry.</p> <ul style="list-style-type: none"> • <code>GroupEntry</code> • <code>UserEntry</code>
<code>ConnectApi.ContentHubExternalItemSharingType</code>	<p>Specifies the sharing status for the external file.</p> <ul style="list-style-type: none"> • <code>DomainSharing</code>—File is shared with the domain. • <code>PrivateSharing</code>—File is private or shared only with individuals. • <code>PublicSharing</code>—File is publicly shared.
<code>ConnectApi.ContentHubGroupType</code>	<p>Specifies the type of group.</p> <ul style="list-style-type: none"> • <code>Everybody</code>—Group is public to everybody. • <code>EverybodyInDomain</code>—Group is public to everybody in the same domain. • <code>Unknown</code>—Group type is unknown.
<code>ConnectApi.ContentHubItemType</code>	<p>Specifies the item types.</p> <ul style="list-style-type: none"> • <code>Any</code>—Includes files and folders. • <code>FilesOnly</code>—Includes files only. • <code>FoldersOnly</code>—Includes folders only.
<code>ConnectApi.ContentHubStreamSupport</code>	<p>Specifies support for content streaming.</p> <ul style="list-style-type: none"> • <code>ContentStreamAllowed</code> • <code>ContentStreamNotAllowed</code> • <code>ContentStreamRequired</code>
<code>ConnectApi.ContentHubVariableType</code>	<p>Specifies the data type of the value of the field.</p> <ul style="list-style-type: none"> • <code>BooleanType</code> • <code>DateTimeType</code> • <code>DecimalType</code> • <code>HtmlType</code> • <code>IdType</code> • <code>IntegerType</code> • <code>StringType</code> • <code>UriType</code> • <code>XmlType</code>

Enum	Description
<code>ConnectApi.DatacloudUserType</code>	<p>Specifies the type of user.</p> <ul style="list-style-type: none"> <code>Monthly</code>—A user type that's assigned monthly point limits for purchasing Data.com records. Only the assigned user can use monthly points. Points expire at the end of the month. Monthly is the default setting for <code>DatacloudUserType</code>. <code>Listpool</code>—A user type that allows users to draw from a pool of points to purchase Data.com records.
<code>ConnectApi.DatacloudImportStatusTypeEnum</code>	<p>Specifies the status of the import.</p> <ul style="list-style-type: none"> <code>Success</code>—Indicates that selected records were added to the organization's CRM. <code>Duplicate</code>—Marks a record that is already in the organization's CRM. The API determines whether an organization allows the addition of duplicate records in its CRM. <code>Error</code>—Indicates that the selected records weren't added to the organization's CRM.
<code>ConnectApi.DigestPeriod</code>	<p>Specifies the period of time that is included in a Chatter email digest.</p> <ul style="list-style-type: none"> <code>DailyDigest</code>—The email includes up to the 50 latest posts from the previous day. <code>WeeklyDigest</code>—The email includes up to the 50 latest posts from the previous week.
<code>ConnectApi.EmailMessageDirection</code>	<p>Specifies the direction of an email message on a case.</p> <ul style="list-style-type: none"> <code>Inbound</code>—An inbound message (sent by a customer). <code>Outbound</code>—An outbound message (sent to a customer by a support agent).
<code>ConnectApi.ExtensionInformationType (Pilot)</code>	<p>Specifies the information type of the extension.</p> <ul style="list-style-type: none"> <code>Lightning</code>
<code>ConnectApi.FeedDensity</code>	<p>Specifies the density of the feed.</p> <ul style="list-style-type: none"> <code>AllUpdates</code>—Displays all updates from people and records the user follows and groups the user is a member of. <code>FewerUpdates</code>—Displays all updates from people and records the user follows and groups the user is a member of, but hides some system-generated updates from records.
<code>ConnectApi.FeedElementCapabilityType</code>	<p>Specifies the capabilities of a feed element in API versions 31.0 and later. If a capability exists on a feed element, the capability is available, even if the value doesn't exist or is <code>null</code>. If the capability doesn't exist, it isn't available.</p> <ul style="list-style-type: none"> <code>AssociatedActions</code>—The feed element includes information about actions associated with it. <code>Approval</code>—The feed element includes information about an approval. <code>Banner</code>—The body of the feed element has an icon and border. <code>Bookmarks</code>—The context user can bookmark the feed element. Bookmarked feed elements are visible in the bookmarks feed. <code>Bundle</code>—The feed element has a group of other feed elements that display as a bundle in the feed. The bundle type determines the additional data associated with the bundle. <code>Canvas</code>—The feed element renders a canvas app.

Enum	Description
	<ul style="list-style-type: none"> • <code>CaseComment</code>—The feed element has a case comment in the case feed. • <code>ChatterLikes</code>—The context user can like the feed element. • <code>Comments</code>—The context user can add comments to the feed element. • <code>Content</code>—The feed element has a file. • <code>DashboardComponentSnapshot</code>—The feed element has a dashboard component snapshot. • <code>DirectMessage</code>—The feed element is a direct message. • <code>Edit</code>—Users who have permission can edit the feed element. • <code>EmailMessage</code>—The feed element has an email message from a case. • <code>EnhancedLink</code>—The feed element has a link that can contain supplemental information like an icon, a title, and a description. • <code>Extensions</code>—The feed element has one or more extension attachments. • <code>FeedEntityShare</code>—The feed element has a feed entity shared with it. • <code>Files</code>—The feed element has one or more file attachments. • <code>Interactions</code>—The feed element has information about user interactions. • <code>Link</code>—The feed element has a URL. • <code>Moderation</code>—Users in a community can flag the feed element for moderation. • <code>Mute</code>—The context user can mute the feed element. • <code>Origin</code>—The feed element was created by a feed action. • <code>Poll</code>—The feed element has poll voting. • <code>QuestionAndAnswers</code>—The feed element has a question, and users can add answers to the feed element instead of comments. Users can also select the best answer. • <code>ReadBy</code>—The context user can mark the feed element as read. • <code>Recommendations</code>—The feed element has a recommendation. • <code>RecordSnapshot</code>—The feed element has all the snapshotted fields of a record for a single create record event. • <code>SocialPost</code>—The feed element can interact with a social post on a social network. • <code>Status</code>—The feed element has a status that determines its visibility. • <code>Topics</code>—The context user can add topics to the feed element. • <code>TrackedChanges</code>—The feed element has all changes to a record for a single tracked change event.
<p><code>ConnectApi.FeedElement</code> Type</p>	<p>Feed elements are the top-level objects that a feed contains. The feed element type describes the characteristics of that feed element.</p> <ul style="list-style-type: none"> • <code>Bundle</code>—A container of feed elements. A bundle also has a body made up of message segments that can always be gracefully degraded to text-only values. • <code>FeedItem</code>—A feed item has a single parent and is scoped to one community or across all communities. A feed item can have capabilities such as bookmarks, canvas, content, comment, link, poll. Feed items have a body made up of message segments that can always be gracefully degraded to text-only values.

Enum	Description
	<ul style="list-style-type: none"> <code>Recommendation</code>—A recommendation is a feed element with a recommendations capability. A recommendation suggests records to follow, groups to join, or applications that are helpful to the context user.
<code>ConnectApi.FeedEntityStatus</code>	<p>Specifies the status of the feed post or comment.</p> <ul style="list-style-type: none"> <code>PendingReview</code>—The feed post or comment isn't approved yet and therefore isn't published or visible. <code>Published</code>—The feed post or comment is approved and visible.
<code>ConnectApi.FeedFavoriteType</code>	<p>Specifies the origin of the feed favorite, such as whether it's a search term or a list view:</p> <ul style="list-style-type: none"> <code>ListView</code> <code>Search</code> <code>Topic</code>
<code>ConnectApi.FeedFilter</code>	<p>Specifies a filter value for a feed.</p> <ul style="list-style-type: none"> <code>AllQuestions</code>—Feed elements that are questions. <code>AuthoredBy</code>—Feed elements authored by the user profile owner. This value is valid only for the <code>UserProfile</code> feed. <code>CommunityScoped</code>—Feed elements that are scoped to communities. Currently, these feed elements have a <code>User</code> or a <code>Group</code> parent record. However, other parent record types could be scoped to communities in the future. Feed elements that are always visible in all communities are filtered out. This value is valid only for the <code>UserProfile</code> feed. <code>Read</code>—Feed elements that are older than 30 days or are marked as read for the context user. Includes existing feed elements when the context user joined the group. This value is valid only for the <code>Record</code> feed of a group. <code>SolvedQuestions</code>—Feed elements that are questions and that have a best answer. <code>UnansweredQuestions</code>—Feed elements that are questions and that don't have any answers. <code>Unread</code>—Feed elements that are created in the past 30 days and aren't marked as read for the context user. This value is valid only for the <code>Record</code> feed of a group. <code>UnsolvedQuestions</code>—Feed elements that are questions and that don't have a best answer.
<code>ConnectApi.FeedItemAttachmentType</code>	<p>Specifies the attachment type for feed item output objects:</p> <ul style="list-style-type: none"> <code>Approval</code>—A feed item requiring approval. <code>BasicTemplate</code>—A feed item with a generic rendering of an image, link, and title. <code>Canvas</code>—A feed item that contains the metadata to render a link to a canvas app. <code>CaseComment</code>—A feed item created from a comment to a case record. <code>CaseComment</code>—A feed item created from a comment to a case record. <code>Content</code>—A feed item with a file attached. <code>DashboardComponent</code>—A feed item with a dashboard attached. <code>EmailMessage</code>—An email attached to a case record in Case Feed.

Enum	Description
	<ul style="list-style-type: none"> • <code>Link</code>—A feed item with a URL attached. • <code>Poll</code>—A feed item with a poll attached. • <code>Question</code>—A feed item with a question attached. • <code>RecordSnapshot</code>—The feed item attachment contains a view of a record at a single <code>ConnectApi.FeedItemType.CreateRecordEvent</code>. • <code>TrackedChange</code>—All changes to a record for a single <code>ConnectApi.FeedItemType.TrackedChange</code> event.
<code>ConnectApi.FeedItemType</code>	<p data-bbox="527 546 1459 588">Specifies the type of feed item, such as a content post or a text post.</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—Feed item generated in Case Feed when an event or task associated with a parent record with a feed enabled is created or updated. • <code>AdvancedTextPost</code>—A feed item with advanced text formatting, such as a group announcement post. • <code>ApprovalPost</code>—Feed item with an approval capability. Approvers can act on the feed item parent. • <code>AttachArticleEvent</code>—Feed item generated when an article is attached to a case in Case Feed. • <code>BasicTemplateFeedItem</code>—Feed item with an enhanced link capability. • <code>CallLogPost</code>—Feed item generated when a call log is saved to a case in Case Feed. • <code>CanvasPost</code>—Feed item generated by a canvas app in the publisher or from Chatter REST API or Chatter in Apex. The post itself is a link to a canvas app. • <code>CaseCommentPost</code>—Feed item generated when a case comment is saved in Case Feed. • <code>ChangeStatusPost</code>—Feed item generated when the status of a case is changed in Case Feed. • <code>ChatTranscriptionPost</code>—Feed item generated in Case Feed when a Live Agent chat transcript is saved to a case. • <code>CollaborationGroupCreated</code>—Feed item generated when a new public group is created. Contains a link to the new group. • <code>CollaborationGroupUnarchived</code>—Deprecated. Feed item generated when an archived group is activated. • <code>ContentPost</code>—Feed item with a content capability. • <code>CreateRecordEvent</code>—Feed item that describes a record created in the publisher. • <code>DashboardComponentAlert</code>—Feed item with a dashboard alert. • <code>DashboardComponentSnapshot</code>—Feed item with a dashboard component snapshot capability. • <code>EmailMessageEvent</code>—Feed item generated when an email is sent from a case in Case Feed. • <code>FacebookPost</code>—Deprecated. Feed item generated when a Facebook post is created from a case in Case Feed. • <code>LinkPost</code>—Feed item with a link capability.

Enum	Description
	<ul style="list-style-type: none"> • <code>MilestoneEvent</code>—Feed item generated when a case milestone is either completed or reaches a violation status. Contains a link to the case milestone. • <code>PollPost</code>—Feed item with a poll capability. Viewers of the feed item are allowed to vote on the options in the poll. • <code>ProfileSkillPost</code>—Feed item generated when a skill is added to a user's profile. • <code>QuestionPost</code>—Feed item generated when a question is asked. As of API version 33.0, a feed item of this type can have a content capability and a link capability. • <code>ReplyPost</code>—Feed item generated by a Chatter Answers reply. • <code>RypplePost</code>—Feed item generated when a user posts thanks. • <code>SocialPost</code>—Feed item generated when a social post is created from a case in Case Feed. • <code>TextPost</code>—Feed item containing text only. • <code>TrackedChange</code>—Feed item created when one or more fields on a record have been changed. • <code>UserStatus</code>—Deprecated. A user's post to their own profile.
<code>ConnectApi.FeedItemVisibilityType</code>	<p>Specifies the type of users who can see a feed item.</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—Visibility is not limited to internal users. • <code>InternalUsers</code>—Visibility is limited to internal users.
<code>ConnectApi.FeedSortOrder</code>	<p>Specifies the order of feed items in the feed.</p> <ul style="list-style-type: none"> • <code>CreatedDateAsc</code>—Sorts by oldest creation date. This sort order is available only for <code>DirectMessageModeration</code>, <code>Moderation</code>, and <code>PendingReview</code> feeds. • <code>CreatedDateDesc</code>—Sorts by most recent creation date. • <code>LastModifiedDateDesc</code>—Sorts by most recent activity. • <code>MostViewed</code>—Sorts by most viewed content. This sort order is available only for Home feeds when the <code>ConnectApi.FeedFilter</code> is <code>UnansweredQuestions</code>. • <code>Relevance</code>—Sorts by most relevant content. This sort order is available only for <code>Company</code>, <code>Home</code>, and <code>Topics</code> feeds.
<code>ConnectApi.FeedType</code>	<p>Specifies the type of feed:</p> <ul style="list-style-type: none"> • <code>Bookmarks</code>—Contains all feed items saved as bookmarks by the context user. • <code>Company</code>—Contains all feed items except feed items of type <code>TrackedChange</code>. To see the feed item, the user must have sharing access to its parent. • <code>DirectMessageModeration</code>—Contains all direct messages that are flagged for moderation. The Direct Message Moderation feed is available only to users with Moderate Communities Chatter Messages permissions. • <code>DirectMessages</code>—Contains all feed items of the context user's direct messages. • <code>Files</code>—Contains all feed items that contain files posted by people or groups that the context user follows.

Enum	Description
	<ul style="list-style-type: none"> • <code>Filter</code>—Contains the news feed filtered to contain feed items whose parent is a specified object type. • <code>Groups</code>—Contains all feed items from all groups the context user either owns or is a member of. • <code>Home</code>—Contains all feed items associated with any managed topic in a community. • <code>Landing</code>—Contains all feed items that best drive user engagement when the feed is requested. Allows clients to avoid an empty feed when there aren't many personalized feed items. • <code>Moderation</code>—Contains all feed items that are flagged for moderation, except direct messages. The Communities Moderation feed is available only to users with Moderate Community Feeds permissions. • <code>Mute</code>—Contains all feed items that the context user muted. • <code>News</code>—Contains all updates for people the context user follows, groups the user is a member of, and files and records the user is following. Also contains all updates for records whose parent is the context user and every feed item and comment that mentions the context user or that mentions a group the context user is a member of. • <code>PendingReview</code>—Contains all feed items and comments that are pending review. • <code>People</code>—Contains all feed items posted by all people the context user follows. • <code>Record</code>—Contains all feed items whose parent is a specified record, which could be a group, user, object, file, or any other standard or custom object. When the record is a group, the feed also contains feed items that mention the group. When the record is a user, the feed contains only feed items on that user. You can get another user's record feed. • <code>Streams</code>—Contains all feed items for any combination of up to 25 feed-enabled entities, such as people, groups, and records, that the context user subscribes to in a stream. • <code>To</code>—Contains all feed items with mentions of the context user, feed items the context user commented on, and feed items created by the context user that are commented on. • <code>Topics</code>—Contains all feed items that include the specified topic. • <code>UserProfile</code>—Contains feed items created when a user changes records that can be tracked in a feed, feed items whose parent is the user, and feed items that @mention the user. This feed is different than the news feed, which returns more feed items, including group updates. You can get another user's user profile feed.
<code>ConnectApi.FieldChangeValueType</code>	Specifies the value type of a field change: <ul style="list-style-type: none"> • <code>NewValue</code>—A new value • <code>OldValue</code>—An old value
<code>ConnectApi.FilePreviewFormat</code>	Specifies the format of the file preview. <ul style="list-style-type: none"> • <code>Pdf</code>—Preview format is PDF. • <code>Svg</code>—Preview format is compressed SVG. • <code>Thumbnail</code>—Preview format is 240 x 180 PNG. • <code>ThumbnailBig</code>—Preview format is 720 x 480 PNG. • <code>ThumbnailTiny</code>—Preview format is 120 x 90 PNG.

Enum	Description
ConnectApi. FilePreviewStatus	Specifies the availability status of the file preview. <ul style="list-style-type: none"> • Available—Preview is available. • InProgress—Preview is being processed. • NotAvailable—Preview is unavailable. • NotScheduled—Generation of the preview isn't scheduled yet.
ConnectApi. FilePublishStatus	The publish status of the file: <ul style="list-style-type: none"> • PendingAccess—File is pending publishing. • PrivateAccess—File is private. • PublicAccess—File is public.
ConnectApi. FileSharingOption	Specifies the sharing option of the file: <ul style="list-style-type: none"> • Allowed—Resharing of the file is allowed. • Restricted—Resharing of the file is restricted.
ConnectApi. FileSharingType	Specifies the sharing role of the file: <ul style="list-style-type: none"> • Admin—Owner permission, but doesn't own the file. • Collaborator—Viewer permission, and can edit, change permissions, and upload a new version of a file. • Owner—Collaborator permission, and can make a file private, and delete a file. • Viewer—Can view, download, and share a file. • WorkspaceManaged—Permission controlled by the library.
ConnectApi.FolderItem Type	Specifies the type of item in a folder. <ul style="list-style-type: none"> • file • folder
ConnectApi.GroupArchive Status	Specifies a set of groups based on whether the groups are archived or not. <ul style="list-style-type: none"> • All—All groups, including groups that are archived and groups that are not archived. • Archived—Only groups that are archived. • NotArchived—Only groups that are not archived.
ConnectApi.GroupEmail Frequency	Specifies the frequency with which a user receives email. <ul style="list-style-type: none"> • EachPost • DailyDigest • WeeklyDigest • Never • UseDefault

Enum	Description
<code>ConnectApi.GroupMembershipType</code>	<p>Specifies the type of membership the user has with the group, such as group owner, manager, or member.</p> <ul style="list-style-type: none"> • <code>GroupOwner</code> • <code>GroupManager</code> • <code>NotAMember</code> • <code>NotAMemberPrivateRequested</code> • <code>StandardMember</code>
<code>ConnectApi.GroupMembershipRequestStatus</code>	<p>The status of a request to join a private group.</p> <ul style="list-style-type: none"> • <code>Accepted</code> • <code>Declined</code> • <code>Pending</code>
<code>ConnectApi.GroupViralInvitationsStatus</code>	<p>Specifies the status of an invitation to join a group.</p> <ul style="list-style-type: none"> • <code>ActedUponUser</code>—The user was added to the group. An email was sent asking the user to visit the group. • <code>Invited</code>—An email was sent asking the user to sign up for the org. • <code>MaxedOutUsers</code>—The group has the maximum allowed members. • <code>MultipleError</code>—The user wasn't invited due to multiple errors. • <code>NoActionNeededUser</code>—The user is already a member of the group. • <code>NotVisibleToExternalInviter</code>—The user is not accessible to the user sending the invitation. • <code>Unhandled</code>—The user couldn't be added to the group for an unknown reason.
<code>ConnectApi.GroupVisibilityType</code>	<p>Specifies the group visibility type.</p> <ul style="list-style-type: none"> • <code>PrivateAccess</code>—Only members of the group can see posts to this group. • <code>PublicAccess</code>—All users within the community can see posts to this group. • <code>Unlisted</code>—Reserved for future use.
<code>ConnectApi.HttpRequestMethod</code>	<p>Specifies the HTTP method.</p> <ul style="list-style-type: none"> • <code>HttpDelete</code>—Returns HTTP 204 on success. Response body or output class is empty. • <code>HttpGet</code>—Returns HTTP 200 on success. • <code>HttpHead</code>—Returns HTTP 200 on success. Response body or output class is empty. • <code>HttpPatch</code>—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • <code>HttpPost</code>—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • <code>HttpPut</code>—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.

Enum	Description
<code>ConnectApi.MaintenanceType</code>	<p>Specifies the type of maintenance. One of the following:</p> <ul style="list-style-type: none"> • <code>Downtime</code>—Downtime maintenance. • <code>GenerallyAvailable</code>—Maintenance with generally available mode. • <code>MaintenanceWithDowntime</code>—Scheduled maintenance with downtime. • <code>ReadOnly</code>—Maintenance with read-only mode.
<code>ConnectApi.ManagedTopicType</code>	<p>Specifies the type of managed topic.</p> <ul style="list-style-type: none"> • <code>Featured</code>—Topics that are featured, for example, on the community home page, but don't provide overall navigation. • <code>Navigational</code>—Topics that display in a navigational menu in the community.
<code>ConnectApi.MarkupType</code>	<p>Specifies the type of rich text markup.</p> <ul style="list-style-type: none"> • <code>Bold</code>—Bold tag. • <code>Code</code>—Code tag. • <code>Italic</code>—Italic tag. • <code>ListItem</code>—List item tag. • <code>OrderedList</code>—Ordered list tag. • <code>Paragraph</code>—Paragraph tag. • <code>Strikethrough</code>—Strikethrough tag. • <code>Underline</code>—Underline tag. • <code>UnorderedList</code>—Unordered list tag.
<code>ConnectApi.MentionCompletionType</code>	<p>Specifies the type of mention completion:</p> <ul style="list-style-type: none"> • <code>All</code>—All mention completions, regardless of the type of record to which the mention refers. • <code>Group</code>—Mention completions for groups. • <code>User</code>—Mention completions for users.
<code>ConnectApi.MentionValidationStatus</code>	<p>Specifies the type of validation error for a proposed mention, if any.</p> <ul style="list-style-type: none"> • <code>Disallowed</code>—The proposed mention is invalid and is rejected because the context user is trying to mention something that is not allowed. For example, a user who is not a member of a private group is trying to mention the private group. • <code>Inaccessible</code>—The proposed mention is allowed but the user or record being mentioned isn't notified because they don't have access to the parent record being discussed. • <code>Ok</code>—There is no validation error for this proposed mention.
<code>ConnectApi.MessageSegmentType</code>	<p>Specifies the type of message segment, such as text, link, field change name, or field change value.</p> <ul style="list-style-type: none"> • <code>EntityLink</code> • <code>FieldChange</code> • <code>FieldChangeName</code>

Enum	Description
	<ul style="list-style-type: none"> • <code>FieldChangeValue</code> • <code>Hashtag</code> • <code>InlineImage</code> • <code>Link</code> • <code>MarkupBegin</code> • <code>MarkupEnd</code> • <code>Mention</code> • <code>MoreChanges</code> • <code>ResourceLink</code> • <code>Text</code>
<code>ConnectApi.OperationType</code>	<p>Specifies the operation to carry out on the file.</p> <ul style="list-style-type: none"> • <code>Add</code>—Adds the file to the feed element. • <code>Remove</code>—Removes the file from the feed element.
<code>ConnectApi.PlatformActionGroupCategory</code>	<p>Specifies the location of an action link group on an associated feed element.</p> <ul style="list-style-type: none"> • <code>Primary</code>—The action link group is displayed in the body of the feed element. • <code>Overflow</code>—The action link group is displayed in the overflow menu of the feed element.
<code>ConnectApi.PlatformActionStatus</code>	<p>Specifies the status of the action.</p> <ul style="list-style-type: none"> • <code>FailedStatus</code>—The action link execution failed. • <code>NewStatus</code>—The action link is ready to be executed. Available for <code>Download</code> and <code>Ui</code> action links only. • <code>PendingStatus</code>—The action link is executing. Choosing this value triggers the API call for <code>Api</code> and <code>ApiAsync</code> action links. • <code>SuccessfulStatus</code>—The action link executed successfully.
<code>ConnectApi.PlatformActionType</code>	<p>Specifies the type of platform action.</p> <ul style="list-style-type: none"> • <code>ActionLink</code>—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI. • <code>CustomButton</code>—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript. • <code>InvocableAction</code> • <code>ProductivityAction</code>—Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions. • <code>QuickAction</code>—A global or object-specific action. • <code>StandardButton</code>—A predefined Salesforce button such as <code>New</code>, <code>Edit</code>, and <code>Delete</code>.
<code>ConnectApi.RecommendationActionType</code>	<p>Specifies the action to take on a recommendation.</p> <ul style="list-style-type: none"> • <code>follow</code>—Follow a file, record, topic, or user. • <code>join</code>—Join a group.

Enum	Description
	<ul style="list-style-type: none"> <code>view</code>—View a file, group, article, record, user, custom, or static recommendation.
<code>ConnectApi.RecommendationAudienceCriteriaType</code>	<p>Specifies the recommendation audience criteria type.</p> <ul style="list-style-type: none"> <code>CustomList</code>—A custom list of users makes up the audience. <code>MaxDaysInCommunity</code>—New community members make up the audience.
<code>ConnectApi.RecommendationAudienceMemberOperationType</code>	<p>Specifies the operation to carry out on the audience members.</p> <ul style="list-style-type: none"> <code>Add</code>—Adds specified members to the audience. <code>Remove</code>—Removes specified members from the audience.
<code>ConnectApi.RecommendationChannel</code>	<p>Specifies a way to tie recommendations together, for example, to display recommendations in specific places in the UI or to show recommendations based on time of day or geographic locations.</p> <ul style="list-style-type: none"> <code>CustomChannel1</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. For example, community managers can use Community Builder to determine where recommendations appear. <code>CustomChannel2</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. <code>CustomChannel3</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. <code>CustomChannel4</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. <code>CustomChannel5</code>—Custom recommendation channel. Not used by default. Work with your community manager to define custom channels. <code>DefaultChannel</code>—Default recommendation channel. Recommendations appear by default on the Customer Service (Napili) community home and question detail pages and in the feed in communities in the Salesforce1 mobile browser app. They also appear anywhere community managers add recommendations using Community Builder in communities using the Summer '15 or later version of the Customer Service (Napili) template.
<code>ConnectApi.RecommendationExplanationType</code>	<p>Indicates the reason for a recommendation.</p> <ul style="list-style-type: none"> <code>ArticleHasRelatedContent</code>—Articles with related content to a context article. <code>ArticleViewedTogether</code>—Articles often viewed together with the article that the context user just viewed. <code>ArticleViewedTogetherWithViewers</code>—Articles often viewed together with other records that the context user views. <code>Custom</code>—Custom recommendations. <code>FilePopular</code>—Files with many followers or views. <code>FileViewedTogether</code>—Files often viewed at the same time as other files that the context user views. <code>FollowedTogetherWithFollowees</code>—Users often followed together with other records that the context user follows. <code>GroupMembersFollowed</code>—Groups with members that the context user follows.

Enum	Description
	<ul style="list-style-type: none"> • <code>GroupNew</code>—Recently created groups. • <code>GroupPopular</code>—Groups with many active members. • <code>ItemViewedTogether</code>—Records often viewed at the same time as other records that the context user views. • <code>PopularApp</code>—Applications that are popular. • <code>RecordOwned</code>—Records that are owned by the context user. • <code>RecordParentOfFollowed</code>—Parent records of records that the context user follows. • <code>RecordViewed</code>—Records that the context user recently viewed. • <code>TopicFollowedTogether</code>—Topics often followed together with the record that the context user just followed. • <code>TopicFollowedTogetherWithFollowees</code>—Topics often followed together with other records that the context user follows. • <code>TopicPopularFollowed</code>—Topics with many followers. • <code>TopicPopularLiked</code>—Topics on posts that have many likes. • <code>UserDirectReport</code>—Users who report to the context user. • <code>UserFollowedTogether</code>—Users often followed together with the record that the context user just followed. • <code>UserFollowsSameUsers</code>—Users who follow the same users as the context user. • <code>UserManager</code>—The context user’s manager. • <code>UserNew</code>—Recently created users. • <code>UserPeer</code>—Users who report to the same manager as the context user. • <code>UserPopular</code>—Users with many followers. • <code>UserViewingSameRecords</code>—Users who view the same records as the context user.
<code>ConnectApi.RecommendationType</code>	<p>Specifies the type of record being recommended.</p> <ul style="list-style-type: none"> • <code>apps</code> • <code>articles</code> • <code>files</code> • <code>groups</code> • <code>records</code> • <code>topics</code> • <code>users</code>
<code>ConnectApi.RecommendedObjectType</code>	<p>Specifies the type of object being recommended.</p> <ul style="list-style-type: none"> • <code>Today</code>—Static recommendations that don’t have an ID, for example, the Today app recommendation.
<code>ConnectApi.RecordColumnOrder</code>	<p>The order in which fields are rendered in a grid.</p> <ul style="list-style-type: none"> • <code>LeftRight</code>—Fields are rendered from left to right. • <code>TopDown</code>—Fields are rendered from the top down.

Enum	Description
ConnectApi. RecordFieldType	<p>The data type of a record field.</p> <ul style="list-style-type: none"> • Address • Blank • Boolean • Compound • CreatedBy • Date • DateTime • Email • LastModifiedBy • Location • Name • Number • Percent • Phone • Picklist • Reference • Text • Time
ConnectApi. RelatedFeedPostType	<p>Specifies the type of related feed post.</p> <ul style="list-style-type: none"> • Answered—Related questions that have at least one answer. • BestAnswer—Related questions that have a best answer. • Generic—All types of related questions, including answered, with a best answer, and unanswered. • Unanswered—Related questions that don't have answers.
ConnectApi. SocialNetworkProvider	<p>The social network provider.</p> <ul style="list-style-type: none"> • Facebook • GooglePlus • Instagram • KakaoTalk • Kik • Klout • Line • LinkedIn • Messenger • Other • Pinterest

Enum	Description
	<ul style="list-style-type: none"> • QQ • Rypple • SinaWeibo • SMS • Snapchat • Telegram • Twitter • VKontakte • WeChat • WhatsApp • YouTube
<code>ConnectApi.SocialPostMessageType</code>	<p>The message type of the social post.</p> <ul style="list-style-type: none"> • Comment • Direct • Post • PrivateMessage • Reply • Retweet • Tweet
<code>ConnectApi.SocialPostStatusType</code>	<p>The current state of the social post.</p> <ul style="list-style-type: none"> • ApprovalPending • ApprovalRecalled • ApprovalRejected • Deleted • Failed • Pending • Replied • Sent • Unknown
<code>ConnectApi.SortOrder</code>	<p>A generic sort order.</p> <ul style="list-style-type: none"> • Ascending—Items are in ascending alphabetical order (A-Z). • Descending—Items are in descending alphabetical order (Z-A). • MostRecentlyViewed—Items are in descending chronological order by view. This sort order is valid only for Chatter feed streams.

Enum	Description
<code>ConnectApi.TopicSort</code>	<p>Specifies the order returned by the sort:</p> <ul style="list-style-type: none"> <code>popularDesc</code>—Sorts topics by popularity with the most popular first. This value is the default. <code>alphaAsc</code>—Sorts topics alphabetically.
<code>ConnectApi.UserProfileTabType</code>	<p>Specifies the type of user profile tab:</p> <ul style="list-style-type: none"> <code>CustomVisualForce</code>—Tab that displays data from a Visualforce page. <code>CustomWeb</code>—Tab that displays data from any external Web-based application or Web page. <code>Element</code>—Tab that displays generic content inline. <code>Feed</code>—Tab that displays the Chatter feed. <code>Overview</code>—Tab that displays user details.
<code>ConnectApi.UserType</code>	<p>Specifies the type of user.</p> <ul style="list-style-type: none"> <code>ChatterGuest</code>—User is an external user in a private group. <code>ChatterOnly</code>—User is a Chatter Free customer. <code>Guest</code>—User is unauthenticated. <code>Internal</code>—User is a standard organization member. <code>Portal</code>—User is an external user in a customer portal, partner portal, or community. <code>System</code>—User is Chatter Expert or a system user. <code>Undefined</code>—User is a user type that is a custom object.
<code>ConnectApi.WorkflowProcessStatus</code>	<p>Specifies the status of a workflow process.</p> <ul style="list-style-type: none"> <code>Approved</code> <code>Fault</code> <code>Held</code> <code>NoResponse</code> <code>Pending</code> <code>Reassigned</code> <code>Rejected</code> <code>Removed</code> <code>Started</code>
<code>ConnectApi.ZoneSearchResultType</code>	<p>Specifies the zone search result type.</p> <ul style="list-style-type: none"> <code>Article</code>—Search results contain only articles. <code>Question</code>—Search results contain only questions.
<code>ConnectApi.ZoneShowIn</code>	<p>Specifies the zone search result type.</p> <ul style="list-style-type: none"> <code>Community</code>—Available in a community. <code>Internal</code>—Available internally only.

Enum	Description
	<ul style="list-style-type: none"> <code>Portal</code>—Available in a portal.

ConnectApi Exceptions

The `ConnectApi` namespace contains exception classes.

All exceptions classes support built-in methods for returning the error message and exception type. See [Exception Class and Built-In Exceptions](#) on page 2483.

The `ConnectApi` namespace contains these exceptions:

Exception	Description
<code>ConnectApi.ConnectApiException</code>	Any logic error in the way your application is utilizing <code>ConnectApi</code> code. This is equivalent to receiving a 400 error from Chatter REST API.
<code>ConnectApi.NotFoundException</code>	Any issues with the specified resource being found. This is equivalent to receiving a 404 error from Chatter REST API.
<code>ConnectApi.RateLimitException</code>	When you exceed the rate limit. This is equivalent to receiving a 503 Service Unavailable error from Chatter REST API.

Database Namespace

The `Database` namespace provides classes used with DML operations.

The following are the classes in the `Database` namespace.

IN THIS SECTION:

[Batchable Interface](#)

The class that implements this interface can be executed as a batch Apex job.

[BatchableContext Interface](#)

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

[DeletedRecord Class](#)

Contains information about a deleted record.

[DeleteResult Class](#)

Represents the result of a delete DML operation returned by the `Database.delete` method.

[DMLOptions Class](#)

Enables you to set options related to DML operations.

[DmlOptions.AssignmentRuleHeader Class](#)

Enables setting assignment rule options.

[DMLOptions.DuplicateRuleHeader Class](#)

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

[DmlOptions.EmailHeader Class](#)

Enables setting email options.

[DuplicateError Class](#)

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

[EmptyRecycleBinResult Class](#)

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

[Error Class](#)

Represents information about an error that occurred during a DML operation when using a Database method.

[GetDeletedResult Class](#)

Contains the deleted records retrieved for a specific sObject type and time window.

[GetUpdatedResult Class](#)

Contains the result for the `Database.getUpdated` method call.

[LeadConvert Class](#)

Contains information used for lead conversion.

[LeadConvertResult Class](#)

The result of a lead conversion.

[MergeResult Class](#)

Contains the result of a merge Database method operation.

[QueryLocator Class](#)

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

[QueryLocatorIterator Class](#)

Represents an iterator over a query locator record set.

[SaveResult Class](#)

The result of an insert or update DML operation returned by a Database method.

[UndeleteResult Class](#)

The result of an undelete DML operation returned by the `Database.undelete` method.

[UpsertResult Class](#)

The result of an upsert DML operation returned by the `Database.upsert` method.

Batchable Interface

The class that implements this interface can be executed as a batch Apex job.

Namespace

[Database](#)

SEE ALSO:

[Using Batch Apex](#)

Batchable Methods

The following are methods for `Batchable`.

IN THIS SECTION:

[execute\(jobId, recordList\)](#)

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

[finish\(jobId\)](#)

Gets invoked when the batch job finishes. Place any clean up code in this method.

[start\(jobId\)](#)

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

[start\(jobId\)](#)

Gets invoked when the batch job starts. Returns the record set as a `QueryLocator` object that will be batched for execution.

execute(jobId, recordList)

Gets invoked when the batch job executes and operates on one batch of records. Contains or calls the main execution logic for the batch job.

Signature

```
public Void execute(Database.BatchableContext jobId, List<sObject> recordList)
```

Parameters

jobId

Type: [Database.BatchableContext](#)

Contains the job ID.

recordList

Type: [List<sObject>](#)

Contains the batch of records to process.

Return Value

Type: Void

finish(jobId)

Gets invoked when the batch job finishes. Place any clean up code in this method.

Signature

```
public Void finish(Database.BatchableContext jobId)
```

Parameters

jobId

Type: [Database.BatchableContext](#)

Contains the job ID.

Return Value

Type: Void

start (jobId)

Gets invoked when the batch job starts. Returns the record set as an iterable that will be batched for execution.

Signature

```
public System.Iterable start(Database.BatchableContext jobId)
```

Parameters

jobId

Type: [Database.BatchableContext](#)

Contains the job ID.

Return Value

Type: System.Iterable

start (jobId)

Gets invoked when the batch job starts. Returns the record set as a QueryLocator object that will be batched for execution.

Signature

```
public Database.QueryLocator start(Database.BatchableContext jobId)
```

Parameters

jobId

Type: [Database.BatchableContext](#)

Contains the job ID.

Return Value

Type: [Database.QueryLocator](#)

BatchableContext Interface

Represents the parameter type of a batch job method and contains the batch job ID. This interface is implemented internally by Apex.

Namespace

[Database](#)

SEE ALSO:

[Batchable Interface](#)

BatchableContext Methods

The following are methods for `BatchableContext`.

IN THIS SECTION:

[getChildJobId\(\)](#)

Returns the ID of the current batch job chunk that is being processed.

[getJobId\(\)](#)

Returns the batch job ID.

getChildJobId()

Returns the ID of the current batch job chunk that is being processed.

Signature

```
public Id getChildJobId()
```

Return Value

Type: [ID](#)

getJobId()

Returns the batch job ID.

Signature

```
public Id getJobId()
```

Return Value

Type: [ID](#)

DeletedRecord Class

Contains information about a deleted record.

Namespace

[Database](#)

Usage

The `getDeletedRecords` method of the `Database.GetDeletedResult` class returns a list of `Database.DeletedRecord` objects. Use the methods in the `Database.DeletedRecord` class to retrieve details about each deleted record.

DeletedRecord Methods

The following are methods for `DeletedRecord`. All are instance methods.

IN THIS SECTION:

[getDeletedDate\(\)](#)

Returns the deleted date of this record.

[getId\(\)](#)

Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

getDeletedDate ()

Returns the deleted date of this record.

Signature

```
public Date getDeletedDate ()
```

Return Value

Type: [Date](#)

getId ()

Returns the ID of a record deleted within the time window specified in the `Database.getDeleted` method.

Signature

```
public Id getId ()
```

Return Value

Type: [ID](#)

DeleteResult Class

Represents the result of a delete DML operation returned by the `Database.delete` method.

Namespace

[Database](#)

Usage

An array of `Database.DeleteResult` objects is returned with the `delete` database method. Each element in the `DeleteResult` array corresponds to the `sObject` array passed as the `sObject[]` parameter in the `delete` Database method; that is, the first element in the `DeleteResult` array matches the first element passed in the `sObject` array, the second element corresponds with the second element, and so on. If only one `sObject` is passed in, the `DeleteResult` array contains a single element.

Example

The following example shows how to obtain and iterate through the returned `Database.DeleteResult` objects. It deletes some queried accounts using `Database.delete` with a false second parameter to allow partial processing of records on failure. Next, it iterates through the results to determine whether the operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records.

```
// Query the accounts to delete
Account[] accts = [SELECT Id from Account WHERE Name LIKE 'Acme%'];
// Delete the accounts
Database.DeleteResult[] drList = Database.delete(accts, false);

// Iterate through each returned result
for(Database.DeleteResult dr : drList) {
    if (dr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully deleted account with ID: ' + dr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : dr.getErrors()) {
            System.debug('The following error has occurred.');
```

DeleteResult Methods

The following are methods for `DeleteResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

[getId\(\)](#)

Returns the ID of the `sObject` you were trying to delete.

isSuccess()

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

getErrors ()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: [Database.Error\[\]](#)

getId ()

Returns the ID of the sObject you were trying to delete.

Signature

```
public ID getId()
```

Return Value

Type: [ID](#)

Usage

If this field contains a value, the object was successfully deleted. If this field is empty, the operation was not successful for that object.

isSuccess ()

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

DMLOptions Class

Enables you to set options related to DML operations.

Namespace

[Database](#)

Usage

`Database.DMLOptions` is only available for Apex saved against API versions 15.0 and higher. `DMLOptions` settings take effect only for record operations performed using Apex DML and not through the Salesforce user interface. The `DMLOptions` class has three child options.

DML Child Options

`DmLOptions.AssignmentRuleHeader`—Enables setting assignment rule options.

`DmLOptions.DuplicateRuleHeader`—Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

`DmLOptions.EmailHeader`—Enables setting email options.

DmLOptions Properties

The following are properties for `DmLOptions`.

IN THIS SECTION:

`allowFieldTruncation`

Specifies the truncation behavior of large strings.

`assignmentRuleHeader`

Specifies the assignment rule to be used when creating a case or lead.

`emailHeader`

Specifies additional information regarding the automatic email that gets sent when an events occurs.

`localeOptions`

Specifies the language of any labels that are returned by Apex.

`optAllOrNone`

Specifies whether the operation allows for partial success.

`allowFieldTruncation`

Specifies the truncation behavior of large strings.

Signature

```
public Boolean allowFieldTruncation {get; set;}
```

Property Value

Type: `Boolean`

Usage

In Apex saved against API versions previous to 15.0, if you specify a value for a string and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and an error message is returned. The `allowFieldTruncation` property allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Apex saved against API versions 15.0 and later.

assignmentRuleHeader

Specifies the assignment rule to be used when creating a case or lead.

Signature

```
public Database.DmlOptions.AssignmentRuleHeader assignmentRuleHeader {get; set;}
```

Property Value

Type: [Database.DMLOptions.AssignmentRuleHeader](#)

Usage

 **Note:** The `Database.DMLOptions` object supports assignment rules for cases and leads, but not for accounts or territory management.

emailHeader

Specifies additional information regarding the automatic email that gets sent when an events occurs.

Signature

```
public Database.DmlOptions.EmailHeader emailHeader {get; set;}
```

Property Value

Type: [Database.DMLOptions.EmailHeader](#)

Usage

The Salesforce user interface allows you to specify whether or not to send an email when the following events occur.

- Creation of a new case or task
- Conversion of a case email to a contact
- New user email notification
- Lead queue email notification
- Password reset

In Apex saved against API version 15.0 or later, the `Database.DMLOptions emailHeader` property enables you to specify additional information regarding the email that gets sent when one of the events occurs because of the code's execution.

localeOptions

Specifies the language of any labels that are returned by Apex.

Signature

```
public Database.DmlOptions.LocaleOptions localeOptions {get; set;}
```

Property Value

Type: [Database.DMLOptions.LocaleOptions](#)

Usage

The value must be a valid user locale (language and country), such as de_DE or en_GB. The value is a String, 2-5 characters long. The first two characters are always an ISO language code, for example 'fr' or 'en.' If the value is further qualified by a country, then the string also has an underscore (_) and another ISO country code, for example 'US' or 'UK.' For example, the string for the United States is 'en_US', and the string for French Canadian is 'fr_CA.'

For a list of the languages that Salesforce supports, see [Supported Languages](#) in the Salesforce online help.

optAllOrNone

Specifies whether the operation allows for partial success.

Signature

```
public Boolean optAllOrNone {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

If `optAllOrNone` is set to `true`, all changes are rolled back if any record causes errors. The default for this property is `false` and successfully processed records are committed while records with errors aren't.

This property is available in Apex saved against Salesforce API version 20.0 and later.

DmlOptions.AssignmentRuleHeader Class

Enables setting assignment rule options.

Namespace

[Database](#)

Example

The following example uses the `useDefaultRule` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.useDefaultRule= true;

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

The following example uses the `assignmentRuleID` option:

```
Database.DMLOptions dmo = new Database.DMLOptions();
dmo.assignmentRuleHeader.assignmentRuleId= '01QD000000EqAn';

Lead l = new Lead(company='ABC', lastname='Smith');
l.setOptions(dmo);
insert l;
```

DmlOptions.AssignmentRuleHeader Properties

The following are properties for `DmlOptions.AssignmentRuleHeader`.

IN THIS SECTION:

[assignmentRuleID](#)

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

[useDefaultRule](#)

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

assignmentRuleID

Specifies the ID of a specific assignment rule to run for the case or lead. The assignment rule can be active or inactive.

Signature

```
public Id assignmentRuleID {get; set;}
```

Property Value

Type: [ID](#)

Usage

The ID can be retrieved by querying the `AssignmentRule` sObject. If specified, do not specify `useDefaultRule`.

If the value is not in the correct ID format (15-character or 18-character Salesforce ID), the call fails and an exception is returned.

useDefaultRule

If specified as `true` for a case or lead, the system uses the default (active) assignment rule for the case or lead. If specified, do not specify an `assignmentRuleId`.

Signature

```
public Boolean useDefaultRule {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

If there are no assignment rules in the organization, in API version 29.0 and earlier, creating a case or lead with `useDefaultRule` set to `true` results in the case or lead being assigned to the predefined default owner. In API version 30.0 and later, the case or lead is unassigned and doesn't get assigned to the default owner.

DMLOptions.DuplicateRuleHeader Class

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

Namespace

[Database](#)

Example

The following example shows how to save an account record that's been identified as a duplicate. To learn how to iterate through duplicate errors, see [DuplicateError Class](#)

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```

IN THIS SECTION:

[DMLOptions.DuplicateRuleHeader Properties](#)

DMLOptions.DuplicateRuleHeader Properties

The following are properties for `DMLOptions.DuplicateRuleHeader`.

IN THIS SECTION:

`allowSave`

Set to `true` to save the duplicate record. Set to `false` to prevent the duplicate record from being saved.

`runAsCurrentUser`

Set to `true` to make sure that sharing rules for the current user are enforced when duplicate rules run. Set to `false` to use the sharing rules specified in the class for the request. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

allowSave

Set to `true` to save the duplicate record. Set to `false` to prevent the duplicate record from being saved.

Signature

```
public Boolean allowSave {get; set;}
```

Property Value

Type: [Boolean](#)

Example

This example shows how to save an account record that's been identified as a duplicate.

`dml.DuplicateRuleHeader.allowSave = true` means the user should be allowed to save the duplicate. To learn how to iterate through duplicate errors, see [DuplicateError Class](#).

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```

runAsCurrentUser

Set to `true` to make sure that sharing rules for the current user are enforced when duplicate rules run. Set to `false` to use the sharing rules specified in the class for the request. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.

Signature

```
public Boolean runAsCurrentUser {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

If specified as `true`, duplicate rules run for the current user, which ensures users can't view duplicate records that aren't available to them.

Use `runAsCurrentUser = true` to detect duplicates when converting leads to contacts. Typically, lead conversion Apex code runs in a system context and does not enforce sharing rules for the current user.

Example

This example shows how to set options so that duplicate rules run for the current user when saving a new account.

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.allowSave = true;
dml.DuplicateRuleHeader.runAsCurrentUser = true;
Account duplicateAccount = new Account(Name='dupe');
```

```
Database.SaveResult sr = Database.insert(duplicateAccount, dml);
if (sr.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
```

DmlOptions.EmailHeader Class

Enables setting email options.

Namespace

[Database](#)

Usage

Even though auto-sent emails can be triggered by actions in the Salesforce user interface, the DMLOptions settings for `emailHeader` take effect only for DML operations carried out in Apex code.

Example

In the following example, the `triggerAutoResponseEmail` option is specified:

```
Account a = new Account(name='Acme Plumbing');

insert a;

Contact c = new Contact(email='jplumber@salesforce.com', firstname='Joe', lastname='Plumber',
    accountid=a.id);

insert c;

Database.DMLOptions dlo = new Database.DMLOptions();

dlo.EmailHeader.triggerAutoResponseEmail = true;

Case ca = new Case(subject='Plumbing Problems', contactid=c.id);

database.insert(ca, dlo);
```

DmlOptions.EmailHeader Properties

The following are properties for `DmlOptions.EmailHeader`.

IN THIS SECTION:

[triggerAutoResponseEmail](#)

Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

[triggerOtherEmail](#)

Indicates whether to trigger email outside the organization (`true`) or not (`false`).

`triggerUserEmail`

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

`triggerAutoResponseEmail`

Indicates whether to trigger auto-response rules (`true`) or not (`false`), for leads and cases.

Signature

```
public Boolean triggerAutoResponseEmail {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

This email can be automatically triggered by a number of events, for example creating a case or resetting a user password. If this value is set to `true`, when a case is created, if there is an email address for the contact specified in `ContactID`, the email is sent to that address. If not, the email is sent to the address specified in `SuppliedEmail`

`triggerOtherEmail`

Indicates whether to trigger email outside the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerOtherEmail {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

This email can be automatically triggered by creating, editing, or deleting a contact for a case.

 **Note:** Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The `EventAttendee` object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:

- Sending a group event invitation to a lead or contact respects the `triggerOtherEmail` option
- Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

`triggerUserEmail`

Indicates whether to trigger email that is sent to users in the organization (`true`) or not (`false`).

Signature

```
public Boolean triggerUserEmail {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

This email can be automatically triggered by a number of events; resetting a password, creating a new user, or creating or modifying a task.

-  **Note:** Adding comments to a case in Apex doesn't trigger email to users in the organization even if `triggerUserEmail` is set to `true`.
-  **Note:** Email sent through Apex because of a group event includes additional behaviors. A *group event* is an event for which `IsGroupEvent` is true. The `EventAttendee` object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through Apex:
 - Sending a group event invitation to a user respects the `triggerUserEmail` option
 - Email sent when updating or deleting a group event also respects the `triggerUserEmail` and `triggerOtherEmail` options, as appropriate

DuplicateError Class

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Namespace

[Database](#)

Example

When you try to save a record that's identified as a duplicate record by a duplicate rule, you'll receive a duplicate error. If the duplicate rule contains the Allow action, an attempt will be made to bypass the error.

```
// Try to save a duplicate account
Account duplicateAccount = new Account(Name='Acme', BillingCity='San Francisco');
Database.SaveResult sr = Database.insert(duplicateAccount, false);
if (!sr.isSuccess()) {

    // Insertion failed due to duplicate detected
    for(Database.Error duplicateError : sr.getErrors()){
        Datacloud.DuplicateResult duplicateResult =
            ((Database.DuplicateError) duplicateError).getDuplicateResult();
        System.debug('Duplicate records have been detected by ' +
            duplicateResult.getDuplicateRule());
        System.debug(duplicateResult.getErrorMessage());
    }

    // If the duplicate rule is an alert rule, we can try to bypass it
```

```
Database.DMLOptions dml = new Database.DMLOptions();
dml.DuplicateRuleHeader.AllowSave = true;
Database.SaveResult sr2 = Database.insert(duplicateAccount, dml);
if (sr2.isSuccess()) {
    System.debug('Duplicate account has been inserted in Salesforce!');
}
}
```

IN THIS SECTION:

[DuplicateError Methods](#)

SEE ALSO:

[SaveResult Class](#)

[DuplicateResult Class](#)

[Error Class](#)

DuplicateError Methods

The following are methods for `DuplicateError`.

IN THIS SECTION:

[getDuplicateResult\(\)](#)

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

[getFields\(\)](#)

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

[getMessage\(\)](#)

Returns the error message text.

[getStatusCode\(\)](#)

Returns a code that characterizes the error.

getDuplicateResult()

Returns the details of a duplicate rule and duplicate records found by the duplicate rule.

Signature

```
public Datacloud.DuplicateResult getDuplicateResult()
```

Return Value

Type: [Datacloud.DuplicateResult](#)

Example

This example shows the code used to get the possible duplicates and related match information after saving a new contact. This code is part of a custom application that implements duplicate management when users add a contact. See [DuplicateResult Class](#) on page 1807 to check out the entire sample applicaton.

```
Datacloud.DuplicateResult duplicateResult =
    duplicateError.getDuplicateResult();
```

getFields ()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public List<String> getFields ()
```

Return Value

Type: [List<String>](#)

getMessage ()

Returns the error message text.

Signature

```
public String getMessage ()
```

Return Value

Type: [String](#)

getStatusCode ()

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode ()
```

Return Value

Type: [StatusCode](#)

EmptyRecycleBinResult Class

The result of the emptyRecycleBin DML operation returned by the `Database.emptyRecycleBin` method.

Namespace

[Database](#)

Usage

A list of `Database.EmptyRecycleBinResult` objects is returned by the `Database.emptyRecycleBin` method. Each object in the list corresponds to either a record ID or an sObject passed as the parameter in the `Database.emptyRecycleBin` method. The first index in the `EmptyRecycleBinResult` list matches the first record or sObject specified in the list, the second with the second, and so on.

EmptyRecycleBinResult Methods

The following are methods for `EmptyRecycleBinResult`. All are instance methods.

IN THIS SECTION:

`getErrors()`

If an error occurred during the delete for this record or sObject, returns a list of one or more `Database.Error` objects. If no errors occurred, the returned list is empty.

`getId()`

Returns the ID of the record or sObject you attempted to delete.

`isSuccess()`

Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

`getErrors()`

If an error occurred during the delete for this record or sObject, returns a list of one or more `Database.Error` objects. If no errors occurred, the returned list is empty.

Signature

```
public Database.Errors[] getErrors()
```

Return Value

Type: `Database.Errors []`

`getId()`

Returns the ID of the record or sObject you attempted to delete.

Signature

```
public ID getId()
```

Return Value

Type: `ID`

`isSuccess()`

Returns `true` if the record or sObject was successfully removed from the Recycle Bin; otherwise `false`.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

Error Class

Represents information about an error that occurred during a DML operation when using a Database method.

Namespace

[Database](#)

Usage

`Error` class is part of `SaveResult`, which is generated when a user attempts to save a Salesforce record.

SEE ALSO:

[SaveResult Class](#)

[DuplicateError Class](#)

Error Methods

The following are methods for `Error`. All are instance methods.

IN THIS SECTION:

[getFields\(\)](#)

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

[getMessage\(\)](#)

Returns the error message text.

[getStatusCode\(\)](#)

Returns a code that characterizes the error.

getFields ()

Returns an array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields()
```

Return Value

Type: [String\[\]](#)

getMessage ()

Returns the error message text.

Signature

```
public String getMessage ()
```

Return Value

Type: [String](#)

getStatusCode ()

Returns a code that characterizes the error.

Signature

```
public StatusCode getStatusCode ()
```

Return Value

Type: [StatusCode](#)

Usage

The full list of status codes is available in the WSDL file for your organization (see [Downloading Salesforce WSDLs and Client Authentication Certificates in the Salesforce online help.](#))

GetDeletedResult Class

Contains the deleted records retrieved for a specific sObject type and time window.

Namespace

[Database](#)

Usage

The `Database.getDeleted` method returns the deleted record information as a `Database.GetDeletedResult` object.

GetDeletedResult Methods

The following are methods for `GetDeletedResult`. All are instance methods.

IN THIS SECTION:

[getDeletedRecords\(\)](#)

Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

[getEarliestDateAvailable\(\)](#)

Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

[getLatestDateCovered\(\)](#)

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

getDeletedRecords ()

Returns a list of deleted records for the time window specified in the `Database.getDeleted` method call.

Signature

```
public List<Database.DeletedRecord> getDeletedRecords ()
```

Return Value

Type: [List<Database.DeletedRecord>](#)

getEarliestDateAvailable ()

Returns the date in Coordinated Universal Time (UTC) of the earliest physically deleted object for the sObject type specified in `Database.getDeleted`.

Signature

```
public Date getEarliestDateAvailable ()
```

Return Value

Type: [Date](#)

getLatestDateCovered ()

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getDeleted` call.

Signature

```
public Date getLatestDateCovered ()
```

Return Value

Type: [Date](#)

Usage

If there is a value, it is less than or equal to the `endDate` argument of `Database.getDeleted`. A value here indicates that, for safety, you should use this value for the `startDate` of your next call to capture the changes that started after this date but didn't complete before `endDate` and were, therefore, not returned in the previous call.

GetUpdatedResult Class

Contains the result for the `Database.getUpdated` method call.

Namespace

[Database](#)

Usage

Use the methods in this class to obtain detailed information about the updated records returned by `Database.getUpdated` for a specific time window.

GetUpdatedResult Methods

The following are methods for `GetUpdatedResult`. All are instance methods.

IN THIS SECTION:

[getIds\(\)](#)

Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

[getLatestDateCovered\(\)](#)

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

getIds ()

Returns the IDs of records updated within the time window specified in the `Database.getUpdated` method.

Signature

```
public List<Id> getIds ()
```

Return Value

Type: [List<ID>](#)

getLatestDateCovered ()

Returns the date in Coordinated Universal Time (UTC) of the last date covered in the `Database.getUpdated` call.

Signature

```
public Date getLatestDateCovered ()
```

Return Value

Type: [Date](#)

LeadConvert Class

Contains information used for lead conversion.

Namespace

[Database](#)

Usage

The `convertLead` Database method converts a lead into an account and contact, as well as (optionally) an opportunity. The `convertLead` takes an instance of the `Database.LeadConvert` class as a parameter. Create an instance of this class and set the information required for conversion, such as setting the lead, and destination account and contact.

Example

This example shows how to use the `Database.convertLead` method to convert a lead. It inserts a new lead, creates a `LeadConvert` object, sets its status to converted, then passes it to the `Database.convertLead` method. Finally, it verifies that the conversion was successful.

```
Lead myLead = new Lead(LastName = 'Fry', Company='Fry And Sons');
insert myLead;

Database.LeadConvert lc = new Database.LeadConvert();
lc.setLeadId(myLead.id);

LeadStatus convertStatus = [SELECT Id, MasterLabel FROM LeadStatus WHERE IsConverted=true
LIMIT 1];
lc.setConvertedStatus(convertStatus.MasterLabel);

Database.LeadConvertResult lcr = Database.convertLead(lc);
System.assert(lcr.isSuccess());
```

IN THIS SECTION:

[LeadConvert Constructors](#)

[LeadConvert Methods](#)

LeadConvert Constructors

The following are constructors for `LeadConvert`.

IN THIS SECTION:

[LeadConvert\(\)](#)

Creates a new instance of the `Database.LeadConvert` class.

LeadConvert ()

Creates a new instance of the `Database.LeadConvert` class.

Signature

```
public LeadConvert ()
```

LeadConvert Methods

The following are methods for `LeadConvert`. All are instance methods.

IN THIS SECTION:

[getAccountId\(\)](#)

Gets the ID of the account into which the lead will be merged.

[getContactId\(\)](#)

Gets the ID of the contact into which the lead will be merged.

[getConvertedStatus\(\)](#)

Gets the lead status value for a converted lead.

[getLeadID\(\)](#)

Gets the ID of the lead to convert.

[getOpportunityName\(\)](#)

Gets the name of the opportunity to create.

[getOwnerId\(\)](#)

Gets the ID of the person to own any newly created account, contact, and opportunity.

[isDoNotCreateOpportunity\(\)](#)

Indicates whether an Opportunity is created during lead conversion (`false`, the default) or not (`true`).

[isOverWriteLeadSource\(\)](#)

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object (`true`), or not (`false`, the default).

[isSendNotificationEmail\(\)](#)

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

[setAccountId\(accountId\)](#)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

[setContactId\(contactId\)](#)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

[setConvertedStatus\(status\)](#)

Sets the lead status value for a converted lead. This field is required.

[setDoNotCreateOpportunity\(createOpportunity\)](#)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

[setLeadId\(leadId\)](#)

Sets the ID of the lead to convert. This field is required.

[setOpportunityName\(opportunityName\)](#)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

[setOverwriteLeadSource\(overwriteLeadSource\)](#)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

[setOwnerId\(ownerId\)](#)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

[setSendNotificationEmail\(sendEmail\)](#)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

getAccountId()

Gets the ID of the account into which the lead will be merged.

Signature

```
public ID getAccountId()
```

Return Value

Type: [ID](#)

getContactId()

Gets the ID of the contact into which the lead will be merged.

Signature

```
public ID getContactId()
```

Return Value

Type: [ID](#)

getConvertedStatus()

Gets the lead status value for a converted lead.

Signature

```
public String getConvertedStatus()
```

Return Value

Type: [String](#)

getLeadID()

Gets the ID of the lead to convert.

Signature

```
public ID getLeadID()
```

Return Value

Type: [ID](#)

getOpportunityName()

Gets the name of the opportunity to create.

Signature

```
public String getOpportunityName()
```

Return Value

Type: [String](#)

getOwnerID()

Gets the ID of the person to own any newly created account, contact, and opportunity.

Signature

```
public ID getOwnerID()
```

Return Value

Type: [ID](#)

isDoNotCreateOpportunity()

Indicates whether an Opportunity is created during lead conversion ([false](#), the default) or not ([true](#)).

Signature

```
public Boolean isDoNotCreateOpportunity()
```

Return Value

Type: [Boolean](#)

isOverWriteLeadSource()

Indicates whether the `LeadSource` field on the target Contact object is overwritten with the contents of the `LeadSource` field in the source Lead object ([true](#)), or not ([false](#), the default).

Signature

```
public Boolean isOverWriteLeadSource()
```

Return Value

Type: [Boolean](#)

isSendNotificationEmail()

Indicates whether a notification email is sent to the owner specified by `setOwnerId` (`true`) or not (`false`, the default).

Signature

```
public Boolean isSendNotificationEmail()
```

Return Value

Type: [Boolean](#)

setAccountId(accountId)

Sets the ID of the account into which the lead is merged. This value is required only when updating an existing account, including person accounts.

Signature

```
public Void setAccountId(ID accountId)
```

Parameters

accountId
Type: [ID](#)

Return Value

Type: Void

setContactId(contactId)

Sets the ID of the contact into which the lead will be merged (this contact must be associated with the account specified with `setAccountId`, and `setAccountId` must be specified). This value is required only when updating an existing contact.

Signature

```
public Void setContactId(ID contactId)
```

Parameters

contactId
Type: [ID](#)

Return Value

Type: Void

Usage

If `setContactId` is specified, then the application creates a new contact that is implicitly associated with the account. The contact name and other existing data are not overwritten (unless `setOverwriteLeadSource` is set to true, in which case only the `LeadSource` field is overwritten).

 **Important:** If you are converting a lead into a person account, do not specify `setContactId` or an error will result. Specify only `setAccountId` of the person account.

setConvertedStatus (status)

Sets the lead status value for a converted lead. This field is required.

Signature

```
public Void setConvertedStatus(String status)
```

Parameters

status

Type: [String](#)

Return Value

Type: Void

setDoNotCreateOpportunity (createOpportunity)

Specifies whether to create an opportunity during lead conversion. The default value is `false`: opportunities are created by default. Set this flag to `true` only if you do not want to create an opportunity from the lead.

Signature

```
public Void setDoNotCreateOpportunity(Boolean createOpportunity)
```

Parameters

createOpportunity

Type: [Boolean](#)

Return Value

Type: Void

setLeadId (leadId)

Sets the ID of the lead to convert. This field is required.

Signature

```
public Void setLeadId(ID leadId)
```

Parameters

leadId
Type: [ID](#)

Return Value

Type: Void

setOpportunityName (opportunityName)

Sets the name of the opportunity to create. If no name is specified, this value defaults to the company name of the lead.

Signature

```
public Void setOpportunityName(String opportunityName)
```

Parameters

opportunityName
Type: [String](#)

Return Value

Type: Void

Usage

The maximum length of this field is 80 characters.

If `setDoNotCreateOpportunity` is true, no Opportunity is created and this field must be left blank; otherwise, an error is returned.

setOverwriteLeadSource (overwriteLeadSource)

Specifies whether to overwrite the `LeadSource` field on the target contact object with the contents of the `LeadSource` field in the source lead object. The default value is `false`, to not overwrite the field. If you specify this as `true`, you must also specify `setContactId` for the target contact.

Signature

```
public Void setOverwriteLeadSource(Boolean overwriteLeadSource)
```

Parameters

overwriteLeadSource
Type: [Boolean](#)

Return Value

Type: Void

setOwnerId (ownerId)

Specifies the ID of the person to own any newly created account, contact, and opportunity. If the application does not specify this value, the owner of the new object will be the owner of the lead.

Signature

```
public Void setOwnerId(ID ownerId)
```

Parameters

ownerId
Type: [ID](#)

Return Value

Type: Void

Usage

This method is not applicable when merging with existing objects—if `setOwnerId` is specified, the `ownerId` field is not overwritten in an existing account or contact.

setSendNotificationEmail (sendEmail)

Specifies whether to send a notification email to the owner specified by `setOwnerId`. The default value is `false`, that is, to not send email.

Signature

```
public Void setSendNotificationEmail(Boolean sendEmail)
```

Parameters

sendEmail
Type: [Boolean](#)

Return Value

Type: Void

LeadConvertResult Class

The result of a lead conversion.

Namespace

[Database](#)

Usage

An array of `LeadConvertResult` objects is returned with the `convertLead` Database method. Each element in the `LeadConvertResult` array corresponds to the `sObject` array passed as the `sObject []` parameter in the `convertLead` Database method, that is, the first element in the `LeadConvertResult` array matches the first element passed in the `sObject` array, the second element corresponds to the second element, and so on. If only one `sObject` is passed in, the `LeadConvertResult` array contains a single element.

LeadConvertResult Methods

The following are methods for `LeadConvertResult`. All are instance methods.

IN THIS SECTION:

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

`getContactId()`

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

`getErrors()`

If an error occurred, an array of one or more database error objects providing the error code and description.

`getLeadId()`

The ID of the converted lead.

`getOpportunityId()`

The ID of the new opportunity, if one was created when `convertLead` was invoked.

`isSuccess()`

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

`getAccountId()`

The ID of the new account (if a new account was specified) or the ID of the account specified when `convertLead` was invoked.

Signature

```
public ID getAccountId()
```

Return Value

Type: ID

`getContactId()`

The ID of the new contact (if a new contact was specified) or the ID of the contact specified when `convertLead` was invoked.

Signature

```
public ID getContactId()
```

Return Value

Type: [ID](#)

getErrors()

If an error occurred, an array of one or more database error objects providing the error code and description.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: [Database.Error\[\]](#)

getLeadId()

The ID of the converted lead.

Signature

```
public ID getLeadId()
```

Return Value

Type: [ID](#)

getOpportunityId()

The ID of the new opportunity, if one was created when `convertLead` was invoked.

Signature

```
public ID getOpportunityId()
```

Return Value

Type: [ID](#)

isSuccess()

A Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

MergeResult Class

Contains the result of a merge Database method operation.

Namespace

[Database](#)

Usage

The `Database.merge` method returns a `Database.MergeResult` object for each merged record.

MergeResult Methods

The following are methods for `MergeResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

[getId\(\)](#)

Returns the ID of the master record into which other records were merged.

[getMergedRecordIds\(\)](#)

Returns the IDs of the records merged into the master record.

[getUpdatedRelatedIds\(\)](#)

Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

[isSuccess\(\)](#)

Indicates whether the merge was successful (`true`) or not (`false`).

getErrors ()

Returns a list of `Database.Error` objects representing the errors encountered, if any, during a merge operation using the `Database.merge` method. If no error occurred, returns null.

Signature

```
public List<Database.Error> getErrors ()
```

Return Value

Type: [List<Database.Error>](#)

getId ()

Returns the ID of the master record into which other records were merged.

Signature

```
public Id getId()
```

Return Value

Type: [ID](#)

getMergedRecordIds ()

Returns the IDs of the records merged into the master record.

Signature

```
public List<String> getMergedRecordIds ()
```

Return Value

Type: [List<String>](#)

getUpdatedRelatedIds ()

Returns the IDs of all related records that were reparented as a result of the merge that are viewable by the user sending the merge call.

Signature

```
public List<String> getUpdatedRelatedIds ()
```

Return Value

Type: [List<String>](#)

isSuccess ()

Indicates whether the merge was successful ([true](#)) or not ([false](#)).

Signature

```
public Boolean isSuccess ()
```

Return Value

Type: [Boolean](#)

QueryLocator Class

Represents the record set returned by `Database.getQueryLocator` and used with Batch Apex.

Namespace

[Database](#)

QueryLocator Methods

The following are methods for `QueryLocator`. All are instance methods.

IN THIS SECTION:

[getQuery\(\)](#)

Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

[iterator\(\)](#)

Returns a new instance of a query locator iterator.

getQuery ()

Returns the query used to instantiate the `Database.QueryLocator` object. This is useful when testing the `start` method.

Signature

```
public String getQuery ()
```

Return Value

Type: [String](#)

Usage

You cannot use the [FOR UPDATE keywords](#) with a `getQueryLocator` query to lock a set of records. The `start` method automatically locks the set of records in the batch.

Example

```
System.assertEquals(QLReturnedFromStart.  
getQuery(),  
Database.getQueryLocator([SELECT Id  
FROM Account]).getQuery());
```

iterator ()

Returns a new instance of a query locator iterator.

Signature

```
public Database.QueryLocatorIterator iterator ()
```

Return Value

Type: [Database.QueryLocatorIterator](#)

Usage

Warning: To iterate over a query locator, save the iterator instance that this method returns in a variable and then use this variable to iterate over the collection. Calling `iterator` every time you want to perform an iteration can result in incorrect behavior because each call returns a new iterator instance.

For an example, see [QueryLocatorIterator Class](#).

QueryLocatorIterator Class

Represents an iterator over a query locator record set.

Namespace

[Database](#)

Example

This sample shows how to obtain an iterator for a query locator, which contains five accounts. This sample calls `hasNext` and `next` to get each record in the collection.

```
// Get a query locator
Database.QueryLocator q = Database.getQueryLocator(
    [SELECT Name FROM Account LIMIT 5]);
// Get an iterator
Database.QueryLocatorIterator it = q.iterator();

// Iterate over the records
while (it.hasNext())
{
    Account a = (Account)it.next();
    System.debug(a);
}
```

QueryLocatorIterator Methods

The following are methods for `QueryLocatorIterator`. All are instance methods.

IN THIS SECTION:

[hasNext\(\)](#)

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

[next\(\)](#)

Advances the iterator to the next `sObject` record and returns the `sObject`.

hasNext ()

Returns `true` if there are one or more records remaining in the collection; otherwise, returns `false`.

Signature

```
public Boolean hasNext ()
```

Return Value

Type: [Boolean](#)

next ()

Advances the iterator to the next sObject record and returns the sObject.

Signature

```
public sObject next ()
```

Return Value

Type: [sObject](#)

Usage

Because the return value is the generic sObject type, you must cast it if using a more specific type. For example:

```
Account a = (Account)myIterator.next ();
```

Example

```
Account a = (Account)myIterator.next ();
```

SaveResult Class

The result of an insert or update DML operation returned by a Database method.

Namespace

[Database](#)

Usage

An array of SaveResult objects is returned with the `insert` and `update` database methods. Each element in the SaveResult array corresponds to the sObject array passed as the `sObject []` parameter in the Database method, that is, the first element in the SaveResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the SaveResult array contains a single element.

A SaveResult object is generated when a new or existing Salesforce record is saved.

Example

The following example shows how to obtain and iterate through the returned `Database.SaveResult` objects. It inserts two accounts using `Database.insert` with a false second parameter to allow partial processing of records on failure. One of the accounts is missing the Name required field, which causes a failure. Next, it iterates through the results to determine whether the

operation was successful or not for each record. It writes the ID of every record that was processed successfully to the debug log, or error messages and fields of the failed records. This example generates one successful operation and one failure.

```
// Create two accounts, one of which is missing a required field
Account[] accts = new List<Account>{
    new Account (Name='Account1'),
    new Account ();
};
Database.SaveResult[] srList = Database.insert(accts, false);

// Iterate through each returned result
for (Database.SaveResult sr : srList) {
    if (sr.isSuccess()) {
        // Operation was successful, so get the ID of the record that was processed
        System.debug('Successfully inserted account. Account ID: ' + sr.getId());
    }
    else {
        // Operation failed, so get all errors
        for(Database.Error err : sr.getErrors()) {
            System.debug('The following error has occurred.');
```

```
            System.debug(err.getStatusCode() + ': ' + err.getMessage());
            System.debug('Account fields that affected this error: ' + err.getFields());
        }
    }
}
```

[Error Class](#)

[DuplicateError Class](#)

SaveResult Methods

The following are methods for `SaveResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

[getId\(\)](#)

Returns the ID of the sObject you were trying to insert or update.

[isSuccess\(\)](#)

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

getErrors ()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: [Database.Error\[\]](#)

getId()

Returns the ID of the sObject you were trying to insert or update.

Signature

```
public ID getId()
```

Return Value

Type: [ID](#)

Usage

If this field contains a value, the object was successfully inserted or updated. If this field is empty, the operation was not successful for that object.

isSuccess()

Returns a Boolean that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

Example

This example shows the code used to process duplicate records, which are detected when there is an unsuccessful save due to an error. This code is part of a custom application that implements duplicate management when users add a contact. See [DuplicateResult Class](#) on page 1807 to check out the entire sample application.

```
if (!saveResult.isSuccess()) { ... }
```

UndeleteResult Class

The result of an undelete DML operation returned by the `Database.undelete` method.

Namespace

[Database](#)

Usage

An array of Database.UndeleteResult objects is returned with the `undelete` database method. Each element in the UndeleteResult array corresponds to the sObject array passed as the `sObject[]` parameter in the `undelete` Database method; that is, the first element in the UndeleteResult array matches the first element passed in the sObject array, the second element corresponds with the second element, and so on. If only one sObject is passed in, the UndeleteResults array contains a single element.

UndeleteResult Methods

The following are methods for `UndeleteResult`. All are instance methods.

IN THIS SECTION:

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

`getId()`

Returns the ID of the sObject you were trying to undelete.

`isSuccess()`

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

`getErrors()`

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns null.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: [Database.Error\[\]](#)

`getId()`

Returns the ID of the sObject you were trying to undelete.

Signature

```
public ID getId()
```

Return Value

Type: [ID](#)

Usage

If this field contains a value, the object was successfully undeleted. If this field is empty, the operation was not successful for that object.

isSuccess ()

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess ()
```

Return Value

Type: [Boolean](#)

UpsertResult Class

The result of an upsert DML operation returned by the `Database.upsert` method.

Namespace

[Database](#)

Usage

An array of `Database.UpsertResult` objects is returned with the `upsert` database method. Each element in the `UpsertResult` array corresponds to the `sObject` array passed as the `sObject []` parameter in the `upsert` Database method; that is, the first element in the `UpsertResult` array matches the first element passed in the `sObject` array, the second element corresponds with the second element, and so on. If only one `sObject` is passed in, the `UpsertResults` array contains a single element.

UpsertResult Methods

The following are methods for `UpsertResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

[getId\(\)](#)

Returns the ID of the `sObject` you were trying to update or insert.

[isCreated\(\)](#)

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

[isSuccess\(\)](#)

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

getErrors ()

If an error occurred, returns an array of one or more database error objects providing the error code and description. If no error occurred, returns an empty set.

Signature

```
public Database.Error[] getErrors()
```

Return Value

Type: [Database.Error](#) []

getId()

Returns the ID of the sObject you were trying to update or insert.

Signature

```
public ID getId()
```

Return Value

Type: [ID](#)

Usage

If this field contains a value, the object was successfully updated or inserted. If this field is empty, the operation was not successful for that object.

isCreated()

A Boolean value that is set to `true` if the record was created, `false` if the record was updated.

Signature

```
public Boolean isCreated()
```

Return Value

Type: [Boolean](#)

isSuccess()

Returns a Boolean value that is set to `true` if the DML operation was successful for this object, `false` otherwise.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

Datacloud Namespace

The `Datacloud` namespace provides classes and methods for retrieving information about duplicate rules. Duplicate rules let you control whether and when users can save duplicate records within Salesforce.

The following are the classes in the `Datacloud` namespace.

IN THIS SECTION:

[AdditionalInformationMap Class](#)

Represents other information, if any, about matched records.

[DuplicateResult Class](#)

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

[FieldDiff Class](#)

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

[MatchRecord Class](#)

Represents a duplicate record detected by a matching rule.

[MatchResult Class](#)

Represents the duplicate results for a matching rule.

AdditionalInformationMap Class

Represents other information, if any, about matched records.

Namespace

[Datacloud](#)

IN THIS SECTION:

[AdditionalInformationMap Methods](#)

AdditionalInformationMap Methods

The following are methods for `AdditionalInformationMap`.

IN THIS SECTION:

[getName\(\)](#)

Returns the element name.

[getValue\(\)](#)

Returns the value of the element.

getName ()

Returns the element name.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getValue ()

Returns the value of the element.

Signature

```
public String getValue ()
```

Return Value

Type: [String](#)

DuplicateResult Class

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Namespace

[Datacloud](#)

Usage

The `DuplicateResult` class and its methods are available to organizations that use duplicate rules.

`DuplicateResult` is contained within `DuplicateError`, which is part of `SaveResult`. `SaveResult` is generated when a user attempts to save a record in Salesforce.

Example

This example shows a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records.

The sample application consists of a Visualforce page and an Apex controller. The Visualforce page is listed first so that you can see how the page makes use of the Apex controller. Save the Apex class first before saving the Visualforce page.

```
<apex:page controller="ContactDedupeController">
  <apex:form >
    <apex:pageBlock title="Duplicate Records" rendered="{!hasDuplicateResult}">
      <apex:pageMessages />
      <apex:pageBlockTable value="{!duplicateRecords}" var="item">
        <apex:column >
          <apex:facet name="header">Name</apex:facet>
          <apex:outputLink value="/{!item['Id']}">{!item['Name']}</apex:outputLink>
        </apex:column>
      </apex:pageBlockTable>
    </apex:pageBlock>
  </apex:form>
</apex:page>
```

```

        <apex:column >
            <apex:facet name="header">Owner</apex:facet>
            <apex:outputField value="{!item['OwnerId']}" />
        </apex:column>
        <apex:column >
            <apex:facet name="header">Last Modified Date</apex:facet>
            <apex:outputField value="{!item['LastModifiedDate']}" />
        </apex:column>
    </apex:pageBlockTable>
</apex:pageBlock>

<apex:pageBlock title="Contact" mode="edit">
    <apex:pageBlockButtons >
        <apex:commandButton value="Save" action="{!save}" />
    </apex:pageBlockButtons>

    <apex:pageBlockSection >
        <apex:inputField value="{!Contact.FirstName}" />
        <apex:inputField value="{!Contact.LastName}" />
        <apex:inputField value="{!Contact.Email}" />
        <apex:inputField value="{!Contact.Phone}" />
        <apex:inputField value="{!Contact.AccountId}" />
    </apex:pageBlockSection>
</apex:pageBlock>
</apex:form>
</apex:page>

```

This sample is the Apex controller for the page. This controller contains the action method for the Save button. The `save` method inserts the new contact. If errors are returned, this method iterates through each error, checks if it's a duplicate error, adds the error message to the page, and returns information about the duplicate records to be displayed on the page.

```

public class ContactDedupeController {

    // Initialize a variable to hold the contact record you're processing
    private final Contact contact;

    // Initialize a list to hold any duplicate records
    private List<sObject> duplicateRecords;

    // Define variable that's true if there are duplicate records
    public boolean hasDuplicateResult{get;set;}

    // Define the constructor
    public ContactDedupeController() {

        // Define the values for the contact you're processing based on its ID
        Id id = ApexPages.currentPage().getParameters().get('id');
        this.contact = (id == null) ? new Contact() :
            [SELECT Id, FirstName, LastName, Email, Phone, AccountId
            FROM Contact WHERE Id = :id];

        // Initialize empty list of potential duplicate records
        this.duplicateRecords = new List<sObject>();
        this.hasDuplicateResult = false;
    }
}

```

```
// Return contact and its values to the Visualforce page for display
public Contact getContact() {
    return this.contact;
}

// Return duplicate records to the Visualforce page for display
public List<sObject> getDuplicateRecords() {
    return this.duplicateRecords;
}

// Process the saved record and handle any duplicates
public PageReference save() {

    // Optionally, set DML options here, use "DML" instead of "false"
    // in the insert()
    // Database.DMLOptions dml = new Database.DMLOptions();
    // dml.DuplicateRuleHeader.allowSave = true;
    // dml.DuplicateRuleHeader.runAsCurrentUser = true;
    Database.SaveResult saveResult = Database.insert(contact, false);

    if (!saveResult.isSuccess()) {
        for (Database.Error error : saveResult.getErrors()) {
            // If there are duplicates, an error occurs
            // Process only duplicates and not other errors
            // (e.g., validation errors)
            if (error instanceof Database.DuplicateError) {
                // Handle the duplicate error by first casting it as a
                // DuplicateError class
                // This lets you use methods of that class
                // (e.g., getDuplicateResult())
                Database.DuplicateError duplicateError =
                    (Database.DuplicateError)error;
                Datacloud.DuplicateResult duplicateResult =
                    duplicateError.getDuplicateResult();

                // Display duplicate error message as defined in the duplicate rule
                ApexPages.Message errorMessage = new ApexPages.Message(
                    ApexPages.Severity.ERROR, 'Duplicate Error: ' +
                    duplicateResult.getErrorMessage());
                ApexPages.addMessage(errorMessage);

                // Get duplicate records
                this.duplicateRecords = new List<sObject>();

                // Return only match results of matching rules that
                // find duplicate records
                Datacloud.MatchResult[] matchResults =
                    duplicateResult.getMatchResults();

                // Just grab first match result (which contains the
                // duplicate record found and other match info)
                Datacloud.MatchResult matchResult = matchResults[0];
            }
        }
    }
}
```

```
        Datacloud.MatchRecord[] matchRecords = matchResult.getMatchRecords();

        // Add matched record to the duplicate records variable
        for (Datacloud.MatchRecord matchRecord : matchRecords) {
            System.debug('MatchRecord: ' + matchRecord.getRecord());
            this.duplicateRecords.add(matchRecord.getRecord());
        }
        this.hasDuplicateResult = !this.duplicateRecords.isEmpty();
    }
}

//If there's a duplicate record, stay on the page
return null;
}

// After save, navigate to the view page:
return (new ApexPages.StandardController(contact)).view();
}
}
```

IN THIS SECTION:

[DuplicateResult Methods](#)

SEE ALSO:

[SaveResult Class](#)

[DuplicateError Class](#)

DuplicateResult Methods

The following are methods for `DuplicateResult`.

IN THIS SECTION:

[getDuplicateRule\(\)](#)

Returns the developer name of the executed duplicate rule that returned duplicate records.

[getErrorMessage\(\)](#)

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

[getMatchResults\(\)](#)

Returns the duplicate records and match information.

[isAllowSave\(\)](#)

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

getDuplicateRule ()

Returns the developer name of the executed duplicate rule that returned duplicate records.

Signature

```
public String getDuplicateRule ()
```

Return Value

Type: [String](#)

getErrorMessage ()

Returns the error message configured by the administrator to warn users they may be creating duplicate records. This message is associated with a duplicate rule.

Signature

```
public String getErrorMessage ()
```

Return Value

Type: [String](#)

Example

This example shows the code used to display the error message when duplicates are found while saving a new contact. This code is part of a custom application that lets users add a contact. When a contact is saved, an alert displays if there are duplicate records. Review [DuplicateResult Class](#) on page 1807 to check out the entire sample applicaton.

```
ApexPages.Message errorMessage = new ApexPages.Message (
    ApexPages.Severity.ERROR, 'Duplicate Error: ' +
    duplicateResult.getErrorMessage () );
ApexPages.addMessage (errorMessage);
```

getMatchResults ()

Returns the duplicate records and match information.

Signature

```
public List<Datacloud.MatchResult> getMatchResults ()
```

Return Value

Type: [List<Datacloud.MatchResult>](#)

Example

This example shows the code used to return duplicate record and match information and assign it to the `matchResults` variable. This code is part of a custom application that implements duplicate management when users add a contact. See [DuplicateResult Class](#) on page 1807 to check out the entire sample applicaton.

```
Datacloud.MatchResult[] matchResults =
    duplicateResult.getMatchResults();
```

isAllowSave ()

Indicates whether the duplicate rule will allow a record that's identified as a duplicate to be saved. Set to `true` if duplicate rule should allow save; otherwise, `false`.

Signature

```
public Boolean isAllowSave ()
```

Return Value

Type: [Boolean](#)

FieldDiff Class

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Namespace

[Datacloud](#)

IN THIS SECTION:

[FieldDiff Methods](#)

FieldDiff Methods

The following are methods for `FieldDiff`.

IN THIS SECTION:

[getDifference\(\)](#)

Returns how the field values compare for the duplicate and its matching record.

[getName\(\)](#)

Returns the name of a field on a matching rule that detected duplicates.

getDifference ()

Returns how the field values compare for the duplicate and its matching record.

Signature

```
public String getDifference ()
```

Return Value

Type: [String](#)

Possible values include:

- `SAME`: Indicates the field values match exactly.
- `DIFFERENT`: Indicates that the field values do not match.
- `NULL`: Indicates that the field values are a match because both values are blank.

getName ()

Returns the name of a field on a matching rule that detected duplicates.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

MatchRecord Class

Represents a duplicate record detected by a matching rule.

Namespace

[Datacloud](#)

IN THIS SECTION:

[MatchRecord Methods](#)

MatchRecord Methods

The following are methods for `MatchRecord`.

IN THIS SECTION:

[getAdditionalInformation\(\)](#)

Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

[getFieldDiffs\(\)](#)

Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

[getMatchConfidence\(\)](#)

Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

[getRecord\(\)](#)

Returns the fields and field values for the duplicate.

getAdditionalInformation()

Returns other information about a matched record. For example, a `matchGrade` represents the quality of the data for the D&B fields in the matched record.

Signature

```
public List<Datacloud.AdditionalInformationMap> getAdditionalInformation()
```

Return Value

Type: List<[Datacloud.AdditionalInformationMap](#)>

getFieldDiffs()

Returns all matching rule fields and how each field value compares for the duplicate and its matching record.

Signature

```
public List<Datacloud.FieldDiff> getFieldDiffs()
```

Return Value

Type: List<[Datacloud.FieldDiff](#)>

getMatchConfidence()

Returns the ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns -1 if unused.

Signature

```
public Double getMatchConfidence()
```

Return Value

Type: [Double](#)

getRecord()

Returns the fields and field values for the duplicate.

Signature

```
public SObject getRecord()
```

Return Value

Type: [SObject](#)

MatchResult Class

Represents the duplicate results for a matching rule.

Namespace

[Datacloud](#)

IN THIS SECTION:

[MatchResult Methods](#)

MatchResult Methods

The following are methods for `MatchResult`.

IN THIS SECTION:

[getEntityType\(\)](#)

Returns the entity type of the matching rule.

[getErrors\(\)](#)

Returns errors that occurred during matching for the matching rule.

[getMatchEngine\(\)](#)

Returns the match engine for the matching rule.

[getMatchRecords\(\)](#)

Returns information about the duplicates for the matching rule.

[getRule\(\)](#)

Returns the developer name of the matching rule.

[getSize\(\)](#)

Returns the number of duplicates detected by the matching rule.

[isSuccess\(\)](#)

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

getEntityType()

Returns the entity type of the matching rule.

Signature

```
public String getEntityType()
```

Return Value

Type: [String](#)

getErrors ()

Returns errors that occurred during matching for the matching rule.

Signature

```
public List<Database.Error> getErrors ()
```

Return Value

Type: List<[Database.Error](#)>

getMatchEngine ()

Returns the match engine for the matching rule.

Signature

```
public String getMatchEngine ()
```

Return Value

Type: [String](#)

getMatchRecords ()

Returns information about the duplicates for the matching rule.

Signature

```
public List<Datacloud.MatchRecord> getMatchRecords ()
```

Return Value

Type: List<[Datacloud.MatchRecord](#)>

getRule ()

Returns the developer name of the matching rule.

Signature

```
public String getRule ()
```

Return Value

Type: [String](#)

getSize ()

Returns the number of duplicates detected by the matching rule.

Signature

```
public Integer getSize ()
```

Return Value

Type: [Integer](#)

isSuccess ()

Returns `false` if there's an error with the matching rule, and `true` if the matching rule successfully ran.

Signature

```
public Boolean isSuccess ()
```

Return Value

Type: [Boolean](#)

DataSource Namespace

The `DataSource` namespace provides the classes for the Apex Connector Framework. Use the Apex Connector Framework to develop a custom adapter for Salesforce Connect. Then connect your Salesforce organization to any data anywhere via the Salesforce Connect custom adapter.

The following are the classes in the `DataSource` namespace.

IN THIS SECTION:

[AsyncDeleteCallback Class](#)

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

[AsyncSaveCallback Class](#)

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

[AuthenticationCapability Enum](#)

Specifies the types of authentication that can be used to access the external system.

[AuthenticationProtocol Enum](#)

Determines what type of credentials are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

DeleteResult Class

Represents the result of a delete operation on an sObject record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Filter Class

Represents a `WHERE` clause in a SOSL or SOQL query.

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

QueryAggregation Enum

Specifies how to aggregate a column in a query.

QueryContext Class

An instance of `QueryContext` is provided to the `query` method on your `DataSource.Connection` class. The instance corresponds to a SOQL request.

[QueryUtils Class](#)

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

[ReadContext Class](#)

Abstract base class for the `QueryContext` and `SearchContext` classes.

[SearchContext Class](#)

An instance of `SearchContext` is provided to the `search` method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

[SearchUtils Class](#)

Helper class for implementing search on a custom adapter for Salesforce Connect.

[Table Class](#)

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

[TableResult Class](#)

Contains the results of a search or query.

[TableSelection Class](#)

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

[UpsertContext Class](#)

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `DataSource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

[UpsertResult Class](#)

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

[DataSource Exceptions](#)

The `DataSource` namespace contains exception classes.

AsyncDeleteCallback Class

A callback class that the `Database.deleteAsync` method references. Salesforce calls this class after the remote `deleteAsync` operation is completed. This class provides the compensating transaction in the completion context of the delete operation. Extend this class to define the actions to execute after the remote delete operation finishes execution.

Namespace

[DataSource](#)

IN THIS SECTION:

[AsyncDeleteCallback Methods](#)

AsyncDeleteCallback Methods

The following are methods for `AsyncDeleteCallback`.

IN THIS SECTION:

[processDelete\(deleteResult\)](#)

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

processDelete (deleteResult)

Override this method to define actions that Salesforce executes after a remote `Database.deleteAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org..

Signature

```
public void processDelete(Database.DeleteResult deleteResult)
```

Parameters

deleteResult

Type: [Database.DeleteResult](#)

The result of the asynchronous delete operation.

Return Value

Type: void

AsyncSaveCallback Class

A callback class that the `Database.insertAsync` or `Database.updateAsync` method references. Salesforce calls this class after the remote operation is completed. This class provides the compensating transaction in the completion context of the insert or update operation. Extend this class to define the actions to execute after the remote insert or update operation finishes execution.

Namespace

[DataSource](#)

IN THIS SECTION:

[AsyncSaveCallback Methods](#)

AsyncSaveCallback Methods

The following are methods for `AsyncSaveCallback`.

IN THIS SECTION:[processSave\(saveResult\)](#)

Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

processSave (saveResult)

Override this method to define actions that Salesforce executes after the remote `Database.insertAsync` or `Database.updateAsync` operation is completed. For example, based on the results of the remote operation, you can update custom object data or other data that's stored in the Salesforce org.

Signature

```
public void processSave(Database.SaveResult saveResult)
```

Parameters

saveResult

Type: [Database.SaveResult](#)

The result of the asynchronous insert or update operation.

Return Value

Type: void

AuthenticationCapability Enum

Specifies the types of authentication that can be used to access the external system.

Usage

The `DataSource.Provider` class returns `DataSource.AuthenticationCapability` enum values. The returned values determine which authentication settings are available on the external data source definition in Salesforce.

If you set up callouts in your `DataSource.Connection` class, you can specify the callout endpoints as named credentials instead of URLs. If you do so for all callouts, return `ANONYMOUS` as the sole entry in the list of data source authentication capabilities. That way, the external data source definition doesn't require authentication settings. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

Enum Values

The following are the values of the `DataSource.AuthenticationCapability` enum.

Value	Description
ANONYMOUS	No credentials are required to authenticate to the external system.
BASIC	A username and password can be used to authenticate to the external system.

Value	Description
CERTIFICATE	A security certificate can be supplied when establishing each connection to the external system.
OAUTH	OAuth can be used to authenticate to the external system.

AuthenticationProtocol Enum

Determines what type of credentials are used to authenticate to the external system.

Enum Values

The following are the values of the `DataSource.AuthenticationProtocol` enum.

Value	Description
NONE	No credentials are used to authenticate to the external system.
OAUTH	OAuth 2.0 is used to authenticate to the external system.
PASSWORD	A username and password are used to authenticate to the external system.

Capability Enum

Declares which functional operations the external system supports. Also specifies required endpoint settings for the external data source definition.

Usage

The `DataSource.Provider` class returns `DataSource.Capability` enum values, which:

- Specify the functional capabilities of the external system.
- Determine which endpoint settings are available on the external data source definition in Salesforce.

Enum Values

The following are the values of the `DataSource.Capability` enum.

Value	Description
QUERY_PAGINATION_SERVER_DRIVEN	<p>With server-driven paging, the external system determines the page sizes and batch boundaries. The external system's paging settings can optimize the external system's performance and improve the load times for external objects in your org. Also, the external data set can change while your users or the Force.com platform are paging through the result set. Typically, server-driven paging adjusts batch boundaries to accommodate changing data sets more effectively than client-driven paging.</p> <p>If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default <code>queryMore()</code> batch size of 500 rows. The pages returned by the external system determine the batches. Also, the</p>

Value	Description
	Apex code must generate a query token and use it to determine and fetch the next batch of results.
QUERY_TOTAL_SIZE	The external system can provide the total number of rows that meet the query criteria, even when requested to return a smaller batch size. This capability enables you to simplify how you paginate results by using <code>queryMore()</code> .
REQUIRE_ENDPOINT	Requires the administrator to specify the endpoint in the URL field in the external data source definition.
REQUIRE_HTTPS	Requires the endpoint URL to use secure HTTP. If <code>REQUIRE_ENDPOINT</code> isn't declared, <code>REQUIRE_HTTPS</code> is ignored.
ROW_CREATE	Allows creating of external data.
ROW_DELETE	Allows deleting external data.
ROW_QUERY	Allows API and SOQL queries of the external data. Also allows reports on the external objects.
ROW_UPDATE	Allows updating external data.
SEARCH	<p>Allows SOSL and Salesforce searches of the external data.</p> <p>When the custom adapter declares the <code>SEARCH</code> capability, you can control which external objects are searchable by selecting or deselecting <code>Allow Search</code> on each external object. However, syncing always overwrites the external object's search status to match the search status of the external data source.</p> <p>Only text, text area, and long text area fields on external objects can be searched. If an external object has no searchable fields, searches on that object return no records.</p>

SEE ALSO:

[Salesforce Help: Validate and Sync an External Data Source](#)

Column Class

Describes a column on a `DataSource.Table`. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

[DataSource](#)

Usage

A list of column metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each column can become a field on an external object.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the column metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

[Column Properties](#)[Column Methods](#)

Column Properties

The following are properties for `Column`.

IN THIS SECTION:

[decimalPlaces](#)

If the data type is numeric, the number of decimal places to the right of the decimal point.

[description](#)

Description of what the column represents.

[filterable](#)

Whether a result set can be filtered based on the values of the column.

[label](#)

User-friendly name for the column that appears in the Salesforce user interface.

[length](#)

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

[name](#)

Name of the column in the external system.

[referenceTargetField](#)

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

[referenceTo](#)

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

[sortable](#)

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

[type](#)

Data type of the column.

decimalPlaces

If the data type is numeric, the number of decimal places to the right of the decimal point.

Signature

```
public Integer decimalPlaces {get; set;}
```

Property Value

Type: [Integer](#)

description

Description of what the column represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: [String](#)

filterable

Whether a result set can be filtered based on the values of the column.

Signature

```
public Boolean filterable {get; set;}
```

Property Value

Type: [Boolean](#)

label

User-friendly name for the column that appears in the Salesforce user interface.

Signature

```
public String label {get; set;}
```

Property Value

Type: [String](#)

length

If the column is a string data type, the number of characters in the column. If the column is a numeric data type, the total number of digits on both sides of the decimal point, but excluding the decimal point.

Signature

```
public Integer length {get; set;}
```

Property Value

Type: [Integer](#)

name

Name of the column in the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: [String](#)

referenceTargetField

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship. Applies only when the column's data type is `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTargetField {get; set;}
```

Property Value

Type: [String](#)

referenceTo

API name of the parent object in the relationship that's represented by this column. Applies only when the column's data type is `LOOKUP_TYPE`, `EXTERNAL_LOOKUP_TYPE`, or `INDIRECT_LOOKUP_TYPE`. For other data types, this value is ignored.

Signature

```
public String referenceTo {get; set;}
```

Property Value

Type: [String](#)

sortable

Whether a result set can be sorted based on the values of the column via an `ORDER BY` clause.

Signature

```
public Boolean sortable {get; set;}
```

Property Value

Type: [Boolean](#)

type

Data type of the column.

Signature

```
public DataSource.DataType type {get; set;}
```

Property Value

Type: [DataSource.DataType](#)

Column Methods

The following are methods for `Column`.

IN THIS SECTION:[boolean\(name\)](#)

Returns a new column of data type `BOOLEAN_TYPE`.

[externalLookup\(name, domain\)](#)

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

[get\(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField\)](#)

Returns a new column with the ten specified `Column` property values.

[get\(name, label, description, isSortable, isFilterable, type, length, decimalPlaces\)](#)

Returns a new column with the eight specified `Column` property values.

[get\(name, label, description, isSortable, isFilterable, type, length\)](#)

Returns a new column with the seven specified `Column` property values.

[indirectLookup\(name, domain, targetField\)](#)

Returns a new column of data type `INDIRECT_LOOKUP_TYPE`.

[integer\(name, length\)](#)

Returns a new numeric column with no decimal places using the specified name and length.

[lookup\(name, domain\)](#)

Returns a new column of data type `LOOKUP_TYPE`.

[number\(name, length, decimalPlaces\)](#)

Returns a new column of data type `NUMBER_TYPE`.

[text\(name, label, length\)](#)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

[text\(name, length\)](#)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

[text\(name\)](#)

Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

[textarea\(name\)](#)

Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

[url\(name, length\)](#)

Returns a new column of data type `URL_TYPE` with the specified name and length.

[url\(name\)](#)

Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

boolean (name)

Returns a new column of data type `BOOLEAN_TYPE`.

Signature

```
public static DataSource.Column boolean(String name)
```

Parameters

name

Type: [String](#)

Name of the column.

Return Value

Type: [DataSource.Column](#)

externalLookup (name, domain)

Returns a new column of data type `EXTERNAL_LOOKUP_TYPE`.

Signature

```
public static DataSource.Column externalLookup(String name, String domain)
```

Parameters

name

Type: [String](#)

Name of the column.

domain

Type: [String](#)

API name of the parent object in the external lookup relationship.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>

Property	Value
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.EXTERNAL_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	<i>domain</i>
referenceTargetField	null

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces, referenceTo, referenceTargetField)

Returns a new column with the ten specified Column property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,
Integer decimalPlaces, String referenceTo, String referenceTargetField)
```

Parameters

See [Column Properties](#) on page 1824 for information about each parameter.

name

Type: [String](#)

label

Type: [String](#)

description

Type: [String](#)

isSortable

Type: [Boolean](#)

isFilterable

Type: [Boolean](#)

type

Type: [DataSource.DataType](#)

length

Type: [Integer](#)

decimalPlaces

Type: [Integer](#)

referenceTo

Type: [String](#)

referenceTargetField

Type: [String](#)

Return Value

Type: [DataSource.Column](#)

get(name, label, description, isSortable, isFilterable, type, length, decimalPlaces)

Returns a new column with the eight specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,  
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length,  
Integer decimalPlaces)
```

Parameters

See [Column Properties](#) on page 1824 for information about each parameter.

name

Type: [String](#)

label

Type: [String](#)

description

Type: [String](#)

isSortable

Type: [Boolean](#)

isFilterable

Type: [Boolean](#)

type

Type: [DataSource.DataType](#)

length

Type: [Integer](#)

decimalPlaces

Type: [Integer](#)

Return Value

Type: [DataSource.Column](#)

get(name, label, description, isSortable, isFilterable, type, length)

Returns a new column with the seven specified `Column` property values.

Signature

```
public static DataSource.Column get(String name, String label, String description,
Boolean isSortable, Boolean isFilterable, DataSource.DataType type, Integer length)
```

Parameters

See [Column Properties](#) on page 1824 for information about each parameter.

name

Type: [String](#)

label

Type: [String](#)

description

Type: [String](#)

isSortable

Type: [Boolean](#)

isFilterable

Type: [Boolean](#)

type

Type: [DataSource.DataType](#)

length

Type: [Integer](#)

Return Value

Type: [DataSource.Column](#)

indirectLookup(name, domain, targetField)

Returns a new column of data type INDIRECT_LOOKUP_TYPE.

Signature

```
public static DataSource.Column indirectLookup(String name, String domain, String
targetField)
```

Parameters

name

Type: [String](#)

Name of the column.

domain

Type: [String](#)

API name of the parent object in the indirect lookup relationship.

targetField

Type: [String](#)

API name of the custom field on the parent object whose values are compared against this column's values. Matching values identify related records in an indirect lookup relationship.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.INDIRECT_LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	<i>domain</i>
referenceTargetField	<i>targetField</i>

integer(name, length)

Returns a new numeric column with no decimal places using the specified name and length.

Signature

```
public static DataSource.Column integer(String name, Integer length)
```

Parameters

name

Type: [String](#)

The column name.

length

Type: [Integer](#)

The column length.

Return Value

Type: [DataSource.Column](#)

lookup(name, domain)

Returns a new column of data type LOOKUP_TYPE.

Signature

```
public static DataSource.Column lookup(String name, String domain)
```

Parameters

name

Type: [String](#)

Name of the column.

domain

Type: [String](#)

API name of the parent object in the lookup relationship.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.LOOKUP_TYPE
length	255
decimalPlaces	0
referenceTo	<i>domain</i>
referenceTargetField	null

number(name, length, decimalPlaces)

Returns a new column of data type NUMBER_TYPE.

Signature

```
public static DataSource.Column number(String name, Integer length, Integer decimalPlaces)
```

Parameters

See [Column Properties](#) on page 1824 for information about each parameter.

name

Type: [String](#)

length

Type: [Integer](#)

decimalPlaces

Type: [Integer](#)

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.NUMBER_TYPE
length	<i>length</i>
decimalPlaces	<i>decimalPlaces</i>

text(name, label, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name, label, and length.

Signature

```
public static DataSource.Column text(String name, String label, Integer length)
```

Parameters

name

Type: [String](#)

Name of the column.

label

Type: [String](#)

User-friendly name for the column that appears in the Salesforce user interface.

length

Type: [Integer](#)

Number of characters allowed in the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>label</i>
description	<i>label</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if <i>length</i> is 255 or less DataSource.DataType.STRING_LONG_TYPE if <i>length</i> is greater than 255
length	<i>length</i>
decimalPlaces	0

text (name, length)

Returns a new column of data type `STRING_SHORT_TYPE` or `STRING_LONG_TYPE`, with the specified name and length.

Signature

```
public static DataSource.Column text(String name, Integer length)
```

Parameters

name

Type: [String](#)

Name of the column.

length

Type: [Integer](#)

Number of characters allowed in the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE if <i>length</i> is 255 or less DataSource.DataType.STRING_LONG_TYPE if <i>length</i> is greater than 255
length	<i>length</i>
decimalPlaces	0

text (name)

Returns a new column of data type `STRING_SHORT_TYPE` with the specified name and the length of 255 characters.

Signature

```
public static DataSource.Column text(String name)
```

Parameters

name

Type: [String](#)

Name of the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_SHORT_TYPE

Property	Value
length	255
decimalPlaces	0

textarea (name)

Returns a new column of data type `STRING_LONG_TYPE` with the specified name and the length of 32,000 characters.

Signature

```
public static DataSource.Column textarea(String name)
```

Parameters

name

Type: [String](#)

Name of the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.STRING_LONG_TYPE
length	32000
decimalPlaces	0

url (name, length)

Returns a new column of data type `URL_TYPE` with the specified name and length.

Signature

```
public static DataSource.Column url(String name, Integer length)
```

Parameters

*name*Type: [String](#)

Name of the column.

*length*Type: [Integer](#)

Number of characters allowed in the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	<i>length</i>
decimalPlaces	0

url (name)Returns a new column of data type `URL_TYPE` with the specified name and the length of 1,000 characters.

Signature

```
public static DataSource.Column url(String name)
```

Parameters

*name*Type: [String](#)

Name of the column.

Return Value

Type: [DataSource.Column](#)

The returned column has these property values.

Property	Value
name	<i>name</i>
label	<i>name</i>
description	<i>name</i>
isSortable	true
isFilterable	true
type	DataSource.DataType.URL_TYPE
length	1000
decimalPlaces	0

ColumnSelection Class

Identifies the list of columns to return during a query or search.

Namespace

[DataSource Namespace](#)

Usage

This class is associated with the `SELECT` clause for a SOQL query, or the `RETURNING` clause for a SOSL query.

IN THIS SECTION:

[ColumnSelection Properties](#)

ColumnSelection Properties

The following are properties for `ColumnSelection`.

IN THIS SECTION:

[aggregation](#)

How to aggregate the column's data.

[columnName](#)

Name of the selected column.

[tableName](#)

Name of the column's table.

aggregation

How to aggregate the column's data.

Signature

```
public DataSource.QueryAggregation aggregation {get; set;}
```

Property Value

Type: [DataSource.QueryAggregation](#)

columnName

Name of the selected column.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: [String](#)

tableName

Name of the column's table.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: [String](#)

Connection Class

Extend this class to enable your Salesforce org to sync the external system's schema and to handle queries, searches, and write operations (upsert and delete) of the external data. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

[DataSource](#)

Usage

Your `DataSource.Connection` and `DataSource.Provider` classes compose a custom adapter for Salesforce Connect. Changing the `sync` method on the `DataSource.Connection` class doesn't automatically resync any external objects.

Example

```
global class SampleDataSourceConnection extends DataSource.Connection {
    global SampleDataSourceConnection(DataSource.ConnectionParams connectionParams) {
```

```

}

override global List<DataSource.Table> sync() {
    List<DataSource.Table> tables = new List<DataSource.Table>();
    List<DataSource.Column> columns;
    columns = new List<DataSource.Column>();
    columns.add(DataSource.Column.text('Name', 255));
    columns.add(DataSource.Column.text('ExternalId', 255));
    columns.add(DataSource.Column.url('DisplayUrl'));
    tables.add(DataSource.Table.get('Sample', 'Title', columns));
    return tables;
}

override global DataSource.TableResult query(DataSource.QueryContext c) {
    return DataSource.TableResult.get(c, DataSource.QueryUtils.process(c, getRows()));
}

override global List<DataSource.TableResult> search(DataSource.SearchContext c) {

    List<DataSource.TableResult> results = new List<DataSource.TableResult>();
    for (DataSource.TableSelection tableSelection : c.tableSelections) {
        results.add(DataSource.TableResult.get(tableSelection, getRows()));
    }
    return results;
}

// Helper method to get record values from the external system for the Sample table.
private List<Map<String, Object>> getRows () {
    // Get row field values for the Sample table from the external system via a callout.

    HttpResponse response = makeGetCallout();
    // Parse the JSON response and populate the rows.
    Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
        response.getBody());
    Map<String, Object> error = (Map<String, Object>)m.get('error');
    if (error != null) {
        throwException(string.valueOf(error.get('message')));
    }
    List<Map<String, Object>> rows = new List<Map<String, Object>>();
    List<Object> jsonRows = (List<Object>)m.get('value');
    if (jsonRows == null) {
        rows.add(foundRow(m));
    } else {
        for (Object jsonRow : jsonRows) {
            Map<String, Object> row = (Map<String, Object>)jsonRow;
            rows.add(foundRow(row));
        }
    }
    return rows;
}

global override List<DataSource.UpsertResult> upsertRows (DataSource.UpsertContext
    context) {

```

```

if (context.tableSelected == 'Sample') {
    List<DataSource.UpsertResult> results = new List<DataSource.UpsertResult>();
    List<Map<String, Object>> rows = context.rows;

    for (Map<String, Object> row : rows){
        // Make a callout to insert or update records in the external system.
        HttpResponse response;
        // Determine whether to insert or update a record.
        if (row.get('ExternalId') == null){
            // Send a POST HTTP request to insert new external record.
            // Make an Apex callout and get HttpResponse.
            response = makePostCallout(
                '{"name":"' + row.get('Name') + ',' + "ExternalId":"' +
                row.get('ExternalId') + '"}');
        }
        else {
            // Send a PUT HTTP request to update an existing external record.
            // Make an Apex callout and get HttpResponse.
            response = makePutCallout(
                '{"name":"' + row.get('Name') + ',' + "ExternalId":"' +
                row.get('ExternalId') + '"',
                String.valueOf(row.get('ExternalId')));
        }

        // Check the returned response.
        // First, deserialize it.
        Map<String, Object> m = (Map<String, Object>)JSON.deserializeUntyped(
            response.getBody());
        if (response.getStatusCode() == 200){
            results.add(DataSource.UpsertResult.success(
                String.valueOf(m.get('id'))));
        }
        else {
            results.add(DataSource.UpsertResult.failure(
                String.valueOf(m.get('id')),
                'The callout resulted in an error: ' +
                response.getStatusCode()));
        }
    }
    return results;
}
return null;
}

global override List<DataSource.DeleteResult> deleteRows(DataSource.DeleteContext
    context) {
    if (context.tableSelected == 'Sample'){
        List<DataSource.DeleteResult> results = new List<DataSource.DeleteResult>();
        for (String externalId : context.externalIds){
            HttpResponse response = makeDeleteCallout(externalId);
            if (response.getStatusCode() == 200){
                results.add(DataSource.DeleteResult.success(externalId));
            }
            else {

```

```
        results.add(DataSource.DeleteResult.failure(externalId,
            'Callout delete error:'
            + response.getBody()));
    }
}
return results;
}
return null;
}

// Helper methods

// Make a GET callout
private static HttpResponse makeGetCallout() {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

// Populate a row based on values from the external system.
private Map<String, Object> foundRow(Map<String, Object> foundRow) {
    Map<String, Object> row = new Map<String, Object>();
    row.put('ExternalId', string.valueOf(foundRow.get('Id')));
    row.put('DisplayUrl', string.valueOf(foundRow.get('DisplayUrl')));
    row.put('Name', string.valueOf(foundRow.get('Name')));
    return row;
}

// Make a POST callout
private static HttpResponse makePostCallout(String jsonBody) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

// Make a PUT callout
private static HttpResponse makePutCallout(String jsonBody, String externalID) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}

// Make a DELETE callout
private static HttpResponse makeDeleteCallout(String externalID) {
    HttpResponse response;
    // Make callout
    // ...
    return response;
}
}
```

IN THIS SECTION:

[Connection Methods](#)

Connection Methods

The following are methods for `Connection`.

IN THIS SECTION:

[deleteRows\(deleteContext\)](#)

Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

[query\(queryContext\)](#)

Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

[search\(searchContext\)](#)

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

[sync\(\)](#)

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

[upsertRows\(upsertContext\)](#)

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

deleteRows (deleteContext)

Invoked when external object records are deleted via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.DeleteResult> deleteRows (DataSource.DeleteContext deleteContext)
```

Parameters

deleteContext

Type: [DataSource.DeleteContext](#)

Contains context information about the delete request.

Return Value

Type: [List<DataSource.DeleteResult>](#)

The results of the delete operation.

query (queryContext)

Invoked by a SOQL query of an external object. A SOQL query is generated and executed when a user visits an external object's list view or record detail page in Salesforce. Returns the results of the query.

Signature

```
public DataSource.TableResult query(DataSource.QueryContext queryContext)
```

Parameters

queryContext

Type: [DataSource.QueryContext](#)

Represents the query to run against a data table.

Return Value

Type: [DataSource.TableResult](#)

search (searchContext)

Invoked by a SOSL query of an external object or when a user performs a Salesforce global search that also searches external objects. Returns the results of the query.

Signature

```
public List<DataSource.TableResult> search(DataSource.SearchContext searchContext)
```

Parameters

searchContext

Type: [DataSource.SearchContext](#)

Represents the query to run against an external data table.

Return Value

Type: List<[DataSource.TableResult](#)>

sync ()

Invoked when an administrator clicks **Validate and Sync** on the external data source detail page. Returns a list of tables that describe the external system's schema.

Signature

```
public List<DataSource.Table> sync()
```

Return Value

Type: List<[DataSource.Table](#)>

Each returned table can be used to create an external object in Salesforce. On the Validate External Data Source page, the administrator views the list of returned tables and selects which tables to sync. When the administrator clicks **Sync**, an external object is created for each selected table. Each column within the selected tables also becomes a field in the external object.

upsertRows (upsertContext)

Invoked when external object records are created or updated via the Salesforce user interface, APIs, or Apex.

Signature

```
public List<DataSource.UpsertResult> upsertRows (DataSource.UpsertContext upsertContext)
```

Parameters

upsertContext

Type: [DataSource.UpsertContext](#)

Contains context information about the upsert request.

Return Value

Type: List<[DataSource.UpsertResult](#)>

The results of the upsert operation.

ConnectionParams Class

Contains the credentials for authenticating to the external system.

Namespace

[DataSource](#)

Usage

If your extension of the [DataSource.Provider](#) class returns [DataSource.AuthenticationCapability](#) values that indicate support for authentication, the [DataSource.Connection](#) class is instantiated with a [DataSource.ConnectionParams](#) instance in the constructor.

The authentication credentials in the [DataSource.ConnectionParams](#) instance depend on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
 - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
 - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

The values in this class can appear in debug logs and can be accessed by users who have the "Author Apex" permission. If you require better security, we recommend that you specify named credentials instead of URLs as your Apex callout endpoints. Salesforce manages all authentication for Apex callouts that specify a named credential as the callout endpoint so that your code doesn't have to.

IN THIS SECTION:

[ConnectionParams Properties](#)

ConnectionParams Properties

The following are properties for `ConnectionParams`.

IN THIS SECTION:

[certificateName](#)

The name of the certificate for establishing each connection to the external system.

[endpoint](#)

The URL of the external system.

[oauthToken](#)

The OAuth token that's issued by the external system.

[password](#)

The password for authenticating to the external system.

[principalType](#)

An instance of `DataSource.IdentityType`, which determines which set of credentials to use to access the external system.

[protocol](#)

The type of protocol that's used to authenticate to the external system.

[repository](#)

Reserved for future use.

[username](#)

The username for authenticating to the external system.

certificateName

The name of the certificate for establishing each connection to the external system.

Signature

```
public String certificateName {get; set;}
```

Property Value

Type: [String](#)

The value comes from the external data source definition in Salesforce.

endpoint

The URL of the external system.

Signature

```
public String endpoint {get; set;}
```

Property Value

Type: [String](#)

The value comes from the external data source definition in Salesforce.

oauthToken

The OAuth token that's issued by the external system.

Signature

```
public String oauthToken {get; set;}
```

Property Value

Type: [String](#)

password

The password for authenticating to the external system.

Signature

```
public String password {get; set;}
```

Property Value

Type: [String](#)

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
 - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
 - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

principalType

An instance of [DataSource.IdentityType](#), which determines which set of credentials to use to access the external system.

Signature

```
public DataSource.IdentityType principalType {get; set;}
```

Property Value

Type: [DataSource.IdentityType](#)

protocol

The type of protocol that's used to authenticate to the external system.

Signature

```
public DataSource.AuthenticationProtocol protocol {get; set;}
```

Property Value

Type: [DataSource.AuthenticationProtocol](#)

repository

Reserved for future use.

Signature

```
public String repository {get; set;}
```

Property Value

Type: [String](#)

Reserved for future use.

username

The username for authenticating to the external system.

Signature

```
public String username {get; set;}
```

Property Value

Type: [String](#)

The value depends on the `Identity Type` field of the external data source definition in Salesforce.

- If `Identity Type` is set to `Named Principal`, the credentials come from the external data source definition.
- If `Identity Type` is set to `Per User`:
 - For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system.
 - For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

DataSourceUtil Class

Parent class for the `DataSource.Provider`, `DataSource.Connection`, `DataSource.Table`, and `DataSource.Column` classes.

Namespace

[DataSource](#)

IN THIS SECTION:

[DataSourceUtil Methods](#)

DataSourceUtil Methods

The following are methods for `DataSourceUtil`.

IN THIS SECTION:

[logWarning\(message\)](#)

Logs the error message in the debug log.

[throwException\(message\)](#)

Throws a `DataSourceException` and displays the provided message to the user.

logWarning (message)

Logs the error message in the debug log.

Signature

```
public void logWarning(String message)
```

Parameters

message

Type: [String](#)

The error message.

Return Value

Type: void

throwException (message)

Throws a `DataSourceException` and displays the provided message to the user.

Signature

```
public void throwException(String message)
```

Parameters

message

Type: [String](#)

Error message to display to the user.

Return Value

Type: void

DataType Enum

Specifies the data types that are supported by the Apex Connector Framework.

Usage

The `DataSource.DataType` enum is referenced by the `type` property on the `DataSource.Column` class.

Enum Values

The following are the values of the `DataSource.DataType` enum.

Value	Description
<code>BOOLEAN_TYPE</code>	Boolean
<code>DATETIME_TYPE</code>	Date/time
<code>EXTERNAL_LOOKUP_TYPE</code>	External lookup relationship
<code>INDIRECT_LOOKUP_TYPE</code>	Indirect lookup relationship
<code>LOOKUP_TYPE</code>	Lookup relationship
<code>NUMBER_TYPE</code>	Number
<code>STRING_LONG_TYPE</code>	Long text area
<code>STRING_SHORT_TYPE</code>	Text area
<code>URL_TYPE</code>	URL

DeleteContext Class

An instance of `DeleteContext` is passed to the `deleteRows()` method on your `Database.Connection` class. The class provides context information about the delete request to the implementor of `deleteRows()`.

Namespace

[DataSource](#)

Usage

The Apex Connector Framework creates context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `DeleteContext` class packages these parameters into an object that can be used when a `deleteRows()` operation is initiated.

IN THIS SECTION:

[DeleteContext Properties](#)

DeleteContext Properties

The following are properties for `DeleteContext`.

IN THIS SECTION:

[externalIds](#)

The external IDs of the rows representing external object records to delete.

[tableSelected](#)

The name of the table to delete rows from.

externalIds

The external IDs of the rows representing external object records to delete.

Signature

```
public List<String> externalIds {get; set;}
```

Property Value

Type: `List<String>`

tableSelected

The name of the table to delete rows from.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: `String`

DeleteResult Class

Represents the result of a delete operation on an `sObject` record. The result is returned by the `DataSource.deleteRows` method of the `DataSource.Connection` class.

Namespace

[DataSource](#)

Usage

A delete operation on external object records generates an array of objects of type `DataSource.DeleteResult`. Its methods create result records that indicate whether the delete operation succeeded or failed.

IN THIS SECTION:

[DeleteResult Properties](#)[DeleteResult Methods](#)

DeleteResult Properties

The following are properties for `DeleteResult`.

IN THIS SECTION:

[errorMessage](#)

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

[externalId](#)

The unique identifier of a row that represents an external object record to delete.

[success](#)

Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed delete operation. Recorded with a result of type `DataSource.DeleteResult`.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: [String](#)

externalId

The unique identifier of a row that represents an external object record to delete.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: [String](#)

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

DeleteResult Methods

The following are methods for `DeleteResult`.

IN THIS SECTION:

[equals\(obj\)](#)

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

[failure\(externalId, errorMessage\)](#)

Creates a delete result indicating the failure of a delete request for a given external ID.

[hashCode\(\)](#)

Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

[success\(externalId\)](#)

Creates a delete result indicating the successful completion of a delete request for a given external ID.

equals (obj)

Maintains the integrity of lists of type `DeleteResult` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj

Type: `Object`

External object whose key is to be validated.

For information about the `equals` method, see [Using Custom Types in Map Keys and Sets](#) on page 105.

Return Value

Type: [Boolean](#)

failure(externalId, errorMessage)

Creates a delete result indicating the failure of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult failure(String externalId, String errorMessage)
```

Parameters

*externalId*Type: [String](#)

The unique identifier of the sObject record to delete.

*errorMessage*Type: [String](#)

The reason the delete operation failed.

Return Value

Type: [DataSource.DeleteResult](#)

Status result of the delete operation.

hashCode ()Maintains the integrity of lists of type `DeleteResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode ()
```

Return Value

Type: [Integer](#)**success (externalId)**

Creates a delete result indicating the successful completion of a delete request for a given external ID.

Signature

```
public static DataSource.DeleteResult success (String externalId)
```

Parameters

*externalId*Type: [String](#)

The unique identifier of the sObject record to delete.

Return Value

Type: [DataSource.DeleteResult](#)

Status result of the delete operation for the sObject with the given external ID.

Filter ClassRepresents a `WHERE` clause in a SOSL or SOQL query.

Namespace

[DataSource](#)

Usage

Compound types require child filters. Specifically, the `subfilters` property can't be null if the `type` property is `NOT_`, `AND_`, or `OR_`.

IN THIS SECTION:

[Filter Properties](#)

Filter Properties

The following are properties for `Filter`.

IN THIS SECTION:

[columnName](#)

Name of the column that's being evaluated in a simple comparative type of filter.

[columnValue](#)

Value that the filter compares records against in a simple comparative type of filter.

[subfilters](#)

List of subfilters for compound filter types, such as `NOT_`, `AND_`, and `OR_`.

[tableName](#)

Name of the table whose column is being evaluated in a simple comparative type of filter.

[type](#)

Type of filter operation that limits the returned data.

columnName

Name of the column that's being evaluated in a simple comparative type of filter.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: [String](#)

columnValue

Value that the filter compares records against in a simple comparative type of filter.

Signature

```
public Object columnValue {get; set;}
```

Property Value

Type: Object

subfilters

List of subfilters for compound filter types, such as NOT_, AND_, and OR_.

Signature

```
public List<DataSource.Filter> subfilters {get; set;}
```

Property Value

Type: [List<DataSource.Filter>](#)

tableName

Name of the table whose column is being evaluated in a simple comparative type of filter.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: [String](#)

type

Type of filter operation that limits the returned data.

Signature

```
public DataSource.FilterType type {get; set;}
```

Property Value

Type: [DataSource.FilterType](#)

FilterType Enum

Referenced by the `type` property on a `DataSource.Filter`.

Usage

Determines how to limit the returned data.

Enum Values

The following are the values of the `DataSource.FilterType` enum.

Value	Description
AND_	This compound filter type returns all rows that match all the subfilters.
CONTAINS	Simple comparative filter type.
ENDS_WITH	Simple comparative filter type.
EQUALS	Simple comparative filter type.
GREATER_THAN	Simple comparative filter type.
GREATER_THAN_OR_EQUAL_TO	Simple comparative filter type.
LESS_THAN	Simple comparative filter type.
LESS_THAN_OR_EQUAL_TO	Simple comparative filter type.
LIKE_	Simple comparative filter type.
NOT_	This compound filter type returns the rows that don't match the subfilter.
NOT_EQUALS	Simple comparative filter type.
OR_	This compound filter type returns all rows that match any of the subfilters.
STARTS_WITH	Simple comparative filter type.

IdentityType Enum

Determines which set of credentials is used to authenticate to the external system.

Usage

The relevant credentials are passed to your `DataSource.Connection` class.

Enum Values

The following are the values of the `DataSource.IdentityType` enum.

Value	Description
ANONYMOUS	No credentials are used to authenticate to the external system.
NAMED_USER	The credentials in the external data source definition are used to authenticate to the external system, regardless of which user is accessing the external data from your organization.
PER_USER	For queries and searches, the credentials are specific to the current user who invokes the query or search. The credentials come from the user's authentication settings for the external system. For administrative connections, such as syncing the external system's schema, the credentials come from the external data source definition.

Order Class

Contains details about how to sort the rows in the result set. Equivalent to an `ORDER BY` statement in a SOQL query.

Namespace

[DataSource](#)

Usage

Used in the `order` property on the [DataSource.TableSelection](#) class.

IN THIS SECTION:

[Order Properties](#)

[Order Methods](#)

Order Properties

The following are properties for `Order`.

IN THIS SECTION:

[columnName](#)

Name of the column whose values are used to sort the rows in the result set.

[direction](#)

Direction for sorting rows based on column values.

[tableName](#)

Name of the table whose column values are used to sort the rows in the result set.

columnName

Name of the column whose values are used to sort the rows in the result set.

Signature

```
public String columnName {get; set;}
```

Property Value

Type: [String](#)

direction

Direction for sorting rows based on column values.

Signature

```
public DataSource.OrderDirection direction {get; set;}
```

Property Value

Type: [DataSource.OrderDirection](#)

tableName

Name of the table whose column values are used to sort the rows in the result set.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: [String](#)

Order Methods

The following are methods for `Order`.

IN THIS SECTION:

[get\(tableName, columnName, direction\)](#)

Creates an instance of the [DataSource.Order](#) class.

get(tableName, columnName, direction)

Creates an instance of the [DataSource.Order](#) class.

Signature

```
public static DataSource.Order get(String tableName, String columnName,  
DataSource.OrderDirection direction)
```

Parameters

tableName

Type: [String](#)

Name of the table whose column values are used to sort the rows in the result set.

columnName

Type: [String](#)

Name of the column whose values are used to sort the rows in the result set.

direction

Type: [DataSource.OrderDirection](#)

Direction for sorting rows based on column values.

Return Value

Type: [DataSource.Order](#)

OrderDirection Enum

Specifies the direction for sorting rows based on column values.

Usage

Used by the `direction` property on the `DataSource.Order` class.

Enum Values

The following are the values of the `DataSource.OrderDirection` enum.

Value	Description
ASCENDING	Sort rows in ascending order (A–Z).
DESCENDING	Sort rows in descending order (Z–A).

Provider Class

Extend this base class to create a custom adapter for Salesforce Connect. The class informs Salesforce of the functional and authentication capabilities that are supported by or required to connect to the external system. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

[DataSource](#)

Usage

Create an Apex class that extends `DataSource.Provider` to specify the following.

- The types of authentication that can be used to access the external system
- The features that are supported for the connection to the external system
- The Apex class that extends `DataSource.Connection` to sync the external system's schema and to handle the queries and searches of the external data

The values that are returned by the `DataSource.Provider` class determine which settings are available in the external data source definition in Salesforce. To access the external data source definition from Setup, enter *External Data Sources* in the `Quick Find` box, then select **External Data Sources**.

IN THIS SECTION:

[Provider Methods](#)

Provider Methods

The following are methods for `Provider`.

IN THIS SECTION:

[getAuthenticationCapabilities\(\)](#)

Returns the types of authentication that can be used to access the external system.

[getCapabilities\(\)](#)

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

[getConnection\(connectionParams\)](#)

Returns a connection that points to an instance of the external data source.

getAuthenticationCapabilities ()

Returns the types of authentication that can be used to access the external system.

Signature

```
public List<DataSource.AuthenticationCapability> getAuthenticationCapabilities ()
```

Return Value

Type: [List<DataSource.AuthenticationCapability>](#)

getCapabilities ()

Returns the functional operations that the external system supports and the required endpoint settings for the external data source definition in Salesforce.

Signature

```
public List<DataSource.Capability> getCapabilities ()
```

Return Value

Type: [List<DataSource.Capability>](#)

getConnection (connectionParams)

Returns a connection that points to an instance of the external data source.

Signature

```
public DataSource.Connection getConnection (DataSource.ConnectionParams connectionParams)
```

Parameters

connectionParams

Type: [DataSource.ConnectionParams](#)

Credentials for authenticating to the external system.

Return Value

Type: [DataSource.Connection](#)

QueryAggregation Enum

Specifies how to aggregate a column in a query.

Usage

Used by the [aggregation](#) property on the [DataSource.ColumnSelection](#) class.

Enum Values

The following are the values of the `DataSource.QueryAggregation` enum.

Value	Description
AVG	Reserved for future use.
COUNT	Returns the number of rows that meet the query criteria.
MAX	Reserved for future use.
MIN	Reserved for future use.
NONE	No aggregation.
SUM	Reserved for future use.

QueryContext Class

An instance of `QueryContext` is provided to the [query](#) method on your [DataSource.Connection](#) class. The instance corresponds to a SOQL request.

Namespace

[DataSource](#)

IN THIS SECTION:

[QueryContext Properties](#)

[QueryContext Methods](#)

QueryContext Properties

The following are properties for `QueryContext`.

IN THIS SECTION:

[queryMoreToken](#)

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

[tableSelection](#)

Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: [String](#)

tableSelection

Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

Signature

```
public DataSource.TableSelection tableSelection {get; set;}
```

Property Value

Type: [DataSource.TableSelection](#)

QueryContext Methods

The following are methods for [QueryContext](#).

IN THIS SECTION:

[get\(metadata, offset, maxResults, tableSelection\)](#)

Creates an instance of the [QueryContext](#) class.

get(metadata, offset, maxResults, tableSelection)

Creates an instance of the [QueryContext](#) class.

Signature

```
public static DataSource.QueryContext get(List<DataSource.Table> metadata, Integer offset, Integer maxResults, DataSource.TableSelection tableSelection)
```

Parameters

metadata

Type: List<[DataSource.Table](#)>

List of table metadata that describes the external system's tables to query.

offset

Type: [Integer](#)

Used for client-driven paging. Specifies the starting row offset into the query's result set.

maxResults

Type: [Integer](#)

Used for client-driven paging. Specifies the maximum number of rows to return in each batch.

tableSelection

Type: [DataSource.TableSelection](#)

Query details that represent the `FROM`, `ORDER BY`, `SELECT`, and `WHERE` clauses in a SOQL or SOSL query.

Return Value

Type: [DataSource.QueryContext](#)

QueryUtils Class

Contains helper methods to locally filter, sort, and apply limit and offset clauses to data rows. This helper class is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Namespace

[DataSource](#)

Usage

The `DataSource.QueryUtils` class and its helper methods can process query results locally within your Salesforce org. This class is provided for your convenience to simplify the development of your Salesforce Connect custom adapter for initial tests. However, the `DataSource.QueryUtils` class and its methods aren't supported for use in production environments that use callouts to retrieve data from external systems. Complete the filtering and sorting on the external system before sending the query results to Salesforce. When possible, use server-driven paging or another technique to have the external system determine the appropriate data subsets according to the limit and offset clauses in the query.

IN THIS SECTION:

[QueryUtils Methods](#)

QueryUtils Methods

The following are methods for `QueryUtils`.

IN THIS SECTION:

[applyLimitAndOffset\(queryContext, rows\)](#)

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

[filter\(queryContext, rows\)](#)

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

[process\(queryContext, rows\)](#)

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

[sort\(queryContext, rows\)](#)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

applyLimitAndOffset(queryContext, rows)

Returns a subset of data rows after locally applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String, Object>> applyLimitAndOffset (DataSource.QueryContext
queryContext, List<Map<String, Object>> rows)
```

Parameters

queryContext

Type: [DataSource.QueryContext](#)

Represents the query to run against a data table.

rows

Type: [List<Map<String, Object>>](#)

Rows of data.

Return Value

Type: [List<Map<String, Object>>](#)

filter(queryContext, rows)

Returns a subset of data rows after locally ordering and applying filters from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String, Object>> filter (DataSource.QueryContext queryContext,
List<Map<String, Object>> rows)
```

Parameters

queryContext

Type: [DataSource.QueryContext](#)

Represents the query to run against a data table.

rows

Type: `List<Map<String, Object>>`

Rows of data.

Return Value

Type: `List<Map<String, Object>>`

process(queryContext, rows)

Returns data rows after locally filtering, sorting, ordering, and applying limit and offset clauses from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String, Object>> process(DataSource.QueryContext queryContext,  
List<Map<String, Object>> rows)
```

Parameters

queryContext

Type: `DataSource.QueryContext`

Represents the query to run against a data table.

rows

Type: `List<Map<String, Object>>`

Rows of data.

Return Value

Type: `List<Map<String, Object>>`

sort(queryContext, rows)

Returns data rows after locally sorting and applying the order from the query. This helper method is provided for your convenience during early development and tests, but it isn't supported for use in production environments.

Signature

```
public static List<Map<String, Object>> sort(DataSource.QueryContext queryContext,  
List<Map<String, Object>> rows)
```

Parameters

queryContext

Type: `DataSource.QueryContext`

Represents the query to run against a data table.

rows

Type: `List<Map<String, Object>>`

Rows of data.

Return Value

Type: [List<Map<String, Object>>](#)

ReadContext Class

Abstract base class for the `QueryContext` and `SearchContext` classes.

Namespace

[DataSource](#)

IN THIS SECTION:

[ReadContext Properties](#)

ReadContext Properties

The following are properties for `ReadContext`.

IN THIS SECTION:

[maxResults](#)

Maximum number of rows that the query can return.

[metadata](#)

Describes the external system's tables to query.

[offset](#)

The starting row offset into the query's result set. Used for client-driven paging.

maxResults

Maximum number of rows that the query can return.

Signature

```
public Integer maxResults {get; set;}
```

Property Value

Type: [Integer](#)

metadata

Describes the external system's tables to query.

Signature

```
public List<DataSource.Table> metadata {get; set;}
```

Property Value

Type: List<[DataSource.Table](#)>

offset

The starting row offset into the query's result set. Used for client-driven paging.

Signature

```
public Integer offset {get; set;}
```

Property Value

Type: [Integer](#)

SearchContext Class

An instance of `SearchContext` is provided to the `search` method on your `DataSource.Connection` class. The instance corresponds to a search or SOSL request.

Namespace

[DataSource](#)

IN THIS SECTION:

[SearchContext Constructors](#)

[SearchContext Properties](#)

SearchContext Constructors

The following are constructors for `SearchContext`.

IN THIS SECTION:

[SearchContext\(metadata, offset, maxResults, tableSelections, searchPhrase\)](#)

Creates an instance of the `SearchContext` class with the specified parameter values.

[SearchContext\(\)](#)

Creates an instance of the `SearchContext` class.

SearchContext(metadata, offset, maxResults, tableSelections, searchPhrase)

Creates an instance of the `SearchContext` class with the specified parameter values.

Signature

```
public SearchContext(List<DataSource.Table> metadata, Integer offset, Integer maxResults, List<DataSource.TableSelection> tableSelections, String searchPhrase)
```

Parameters

metadata

Type: List<[DataSource.Table](#)>

List of table metadata that describes the external system's tables to query.

offset

Type: [Integer](#)

Specifies the starting row offset into the query's result set.

maxResults

Type: [Integer](#)

Specifies the maximum number of rows to return in each batch.

tableSelections

Type: List<[DataSource.TableSelection](#)>

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

searchPhrase

Type: [String](#)

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

SearchContext ()

Creates an instance of the [SearchContext](#) class.

Signature

```
public SearchContext ()
```

SearchContext Properties

The following are properties for [SearchContext](#).

IN THIS SECTION:

[searchPhrase](#)

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

[tableSelections](#)

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

searchPhrase

The user-entered search string as a case-sensitive single phrase, with all non-alphanumeric characters removed.

Signature

```
public String searchPhrase {get; set;}
```

Property Value

Type: [String](#)

tableSelections

List of queries and their details. The details represent the FROM, ORDER BY, SELECT, and WHERE clauses in each SOQL or SOSL query.

Signature

```
public List<DataSource.TableSelection> tableSelections {get; set;}
```

Property Value

Type: List<[DataSource.TableSelection](#)>

SearchUtils Class

Helper class for implementing search on a custom adapter for Salesforce Connect.

Namespace

[DataSource](#)

Usage

We recommend that you develop your own search implementation that can search columns in addition to the designated name field.

IN THIS SECTION:

[SearchUtils Methods](#)

SearchUtils Methods

The following are methods for `SearchUtils`.

IN THIS SECTION:

[searchByName\(searchDetails, connection\)](#)

Queries all the tables and returns each row whose designated name field contains the search phrase.

searchByName (searchDetails, connection)

Queries all the tables and returns each row whose designated name field contains the search phrase.

Signature

```
public static List<DataSource.TableResult> searchByName (DataSource.SearchContext  
searchDetails, DataSource.Connection connection)
```

Parameters

searchDetails

Type: [DataSource.SearchContext](#)

The `SearchContext` class that specifies which data to search and what to search for.

connection

Type: [DataSource.Connection](#)

The `DataSource.Connection` class that connects to the external system.

Return Value

Type: `List<DataSource.TableResult>`

Table Class

Describes a table on an external system that the Salesforce Connect custom adapter connects to. This class extends the `DataSourceUtil` class and inherits its methods.

Namespace

[DataSource](#)

Usage

A list of table metadata is provided by the `DataSource.Connection` class when the `sync()` method is invoked. Each table can become an external object in Salesforce.

The metadata is stored in Salesforce. Updating the Apex code to return new or updated values for the table metadata doesn't automatically update the stored metadata in Salesforce.

IN THIS SECTION:

[Table Properties](#)

[Table Methods](#)

Table Properties

The following are properties for `Table`.

IN THIS SECTION:

[columns](#)

List of table columns.

[description](#)

Description of what the table represents.

[labelPlural](#)

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

[labelSingular](#)

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

[name](#)

Name of the table on the external system.

[nameColumn](#)

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

columns

List of table columns.

Signature

```
public List<DataSource.Column> columns {get; set;}
```

Property Value

Type: [List<DataSource.Column>](#)

description

Description of what the table represents.

Signature

```
public String description {get; set;}
```

Property Value

Type: [String](#)

labelPlural

Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.

Signature

```
public String labelPlural {get; set;}
```

Property Value

Type: [String](#)

labelSingular

Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface. We recommend that you make object labels unique across all standard, custom, and external objects in the org.

Signature

```
public String labelSingular {get; set;}
```

Property Value

Type: [String](#)

name

Name of the table on the external system.

Signature

```
public String name {get; set;}
```

Property Value

Type: [String](#)

nameColumn

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

Signature

```
public String nameColumn {get; set;}
```

Property Value

Type: [String](#)

Table Methods

The following are methods for `Table`.

IN THIS SECTION:

[get\(name, labelSingular, labelPlural, description, nameColumn, columns\)](#)

Returns the table metadata with the specified parameter values.

[get\(name, nameColumn, columns\)](#)

Returns the table metadata with the specified parameter values, using the name for the labels and description.

get(name, labelSingular, labelPlural, description, nameColumn, columns)

Returns the table metadata with the specified parameter values.

Signature

```
public static DataSource.Table get(String name, String labelSingular, String labelPlural,
String description, String nameColumn, List<DataSource.Column> columns)
```

Parameters

*name*Type: [String](#)

Name of the external table.

*labelSingular*Type: [String](#)Singular form of the user-friendly name for the table. The `labelSingular` becomes the object label in the Salesforce user interface.*labelPlural*Type: [String](#)Plural form of the user-friendly name for the table. The `labelPlural` becomes the object's plural label in the Salesforce user interface.*description*Type: [String](#)

Description of the external table.

*nameColumn*Type: [String](#)

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

*columns*Type: [List<DataSource.Column>](#)

List of table columns.

Return Value

Type: [DataSource.Table](#)**get(name, nameColumn, columns)**

Returns the table metadata with the specified parameter values, using the name for the labels and description.

Signature

```
public static DataSource.Table get(String name, String nameColumn,  
List<DataSource.Column> columns)
```

Parameters

*name*Type: [String](#)

Name of the external table.

*nameColumn*Type: [String](#)

Name of the table column that becomes the name field of the external object when the administrator syncs the table.

`columns`

Type: List<[DataSource.Column](#)>

List of table columns.

Return Value

Type: [DataSource.Table](#)

The returned table metadata has these property values.

Property	Value
name	<i>name</i>
labelSingular	<i>name</i>
labelPlural	<i>name</i>
description	<i>name</i>
nameColumn	<i>nameColumn</i>
columns	<i>columns</i>

TableResult Class

Contains the results of a search or query.

Namespace

[DataSource](#)

IN THIS SECTION:

[TableResult Properties](#)

[TableResult Methods](#)

TableResult Properties

The following are properties for `TableResult`.

IN THIS SECTION:

[errorMessage](#)

Error message to display to the user.

[queryMoreToken](#)

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

[rows](#)

Rows of data.

success

Whether the search or query was successful.

tableName

Name of the table that was queried.

totalSize

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

errorMessage

Error message to display to the user.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: [String](#)

queryMoreToken

Query token that's used for server-driven paging to determine and fetch the subsequent batch of results. This token is passed back to the Apex data source on subsequent queries in the `queryMoreToken` property on the `QueryContext`.

Signature

```
public String queryMoreToken {get; set;}
```

Property Value

Type: [String](#)

rows

Rows of data.

Signature

```
public List<Map<String, Object>> rows {get; set;}
```

Property Value

Type: [List<Map<String, Object>>](#)

success

Whether the search or query was successful.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

tableName

Name of the table that was queried.

Signature

```
public String tableName {get; set;}
```

Property Value

Type: [String](#)

totalSize

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Signature

```
public Integer totalSize {get; set;}
```

Property Value

Type: [Integer](#)

TableResult Methods

The following are methods for `TableResult`.

IN THIS SECTION:

[error\(errorMessage\)](#)

Returns failed search or query results with the provided error message.

[get\(success, errorMessage, tableName, rows, totalSize\)](#)

Returns a subset of data rows in a `TableResult` with the provided property values.

[get\(success, errorMessage, tableName, rows\)](#)

Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

[get\(queryContext, rows\)](#)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

[get\(tableSelection, rows\)](#)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

error(errorMessage)

Returns failed search or query results with the provided error message.

Signature

```
public static DataSource.TableResult error(String errorMessage)
```

Parameters

errorMessage

Type: [String](#)

Error message to display to the user.

Return Value

Type: [DataSource.TableResult](#)

The returned `TableResult` has these property values.

Property	Value
success	false
errorMessage	<i>errorMessage</i>
tableName	null
rows	null
rows.size()	0

get(success, errorMessage, tableName, rows, totalSize)

Returns a subset of data rows in a `TableResult` with the provided property values.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String, Object>> rows, Integer totalSize)
```

Parameters

success

Type: [Boolean](#)

Whether the search or query was successful.

errorMessage

Type: [String](#)

Error message to display to the user.

tableName

Type: [String](#)

Name of the table that was queried.

rows

Type: [List<Map<String, Object>>](#)

Rows of data.

totalSize

Type: [Integer](#)

The total number of rows that meet the query criteria, even when the external system is requested to return a smaller batch size.

Return Value

Type: [DataSource.TableResult](#)

get(success, errorMessage, tableName, rows)

Returns a subset of data rows in a `TableResult` with the provided property values and the number of rows in the table.

Signature

```
public static DataSource.TableResult get(Boolean success, String errorMessage, String
tableName, List<Map<String, Object>> rows)
```

Parameters

success

Type: [Boolean](#)

Whether the search or query was successful.

errorMessage

Type: [String](#)

Error message to display to the user.

tableName

Type: [String](#)

Name of the table that was queried.

rows

Type: [List<Map<String, Object>>](#)

Rows of data.

Return Value

Type: [DataSource.TableResult](#)

get(queryContext, rows)

Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a `TableResult`.

Signature

```
public static DataSource.TableResult get(DataSource.QueryContext queryContext,  
List<Map<String, Object>> rows)
```

Parameters

*queryContext*Type: [DataSource.QueryContext](#)

Represents the query to run against a data table.

*rows*Type: [List<Map<String, Object>>](#)

Rows of data.

Return Value

Type: [DataSource.TableResult](#)**get(tableSelection, rows)**Returns the subset of data rows that meet the query criteria, and the number of rows in the table, in a [TableResult](#).

Signature

```
public static DataSource.TableResult get(DataSource.TableSelection tableSelection,  
List<Map<String, Object>> rows)
```

Parameters

*tableSelection*Type: [DataSource.TableSelection](#)

Query details that represent the FROM, ORDER BY, SELECT, and WHERE clauses in a SOQL or SOSL query.

*rows*Type: [List<Map<String, Object>>](#)

Rows of data.

Return Value

Type: [DataSource.TableResult](#)

TableSelection Class

Contains a breakdown of the SOQL or SOSL query. Its properties represent the FROM, ORDER BY, SELECT, and WHERE clauses in the query.

Namespace

[DataSource](#)

IN THIS SECTION:

[TableSelection Properties](#)

TableSelection Properties

The following are properties for `TableSelection`.

IN THIS SECTION:

[columnsSelected](#)

List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

[filter](#)

Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

[order](#)

Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

[tableSelected](#)

Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

columnsSelected

List of columns to query. Corresponds to the `SELECT` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.ColumnSelection> columnsSelected {get; set;}
```

Property Value

Type: [List<DataSource.ColumnSelection>](#)

filter

Identifies the query filter, which can be a compound filter that has a list of subfilters. The filter corresponds to the `WHERE` clause in a SOQL or SOSL query.

Signature

```
public DataSource.Filter filter {get; set;}
```

Property Value

Type: [DataSource.Filter](#)

order

Identifies the order for sorting the query results. Corresponds to the `ORDER BY` clause in a SOQL or SOSL query.

Signature

```
public List<DataSource.Order> order {get; set;}
```

Property Value

Type: [List<DataSource.Order>](#)

tableSelected

Name of the table to query. Corresponds to the `FROM` clause in a SOQL or SOSL query.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: [String](#)

UpsertContext Class

An instance of `UpsertContext` is passed to the `upsertRows()` method on your `DataSource.Connection` class. This class provides context information about the upsert request to the implementor of `upsertRows()`.

Namespace

[DataSource](#)

Usage

The Apex Connector Framework creates the context for operations. Context is comprised of parameters about the operations, which other methods can use. An instance of the `UpsertContext` class packages these parameters into an object that can be used when an `upsertRows()` operation is initiated.

IN THIS SECTION:

[UpsertContext Properties](#)

UpsertContext Properties

The following are properties for `UpsertContext`.

IN THIS SECTION:

[rows](#)

List of rows corresponding to the external object records to upsert.

[tableSelected](#)

The name of the table to upsert rows in.

rows

List of rows corresponding to the external object records to upsert.

Signature

```
public List<Map<String,ANY>> rows {get; set;}
```

Property Value

Type: List<Map<String,Object>>

tableSelected

The name of the table to upsert rows in.

Signature

```
public String tableSelected {get; set;}
```

Property Value

Type: [String](#)

UpsertResult Class

Represents the result of an upsert operation on an external object record. The result is returned by the `upsertRows` method of the `DataSource.Connection` class.

Namespace

[DataSource](#)

Usage

An upsert operation on external object records generates an array of objects of type `DataSource.UpsertResult`. Its methods create result records that indicate whether the upsert operation succeeded or failed.

IN THIS SECTION:

[UpsertResult Properties](#)

[UpsertResult Methods](#)

UpsertResult Properties

The following are properties for `UpsertResult`.

IN THIS SECTION:

[errorMessage](#)

The error message that's generated by a failed upsert operation.

externalId

The unique identifier of a row that represents an external object record to upsert.

success

Indicates whether a delete operation succeeded or failed.

errorMessage

The error message that's generated by a failed upsert operation.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: [String](#)

externalId

The unique identifier of a row that represents an external object record to upsert.

Signature

```
public String externalId {get; set;}
```

Property Value

Type: [String](#)

success

Indicates whether a delete operation succeeded or failed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

UpsertResult Methods

The following are methods for `UpsertResult`.

IN THIS SECTION:

[equals\(obj\)](#)

Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

[failure\(externalId, errorMessage\)](#)

Creates an upsert result that indicates the failure of a delete request for a given external ID.

[hashCode\(\)](#)

Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

[success\(externalId\)](#)

Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

equals (obj)

Maintains the integrity of lists of type `UpsertResult` by determining the equality of external object records in a list. This method is dynamic and is based on the `equals` method in Java.

Signature

```
public Boolean equals(Object obj)
```

Parameters

obj

Type: `Object`

External object whose key is to be validated.

Return Value

Type: `Boolean`

failure (externalId, errorMessage)

Creates an upsert result that indicates the failure of a delete request for a given external ID.

Signature

```
public static DataSource.UpsertResult failure(String externalId, String errorMessage)
```

Parameters

externalId

Type: `String`

The unique identifier of the external object record to upsert.

errorMessage

Type: `String`

The reason the upsert operation failed.

Return Value

Type: `DataSource.UpsertResult`

Status result for the upsert operation.

hashCode ()

Maintains the integrity of lists of type `UpsertResult` by determining the uniqueness of the external object records in a list.

Signature

```
public Integer hashCode ()
```

Return Value

Type: [Integer](#)

success (externalId)

Creates a delete result that indicates the successful completion of an upsert request for a given external ID.

Signature

```
public static DataSource.UpsertResult success (String externalId)
```

Parameters

externalId

Type: [String](#)

The unique identifier of the external object record to upsert.

Return Value

Type: [DataSource.UpsertResult](#)

Status result of the upsert operation for the external object record with the given external ID.

DataSource Exceptions

The `DataSource` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See [Exception Class and Built-In Exceptions](#).

The `DataSource` namespace contains these exceptions.

Exception	Description	Methods
<code>DataSource.DataSourceException</code>	Throw this exception to indicate that an error occurred while communicating with an external data source.	To get the error message and write it to debug log, use the <code>String getMessage ()</code> .
<code>DataSource.OAuthTokenExpiredException</code>	Throw this exception to indicate that an OAuth token has expired. The system then attempts to refresh the token automatically and restart the query, search, or sync operation.	To get the error message and write it to debug log, use the <code>String getMessage ()</code> .

Dom Namespace

The `Dom` namespace provides classes and methods for parsing and creating XML content.

The following are the classes in the `Dom` namespace.

IN THIS SECTION:

[Document Class](#)

Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

[XmlNode Class](#)

Use the `XmlNode` class to work with a node in an XML document.

Document Class

Use the `Document` class to process XML content. You can parse nested XML content that's up to 50 nodes deep.

Namespace

[Dom](#)

Usage

One common application is to use it to create the body of a request for [HttpRequest](#) or to parse a response accessed by [HttpResponse](#).

IN THIS SECTION:

[Document Constructors](#)

[Document Methods](#)

SEE ALSO:

[Reading and Writing XML Using the DOM](#)

Document Constructors

The following are constructors for `Document`.

IN THIS SECTION:

[Document\(\)](#)

Creates a new instance of the `Dom.Document` class.

Document ()

Creates a new instance of the `Dom.Document` class.

Signature

```
public Document ()
```

Document Methods

The following are methods for `Document`. All are instance methods.

IN THIS SECTION:

[createRootElement\(name, namespace, prefix\)](#)

Creates the top-level root element for a document.

[getRootElement\(\)](#)

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

[load\(xml\)](#)

Parse the XML representation of the document specified in the `xml` argument and load it into a document.

[toXmlString\(\)](#)

Returns the XML representation of the document as a String.

createRootElement(name, namespace, prefix)

Creates the top-level root element for a document.

Signature

```
public Dom.XmlNode createRootElement(String name, String namespace, String prefix)
```

Parameters

name

Type: [String](#)

namespace

Type: [String](#)

prefix

Type: [String](#)

Return Value

Type: [Dom.XmlNode](#)

Usage

For more information about namespaces, see [XML Namespaces](#).

Calling this method more than once on a document generates an error as a document can have only one root element.

getRootElement()

Returns the top-level root element node in the document. If this method returns `null`, the root element has not been created yet.

Signature

```
public Dom.XmlNode getRootElement()
```

Return Value

Type: [Dom.XmlNode](#)

load (xml)

Parse the XML representation of the document specified in the *xml* argument and load it into a document.

Signature

```
public Void load(String xml)
```

Parameters

xml

Type: [String](#)

Return Value

Type: Void

Example

```
Dom.Document doc = new Dom.Document ();  
doc.load(xml);
```

toXmlString ()

Returns the XML representation of the document as a String.

Signature

```
public String toXmlString()
```

Return Value

Type: [String](#)

XmlNode Class

Use the `XmlNode` class to work with a node in an XML document.

Namespace

[Dom](#)

XmlNode Methods

The following are methods for `XmlNode`. All are instance methods.

IN THIS SECTION:

[addChildElement\(name, namespace, prefix\)](#)

Creates a child element node for this node.

[addCommentNode\(text\)](#)

Creates a child comment node for this node.

[addTextNode\(text\)](#)

Creates a child text node for this node.

[getAttribute\(key, keyNamespace\)](#)

Returns *namespacePrefix:attributeValue* for the given key and key namespace.

[getAttributeCount\(\)](#)

Returns the number of attributes for this node.

[getAttributeKeyAt\(index\)](#)

Returns the attribute key for the given index. Index values start at 0.

[getAttributeKeyNsAt\(index\)](#)

Returns the attribute key namespace for the given index.

[getAttributeValue\(key, keyNamespace\)](#)

Returns the attribute value for the given key and key namespace.

[getAttributeValueNs\(key, keyNamespace\)](#)

Returns the attribute value namespace for the given key and key namespace.

[getChildElement\(name, namespace\)](#)

Returns the child element node for the node with the given name and namespace.

[getChildElements\(\)](#)

Returns the child element nodes for this node. This doesn't include child text or comment nodes.

[getChildren\(\)](#)

Returns the child nodes for this node. This includes all node types.

[getName\(\)](#)

Returns the element name.

[getNamespace\(\)](#)

Returns the namespace of the element.

[getNamespaceFor\(prefix\)](#)

Returns the namespace of the element for the given prefix.

[getNodeType\(\)](#)

Returns the node type.

[getParent\(\)](#)

Returns the parent of this element.

[getPrefixFor\(namespace\)](#)

Returns the prefix of the given namespace.

[getText\(\)](#)

Returns the text for this node.

[insertBefore\(newChild, refChild\)](#)

Inserts a new child node before the specified node.

[removeAttribute\(key, keyNamespace\)](#)

Removes the attribute with the given key and key namespace. Returns `true` if successful, `false` otherwise.

[removeChild\(childNode\)](#)

Removes the given child node.

[setAttribute\(key, value\)](#)

Sets the key attribute value.

[setAttributeNs\(key, value, keyNamespace, valueNamespace\)](#)

Sets the key attribute value.

[setNamespace\(prefix, namespace\)](#)

Sets the namespace for the given prefix.

addChildElement(name, namespace, prefix)

Creates a child element node for this node.

Signature

```
public Dom.XmlNode addChildElement(String name, String namespace, String prefix)
```

Parameters

name

Type: [String](#)

The *name* argument can't have a `null` value.

namespace

Type: [String](#)

prefix

Type: [String](#)

Return Value

Type: [Dom.XmlNode](#)

Usage

- If the *namespace* argument has a non-`null` value and the *prefix* argument is `null`, the namespace is set as the default namespace.
- If the *prefix* argument is `null`, Salesforce automatically assigns a prefix for the element. The format of the automatic prefix is `nsi`, where *i* is a number. If the *prefix* argument is `'`, the namespace is set as the default namespace.

addCommentNode(text)

Creates a child comment node for this node.

Signature

```
public Dom.XmlNode addCommentNode(String text)
```

Parameters

text

Type: [String](#)

The *text* argument can't have a `null` value.

Return Value

Type: [Dom.XmlNode](#)

addTextNode (text)

Creates a child text node for this node.

Signature

```
public Dom.XmlNode addTextNode(String text)
```

Parameters

text

Type: [String](#)

The *text* argument can't have a `null` value.

Return Value

Type: [Dom.XmlNode](#)

getAttribute (key, keyNamespace)

Returns *namespacePrefix:attributeValue* for the given key and key namespace.

Signature

```
public String getAttribute(String key, String keyNamespace)
```

Parameters

key

Type: [String](#)

keyNamespace

Type: [String](#)

Return Value

Type: [String](#)

Example

For example, for the `<foo a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

`getAttributeCount()`

Returns the number of attributes for this node.

Signature

```
public Integer getAttributeCount()
```

Return Value

Type: [Integer](#)

`getAttributeKeyAt(index)`

Returns the attribute key for the given index. Index values start at 0.

Signature

```
public String getAttributeKeyAt(Integer index)
```

Parameters

index

Type: [Integer](#)

Return Value

Type: [String](#)

`getAttributeKeyNsAt(index)`

Returns the attribute key namespace for the given index.

Signature

```
public String getAttributeKeyNsAt(Integer index)
```

Parameters

index

Type: [Integer](#)

Return Value

Type: [String](#)

getAttributeValue(key, keyNamespace)

Returns the attribute value for the given key and key namespace.

Signature

```
public String getAttributeValue(String key, String keyNamespace)
```

Parameters

key

Type: [String](#)

keyNamespace

Type: [String](#)

Return Value

Type: [String](#)

Example

For example, for the `<foo a:b="c:d" />` element:

- `getAttribute` returns `c:d`
- `getAttributeValue` returns `d`

getAttributeValueNs(key, keyNamespace)

Returns the attribute value namespace for the given key and key namespace.

Signature

```
public String getAttributeValueNs(String key, String keyNamespace)
```

Parameters

key

Type: [String](#)

keyNamespace

Type: [String](#)

Return Value

Type: [String](#)

getChildElement(name, namespace)

Returns the child element node for the node with the given name and namespace.

Signature

```
public Dom.XmlNode getChildElement(String name, String namespace)
```

Parameters

name

Type: [String](#)

namespace

Type: [String](#)

Return Value

Type: [Dom.XmlNode](#)

getChildElements ()

Returns the child element nodes for this node. This doesn't include child text or comment nodes.

Signature

```
public Dom.XmlNode[] getChildElements ()
```

Return Value

Type: [Dom.XmlNode\[\]](#)

getChildren ()

Returns the child nodes for this node. This includes all node types.

Signature

```
public Dom.XmlNode[] getChildren ()
```

Return Value

Type: [Dom.XmlNode\[\]](#)

getName ()

Returns the element name.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getNamespace ()

Returns the namespace of the element.

Signature

```
public String getNamespace ()
```

Return Value

Type: [String](#)

getNamespaceFor (prefix)

Returns the namespace of the element for the given prefix.

Signature

```
public String getNamespaceFor (String prefix)
```

Parameters

prefix

Type: [String](#)

Return Value

Type: [String](#)

getNodeType ()

Returns the node type.

Signature

```
public Dom.XmlNodeType getNodeType ()
```

Return Value

Type: [Dom.XmlNodeType](#)

getParent ()

Returns the parent of this element.

Signature

```
public Dom.XmlNode getParent ()
```

Return Value

Type: [Dom.XmlNode](#)

getPrefixFor (namespace)

Returns the prefix of the given namespace.

Signature

```
public String getPrefixFor(String namespace)
```

Parameters

namespace

Type: [String](#)

The *namespace* argument can't have a `null` value.

Return Value

Type: [String](#)

getText ()

Returns the text for this node.

Signature

```
public String getText ()
```

Return Value

Type: [String](#)

insertBefore (newChild, refChild)

Inserts a new child node before the specified node.

Signature

```
public Dom.XmlNode insertBefore(Dom.XmlNode newChild, Dom.XmlNode refChild)
```

Parameters

newChild

Type: [Dom.XmlNode](#)

The node to insert.

refChild

Type: [Dom.XmlNode](#)

The node before the new node.

Return Value

Type: [Dom.XmlNode](#)

Usage

- If *refChild* is *null*, *newChild* is inserted at the end of the list.
- If *refChild* doesn't exist, an exception is thrown.

removeAttribute(key, keyNamespace)

Removes the attribute with the given key and key namespace. Returns *true* if successful, *false* otherwise.

Signature

```
public Boolean removeAttribute(String key, String keyNamespace)
```

Parameters

key

Type: [String](#)

keyNamespace

Type: [String](#)

Return Value

Type: [Boolean](#)

removeChild(childNode)

Removes the given child node.

Signature

```
public Boolean removeChild(Dom.XmlNode childNode)
```

Parameters

childNode

Type: [Dom.XmlNode](#)

Return Value

Type: [Boolean](#)

setAttribute(key, value)

Sets the key attribute value.

Signature

```
public Void setAttribute(String key, String value)
```

Parameters

*key*Type: [String](#)*value*Type: [String](#)

Return Value

Type: Void

setAttributeNs(key, value, keyNamespace, valueNamespace)

Sets the key attribute value.

Signature

```
public Void setAttributeNs(String key, String value, String keyNamespace, String valueNamespace)
```

Parameters

*key*Type: [String](#)*value*Type: [String](#)*keyNamespace*Type: [String](#)*valueNamespace*Type: [String](#)

Return Value

Type: Void

setNamespace(prefix, namespace)

Sets the namespace for the given prefix.

Signature

```
public Void setNamespace(String prefix, String namespace)
```

Parameters

*prefix*Type: [String](#)*namespace*Type: [String](#)

Return Value

Type: Void

EventBus Namespace

Contains a class used for platform event triggers.

The following are the classes in the `EventBus` namespace.

IN THIS SECTION:

[TriggerContext Class](#)

Provides information about the trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`.

SEE ALSO:

[Platform Events Developer Guide](#)

TriggerContext Class

Provides information about the trigger that's currently executing, such as how many times the trigger was retried due to the `EventBus.RetryableException`.

Namespace

[EventBus](#)

IN THIS SECTION:

[TriggerContext Properties](#)

[TriggerContext Methods](#)

TriggerContext Properties

The following are properties for `TriggerContext`.

IN THIS SECTION:

[lastError](#)

Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

[retries](#)

Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

lastError

Read-only. The error message that the last thrown `EventBus.RetryableException` contains.

Signature

```
public String lastError {get;}
```

Property Value

Type: [String](#)

Usage

The error message that this property returns is the message that was passed in when creating the `EventBus.RetryableException` exception, as follows.

```
throw new EventBus.RetryableException(  
    'Condition is not met, so retrying the trigger again.');
```

retries

Read-only. The number of times the trigger was retried due to throwing the `EventBus.RetryableException`.

Signature

```
public Integer retries {get;}
```

Property Value

Type: [Integer](#)

TriggerContext Methods

The following are methods for `TriggerContext`.

IN THIS SECTION:

[currentContext\(\)](#)

Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

currentContext ()

Returns an instance of the `EventBus.TriggerContext` class containing information about the currently executing trigger.

Signature

```
public static EventBus.TriggerContext currentContext ()
```

Return Value

Type: [EventBus.TriggerContext](#)

Information about the currently executing trigger.

Flow Namespace

The `Flow` namespace provides a class for advanced Visualforce controller access to flows.

The following is the class in the `Flow` namespace.

IN THIS SECTION:

[Interview Class](#)

The `Flow.Interview` class provides advanced Visualforce controller access to flows and the ability to start a flow.

Interview Class

The `Flow.Interview` class provides advanced Visualforce controller access to flows and the ability to start a flow.

Namespace

[Flow](#)

Usage

The `Flow.Interview` class is used with Visual Workflow. Use the methods in this class to invoke an autolaunched flow or to enable a Visualforce controller to access a flow variable.

SOQL and DML limits apply during flow execution. See [Apex Governor Limits that Affect Flows](#) in the *Visual Workflow Guide*.

Example

This sample uses the `getVariableValue` method to obtain breadcrumb (navigation) information from the flow embedded in the Visualforce page. If that flow contains subflow elements, and each of the referenced flows also contains a `vaBreadcrumb` variable, the Visualforce page can provide users with breadcrumbs regardless of which flow the interview is running.

```
public class SampleController {

    //Instance of the flow
    public Flow.Interview.Flow_Template_Gallery myFlow {get; set;}

    public String getBreadcrumb() {
        String aBreadcrumb;
        if (myFlow==null) { return 'Home';}
        else aBreadcrumb = (String) myFlow.getVariableValue('vaBreadcrumb');

        return(aBreadcrumb==null ? 'Home': aBreadcrumb);
    }
}
```

The following includes a sample controller that starts a flow and the corresponding Visualforce page. The Visualforce page contains an input box and a start button. When the user enters a number in the input box and clicks **Start**, the controller's `start` method is called. The button saves the user-entered value to the flow's `input` variable and launches the flow using the `start` method. The flow

doubles the value of `input` and assigns it to the `output` variable, and the output label displays the value for `output` by using the `getVariableValue` method.

```
public class FlowController {

    //Instance of the Flow
    public Flow.Interview.doubler myFlow {get; set;}
    public Double value {get; set;}

    public Double getOutput() {
        if (myFlow == null) return null;
        return (Double)(myFlow.getVariableValue('v1'));
    }

    public void start() {
        Map<String, Object> myMap = new Map<String, Object>();
        myMap.put('v1', input);
        myFlow = new Flow.Interview.doubler(myMap);
        myFlow.start();
    }
}
```

The following is the Visualforce page that uses the sample flow controller.

```
<apex:page controller="FlowController">
    <apex:outputLabel id="text">v1 = {!output}</apex:outputLabel>

    <apex:form >
        value : <apex:inputText value="{!output}"/>
        <apex:commandButton action="{!start}" value="Start" reRender="text"/>
    </apex:form>
</apex:page>
```

Interview Methods

The following are instance methods for `Interview`.

IN THIS SECTION:

[getVariableValue\(variableName\)](#)

Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

[start\(\)](#)

Invokes an autolaunched flow or user provisioning flow.

getVariableValue(variableName)

Returns the value of the specified flow variable. The flow variable can be in the flow embedded in the Visualforce page, or in a separate flow that is called by a subflow element.

Signature

```
public Object getVariableValue(String variableName)
```

Parameters

variableName

Type: [String](#)

Specifies the unique name of the flow variable.

Return Value

Type: Object

Usage

The returned variable value comes from whichever flow the interview is running. If the specified variable can't be found in that flow, the method returns `null`.

This method checks for the existence of the variable at run time only, not at compile time.

start()

Invokes an autolaunched flow or user provisioning flow.

Signature

```
public Void start()
```

Return Value

Type: Void

Usage

This method can be used only with flows that have one of these types.

- Autolaunched Flow
- User Provisioning Flow

For details, see “[Flow Types](#)” in the *Visual Workflow Guide*.

When a flow user invokes an autolaunched flow, the active flow version is run. If there's no active version, the latest version is run. When a flow admin invokes an autolaunched flow, the latest version is always run.

KbManagement Namespace

The `KbManagement` namespace provides a class for managing knowledge articles.

The following is the class in the `KbManagement` namespace.

IN THIS SECTION:

[PublishingService Class](#)

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

PublishingService Class

Use the methods in the `KbManagement.PublishingService` class to manage the lifecycle of an article and its translations.

Namespace

[KbManagement](#)

Usage

Use the methods in the `KbManagement.PublishingService` class to manage the following parts of the lifecycle of an article and its translations:

- Publishing
- Updating
- Retrieving
- Deleting
- Submitting for translation
- Setting a translation to complete or incomplete status
- Archiving
- Assigning review tasks for draft articles or translations

Note: Date values are based on GMT.

To use the methods in this class, you must enable Salesforce Knowledge. See [Salesforce Knowledge Implementation Guide](#) for more information on setting up Salesforce Knowledge.

PublishingService Methods

The following are methods for `PublishingService`. All methods are static.

IN THIS SECTION:

[archiveOnlineArticle\(articleId, scheduledDate\)](#)

Archives an online version of an article. If the specified `scheduledDate` is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

[assignDraftArticleTask\(articleId, assigneeId, instructions, dueDate, sendEmailNotification\)](#)

Assigns a review task related to a draft article.

[assignDraftTranslationTask\(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification\)](#)

Assigns a review task related to a draft translation.

[cancelScheduledArchivingOfArticle\(articleId\)](#)

Cancels the scheduled archiving of an online article.

[cancelScheduledPublicationOfArticle\(articleId\)](#)

Cancels the scheduled publication of a draft article.

[completeTranslation\(articleVersionId\)](#)

Puts a translation in a completed state that is ready to publish.

[deleteArchivedArticle\(articleId\)](#)

Deletes an archived article.

[deleteArchivedArticleVersion\(articleId, versionNumber\)](#)

Deletes a specific version of an archived article.

[deleteDraftArticle\(articleId\)](#)

Deletes a draft article.

[deleteDraftTranslation\(articleVersionId\)](#)

Deletes a draft translation.

[editArchivedArticle\(articleId\)](#)

Creates a draft article from the archived master version and returns the new draft master version ID of the article.

[editOnlineArticle\(articleId, unpublish\)](#)

Creates a draft article from the online version and returns the new draft master version ID of the article. Also, unpublishes the online article, if *unpublish* is set to *true*.

[editPublishedTranslation\(articleId, language, unpublish\)](#)

Creates a draft version of the online translation for a specific language and returns the new draft master version ID of the article. Also, unpublishes the article, if set to *true*.

[publishArticle\(articleId, flagAsNew\)](#)

Publishes an article. If *flagAsNew* is set to *true*, the article is published as a major version.

[restoreOldVersion\(articleId, versionNumber\)](#)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

[scheduleForPublication\(articleId, scheduledDate\)](#)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

[setTranslationToIncomplete\(articleVersionId\)](#)

Sets a draft translation that is ready for publication back to “in progress” status.

[submitForTranslation\(articleId, language, assigneeId, dueDate\)](#)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

archiveOnlineArticle(articleId, scheduledDate)

Archives an online version of an article. If the specified *scheduledDate* is null, the article is archived immediately. Otherwise, it archives the article on the scheduled date.

Signature

```
public static Void archiveOnlineArticle(String articleId, Datetime scheduledDate)
```

Parameters

articleId

Type: [String](#)

scheduledDate

Type: [Datetime](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12,1,13,30,0);
KbManagement.PublishingService.archiveOnlineArticle(articleId, scheduledDate);
```

assignDraftArticleTask(articleId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft article.

Signature

```
public static Void assignDraftArticleTask(String articleId, String assigneeId, String
instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleId

Type: [String](#)

assigneeId

Type: [String](#)

instructions

Type: [String](#)

dueDate

Type: [Datetime](#)

sendEmailNotification

Type: [Boolean](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = '';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftArticleTask(articleId, assigneeId, instructions,
dueDate, true);
```

assignDraftTranslationTask(articleVersionId, assigneeId, instructions, dueDate, sendEmailNotification)

Assigns a review task related to a draft translation.

Signature

```
public static Void assignDraftTranslationTask(String articleVersionId, String assigneeId, String instructions, Datetime dueDate, Boolean sendEmailNotification)
```

Parameters

articleVersionId

Type: [String](#)

assigneeId

Type: [String](#)

instructions

Type: [String](#)

dueDate

Type: [Datetime](#)

sendEmailNotification

Type: [Boolean](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
String assigneeId = 'Insert assignee ID';
String instructions = 'Please review this draft.';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
KbManagement.PublishingService.assignDraftTranslationTask(articleId, assigneeId,
instructions, dueDate, true);
```

cancelScheduledArchivingOfArticle(articleId)

Cancels the scheduled archiving of an online article.

Signature

```
public static Void cancelScheduledArchivingOfArticle(String articleId)
```

Parameters

articleId

Type: [String](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledArchivingOfArticle (articleId);
```

cancelScheduledPublicationOfArticle (articleId)

Cancels the scheduled publication of a draft article.

Signature

```
public static Void cancelScheduledPublicationOfArticle(String articleId)
```

Parameters

articleId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.cancelScheduledPublicationOfArticle (articleId);
```

completeTranslation (articleVersionId)

Puts a translation in a completed state that is ready to publish.

Signature

```
public static Void completeTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';  
KbManagement.PublishingService.completeTranslation(articleVersionId);
```

deleteArchivedArticle(articleId)

Deletes an archived article.

Signature

```
public static Void deleteArchivedArticle(String articleId)
```

Parameters

articleId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';  
KbManagement.PublishingService.deleteArchivedArticle(articleId);
```

deleteArchivedArticleVersion(articleId, versionNumber)

Deletes a specific version of an archived article.

Signature

```
public static Void deleteArchivedArticleVersion(String articleId, Integer versionNumber)
```

Parameters

articleId
Type: [String](#)

versionNumber
Type: [Integer](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
Integer versionNumber = 1;
KbManagement.PublishingService.deleteArchivedArticleVersion(articleId, versionNumber);
```

deleteDraftArticle(articleId)

Deletes a draft article.

Signature

```
public static Void deleteDraftArticle(String articleId)
```

Parameters

articleId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftArticle(articleId);
```

deleteDraftTranslation(articleVersionId)

Deletes a draft translation.

Signature

```
public static Void deleteDraftTranslation(String articleVersionId)
```

Parameters

articleVersionId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.deleteDraftTranslation (articleVersionId);
```

editArchivedArticle(articleId)

Creates a draft article from the archived master version and returns the new draft master version ID of the article.

Signature

```
public static String editArchivedArticle(String articleId)
```

Parameters

articleId
Type: [String](#)

Return Value

Type: [String](#)

Example

```
String articleId = 'Insert article ID';  
String id = KbManagement.PublishingService.editArchivedArticle(articleId);
```

editOnlineArticle(articleId, unpublish)

Creates a draft article from the online version and returns the new draft master version ID of the article. Also, unpublishes the online article, if *unpublish* is set to `true`.

Signature

```
public static String editOnlineArticle(String articleId, Boolean unpublish)
```

Parameters

articleId
Type: [String](#)
unpublish
Type: [Boolean](#)

Return Value

Type: [String](#)

Example

```
String articleId = 'Insert article ID';  
String id = KbManagement.PublishingService.editOnlineArticle (articleId, true);
```

editPublishedTranslation(articleId, language, unpublish)

Creates a draft version of the online translation for a specific language and returns the new draft master version ID of the article. Also, unpublishes the article, if set to `true`.

Signature

```
public static String editPublishedTranslation(String articleId, String language, Boolean unpublish)
```

Parameters

articleId

Type: `String`

language

Type: `String`

unpublish

Type: `Boolean`

Return Value

Type: `String`

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String id = KbManagement.PublishingService.editPublishedTranslation(articleId, language, true);
```

publishArticle(articleId, flagAsNew)

Publishes an article. If *flagAsNew* is set to `true`, the article is published as a major version.

Signature

```
public static Void publishArticle(String articleId, Boolean flagAsNew)
```

Parameters

articleId

Type: `String`

flagAsNew

Type: `Boolean`

Return Value

Type: `Void`

Example

```
String articleId = 'Insert article ID';
KbManagement.PublishingService.publishArticle(articleId, true);
```

restoreOldVersion(articleId, versionNumber)

Creates a draft article from an existing online article based on the specified archived version of the article and returns the article version ID.

Signature

```
public static String restoreOldVersion(String articleId, Integer versionNumber)
```

Parameters

articleId

Type: [String](#)

versionNumber

Type: [Integer](#)

Return Value

Type: [String](#)

Example

```
String articleId = 'Insert article ID';
String id = KbManagement.PublishingService.restoreOldVersion (articleId, 1);
```

scheduleForPublication(articleId, scheduledDate)

Schedules the article for publication as a major version. If the specified date is null, the article is published immediately.

Signature

```
public static Void scheduleForPublication(String articleId, Datetime scheduledDate)
```

Parameters

articleId

Type: [String](#)

scheduledDate

Type: [Datetime](#)

Return Value

Type: [Void](#)

Example

```
String articleId = 'Insert article ID';
Datetime scheduledDate = Datetime.newInstanceGmt(2012, 12, 1, 13, 30, 0);
KbManagement.PublishingService.scheduleForPublication(articleId, scheduledDate);
```

setTranslationToIncomplete(articleVersionId)

Sets a draft translation that is ready for publication back to “in progress” status.

Signature

```
public static Void setTranslationToIncomplete(String articleVersionId)
```

Parameters

articleVersionId
Type: [String](#)

Return Value

Type: Void

Example

```
String articleVersionId = 'Insert article ID';
KbManagement.PublishingService.setTranslationToIncomplete(articleVersionId);
```

submitForTranslation(articleId, language, assigneeId, dueDate)

Submits an article for translation to the specified language. Also assigns the specified user and due date to the submittal and returns new ID of the draft translation.

Signature

```
public static String submitForTranslation(String articleId, String language, String assigneeId, Datetime dueDate)
```

Parameters

articleId
Type: [String](#)

language
Type: [String](#)

assigneeId
Type: [String](#)

dueDate
Type: [Datetime](#)

Return Value

Type: [String](#)

Example

```
String articleId = 'Insert article ID';
String language = 'fr';
String assigneeId = 'Insert assignee ID';
Datetime dueDate = Datetime.newInstanceGmt(2012, 12, 1);
String id = KbManagement.PublishingService.submitForTranslation(articleId, language,
assigneeId, dueDate);
```

Messaging Namespace

The `Messaging` namespace provides classes and methods for Salesforce outbound and inbound email functionality.

The following are the classes in the `Messaging` namespace.

IN THIS SECTION:

[AttachmentRetrievalOption Enum](#)

Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

[Email Class \(Base Email Methods\)](#)

Contains base email methods common to both single and mass email.

[EmailFileAttachment Class](#)

`EmailFileAttachment` is used in `SingleEmailMessage` to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

[InboundEmail Class](#)

Represents an inbound email object.

[InboundEmail.BinaryAttachment Class](#)

An `InboundEmail` object stores binary attachments in an `InboundEmail.BinaryAttachment` object.

[InboundEmail.TextAttachment Class](#)

An `InboundEmail` object stores text attachments in an `InboundEmail.TextAttachment` object.

[InboundEmailResult Class](#)

The `InboundEmailResult` object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

[InboundEnvelope Class](#)

The `InboundEnvelope` object stores the envelope information associated with the inbound email, and has the following fields.

[MassEmailMessage Class](#)

Contains methods for sending mass email.

[InboundEmail.Header Class](#)

An `InboundEmail` object stores RFC 2822 email header information in an `InboundEmail.Header` object with the following properties.

[PushNotification Class](#)

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

[PushNotificationPayload Class](#)

Contains methods to create the notification message payload for an Apple device.

[RenderEmailTemplateBodyResult Class](#)

Contains the results for rendering email templates.

[RenderEmailTemplateError Class](#)

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

[SendEmailError Class](#)

Represents an error that the `SendEmailResult` object may contain.

[SendEmailResult Class](#)

Contains the result of sending an email message.

[SingleEmailMessage Methods](#)

Contains methods for sending single email messages.

AttachmentRetrievalOption Enum

Provides options for including attachment metadata only, attachment metadata and content, or excluding attachments.

Namespace

[Messaging](#)

Usage

Use these enum values with the `renderStoredEmailTemplate(templateId, whoId, whatId, attachmentRetrievalOption)` method.

Enum Values

The following are the values of the `Messaging.AttachmentRetrievalOption` enum.

Value	Description
<code>METADATA_ONLY</code>	Includes only the file name, content type, and the object ID in the <code>fileAttachments</code> property of <code>Messaging.SingleEmailMessage</code> .  Note: When the template is rendered from a Visualforce template (and not from a static file attached to the template), the object ID is not available.
<code>METADATA_WITH_BODY</code>	Includes the attachment content, in addition to the file name, content type, and the object ID in the <code>fileAttachments</code> property of <code>Messaging.SingleEmailMessage</code> .
<code>NONE</code>	Doesn't include any attachments in <code>Messaging.SingleEmailMessage</code> .

Email Class (Base Email Methods)

Contains base email methods common to both single and mass email.

Namespace

[Messaging](#)

Usage

Note: If templates are not being used, all email content must be in plain text, HTML, or both. Visualforce email templates cannot be used for mass email.

Email Methods

The following are methods for `Email`. All are instance methods.

IN THIS SECTION:

[setBccSender\(bcc\)](#)

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

[setReplyTo\(replyAddress\)](#)

Optional. The email address that receives the message when a recipient replies.

[setTemplateID\(templateId\)](#)

The ID of the template to be merged to create this email. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

[setSaveAsActivity\(saveAsActivity\)](#)

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

[setSenderDisplayName\(displayName\)](#)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a `SingleEmailMessage` has defined its `DisplayName` field.

[setUseSignature\(useSignature\)](#)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

setBccSender (bcc)

Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.

Signature

```
public Void setBccSender (Boolean bcc)
```

Parameters

bcc

Type: [Boolean](#)

Return Value

Type: Void

Usage

 **Note:** If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

setReplyTo (replyAddress)

Optional. The email address that receives the message when a recipient replies.

Signature

```
public Void setReplyTo(String replyAddress)
```

Parameters

replyAddress
Type: [String](#)

Return Value

Type: Void

setTemplateID (templateId)

The ID of the template to be merged to create this email. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setTemplateID(ID templateId)
```

Parameters

templateId
Type: [ID](#)

Return Value

Type: Void

Usage

 **Note:** `setHtmlBody` and `setPlainTextBody` apply only to single email methods, not to mass email methods.

setSaveAsActivity (saveAsActivity)

Optional. The default value is `true`, meaning the email is saved as an activity. This argument only applies if the recipient list is based on `targetObjectId` or `targetObjectIds`. If HTML email tracking is enabled for the organization, you will be able to track open rates.

Signature

```
public Void setSaveAsActivity(Boolean saveAsActivity)
```

Parameters

saveAsActivity
Type: [Boolean](#)

Return Value

Type: Void

setSenderDisplayName (displayName)

Optional. The name that appears on the From line of the email. This cannot be set if the object associated with a `setOrgWideEmailAddressId` for a `SingleEmailMessage` has defined its `DisplayName` field.

Signature

```
public Void setSenderDisplayName(String displayName)
```

Parameters

displayName
Type: [String](#)

Return Value

Type: Void

setUseSignature (useSignature)

Indicates whether the email includes an email signature if the user has one configured. The default is `true`, meaning if the user has a signature it is included in the email unless you specify `false`.

Signature

```
public Void setUseSignature(Boolean useSignature)
```

Parameters

useSignature
Type: [Boolean](#)

Return Value

Type: Void

EmailFileAttachment Class

EmailFileAttachment is used in SingleEmailMessage to specify attachments passed in as part of the request, as opposed to existing documents in Salesforce.

Namespace

[Messaging](#)

IN THIS SECTION:

[EmailFileAttachment Constructors](#)

[EmailFileAttachment Properties](#)

EmailFileAttachment Constructors

The following are constructors for EmailFileAttachment.

IN THIS SECTION:

[EmailFileAttachment\(\)](#)

Creates a new instance of the Messaging.EmailFileAttachment class.

EmailFileAttachment()

Creates a new instance of the Messaging.EmailFileAttachment class.

Signature

```
public EmailFileAttachment()
```

EmailFileAttachment Properties

The following are properties for EmailFileAttachment.

IN THIS SECTION:

[body](#)

Gets or sets the attachment itself.

[contenttype](#)

Gets or sets the attachment's Content-Type.

[filename](#)

Gets or sets the name of the file to attach.

[id](#)

Read-Only. Gets the attachment ID.

inline

Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

body

Gets or sets the attachment itself.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: [Blob](#)

contenttype

Gets or sets the attachment's Content-Type.

Signature

```
public String contenttype {get; set;}
```

Property Value

Type: [String](#)

filename

Gets or sets the name of the file to attach.

Signature

```
public String filename {get; set;}
```

Property Value

Type: [String](#)

id

Read-Only. Gets the attachment ID.

Signature

```
public Id id {get;}
```

Property Value

Type: [Id](#)

inline

Specifies a Content-Disposition of inline (`true`) or attachment (`false`).

Signature

```
public Boolean inline {get; set;}
```

Property Value

Type: [Boolean](#)

InboundEmail Class

Represents an inbound email object.

Namespace

[Messaging](#)

IN THIS SECTION:

[InboundEmail Constructors](#)

[InboundEmail Properties](#)

InboundEmail Constructors

The following are constructors for `InboundEmail`.

IN THIS SECTION:

[InboundEmail\(\)](#)

Creates a new instance of the `Messaging.InboundEmail` class.

InboundEmail ()

Creates a new instance of the `Messaging.InboundEmail` class.

Signature

```
public InboundEmail ()
```

InboundEmail Properties

The following are properties for `InboundEmail`.

IN THIS SECTION:

[binaryAttachments](#)

A list of binary attachments received with the email, if any.

[ccAddresses](#)

A list of carbon copy (CC) addresses, if any.

[fromAddress](#)

The email address that appears in the From field.

[fromName](#)

The name that appears in the From field, if any.

[headers](#)

A list of the RFC 2822 headers in the email.

[htmlBody](#)

The HTML version of the email, if specified by the sender.

[htmlBodyIsTruncated](#)

Indicates whether the HTML body text is truncated (`true`) or not (`false`.)

[inReplyTo](#)

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

[messageId](#)

The Message-ID—the incoming email's unique identifier.

[plainTextBody](#)

The plain text version of the email, if specified by the sender.

[plainTextBodyIsTruncated](#)

Indicates whether the plain body text is truncated (`true`) or not (`false`.)

[references](#)

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

[replyTo](#)

The email address that appears in the reply-to header.

[subject](#)

The subject line of the email, if any.

[textAttachments](#)

A list of text attachments received with the email, if any.

[toAddresses](#)

The email address that appears in the To field.

binaryAttachments

A list of binary attachments received with the email, if any.

Signature

```
public InboundEmail.BinaryAttachment[] binaryAttachments {get; set;}
```

Property Value

Type: [InboundEmail.BinaryAttachment\[\]](#)

Usage

Examples of binary attachments include image, audio, application, and video files.

ccAddresses

A list of carbon copy (CC) addresses, if any.

Signature

```
public String[] ccAddresses {get; set;}
```

Property Value

Type: [String\[\]](#)

fromAddress

The email address that appears in the From field.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: [String](#)

fromName

The name that appears in the From field, if any.

Signature

```
public String fromName {get; set;}
```

Property Value

Type: [String](#)

headers

A list of the RFC 2822 headers in the email.

Signature

```
public InboundEmail.Header[] headers {get; set;}
```

Property Value

Type: [InboundEmail.Header\[\]](#)

Usage

The list of the RFC 2822 headers includes:

- Received from
- Custom headers
- Message-ID
- Date

htmlBody

The HTML version of the email, if specified by the sender.

Signature

```
public String htmlBody {get; set;}
```

Property Value

Type: [String](#)

htmlBodyIsTruncated

Indicates whether the HTML body text is truncated ([true](#)) or not ([false](#).)

Signature

```
public Boolean htmlBodyIsTruncated {get; set;}
```

Property Value

Type: [Boolean](#)

inReplyTo

The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.

Signature

```
public String inReplyTo {get; set;}
```

Property Value

Type: [String](#)

messageId

The Message-ID—the incoming email's unique identifier.

Signature

```
public String messageId {get; set;}
```

Property Value

Type: [String](#)

plainTextBody

The plain text version of the email, if specified by the sender.

Signature

```
public String plainTextBody {get; set;}
```

Property Value

Type: [String](#)

plainTextBodyIsTruncated

Indicates whether the plain body text is truncated ([true](#)) or not ([false](#).)

Signature

```
public Boolean plainTextBodyIsTruncated {get; set;}
```

Property Value

Type: [Boolean](#)

references

The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public String[] references {get; set;}
```

Property Value

Type: [String\[\]](#)

replyTo

The email address that appears in the reply-to header.

Signature

```
public String replyTo {get; set;}
```

Property Value

Type: [String](#)

Usage

If there is no reply-to header, this field is identical to the `fromAddress` field.

subject

The subject line of the email, if any.

Signature

```
public String subject {get; set;}
```

Property Value

Type: [String](#)

textAttachments

A list of text attachments received with the email, if any.

Signature

```
public InboundEmail.TextAttachment[] textAttachments {get; set;}
```

Property Value

Type: [InboundEmail.TextAttachment\[\]](#)

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

toAddresses

The email address that appears in the `To` field.

Signature

```
public String[] toAddresses {get; set;}
```

Property Value

Type: [String\[\]](#)

InboundEmail.BinaryAttachment Class

An `InboundEmail` object stores binary attachments in an `InboundEmail.BinaryAttachment` object.

Namespace

[Messaging](#)

Usage

Examples of binary attachments include image, audio, application, and video files.

IN THIS SECTION:

[InboundEmail.BinaryAttachment Constructors](#)

[InboundEmail.BinaryAttachment Properties](#)

InboundEmail.BinaryAttachment Constructors

The following are constructors for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

[InboundEmail.BinaryAttachment\(\)](#)

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

`InboundEmail.BinaryAttachment()`

Creates a new instance of the `Messaging.InboundEmail.BinaryAttachment` class.

Signature

```
public InboundEmail.BinaryAttachment()
```

InboundEmail.BinaryAttachment Properties

The following are properties for `InboundEmail.BinaryAttachment`.

IN THIS SECTION:

[body](#)

The body of the attachment.

[fileName](#)

The name of the attached file.

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

contentTypeSubType

The primary and sub MIME-type.

body

The body of the attachment.

Signature

```
public Blob body {get; set;}
```

Property Value

Type: [Blob](#)

fileName

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: [String](#)

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: [List<Messaging.InboundEmail.Header>](#)

contentTypeSubType

The primary and sub MIME-type.

Signature

```
public String contentTypeSubType {get; set;}
```

Property Value

Type: [String](#)

InboundEmail.TextAttachment Class

An `InboundEmail` object stores text attachments in an `InboundEmail.TextAttachment` object.

Namespace

[Messaging](#)

Usage

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

IN THIS SECTION:

[InboundEmail.TextAttachment Constructors](#)

[InboundEmail.TextAttachment Properties](#)

InboundEmail.TextAttachment Constructors

The following are constructors for `InboundEmail.TextAttachment`.

IN THIS SECTION:

[InboundEmail.TextAttachment\(\)](#)

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

`InboundEmail.TextAttachment()`

Creates a new instance of the `Messaging.InboundEmail.TextAttachment` class.

Signature

```
public InboundEmail.TextAttachment()
```

InboundEmail.TextAttachment Properties

The following are properties for `InboundEmail.TextAttachment`.

IN THIS SECTION:

[body](#)

The body of the attachment.

[bodyIsTruncated](#)

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

[charset](#)

The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

[fileName](#)

The name of the attached file.

[headers](#)

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

[mimeTypeSubType](#)

The primary and sub MIME-type.

body

The body of the attachment.

Signature

```
public String body {get; set;}
```

Property Value

Type: [String](#)

bodyIsTruncated

Indicates whether the attachment body text is truncated (`true`) or not (`false`.)

Signature

```
public Boolean bodyIsTruncated {get; set;}
```

Property Value

Type: [Boolean](#)

charset

The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.

Signature

```
public String charset {get; set;}
```

Property Value

Type: [String](#)

fileName

The name of the attached file.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: [String](#)

headers

Any header values associated with the attachment. Examples of header names include `Content-Type`, `Content-Transfer-Encoding`, and `Content-ID`.

Signature

```
public List<Messaging.InboundEmail.Header> headers {get; set;}
```

Property Value

Type: [List<Messaging.InboundEmail.Header>](#)

mimeTypeSubType

The primary and sub MIME-type.

Signature

```
public String mimeTypeSubType {get; set;}
```

Property Value

Type: [String](#)

InboundEmailResult Class

The `InboundEmailResult` object is used to return the result of the email service. If this object is null, the result is assumed to be successful.

Namespace

[Messaging](#)

InboundEmailResult Properties

The following are properties for `InboundEmailResult`.

IN THIS SECTION:[message](#)

A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

[success](#)

A value that indicates whether the email was successfully processed.

message

A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

Signature

```
public String message {get; set;}
```

Property Value

Type: [String](#)

success

A value that indicates whether the email was successfully processed.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

Usage

If `false`, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the `Message` field.

InboundEnvelope Class

The `InboundEnvelope` object stores the envelope information associated with the inbound email, and has the following fields.

Namespace

[Messaging](#)

InboundEnvelope Properties

The following are properties for `InboundEnvelope`.

IN THIS SECTION:

[fromAddress](#)

The name that appears in the `From` field of the envelope, if any.

[toAddress](#)

The name that appears in the `To` field of the envelope, if any.

fromAddress

The name that appears in the `From` field of the envelope, if any.

Signature

```
public String fromAddress {get; set;}
```

Property Value

Type: [String](#)

toAddress

The name that appears in the `To` field of the envelope, if any.

Signature

```
public String toAddress {get; set;}
```

Property Value

Type: [String](#)

MassEmailMessage Class

Contains methods for sending mass email.

Namespace

[Messaging](#)

Usage

All base email (`Email` class) methods are also available to the `MassEmailMessage` objects.

IN THIS SECTION:

[MassEmailMessage Constructors](#)

[MassEmailMessage Methods](#)

SEE ALSO:

[Email Class \(Base Email Methods\)](#)

MassEmailMessage Constructors

The following are constructors for `MassEmailMessage`.

IN THIS SECTION:

[MassEmailMessage\(\)](#)

Creates a new instance of the `Messaging.MassEmailMessage` class.

MassEmailMessage ()

Creates a new instance of the `Messaging.MassEmailMessage` class.

Signature

```
public MassEmailMessage ()
```

MassEmailMessage Methods

The following are methods for `MassEmailMessage`. All are instance methods.

IN THIS SECTION:

[setDescription\(description\)](#)

The description of the email.

[setTargetObjectIds\(targetObjectIds\)](#)

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

[setWhatIds\(whatIds\)](#)

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

setDescription (description)

The description of the email.

Signature

```
public Void setDescription (String description)
```

Parameters

description

Type: [String](#)

Return Value

Type: Void

setTargetObjectIds (targetObjectIds)

A list of IDs of the contacts, leads, or users to which the email will be sent. The IDs you specify set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (all contacts, all leads, or all users).

Signature

```
public Void setTargetObjectIds(ID[] targetObjectIds)
```

Parameters

targetObjectIds

Type: ID[]

Return Value

Type: Void

Usage

You can list up to 250 IDs per email. If you specify a value for the `targetObjectIds` field, optionally specify a `whatId` as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data.

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setWhatIds (whatIds)

Optional. If you specify a list of contacts for the `targetObjectIds` field, you can specify a list of `whatIds` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatIds(ID[] whatIds)
```

Parameters

whatIds

Type: ID[]

Return Value

Type: Void

Usage

The values must be one of the following types:

- Contract
- Case
- Opportunity
- Product

 **Note:** If you specify `whatIds`, specify one for each `targetObjectId`; otherwise, you will receive an `INVALID_ID_FIELD` error.

InboundEmail.Header Class

An `InboundEmail` object stores RFC 2822 email header information in an `InboundEmail.Header` object with the following properties.

Namespace

[Messaging](#)

InboundEmail.Header Properties

The following are properties for `InboundEmail.Header`.

IN THIS SECTION:

`name`

The name of the header parameter, such as `Date` or `Message-ID`.

`value`

The value of the header.

name

The name of the header parameter, such as `Date` or `Message-ID`.

Signature

```
public String name {get; set;}
```

Property Value

Type: [String](#)

value

The value of the header.

Signature

```
public String value {get; set;}
```

Property Value

Type: [String](#)

PushNotification Class

`PushNotification` is used to configure push notifications and send them from an Apex trigger.

Namespace

[Messaging](#)

Example

This sample Apex trigger sends push notifications to the connected app named `Test_App`, which corresponds to a mobile app on iOS mobile clients. The trigger fires after cases have been updated and sends the push notification to two users: the case owner and the user who last modified the case.

```
trigger caseAlert on Case (after update) {

    for(Case cs : Trigger.New)
    {
        // Instantiating a notification
        Messaging.PushNotification msg =
            new Messaging.PushNotification();

        // Assembling the necessary payload parameters for Apple.
        // Apple params are:
        // (<alert text>,<alert sound>,<badge count>,
        // <free-form data>)
        // This example doesn't use badge count or free-form data.
        // The number of notifications that haven't been acted
        // upon by the intended recipient is best calculated
        // at the time of the push. This timing helps
        // ensure accuracy across multiple target devices.
        Map<String, Object> payload =
            Messaging.PushNotificationPayload.apple(
                'Case ' + cs.CaseNumber + ' status changed to: '
                + cs.Status, '', null, null);

        // Adding the assembled payload to the notification
        msg.setPayload(payload);

        // Getting recipient users
        String userId1 = cs.OwnerId;
        String userId2 = cs.LastModifiedById;

        // Adding recipient users to list
        Set<String> users = new Set<String>();
        users.add(userId1);
        users.add(userId2);

        // Sending the notification to the specified app and users.
        // Here we specify the API name of the connected app.
```

```
        msg.send('Test_App', users);
    }
}
```

IN THIS SECTION:

[PushNotification Constructors](#)

[PushNotification Methods](#)

PushNotification Constructors

The following are the constructors for `PushNotification`.

IN THIS SECTION:

[PushNotification\(\)](#)

Creates a new instance of the `Messaging.PushNotification` class.

[PushNotification\(payload\)](#)

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

PushNotification()

Creates a new instance of the `Messaging.PushNotification` class.

Signature

```
public PushNotification()
```

PushNotification(payload)

Creates a new instance of the `Messaging.PushNotification` class using the specified payload parameters as key-value pairs. When you use this constructor, you don't need to call `setPayload` to set the payload.

Signature

```
public PushNotification(Map<String, Object> payload)
```

Parameters

payload

Type: `Map<String, Object>`

The payload, expressed as a map of key-value pairs.

PushNotification Methods

The following are the methods for `PushNotification`. All are global methods.

IN THIS SECTION:

[send\(application, users\)](#)

Sends a push notification message to the specified users.

[setPayload\(payload\)](#)

Sets the payload of the push notification message.

[setTtl\(ttl\)](#)

Reserved for future use.

send(application, users)

Sends a push notification message to the specified users.

Signature

```
public void send(String application, Set<String> users)
```

Parameters

application

Type: [String](#)

The connected app API name. This corresponds to the mobile client app the notification should be sent to.

users

Type: [Set](#)

A set of user IDs that correspond to the users the notification should be sent to.

Example

See the [Push Notification Example](#).

setPayload(payload)

Sets the payload of the push notification message.

Signature

```
public void setPayload(Map<String, Object> payload)
```

Parameters

payload

Type: [Map<String, Object>](#)

The payload, expressed as a map of key-value pairs.

Payload parameters can be different for each mobile OS vendor. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at <https://developer.apple.com/library/mac/documentation/>.

To create the payload for an Apple device, see the [PushNotificationPayload Class](#).

Example

See the [Push Notification Example](#).

setTtl (ttl)

Reserved for future use.

Signature

```
public void setTtl(Integer ttl)
```

Parameters

ttl

Type: [Integer](#)

Reserved for future use.

PushNotificationPayload Class

Contains methods to create the notification message payload for an Apple device.

Namespace

[Messaging](#)

Usage

Apple has specific requirements for the notification payload, and this class has helper methods to create the payload. For more information on Apple's payload parameters, search for "Apple Push Notification Service" at <https://developer.apple.com/library/mac/documentation/>.

Example

See the [Push Notification Example](#).

IN THIS SECTION:

[PushNotificationPayload Methods](#)

PushNotificationPayload Methods

The following are the methods for `PushNotificationPayload`. All are global static methods.

IN THIS SECTION:

[apple\(alert, sound, badgeCount, userData\)](#)

Helper method that creates a valid Apple payload from the specified arguments.

[apple\(alertBody, actionLockKey, lockKey, locArgs, launchImage, sound, badgeCount, userData\)](#)

Helper method that creates a valid Apple payload from the specified arguments.

apple(alert, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String, Object> apple(String alert, String sound, Integer badgeCount,
Map<String, Object> userData)
```

Parameters

alert

Type: [String](#)

Notification message to be sent to the mobile client.

sound

Type: [String](#)

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount

Type: [Integer](#)

Number to display as the badge of the application icon.

userData

Type: [Map<String, Object>](#)

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: [Map<String, Object>](#)

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

Example

See the [Push Notification Example](#).

apple(alertBody, actionLocKey, locKey, locArgs, launchImage, sound, badgeCount, userData)

Helper method that creates a valid Apple payload from the specified arguments.

Signature

```
public static Map<String, Object> apple(String alertBody, String actionLocKey, String
locKey, String[] locArgs, String launchImage, String sound, Integer badgeCount,
Map<String, Object> userData)
```

Parameters

alertBody

Type: [String](#)

Text of the alert message.

actionLocKey

Type: [String](#)

If a value is specified for the *actionLocKey* argument, an alert with two buttons is displayed. The value is a key to get a localized string in a `Localizable.strings` file to use for the right button's title.

locKey

Type: [String](#)

Key to an alert-message string in a `Localizable.strings` file for the current localization.

locArgs

Type: [List<String>](#)

Variable string values to appear in place of the format specifiers in *locKey*.

launchImage

Type: [String](#)

File name of an image file in the application bundle.

sound

Type: [String](#)

Name of a sound file to be played as an alert. This sound file should be in the mobile application bundle.

badgeCount

Type: [Integer](#)

Number to display as the badge of the application icon.

userData

Type: [Map<String, Object>](#)

Map of key-value pairs that contains any additional data used to provide context for the notification. For example, it can contain IDs of the records that caused the notification to be sent. The mobile client app can use these IDs to display these records.

Return Value

Type: [Map<String, Object>](#)

Returns a formatted payload that includes all of the specified arguments.

Usage

To generate a valid payload, you must provide a value for at least one of the following parameters: `alert`, `sound`, `badgeCount`.

RenderEmailTemplateBodyResult Class

Contains the results for rendering email templates.

Namespace

[Messaging](#)

IN THIS SECTION:

[RenderEmailTemplateBodyResult Methods](#)

RenderEmailTemplateBodyResult Methods

The following are methods for `RenderEmailTemplateBodyResult`.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

[getMergedBody\(\)](#)

Returns the rendered body text with merge field references replaced with the corresponding record data.

[getSuccess\(\)](#)

Indicates whether the operation was successful.

getErrors ()

If an error occurred during the `renderEmailTemplate` method, a `RenderEmailTemplateError` object is returned.

Signature

```
public List<Messaging.RenderEmailTemplateError> getErrors ()
```

Return Value

Type: `List<Messaging.RenderEmailTemplateError>`

getMergedBody ()

Returns the rendered body text with merge field references replaced with the corresponding record data.

Signature

```
public String getMergedBody ()
```

Return Value

Type: `String`

getSuccess ()

Indicates whether the operation was successful.

Signature

```
public Boolean getSuccess ()
```

Return Value

Type: [Boolean](#)

RenderEmailTemplateError Class

Represents an error that the `RenderEmailTemplateBodyResult` object can contain.

Namespace

[Messaging](#)

IN THIS SECTION:

[RenderEmailTemplateError Methods](#)

RenderEmailTemplateError Methods

The following are methods for `RenderEmailTemplateError`.

IN THIS SECTION:

[getFieldName\(\)](#)

Returns the name of the merge field in the error.

[getMessage\(\)](#)

Returns a message describing the error.

[getOffset\(\)](#)

Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

[getStatusCode\(\)](#)

Returns a Salesforce API status code.

getFieldName ()

Returns the name of the merge field in the error.

Signature

```
public String getFieldName ()
```

Return Value

Type: [String](#)

getMessage ()

Returns a message describing the error.

Signature

```
public String getMessage ()
```

Return Value

Type: [String](#)

getOffset ()

Returns the offset within the supplied body text where the error was discovered. If the offset cannot be determined, -1 is returned.

Signature

```
public Integer getOffset ()
```

Return Value

Type: [Integer](#)

getStatusCode ()

Returns a Salesforce API status code.

Signature

```
public System.StatusCode getStatusCode ()
```

Return Value

Type: [System.StatusCode](#)

SendEmailError Class

Represents an error that the `SendEmailResult` object may contain.

Namespace

[Messaging](#)

SendEmailError Methods

The following are methods for `SendEmailError`. All are instance methods.

IN THIS SECTION:

[getFields\(\)](#)

A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

[getMessage\(\)](#)

The text of the error message.

getStatusCode()

Returns a code that characterizes the error.

getTargetObjectId()

The ID of the target record for which the error occurred.

getFields ()

A list of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Signature

```
public String[] getFields ()
```

Return Value

Type: [String\[\]](#)

getMessage ()

The text of the error message.

Signature

```
public String getMessage ()
```

Return Value

Type: [String](#)

getStatusCode ()

Returns a code that characterizes the error.

Signature

```
public System.StatusCode getStatusCode ()
```

Return Value

Type: [System.StatusCode](#)

Usage

The full list of status codes is available in the WSDL file for your organization. For more information about accessing the WSDL file for your organization, see “Downloading Salesforce WSDLs and Client Authentication Certificates” in the Salesforce online help.

getTargetObjectId ()

The ID of the target record for which the error occurred.

Signature

```
public String getTargetObjectId()
```

Return Value

Type: [String](#)

SendEmailResult Class

Contains the result of sending an email message.

Namespace

[Messaging](#)

SendEmailResult Methods

The following are methods for `SendEmailResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

[isSuccess\(\)](#)

Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

getErrors ()

If an error occurred during the `sendEmail` method, a `SendEmailError` object is returned.

Signature

```
public SendEmailError[] getErrors()
```

Return Value

Type: [Messaging.SendEmailError\[\]](#)

isSuccess ()

Indicates whether the email was successfully submitted for delivery (`true`) or not (`false`). Even if `isSuccess` is true, it does not mean the intended recipients received the email, as there could have been a problem with the email address or it could have bounced or been blocked by a spam blocker.

Signature

```
public Boolean isSuccess()
```

Return Value

Type: [Boolean](#)

SingleEmailMessage Methods

Contains methods for sending single email messages.

Namespace

[Messaging](#)

Usage

All base email ([Email](#) class) methods are also available to the [SingleEmailMessage](#) objects.

Email properties are readable and writable. Each property has corresponding setter and getter methods. For example, the `toAddresses()` property is equivalent to the `setToAddresses()` and `getToAddresses()` methods. Only the setter methods are documented.

IN THIS SECTION:

[SingleEmailMessage Constructors](#)

[SingleEmailMessage Methods](#)

SEE ALSO:

[Email Class \(Base Email Methods\)](#)

SingleEmailMessage Constructors

The following are constructors for [SingleEmailMessage](#).

IN THIS SECTION:

[SingleEmailMessage\(\)](#)

Creates a new instance of the `Messaging.SingleEmailMessage` class.

SingleEmailMessage ()

Creates a new instance of the `Messaging.SingleEmailMessage` class.

Signature

```
public SingleEmailMessage ()
```

SingleEmailMessage Methods

The following are methods for [SingleEmailMessage](#). All are instance methods.

IN THIS SECTION:

[setBccAddresses\(bccAddresses\)](#)

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

[setCcAddresses\(ccAddresses\)](#)

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

[setCharset\(characterSet\)](#)

Optional. The character set for the email. If this value is null, the user's default value is used.

[setDocumentAttachments\(documentIds\)](#)

(Deprecated. Use `setEntityAttachments()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

[setEntityAttachments\(ids\)](#)

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

[setFileAttachments\(fileName\)](#)

Optional. A list containing the file names of the binary and text files you want to attach to the email.

[setHtmlBody\(htmlBody\)](#)

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

[setInReplyTo\(parentMessageIds\)](#)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

[setOptOutPolicy\(emailOptOutPolicy\)](#)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

[setPlainTextBody\(plainTextBody\)](#)

Optional. The text version of the email, specified by the sender. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

[setOrgWideEmailAddressId\(emailAddressId\)](#)

Optional. The ID of the organization-wide email address associated with the outgoing email. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

[setReferences\(references\)](#)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

[setSubject\(subject\)](#)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

[setTargetObjectId\(targetObjectId\)](#)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

[setTemplateId\(templateId\)](#)

Required if using a template, optional otherwise. The ID of the template used to create the email.

[setToAddresses\(toAddresses\)](#)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum number of email addresses allowed is 100.

[setTreatBodiesAsTemplate\(treatAsTemplate\)](#)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data.

[setTreatTargetObjectAsRecipient\(treatAsRecipient\)](#)

Optional. If set to `true`, the `targetObjectId` (a contact, lead, or user) is the recipient of the email. If set to `false`, the `targetObjectId` is supplied as the `whoId` field for template rendering but isn't a recipient of the email. The default is `true`.

[setWhatId\(whatId\)](#)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

setBccAddresses (bccAddresses)

Optional. A list of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

Signature

```
public void setBccAddresses(String[] bccAddresses)
```

Parameters

bccAddresses

Type: [String\[\]](#)

Return Value

Type: `void`

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

If the BCC compliance option is set at the organization level, the user cannot add BCC addresses on standard messages. The following error code is returned: `BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED`. Contact your Salesforce representative for information on BCC compliance.

setCcAddresses (ccAddresses)

Optional. A list of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum allowed is 25.

Signature

```
public Void setCcAddresses(String[] ccAddresses)
```

Parameters

ccAddresses
Type: [String\[\]](#)

Return Value

Type: Void

Usage

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setCharset (characterSet)

Optional. The character set for the email. If this value is null, the user's default value is used.

Signature

```
public Void setCharset(String characterSet)
```

Parameters

characterSet
Type: [String](#)

Return Value

Type: Void

setDocumentAttachments (documentIds)

(Deprecated. Use `setEntityAttachments ()` instead.) Optional. A list containing the ID of each document object you want to attach to the email.

Signature

```
public Void setDocumentAttachments(ID[] documentIds)
```

Parameters

documentIds
Type: [ID\[\]](#)

Return Value

Type: Void

Usage

You can attach multiple documents as long as the total size of all attachments does not exceed 10 MB.

setEntityAttachments (ids)

Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email.

Signature

```
public void setEntityAttachments(List<String> ids)
```

Parameters

ids
Type: [List<String>](#)

Return Value

Type: void

setFileAttachments (fileNames)

Optional. A list containing the file names of the binary and text files you want to attach to the email.

Signature

```
public Void setFileAttachments(EmailFileAttachment[] fileNames)
```

Parameters

fileNames
Type: [Messaging.EmailFileAttachment\[\]](#)

Return Value

Type: Void

Usage

You can attach multiple files as long as the total size of all attachments does not exceed 10 MB.

setHtmlBody (htmlBody)

Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setHtmlBody(String htmlBody)
```

Parameters

htmlBody

Type: [String](#)

Return Value

Type: Void

setInReplyTo (parentMessageIds)

Sets the optional In-Reply-To field of the outgoing email. This field identifies the email or emails to which this email is a reply (parent emails).

Signature

```
public Void setInReplyTo(String parentMessageIds)
```

Parameters

parentMessageIds

Type: [String](#)

Contains one or more parent email message IDs.

Return Value

Type: Void

setOptOutPolicy (emailOptOutPolicy)

Optional. If you added recipients by ID instead of email address and the `Email Opt Out` option is set, this method determines the behavior of the `sendEmail()` call. If you add recipients by their email addresses, the opt-out settings for those recipients aren't checked and those recipients always receive the email.

Signature

```
public void setOptOutPolicy(String emailOptOutPolicy)
```

Parameters

*emailOptOutPolicy*Type: [String](#)Possible values of the *emailOptOutPolicy* parameter are:

- **SEND** (default)—The email is sent to all recipients and the `Email Opt Out` option of the recipients is ignored.
- **FILTER**—No email is sent to the recipients that have the `Email Opt Out` option set and emails are sent to the other recipients.
- **REJECT**—If any of the recipients have the `Email Opt Out` option set, `sendEmail()` throws an error and no email is sent.

Return Value

Type: void

Example

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The `FILTER` option causes the email to be sent only to recipients that haven't opted out from email. This example uses dot notation of the email properties, which is equivalent to using the set methods.

```
Messaging.SingleEmailMessage message = new Messaging.SingleEmailMessage();
// Set recipients to two contact IDs.
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { '003D000000QDexS', '003D000000QDfw5' };
message.optOutPolicy = 'FILTER';
message.subject = 'Opt Out Test Message';
message.plainTextBody = 'This is the message body.';
Messaging.SingleEmailMessage[] messages =
    new List<Messaging.SingleEmailMessage> {message};
Messaging.SendEmailResult[] results = Messaging.sendEmail(messages);
if (results[0].success) {
    System.debug('The email was sent successfully.');
```

setPlainTextBody (plainTextBody)

Optional. The text version of the email, specified by the sender. You must specify a value for `setTemplateId`, `setHtmlBody`, or `setPlainTextBody`. Or, you can define both `setHtmlBody` and `setPlainTextBody`.

Signature

```
public Void setPlainTextBody(String plainTextBody)
```

Parameters

*plainTextBody*Type: [String](#)

Return Value

Type: Void

setOrgWideEmailAddressId(emailAddressId)

Optional. The ID of the organization-wide email address associated with the outgoing email. The object's `DisplayName` field cannot be set if the `setSenderDisplayName` field is already set.

Signature

```
public Void setOrgWideEmailAddressId(ID emailAddressId)
```

Parameters

emailAddressId

Type: ID

Return Value

Type: Void

setReferences(references)

Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Signature

```
public Void setReferences(String references)
```

Parameters

references

Type: String

Return Value

Type: Void

setSubject(subject)

Optional. The email subject line. If you are using an email template, the subject line of the template overrides this value.

Signature

```
public Void setSubject(String subject)
```

Parameters

subject

Type: String

Return Value

Type: Void

setTargetObjectId(targetObjectId)

Required if using a template, optional otherwise. The ID of the contact, lead, or user to which the email will be sent. The ID you specify sets the context and ensures that merge fields in the template contain the correct data.

Signature

```
public Void setTargetObjectId(ID targetObjectId)
```

Parameters

targetObjectId

Type: ID

Return Value

Type: Void

Usage

Do not specify the IDs of records that have the `Email Opt Out` option selected.

All emails must have a recipient value in at least one of the following fields:

- `toAddresses`
- `ccAddresses`
- `bccAddresses`
- `targetObjectId`

setTemplateId(templateId)

Required if using a template, optional otherwise. The ID of the template used to create the email.

Signature

```
public Void setTemplateId(ID templateId)
```

Parameters

templateId

Type: ID

Return Value

Type: Void

setToAddresses (toAddresses)

Optional. A list of email addresses or object IDs of the contacts, leads, and users you're sending the email to. The maximum number of email addresses allowed is 100.

Signature

```
public void setToAddresses(String[] toAddresses)
```

Parameters

toAddresses
Type: [String\[\]](#)

Return Value

Type: void

Usage

All emails must have a recipient value in at least one of the following fields:

- *toAddresses*
- *ccAddresses*
- *bccAddresses*
- *targetObjectId*

setTreatBodiesAsTemplate (treatAsTemplate)

Optional. If set to `true`, the subject, plain text, and HTML text bodies of the email are treated as template data.

Signature

```
public void setTreatBodiesAsTemplate(Boolean treatAsTemplate)
```

Parameters

treatAsTemplate
Type: [Boolean](#)

Return Value

Type: void

setTreatTargetObjectAsRecipient (treatAsRecipient)

Optional. If set to `true`, the *targetObjectId* (a contact, lead, or user) is the recipient of the email. If set to `false`, the *targetObjectId* is supplied as the *whoId* field for template rendering but isn't a recipient of the email. The default is `true`.

Signature

```
public void setTreatTargetObjectAsRecipient (Boolean treatAsRecipient)
```

Parameters

treatAsRecipient
Type: Boolean

Return Value

Type: void

Usage

Note: You can set TO, CC, and BCC addresses using the email messaging methods regardless of whether a template is used for the email or the target object is a recipient.

setWhatId(whatId)

If you specify a contact for the `targetObjectId` field, you can specify an optional `whatId` as well. This helps to further ensure that merge fields in the template contain the correct data.

Signature

```
public Void setWhatId(ID whatId)
```

Parameters

whatId
Type: ID

Return Value

Type: Void

Usage

The value must be one of the following types:

- Account
- Asset
- Campaign
- Case
- Contract
- Opportunity
- Order
- Product
- Solution

- [Custom](#)

Metadata Namespace

The `Metadata` namespace provides classes and methods for working with custom metadata in Salesforce.

Salesforce uses metadata types and components to represent org configuration and customization. Metadata is used for org settings that admins control or configuration information applied by installed apps and packages. Use the classes in the `Metadata` namespace to access metadata from within Apex code.

Metadata access in Apex is available for Apex classes using API version 40.0 and later.

For more information, see [Metadata](#).

The following are the classes in the `Metadata` namespace.

IN THIS SECTION:

[AnalyticsCloudComponentLayoutItem Class](#)

Represents the settings for a Wave Analytics dashboard on a standard or custom page.

[ConsoleComponent Class](#)

Represents a custom console component on a section of a page layout.

[Container Class](#)

Represents a location and style in which to display more than one custom console component in the sidebars of the console.

[CustomConsoleComponents Class](#)

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

[CustomMetadata Class](#)

Represents records of custom metadata types.

[CustomMetadataValue Class](#)

Represents custom metadata values for a custom metadata component.

[DeployCallback Interface](#)

An interface for metadata deployment callback classes.

[DeployCallbackContext Class](#)

Represents context information for a deployment job.

[DeployContainer Class](#)

Represents a container for custom metadata components to be deployed.

[DeployDetails Class](#)

Contains detailed information on deployed components.

[DeployMessage Class](#)

Represents result information for the deployment of a metadata component.

[DeployProblemType Enum](#)

Describes the problem type for an unsuccessful component deploy.

[DeployResult Class](#)

Represents the results of a metadata deployment.

[DeployStatus Enum](#)

The result status of a deployment.

[FeedItemTypeEnum Enum](#)

The type of feed item in a feed-based page layout.

[FeedLayout Class](#)

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

[FeedLayoutComponent Class](#)

Represents a component in the feed view of a feed-based page layout.

[FeedLayoutComponentType Enum](#)

Indicates the type of feed layout component.

[FeedLayoutFilter Class](#)

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

[FeedLayoutFilterPosition Enum](#)

Describes where the feed filters list is included in the layout.

[FeedLayoutFilterType Enum](#)

The type of feed layout filter.

[Layout Class](#)

Represents the metadata associated with a page layout.

[LayoutColumn Class](#)

Represents the items in a column within a layout section.

[LayoutHeader Enum](#)

Represents tagging types used for `Metadata.Layout.headers`

[LayoutItem Class](#)

Represents the valid values that define a layout item.

[LayoutSection Class](#)

Represents a section of a page layout, such as the Custom Links section.

[LayoutSectionStyle Enum](#)

Describes the possible styles for a layout section.

[Metadata Class](#)

An abstract base class that represents a custom metadata component.

[MetadataType Enum](#)

Represents the custom metadata components available in Apex.

[MetadataValue Class](#)

An abstract base class that represents a custom metadata component field.

[MiniLayout Class](#)

Represents a mini view of a record in the Console tab, hover details, and event overlays.

[Operations Class](#)

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

[PlatformActionList Class](#)

Represents the list of actions, and their order, that display in the Salesforce1 action bar for the layout.

[PlatformActionListContextEnum Enum](#)

Describes the different contexts of action lists.

[PlatformActionListItem Class](#)

Represents an action in the platform action list for a layout.

[PlatformActionTypeEnum Enum](#)

The type of action for a `PlatformActionListItem`.

[PrimaryTabComponents Class](#)

Represents custom console components on primary tabs in the Salesforce console.

[QuickActionList Class](#)

Represents the list of actions associated with the page layout.

[QuickActionListItem Class](#)

Represents an action in the `QuickActionList`.

[RelatedContent Class](#)

Represents the Mobile Cards section of the page layout.

[RelatedContentItem Class](#)

Represents an individual item in the `RelatedContent` list.

[RelatedList Class](#)

Represents related list custom components on the sidebars of the Salesforce console.

[RelatedListItem Class](#)

Represents an item in the related list in a page layout.

[ReportChartComponentLayoutItem Class](#)

Represents the settings for a report chart on a standard or custom page.

[ReportChartComponentSize Enum](#)

Describes the size of the displayed report chart component.

[SidebarComponent Class](#)

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

[SortOrder Enum](#)

Describes the sort order of a related list.

[SubtabComponents Class](#)

Represents custom console components on subtabs in the Salesforce console.

[SummaryLayoutStyleEnum Enum](#)

Describes the highlights panel style for a `SummaryLayout`.

[SummaryLayout Class](#)

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

[SummaryLayoutItem Class](#)

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

[UIBehavior Enum](#)

Describes the behavior for a layout item on a layout page.

AnalyticsCloudComponentLayoutItem Class

Represents the settings for a Wave Analytics dashboard on a standard or custom page.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “AnalyticsCloudComponentLayoutItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[AnalyticsCloudComponentLayoutItem Properties](#)

[AnalyticsCloudComponentLayoutItem Methods](#)

AnalyticsCloudComponentLayoutItem Properties

The following are properties for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

[assetType](#)

Specifies the type of Wave Analytics asset.

[devName](#)

Unique development name of the dashboard to add.

[error](#)

An error string that is populated only when an error occurred in the underlying dashboard.

[filter](#)

Dashboard filters for mapping data fields in the dashboard to the object’s fields.

[height](#)

Specifies the height of the dashboard, in pixels.

[hideOnError](#)

Controls whether users see a dashboard that has an error.

[showSharing](#)

If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn’t show the Share icon.

[showTitle](#)

If true, includes the dashboard’s title above the dashboard. If false, the dashboard appears without a title.

[width](#)

Specifies the width of the dashboard, in pixels or percentage.

assetType

Specifies the type of Wave Analytics asset.

Signature

```
public String assetType {get; set;}
```

Property Value

Type: [String](#)

devName

Unique development name of the dashboard to add.

Signature

```
public String devName {get; set;}
```

Property Value

Type: [String](#)

error

An error string that is populated only when an error occurred in the underlying dashboard.

Signature

```
public String error {get; set;}
```

Property Value

Type: [String](#)

filter

Dashboard filters for mapping data fields in the dashboard to the object's fields.

Signature

```
public String filter {get; set;}
```

Property Value

Type: [String](#)

height

Specifies the height of the dashboard, in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

hideOnError

Controls whether users see a dashboard that has an error.

Signature

```
public Boolean hideOnError {get; set;}
```

Property Value

Type: [Boolean](#)

showSharing

If set to true, and the dashboard is shareable the dashboard shows the Share icon. If set to false, the dashboard doesn't show the Share icon.

Signature

```
public Boolean showSharing {get; set;}
```

Property Value

Type: [Boolean](#)

showTitle

If true, includes the dashboard's title above the dashboard. If false, the dashboard appears without a title.

Signature

```
public Boolean showTitle {get; set;}
```

Property Value

Type: [Boolean](#)

width

Specifies the width of the dashboard, in pixels or percentage.

Signature

```
public String width {get; set;}
```

Property Value

Type: [String](#)

AnalyticsCloudComponentLayoutItem Methods

The following are methods for `AnalyticsCloudComponentLayoutItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

clone ()

Makes a duplicate copy of the `Metadata.AnalyticsCloudComponentLayoutItem`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

ConsoleComponent Class

Represents a custom console component on a section of a page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “ConsoleComponent” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[ConsoleComponent Properties](#)

[ConsoleComponent Methods](#)

ConsoleComponent Properties

The following are properties for `ConsoleComponent`.

IN THIS SECTION:

[height](#)

The height of the custom console component in pixels.

[location](#)

The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

[visualforcePage](#)

The unique name of the custom console component.

[width](#)

The width of the custom console component in pixels.

height

The height of the custom console component in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

location

The location of the custom console component on the page layout. Valid values are right, left, top, and bottom.

Signature

```
public String location {get; set;}
```

Property Value

Type: [String](#)

visualforcePage

The unique name of the custom console component.

Signature

```
public String visualforcePage {get; set;}
```

Property Value

Type: [String](#)

width

The width of the custom console component in pixels.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: [Integer](#)

ConsoleComponent Methods

The following are methods for `ConsoleComponent`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.ConsoleComponent`.

clone ()

Makes a duplicate copy of the `Metadata.ConsoleComponent`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

Container Class

Represents a location and style in which to display more than one custom console component in the sidebars of the console.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “Container” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[Container Properties](#)

[Container Methods](#)

Container Properties

The following are properties for `Container`.

IN THIS SECTION:

[height](#)

The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

[isContainerAutoSizeEnabled](#)

If set to true, stacked console components in the sidebars autosize vertically.

[region](#)

The location of the component's container (right, left, bottom, top).

[sidebarComponents](#)

Represents a specific custom console component to display in the components' container.

[style](#)

The style of the container in which to display multiple components (stack, tab, accordion).

[unit](#)

The unit of measurement, in pixels or percent, for the height or width of the components' container.

[width](#)

The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

height

The height of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

isContainerAutoSizeEnabled

If set to true, stacked console components in the sidebars autosize vertically.

Signature

```
public Boolean isContainerAutoSizeEnabled {get; set;}
```

Property Value

Type: [Boolean](#)

region

The location of the component's container (right, left, bottom, top).

Signature

```
public String region {get; set;}
```

Property Value

Type: [String](#)

sidebarComponents

Represents a specific custom console component to display in the components' container.

Signature

```
public List<Metadata.SidebarComponent> sidebarComponents {get; set;}
```

Property Value

Type: [List<Metadata.SidebarComponent>](#)

style

The style of the container in which to display multiple components (stack, tab, accordion).

Signature

```
public String style {get; set;}
```

Property Value

Type: [String](#)

unit

The unit of measurement, in pixels or percent, for the height or width of the components' container.

Signature

```
public String unit {get; set;}
```

Property Value

Type: [String](#)

width

The width of the component's container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: [Integer](#)

Container Methods

The following are methods for `Container`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.Container`.

clone()

Makes a duplicate copy of the `Metadata.Container`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomConsoleComponents Class

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “CustomConsoleComponents” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[CustomConsoleComponents Properties](#)

[CustomConsoleComponents Methods](#)

CustomConsoleComponents Properties

The following are properties for `CustomConsoleComponents`.

IN THIS SECTION:

[primaryTabComponents](#)

Represents custom console components on primary tabs in the Salesforce console.

[subtabComponents](#)

Represents custom console components on subtabs in the Salesforce console.

primaryTabComponents

Represents custom console components on primary tabs in the Salesforce console.

Signature

```
public Metadata.PrimaryTabComponents primaryTabComponents {get; set;}
```

Property Value

Type: [Metadata.PrimaryTabComponents](#)

subtabComponents

Represents custom console components on subtabs in the Salesforce console.

Signature

```
public Metadata.SubtabComponents subtabComponents {get; set;}
```

Property Value

Type: [Metadata.SubtabComponents](#)

CustomConsoleComponents Methods

The following are methods for `CustomConsoleComponents`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

clone ()

Makes a duplicate copy of the `Metadata.CustomConsoleComponents`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

CustomMetadata Class

Represents records of custom metadata types.

Namespace

[Metadata](#)

Usage

Use `Metadata.CustomMetadata` to represent records of custom metadata types in Apex. For more information, see [Custom Metadata Types](#) in the *Metadata API Developer Guide*.

Example

```
// Set up custom metadata to be created in the subscriber org.
Metadata.CustomMetadata customMetadata = new Metadata.CustomMetadata();
customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'customField__c';
customField.value = 'New value';

customMetadata.values.add(customField);
```

IN THIS SECTION:

[CustomMetadata Properties](#)

[CustomMetadata Methods](#)

CustomMetadata Properties

The following are properties for `CustomMetadata`.

IN THIS SECTION:

[description](#)

The description of the custom metadata.

[label](#)

The label of the custom metadata record.

[protected_x](#)

Property that describes whether the custom metadata record is a protected component.

[values](#)

A list of custom metadata values, such as custom fields, for the custom metadata record.

description

The description of the custom metadata.

Signature

```
public String description {get; set;}
```

Property Value

Type: [String](#)

label

The label of the custom metadata record.

Signature

```
public String label {get; set;}
```

Property Value

Type: [String](#)

protected_x

Property that describes whether the custom metadata record is a protected component.

Signature

```
public Boolean protected_x {get; set;}
```

Property Value

Type: [Boolean](#)

values

A list of custom metadata values, such as custom fields, for the custom metadata record.

Signature

```
public List<Metadata.CustomMetadataValue> values {get; set;}
```

Property Value

Type: [List<Metadata.CustomMetadataValue>](#)

CustomMetadata Methods

The following are methods for `CustomMetadata`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.CustomMetadata`.

clone()

Makes a duplicate copy of the `Metadata.CustomMetadata`.

Signature

```
public Object clone()
```

Return Value

Type: Object

CustomMetadataValue Class

Represents custom metadata values for a custom metadata component.

Namespace

[Metadata](#)

Usage

Use `Metadata.CustomMetadataValue` to access values for custom fields of custom metadata records.

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

Example

```
// Set a custom field value for a custom metadata record
Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
customField.field = 'CustomField1__c';
customField.value = 'New Value';
customMetadata.values.add(customField);
```

IN THIS SECTION:

[CustomMetadataValue Properties](#)

[CustomMetadataValue Methods](#)

CustomMetadataValue Properties

The following are properties for `CustomMetadataValue`.

IN THIS SECTION:

field

The field name for the custom metadata value.

value

The field value for the custom metadata value.

field

The field name for the custom metadata value.

Signature

```
public String field {get; set;}
```

Property Value

Type: [String](#)

value

The field value for the custom metadata value.

Signature

```
public Object value {get; set;}
```

Property Value

Type: Object

Supported Apex primitive types are:

- Boolean
- Date
- DateTime
- Decimal
- Double
- Integer
- Long
- String

When setting the value for relationship fields, use the qualified API name of the related metadata, not the ID.

For more information, see [Primitive Data Types](#).

CustomMetadataValue Methods

The following are methods for `CustomMetadataValue`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

clone()

Makes a duplicate copy of the `Metadata.CustomMetadataValue`.

Signature

```
public Object clone()
```

Return Value

Type: Object

DeployCallback Interface

An interface for metadata deployment callback classes.

Namespace

[Metadata](#)

Usage

You must provide a callback class for the asynchronous deployment of custom metadata through Apex. This class must implement the `Metadata.DeployCallback` interface.

Salesforce calls your `DeployCallback.handleResult()` method asynchronously once the queued deployment completes. Because the callback is called as asynchronous Apex after deployment, there may be a brief period where the deploy has completed, but your callback has not been called yet.

IN THIS SECTION:

[DeployCallback Methods](#)

[DeployCallback Example Implementation](#)

DeployCallback Methods

The following are methods for `DeployCallback`.

IN THIS SECTION:

[handleResult\(var1, var2\)](#)

Method that is called when the asynchronous deployment of custom metadata completes.

handleResult(var1, var2)

Method that is called when the asynchronous deployment of custom metadata completes.

Signature

```
public void handleResult (Metadata.DeployResult var1, Metadata.DeployCallbackContext var2)
```

Parameters

var1

Type: [Metadata.DeployResult](#)

The results of the asynchronous deployment.

var2

Type: [Metadata.DeployCallbackContext](#)

The context for the queued asynchronous deployment job.

Return Value

Type: void

DeployCallback Example Implementation

This is an example implementation of the `Metadata.DeployCallback` interface.

```
public class MyCallback implements Metadata.DeployCallback {
    public void handleResult (Metadata.DeployResult result,
                             Metadata.DeployCallbackContext context) {
        if (result.status == Metadata.DeployStatus.Succeeded) {
            // Deployment was successful
        } else {
            // Deployment was not successful
        }
    }
}
```

The following example uses this implementation for a deployment.

```
// Setup callback and deploy
MyCallback callback = new MyCallback();
Metadata.Operations.enqueueDeployment (mdContainer, callback);
```

DeployCallbackContext Class

Represents context information for a deployment job.

Namespace

[Metadata](#)

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of `Metadata.DeployCallbackContext` in an asynchronous call to your implementation of `handleResult ()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                        Metadata.DeployCallbackContext context) {
    // Check the callback job ID for the deployment
    Id jobId = context.getCallbackJobId();
    // ...process the results...
}
```

IN THIS SECTION:

[DeployCallbackContext Methods](#)

DeployCallbackContext Methods

The following are methods for `DeployCallbackContext`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.DeployCallbackContext`.

[getCallbackJobId\(\)](#)

Gets the asynchronous Apex job ID for the callback job.

clone ()

Makes a duplicate copy of the `Metadata.DeployCallbackContext`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

getCallbackJobId ()

Gets the asynchronous Apex job ID for the callback job.

Signature

```
public Id getCallbackJobId ()
```

Return Value

Type: Id

DeployContainer Class

Represents a container for custom metadata components to be deployed.

Namespace

[Metadata](#)

Usage

Use `Metadata.DeployContainer` to manage custom metadata components for deployment. A container must have one or more components before being deployed.

Example

```
// Use DeployContainer for deployment
Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
mdContainer.addMetadata(customMetadata);

...

// Enqueue deploy
Metadata.Operations.enqueueDeployment(mdContainer, callback);
```

IN THIS SECTION:

[DeployContainer Methods](#)

DeployContainer Methods

The following are methods for `DeployContainer`.

IN THIS SECTION:

[addMetadata\(md\)](#)

Add a custom metadata component to the container.

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.DeployContainer`.

[getMetadata\(\)](#)

Retrieves a list of custom metadata components from the container.

[removeMetadata\(md\)](#)

Removes a metadata component from the container.

[removeMetadataByFullName\(fullName\)](#)

Removes a metadata component from the container using the component's full name.

addMetadata (md)

Add a custom metadata component to the container.

Signature

```
public void addMetadata (Metadata.Metadata md)
```

Parameters

md

Type: [Metadata.Metadata](#)

A custom metadata component class that derives from `Metadata.Metadata`. Avoid adding components to a `Metadata.DeployContainer` that have the same `Metadata.Metadata.fullName` because it causes deployment errors.

Return Value

Type: void

clone ()

Makes a duplicate copy of the `Metadata.DeployContainer`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

getMetadata ()

Retrieves a list of custom metadata components from the container.

Signature

```
public List<Metadata.Metadata> getMetadata ()
```

Return Value

Type: [List<Metadata.Metadata>](#)

removeMetadata (md)

Removes a metadata component from the container.

Signature

```
public Boolean removeMetadata (Metadata.Metadata md)
```

Parameters

md

Type: [Metadata.Metadata](#)

Metadata component to remove.

Return Value

Type: [Boolean](#)

Returns `true` if the container changed as a result of the call.

removeMetadataByFullName (fullName)

Removes a metadata component from the container using the component's full name.

Signature

```
public Boolean removeMetadataByFullName (String fullName)
```

Parameters

fullName

Type: [String](#)

Full name of the component to remove.

Return Value

Type: [Boolean](#)

Returns `true` if the container changed as a result of the call.

DeployDetails Class

Contains detailed information on deployed components.

Namespace

[Metadata](#)

Usage

Use this class to obtain a list of the successfully and unsuccessfully deployed components after a completed deployment by Salesforce in your `Metadata.DeployCallback` results.

IN THIS SECTION:

[DeployDetails Properties](#)

[DeployDetails Methods](#)

DeployDetails Properties

The following are properties for `DeployDetails`.

IN THIS SECTION:

[componentFailures](#)

Contains a list of information about components that failed to deploy.

[componentSuccesses](#)

Contains a list of information about components that deployed successfully.

componentFailures

Contains a list of information about components that failed to deploy.

Signature

```
public List<Metadata.DeployMessage> componentFailures {get; set;}
```

Property Value

Type: [List<Metadata.DeployMessage>](#)

componentSuccesses

Contains a list of information about components that deployed successfully.

Signature

```
public List<Metadata.DeployMessage> componentSuccesses {get; set;}
```

Property Value

Type: [List<Metadata.DeployMessage>](#)

DeployDetails Methods

The following are methods for `DeployDetails`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.DeployDetails`.

clone ()

Makes a duplicate copy of the `Metadata.DeployDetails`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

DeployMessage Class

Represents result information for the deployment of a metadata component.

Namespace

[Metadata](#)

Usage

Use `DeployMessage` to access detailed information about component deployments. Salesforce provides a list of `DeployMessages` for a completed deployment via the `DeployDetails` and `DeployResults` instances sent in the `DeployCallback.handleResult()` callback.

IN THIS SECTION:

[DeployMessage Properties](#)

[DeployMessage Methods](#)

DeployMessage Properties

The following are properties for `DeployMessage`.

IN THIS SECTION:

[changed](#)

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

[columnNumber](#)

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

[componentType](#)

The metadata type of the component in the deployment.

[created](#)

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

[createdDate](#)

The date and time when the component was created as a result of the deployment.

[deleted](#)

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

[fileName](#)

The name of the file in the metadata archive used to deploy the component.

fullName

Full name for the custom metadata component.

id

ID of the component that was deployed.

lineNumber

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

problem

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

problemType

Indicates the problem type, for example, an error or warning.

success

Indicates whether the component was successfully deployed (true) or not (false).

changed

Determines whether the component was changed after deployment. If true, the component was changed as a result of the deployment. If false, the deployed component was the same as the corresponding component already in the org.

Signature

```
public Boolean changed {get; set;}
```

Property Value

Type: [Boolean](#)

columnNumber

Each component is represented by a text file. If an error occurs during deployment, this property represents the column of the text file where the error occurred.

Signature

```
public Integer columnNumber {get; set;}
```

Property Value

Type: [Integer](#)

componentType

The metadata type of the component in the deployment.

Signature

```
public String componentType {get; set;}
```

Property Value

Type: [String](#)

created

If true, the component was created as a result of the deployment. If false, the component was modified as a result of the deployment.

Signature

```
public Boolean created {get; set;}
```

Property Value

Type: [Boolean](#)

createdDate

The date and time when the component was created as a result of the deployment.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: [Datetime](#)

deleted

If true, the component was deleted as a result of the deployment. If false, the component was either new or modified as result of the deployment.

Signature

```
public Boolean deleted {get; set;}
```

Property Value

Type: [Boolean](#)

fileName

The name of the file in the metadata archive used to deploy the component.

Signature

```
public String fileName {get; set;}
```

Property Value

Type: [String](#)

fullName

Full name for the custom metadata component.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: [String](#)

id

ID of the component that was deployed.

Signature

```
public Id id {get; set;}
```

Property Value

Type: [Id](#)

lineNumber

Each component is represented by a text file. If an error occurs during deployment, this field represents the line number of the text file where the error occurred.

Signature

```
public Integer lineNumber {get; set;}
```

Property Value

Type: [Integer](#)

problem

If an error or warning occurred, this field contains a description of the problem that caused the deployment to fail.

Signature

```
public String problem {get; set;}
```

Property Value

Type: [String](#)

problemType

Indicates the problem type, for example, an error or warning.

Signature

```
public Metadata.DeployProblemType problemType {get; set;}
```

Property Value

Type: [Metadata.DeployProblemType](#)

success

Indicates whether the component was successfully deployed (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

DeployMessage Methods

The following are methods for `DeployMessage`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.DeployMessage`.

clone ()

Makes a duplicate copy of the `Metadata.DeployMessage`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

DeployProblemType Enum

Describes the problem type for an unsuccessful component deploy.

Enum Values

The following are the values of the `Metadata.DeployProblemType` enum.

Value	Description
Error	The deploy problem is an error.
Warning	The deploy problem is a warning.

DeployResult Class

Represents the results of a metadata deployment.

Namespace

[Metadata](#)

Usage

After an asynchronous metadata deployment finishes, Salesforce provides an instance of `Metadata.DeployResult` in a call to your implementation of `handleResult()` in your `Metadata.DeployCallback` class.

Example

```
public void handleResult(Metadata.DeployResult result,
                        Metadata.DeployCallbackContext context) {
    if (result.status == Metadata.DeployStatus.Succeeded) {
        // Deployment was successful
    } else {
        // Deployment was not successful
    }
}
```

IN THIS SECTION:

[DeployResult Properties](#)

[DeployResult Methods](#)

DeployResult Properties

The following are properties for `DeployResult`.

IN THIS SECTION:

[canceledBy](#)

ID of the user who canceled the queued deployment.

[canceledByName](#)

Full name of the user who canceled the queued deployment.

[checkOnly](#)

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

[completedDate](#)

Date and time for when the deployment process ended.

[createdBy](#)

ID of the user who created the deployment job.

[createdByName](#)

Full name of the user who created the deployment job.

[createdDate](#)

Date and time the deployment job was first queued.

[details](#)

Provides the details for components in a completed deployment.

[done](#)

Indicates whether Salesforce finished processing the deployment.

[errorMessage](#)

Message corresponding to the values in the `errorStatusCode` property, if any.

[errorStatusCode](#)

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessageField` property.

[id](#)

ID of the deployment job.

[ignoreWarnings](#)

Specifies whether a deployment continues, even if the deployment generates warnings.

[lastModifiedDate](#)

Date and time of the last update for the deployment process.

[messages](#)

A list of all the detail messages for a deployment.

[numberComponentErrors](#)

The number of components that generated errors during the deployment.

[numberComponentsDeployed](#)

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

[numberComponentsTotal](#)

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

[rollbackOnError](#)

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

[startDate](#)

Date and time the deployment process began.

[stateDetail](#)

Indicates which component is being deployed.

[status](#)

Indicates the current state of the deployment.

success

Indicates whether the deployment was successful (true) or not (false).

canceledBy

ID of the user who canceled the queued deployment.

Signature

```
public String canceledBy {get; set;}
```

Property Value

Type: [String](#)

canceledByName

Full name of the user who canceled the queued deployment.

Signature

```
public String canceledByName {get; set;}
```

Property Value

Type: [String](#)

checkOnly

Indicates whether the deployment checked only the validity of the deployed files without making changes in the org. A check-only deployment does not deploy components or change the org in any way.

Signature

```
public Boolean checkOnly {get; set;}
```

Property Value

Type: [Boolean](#)

completedDate

Date and time for when the deployment process ended.

Signature

```
public Datetime completedDate {get; set;}
```

Property Value

Type: [Datetime](#)

createdBy

ID of the user who created the deployment job.

Signature

```
public String createdBy {get; set;}
```

Property Value

Type: [String](#)

createdByName

Full name of the user who created the deployment job.

Signature

```
public String createdByName {get; set;}
```

Property Value

Type: [String](#)

createdDate

Date and time the deployment job was first queued.

Signature

```
public Datetime createdDate {get; set;}
```

Property Value

Type: [Datetime](#)

details

Provides the details for components in a completed deployment.

Signature

```
public Metadata.DeployDetails details {get; set;}
```

Property Value

Type: [Metadata.DeployDetails](#)

done

Indicates whether Salesforce finished processing the deployment.

Signature

```
public Boolean done {get; set;}
```

Property Value

Type: [Boolean](#)

errorMessage

Message corresponding to the values in the `errorStatusCode` property, if any.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: [String](#)

errorStatusCode

If an error occurs during deployment, a status code is returned. The message corresponding to the status code is returned in the `errorMessage` field property.

Signature

```
public String errorStatusCode {get; set;}
```

Property Value

Type: [String](#)

For a description of each status code value, see “[StatusCode](#)” under “[Core Data Types Used in API Calls](#)” in the [SOAP API Developer Guide](#).

id

ID of the deployment job.

Signature

```
public Id id {get; set;}
```

Property Value

Type: [Id](#)

ignoreWarnings

Specifies whether a deployment continues, even if the deployment generates warnings.

Signature

```
public Boolean ignoreWarnings {get; set;}
```

Property Value

Type: [Boolean](#)

lastModifiedDate

Date and time of the last update for the deployment process.

Signature

```
public Datetime lastModifiedDate {get; set;}
```

Property Value

Type: [Datetime](#)

messages

A list of all the detail messages for a deployment.

Signature

```
public List<Metadata.DeployMessage> messages {get; set;}
```

Property Value

Type: [List<Metadata.DeployMessage>](#)

numberComponentErrors

The number of components that generated errors during the deployment.

Signature

```
public Integer numberComponentErrors {get; set;}
```

Property Value

Type: [Integer](#)

numberComponentsDeployed

The number of components deployed in the deployment process. Use this value with the `numberComponentsTotal` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsDeployed {get; set;}
```

Property Value

Type: [Integer](#)

numberComponentsTotal

The total number of components in the deployment. Use this value with the `numberComponentsDeployed` property to get an estimate of the deployment's progress.

Signature

```
public Integer numberComponentsTotal {get; set;}
```

Property Value

Type: [Integer](#)

rollbackOnError

Indicates whether any failure causes a complete rollback (true) or not (false) of the deployment.

Signature

```
public Boolean rollbackOnError {get; set;}
```

Property Value

Type: [Boolean](#)

startDate

Date and time the deployment process began.

Signature

```
public Datetime startDate {get; set;}
```

Property Value

Type: [Datetime](#)

stateDetail

Indicates which component is being deployed.

Signature

```
public String stateDetail {get; set;}
```

Property Value

Type: [String](#)

status

Indicates the current state of the deployment.

Signature

```
public Metadata.DeployStatus status {get; set;}
```

Property Value

Type: [Metadata.DeployStatus](#)

success

Indicates whether the deployment was successful (true) or not (false).

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: [Boolean](#)

DeployResult Methods

The following are methods for `DeployResult`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.DeployResult`.

clone ()

Makes a duplicate copy of the `Metadata.DeployResult`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

DeployStatus Enum

The result status of a deployment.

Usage

`Metadata.DeployResult.status` uses this enum to describe the results of the deployment.

Enum Values

The following are the values of the `Metadata.DeployStatus` enum.

Value	Description
<code>Canceled</code>	The queued deployment was canceled.
<code>Canceling</code>	The queued deployment is being canceled.
<code>Failed</code>	The deployment failed.
<code>InProgress</code>	The deployment has been started and is in progress.
<code>Pending</code>	The deployment has been queued but not started.
<code>Succeeded</code>	The deployment succeeded.
<code>SucceededPartial</code>	The deployment succeeded, but some components might not have been successfully deployed. Check <code>Metadata.DeployResult</code> for more details.

FeedItemTypeEnum Enum

The type of feed item in a feed-based page layout.

Enum Values

The following are the values of the `Metadata.FeedItemTypeEnum` enum.

Value	Description
<code>ActivityEvent</code>	Activity on tasks and events associated with a case. Available only on Case layouts.
<code>AdvancedTextPost</code>	Group announcements posted on a feed.
<code>AnnouncementPost</code>	Not used.
<code>ApprovalPost</code>	Approvals submitted on a feed.
<code>AttachArticleEvent</code>	Activity related to attaching articles to cases.
<code>BasicTemplateFeedItem</code>	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
<code>CallLogPost</code>	Activity from the Log a Call action. Available only on layouts for objects that support Activities (tasks and events).
<code>CanvasPost</code>	Posts a canvas app makes on a feed.
<code>CaseCommentPost</code>	Activity from the Case Note action. Available only on Case layouts.
<code>ChangeStatusPost</code>	Activity from the Change Status action. Available only on Case layouts.

Value	Description
ChatTranscriptPost	Activity related to attaching Live Agent chat transcripts to cases. Available only on Case layouts.
CollaborationGroupCreated	Creating a public group.
CollaborationGroupUnarchived	Not used.
ContentPost	Attaching a file to a post.
CreateRecordEvent	Creating a record from the publisher.
DashboardComponentAlert	Not used.
DashboardComponentSnapshot	Posting a dashboard snapshot on a feed.
EmailMessageEvent	Activity from the Email action. Available only on Case layouts.
FacebookPost	Not used.
LinkPost	Attaching a URL to a post.
MilestoneEvent	Changing the milestone status on a case. Available only on Case layouts.
PollPost	Posting a poll on a feed.
ProfileSkillPost	Adding skills to a user's Chatter profile.
QuestionPost	Posting a question on a feed.
ReplyPost	Activity from the Portal action. Available only on Case layouts.
RypplePost	Creating a Thanks badge in Work.com.
SocialPost	Activity on Twitter from the Social Post action.
TestItem	Creating a text post from the publisher.
TextPost	Making a change or group of changes to a tracked field.
TrackedChange	Not used.
Undefined	Undefined feed item.
UserStatus	Not used.

FeedLayout Class

Represents the values that define the feed view of a feed-based page layout. Feed-based layouts are available on Account, Case, Contact, Lead, Opportunity, custom, and external objects. They include a feed view and a detail view.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “FeedLayout” in the *Metadata API Developer Guide*.

IN THIS SECTION:

[FeedLayout Properties](#)

[FeedLayout Methods](#)

FeedLayout Properties

The following are properties for `FeedLayout`.

IN THIS SECTION:

[autocollapsePublisher](#)

Specifies whether the publisher is collapsed when the page loads (`true`) or not (`false`).

[compactFeed](#)

Specifies whether the feed-based page layout uses a compact feed (`true`) or not (`false`). If set to `true`, feed items on the page are collapsed by default, and the feed view has an updated design.

[feedFilterPosition](#)

Indicates where the feed filters list is included in the layout.

[feedFilters](#)

The individual filters displayed in the feed filters list.

[fullWidthFeed](#)

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

[hideSidebar](#)

Specifies whether the sidebar is hidden (`true`) or not (`false`).

[highlightExternalFeedItems](#)

Controls whether to highlight external feed items (`true`) or not (`false`).

[leftComponents](#)

The individual components displayed in the left column of the feed view.

[rightComponents](#)

Lists the individual components displayed in the right column of the feed view.

[useInlineFiltersInConsole](#)

Indicates whether to use inline filters in the Salesforce console.

autocollapsePublisher

Specifies whether the publisher is collapsed when the page loads (`true`) or not (`false`).

Signature

```
public Boolean autocollapsePublisher {get; set;}
```

Property Value

Type: [Boolean](#)

compactFeed

Specifies whether the feed-based page layout uses a compact feed (`true`) or not (`false`). If set to `true`, feed items on the page are collapsed by default, and the feed view has an updated design.

Signature

```
public Boolean compactFeed {get; set;}
```

Property Value

Type: [Boolean](#)

feedFilterPosition

Indicates where the feed filters list is included in the layout.

Signature

```
public Metadata.FeedLayoutFilterPosition feedFilterPosition {get; set;}
```

Property Value

Type: [FeedLayoutFilterPosition Enum](#)

feedFilters

The individual filters displayed in the feed filters list.

Signature

```
public List<Metadata.FeedLayoutFilter> feedFilters {get; set;}
```

Property Value

Type: [List<FeedLayoutFilter Class>](#).

fullWidthFeed

Specifies whether the feed expands horizontally to take up all available space on the page (`true`) or not (`false`).

Signature

```
public Boolean fullWidthFeed {get; set;}
```

Property Value

Type: [Boolean](#)

hideSidebar

Specifies whether the sidebar is hidden (`true`) or not (`false`).

Signature

```
public Boolean hideSidebar {get; set;}
```

Property Value

Type: [Boolean](#)

highlightExternalFeedItems

Controls whether to highlight external feed items (`true`) or not (`false`).

Signature

```
public Boolean highlightExternalFeedItems {get; set;}
```

Property Value

Type: [Boolean](#)

leftComponents

The individual components displayed in the left column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> leftComponents {get; set;}
```

Property Value

Type: [List<FeedLayoutComponent Class>](#)

rightComponents

Lists the individual components displayed in the right column of the feed view.

Signature

```
public List<Metadata.FeedLayoutComponent> rightComponents {get; set;}
```

Property Value

Type: [List<FeedLayoutComponent Class>](#)

useInlineFiltersInConsole

Indicates whether to use inline filters in the Salesforce console.

Signature

```
public Boolean useInlineFiltersInConsole {get; set;}
```

Property Value

Type: [Boolean](#)

FeedLayout Methods

The following are methods for `FeedLayout`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.FeedLayout`.

clone ()

Makes a duplicate copy of the `Metadata.FeedLayout`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

FeedLayoutComponent Class

Represents a component in the feed view of a feed-based page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “FeedLayoutComponent” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[FeedLayoutComponent Properties](#)

[FeedLayoutComponent Methods](#)

FeedLayoutComponent Properties

The following are properties for `FeedLayoutComponent`.

See `FeedLayoutComponent` in the [Metadata API Developer Guide](#)

IN THIS SECTION:

[componentType](#)

Represents a component in the feed view of a feed-based page layout. The type of component is required.

[height](#)

The height, in pixels, of the component. Doesn't apply to `standardComponents`

[page_x](#)

The name of the Visualforce page used as a custom component.

componentType

Represents a component in the feed view of a feed-based page layout. The type of component is required.

Signature

```
public Metadata.FeedLayoutComponentType componentType {get; set;}
```

Property Value

Type: [Metadata.FeedLayoutComponentType](#) on page 2006

height

The height, in pixels, of the component. Doesn't apply to `standardComponents`

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

page_x

The name of the Visualforce page used as a custom component.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: [String](#)

FeedLayoutComponent Methods

The following are methods for `FeedLayoutComponent`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

clone ()

Makes a duplicate copy of the `Metadata.FeedLayoutComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

FeedLayoutComponentType Enum

Indicates the type of feed layout component.

Enum Values

The following are the values of the `Metadata.FeedLayoutComponentType` enum.

Value	Description
CaseExperts	List of case experts.
CaseUnifiedFiles	List of all files attached to the case.
CustomButtons	Custom button.
CustomLinks	Custom link.
Followers	List of followers.
Following	Icon that toggles between a Follow button (if the user viewing a record doesn't already follow it) and a Following indicator (if the user viewing a record does follow it).
HelpAndToolLinks	Icons that link to the help topic for the page, the page layout, and, the printable view of the page. Available only on Case layouts.
Milestones	Milestone tracker, which lets users see the status of a milestone on a case. Available only on Case layouts.
SimilarCases	List of similar cases.
Topics	List of topics related to the record.
Visualforce	Custom Visualforce component.

FeedLayoutFilter Class

Represents a feed filter option in the feed view of a feed-based page layout. A filter can have only `standardFilter` or `feedItemType` set.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata .Layout](#) metadata components. For more information, see “FeedLayoutFilter” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[FeedLayoutFilter Properties](#)

[FeedLayoutFilter Methods](#)

FeedLayoutFilter Properties

The following are properties for `FeedLayoutFilter`.

IN THIS SECTION:

[feedFilterName](#)

The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

[feedFilterType](#)

The type of filter.

[feedItemType](#)

The type of feed item to display.

feedFilterName

The name of a `CustomFeedFilter` component. Names are prefixed with the name of the parent object. For example, `Case.MyCustomFeedFilter`.

Signature

```
public String feedFilterName {get; set;}
```

Property Value

Type: [String](#)

feedFilterType

The type of filter.

Signature

```
public Metadata.FeedLayoutFilterType feedFilterType {get; set;}
```

Property Value

Type: [FeedLayoutFilterType Enum](#)

feedItemType

The type of feed item to display.

Signature

```
public Metadata.FeedItemTypeEnum feedItemType {get; set;}
```

Property Value

Type: [FeedItemTypeEnum Enum](#)

FeedLayoutFilter Methods

The following are methods for `FeedLayoutFilter`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

clone ()

Makes a duplicate copy of the `Metadata.FeedLayoutFilter`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

FeedLayoutFilterPosition Enum

Describes where the feed filters list is included in the layout.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterPosition` enum.

Value	Description
CenterDropDown	As a drop-down list in the center column.
LeftFixed	As a fixed list in the left column.
LeftFloat	As a floating list in the left column.

FeedLayoutFilterType Enum

The type of feed layout filter.

Enum Values

The following are the values of the `Metadata.FeedLayoutFilterType` enum.

Value	Description
AllUpdates	Shows all feed items on a record.
Custom	Shows custom feed items.
FeedItemType	Shows feed items only for a particular type of activity on the record.

Layout Class

Represents the metadata associated with a page layout.

Namespace

[Metadata](#)

Usage

Use this class to access layout metadata components. For more information, see [Layout](#) in the *Metadata API Developer Guide*.

IN THIS SECTION:

[Layout Properties](#)

[Layout Methods](#)

Layout Properties

The following are properties for `Layout`.

IN THIS SECTION:

[customButtons](#)

The custom buttons for this layout.

[customConsoleComponents](#)

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

[emailDefault](#)

Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

[excludeButtons](#)

List of standard buttons to exclude from this layout.

[feedLayout](#)

Represents the values that define the feed view of a feed-based page layout.

[headers](#)

Represents the layout headers used for tagging.

[layoutSections](#)

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

[miniLayout](#)

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

[multilineLayoutFields](#)

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

[platformActionList](#)

The list of actions, and their order, that display in the Salesforce1 action bar for the layout.

[quickActionList](#)

The list of quick actions that display in the full Salesforce site for the page layout.

[relatedContent](#)

The Related Content section of the page layout.

[relatedLists](#)

The related lists for the layout, listed in the order they appear in the user interface.

[relatedObjects](#)

The list of related objects that appears in the mini view of the console.

[runAssignmentRulesDefault](#)

Default value for the "run assignment rules" checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

[showEmailCheckbox](#)

Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

[showHighlightsPanel](#)

If set, the highlights panel displays on pages in the Salesforce console.

[showInteractionLogPanel](#)

If set, the interaction log displays on pages in the Salesforce console.

[showKnowledgeComponent](#)

Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

[showRunAssignmentRulesCheckbox](#)

Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

[showSolutionSection](#)

Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

[showSubmitAndAttachButton](#)

For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

[summaryLayout](#)

The summary layout for this layout.

customButtons

The custom buttons for this layout.

Signature

```
public List<String> customButtons {get; set;}
```

Property Value

Type: [List<String>](#)

customConsoleComponents

Represents custom console components (Visualforce pages, lookup fields, or related lists) on a page layout.

Signature

```
public Metadata.CustomConsoleComponents customConsoleComponents {get; set;}
```

Property Value

Type: [CustomConsoleComponents Class](#)

emailDefault

Default value for the email checkbox. Only relevant if the `showEmailCheckbox` property is set.

Signature

```
public Boolean emailDefault {get; set;}
```

Property Value

Type: [Boolean](#)

excludeButtons

List of standard buttons to exclude from this layout.

Signature

```
public List<String> excludeButtons {get; set;}
```

Property Value

Type: [List<String>](#)

feedLayout

Represents the values that define the feed view of a feed-based page layout.

Signature

```
public Metadata.FeedLayout feedLayout {get; set;}
```

Property Value

Type: [Metadata.FeedLayout](#)

headers

Represents the layout headers used for tagging.

Signature

```
public List<Metadata.LayoutHeader> headers {get; set;}
```

Property Value

Type: [List<Metadata.LayoutHeader>](#)

layoutSections

The main sections of the layout containing fields, s-controls, and custom links. The order here determines the layout order.

Signature

```
public List<Metadata.LayoutSection> layoutSections {get; set;}
```

Property Value

Type: [List<Metadata.LayoutSection>](#)

miniLayout

Represents a minilayout, which is used in the mini view of a record in the Console tab, hover details, and event overlays.

Signature

```
public Metadata.MiniLayout miniLayout {get; set;}
```

Property Value

Type: [Metadata.MiniLayout](#)

multilineLayoutFields

Fields for special multiline layout fields which appear in OpportunityProduct layouts.

Signature

```
public List<String> multilineLayoutFields {get; set;}
```

Property Value

Type: [List<String>](#)

platformActionList

The list of actions, and their order, that display in the Salesforce1 action bar for the layout.

Signature

```
public Metadata.PlatformActionList platformActionList {get; set;}
```

Property Value

Type: [Metadata.PlatformActionList](#)

quickActionList

The list of quick actions that display in the full Salesforce site for the page layout.

Signature

```
public Metadata.QuickActionList quickActionList {get; set;}
```

Property Value

Type: [Metadata.QuickActionL](#)

relatedContent

The Related Content section of the page layout.

Signature

```
public Metadata.RelatedContent relatedContent {get; set;}
```

Property Value

Type: [Metadata.RelatedContent](#)

relatedLists

The related lists for the layout, listed in the order they appear in the user interface.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: [List<Metadata.RelatedListItem>](#)

relatedObjects

The list of related objects that appears in the mini view of the console.

Signature

```
public List<String> relatedObjects {get; set;}
```

Property Value

Type: [List<String>](#)

runAssignmentRulesDefault

Default value for the “run assignment rules” checkbox. Only relevant if the `showRunAssignmentRulesCheckbox` property is set.

Signature

```
public Boolean runAssignmentRulesDefault {get; set;}
```

Property Value

Type: [Boolean](#)

showEmailCheckbox

Controls whether to show the email checkbox. Only allowed on Case, CaseClose, and Task layouts. The default state of checkbox is controlled by the `emailDefault` property.

Signature

```
public Boolean showEmailCheckbox {get; set;}
```

Property Value

Type: [Boolean](#)

showHighlightsPanel

If set, the highlights panel displays on pages in the Salesforce console.

Signature

```
public Boolean showHighlightsPanel {get; set;}
```

Property Value

Type: [Boolean](#)

showInteractionLogPanel

If set, the interaction log displays on pages in the Salesforce console.

Signature

```
public Boolean showInteractionLogPanel {get; set;}
```

Property Value

Type: [Boolean](#)

showKnowledgeComponent

Only allowed on Case layouts. If set, the Knowledge sidebar displays on cases in the Salesforce console.

Signature

```
public Boolean showKnowledgeComponent {get; set;}
```

Property Value

Type: [Boolean](#)

showRunAssignmentRulesCheckbox

Controls whether to show the Run Assignment Rules checkbox. Only allowed on Lead and Case layouts. The default state of checkbox is controlled by the `runAssignmentRulesDefault` property.

Signature

```
public Boolean showRunAssignmentRulesCheckbox {get; set;}
```

Property Value

Type: [Boolean](#)

showSolutionSection

Only allowed on CaseClose layout. If set, the built-in solution information section shows up on the page.

Signature

```
public Boolean showSolutionSection {get; set;}
```

Property Value

Type: [Boolean](#)

showSubmitAndAttachButton

For Cast layouts only. If set, the Submit & Add Attachment button displays on case edit pages to portal users in the Customer Portal.

Signature

```
public Boolean showSubmitAndAttachButton {get; set;}
```

Property Value

Type: [Boolean](#)

summaryLayout

The summary layout for this layout.

Signature

```
public Metadata.SummaryLayout summaryLayout {get; set;}
```

Property Value

Type: [Metadata.SummaryLayout](#)

Layout Methods

The following are methods for `Layout`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.Layout`.

clone ()

Makes a duplicate copy of the `Metadata.Layout`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

LayoutColumn Class

Represents the items in a column within a layout section.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata . Layout](#) metadata components. For more information, see “LayoutColumn” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[LayoutColumn Properties](#)

[LayoutColumn Methods](#)

LayoutColumn Properties

The following are properties for `LayoutColumn`.

IN THIS SECTION:

[layoutItems](#)

The individual items within a column (ordered from top to bottom).

[reserved](#)

This field is reserved for Salesforce.

layoutItems

The individual items within a column (ordered from top to bottom).

Signature

```
public List<Metadata.LayoutItem> layoutItems {get; set;}
```

Property Value

Type: [List<Metadata.LayoutItem>](#)

reserved

This field is reserved for Salesforce.

Signature

```
public String reserved {get; set;}
```

Property Value

Type: [String](#)

LayoutColumn Methods

The following are methods for `LayoutColumn`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.LayoutColumn`.

clone ()

Makes a duplicate copy of the `Metadata.LayoutColumn`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

LayoutHeader Enum

Represents tagging types used for `Metadata.Layout.headers`

Enum Values

The following are the values of the `Metadata.LayoutHeader` enum.

Value	Description
<code>PersonalTagging</code>	Tag is set to private user.
<code>PublicTagging</code>	Tag is viewable to any user who can access the record.

LayoutItem Class

Represents the valid values that define a layout item.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “LayoutItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[LayoutItem Properties](#)[LayoutItem Methods](#)

LayoutItem Properties

The following are properties for `LayoutItem`.

IN THIS SECTION:

[analyticsCloudComponent](#)

A Wave Analytics dashboard component on a page.

[behavior](#)

Determines the field behavior.

[canvas](#)

References a canvas app.

[component](#)

References a component.

[customLink](#)

The custom link reference.

[emptySpace](#)

Controls if this layout item is a blank space.

[field](#)

The field name reference, relative to the layout, for example "Description" or "MyField__c".

[height](#)

For s-controls and pages only, the height in pixels.

[page_x](#)

Reference to a Visualforce page.

[reportChartComponent](#)

Refers to a report chart that you can add to a standard or custom object page.

[scontrol](#)

Reference to an s-control.

[showLabel](#)

For s-control and pages only, whether to show the label.

[showScrollbars](#)

For s-control and pages only, whether to show scrollbars.

[width](#)

For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

analyticsCloudComponent

A Wave Analytics dashboard component on a page.

Signature

```
public Metadata.AnalyticsCloudComponentLayoutItem analyticsCloudComponent {get; set;}
```

Property Value

Type: [Metadata.AnalyticsCloudComponentLayoutItem](#)

behavior

Determines the field behavior.

Signature

```
public Metadata.UiBehavior behavior {get; set;}
```

Property Value

Type: [Metadata.UiBehavior](#)

canvas

References a canvas app.

Signature

```
public String canvas {get; set;}
```

Property Value

Type: [String](#)

component

References a component.

Signature

```
public String component {get; set;}
```

Property Value

Type: [String](#)

customLink

The custom link reference.

Signature

```
public String customLink {get; set;}
```

Property Value

Type: [String](#)

emptySpace

Controls if this layout item is a blank space.

Signature

```
public Boolean emptySpace {get; set;}
```

Property Value

Type: [Boolean](#)

field

The field name reference, relative to the layout, for example "Description" or "MyField__c".

Signature

```
public String field {get; set;}
```

Property Value

Type: [String](#)

height

For s-controls and pages only, the height in pixels.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

page_x

Reference to a Visualforce page.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: [String](#)

reportChartComponent

Refers to a report chart that you can add to a standard or custom object page.

Signature

```
public Metadata.ReportChartComponentLayoutItem reportChartComponent {get; set;}
```

Property Value

Type: [Metadata.ReportChartComponentLayoutItem](#)

scontrol

Reference to an s-control.

Signature

```
public String scontrol {get; set;}
```

Property Value

Type: [String](#)

showLabel

For s-control and pages only, whether to show the label.

Signature

```
public Boolean showLabel {get; set;}
```

Property Value

Type: [Boolean](#)

showScrollbars

For s-control and pages only, whether to show scrollbars.

Signature

```
public Boolean showScrollbars {get; set;}
```

Property Value

Type: [Boolean](#)

width

For s-control and pages only, the width in pixels or percent. Pixel values are simply the number of pixels, for example, 500. Percentage values must include the percent sign, for example, 20%.

Signature

```
public String width {get; set;}
```

Property Value

Type: [String](#)

LayoutItem Methods

The following are methods for `LayoutItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.LayoutItem`.

clone ()

Makes a duplicate copy of the `Metadata.LayoutItem`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

LayoutSection Class

Represents a section of a page layout, such as the Custom Links section.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “LayoutSection” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[LayoutSection Properties](#)

[LayoutSection Methods](#)

LayoutSection Properties

The following are properties for `LayoutSection`.

IN THIS SECTION:

[customLabel](#)

Indicates if this section's label is custom or standard (built-in).

[detailHeading](#)

Controls if this section appears in the detail page.

[editHeading](#)

Controls if this section appears in the edit page.

[label](#)

The label; either standard or custom, based on the customLabel property.

[layoutColumns](#)

Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

[style](#)

The style of the layout for this section.

customLabel

Indicates if this section's label is custom or standard (built-in).

Signature

```
public Boolean customLabel {get; set;}
```

Property Value

Type: [Boolean](#)

detailHeading

Controls if this section appears in the detail page.

Signature

```
public Boolean detailHeading {get; set;}
```

Property Value

Type: [Boolean](#)

editHeading

Controls if this section appears in the edit page.

Signature

```
public Boolean editHeading {get; set;}
```

Property Value

Type: [Boolean](#)

label

The label; either standard or custom, based on the `customLabel` property.

Signature

```
public String label {get; set;}
```

Property Value

Type: [String](#)

layoutColumns

Lists the layout columns. You can have one, two, or three columns, ordered left to right, are possible.

Signature

```
public List<Metadata.LayoutColumn> layoutColumns {get; set;}
```

Property Value

Type: [List<Metadata.LayoutColumn>](#)

style

The style of the layout for this section.

Signature

```
public Metadata.LayoutSectionStyle style {get; set;}
```

Property Value

Type: [Metadata.LayoutSectionStyle](#)

LayoutSection Methods

The following are methods for `LayoutSection`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.LayoutSection`.

clone()

Makes a duplicate copy of the `Metadata.LayoutSection`.

Signature

```
public Object clone()
```

Return Value

Type: Object

LayoutSectionStyle Enum

Describes the possible styles for a layout section.

Enum Values

The following are the values of the `Metadata.LayoutSectionStyle` enum.

Value	Description
<code>CustomLinks</code>	Contains custom links only
<code>OneColumn</code>	One column
<code>TwoColumnsLeftToRight</code>	Two columns, tab goes left to right
<code>TwoColumnsTopToBottom</code>	Two columns, tab goes top to bottom

Metadata Class

An abstract base class that represents a custom metadata component.

Namespace

[Metadata](#)

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component class that derives from `Metadata.Metadata`, such as `Metadata.CustomMetadata`. For more information, see [Metadata](#) in the *Metadata API Developer Guide*.

IN THIS SECTION:

[Metadata Properties](#)

[Metadata Methods](#)

Metadata Properties

The following are properties for `Metadata`.

IN THIS SECTION:**fullName**

The full name of the custom metadata, which can include the namespace, type, and component name.

fullName

The full name of the custom metadata, which can include the namespace, type, and component name.

Signature

```
public String fullName {get; set;}
```

Property Value

Type: [String](#)

The format of the full name can include the namespace, metadata type, and metadata component name. If you're updating components in a namespace, you also need to qualify the namespace for the component in the full name. For example, the full name for a custom metadata "MDType1__mdt" component named "Component1" that is contained in the "myPackage" namespace is "myPackage__MDType1__mdt.myPackage__Component1". For more information on full name formats for different metadata types, see reference documentation on the metadata types in the [Metadata API Developer Guide](#).

Metadata Methods

The following are methods for `Metadata`.

IN THIS SECTION:**clone()**

Makes a duplicate copy of the `Metadata.Metadata`.

clone ()

Makes a duplicate copy of the `Metadata.Metadata`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

MetadataType Enum

Represents the custom metadata components available in Apex.

Enum Values

The following are the values of the `Metadata.MetadataType` enum.

Value	Description
CustomMetadata	Records of custom metadata types
Layout	Layouts

MetadataValue Class

An abstract base class that represents a custom metadata component field.

Namespace

[Metadata](#)

Usage

You can't create instances of this abstract class. Instead, create an instance of a specific custom metadata component value class that derives from `Metadata.MetadataValue`, such as [Metadata.CustomMetadataValue](#).

IN THIS SECTION:

[MetadataValue Methods](#)

MetadataValue Methods

The following are methods for `MetadataValue`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.MetadataValue`.

clone ()

Makes a duplicate copy of the `Metadata.MetadataValue`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

MiniLayout Class

Represents a mini view of a record in the Console tab, hover details, and event overlays.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “MiniLayout” in the *Metadata API Developer Guide*.

IN THIS SECTION:

[MiniLayout Properties](#)

[MiniLayout Methods](#)

MiniLayout Properties

The following are properties for `MiniLayout`.

IN THIS SECTION:

[fields](#)

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

[relatedLists](#)

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

fields

The fields for the mini-layout, listed in the order they appear in the UI. Fields that appear in the mini-layout must appear in the main layout.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: [List<String>](#)

relatedLists

The mini related lists, listed in the order they appear in the UI. You cannot set sorting on mini related lists. Fields that appear in the mini related lists must appear in the main layout.

Signature

```
public List<Metadata.RelatedListItem> relatedLists {get; set;}
```

Property Value

Type: [List<Metadata.RelatedListItem>](#)

MiniLayout Methods

The following are methods for `MiniLayout`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.MiniLayout`.

clone ()

Makes a duplicate copy of the `Metadata.MiniLayout`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

Operations Class

Represents a class to execute metadata operations, such as retrieving or deploying custom metadata.

Namespace

[Metadata](#)

Usage

Use the `Metadata.Operations` class to execute metadata operations. For more information on use cases and restrictions of metadata operations in Apex, see [Metadata](#).

Example: Retrieve Metadata

The following example retrieves the “MyTestCustomMDType” custom metadata record from the subscriber org, and inspects the custom fields.

```
public class ReadMetadata {
    public void retrieveMetadata () {
        // List fullnames of components we want to retrieve
        List<String> componentNameList =
new List<String>{ 'ISVNamespace__TestCustomMDType.MyTestCustomMDType' };

        // Retrieve components that are records of custom metadata types
        // based on name
        List<Metadata.Metadata> components = Metadata.Operations.retrieve(
```

```

Metadata.MetadataType.CustomMetadata, componentNameList);
    Metadata.CustomMetadata customMetadataRecord = (Metadata.CustomMetadata)
components.get(0);

    // Check fields of retrieved component
List<Metadata.CustomMetadataValue> values = customMetadataRecord.values;
for (integer i = 0; i < values.size(); i++) {
    if (values.get(i).field == 'testField__c' &&
        values.get(i).value == 'desired value') {
        // ...process accordingly...
    }
}
}
}
}

```

Example: Deploy Metadata

The following example uses the Metadata API in Apex to update the customField custom field value of the MetadataRecordName custom metadata record and deploy this change into the subscriber org. Because the deployment is asynchronous, you must provide a callback class that implements the `Metadata.DeployCallback` interface, which is then used when the queued deployment completes.

```

public class CreateMetadata{
    public void updateAndDeployMetadata() {
        // Setup custom metadata to be created in the subscriber org.
        Metadata.CustomMetadata customMetadata = new Metadata.CustomMetadata();
        customMetadata.fullName = 'ISVNamespace__MetadataTypeName.MetadataRecordName';

        Metadata.CustomMetadataValue customField = new Metadata.CustomMetadataValue();
        customField.field = 'customField__c';
        customField.value = 'New value';

        customMetadata.values.add(customField);

        Metadata.DeployContainer mdContainer = new Metadata.DeployContainer();
        mdContainer.addMetadata(customMetadata);

        // Setup deploy callback, MyDeployCallback implements
        // the Metadata.DeployCallback interface (code for
        // this class not shown in this example)
        MyDeployCallback callback = new MyDeployCallback();

        // Enqueue custom metadata deployment
        Id jobId = Metadata.Operations.enqueueDeployment(mdContainer, callback);
    }
}

```

IN THIS SECTION:

[Operations Methods](#)

Operations Methods

The following are methods for `Operations`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.Operations`.

[enqueueDeployment\(container, callback\)](#)

Deploys custom metadata components asynchronously.

[retrieve\(type, fullNames\)](#)

Retrieves a list of custom metadata components.

clone ()

Makes a duplicate copy of the `Metadata.Operations`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

enqueueDeployment (container, callback)

Deploys custom metadata components asynchronously.

Signature

```
public static Id enqueueDeployment (Metadata.DeployContainer container,  
Metadata.DeployCallback callback)
```

Parameters

container

Type: [Metadata.DeployContainer](#)

Container that contains the set of metadata components to deploy.

callback

Type: [Metadata.DeployCallback](#)

A class that implements the `Metadata.DeployCallback` interface. Used by Salesforce to return information about the deployment results.

Return Value

Type: [Id](#)

ID of deployment request.

retrieve (type, fullNames)

Retrieves a list of custom metadata components.

Signature

```
public static List<Metadata.Metadata> retrieve (Metadata.MetadataType type, List<String> fullNames)
```

Parameters

type

Type: [Metadata.MetadataType](#)

The metadata component type.

fullNames

Type: [List<String>](#)

A list of component names to retrieve. For information on component name formats, see [Metadata.fullName\(\)](#).

Return Value

Type: [List<Metadata.Metadata>](#)

PlatformActionList Class

Represents the list of actions, and their order, that display in the Salesforce1 action bar for the layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “PlatformActionList” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[PlatformActionList Properties](#)

[PlatformActionList Methods](#)

PlatformActionList Properties

The following are properties for `PlatformActionList`.

IN THIS SECTION:

[actionListContext](#)

The context of the action list.

[platformActionListItems](#)

The actions in the platform action list.

[relatedSourceEntity](#)

When the `actionListContext` property is “RelatedList” or “RelatedListRecord”, this field represents the API name of the related list to which the action belongs.

actionListContext

The context of the action list.

Signature

```
public Metadata.PlatformActionListContextEnum actionListContext {get; set;}
```

Property Value

Type: [Metadata.PlatformActionListContextEnum](#)

platformActionListItems

The actions in the platform action list.

Signature

```
public List<Metadata.PlatformActionListItem> platformActionListItems {get; set;}
```

Property Value

Type: [List<Metadata.PlatformActionListItem>](#)

relatedSourceEntity

When the `actionListContext` property is “RelatedList” or “RelatedListRecord”, this field represents the API name of the related list to which the action belongs.

Signature

```
public String relatedSourceEntity {get; set;}
```

Property Value

Type: [String](#)

PlatformActionList Methods

The following are methods for `PlatformActionList`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.PlatformActionList`.

clone ()

Makes a duplicate copy of the `Metadata.PlatformActionList`.

Signature

```
public Object clone()
```

Return Value

Type: Object

PlatformActionListContextEnum Enum

Describes the different contexts of action lists.

Enum Values

The following are the values of the `Metadata.PlatformActionListContextEnum` enum.

Value	Description
Assistant	Assistant context.
BannerPhoto	Banner photo context.
Chatter	Chatter context.
Dockable	Dockable context.
FeedElement	Feed element context.
Flexipage	Flexipage context.
Global_x	Global context.
ListView	Listview context.
ListViewDefinition	Listview definition context.
ListViewRecord	Listview record context.
Lookup	Lookup context.
MruList	MRU list context.
MruRow	MRU row context.
ObjectHomeChart	Object home chart context.
Photo	Photo context
Record	Record context.
RecordEdit	Record edit context
RelatedList	Related list context.

Value	Description
<code>RelatedListRecord</code>	Related list record context.

PlatformActionListItem Class

Represents an action in the platform action list for a layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “PlatformActionListItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[PlatformActionListItem Properties](#)

[PlatformActionListItem Methods](#)

PlatformActionListItem Properties

The following are properties for `PlatformActionListItem`.

IN THIS SECTION:

[actionName](#)

The API name for the action in the list.

[actionType](#)

The type of action.

[sortOrder](#)

The placement of the action in the list.

[subtype](#)

The subtype of the action.

actionName

The API name for the action in the list.

Signature

```
public String actionName {get; set;}
```

Property Value

Type: [String](#)

actionType

The type of action.

Signature

```
public Metadata.PlatformActionTypeEnum actionType {get; set;}
```

Property Value

Type: [Metadata.PlatformActionTypeEnum](#)

sortOrder

The placement of the action in the list.

Signature

```
public Integer sortOrder {get; set;}
```

Property Value

Type: [Integer](#)

subtype

The subtype of the action.

Signature

```
public String subtype {get; set;}
```

Property Value

Type: [String](#)

PlatformActionListItem Methods

The following are methods for `PlatformActionListItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.PlatformActionListItem`.

clone ()

Makes a duplicate copy of the `Metadata.PlatformActionListItem`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

PlatformActionTypeEnum Enum

The type of action for a `PlatformActionListItem`.

Enum Values

The following are the values of the `Metadata.PlatformActionTypeEnum` enum.

Value	Description
<code>ActionLink</code>	An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.
<code>CustomButton</code>	When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.
<code>InvocableAction</code>	An invocable action such as posting to Chatter.
<code>ProductivityAction</code>	Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions.
<code>QuickAction</code>	A global or object-specific action.
<code>StandardButton</code>	A predefined Salesforce button such as New, Edit, and Delete.

PrimaryTabComponents Class

Represents custom console components on primary tabs in the Salesforce console.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see "PrimaryTabComponents" in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[PrimaryTabComponents Properties](#)

[PrimaryTabComponents Methods](#)

PrimaryTabComponents Properties

The following are properties for `PrimaryTabComponents`.

IN THIS SECTION:

[component](#)

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

[containers](#)

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

component

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

Signature

```
public List<Metadata.ConsoleComponent> component {get; set;}
```

Property Value

Type: [List<Metadata.ConsoleComponent>](#)

containers

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

Signature

```
public List<Metadata.Container> containers {get; set;}
```

Property Value

Type: [List<Metadata.Container>](#)

PrimaryTabComponents Methods

The following are methods for `PrimaryTabComponents`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.PrimaryTabComponents`.

clone ()

Makes a duplicate copy of the `Metadata.PrimaryTabComponents`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

QuickActionList Class

Represents the list of actions associated with the page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata . Layout](#) metadata components. For more information, see “QuickActionList” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[QuickActionList Properties](#)

[QuickActionList Methods](#)

QuickActionList Properties

The following are properties for `QuickActionList`.

IN THIS SECTION:

[quickActionListItems](#)

List of `QuickActionList` objects.

quickActionListItems

List of `QuickActionList` objects.

Signature

```
public List<Metadata.QuickActionListItem> quickActionListItems {get; set;}
```

Property Value

Type: [List<Metadata.QuickActionListItem>](#)

QuickActionList Methods

The following are methods for `QuickActionList`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.QuickActionList`.

clone ()

Makes a duplicate copy of the `Metadata.QuickActionList`.

Signature

```
public Object clone()
```

Return Value

Type: Object

QuickActionListItem Class

Represents an action in the `QuickActionList`.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “QuickActionListItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[QuickActionListItem Properties](#)

[QuickActionListItem Methods](#)

QuickActionListItem Properties

The following are properties for `QuickActionListItem`.

IN THIS SECTION:

[quickActionName](#)

The API name of the action.

quickActionName

The API name of the action.

Signature

```
public String quickActionName {get; set;}
```

Property Value

Type: [String](#)

QuickActionListItem Methods

The following are methods for `QuickActionListItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.QuickActionListItem`.

clone ()

Makes a duplicate copy of the `Metadata.QuickActionListItem`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

RelatedContent Class

Represents the Mobile Cards section of the page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “RelatedContent” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[RelatedContent Properties](#)

[RelatedContent Methods](#)

RelatedContent Properties

The following are properties for `RelatedContent`.

IN THIS SECTION:[relatedContentItems](#)

A list of layout items in the Mobile Cards section of the page layout.

relatedContentItems

A list of layout items in the Mobile Cards section of the page layout.

Signature

```
public List<Metadata.RelatedContentItem> relatedContentItems {get; set;}
```

Property Value

Type: [List<Metadata.RelatedContentItem>](#)

RelatedContent Methods

The following are methods for `RelatedContent`.

IN THIS SECTION:[clone\(\)](#)

Makes a duplicate copy of the `Metadata.RelatedContent`.

clone ()

Makes a duplicate copy of the `Metadata.RelatedContent`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

RelatedContentItem Class

Represents an individual item in the `RelatedContent` list.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “[RelatedContentItem](#)” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[RelatedContentItem Properties](#)

[RelatedContentItem Methods](#)

RelatedContentItem Properties

The following are properties for `RelatedContentItem`.

IN THIS SECTION:

[layoutItem](#)

An individual layout item in the Mobile Cards section.

layoutItem

An individual layout item in the Mobile Cards section.

Signature

```
public Metadata.LayoutItem layoutItem {get; set;}
```

Property Value

Type: [Metadata.LayoutItem](#)

RelatedContentItem Methods

The following are methods for `RelatedContentItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.RelatedContentItem`.

clone ()

Makes a duplicate copy of the `Metadata.RelatedContentItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

RelatedList Class

Represents related list custom components on the sidebars of the Salesforce console.

Namespace

[Metadata](#)

Usage

Use this class when accessing `Metadata.Layout` metadata components. For more information, see “RelatedList” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[RelatedList Properties](#)

[RelatedList Methods](#)

RelatedList Properties

The following are properties for `RelatedList`.

IN THIS SECTION:

[hideOnDetail](#)

When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

[name](#)

The name of the component as it appears to console users.

hideOnDetail

When set to true, the related list is hidden from detail pages where it appears as a component to prevent duplicate information from showing.

Signature

```
public Boolean hideOnDetail {get; set;}
```

Property Value

Type: [Boolean](#)

name

The name of the component as it appears to console users.

Signature

```
public String name {get; set;}
```

Property Value

Type: [String](#)

RelatedList Methods

The following are methods for `RelatedList`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.RelatedList`.

clone ()

Makes a duplicate copy of the `Metadata.RelatedList`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

RelatedListItem Class

Represents an item in the related list in a page layout.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “RelatedListItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[RelatedListItem Properties](#)

[RelatedListItem Methods](#)

RelatedListItem Properties

The following are properties for `RelatedListItem`.

IN THIS SECTION:

[customButtons](#)

A list of custom buttons used in the related list.

[excludeButtons](#)

A list of excluded related-list buttons.

fields

A list of fields displayed in the related list. Uses aliases instead of field or API names.

relatedList

The name of the related list.

sortField

The name of the field used for sorting.

sortOrder

When `sortField` is set, the `sortOrder` property determines the sort order.

customButtons

A list of custom buttons used in the related list.

Signature

```
public List<String> customButtons {get; set;}
```

Property Value

Type: [List<String>](#)

For more information, see “Define Custom Buttons and Links” in the Salesforce online help.

excludeButtons

A list of excluded related-list buttons.

Signature

```
public List<String> excludeButtons {get; set;}
```

Property Value

Type: [List<String>](#)

fields

A list of fields displayed in the related list. Uses aliases instead of field or API names.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: [List<String>](#)

relatedList

The name of the related list.

Signature

```
public String relatedList {get; set;}
```

Property Value

Type: [String](#)

sortField

The name of the field used for sorting.

Signature

```
public String sortField {get; set;}
```

Property Value

Type: [String](#)

sortOrder

When `sortField` is set, the `sortOrder` property determines the sort order.

Signature

```
public Metadata.SortOrder sortOrder {get; set;}
```

Property Value

Type: [Metadata.SortOrder](#)

RelatedListItem Methods

The following are methods for `RelatedListItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.RelatedListItem`.

clone ()

Makes a duplicate copy of the `Metadata.RelatedListItem`.

Signature

```
public Object clone ()
```

Return Value

Type: `Object`

ReportChartComponentLayoutItem Class

Represents the settings for a report chart on a standard or custom page.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “ReportChartComponentLayoutItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[ReportChartComponentLayoutItem Properties](#)

[ReportChartComponentLayoutItem Methods](#)

ReportChartComponentLayoutItem Properties

The following are properties for `ReportChartComponentLayoutItem`.

IN THIS SECTION:

[cacheData](#)

Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

[contextFilterableField](#)

Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.

[error](#)

Error string that is populated only when an error occurs in the underlying report.

[hideOnError](#)

Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn't show any data except the error. Set the attribute to true to hide the chart from a page on error.

[includeContext](#)

If true, filters the report chart to return data that's relevant to the page.

[reportName](#)

Unique development name of a report that includes a chart.

[showTitle](#)

If true, applies the title from the report to the chart.

[size](#)

Size of the displayed chart. The default is medium.

cacheData

Indicates whether to use cached data when displaying the chart. When the attribute is set to true, data is cached for 24 hours. When the attribute is set to false, the report is run every time the page is refreshed.

Signature

```
public Boolean cacheData {get; set;}
```

Property Value

Type: [Boolean](#)

contextFilterableField

Unique development name of the field by which a report chart is filtered to return data relevant to the page. If set, the ID field for the parent object of the page or report type is the chart data filter. The parent object for the report type and the page must match for a chart to return relevant data.

Signature

```
public String contextFilterableField {get; set;}
```

Property Value

Type: [String](#)

error

Error string that is populated only when an error occurs in the underlying report.

Signature

```
public String error {get; set;}
```

Property Value

Type: [String](#)

hideOnError

Controls whether users see a chart that has an error. When an error occurs and this attribute is not set, the chart doesn't show any data except the error. Set the attribute to true to hide the chart from a page on error.

Signature

```
public Boolean hideOnError {get; set;}
```

Property Value

Type: [Boolean](#)

includeContext

If true, filters the report chart to return data that's relevant to the page.

Signature

```
public Boolean includeContext {get; set;}
```

Property Value

Type: [Boolean](#)

reportName

Unique development name of a report that includes a chart.

Signature

```
public String reportName {get; set;}
```

Property Value

Type: [String](#)

showTitle

If true, applies the title from the report to the chart.

Signature

```
public Boolean showTitle {get; set;}
```

Property Value

Type: [Boolean](#)

size

Size of the displayed chart. The default is medium.

Signature

```
public Metadata.ReportChartComponentSize size {get; set;}
```

Property Value

Type: [Metadata.ReportChartComponentSize](#)

ReportChartComponentLayoutItem Methods

The following are methods for `ReportChartComponentLayoutItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.ReportChartComponentLayoutItem`.

clone ()

Makes a duplicate copy of the `Metadata.ReportChartComponentLayoutItem`.

Signature

```
public Object clone()
```

Return Value

Type: Object

ReportChartComponentSize Enum

Describes the size of the displayed report chart component.

Enum Values

The following are the values of the `Metadata.ReportChartComponentSize` enum.

Value	Description
LARGE	Large chart size.
MEDIUM	Medium chart size.
SMALL	Small chart size.

SidebarComponent Class

Represents a specific custom console component to display in a container that hosts multiple components in one of the sidebars of the Salesforce console.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “SidebarComponent” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[SidebarComponent Properties](#)[SidebarComponent Methods](#)

SidebarComponent Properties

The following are properties for `SidebarComponent`.

IN THIS SECTION:

[componentType](#)

Specifies the component type. Valid values are "KnowledgeOne", "Lookup", "Milestones", "RelatedList", "Topics", "Files", and "CaseExperts".

[height](#)

The height of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

[knowledgeOneEnable](#)

Indicates if the component is enabled for Knowledge One.

[label](#)

The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

[lookup](#)

If the component is a lookup field, the name of the field.

[page_x](#)

If the component is a Visualforce page, the name of the Visualforce page.

[relatedLists](#)

If the component is a related list component, the list of related list names.

[unit](#)

The unit of measurement (pixels or percent) for the height and width of the component in the container.

[width](#)

The width of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

componentType

Specifies the component type. Valid values are "KnowledgeOne", "Lookup", "Milestones", "RelatedList", "Topics", "Files", and "CaseExperts".

Signature

```
public String componentType {get; set;}
```

Property Value

Type: [String](#)

height

The height of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

knowledgeOneEnable

Indicates if the component is enabled for Knowledge One.

Signature

```
public Boolean knowledgeOneEnable {get; set;}
```

Property Value

Type: [Boolean](#)

label

The name of the component as it displays to console users. Available for components in a container with the style of tabs or accordion.

Signature

```
public String label {get; set;}
```

Property Value

Type: [String](#)

lookup

If the component is a lookup field, the name of the field.

Signature

```
public String lookup {get; set;}
```

Property Value

Type: [String](#)

page_x

If the component is a Visualforce page, the name of the Visualforce page.

Signature

```
public String page_x {get; set;}
```

Property Value

Type: [String](#)

relatedLists

If the component is a related list component, the list of related list names.

Signature

```
public List<Metadata.RelatedList> relatedLists {get; set;}
```

Property Value

Type: [List<Metadata.RelatedList>](#)

unit

The unit of measurement (pixels or percent) for the height and width of the component in the container.

Signature

```
public String unit {get; set;}
```

Property Value

Type: [String](#)

width

The width of the component in the container. The `unit` property determines the unit of measurement, in pixels or percent.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: [Integer](#)

SidebarComponent Methods

The following are methods for `SidebarComponent`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.SidebarComponent`.

clone()

Makes a duplicate copy of the `Metadata.SidebarComponent`.

Signature

```
public Object clone()
```

Return Value

Type: Object

SortOrder Enum

Describes the sort order of a related list.

Enum Values

The following are the values of the `Metadata.SortOrder` enum.

Value	Description
<code>Asc_x</code>	Sort in ascending order.
<code>Desc_x</code>	Sort in descending order.

SubtabComponents Class

Represents custom console components on subtabs in the Salesforce console.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “SubtabComponents” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[SubtabComponents Properties](#)

[SubtabComponents Methods](#)

SubtabComponents Properties

The following are properties for `SubtabComponents`.

IN THIS SECTION:

[component](#)

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

[containers](#)

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

component

Represents a custom console component (Visualforce page, lookup field, or related lists) on a section of a page layout.

Signature

```
public List<Metadata.ConsoleComponent> component {get; set;}
```

Property Value

Type: [List<Metadata.ConsoleComponent>](#)

containers

Represents a location and style in which to display more than one custom console component on the sidebars of the Salesforce console.

Signature

```
public List<Metadata.Container> containers {get; set;}
```

Property Value

Type: [List<Metadata.Container>](#)

SubtabComponents Methods

The following are methods for `SubtabComponents`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.SubtabComponents`.

clone ()

Makes a duplicate copy of the `Metadata.SubtabComponents`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

SummaryLayoutStyleEnum Enum

Describes the highlights panel style for a `SummaryLayout`.

Enum Values

The following are the values of the `Metadata.SummaryLayoutStyleEnum` enum.

Value	Description
<code>CaseInteraction</code>	Case interaction style.
<code>ChildServiceReportTemplateStyle</code>	Child service report template style.
<code>DefaultQuoteTemplate</code>	Default quote template style.
<code>DefaultServiceReportTemplate</code>	Default service report style
<code>Default_x</code>	Default style.
<code>PathAssistant</code>	Path assistant style.
<code>QuickActionLayoutLeftRight</code>	Quick action left-right layout style.
<code>QuickActionLayoutTopDown</code>	Quick action top-down layout style.
<code>QuoteTemplate</code>	Quote template style.
<code>ServiceReportTemplate</code>	Service report style.

SummaryLayout Class

Controls the appearance of the highlights panel, which summarizes key fields in a grid at the top of a page layout, when Case Feed is enabled.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “SummaryLayout” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[SummaryLayout Properties](#)

[SummaryLayout Methods](#)

SummaryLayout Properties

The following are properties for `SummaryLayout`.

IN THIS SECTION:

[masterLabel](#)

The name of the layout label.

[sizeX](#)

Number of columns in the highlights pane, between 1 and 4 (inclusive).

[sizeY](#)

Number of rows in each column, either 1 or 2.

[sizeZ](#)

If provided, the setting is not visible to users.

[summaryLayoutItems](#)

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

[summaryLayoutStyle](#)

Specifies the panel style.

masterLabel

The name of the layout label.

Signature

```
public String masterLabel {get; set;}
```

Property Value

Type: [String](#)

sizeX

Number of columns in the highlights pane, between 1 and 4 (inclusive).

Signature

```
public Integer sizeX {get; set;}
```

Property Value

Type: [Integer](#)

sizeY

Number of rows in each column, either 1 or 2.

Signature

```
public Integer sizeY {get; set;}
```

Property Value

Type: [Integer](#)

sizeZ

If provided, the setting is not visible to users.

Signature

```
public Integer sizeZ {get; set;}
```

Property Value

Type: [Integer](#)

summaryLayoutItems

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. At least one is required.

Signature

```
public List<Metadata.SummaryLayoutItem> summaryLayoutItems {get; set;}
```

Property Value

Type: [List<Metadata.SummaryLayoutItem>](#)

summaryLayoutStyle

Specifies the panel style.

Signature

```
public Metadata.SummaryLayoutStyleEnum summaryLayoutStyle {get; set;}
```

Property Value

Type: [Metadata.SummaryLayoutStyleEnum](#)

SummaryLayout Methods

The following are methods for `SummaryLayout`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.SummaryLayout`.

clone()

Makes a duplicate copy of the `Metadata.SummaryLayout`.

Signature

```
public Object clone()
```

Return Value

Type: Object

SummaryLayoutItem Class

Controls the appearance of an individual field and its column and row position within the highlights panel grid, when Case Feed is enabled. You can have two fields per each grid in a highlights panel.

Namespace

[Metadata](#)

Usage

Use this class when accessing [Metadata.Layout](#) metadata components. For more information, see “SummaryLayoutItem” in the [Metadata API Developer Guide](#).

IN THIS SECTION:

[SummaryLayoutItem Properties](#)

[SummaryLayoutItem Methods](#)

SummaryLayoutItem Properties

The following are properties for `SummaryLayoutItem`.

IN THIS SECTION:

[customLink](#)

The custom link reference.

[field](#)

The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.

[posX](#)

The item's column position in the highlights panel grid. Must be within the range of `sizeX`.

[posY](#)

The item's row position in the highlights panel grid. Must be within the range of `sizeY`.

[posZ](#)

Reserved for future use. If provided, the setting is not visible to users.

customLink

The custom link reference.

Signature

```
public String customLink {get; set;}
```

Property Value

Type: [String](#)

field

The field name reference, relative to the page layout. Must be a standard or custom field that also exists on the detail page.

Signature

```
public String field {get; set;}
```

Property Value

Type: [String](#)

posX

The item's column position in the highlights panel grid. Must be within the range of `sizeX`.

Signature

```
public Integer posX {get; set;}
```

Property Value

Type: [Integer](#)

posY

The item's row position in the highlights panel grid. Must be within the range of `sizeY`.

Signature

```
public Integer posY {get; set;}
```

Property Value

Type: [Integer](#)

posZ

Reserved for future use. If provided, the setting is not visible to users.

Signature

```
public Integer posZ {get; set;}
```

Property Value

Type: [Integer](#)

SummaryLayoutItem Methods

The following are methods for `SummaryLayoutItem`.

IN THIS SECTION:

[clone\(\)](#)

Makes a duplicate copy of the `Metadata.SummaryLayoutItem`.

clone ()

Makes a duplicate copy of the `Metadata.SummaryLayoutItem`.

Signature

```
public Object clone ()
```

Return Value

Type: Object

UiBehavior Enum

Describes the behavior for a layout item on a layout page.

Enum Values

The following are the values of the `Metadata.UiBehavior` enum.

Value	Description
Edit	The layout field can be edited but is not required.
ReadOnly	The layout field is read-only.
Required	The layout field can be edited and is required.

Process Namespace

The `Process` namespace provides an interface and classes for passing data between your organization and a flow.

The following are the interfaces and classes in the `Process` namespace.

IN THIS SECTION:

[Plugin Interface](#)

Allows you to pass data between your organization and a specified flow.

[PluginDescribeResult Class](#)

Describes the input and output parameters for `Process.PluginResult`.

[PluginDescribeResult.InputParameter Class](#)

Describes the input parameter for `Process.PluginResult`.

[PluginDescribeResult.OutputParameter Class](#)

Describes the output parameter for `Process.PluginResult`.

[PluginRequest Class](#)

Passes input parameters from the class that implements the `Process.Plugin` interface to the flow.

[PluginResult Class](#)

Returns output parameters from the class that implements the `Process.Plugin` interface to the flow.

Plugin Interface

Allows you to pass data between your organization and a specified flow.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

[Process](#)

IN THIS SECTION:

[Plugin Methods](#)

[Plugin Example Implementation](#)

Plugin Methods

The following are instance methods for `Plugin`.

IN THIS SECTION:

[describe\(\)](#)

Returns a `Process.PluginDescribeResult` object that describes this method call.

[invoke\(request\)](#)

Primary method that the system invokes when the class that implements the interface is instantiated.

describe ()

Returns a `Process.PluginDescribeResult` object that describes this method call.

Signature

```
public Process.PluginDescribeResult describe()
```

Return Value

Type: [Process.PluginDescribeResult](#)

invoke (request)

Primary method that the system invokes when the class that implements the interface is instantiated.

Signature

```
public Process.PluginResult invoke(Process.PluginRequest request)
```

Parameters

request

Type: [Process.PluginRequest](#)

Return Value

Type: [Process.PluginResult](#)

Plugin Example Implementation

```
global class flowChat implements Process.Plugin {

    // The main method to be implemented. The Flow calls this at run time.
    global Process.PluginResult invoke(Process.PluginRequest request) {
        // Get the subject of the Chatter post from the flow
        String subject = (String) request.inputParameters.get('subject');

        // Use the Chatter APIs to post it to the current user's feed
        FeedItem fItem = new FeedItem();
        fItem.ParentId = UserInfo.getUserId();
        fItem.Body = 'Force.com flow Update: ' + subject;
        insert fItem;

        // return to Flow
        Map<String, Object> result = new Map<String, Object>();
        return new Process.PluginResult(result);
    }

    // Returns the describe information for the interface
    global Process.PluginDescribeResult describe() {
        Process.PluginDescribeResult result = new Process.PluginDescribeResult();
        result.Name = 'flowchatplugin';
        result.Tag = 'chat';
        result.inputParameters = new
            List<Process.PluginDescribeResult.InputParameter>{
                new Process.PluginDescribeResult.InputParameter('subject',
```

```

        Process.PluginDescribeResult.ParameterType.STRING, true)
    };
    result.outputParameters = new
        List<Process.PluginDescribeResult.OutputParameter>{ };
    return result;
}
}

```

Test Class

The following is a test class for the above class.

```

@Test
private class flowChatTest {

    static testmethod void flowChatTests() {

        flowChat plugin = new flowChat();
        Map<String, Object> inputParams = new Map<String, Object>();

        string feedSubject = 'Flow is alive';
        InputParams.put('subject', feedSubject);

        Process.PluginRequest request = new Process.PluginRequest(inputParams);

        plugin.invoke(request);
    }
}

```

PluginDescribeResult Class

Describes the input and output parameters for `Process.PluginResult`.

Tip: We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

Namespace

[Process](#)

IN THIS SECTION:

[PluginDescribeResult Constructors](#)

[PluginDescribeResult Properties](#)

PluginDescribeResult Constructors

The following are constructors for `PluginDescribeResult`.

IN THIS SECTION:

[PluginDescribeResult\(\)](#)

Creates a new instance of the `Process.PluginDescribeResult` class.

PluginDescribeResult ()

Creates a new instance of the `Process.PluginDescribeResult` class.

Signature

```
public PluginDescribeResult ()
```

PluginDescribeResult Properties

The following are properties for `PluginDescribeResult`.

IN THIS SECTION:

[description](#)

This optional field describes the purpose of the plug-in.

[inputParameters](#)

The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

[name](#)

Unique name of the plug-in.

[outputParameters](#)

The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

[tag](#)

With this optional field, you can group plug-ins by tag name so they appear together in the Apex plug-in section of the Palette within the Flow Designer. This is helpful if you have multiple plug-ins in your flow.

description

This optional field describes the purpose of the plug-in.

Signature

```
public String description {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 255 characters.

inputParameters

The input parameters passed by the `Process.PluginRequest` class from a flow to the class that implements the `Process.Plugin` interface.

Signature

```
public List<Process.PluginDescribeResult.InputParameter> inputParameters {get; set;}
```

Property Value

Type: [List<Process.PluginDescribeResult.InputParameter>](#)

name

Unique name of the plug-in.

Signature

```
public String name {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 40 characters.

outputParameters

The output parameters passed by the `Process.PluginResult` class from the class that implements the `Process.Plugin` interface to the flow.

Signature

```
public List<Process.PluginDescribeResult.OutputParameter> outputParameters {get; set;}
```

Property Value

Type: [List<Process.PluginDescribeResult.OutputParameter>](#)

tag

With this optional field, you can group plug-ins by tag name so they appear together in the Apex plug-in section of the Palette within the Flow Designer. This is helpful if you have multiple plug-ins in your flow.

Signature

```
public String tag {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 40 characters.

PluginDescribeResult.InputParameter Class

Describes the input parameter for `Process.PluginResult`.

 **Tip:** We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support `Blob`, `Collection`, `sObject`, and `Time` data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

[PluginDescribeResult.InputParameter Constructors](#)

[PluginDescribeResult.InputParameter Properties](#)

PluginDescribeResult.InputParameter Constructors

The following are constructors for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

[PluginDescribeResult.InputParameter\(name, description, parameterType, required\)](#)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

[PluginDescribeResult.InputParameter\(name, parameterType, required\)](#)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

PluginDescribeResult.InputParameter(name, description, parameterType, required)

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, description, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name, String description,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

*name*Type: [String](#)

Unique name of the plug-in.

*description*Type: [String](#)

Describes the purpose of the plug-in.

*parameterType*Type: `Process.PluginDescribeResult.ParameterType`

The data type of the input parameter.

*required*Type: [Boolean](#)Set to `true` for required and `false` otherwise.**PluginDescribeResult.InputParameter(name, parameterType, required)**

Creates a new instance of the `Process.PluginDescribeResult.InputParameter` class using the specified name, parameter type, and required option.

Signature

```
public PluginDescribeResult.InputParameter(String name,
Process.PluginDescribeResult.ParameterType parameterType, Boolean required)
```

Parameters

*name*Type: [String](#)

Unique name of the plug-in.

*parameterType*Type: `Process.PluginDescribeResult.ParameterType`

The data type of the input parameter.

*required*Type: [Boolean](#)Set to `true` for required and `false` otherwise.**PluginDescribeResult.InputParameter Properties**

The following are properties for `PluginDescribeResult.InputParameter`.

IN THIS SECTION:

[Description](#)

This optional field describes the purpose of the plug-in.

[Name](#)

Unique name of the plug-in.

[ParameterType](#)

The data type of the input parameter.

[Required](#)

Set to `true` for required and `false` otherwise.

Description

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 255 characters.

Name

Unique name of the plug-in.

Signature

```
public String Name {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 40 characters.

ParameterType

The data type of the input parameter.

Signature

```
public Process.PluginDescribeResult.ParameterType ParameterType {get; set;}
```

Property Value

Type: [Process.PluginDescribeResult.ParameterType](#)

Required

Set to `true` for required and `false` otherwise.

Signature

```
public Boolean Required {get; set;}
```

Property Value

Type: [Boolean](#)

PluginDescribeResult.OutputParameter Class

Describes the output parameter for `Process.PluginResult`.

 **Tip:** We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

- The interface doesn't support Blob, Collection, sObject, and Time data types, and it doesn't support bulk operations. Once you implement the interface on a class, the class can be referenced only from flows.
- The annotation supports all data types and bulk operations. Once you implement the annotation on a class, the class can be referenced from flows, processes, and the Custom Invocable Actions REST API endpoint.

[PluginDescribeResult.OutputParameter\(name, description, parameterType\)](#)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

[PluginDescribeResult.OutputParameter\(name, parameterType\)](#)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

PluginDescribeResult.OutputParameter(name, description, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name, String description,  
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

name

Type: `String`

Unique name of the plug-in.

description

Type: `String`

Describes the purpose of the plug-in.

parameterType

Type: `Process.PluginDescribeResult.ParameterType`

The data type of the input parameter.

PluginDescribeResult.OutputParameter(name, parameterType)

Creates a new instance of the `Process.PluginDescribeResult.OutputParameter` class using the specified name, description, and parameter type.

Signature

```
public PluginDescribeResult.OutputParameter(String name,  
Process.PluginDescribeResult.ParameterType parameterType)
```

Parameters

name

Type: `String`

Unique name of the plug-in.

parameterType

Type: `Process.PluginDescribeResult.ParameterType`

The data type of the input parameter.

PluginDescribeResult.OutputParameter Properties

The following are properties for `PluginDescribeResult.OutputParameter`.

IN THIS SECTION:

[Description](#)

This optional field describes the purpose of the plug-in.

[Name](#)

Unique name of the plug-in.

[ParameterType](#)

The data type of the input parameter.

Description

This optional field describes the purpose of the plug-in.

Signature

```
public String Description {get; set;}
```

Property Value

Type: [String](#)

Usage

Size limit: 255 characters.

Name

Unique name of the plug-in.

Signature

```
public String Name {get; set;}

[Process](#)

PluginResult Properties

The following are properties for `PluginResult`.

IN THIS SECTION:

[outputParameters](#)

Output parameters returned from the class that implements the interface to the flow.

outputParameters

Output parameters returned from the class that implements the interface to the flow.

Signature

```
public MAP<String, ANY> outputParameters {get; set;}
```

Property Value

Type: [Map<String, Object>](#)

QuickAction Namespace

The `QuickAction` namespace provides classes and methods for quick actions.

The following are the classes in the `QuickAction` namespace.

IN THIS SECTION:

[DescribeAvailableQuickActionResult Class](#)

Contains describe metadata information for a quick action that is available for a specified parent.

[DescribeLayoutComponent Class](#)

Represents the smallest unit in a layout—a field or a separator.

[DescribeLayoutItem Class](#)

Represents an individual item in a `QuickAction.DescribeLayoutRow`.

[DescribeLayoutRow Class](#)

Represents a row in a `QuickAction.DescribeLayoutSection`.

[DescribeLayoutSection Class](#)

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

[DescribeQuickActionDefaultValue Class](#)

Returns a default value for a quick action.

[DescribeQuickActionResult Class](#)

Contains describe metadata information for a quick action.

[QuickActionDefaults Class](#)

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

[QuickActionDefaultsHandler Interface](#)

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email Action on Case Feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email Action in Case Feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

[QuickActionRequest Class](#)

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

[QuickActionResult Class](#)

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

[SendEmailQuickActionDefaults Class](#)

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

DescribeAvailableQuickActionResult Class

Contains describe metadata information for a quick action that is available for a specified parent.

Namespace

[QuickAction](#)

Usage

The `QuickAction.describeAvailableQuickActions` method returns an array of available quick action describe result objects (`QuickAction.DescribeAvailableQuickActionResult`).

DescribeAvailableQuickActionResult Methods

The following are methods for `DescribeAvailableQuickActionResult`. All are instance methods.

IN THIS SECTION:

[getActionEnumOrId\(\)](#)

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

[getLabel\(\)](#)

The quick action label.

[getName\(\)](#)

The quick action name.

[getType\(\)](#)

The quick action type.

getActionEnumOrId ()

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: [String](#)

getLabel ()

The quick action label.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

The quick action name.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getType ()

The quick action type.

Signature

```
public String getType ()
```

Return Value

Type: [String](#)

DescribeLayoutComponent Class

Represents the smallest unit in a layout—a field or a separator.

Namespace

[QuickAction](#)

DescribeLayoutComponent Methods

The following are methods for `DescribeLayoutComponent`. All are instance methods.

IN THIS SECTION:

[getDisplayLines\(\)](#)

Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

[getTabOrder\(\)](#)

Returns the tab order for the item in the row.

[getType\(\)](#)

Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

[getValue\(\)](#)

Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

getDisplayLines ()

Returns the vertical lines displayed for a field. Applies to `textarea` and multi-select picklist fields.

Signature

```
public Integer getDisplayLines ()
```

Return Value

Type: [Integer](#)

getTabOrder ()

Returns the tab order for the item in the row.

Signature

```
public Integer getTabOrder ()
```

Return Value

Type: [Integer](#)

getType ()

Returns the name of the `QuickAction.DescribeLayoutComponent` type for this component.

Signature

```
public String getType ()
```

Return Value

Type: [String](#)

getValue ()

Returns the name of the field if the type for `QuickAction.DescribeLayoutComponent` is `textarea`.

Signature

```
public String getValue ()
```

Return Value

Type: [String](#)

DescribeLayoutItem Class

Represents an individual item in a `QuickAction.DescribeLayoutRow`.

Namespace

[QuickAction](#)

Usage

For most fields on a layout, there is only one component per layout item. However, in a display-only view, the `QuickAction.DescribeLayoutItem` might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate `QuickAction.DescribeLayoutItems`.

DescribeLayoutItem Methods

The following are methods for `DescribeLayoutItem`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the label text for this item.

[getLayoutComponents\(\)](#)

Returns a list of `QuickAction.DescribeLayoutComponents` for this item.

[isEditable\(\)](#)

Indicates whether this item can be edited (`true`) or not (`false`).

[isPlaceholder\(\)](#)

Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

[isRequired\(\)](#)

Indicates whether this item is required (`true`) or not (`false`).

getLabel ()

Returns the label text for this item.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getLayoutComponents ()

Returns a list of `QuickAction.DescribeLayoutComponent` for this item.

Signature

```
public List<QuickAction.DescribeLayoutComponent> getLayoutComponents ()
```

Return Value

Type: [List<QuickAction.DescribeLayoutComponent>](#)

isEditable ()

Indicates whether this item can be edited (`true`) or not (`false`).

Signature

```
public Boolean isEditable ()
```

Return Value

Type: [Boolean](#)

isPlaceholder ()

Indicates whether this item is a placeholder (`true`) or not (`false`). If `true`, then this item is blank.

Signature

```
public Boolean isPlaceholder ()
```

Return Value

Type: [Boolean](#)

isRequired ()

Indicates whether this item is required (`true`) or not (`false`).

Signature

```
public Boolean isRequired()
```

Return Value

Type: [Boolean](#)

Usage

This is useful if, for example, you want to render required fields in a contrasting color.

DescribeLayoutRow Class

Represents a row in a `QuickAction.DescribeLayoutSection`.

Namespace

[QuickAction](#)

Usage

A `QuickAction.DescribeLayoutRow` consists of one or more `QuickAction.DescribeLayoutItem` objects. For each `QuickAction.DescribeLayoutRow`, a `QuickAction.DescribeLayoutItem` refers either to a specific field or to an “empty” `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects). An empty `QuickAction.DescribeLayoutItem` can be returned when a given `QuickAction.DescribeLayoutRow` is sparse (for example, containing more fields on the right column than on the left column).

DescribeLayoutRow Methods

The following are methods for `DescribeLayoutRow`. All are instance methods.

IN THIS SECTION:

[getLayoutItems\(\)](#)

Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

[getNumItems\(\)](#)

Returns the number of `QuickAction.DescribeLayoutItem`.

getLayoutItems ()

Returns either a specific field or an empty `QuickAction.DescribeLayoutItem` (one that contains no `QuickAction.DescribeLayoutComponent` objects).

Signature

```
public List<QuickAction.DescribeLayoutItem> getLayoutItems ()
```

Return Value

Type: [List<QuickAction.DescribeLayoutItem>](#)

getNumItems ()

Returns the number of `QuickAction.DescribeLayoutItem`.

Signature

```
public Integer getNumItems ()
```

Return Value

Type: [Integer](#)

DescribeLayoutSection Class

Represents a section of a layout and consists of one or more columns and one or more rows (an array of `QuickAction.DescribeLayoutRow`).

Namespace

[QuickAction](#)

DescribeLayoutSection Properties

The following are properties for `DescribeLayoutSection`.

collapsed

The current view of the record details section: `collapsed` (`true`) or `expanded` (`false`).

Signature

```
public Boolean collapsed {get; set;}
```

Property Value

Type: [Boolean](#)

layoutsectionid

The unique ID of the record details section in the layout.

Signature

```
public Id layoutsectionid {get; set;}
```

Property Value

Type: `Id`

DescribeLayoutSection Methods

The following are methods for `DescribeLayoutSection`.

IN THIS SECTION:

`getColumns()`

Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

`getHeading()`

The heading text (label) for the `QuickAction.DescribeLayoutSection`.

`getLayoutRows()`

Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

`getLayoutSectionId()`

Returns the ID of the record details section in the layout.

`getParentLayoutId()`

Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

`getRows()`

Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

`isCollapsed()`

Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

`isUseCollapsibleSection()`

Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

`isUseHeading()`

Indicates whether to use the heading (`true`) or not (`false`).

`getColumns ()`

Returns the number of columns in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getColumns ()
```

Return Value

Type: `Integer`

`getHeading ()`

The heading text (label) for the `QuickAction.DescribeLayoutSection`.

Signature

```
public String getHeading()
```

Return Value

Type: [String](#)

getLayoutRows ()

Returns an array of one or more `QuickAction.DescribeLayoutRow` objects.

Signature

```
public List<QuickAction.DescribeLayoutRow> getLayoutRows()
```

Return Value

Type: [List<QuickAction.DescribeLayoutRow>](#)

getLayoutSectionId ()

Returns the ID of the record details section in the layout.

Signature

```
public Id getLayoutSectionId()
```

Return Value

Type: [Id](#)

getParentLayoutId ()

Returns the ID of the layout upon which this `DescribeLayoutSection` resides.

Signature

```
public Id getParentLayoutId()
```

Return Value

Type: [Id](#)

getRows ()

Returns the number of rows in the `QuickAction.DescribeLayoutSection`.

Signature

```
public Integer getRows()
```

Return Value

Type: [Integer](#)

isCollapsed()

Indicates whether the record details section is collapsed (`true`) or expanded (`false`). If you build your own app, you can use this method to see whether the current user collapsed a section, and respect that preference in your own UI.

Signature

```
public Boolean isCollapsed()
```

Return Value

Type: [Boolean](#)

isUseCollapsibleSection()

Indicates whether the `QuickAction.DescribeLayoutSection` is a collapsible section (`true`) or not (`false`).

Signature

```
public Boolean isUseCollapsibleSection()
```

Return Value

Type: [Boolean](#)

isUseHeading()

Indicates whether to use the heading (`true`) or not (`false`).

Signature

```
public Boolean isUseHeading()
```

Return Value

Type: [Boolean](#)

DescribeQuickActionDefaultValue Class

Returns a default value for a quick action.

Namespace

[QuickAction](#)

Usage

Represents the default values of fields to use in default layouts.

DescribeQuickActionDefaultValue Methods

The following are methods for `DescribeQuickActionDefaultValue`. All are instance methods.

IN THIS SECTION:

[getDefaultValue\(\)](#)

Returns the default value of the quick action.

[getField\(\)](#)

Returns the field name of the action.

getDefaultValue ()

Returns the default value of the quick action.

Signature

```
public String getDefaultValue()
```

Return Value

Type: [String](#)

getField ()

Returns the field name of the action.

Signature

```
public String getField()
```

Return Value

Type: [String](#)

DescribeQuickActionResult Class

Contains describe metadata information for a quick action.

Namespace

[QuickAction](#)

Usage

The QuickAction `describeQuickActions` method returns an array of quick action describe result objects (`QuickAction.DescribeQuickActionResult`).

IN THIS SECTION:

[DescribeQuickActionResult Properties](#)

[DescribeQuickActionResult Methods](#)

DescribeQuickActionResult Properties

The following are properties for `DescribeQuickActionResult`.

IN THIS SECTION:

[canvasapplicationname](#)

The name of the Force.com Canvas application invoked by the custom action.

[colors](#)

Array of color information. Each color is associated with a theme.

[contextsubjecttype](#)

The object used for the action. Was `getSourceSubjectType()` in API version 29.0 and earlier.

[defaultvalues](#)

The action's default values.

[height](#)

The height in pixels of the action pane.

[iconname](#)

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

[icons](#)

Array of icons. Each icon is associated with a theme.

[iconurl](#)

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

[layout](#)

The section of the layout where the action resides.

[lightningcomponentbundleid](#)

If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

[lightningcomponentbundlename](#)

If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

[lightningcomponentqualifiedname](#)

The fully qualified name of the Lightning component invoked by the custom action.

[miniiconurl](#)

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

[showquickactionlheader](#)

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

[showquickactionvfheader](#)

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

[targetparentfield](#)

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

[targetrecordtypeid](#)

The record type of the target record.

[targetobjecttype](#)

The action's target object type.

[visualforcepagename](#)

The name of the Visualforce page associated with the custom action.

[visualforcepageurl](#)

The URL of the Visualforce page associated with the action.

[width](#)

The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

canvasapplicationname

The name of the Force.com Canvas application invoked by the custom action.

Signature

```
public String canvasapplicationname {get; set;}
```

Property Value

Type: [String](#)

colors

Array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> colors {get; set;}
```

Property Value

Type: [List<Schema.DescribeColorResult>](#) on page 2238

contextsubjecttype

The object used for the action. Was `getSourceObjectType ()` in API version 29.0 and earlier.

Signature

```
public String contextsubjecttype {get; set;}
```

Property Value

Type: [String](#)

defaultvalues

The action's default values.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> defaultvalues {get; set;}
```

Property Value

Type: [List<QuickAction.DescribeQuickActionDefaultValue>](#)

height

The height in pixels of the action pane.

Signature

```
public Integer height {get; set;}
```

Property Value

Type: [Integer](#)

iconname

The name of the icon used for the action. If a custom icon is not used, this value isn't set.

Signature

```
public String iconname {get; set;}
```

Property Value

Type: [String](#)

icons

Array of icons. Each icon is associated with a theme.

Signature

```
public List<Schema.DescribeIconResult> icons {get; set;}
```

Property Value

Type: [List<Schema.DescribeIconResult](#) on page 2260>

If no custom icon was associated with the quick action and the quick action creates a specific object, the icons will correspond to the icons used for the created object. For example, if the quick action creates an Account, the icon array will contain the icons used for Account.

If a custom icon was associated with the quick action, the array will contain that custom icon.

iconurl

The URL of the icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String iconurl {get; set;}
```

Property Value

Type: [String](#)

layout

The section of the layout where the action resides.

Signature

```
public QuickAction.DescribeLayoutSection layout {get; set;}
```

Property Value

Type: [QuickAction.DescribeLayoutSection](#) on page 2083

lightningcomponentbundleid

If the custom action invokes a Lightning component, the ID of the Lightning component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundleid {get; set;}
```

Property Value

Type: [String](#)

lightningcomponentbundlename

If the custom action invokes a Lightning component, the name of the Lightning component bundle to which the component belongs.

Signature

```
public String lightningcomponentbundlename {get; set;}
```

Property Value

Type: [String](#)

lightningcomponentqualifiedname

The fully qualified name of the Lightning component invoked by the custom action.

Signature

```
public String lightningcomponentqualifiedname {get; set;}
```

Property Value

Type: [String](#)

miniiconurl

The icon's URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10, or the custom icon, if there is one.

Signature

```
public String miniiconurl {get; set;}
```

Property Value

Type: [String](#)

showquickactionlheader

Indicates whether the Lightning component quick action header and footer are shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionlheader {get; set;}
```

Property Value

Type: [Boolean](#)

showquickactionvfheader

Indicates whether the Visualforce quick action header and footer should be shown. If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

Signature

```
public Boolean showquickactionvfheader {get; set;}
```

Property Value

Type: [Boolean](#)

targetparentfield

The parent object type of the action. Links the target object to the parent object. For example, the value is Account if the target object is Contact and the parent object is Account.

Signature

```
public String targetparentfield {get; set;}
```

Property Value

Type: [String](#)

targetrecordtypeid

The record type of the target record.

Signature

```
public String targetrecordtypeid {get; set;}
```

Property Value

Type: [String](#)

targetobjecttype

The action's target object type.

Signature

```
public String targetobjecttype {get; set;}
```

Property Value

Type: [String](#)

visualforcepagename

The name of the Visualforce page associated with the custom action.

Signature

```
public String visualforcepagename {get; set;}
```

Property Value

Type: [String](#)

visualforcepageurl

The URL of the Visualforce page associated with the action.

Signature

```
public String visualforcepageurl {get; set;}
```

Property Value

Type: [String](#)

width

The width in pixels of the action pane, for custom actions that call Visualforce pages, Canvas apps, or Lightning components.

Signature

```
public Integer width {get; set;}
```

Property Value

Type: [Integer](#)

DescribeQuickActionResult Methods

The following are methods for `DescribeQuickActionResult`. All are instance methods.

IN THIS SECTION:[getActionEnumOrd\(\)](#)

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

[getCanvasApplicationName\(\)](#)

Returns the name of the Canvas application, if used.

[getColors\(\)](#)

Returns an array of color information. Each color is associated with a theme.

[getContextSubjectType\(\)](#)

Returns the object used for the action. Replaces `getSourceSubjectType()` in API version 30.0 and later.

[getDefaultValues\(\)](#)

Returns the default values for an action.

[getHeight\(\)](#)

Returns the height in pixels of the action pane.

[getIconName\(\)](#)

Returns the actions' icon name.

[getIconUrl\(\)](#)

Returns the URL of the 32x32 icon used for the action.

[getIcons\(\)](#)

Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

[getLabel\(\)](#)

Returns the action label.

[getLayout\(\)](#)

Returns the layout sections that comprise an action.

[getLightningComponentBundleId\(\)](#)

If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

[getLightningComponentBundleName\(\)](#)

If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

[getLightningComponentQualifiedName\(\)](#)

If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

[getMinIconUrl\(\)](#)

Returns the 16x16 icon URL.

[getName\(\)](#)

Returns the action name.

[getShowQuickActionLcHeader\(\)](#)

Returns an indication of whether the Lightning component quick action header and footer are shown.

[getShowQuickActionVfHeader\(\)](#)

Returns an indication of whether the Visualforce quick action header and footer should be shown.

[getSourceObjectType\(\)](#)

Returns the object type used for the action.

[getTargetParentField\(\)](#)

Returns the parent object's type for the action.

[getTargetRecordTypeId\(\)](#)

Returns the record type of the targeted record.

[getTargetObjectType\(\)](#)

Returns the action's target object type.

[getType\(\)](#)

Returns a create or custom Visualforce action.

getVisualforcePageName()

If Visualforce is used, returns the name of the associated page for the action.

getVisualforcePageUrl()

Returns the URL of the Visualforce page associated with the action.

getWidth()

If a custom action is created, returns the width in pixels of the action pane.

getActionEnumOrId()

Returns the unique ID for the action. If the action doesn't have an ID, its API name is used.

Signature

```
public String getActionEnumOrId()
```

Return Value

Type: [String](#)

getCanvasApplicationName()

Returns the name of the Canvas application, if used.

Syntax

```
public String getCanvasApplicationName()
```

Return Value

Type: [String](#)

getColors()

Returns an array of color information. Each color is associated with a theme.

Signature

```
public List<Schema.DescribeColorResult> getColors()
```

Return Value

Type: [List <Schema.DescribeColorResult>](#)

getContextSubjectType()

Returns the object used for the action. Replaces `getSourceSubjectType()` in API version 30.0 and later.

Signature

```
public String getContextSubjectType()
```

Return Value

Type: [String](#)

getDefaultValues ()

Returns the default values for a action.

Signature

```
public List<QuickAction.DescribeQuickActionDefaultValue> getDefaultValues ()
```

Return Value

Type: [List<QuickAction.DescribeQuickActionDefaultValue>](#)

getHeight ()

Returns the height in pixels of the action pane.

Signature

```
public Integer getHeight ()
```

Return Value

Type: [Integer](#)

getIconName ()

Returns the actions' icon name.

Signature

```
public String getIconName ()
```

Return Value

Type: [String](#)

getIconUrl ()

Returns the URL of the 32x32 icon used for the action.

Signature

```
public String getIconUrl ()
```

Return Value

Type: [String](#)

getIcons ()

Returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

Signature

```
public List<Schema.DescribeIconResult> getIcons ()
```

Return Value

Type: [List<Schema.DescribeIconResult>](#)

getLabel ()

Returns the action label.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getLayout ()

Returns the layout sections that comprise an action.

Signature

```
public QuickAction.DescribeLayoutSection getLayout ()
```

Return Value

Type: [QuickAction.DescribeLayoutSection](#)

getLightningComponentBundleId ()

If the custom action invokes a Lightning component, returns the ID of the Lightning component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleId ()
```

Return Value

Type: [String](#)

getLightningComponentBundleName ()

If the custom action invokes a Lightning component, returns the name of the Lightning component bundle to which the component belongs.

Signature

```
public String getLightningComponentBundleName ()
```

Return Value

Type: [String](#)

getLightningComponentQualifiedName ()

If the custom action invokes a Lightning component, returns the fully qualified name of the Lightning component invoked by the custom action.

Signature

```
public String getLightningComponentQualifiedName ()
```

Return Value

Type: [String](#)

getMiniIconUrl ()

Returns the 16x16 icon URL.

Signature

```
public String getMiniIconUrl ()
```

Return Value

Type: [String](#)

getName ()

Returns the action name.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getShowQuickActionLcHeader ()

Returns an indication of whether the Lightning component quick action header and footer are shown.

Signature

```
public Boolean getShowQuickActionLcHeader ()
```

Return Value

Type: [Boolean](#)

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

getShowQuickActionVfHeader ()

Returns an indication of whether the Visualforce quick action header and footer should be shown.

Signature

```
public Boolean getShowQuickActionVfHeader ()
```

Return Value

Type: [Boolean](#)

If `false`, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren't displayed.

getSourceObjectType ()

Returns the object type used for the action.

Signature

```
public String getSourceObjectType ()
```

Return Value

Type: [String](#)

getTargetParentField ()

Returns the parent object's type for the action.

Signature

```
public String getTargetParentField ()
```

Return Value

Type: [String](#)

getTargetRecordTypeId ()

Returns the record type of the targeted record.

Signature

```
public String getTargetRecordTypeId ()
```

Return Value

Type: [String](#)

getTargetObjectType ()

Returns the action's target object type.

Signature

```
public String getTargetObjectType ()
```

Return Value

Type: [String](#)

getType ()

Returns a create or custom Visualforce action.

Signature

```
public String getType ()
```

Return Value

Type: [String](#)

getVisualforcePageName ()

If Visualforce is used, returns the name of the associated page for the action.

Signature

```
public String getVisualforcePageName ()
```

Return Value

Type: [String](#)

getVisualforcePageUrl ()

Returns the URL of the Visualforce page associated with the action.

Signature

```
public String getVisualforcePageUrl ()
```

Return Value

Type: [String](#)

getWidth ()

If a custom action is created, returns the width in pixels of the action pane.

Signature

```
public Integer getWidth ()
```

Return Value

Type: [Integer](#)

QuickActionDefaults Class

Represents an abstract Apex class that provides the context for running the standard Email Action on Case Feed and the container of the Email Message fields for the action payload. You can override the target fields before the standard Email Action is rendered.

Namespace

[QuickAction](#)

Usage

 **Note:** You cannot extend this abstract class. You can use the getter methods when using it in the context of `QuickAction.QuickActionDefaultsHandler`. Salesforce provides a class that extends this class (See `QuickAction.SendEmailQuickActionDefaults`.)

IN THIS SECTION:

[QuickActionDefaults Methods](#)

QuickActionDefaults Methods

The following are methods for `QuickActionDefaults`.

IN THIS SECTION:

[getActionName\(\)](#)

Returns the name of the standard Email Action on Case Feed (Case.Email).

[getActionType\(\)](#)

Returns the type of the standard Email Action on Case Feed (Email).

[getContextId\(\)](#)

The ID of the context related to the standard Email Action on Case Feed (Case ID).

[getTargetSObject\(\)](#)

The target object of the standard Email Action on Case Feed (EmailMessage).

getActionName ()

Returns the name of the standard Email Action on Case Feed (Case.Email).

Signature

```
public String getActionName ()
```

Return Value

Type: [String](#)

getActionType ()

Returns the type of the standard Email Action on Case Feed (Email).

Signature

```
public String getActionType ()
```

Return Value

Type: [String](#)

getContextId ()

The ID of the context related to the standard Email Action on Case Feed (Case ID).

Signature

```
public Id getContextId ()
```

Return Value

Type: [Id](#)

getTargetSObject ()

The target object of the standard Email Action on Case Feed (EmailMessage).

Signature

```
public SObject getTargetSObject ()
```

Return Value

Type: [SObject](#)

QuickActionDefaultsHandler Interface

The `QuickAction.QuickActionDefaultsHandler` interface lets you specify the default values for the standard Email Action on Case Feed. You can use this interface to specify the From address, CC address, BCC address, subject, and email body for the Email Action in Case Feed. You can use the interface to pre-populate these fields based on the context where the action is displayed, such as the case origin (for example, country) and subject.

Namespace

[QuickAction](#)

Usage

To specify default values for the standard Email Action on Case Feed, create a class that implements `QuickAction.QuickActionDefaultsHandler`.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

[QuickActionDefaultsHandler Methods](#)

[QuickActionDefaultsHandler Example Implementation](#)

QuickActionDefaultsHandler Methods

The following are methods for `QuickActionDefaultsHandler`.

IN THIS SECTION:

[onInitDefaults\(actionDefaults\)](#)

Implement this method to provide default values for the standard Email Action in Case Feed.

onInitDefaults (actionDefaults)

Implement this method to provide default values for the standard Email Action in Case Feed.

Signature

```
public void onInitDefaults (QuickAction.QuickActionDefaults[] actionDefaults)
```

Parameters

actionDefaults

Type: [QuickAction.QuickActionDefaults\[\]](#)

This array contains only one item of type `QuickAction.SendEmailQuickActionDefaults`.

Return Value

Type: void

QuickActionDefaultsHandler Example Implementation

This is an example implementation of the `QuickAction.QuickActionDefaultsHandler` interface.

In this example, the `onInitDefaults` method checks whether the element passed in the array is for the standard Email Action on Case Feed. Then, it performs a query to retrieve the case that corresponds to the context ID. Next, it sets the value of the BCC address of the corresponding email message to a default value. The default value is based on the case reason. Finally, it sets the default values of the email template properties. The `onInitDefaults` method determines the default values based on two criteria: first, whether a reply action on an email message initiated the call to the method, and second, whether any previous emails attached to the case are associated with the call.

```
global class EmailPublisherLoader implements QuickAction.QuickActionDefaultsHandler {
    // Empty constructor
    global EmailPublisherLoader() {
    }

    // The main interface method
    global void onInitDefaults(QuickAction.QuickActionDefaults[] defaults) {
        QuickAction.SendEmailQuickActionDefaults sendEmailDefaults = null;

        // Check if the quick action is the standard Case Feed send email action
        for (Integer j = 0; j < defaults.size(); j++) {
            if (defaults.get(j) instanceof QuickAction.SendEmailQuickActionDefaults &&
                defaults.get(j).getTargetSObject().getObjectType() ==
                    ErrorMessage.SObjectType &&
                defaults.get(j).getActionName().equals('Case.Email') &&
                defaults.get(j).getActionType().equals('Email')) {
                sendEmailDefaults =
                    (QuickAction.SendEmailQuickActionDefaults)defaults.get(j);
                break;
            }
        }

        if (sendEmailDefaults != null) {
            Case c = [SELECT Status, Reason FROM Case
                     WHERE Id=:sendEmailDefaults.getContextId()];

            ErrorMessage emailMessage = (ErrorMessage)sendEmailDefaults.getTargetSObject();

            // Set bcc address to make sure each email goes for audit
            emailMessage.BccAddress = getBccAddress(c.Reason);

            /*
            Set Template related fields
            When the In Reply To Id field is null we know the interface
            is called on page load. Here we check if
            there are any previous emails attached to the case and load
            the 'New_Case_Created' or 'Automatic_Response' template.
            When the In Reply To Id field is not null we know that
            the interface is called on click of reply/reply all
            */
        }
    }
}
```

```

of an email and we load the 'Default_reply_template' template
*/
if (sendEmailDefaults.getInReplyToId() == null) {
    Integer emailCount = [SELECT count() FROM EmailMessage
                          WHERE ParentId=:sendEmailDefaults.getContextId()];
    if (emailCount != null && emailCount > 0) {
        sendEmailDefaults.setTemplateId(
            getTemplateIdHelper('Automatic_Response'));
    } else {
        sendEmailDefaults.setTemplateId(
            getTemplateIdHelper('New_Case_Created'));
    }
    sendEmailDefaults.setInsertTemplateBody(false);
    sendEmailDefaults.setIgnoreTemplateSubject(false);
} else {
    sendEmailDefaults.setTemplateId(
        getTemplateIdHelper('Default_reply_template'));
    sendEmailDefaults.setInsertTemplateBody(false);
    sendEmailDefaults.setIgnoreTemplateSubject(true);
}
}
}

private Id getTemplateIdHelper(String templateApiName) {
    Id templateId = null;
    try {
        templateId = [select id, name from EmailTemplate
                     where developername = : templateApiName].id;
    } catch (Exception e) {
        system.debug('Unable to locate EmailTemplate using name: ' +
                    templateApiName + ' refer to Setup | Communications Templates '
                    + templateApiName);
    }
    return templateId;
}

private String getBccAddress(String reason) {
    if (reason != null && reason.equals('Technical'))
        { return 'support_technical@mycompany.com'; }
    else if (reason != null && reason.equals('Billing'))

    else { return 'support@mycompany.com'; }
}
}
}

```

QuickActionRequest Class

Use the `QuickAction.QuickActionRequest` class for providing action information for quick actions to be performed by `QuickAction` class methods. Action information includes the action name, context record ID, and record.

Namespace

[QuickAction](#)

Usage

For Apex saved using Salesforce API version 28.0, a parent ID is associated with the `QuickActionRequest` instead of the context ID.

The constructor of this class takes no arguments:

```
QuickAction.QuickActionRequest qar = new QuickAction.QuickActionRequest();
```

Example

In this sample, a new quick action is created to create a contact and assign a record to it.

```
QuickAction.QuickActionRequest req = new QuickAction.QuickActionRequest();
// Some quick action name
req.quickActionName = Schema.Account.QuickAction.AccountCreateContact;

// Define a record for the quick action to create
Contact c = new Contact();
c.lastname = 'last name';
req.record = c;

// Provide the context ID (or parent ID). In this case, it is an Account record.
req.contextid = '001xx000003DGcO';

QuickAction.QuickActionResult res = QuickAction.performQuickAction(req);
```

[QuickActionRequest Constructors](#)

[QuickActionRequest Methods](#)

SEE ALSO:

[QuickAction Class](#)

QuickActionRequest Constructors

The following are constructors for `QuickActionRequest`.

IN THIS SECTION:

[QuickActionRequest\(\)](#)

Creates a new instance of the `QuickAction.QuickActionRequest` class.

QuickActionRequest ()

Creates a new instance of the `QuickAction.QuickActionRequest` class.

Signature

```
public QuickActionRequest ()
```

QuickActionRequest Methods

The following are methods for `QuickActionRequest`. All are instance methods.

IN THIS SECTION:

[getContextId\(\)](#)

Returns this QuickAction's context record ID.

[getQuickActionName\(\)](#)

Returns this QuickAction's name.

[getRecord\(\)](#)

Returns the QuickAction's associated record.

[setContextId\(contextId\)](#)

Sets this QuickAction's context ID. Returned by `getContextId`.

[setQuickActionName\(name\)](#)

Sets this QuickAction's name. Returned by `getQuickActionName`.

[setRecord\(record\)](#)

Sets a record for this QuickAction. Returned by `getRecord`.

getContextId ()

Returns this QuickAction's context record ID.

Signature

```
public Id getContextId ()
```

Return Value

Type: [ID](#)

getQuickActionName ()

Returns this QuickAction's name.

Signature

```
public String getQuickActionName ()
```

Return Value

Type: [String](#)

getRecord()

Returns the QuickAction's associated record.

Signature

```
public SObject getRecord()
```

Return Value

Type: [SObject](#)

setContextId(contextId)

Sets this QuickAction's context ID. Returned by `getContextId`.

Signature

```
public Void setContextId(Id contextId)
```

Parameters

contextId
Type: [ID](#)

Return Value

Type: Void

Usage

For Apex saved using SalesforceAPI version 28.0, sets this QuickAction's parent ID and is returned by `getParentId`.

setQuickActionName(name)

Sets this QuickAction's name. Returned by `getQuickActionName`.

Signature

```
public Void setQuickActionName(String name)
```

Parameters

name
Type: [String](#)

Return Value

Type: Void

setRecord(record)

Sets a record for this QuickAction. Returned by `getRecord`.

Signature

```
public void setRecord(SObject record)
```

Parameters

record
Type: [SObject](#)

Return Value

Type: Void

QuickActionResult Class

After you initiate a quick action with the `QuickAction` class, use the `QuickActionResult` class for processing action results.

Namespace

[QuickAction](#)

SEE ALSO:

[QuickAction Class](#)

QuickActionResult Methods

The following are methods for `QuickActionResult`. All are instance methods.

IN THIS SECTION:

[getErrors\(\)](#)

If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

[getIds\(\)](#)

The IDs of the QuickActions being processed.

[getSuccessMessage\(\)](#)

Returns the success message associated with the quick action.

[isCreated\(\)](#)

Returns `true` if the action is created; otherwise, `false`.

[isSuccess\(\)](#)

Returns `true` if the action completes successfully; otherwise, `false`.

getErrors()

If an error occurs, an array of one or more database error objects, along with error codes and descriptions, is returned.

Signature

```
public List<Database.Error> getErrors ()
```

Return Value

Type: [List<Database.Error>](#)

getIds ()

The IDs of the QuickActions being processed.

Signature

```
public List<Id> getIds ()
```

Return Value

Type: [List<Id>](#)

getSuccessMessage ()

Returns the success message associated with the quick action.

Signature

```
public String getSuccessMessage ()
```

Return Value

Type: [String](#)

isCreated ()

Returns [true](#) if the action is created; otherwise, [false](#).

Signature

```
public Boolean isCreated ()
```

Return Value

Type: [Boolean](#)

isSuccess ()

Returns [true](#) if the action completes successfully; otherwise, [false](#).

Signature

```
public Boolean isSuccess ()
```

Return Value

Type: [Boolean](#)

SendEmailQuickActionDefaults Class

Represents an Apex class that provides: the From address list; the original email's email message ID, provided that the reply action was invoked on the email message feed item; and methods to specify related settings on templates. You can override these fields before the standard Email Action is rendered.

Namespace

[QuickAction](#)

Usage

Note: You cannot instantiate this class. One can use the getters/setters when using it in the context of `QuickAction.QuickActionDefaultsHandler`.

IN THIS SECTION:

[SendEmailQuickActionDefaults Methods](#)

SendEmailQuickActionDefaults Methods

The following are methods for `SendEmailQuickActionDefaults`.

IN THIS SECTION:

[getFromAddressList\(\)](#)

Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

[getInReplyToId\(\)](#)

Returns the email message ID of the email to which the reply/reply all action has been invoked.

[setIgnoreTemplateSubject\(useOriginalSubject\)](#)

Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

[setInsertTemplateBody\(keepOriginalBodyContent\)](#)

Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

[setTemplateId\(templateId\)](#)

Sets the email template ID to load into the email body.

getFromAddressList ()

Returns a list of email addresses that are available in the From: address drop-down menu for the standard Email Action.

Signature

```
public List<String> getFromAddressList ()
```

Return Value

Type: List<String>

getInReplyToId ()

Returns the email message ID of the email to which the reply/reply all action has been invoked.

Signature

```
public Id getInReplyToId ()
```

Return Value

Type: Id

setIgnoreTemplateSubject (useOriginalSubject)

Specifies whether the template subject should be ignored (true), thus using the original subject, or whether the template subject should replace the original subject (false).

Signature

```
public void setIgnoreTemplateSubject (Boolean useOriginalSubject)
```

Parameters

useOriginalSubject

Type: Boolean

Return Value

Type: void

setInsertTemplateBody (keepOriginalBodyContent)

Specifies whether the template body should be inserted above the original body content (true) or whether it should replace the entire content with the template body (false).

Signature

```
public void setInsertTemplateBody (Boolean keepOriginalBodyContent)
```

Parameters

keepOriginalBodyContent

Type: Boolean

Return Value

Type: void

setTemplateId(templateId)

Sets the email template ID to load into the email body.

Signature

```
public void setTemplateId(Id templateId)
```

Parameters

templateId

Type: Id

The template ID.

Return Value

Type: void

Reports Namespace

The `Reports` namespace provides classes for accessing the same data as is available in the Salesforce Reports and Dashboards REST API.

The following are the classes in the `Reports` namespace.

IN THIS SECTION:

[AggregateColumn Class](#)

Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

[BucketField Class](#)

Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

[BucketFieldValue Class](#)

Contains information about the report values included in a bucket field.

[BucketType Enum](#)

The types of values included in a bucket.

[ColumnDataType Enum](#)

The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

[ColumnSortOrder Enum](#)

The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

[CrossFilter Class](#)

Contains methods and constructors used to work with information about a cross filter.

[CsfGroupType Enum](#)

The group level at which the custom summary format aggregate is displayed in a report.

[DateGranularity Enum](#)

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

[DetailColumn Class](#)

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

[Dimension Class](#)

Contains information for each row or column grouping.

[EvaluatedCondition Class](#)

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

[EvaluatedConditionOperator Enum](#)

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

[FilterOperator Class](#)

Contains information about a filter operator, such as display name and API name.

[FilterValue Class](#)

Contains information about a filter value, such as the display name and API name.

[FormulaType Enum](#)

The format of the numbers in a custom summary formula.

[GroupingColumn Class](#)

Contains methods for describing fields that are used for column grouping.

[GroupingInfo Class](#)

Contains methods for describing fields that are used for grouping.

[GroupingValue Class](#)

Contains grouping values for a row or column, including the key, label, and value.

[NotificationAction Interface](#)

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

[NotificationActionContext Class](#)

Contains information about the report instance and condition threshold for a report notification.

[ReportCsf Class](#)

Contains methods and constructors for working with information about a custom summary formula (CSF).

[ReportCurrency Class](#)

Contains information about a currency value, including the amount and currency code.

[ReportDataCell Class](#)

Contains the data for a cell in the report, including the display label and value.

[ReportDescribeResult Class](#)

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

[ReportDetailRow Class](#)

Contains data cells for a detail row of a report.

[ReportDivisionInfo Class](#)

Contains information about the divisions that can be used to filter a report.

[ReportExtendedMetadata Class](#)

Contains report extended metadata for a tabular, summary, or matrix report.

[ReportFact Class](#)

Contains the fact map for the report, which represents the report's data values.

[ReportFactWithDetails Class](#)

Contains the detailed fact map for the report, which represents the report's data values.

[ReportFactWithSummaries Class](#)

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

[ReportFilter Class](#)

Contains information about a report filter, including column, operator, and value.

[ReportFormat Enum](#)

Contains the possible report format types.

[ReportInstance Class](#)

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

[ReportManager Class](#)

Runs a report synchronously or asynchronously and with or without details.

[ReportMetadata Class](#)

Contains report metadata for a tabular, summary, or matrix report.

[ReportResults Class](#)

Contains the results of running a report.

[ReportScopeInfo Class](#)

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

[ReportScopeValue Class](#)

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

[ReportType Class](#)

Contains the unique API name and display name for the report type.

[ReportTypeColumn Class](#)

Contains detailed report type metadata about a field, including data type, display name, and filter values.

[ReportTypeColumnCategory Class](#)

Information about categories of fields in a report type.

[ReportTypeMetadata Class](#)

Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

[SortColumn Class](#)

Contains information about the sort column used in the report.

[StandardDateFilter Class](#)

Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

[StandardDateFilterDuration Class](#)

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

[StandardDateFilterDurationGroup Class](#)

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include `Calendar Year`, `Calendar Quarter`, `Calendar Month`, `Calendar Week`, `Fiscal Year`, `Fiscal Quarter`, `Day`, and custom values based on user-defined date ranges.

[StandardFilter Class](#)

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

[StandardFilterInfo Class](#)

Is an abstract base class for an object that provides standard filter information.

[StandardFilterInfoPicklist Class](#)

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

[StandardFilterType Enum](#)

The `StandardFilterType` enum describes the type of standard filters in a report. The `getType()` method returns a `Reports.StandardFilterType` enum value.

[SummaryValue Class](#)

Contains summary data for a cell of the report.

[ThresholdInformation Class](#)

Contains a list of evaluated conditions for a report notification.

[TopRows Class](#)

Contains methods and constructors for working with information about a row limit filter.

[Reports Exceptions](#)

The `Reports` namespace contains exception classes.

AggregateColumn Class

Contains methods for describing summary fields such as Record Count, Sum, Average, Max, Min, and custom summary formulas. Includes name, label, data type, and grouping context.

Namespace

[Reports](#)

AggregateColumn Methods

The following are methods for `AggregateColumn`. All are instance methods.

IN THIS SECTION:

[getName\(\)](#)

Returns the unique API name of the summary field.

[getLabel\(\)](#)

Returns the localized display name for the summarized or custom summary formula field.

[getDataType\(\)](#)

Returns the data type of the summarized or custom summary formula field.

[getAcrossGroupingContext\(\)](#)

Returns the column grouping in the report where the summary field is displayed.

[getDownGroupingContext\(\)](#)

Returns the row grouping in the report where the summary field is displayed.

getName ()

Returns the unique API name of the summary field.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the localized display name for the summarized or custom summary formula field.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getDataType ()

Returns the data type of the summarized or custom summary formula field.

Syntax

```
public Reports.ColumnDataType getDataType ()
```

Return Value

Type: [Reports.ColumnDataType](#)

getAcrossGroupingContext ()

Returns the column grouping in the report where the summary field is displayed.

Syntax

```
public String getAcrossGroupingContext ()
```

Return Value

Type: [String](#)

getDownGroupingContext ()

Returns the row grouping in the report where the summary field is displayed.

Syntax

```
public String getDownGroupingContext ()
```

Return Value

Type: [String](#)

BucketField Class

Contains methods and constructors to work with information about a bucket field, including bucket type, name, and bucketed values.

Namespace

[Reports](#)

IN THIS SECTION:

[BucketField Constructors](#)

[BucketField Methods](#)

BucketField Constructors

The following are constructors for `BucketField`.

IN THIS SECTION:

[BucketField\(bucketType, developerName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values\)](#)

Creates an instance of the `Reports.BucketField` class using the specified parameters.

[BucketField\(\)](#)

Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

```
BucketField(bucketType, developerName, label, nullTreatedAsZero, otherBucketLabel, sourceColumnName, values)
```

Creates an instance of the `Reports.BucketField` class using the specified parameters.

Signature

```
public BucketField(Reports.BucketType bucketType, String developerName, String label, Boolean nullTreatedAsZero, String otherBucketLabel, String sourceColumnName, List<Reports.BucketFieldValue> values)
```

Parameters

bucketType

Type: [Reports.BucketType](#)

The type of bucket.

developerName

Type: [String](#)

API name of the bucket.

label

Type: [String](#)

User-facing name of the bucket.

nullTreatedAsZero

Type: [Boolean](#)

Specifies whether null values are converted to zero (`true`) or not (`false`).

otherBucketLabel

Type: [String](#)

Name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

sourceColumnName

Type: [String](#)

Name of the bucketed field.

values

Type: List<[Reports.BucketType](#)>

Types of the values included in the bucket.

BucketField()

Creates an instance of the `Reports.BucketField` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketField()
```

BucketField Methods

The following are methods for `BucketField`.

IN THIS SECTION:

[getBucketType\(\)](#)

Returns the bucket type.

[getDeveloperName\(\)](#)

Returns the bucket's API name.

[getLabel\(\)](#)

Returns the user-facing name of the bucket.

[getNullTreatedAsZero\(\)](#)

Returns `true` if null values are converted to the number zero, otherwise returns `false`.

[getOtherBucketLabel\(\)](#)

Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

[getSourceColumnName\(\)](#)

Returns the API name of the bucketed field.

[getValues\(\)](#)

Returns the report values grouped by the bucket field.

[setBucketType\(value\)](#)

Sets the `BucketType` of the bucket.

[setBucketType\(bucketType\)](#)

Sets the `BucketType` of the bucket.

[setDeveloperName\(developerName\)](#)

Sets the API name of the bucket.

[setLabel\(label\)](#)

Sets the user-facing name of the bucket.

[setNullTreatedAsZero\(nullTreatedAsZero\)](#)

Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

[setOtherBucketLabel\(otherBucketLabel\)](#)

Sets the name of the fields grouped as `Other` (in buckets of `BucketType PICKLIST`).

[setSourceColumnName\(sourceColumnName\)](#)

Specifies the name of the bucketed field.

[setValues\(values\)](#)

Specifies which type of values are included in the bucket.

[toString\(\)](#)

Returns a string.

getBucketType ()

Returns the bucket type.

Signature

```
public Reports.BucketType getBucketType ()
```

Return Value

Type: [Reports.BucketType](#)

getDeveloperName ()

Returns the bucket's API name.

Signature

```
public String getDeveloperName ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the user-facing name of the bucket.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getNullTreatedAsZero ()

Returns `true` if null values are converted to the number zero, otherwise returns `false`.

Signature

```
public Boolean getNullTreatedAsZero ()
```

Return Value

Type: [Boolean](#)

getOtherBucketLabel ()

Returns the name of fields grouped as `Other` in buckets of type `PICKLIST`.

Signature

```
public String getOtherBucketLabel ()
```

Return Value

Type: [String](#)

getSourceColumnName ()

Returns the API name of the bucketed field.

Signature

```
public String getSourceColumnName ()
```

Return Value

Type: [String](#)

getValues ()

Returns the report values grouped by the bucket field.

Signature

```
public List<Reports.BucketFieldValue> getValues ()
```

Return Value

Type: [List](#) on page 2567<[Reports.BucketFieldValue](#)>

setBucketType (value)

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType (String value)
```

Parameters

value

Type: [String](#)

See the [Reports.BucketType](#) enum for valid values.

Return Value

Type: void

setBucketType (bucketType)

Sets the `BucketType` of the bucket.

Signature

```
public void setBucketType (Reports.BucketType bucketType)
```

Parameters

bucketType
Type: [Reports.BucketType](#)

Return Value

Type: void

setDeveloperName (developerName)

Sets the API name of the bucket.

Signature

```
public void setDeveloperName (String developerName)
```

Parameters

developerName
Type: [String](#)

The API name to assign to the bucket.

Return Value

Type: void

setLabel (label)

Sets the user-facing name of the bucket.

Signature

```
public void setLabel (String label)
```

Parameters

label
Type: [String](#)

Return Value

Type: void

setNullTreatedAsZero (nullTreatedAsZero)

Specifies whether null values in the bucket are converted to zero (`true`) or not (`false`).

Signature

```
public void setNullTreatedAsZero (Boolean nullTreatedAsZero)
```

Parameters

nullTreatedAsZero
Type: [Boolean](#)

Return Value

Type: void

setOtherBucketLabel (otherBucketLabel)

Sets the name of the fields grouped as Other (in buckets of BucketType PICKLIST).

Signature

```
public void setOtherBucketLabel (String otherBucketLabel)
```

Parameters

otherBucketLabel
Type: [String](#)

Return Value

Type: void

setSourceColumnName (sourceColumnName)

Specifies the name of the bucketed field.

Signature

```
public void setSourceColumnName (String sourceColumnName)
```

Parameters

sourceColumnName
Type: [String](#)

Return Value

Type: void

setValues (values)

Specifies which type of values are included in the bucket.

Signature

```
public void setValues (List<Reports.BucketFieldValue> values)
```

Parameters

values

Type: [List](#) on page 2567 <[Reports.BucketFieldValue](#)>

Return Value

Type: void

toString()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

BucketFieldValue Class

Contains information about the report values included in a bucket field.

Namespace

[Reports](#)

IN THIS SECTION:

[BucketFieldValue Constructors](#)

[BucketFieldValue Methods](#)

BucketFieldValue Constructors

The following are constructors for `BucketFieldValue`.

IN THIS SECTION:

[BucketFieldValue\(label, sourceDimensionValues, rangeUpperBound\)](#)

Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

[BucketFieldValue\(\)](#)

Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

BucketFieldValue(label, sourceDimensionValues, rangeUpperBound)

Creates an instance of the `Reports.BucketFieldValue` class using the specified parameters.

Signature

```
public BucketFieldValue(String label, List<String> sourceDimensionValues, Double rangeUpperBound)
```

Parameters

label

Type: [String](#)

The user-facing name of the bucket.

sourceDimensionValues

Type: [List](#) on page 2567<[String](#)>

A list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

rangeUpperBound

Type: [Double](#)

The greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

BucketFieldValue ()

Creates an instance of the `Reports.BucketFieldValue` class. You can then set values by using the class's `set` methods.

Signature

```
public BucketFieldValue ()
```

BucketFieldValue Methods

The following are methods for `BucketFieldValue`.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the user-facing name of the bucket category.

[getRangeUpperBound\(\)](#)

Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

[getSourceDimensionValues\(\)](#)

Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

[setLabel\(label\)](#)

Set the user-facing name of the bucket category.

[setRangeUpperBound\(rangeUpperBound\)](#)

Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type `NUMBER`).

[setSourceDimensionValues\(sourceDimensionValues\)](#)

Specifies the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

`toString()`

Returns a string.

getLabel ()

Returns the user-facing name of the bucket category.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getRangeUpperBound ()

Returns the greatest range limit under which values are included in this bucket category (in buckets of type `NUMBER`).

Signature

```
public Double getRangeUpperBound ()
```

Return Value

Type: [Double](#)

getSourceDimensionValues ()

Returns a list of the values from the source field included in this bucket category (in buckets of type `PICKLIST` and buckets of type `TEXT`).

Signature

```
public List<String> getSourceDimensionValues ()
```

Return Value

Type: [List<String>](#)

setLabel (label)

Set the user-facing name of the bucket category.

Signature

```
public void setLabel (String label)
```

Parameters

label

Type: [String](#)

Return Value

Type: void

setRangeUpperBound (rangeUpperBound)

Sets the greatest limit of a range under which values are included in this bucket category (in buckets of type NUMBER).

Signature

```
public void setRangeUpperBound(Double rangeUpperBound)
```

Parameters

rangeUpperBound

Type: [Double](#)

Return Value

Type: void

setSourceDimensionValues (sourceDimensionValues)

Specifies the values from the source field included in this bucket category (in buckets of type PICKLIST and buckets of type TEXT).

Signature

```
public void setSourceDimensionValues(List<String> sourceDimensionValues)
```

Parameters

sourceDimensionValues

Type: [List<String>](#)

Return Value

Type: void

toString ()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

BucketType Enum

The types of values included in a bucket.

Enum Values

The following are the values of the `Reports.BucketType` enum.

Value	Description
NUMBER	Numeric values
PICKLIST	Picklist values
TEXT	String values

ColumnDataType Enum

The `Reports.ColumnDataType` enum describes the type of data in a column. It is returned by the `getDataType` method.

Namespace

[Reports](#)

Enum Values

The following are the values of the `Reports.ColumnDataType` enum.

Value	Description
BOOLEAN_DATA	Boolean (<code>true</code> or <code>false</code>) values
COMBOBOX_DATA	Comboboxes, which provide a set of enumerated values and enable the user to specify a value that is not in the list
CURRENCY_DATA	Currency values
DATETIME_DATA	DateTime values
DATE_DATA	Date values
DOUBLE_DATA	Double values
EMAIL_DATA	Email addresses
ID_DATA	An object's Salesforce ID
INT_DATA	Integer values

Value	Description
MULTIPICKLIST_DATA	Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected
PERCENT_DATA	Percent values
PHONE_DATA	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.
PICKLIST_DATA	Single-select picklists, which provide a set of enumerated values from which only one value can be selected
REFERENCE_DATA	Cross-references to another object, analogous to a foreign key field
STRING_DATA	String values
TEXTAREA_DATA	String values that are displayed as multiline text fields
TIME_DATA	Time values
URL_DATA	URL values that are displayed as hyperlinks

ColumnSortOrder Enum

The `Reports.ColumnSortOrder` enum describes the order that the grouping column uses to sort data.

Namespace

[Reports](#)

Usage

The `GroupingInfo.getColumnSortOrder()` method returns a `Reports.ColumnSortOrder` enum value. The `GroupingInfo.setColumnSortOrder()` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.ColumnSortOrder` enum.

Value	Description
ASCENDING	Sort data in ascending order (A–Z)
DESCENDING	Sort data in descending order (Z–A)

CrossFilter Class

Contains methods and constructors used to work with information about a cross filter.

Namespace

Reports

IN THIS SECTION:

[CrossFilter Constructors](#)

[CrossFilter Methods](#)

CrossFilter Constructors

The following are constructors for `CrossFilter`.

IN THIS SECTION:

[CrossFilter\(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField\)](#)

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

[CrossFilter\(\)](#)

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

CrossFilter(criteria, includesObject, primaryEntityField, relatedEntity, relatedEntityJoinField)

Creates an instance of the `Reports.CrossFilter` class using the specified parameters.

Signature

```
public CrossFilter(List<Reports.ReportFilter> criteria, Boolean includesObject, String
primaryEntityField, String relatedEntity, String relatedEntityJoinField)
```

Parameters

criteria

Type: [List<Reports.ReportFilter>](#)

Information about how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

includesObject

Type: [Boolean](#)

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

primaryEntityField

Type: [String](#)

The name of the object on which the cross filter is evaluated.

relatedEntity

Type: [String](#)

The name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

relatedEntityJoinField

Type: [String](#)

The name of the field used to join the `primaryEntityField` and `relatedEntity`.

CrossFilter()

Creates an instance of the `Reports.CrossFilter` class. You can then set values by using the class's `set` methods.

Signature

```
public CrossFilter()
```

CrossFilter Methods

The following are methods for `CrossFilter`.

IN THIS SECTION:

[getCriteria\(\)](#)

Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

[getIncludesObject\(\)](#)

Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

[getPrimaryEntityField\(\)](#)

Returns the name of the object on which the cross filter is evaluated.

[getRelatedEntity\(\)](#)

Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

[getRelatedEntityJoinField\(\)](#)

Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

[setCriteria\(criteria\)](#)

Specifies how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

[setIncludesObject\(includesObject\)](#)

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

[setPrimaryEntityField\(primaryEntityField\)](#)

Specifies the name of the object on which the cross filter is evaluated.

[setRelatedEntity\(relatedEntity\)](#)

Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

[setRelatedEntityJoinField\(relatedEntityJoinField\)](#)

Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

[toString\(\)](#)

Returns a string.

getCriteria()

Returns information about how to filter the `relatedEntity`. Describes the subset of the `relatedEntity` which the primary entity is evaluated against.

Signature

```
public List<Reports.ReportFilter> getCriteria()
```

Return Value

Type: [List<Reports.ReportFilter>](#)

getIncludesObject()

Returns `true` if primary object has a relationship with the `relatedEntity`, otherwise returns `false`.

Signature

```
public Boolean getIncludesObject()
```

Return Value

Type: [Boolean](#)

getPrimaryEntityField()

Returns the name of the object on which the cross filter is evaluated.

Signature

```
public String getPrimaryEntityField()
```

Return Value

Type: [String](#)

getRelatedEntity()

Returns name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public String getRelatedEntity()
```

Return Value

Type: [String](#)

getRelatedEntityJoinField()

Returns the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public String getRelatedEntityJoinField()
```

Return Value

Type: [String](#)

setCriteria(criteria)

Specifies how to filter the `relatedEntity`. Relates the primary entity with a subset of the `relatedEntity`.

Signature

```
public void setCriteria(List<Reports.ReportFilter> criteria)
```

Parameters

criteria

Type: [List<Reports.ReportFilter>](#)

Return Value

Type: void

setIncludesObject(includesObject)

Specifies whether objects returned have a relationship with the `relatedEntity` (`true`) or not (`false`).

Signature

```
public void setIncludesObject(Boolean includesObject)
```

Parameters

includesObject

Type: [Boolean](#)

Return Value

Type: void

setPrimaryEntityField(primaryEntityField)

Specifies the name of the object on which the cross filter is evaluated.

Signature

```
public void setPrimaryEntityField(String primaryEntityField)
```

Parameters

primaryEntityField

Type: [String](#)

Return Value

Type: void

setRelatedEntity (relatedEntity)

Specifies the name of the object that the `primaryEntityField` is evaluated against—the right-hand side of the cross filter.

Signature

```
public void setRelatedEntity(String relatedEntity)
```

Parameters

relatedEntity
Type: [String](#)

Return Value

Type: void

setRelatedEntityJoinField (relatedEntityJoinField)

Specifies the name of the field used to join the `primaryEntityField` and `relatedEntity`.

Signature

```
public void setRelatedEntityJoinField(String relatedEntityJoinField)
```

Parameters

relatedEntityJoinField
Type: [String](#)

Return Value

Type: void

toString ()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

CsfGroupType Enum

The group level at which the custom summary format aggregate is displayed in a report.

Enum Values

The following are the values of the `Reports.CsfGroupType` enum.

Value	Description
ALL	The aggregate is displayed at the end of every summary row.
CUSTOM	The aggregate is displayed at specified grouping levels.
GRAND_TOTAL	The aggregate is displayed only at the grand total level.

DateGranularity Enum

The `Reports.DateGranularity` enum describes the date interval that is used for grouping.

Namespace

[Reports](#)

Usage

The `GroupingInfo.getDateGranularity` method returns a `Reports.DateGranularity` enum value. The `GroupingInfo.setDateGranularity` method takes the enum value as an argument.

Enum Values

The following are the values of the `Reports.DateGranularity` enum.

Value	Description
DAY	The day of the week (Monday–Sunday)
DAY_IN_MONTH	The day of the month (1–31)
FISCAL_PERIOD	The fiscal period
FISCAL_QUARTER	The fiscal quarter
FISCAL_WEEK	The fiscal week
FISCAL_YEAR	The fiscal year
MONTH	The month (January–December)
MONTH_IN_YEAR	The month number (1–12)
NONE	No date grouping
QUARTER	The quarter number (1–4)

Value	Description
WEEK	The week number (1–52)
YEAR	The year number (####)

DetailColumn Class

Contains methods for describing fields that contain detailed data. Detailed data fields are also listed in the report metadata.

Namespace

[Reports](#)

DetailColumn Instance Methods

The following are instance methods for `DetailColumn`. All are instance methods.

IN THIS SECTION:

[getName\(\)](#)

Returns the unique API name of the detail column field.

[getLabel\(\)](#)

Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

[getDataType\(\)](#)

Returns the data type of a detail column field.

getName ()

Returns the unique API name of the detail column field.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the localized display name of a standard field, the ID of a custom field, or the API name of a bucket field that has detailed data.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getDataType ()

Returns the data type of a detail column field.

Syntax

```
public Reports.ColumnDataType getDataType ()
```

Return Value

Type: [Reports.ColumnDataType](#)

Dimension Class

Contains information for each row or column grouping.

Namespace

[Reports](#)

Dimension Methods

The following are methods for `Dimension`. All are instance methods.

IN THIS SECTION:

[getGroupings\(\)](#)

Returns information for each row or column grouping as a list.

getGroupings ()

Returns information for each row or column grouping as a list.

Syntax

```
public List<Reports.GroupingValue> getGroupings ()
```

Return Value

Type: [List<Reports.GroupingValue>](#)

EvaluatedCondition Class

Contains the individual components of an evaluated condition for a report notification, such as the aggregate name and label, the operator, and the value that the aggregate is compared to.

Namespace

Reports

IN THIS SECTION:

[EvaluatedCondition Constructors](#)

[EvaluatedCondition Methods](#)

EvaluatedCondition Constructors

The following are constructors for `EvaluatedCondition`.

IN THIS SECTION:

[EvaluatedCondition\(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator\)](#)

Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

EvaluatedCondition(aggregateName, aggregateLabel, compareToValue, aggregateValue, displayCompareTo, displayValue, operator)

Creates a new instance of the `Reports.EvaluatedConditions` class using the specified parameters.

Signature

```
public EvaluatedCondition(String aggregateName, String aggregateLabel, Double
compareToValue, Double aggregateValue, String displayCompareTo, String displayValue,
Reports.EvaluatedConditionOperator operator)
```

Parameters

aggregateName

Type: [String](#)

The unique API name of the aggregate.

aggregateLabel

Type: [String](#)

The localized display name of the aggregate.

compareToValue

Type: [Double](#)

The value that the aggregate is compared to in the condition.

aggregateValue

Type: [Double](#)

The actual value of the aggregate when the report is run.

displayCompareTo

Type: [String](#)

The value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

displayValue

Type: [String](#)

The value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

operator

Type: [Reports.EvaluatedConditionOperator](#)

The operator used in the condition.

EvaluatedCondition Methods

The following are methods for `EvaluatedCondition`.

IN THIS SECTION:

[getAggregateLabel\(\)](#)

Returns the localized display name of the aggregate.

[getAggregateName\(\)](#)

Returns the unique API name of the aggregate.

[getCompareTo\(\)](#)

Returns the value that the aggregate is compared to in the condition.

[getDisplayCompareTo\(\)](#)

Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

[getDisplayValue\(\)](#)

Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

[getOperator\(\)](#)

Returns the operator used in the condition.

[getValue\(\)](#)

Returns the actual value of the aggregate when the report is run.

getAggregateLabel ()

Returns the localized display name of the aggregate.

Signature

```
public String getAggregateLabel ()
```

Return Value

Type: [String](#)

getAggregateName ()

Returns the unique API name of the aggregate.

Signature

```
public String getAggregateName ()
```

Return Value

Type: [String](#)

getCompareTo ()

Returns the value that the aggregate is compared to in the condition.

Signature

```
public Double getCompareTo ()
```

Return Value

Type: [Double](#)

getDisplayCompareTo ()

Returns the value that the aggregate is compared to in the condition, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayCompareTo ()
```

Return Value

Type: [String](#)

getDisplayValue ()

Returns the value of the aggregate when the report is run, formatted for display. For example, a display value for a currency is \$20.00 or USD20.00 instead of 20.00.

Signature

```
public String getDisplayValue ()
```

Return Value

Type: [String](#)

getOperator ()

Returns the operator used in the condition.

Signature

```
public Reports.EvaluatedConditionOperator getOperator()
```

Return Value

Type: [Reports.EvaluatedConditionOperator](#)

getValue ()

Returns the actual value of the aggregate when the report is run.

Signature

```
public Double getValue ()
```

Return Value

Type: [Double](#)

EvaluatedConditionOperator Enum

The `Reports.EvaluatedConditionOperator` enum describes the type of operator used to compare an aggregate to a value. It is returned by the `getOperator` method.

Namespace

[Reports](#)

Enum Values

The following are the values of the `Reports.EvaluatedConditionOperator` enum.

Value	Description
EQUAL	Equality operator.
GREATER_THAN	Greater than operator.
GREATER_THAN_EQUAL	Greater than or equal to operator.
LESS_THAN	Less than operator.
LESS_THAN_EQUAL	Less than or equal to operator.
NOT_EQUAL	Inequality operator.

FilterOperator Class

Contains information about a filter operator, such as display name and API name.

Namespace

[Reports](#)

FilterOperator Methods

The following are methods for `FilterOperator`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

[getName\(\)](#)

Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

getLabel ()

Returns the localized display name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

Returns the unique API name of the filter operator. Possible values for this name are restricted based on the data type of the column being filtered. For example `multipicklist` fields can use the following filter operators: "equals," "not equal to," "includes," and "excludes." Bucket fields are considered to be of the `String` type.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

FilterValue Class

Contains information about a filter value, such as the display name and API name.

Namespace

[Reports](#)

FilterValue Methods

The following are methods for `FilterValue`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

[getName\(\)](#)

Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

getLabel ()

Returns the localized display name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

Returns the unique API name of the filter value. Possible values for this name are restricted based on the data type of the column being filtered.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

FormulaType Enum

The format of the numbers in a custom summary formula.

Enum Values

The following are the values of the `Reports.FormulaType` enum.

Value	Description
CURRENCY	Formatted as currency. For example, \$100.00.
NUMBER	Formatted as numbers. For example, 100.
PERCENT	Formatted as percentages. For example, 100%.

GroupingColumn Class

Contains methods for describing fields that are used for column grouping.

Namespace

[Reports](#)

The `GroupingColumn` class provides basic information about column grouping fields. The `GroupingInfo` class includes additional methods for describing and updating grouping fields.

GroupingColumn Methods

The following are methods for `GroupingColumn`. All are instance methods.

IN THIS SECTION:

[getName\(\)](#)

Returns the unique API name of the field or bucket field that is used for column grouping.

[getLabel\(\)](#)

Returns the localized display name of the field that is used for column grouping.

[getDataType\(\)](#)

Returns the data type of the field that is used for column grouping.

[getGroupingLevel\(\)](#)

Returns the level of grouping for the column.

getName ()

Returns the unique API name of the field or bucket field that is used for column grouping.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the localized display name of the field that is used for column grouping.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getDataType ()

Returns the data type of the field that is used for column grouping.

Syntax

```
public Reports.ColumnDataType getDataType ()
```

Return Value

Type: [Reports.ColumnDataType](#)

getGroupingLevel ()

Returns the level of grouping for the column.

Syntax

```
public Integer getGroupingLevel ()
```

Return Value

Type: [Integer](#)

Usage

- In a summary report, 0, 1, or 2 indicates grouping at the first, second, or third row level.
- In a matrix report, 0 or 1 indicates grouping at the first or second row or column level.

GroupingInfo Class

Contains methods for describing fields that are used for grouping.

Namespace

[Reports](#)

GroupingInfo Methods

The following are methods for `GroupingInfo`. All are instance methods.

IN THIS SECTION:

[getName\(\)](#)

Returns the unique API name of the field or bucket field that is used for row or column grouping.

[getSortOrder\(\)](#)

Returns the order that is used to sort data in a row or column grouping (ASCENDING or DESCENDING).

[getDateGranularity\(\)](#)

Returns the date interval that is used for row or column grouping.

[getSortAggregate\(\)](#)

Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

getName ()

Returns the unique API name of the field or bucket field that is used for row or column grouping.

Syntax

```
public String getName ()
```

Return Value

Type: [String](#)

getSortOrder ()

Returns the order that is used to sort data in a row or column grouping (ASCENDING or DESCENDING).

Syntax

```
public Reports.ColumnSortOrder getSortOrder ()
```

Return Value

Type: [Reports.ColumnSortOrder](#)

getDateGranularity ()

Returns the date interval that is used for row or column grouping.

Syntax

```
public Reports.DateGranularity getDateGranularity ()
```

Return Value

Type: [Reports.DateGranularity](#)

getSortAggregate ()

Returns the summary field that is used to sort data within a grouping in a summary report. The value is null when data within a grouping is not sorted by a summary field.

Syntax

```
public String getSortAggregate ()
```

Return Value

Type: [String](#)

GroupingValue Class

Contains grouping values for a row or column, including the key, label, and value.

Namespace

[Reports](#)

GroupingValue Methods

The following are methods for `GroupingValue`. All are instance methods.

IN THIS SECTION:

[getGroupings\(\)](#)

Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

[getKey\(\)](#)

Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

[getLabel\(\)](#)

Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

[getValue\(\)](#)

Returns the value of the field that is used as a row or column grouping.

getGroupings ()

Returns a list of second- or third-level row or column groupings. If there are none, the value is an empty array.

Syntax

```
public List<Reports.GroupingValue> getGroupings ()
```

Return Value

Type: [List<Reports.GroupingValue>](#)

getKey ()

Returns the unique identifier for a row or column grouping. The identifier is used by the fact map to specify data values within each grouping.

Syntax

```
public String getKey ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the localized display name of a row or column grouping. For date and time fields, the label is the localized date or time.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getValue ()

Returns the value of the field that is used as a row or column grouping.

Syntax

```
public Object getValue ()
```

Return Value

Type: [Object](#)

Usage

The value depends on the field's data type.

- Currency fields:
 - `amount`: Of type currency. A data cell's value.
 - `currency`: Of type picklist. The ISO 4217 currency code, if available; for example, USD for US dollars or CNY for Chinese yuan. (If the grouping is on the converted currency, this value is the currency code for the report and not for the record.)
- Picklist fields: API name. For example, a custom picklist field—`Type of Business` with values 1, 2, and 3 for Consulting, Services, and Add-On Business respectively—has 1, 2, or 3 as the grouping value.
- ID fields: API name.
- Record type fields: API name.
- Date and time fields: Date or time in ISO-8601 format.

- Lookup fields: Unique API name. For example, for the `Opportunity Owner` lookup field, the ID of each opportunity owner's Chatter profile page can be a grouping value.

NotificationAction Interface

Implement this interface to trigger a custom Apex class when the conditions for a report notification are met.

Namespace

[Reports](#)

Usage

Report notifications for reports that users have subscribed to can trigger a custom Apex class, which must implement the `Reports.NotificationAction` interface. The `execute` method in this interface receives a `NotificationActionContext` object as a parameter, which contains information about the report instance and the conditions that must be met for a notification to be triggered.

IN THIS SECTION:

[NotificationAction Methods](#)

[NotificationAction Example Implementation](#)

NotificationAction Methods

The following are methods for `NotificationAction`.

IN THIS SECTION:

[execute\(context\)](#)

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

execute (context)

Executes the custom Apex action specified in the `context` parameter of the context object, `NotificationActionContext`. The object contains information about the report instance and the conditions that must be met for a notification to be triggered. The method executes whenever the specified conditions are met.

Signature

```
public void execute(Reports.NotificationActionContext context)
```

Parameters

context

Type: [Reports.NotificationActionContext](#)

Return Value

Type: Void

NotificationAction Example Implementation

This is an example implementation of the `Reports.NotificationAction` interface.

```
public class AlertOwners implements Reports.NotificationAction {

    public void execute(Reports.NotificationActionContext context) {
        Reports.ReportResults results = context.getReportInstance().getReportResults();
        for(Reports.GroupingValue g: results.getGroupingsDown().getGroupings()) {
            FeedItem t = new FeedItem();
            t.ParentId = (Id)g.getValue();
            t.Body = 'This record needs attention. Please view the report.';
            t.Title = 'Needs Attention: ' + results.getReportMetadata().getName();
            t.LinkUrl = '/' + results.getReportMetadata().getId();
            insert t;
        }
    }
}
```

NotificationActionContext Class

Contains information about the report instance and condition threshold for a report notification.

Namespace

[Reports](#)

IN THIS SECTION:

[NotificationActionContext Constructors](#)

[NotificationActionContext Methods](#)

NotificationActionContext Constructors

The following are constructors for `NotificationActionContext`.

IN THIS SECTION:

[NotificationActionContext\(reportInstance, thresholdInformation\)](#)

Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

NotificationActionContext(reportInstance, thresholdInformation)

Creates a new instance of the `Reports.NotificationActionContext` class using the specified parameters.

Signature

```
public NotificationActionContext (Reports.ReportInstance reportInstance,  
Reports.ThresholdInformation thresholdInformation)
```

Parameters

reportInstance

Type: [Reports.ReportInstance](#)

An instance of a report.

thresholdInformation

Type: [Reports.ThresholdInformation](#)

The evaluated conditions for the notification.

NotificationActionContext Methods

The following are methods for `NotificationActionContext`.

IN THIS SECTION:

[getReportInstance\(\)](#)

Returns the report instance associated with the notification.

[getThresholdInformation\(\)](#)

Returns the threshold information associated with the notification.

getReportInstance ()

Returns the report instance associated with the notification.

Signature

```
public Reports.ReportInstance getReportInstance ()
```

Return Value

Type: [Reports.ReportInstance](#)

getThresholdInformation ()

Returns the threshold information associated with the notification.

Signature

```
public Reports.ThresholdInformation getThresholdInformation ()
```

Return Value

Type: [Reports.ThresholdInformation](#)

ReportCsf Class

Contains methods and constructors for working with information about a custom summary formula (CSF).

Namespace

[Reports](#)

IN THIS SECTION:

[ReportCsf Constructors](#)

[ReportCsf Methods](#)

ReportCsf Constructors

The following are constructors for `ReportCsf`.

IN THIS SECTION:

[ReportCsf\(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula\)](#)
Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

[ReportCsf\(\)](#)

Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

`ReportCsf(label, description, formulaType, decimalPlaces, downGroup, downGroupType, acrossGroup, acrossGroupType, formula)`

Creates an instance of the `Reports.ReportCsf` class using the specified parameters.

Signature

```
public ReportCsf(String label, String description, Reports.FormulaType formulaType, Integer decimalPlaces, String downGroup, Reports.CsfGroupType downGroupType, String acrossGroup, Reports.CsfGroupType acrossGroupType, String formula)
```

Parameters

label

Type: [String](#)

The user-facing name of the custom summary formula.

description

Type: [String](#)

The user-facing description of the custom summary formula.

formulaType

Type: [Reports.FormulaType](#)

The format of the numbers in the custom summary formula.

decimalPlaces

Type: [Integer](#)

The number of decimal places to include in numbers.

downGroup

Type: [String](#)

The name of a row grouping when the `downGroupType` is `CUSTOM`; `null` otherwise.

downGroupType

Type: [Reports.CsfGroupType](#)

Where to display the aggregate of the custom summary formula.

acrossGroup

Type: [String](#)

The name of a column grouping when the `acrossGroupType` is `CUSTOM`; `null` otherwise.

acrossGroupType

Type: [Reports.CsfGroupType](#)

Where to display the aggregate of the custom summary formula.

formula

Type: [String](#)

The operations performed on values in the custom summary formula.

ReportCsf ()

Creates an instance of the `Reports.ReportCsf` class. You can then set values by using the class's `set` methods.

Signature

```
public ReportCsf()
```

ReportCsf Methods

The following are methods for `ReportCsf`.

IN THIS SECTION:

[getAcrossGroup\(\)](#)

Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

[getAcrossGroupType\(\)](#)

Returns where to display the aggregate.

[getDecimalPlaces\(\)](#)

Returns the number of decimal places that numbers in the custom summary formula have.

[getDescription\(\)](#)

Returns the user-facing description of a custom summary formula.

[getDownGroup\(\)](#)

Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

[getDownGroupType\(\)](#)

Returns where to display the aggregate of the custom summary formula.

[getFormula\(\)](#)

Returns the operations performed on values in the custom summary formula.

[getFormulaType\(\)](#)

Returns the formula type.

[getLabel\(\)](#)

Returns the user-facing name of the custom summary formula.

[setAcrossGroup\(acrossGroup\)](#)

Specifies the column for the across grouping.

[setAcrossGroupType\(value\)](#)

Sets where to display the aggregate.

[setAcrossGroupType\(acrossGroupType\)](#)

Sets where to display the aggregate.

[setDecimalPlaces\(decimalPlaces\)](#)

Sets the number of decimal places in numbers.

[setDescription\(description\)](#)

Sets the user-facing description of the custom summary formula.

[setDownGroup\(downGroup\)](#)

Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

[setDownGroupType\(value\)](#)

Sets where to display the aggregate.

[setDownGroupType\(downGroupType\)](#)

Sets where to display the aggregate.

[setFormula\(formula\)](#)

Sets the operations to perform on values in the custom summary formula.

[setFormulaType\(value\)](#)

Sets the format of the numbers in the custom summary formula.

[setFormulaType\(formulaType\)](#)

Sets the format of numbers used in the custom summary formula.

[setLabel\(label\)](#)

Sets the user-facing name of the custom summary formula.

[toString\(\)](#)

Returns a string.

getAcrossGroup ()

Returns the name of a column grouping when the `acrossGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getAcrossGroup()
```

Return Value

Type: [String](#)

getAcrossGroupType ()

Returns where to display the aggregate.

Signature

```
public Reports.CsfGroupType getAcrossGroupType ()
```

Return Value

Type: [Reports.CsfGroupType](#)

getDecimalPlaces ()

Returns the number of decimal places that numbers in the custom summary formula have.

Signature

```
public Integer getDecimalPlaces ()
```

Return Value

Type: [Integer](#)

getDescription ()

Returns the user-facing description of a custom summary formula.

Signature

```
public String getDescription ()
```

Return Value

Type: [String](#)

getDownGroup ()

Returns the name of a row grouping when the `downGroupType` is `CUSTOM`. Otherwise, returns `null`.

Signature

```
public String getDownGroup ()
```

Return Value

Type: [String](#)

getDownGroupType ()

Returns where to display the aggregate of the custom summary formula.

Signature

```
public Reports.CsfGroupType getDownGroupType ()
```

Return Value

Type: [Reports.CsfGroupType](#)

getFormula ()

Returns the operations performed on values in the custom summary formula.

Signature

```
public String getFormula ()
```

Return Value

Type: [String](#)

getFormulaType ()

Returns the formula type.

Signature

```
public Reports.FormulaType getFormulaType ()
```

Return Value

Type: [Reports.FormulaType](#)

getLabel ()

Returns the user-facing name of the custom summary formula.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

setAcrossGroup (acrossGroup)

Specifies the column for the across grouping.

Signature

```
public void setAcrossGroup(String acrossGroup)
```

Parameters

acrossGroup

Type: [String](#)

Return Value

Type: void

setAcrossGroupType (value)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(String value)
```

Parameters

value

Type: [String](#)

For possible values, see [Reports.CsfGroupType](#).

Return Value

Type: void

setAcrossGroupType (acrossGroupType)

Sets where to display the aggregate.

Signature

```
public void setAcrossGroupType(Reports.CsfGroupType acrossGroupType)
```

Parameters

acrossGroupType

Type: [Reports.CsfGroupType](#)

Return Value

Type: void

setDecimalPlaces (decimalPlaces)

Sets the number of decimal places in numbers.

Signature

```
public void setDecimalPlaces(Integer decimalPlaces)
```

Parameters

decimalPlaces
Type: [Integer](#)

Return Value

Type: void

setDescription(description)

Sets the user-facing description of the custom summary formula.

Signature

```
public void setDescription(String description)
```

Parameters

description
Type: [String](#)

Return Value

Type: void

setDownGroup(downGroup)

Sets the name of a row grouping when the `downGroupType` is `CUSTOM`.

Signature

```
public void setDownGroup(String downGroup)
```

Parameters

downGroup
Type: [String](#)

Return Value

Type: void

setDownGroupType(value)

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(String value)
```

Parameters

value

Type: [String](#)

For valid values, see [Reports.CsfGroupType](#).

Return Value

Type: void

setDownGroupType (downGroupType)

Sets where to display the aggregate.

Signature

```
public void setDownGroupType(Reports.CsfGroupType downGroupType)
```

Parameters

downGroupType

Type: [Reports.CsfGroupType](#)

Return Value

Type: void

setFormula (formula)

Sets the operations to perform on values in the custom summary formula.

Signature

```
public void setFormula(String formula)
```

Parameters

formula

Type: [String](#)

Return Value

Type: void

setFormulaType (value)

Sets the format of the numbers in the custom summary formula.

Signature

```
public void setFormulaType(String value)
```

Parameters

value

Type: [String](#)

For valid values, see [Reports.FormulaType](#).

Return Value

Type: void

setFormulaType (formulaType)

Sets the format of numbers used in the custom summary formula.

Signature

```
public void setFormulaType(Reports.FormulaType formulaType)
```

Parameters

formulaType

Type: [Reports.FormulaType](#)

Return Value

Type: void

setLabel (label)

Sets the user-facing name of the custom summary formula.

Signature

```
public void setLabel(String label)
```

Parameters

label

Type: [String](#)

Return Value

Type: void

toString ()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

ReportCurrency Class

Contains information about a currency value, including the amount and currency code.

Namespace

[Reports](#)

ReportCurrency Methods

The following are methods for `ReportCurrency`. All are instance methods.

IN THIS SECTION:

[getAmount\(\)](#)

Returns the amount of the currency value.

[getCurrencyCode\(\)](#)

Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

getAmount ()

Returns the amount of the currency value.

Syntax

```
public Decimal getAmount ()
```

Return Value

Type: [Decimal](#)

getCurrencyCode ()

Returns the report currency code, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode ()
```

Return Value

Type: [String](#)

ReportDataCell Class

Contains the data for a cell in the report, including the display label and value.

Namespace

[Reports](#)

ReportDataCell Methods

The following are methods for `ReportDataCell`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the localized display name of the value of a specified cell in the report.

[getValue\(\)](#)

Returns the value of a specified cell of a detail row of a report.

getLabel ()

Returns the localized display name of the value of a specified cell in the report.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getValue ()

Returns the value of a specified cell of a detail row of a report.

Syntax

```
public Object getValue ()
```

Return Value

Type: Object

ReportDescribeResult Class

Contains report, report type, and extended metadata for a tabular, summary, or matrix report.

Namespace

[Reports](#)

ReportDescribeResult Methods

The following are methods for `ReportDescribeResult`. All are instance methods.

IN THIS SECTION:

[getReportExtendedMetadata\(\)](#)

Returns additional information about grouping and summaries.

[getReportMetadata\(\)](#)

Returns unique identifiers for groupings and summaries.

[getReportTypeMetadata\(\)](#)

Returns the fields in each section of a report type, plus filtering information for those fields.

getReportExtendedMetadata ()

Returns additional information about grouping and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata ()
```

Return Value

Type: [Reports.ReportExtendedMetadata](#)

getReportMetadata ()

Returns unique identifiers for groupings and summaries.

Syntax

```
public Reports.ReportMetadata getReportMetadata ()
```

Return Value

Type: [Reports.ReportMetadata](#)

getReportTypeMetadata ()

Returns the fields in each section of a report type, plus filtering information for those fields.

Syntax

```
public Reports.ReportTypeMetadata getReportTypeMetadata ()
```

Return Value

Type: [Reports.ReportTypeMetadata](#)

ReportDetailRow Class

Contains data cells for a detail row of a report.

Namespace

[Reports](#)

ReportDetailRow Methods

The following are methods for `ReportDetailRow`. All are instance methods.

IN THIS SECTION:

[getDataCells\(\)](#)

Returns a list of data cells for a detail row.

getDataCells ()

Returns a list of data cells for a detail row.

Syntax

```
public List<Reports.ReportDataCell> getDataCells ()
```

Return Value

Type: [List<Reports.ReportDataCell>](#)

ReportDivisionInfo Class

Contains information about the divisions that can be used to filter a report.

Available only if your organization uses divisions to segment data and you have the “Affected by Divisions” permission. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.

Namespace

[Reports](#)

Usage

Use to filter records in the report based on a division, like West Coast and East Coast.

ReportDivisionInfo Methods

The following are methods for `ReportDivisionInfo`.

getDefaultValue ()

Returns the default division for the report.

Signature

```
public String getDefaultValue ()
```

Return Value

Type: [String](#)

getValues ()

Returns a list of all possible divisions for the report.

Signature

```
public List<Reports.FilterValue> getValues ()
```

Return Value

Type: [List<Reports.FilterValue>](#)

ReportExtendedMetadata Class

Contains report extended metadata for a tabular, summary, or matrix report.

Namespace

[Reports](#)

Report extended metadata provides additional, detailed metadata about summary and grouping fields, including data type and label information.

ReportExtendedMetadata Methods

The following are methods for `ReportExtendedMetadata`. All are instance methods.

IN THIS SECTION:

[getAggregateColumnInfo\(\)](#)

Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

[getDetailColumnInfo\(\)](#)

Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

[getGroupingColumnInfo\(\)](#)

Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the `groupingsDown` and `groupingsAcross` lists.

getAggregateColumnInfo ()

Returns all report summaries such as `Record Count`, `Sum`, `Average`, `Max`, `Min`, and custom summary formulas. Contains values for each summary that is listed in the report metadata.

Syntax

```
public MAP<String, Reports.AggregateColumn> getAggregateColumnInfo ()
```

Return Value

Type: [Map<String, Reports.AggregateColumn>](#)

getDetailColumnInfo ()

Returns a map of two properties for each field that has detailed data identified by its unique API name. The detailed data fields are also listed in the report metadata.

Syntax

```
public MAP<String, Reports.DetailColumn> getDetailColumnInfo ()
```

Return Value

Type: [Map<String, Reports.DetailColumn>](#)

getGroupingColumnInfo ()

Returns a map of each row or column grouping to its metadata. Contains values for each grouping that is identified in the `groupingsDown` and `groupingsAcross` lists.

Syntax

```
public MAP<String, Reports.GroupingColumn> getGroupingColumnInfo ()
```

Return Value

Type: [Map<String, Reports.GroupingColumn>](#)

ReportFact Class

Contains the fact map for the report, which represents the report's data values.

Namespace

[Reports](#)

Usage

`ReportFact` is the parent class of `ReportFactWithDetails` and `ReportFactWithSummaries`. If `includeDetails` is `true` when the report is run, the fact map is a `ReportFactWithDetails` object. If `includeDetails` is `false` when the report is run, the fact map is a `ReportFactWithSummaries` object.

ReportFact Methods

The following are methods for `ReportFact`. All are instance methods.

IN THIS SECTION:

[getAggregates\(\)](#)

Returns summary-level data for a report, including the record count.

[getKey\(\)](#)

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

getAggregates ()

Returns summary-level data for a report, including the record count.

Syntax

```
public List<Reports.SummaryValue> getAggregates ()
```

Return Value

Type: [List<Reports.SummaryValue>](#)

getKey ()

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey ()
```

Return Value

Type: [String](#)

ReportFactWithDetails Class

Contains the detailed fact map for the report, which represents the report's data values.

Namespace

[Reports](#)

Usage

The `ReportFactWithDetails` class extends the `ReportFact` class. A `ReportFactWithDetails` object is returned if `includeDetails` is set to `true` when the report is run. To access the detail values, you'll need to cast the return value of the `ReportResults.getFactMap` method to a `ReportFactWithDetails` object.

ReportFactWithDetails Methods

The following are methods for `ReportFactWithDetails`. All are instance methods.

IN THIS SECTION:

[getAggregates\(\)](#)

Returns summary-level data for a report, including the record count.

[getKey\(\)](#)

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

[getRows\(\)](#)

Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

getAggregates ()

Returns summary-level data for a report, including the record count.

Syntax

```
public List<Reports.SummaryValue> getAggregates ()
```

Return Value

Type: [List<Reports.SummaryValue>](#)

getKey ()

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey ()
```

Return Value

Type: [String](#)

getRows ()

Returns a list of detailed report data in the order of the detail columns that are provided by the report metadata.

Syntax

```
public LIST<Reports.ReportDetailRow> getRows ()
```

Return Value

Type: [List<Reports.ReportDetailRow>](#)

ReportFactWithSummaries Class

Contains the fact map for the report, which represents the report's data values, and includes summarized fields.

Namespace

[Reports](#)

Usage

The `ReportFactWithSummaries` class extends the `ReportFact` class. A `ReportFactWithSummaries` object is returned if `includeDetails` is set to `false` when the report is run.

ReportFactWithSummaries Methods

The following are methods for `ReportFactWithSummaries`. All are instance methods.

IN THIS SECTION:

[getAggregates\(\)](#)

Returns summary-level data for a report, including the record count.

[getKey\(\)](#)

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

[toString\(\)](#)

Returns a string.

getAggregates ()

Returns summary-level data for a report, including the record count.

Syntax

```
public LIST<Reports.SummaryValue> getAggregates ()
```

Return Value

Type: [List<Reports.SummaryValue>](#)

getKey ()

Returns the unique identifier for a row or column grouping. This identifier can be used to index specific data values within each grouping.

Syntax

```
public String getKey()
```

Return Value

Type: [String](#)

toString()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

ReportFilter Class

Contains information about a report filter, including column, operator, and value.

Namespace

[Reports](#)

IN THIS SECTION:

[ReportFilter Constructors](#)

[ReportFilter Methods](#)

ReportFilter Constructors

The following are constructors for `ReportFilter`.

IN THIS SECTION:

[ReportFilter\(\)](#)

Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the “set” methods.

[ReportFilter\(column, operator, value\)](#)

Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

ReportFilter ()

Creates a new instance of the `Reports.ReportFilter` class. You can then set values by using the “set” methods.

Signature

```
public ReportFilter()
```

ReportFilter(column, operator, value)

Creates a new instance of the `Reports.ReportFilter` class by using the specified parameters.

Signature

```
public ReportFilter(String column, String operator, String value)
```

Parameters

column

Type: [String](#)

operator

Type: [String](#)

value

Type: [String](#)

ReportFilter Methods

The following are methods for `ReportFilter`. All are instance methods.

IN THIS SECTION:

[getColumn\(\)](#)

Returns the unique API name for the field that's being filtered.

[getOperator\(\)](#)

Returns the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

[getValue\(\)](#)

Returns the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

[setColumn\(column\)](#)

Sets the unique API name for the field that's being filtered.

[setOperator\(operator\)](#)

Sets the unique API name for the condition that is used to filter a field, such as "greater than" or "not equal to." Filter conditions depend on the data type of the field.

[setValue\(value\)](#)

Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

getColumn()

Returns the unique API name for the field that's being filtered.

Syntax

```
public String getColumn()
```

Return Value

Type: [String](#)

getOperator()

Returns the unique API name for the condition that is used to filter a field, such as “greater than” or “not equal to.” Filter conditions depend on the data type of the field.

Syntax

```
public String getOperator()
```

Return Value

Type: [String](#)

getValue()

Returns the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public String getValue()
```

Return Value

Type: [String](#)

setColumn(column)

Sets the unique API name for the field that’s being filtered.

Syntax

```
public void setColumn(String column)
```

Parameters

column

Type: [String](#)

Return Value

Type: `void`

setOperator (operator)

Sets the unique API name for the condition that is used to filter a field, such as “greater than” or “not equal to.” Filter conditions depend on the data type of the field.

Syntax

```
public Void setOperator(String operator)
```

Parameters

operator

Type: [String](#)

Return Value

Type: Void

setValue (value)

Sets the value by which a field can be filtered. For example, the field `Age` can be filtered by a numeric value.

Syntax

```
public Void setValue(String value)
```

Parameters

value

Type: [String](#)

Return Value

Type: Void

ReportFormat Enum

Contains the possible report format types.

Namespace

[Reports](#)

Enum Values

The following are the values of the `Reports.ReportFormat` enum.

Value	Description
MATRIX	Matrix report format
SUMMARY	Summary report format

Value	Description
TABULAR	Tabular report format

ReportInstance Class

Returns an instance of a report that was run asynchronously. Retrieves the results for that instance.

Namespace

[Reports](#)

ReportInstance Methods

The following are methods for `ReportInstance`. All are instance methods.

IN THIS SECTION:

[getCompletionDate\(\)](#)

Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

[getId\(\)](#)

Returns the unique ID for an instance of a report that was run asynchronously.

[getOwnerId\(\)](#)

Returns the ID of the user who created the report instance.

[getReportId\(\)](#)

Returns the unique ID of the report this instance is based on.

[getReportResults\(\)](#)

Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

[getRequestDate\(\)](#)

Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

[getStatus\(\)](#)

Returns the status of a report.

getCompletionDate()

Returns the date and time when the instance of the report finished running. The completion date is available only if the report instance ran successfully or couldn't be run because of an error. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getCompletionDate()
```

Return Value

Type: [Datetime](#)

getId()

Returns the unique ID for an instance of a report that was run asynchronously.

Syntax

```
public Id getId()
```

Return Value

Type: [Id](#)

getOwnerId()

Returns the ID of the user who created the report instance.

Syntax

```
public Id getOwnerId()
```

Return Value

Type: [Id](#)

getReportId()

Returns the unique ID of the report this instance is based on.

Syntax

```
public Id getReportId()
```

Return Value

Type: [Id](#)

getReportResults()

Retrieves results for an instance of an asynchronous report. When you request your report, you can specify whether to summarize data or include details.

Syntax

```
public Reports.ReportResults getReportResults()
```

Return Value

Type: [Reports.ReportResults](#)

getRequestDate()

Returns the date and time when an instance of the report was run. Date and time information is in ISO-8601 format.

Syntax

```
public Datetime getRequestDate()
```

Return Value

Type: [Datetime](#)

getStatus()

Returns the status of a report.

Syntax

```
public String getStatus()
```

Return Value

Type: [String](#)

Usage

- `New` if the report run was recently triggered through a request.
- `Success` if the report ran.
- `Running` if the report is being run.
- `Error` if the report run failed. The instance of a report run can return an error if, for example, your permission to access the report was removed after you requested the run.

ReportManager Class

Runs a report synchronously or asynchronously and with or without details.

Namespace

[Reports](#)

Usage

Gets instances of reports and describes the metadata of Reports.

ReportManager Methods

The following are methods for `ReportManager`. All methods are static.

IN THIS SECTION:

[describeReport\(reportId\)](#)

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

[getDatatypeFilterOperatorMap\(\)](#)

Lists the field data types that you can use to filter the report.

[getReportInstance\(instanceId\)](#)

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

[getReportInstances\(reportId\)](#)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

[runAsyncReport\(reportId, reportMetadata, includeDetails\)](#)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`. Filters the report based on the report metadata in *reportMetadata*.

[runAsyncReport\(reportId, includeDetails\)](#)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`.

[runAsyncReport\(reportId, reportMetadata\)](#)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *reportMetadata*.

[runAsyncReport\(reportId\)](#)

Runs a report asynchronously with the report ID.

[runReport\(reportId, reportMetadata, includeDetails\)](#)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`. Filters the results based on the report metadata in *reportMetadata*.

[runReport\(reportId, includeDetails\)](#)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`.

[runReport\(reportId, reportMetadata\)](#)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *rmData*.

[runReport\(reportId\)](#)

Runs a report immediately with the report ID.

describeReport (reportId)

Retrieves report, report type, and extended metadata for a tabular, summary, or matrix report.

Syntax

```
public static Reports.ReportDescribeResult describeReport(Id reportId)
```

Parameters

reportId

Type: `Id`

Return Value

Type: [Reports.ReportDescribeResult](#)

getDatatypeFilterOperatorMap ()

Lists the field data types that you can use to filter the report.

Syntax

```
public static MAP<String, LIST<Reports.FilterOperator>> getDatatypeFilterOperatorMap()
```

Return Value

Type: [Map<String, List<Reports.FilterOperator>>](#)

getReportInstance (instanceId)

Retrieves results for an instance of a report that has been run asynchronously. The settings you use when you run your asynchronous report determine whether you can retrieve summary data or detailed data.

Syntax

```
public static Reports.ReportInstance getReportInstance(Id instanceId)
```

Parameters

instanceId

Type: [Id](#)

Return Value

Type: [Reports.ReportInstance](#)

getReportInstances (reportId)

Returns a list of instances for a report that was run asynchronously. Each item in the list represents a separate instance of the report, with metadata for the time at which the report was run.

Syntax

```
public static LIST<Reports.ReportInstance> getReportInstances(Id reportId)
```

Parameters

reportId

Type: [Id](#)

Return Value

Type: [List<Reports.ReportInstance>](#)

runAsyncReport (reportId, reportMetadata, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`. Filters the report based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata reportMetadata, Boolean includeDetails)
```

Parameters

reportId

Type: [Id](#)

reportMetadata

Type: [Reports.ReportMetadata](#)

includeDetails

Type: [Boolean](#)

Return Value

Type: [Reports.ReportInstance](#)

runAsyncReport(reportId, includeDetails)

Runs a report asynchronously with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Boolean includeDetails)
```

Parameters

reportId

Type: [Id](#)

includeDetails

Type: [Boolean](#)

Return Value

Type: [Reports.ReportInstance](#)

runAsyncReport(reportId, reportMetadata)

Runs a report asynchronously with the report ID. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId, Reports.ReportMetadata reportMetadata)
```

Parameters

reportId

Type: [Id](#)

reportMetadata

Type: [Reports.ReportMetadata](#)

Return Value

Type: [Reports.ReportInstance](#)

runAsyncReport (reportId)

Runs a report asynchronously with the report ID.

Syntax

```
public static Reports.ReportInstance runAsyncReport(Id reportId)
```

Parameters

reportId

Type: [Id](#)

Return Value

Type: [Reports.ReportInstance](#)

runReport (reportId, reportMetadata, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`. Filters the results based on the report metadata in *reportMetadata*.

Syntax

```
public static Reports.ReportResults runReport(Id reportId, Reports.ReportMetadata reportMetadata, Boolean includeDetails)
```

Parameters

reportId

Type: [Id](#)

reportMetadata

Type: [Reports.ReportMetadata](#)

includeDetails

Type: [Boolean](#)

Return Value

Type: [Reports.ReportResults](#)

runReport (reportId, includeDetails)

Runs a report immediately with the report ID. Includes details if *includeDetails* is set to `true`.

Syntax

```
public static Reports.ReportResults runReport (Id reportId, Boolean includeDetails)
```

Parameters

reportId

Type: [Id](#)

includeDetails

Type: [Boolean](#)

Return Value

Type: [Reports.ReportResults](#)

runReport (reportId, reportMetadata)

Runs a report immediately with the report ID. Filters the results based on the report metadata in *rmData*.

Syntax

```
public static Reports.ReportResults runReport (Id reportId, Reports.ReportMetadata  
reportMetadata)
```

Parameters

reportId

Type: [Id](#)

reportMetadata

Type: [Reports.ReportMetadata](#) [Reports.ReportMetadata](#)

Return Value

Type: [Reports.ReportResults](#)

runReport (reportId)

Runs a report immediately with the report ID.

Syntax

```
public static Reports.ReportResults runReport (Id reportId)
```

Parameters

reportId

Type: [Id](#)

Return Value

Type: [Reports.ReportResults](#)

ReportMetadata Class

Contains report metadata for a tabular, summary, or matrix report.

Namespace

[Reports](#)

Usage

Report metadata gives information about the report as a whole, such as the report type, format, summary fields, row or column groupings, and filters that are saved to the report. You can use the `ReportMetadata` class to retrieve report metadata and to set metadata that can be used to filter a report.

ReportMetadata Methods

The following are methods for `ReportMetadata`. All are instance methods.

IN THIS SECTION:

[getAggregates\(\)](#)

Returns unique identifiers for summary or custom summary formula fields in the report.

[getBuckets\(\)](#)

Returns a list of bucket fields in the report.

[getCrossFilters\(\)](#)

Returns information about cross filters applied to a report.

[getCurrencyCode\(\)](#)

Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

[getCustomSummaryFormula\(\)](#)

Returns information about custom summary formulas in a report.

[getDescription\(\)](#)

Returns the description of the report.

[getDetailColumns\(\)](#)

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

[getDeveloperName\(\)](#)

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

[getDivision\(\)](#)

Returns the division specified in the report.

[getGroupingsAcross\(\)](#)

Returns column groupings in a report.

[getGroupingsDown\(\)](#)

Returns row groupings for a report.

[getHasDetailRows\(\)](#)

Indicates whether the report has detail rows.

[getHasRecordCount\(\)](#)

Indicates whether the report shows the total number of records.

[getHistoricalSnapshotDates\(\)](#)

Returns a list of historical snapshot dates.

[getId\(\)](#)

Returns the unique report ID.

[getName\(\)](#)

Returns the report name.

[getReportBooleanFilter\(\)](#)

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

[getReportFilters\(\)](#)

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

[getReportFormat\(\)](#)

Returns the format of the report.

[getReportType\(\)](#)

Returns the unique API name and display name for the report type.

[getScope\(\)](#)

Returns the API name for the scope defined for the report. Scope values depend on the report type.

[getShowGrandTotal\(\)](#)

Indicates whether the report shows the grand total.

[getShowSubtotals\(\)](#)

Indicates whether the report shows subtotals, such as column or row totals.

[getSortBy\(\)](#)

Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

[getStandardDateFilter\(\)](#)

Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

[getStandardFilters\(\)](#)

Returns a list of standard filters for the report.

[getTopRows\(\)](#)

Returns information about a row limit filter, including the number of rows returned and the sort order.

[setAggregates\(aggregates\)](#)

Sets unique identifiers for standard or custom summary formula fields in the report.

[setBuckets\(buckets\)](#)

Creates bucket fields in a report.

[setCrossFilters\(crossFilters\)](#)

Applies cross filters to a report.

[setCurrencyCode\(currencyCode\)](#)

Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

[setCustomSummaryFormula\(customSummaryFormula\)](#)

Adds a custom summary formula to a report.

[setDescription\(description\)](#)

Sets the description of the report.

[setDetailColumns\(detailColumns\)](#)

Sets the unique API names for the fields that contain detailed data—for example, `OPPORTUNITY_NAME`, `TYPE`, `LEAD_SOURCE`, or `AMOUNT`.

[setDeveloperName\(developerName\)](#)

Sets the report API name—for example, `Closed_Sales_This_Quarter`.

[setDivision\(division\)](#)

Sets the division of the report.

[setGroupingsAcross\(groupingInfo\)](#)

Sets column groupings in a report.

[setGroupingsDown\(groupingInfo\)](#)

Sets row groupings for a report.

[setHasDetailRows\(hasDetailRows\)](#)

Specifies whether the report has detail rows.

[setHasRecordCount\(hasRecordCount\)](#)

Specifies whether the report is configured to show the total number of records.

[setHistoricalSnapshotDates\(historicalSnapshot\)](#)

Sets a list of historical snapshot dates.

[setId\(id\)](#)

Sets the unique report ID.

[setName\(name\)](#)

Sets the report name.

[setReportBooleanFilter\(reportBooleanFilter\)](#)

Sets logic to parse custom field filters.

[setReportFilters\(reportFilters\)](#)

Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

[setReportFormat\(format\)](#)

Sets the format of the report.

[setReportType\(reportType\)](#)

Sets the unique API name and display name for the report type.

[setScope\(scopeName\)](#)

Sets the API name for the scope defined for the report. Scope values depend on the report type.

[setShowGrandTotal\(showGrandTotal\)](#)

Specifies whether the report shows the grand total.

[setShowSubtotals\(showSubtotals\)](#)

Specifies whether the report shows subtotals, such as column or row totals.

[setSortBy\(column\)](#)

Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

[setStandardDateFilter\(dateFilter\)](#)

Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

[setStandardFilters\(filters\)](#)

Sets one or more standard filters on the report.

[setTopRows\(topRows\)](#)

Applies a row limit filter to a report.

getAggregates ()

Returns unique identifiers for summary or custom summary formula fields in the report.

Syntax

```
public LIST<String> getAggregates ()
```

Return Value

Type: [List<String>](#)

Usage

For example:

- `a!Amount` represents the average for the `Amount` column.
- `s!Amount` represents the sum of the `Amount` column.
- `m!Amount` represents the minimum value of the `Amount` column.
- `x!Amount` represents the maximum value of the `Amount` column.
- `s!<customfieldID>` represents the sum of a custom field column. For custom fields and custom report types, the identifier is a combination of the summary type and the field ID.

getBuckets ()

Returns a list of bucket fields in the report.

Signature

```
public List<Reports.BucketField> getBuckets ()
```

Return Value

Type: [List<Reports.BucketField>](#)

getCrossFilters ()

Returns information about cross filters applied to a report.

Signature

```
public Reports.CrossFilter getCrossFilters ()
```

Return Value

Type: [List<Reports.CrossFilter>](#)

getCurrencyCode ()

Returns report currency, such as USD, EUR, or GBP, for an organization that has multicurrency enabled. The value is `null` if the organization does not have multicurrency enabled.

Syntax

```
public String getCurrencyCode ()
```

Return Value

Type: [String](#)

getCustomSummaryFormula ()

Returns information about custom summary formulas in a report.

Signature

```
public Map<String, Reports.ReportCsf> getCustomSummaryFormula ()
```

Return Value

Type: [Map<String, Reports.ReportCsf>](#)

getDescription ()

Returns the description of the report.

Signature

```
public String getDescription ()
```

Return Value

Type: [String](#)

getDetailColumns ()

Returns unique API names (column names) for the fields that contain detailed data. For example, the method might return the following values: "OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, AMOUNT."

Syntax

```
public LIST<String> getDetailColumns ()
```

Return Value

Type: [List<String>](#)

getDeveloperName ()

Returns the report API name. For example, the method might return the following value: "Closed_Sales_This_Quarter."

Syntax

```
public String getDeveloperName ()
```

Return Value

Type: [String](#)

getDivision ()

Returns the division specified in the report.

 **Note:** Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public String getDivision ()
```

Return Value

Type: [String](#)

getGroupingsAcross ()

Returns column groupings in a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsAcross ()
```

Return Value

Type: [List<Reports.GroupingInfo>](#)

Usage

The identifier is:

- An empty array for reports in summary format, because summary reports don't include column groupings
- `BucketField_ (ID)` for bucket fields
- The ID of a custom field when the custom field is used for a column grouping

getGroupingsDown ()

Returns row groupings for a report.

Syntax

```
public LIST<Reports.GroupingInfo> getGroupingsDown ()
```

Return Value

Type: [List<Reports.GroupingInfo>](#)

Usage

The identifier is:

- `BucketField_ (ID)` for bucket fields
- The ID of a custom field when the custom field is used for grouping

getHasDetailRows ()

Indicates whether the report has detail rows.

Signature

```
public Boolean getHasDetailRows ()
```

Return Value

Type: [Boolean](#)

getHasRecordCount ()

Indicates whether the report shows the total number of records.

Signature

```
public Boolean getHasRecordCount ()
```

Return Value

Type: [Boolean](#)

getHistoricalSnapshotDates ()

Returns a list of historical snapshot dates.

Syntax

```
public LIST<String> getHistoricalSnapshotDates ()
```

Return Value

Type: [List<String>](#)

getId()

Returns the unique report ID.

Syntax

```
public Id getId()
```

Return Value

Type: [Id](#)

getName()

Returns the report name.

Syntax

```
public String getName()
```

Return Value

Type: [String](#)

getReportBooleanFilter()

Returns logic to parse custom field filters. The value is `null` when filter logic is not specified.

Syntax

```
public String getReportBooleanFilter()
```

Return Value

Type: [String](#)

getReportFilters()

Returns a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public List<Reports.ReportFilter> getReportFilters()
```

Return Value

Type: [List<Reports.ReportFilter>](#)

getReportFormat ()

Returns the format of the report.

Syntax

```
public Reports.ReportFormat getReportFormat ()
```

Return Value

Type: [Reports.ReportFormat](#)

Usage

This value can be:

- TABULAR
- SUMMARY
- MATRIX

getReportType ()

Returns the unique API name and display name for the report type.

Syntax

```
public Reports.ReportType getReportType ()
```

Return Value

Type: [Reports.ReportType](#)

getScope ()

Returns the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public String getScope ()
```

Return Value

Type: [String](#)

getShowGrandTotal ()

Indicates whether the report shows the grand total.

Signature

```
public Boolean getShowGrandTotal ()
```

Return Value

Type: [Boolean](#)

getShowSubtotals ()

Indicates whether the report shows subtotals, such as column or row totals.

Signature

```
public Boolean getShowSubtotals ()
```

Return Value

Type: [Boolean](#)

getSortBy ()

Returns the list of columns on which the report is sorted. Currently, you can sort on only one column.

Signature

```
public List<Reports.SortColumn> getSortBy ()
```

Return Value

Type: [List<Reports.SortColumn>](#)

getStandardDateFilter ()

Returns information about the standard date filter for the report, such as the start date, end date, date range, and date field API name.

Signature

```
public Reports.StandardDateFilter getStandardDateFilter ()
```

Return Value

Type: [Reports.StandardDateFilter](#)

getStandardFilters ()

Returns a list of standard filters for the report.

Signature

```
public List<Reports.StandardFilter> getStandardFilters ()
```

Return Value

Type: [List<Reports.StandardFilter>](#)

getTopRows ()

Returns information about a row limit filter, including the number of rows returned and the sort order.

Signature

```
public Reports.TopRows getTopRows ()
```

Return Value

Type: [Reports.TopRows](#)

setAggregates (aggregates)

Sets unique identifiers for standard or custom summary formula fields in the report.

Signature

```
public void setAggregates (List<String> aggregates)
```

Parameters

aggregates
Type: List<[String](#)>

Return Value

Type: void

setBuckets (buckets)

Creates bucket fields in a report.

Signature

```
public void setBuckets (List<Reports.BucketField> buckets)
```

Parameters

buckets
Type: List<[Reports.BucketField](#)>

Return Value

Type: void

setCrossFilters (crossFilters)

Applies cross filters to a report.

Signature

```
public void setCrossFilters(List<Reports.CrossFilter> crossFilters)
```

Parameters

crossFilter

Type: [List<Reports.CrossFilter>](#)

Return Value

Type: void

setCurrencyCode (currencyCode)

Sets the currency, such as USD, EUR, or GBP, for report summary fields in an organization that has multicurrency enabled.

Signature

```
public void setCurrencyCode(String currencyCode)
```

Parameters

currencyCode

Type: [String](#)

Return Value

Type: void

setCustomSummaryFormula (customSummaryFormula)

Adds a custom summary formula to a report.

Signature

```
public void setCustomSummaryFormula(Map<String, Reports.ReportCsf> customSummaryFormula)
```

Parameters

customSummaryFormula

Type: [Map<String, Reports.ReportCsf>](#)

Return Value

Type: void

setDescription (description)

Sets the description of the report.

Signature

```
public void setDescription(String description)
```

Parameters

description
Type: [String](#)

Return Value

Type: void

setDetailColumns (detailColumns)

Sets the unique API names for the fields that contain detailed data—for example, OPPORTUNITY_NAME, TYPE, LEAD_SOURCE, or AMOUNT.

Signature

```
public void setDetailColumns(List<String> detailColumns)
```

Parameters

detailColumns
Type: [List<String>](#)

Return Value

Type: void

setDeveloperName (developerName)

Sets the report API name—for example, Closed_Sales_This_Quarter.

Signature

```
public void setDeveloperName(String developerName)
```

Parameters

developerName
Type: [String](#)

Return Value

Type: void

setDivision (division)

Sets the division of the report.

 **Note:** Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

Signature

```
public void setDivision(String division)
```

Parameters

division
Type: [String](#)

Return Value

Type: void

setGroupingsAcross (groupingInfo)

Sets column groupings in a report.

Signature

```
public void setGroupingsAcross(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<[Reports.GroupingInfo](#)>

Return Value

Type: void

setGroupingsDown (groupingInfo)

Sets row groupings for a report.

Signature

```
public void setGroupingsDown(List<Reports.GroupingInfo> groupingInfo)
```

Parameters

groupingInfo
Type: List<[Reports.GroupingInfo](#)>

Return Value

Type: void

setHasDetailRows (hasDetailRows)

Specifies whether the report has detail rows.

Signature

```
public void setHasDetailRows(Boolean hasDetailRows)
```

Parameters

hasDetailRows
Type: [Boolean](#)

Return Value

Type: void

setHasRecordCount (hasRecordCount)

Specifies whether the report is configured to show the total number of records.

Signature

```
public void setHasRecordCount(Boolean hasRecordCount)
```

Parameters

hasRecordCount
Type: [Boolean](#)

Return Value

Type: void

setHistoricalSnapshotDates (historicalSnapshot)

Sets a list of historical snapshot dates.

Syntax

```
public Void setHistoricalSnapshotDates(List<String> historicalSnapshot)
```

Parameters

historicalSnapshot
Type: [List<String>](#)

Return Value

Type: Void

setId(id)

Sets the unique report ID.

Signature

```
public void setId(Id id)
```

Parameters

id
Type: [Id](#)

Return Value

Type: void

setName(name)

Sets the report name.

Signature

```
public void setName(String name)
```

Parameters

name
Type: [String](#)

Return Value

Type: void

setReportBooleanFilter(reportBooleanFilter)

Sets logic to parse custom field filters.

Syntax

```
public Void setReportBooleanFilter(String reportBooleanFilter)
```

Parameters

reportBooleanFilter
Type: [String](#)

Return Value

Type: Void

setReportFilters (reportFilters)

Sets a list of each custom filter in the report along with the field name, filter operator, and filter value.

Syntax

```
public Void setReportFilters (LIST<Reports.ReportFilter> reportFilters)
```

Parameters

reportFilters

Type: [List<Reports.ReportFilter>](#)

Return Value

Type: Void

setReportFormat (format)

Sets the format of the report.

Signature

```
public void setReportFormat (Reports.ReportFormat format)
```

Parameters

format

Type: [Reports.ReportFormat](#)

Return Value

Type: void

setReportType (reportType)

Sets the unique API name and display name for the report type.

Signature

```
public void setReportType (Reports.ReportType reportType)
```

Parameters

reportType

Type: [Reports.ReportType](#)

Return Value

Type: void

setScope (scopeName)

Sets the API name for the scope defined for the report. Scope values depend on the report type.

Signature

```
public void setScope(String scopeName)
```

Parameters

scopeName
Type: [String](#)

Return Value

Type: void

setShowGrandTotal (showGrandTotal)

Specifies whether the report shows the grand total.

Signature

```
public void setShowGrandTotal(Boolean showGrandTotal)
```

Parameters

showGrandTotal
Type: [Boolean](#)

Return Value

Type: void

setShowSubtotals (showSubtotals)

Specifies whether the report shows subtotals, such as column or row totals.

Signature

```
public void setShowSubtotals(Boolean showSubtotals)
```

Parameters

showSubtotals
Type: [Boolean](#)

Return Value

Type: void

setSortBy(column)

Sets the list of columns on which the report is sorted. Currently, you can only sort on one column.

Signature

```
public void setSortBy(List<Reports.SortColumn> column)
```

Parameters

column

Type: List<Reports.SortColumn>

Return Value

Type: void

setStandardDateFilter(dateFilter)

Sets the standard date filter—which includes the start date, end date, date range, and date field API name—for the report.

Signature

```
public void setStandardDateFilter(Reports.StandardDateFilter dateFilter)
```

Parameters

dateFilter

Type: Reports.StandardDateFilter

Return Value

Type: void

setStandardFilters(filters)

Sets one or more standard filters on the report.

Signature

```
public void setStandardFilters(List<Reports.StandardFilter> filters)
```

Parameters

filters

Type: List<Reports.StandardFilter>

Return Value

Type: void

setTopRows (topRows)

Applies a row limit filter to a report.

Signature

```
public Reports.TopRows setTopRows(Reports.TopRows topRows)
```

Parameters

topRows

Type: [Reports.TopRows](#)

Return Value

Type: void

ReportResults Class

Contains the results of running a report.

Namespace

[Reports](#)

ReportResults Methods

The following are methods for `ReportResults`. All are instance methods.

IN THIS SECTION:

[getAllData\(\)](#)

Returns all report data.

[getFactMap\(\)](#)

Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

[getGroupingsAcross\(\)](#)

Returns a collection of column groupings, keys, and values.

[getGroupingsDown\(\)](#)

Returns a collection of row groupings, keys, and values.

[getHasDetailRows\(\)](#)

Returns information about whether the fact map has detail rows.

[getReportExtendedMetadata\(\)](#)

Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

[getReportMetadata\(\)](#)

Returns metadata about the report, including grouping and summary information.

getAllData ()

Returns all report data.

Syntax

```
public Boolean getAllData ()
```

Return Value

Type: [Boolean](#)

Usage

When `true`, indicates that all report results are returned.

When `false`, indicates that results are returned for the same number of rows as in a report run in Salesforce.

 **Note:** For reports that contain too many records, use filters to refine results.

getFactMap ()

Returns summary-level data or summary and detailed data for each row or column grouping. Detailed data is available if the `includeDetails` parameter is set to `true` when the report is run.

Syntax

```
public MAP<String, Reports.ReportFact> getFactMap ()
```

Return Value

Type: [Map<String, Reports.ReportFact>](#)

getGroupingsAcross ()

Returns a collection of column groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsAcross ()
```

Return Value

Type: [Reports.Dimension](#)

getGroupingsDown ()

Returns a collection of row groupings, keys, and values.

Syntax

```
public Reports.Dimension getGroupingsDown ()
```

Return Value

Type: [Reports.Dimension](#)

getHasDetailRows ()

Returns information about whether the fact map has detail rows.

Syntax

```
public Boolean getHasDetailRows ()
```

Return Value

Type: [Boolean](#)

Usage

- When `true`, indicates that the fact map returns values for summary-level and record-level data.
- When `false`, indicates that the fact map returns summary values.

getReportExtendedMetadata ()

Returns additional, detailed metadata about the report, including data type and label information for groupings and summaries.

Syntax

```
public Reports.ReportExtendedMetadata getReportExtendedMetadata ()
```

Return Value

Type: [Reports.ReportExtendedMetadata](#)

getReportMetadata ()

Returns metadata about the report, including grouping and summary information.

Syntax

```
public Reports.ReportMetadata getReportMetadata ()
```

Return Value

Type: [Reports.ReportMetadata](#)

ReportScopeInfo Class

Contains information about possible scope values that you can choose. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

Namespace

[Reports](#)

IN THIS SECTION:

[ReportScopeInfo Methods](#)

ReportScopeInfo Methods

The following are methods for `ReportScopeInfo`.

IN THIS SECTION:

[getDefaultValue\(\)](#)

Returns the default scope of the data to display in the report.

[getValues\(\)](#)

Returns a list of scope values specified for the report.

getDefaultValue ()

Returns the default scope of the data to display in the report.

Signature

```
public String getDefaultValue ()
```

Return Value

Type: [String](#)

getValues ()

Returns a list of scope values specified for the report.

Signature

```
public List<Reports.ReportScopeValue> getValues ()
```

Return Value

Type: [List<Reports.ReportScopeValue>](#)

ReportScopeValue Class

Contains information about a possible scope value. Scope values depend on the report type. For example, you can set the scope for opportunity reports to `All opportunities`, `My team's opportunities`, or `My opportunities`.

Namespace

[Reports](#)

IN THIS SECTION:

[ReportScopeValue Methods](#)

ReportScopeValue Methods

The following are methods for `ReportScopeValue`.

IN THIS SECTION:

[getAllowsDivision\(\)](#)

Returns a boolean value that indicates whether you can segment the report by this scope.

[getLabel\(\)](#)

Returns the display name of the scope of the report.

[getValue\(\)](#)

Returns the scope value for the report.

getAllowsDivision()

Returns a boolean value that indicates whether you can segment the report by this scope.

Signature

```
public Boolean getAllowsDivision()
```

Return Value

Type: [Boolean](#)

getLabel()

Returns the display name of the scope of the report.

Signature

```
public String getLabel()
```

Return Value

Type: [String](#)

getValue()

Returns the scope value for the report.

Signature

```
public String getValue()
```

Return Value

Type: [String](#)

ReportType Class

Contains the unique API name and display name for the report type.

Namespace

[Reports](#)

ReportType Methods

The following are methods for `ReportType`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the localized display name of the report type.

[getType\(\)](#)

Returns the unique identifier of the report type.

getLabel ()

Returns the localized display name of the report type.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getType ()

Returns the unique identifier of the report type.

Syntax

```
public String getType ()
```

Return Value

Type: [String](#)

ReportTypeColumn Class

Contains detailed report type metadata about a field, including data type, display name, and filter values.

Namespace

[Reports](#)

ReportTypeColumn Methods

The following are methods for `ReportTypeColumn`. All are instance methods.

IN THIS SECTION:

[getDataType\(\)](#)

Returns the data type of the field.

[getFilterValues\(\)](#)

If the field data type is picklist, multi-select picklist, boolean, or checkbox, returns all filter values for a field. For example, checkbox fields always have a value of `true` or `false`. For fields of other data types, the filter value is an empty array, because their values can't be determined.

[getFilterable\(\)](#)

If the field is of a type that can't be filtered, returns `False`. For example, fields of the type `Encrypted Text` can't be filtered.

[getLabel\(\)](#)

Returns the localized display name of the field.

[getName\(\)](#)

Returns the unique API name of the field.

getDataType ()

Returns the data type of the field.

Syntax

```
public Reports.ColumnDataType getDataType ()
```

Return Value

Type: [Reports.ColumnDataType](#)

getFilterValues ()

If the field data type is picklist, multi-select picklist, boolean, or checkbox, returns all filter values for a field. For example, checkbox fields always have a value of `true` or `false`. For fields of other data types, the filter value is an empty array, because their values can't be determined.

Syntax

```
public LIST<Reports.FilterValue> getFilterValues ()
```

Return Value

Type: [List<Reports.FilterValue>](#)

getFilterable ()

If the field is of a type that can't be filtered, returns `False`. For example, fields of the type `Encrypted Text` can't be filtered.

Syntax

```
public Boolean getFilterable()
```

Return Value

Type: [Boolean](#)

getLabel ()

Returns the localized display name of the field.

Syntax

```
public String getLabel()
```

Return Value

Type: [String](#)

getName ()

Returns the unique API name of the field.

Syntax

```
public String getName()
```

Return Value

Type: [String](#)

ReportTypeColumnCategory Class

Information about categories of fields in a report type.

Namespace

[Reports](#)

Usage

A report type column category is a set of fields that the report type grants access to. For example, an opportunity report has categories like *Opportunity Information* and *Primary Contact*. The Opportunity Information category has fields like *Amount*, *Probability*, and *Close Date*.

Get category information about a report by first getting the report metadata:

```
// Get the report ID
List<Report> reportList = [SELECT Id,DeveloperName FROM Report where DeveloperName =
'Q1_Opportunities2'];

String reportId = (String)reportList.get(0).get('Id');

// Describe the report
Reports.ReportDescribeResult describeResults =
Reports.ReportManager.describeReport(reportId);

// Get report type metadata
Reports.ReportTypeMetadata reportTypeMetadata = describeResults.getReportTypeMetadata();

// Get report type column categories
List<Reports.ReportTypeColumnCategory> reportTypeColumnCategories =
reportTypeMetadata.getCategories();

System.debug('reportTypeColumnCategories: ' + reportTypeColumnCategories);
```

ReportTypeColumnCategory Methods

The following are methods for `ReportTypeColumnCategory`. All are instance methods.

IN THIS SECTION:

[getColumns\(\)](#)

Returns information for all fields in the report type. The information is organized by each section's unique API name.

[getLabel\(\)](#)

Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, `Account General` is the display name of the section that contains fields on general account information.

getColumns ()

Returns information for all fields in the report type. The information is organized by each section's unique API name.

Syntax

```
public MAP<String,Reports.ReportTypeColumn> getColumns ()
```

Return Value

Type: [Map<String,Reports.ReportTypeColumn>](#)

getLabel ()

Returns the localized display name of a section in the report type under which fields are organized. For example, in an Accounts with Contacts custom report type, `Account General` is the display name of the section that contains fields on general account information.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

ReportTypeMetadata Class

Contains report type metadata, which gives you information about the fields that are available in each section of the report type, plus filter information for those fields.

Namespace

[Reports](#)

IN THIS SECTION:

[ReportTypeMetadata Methods](#)

ReportTypeMetadata Methods

The following are methods for `ReportTypeMetadata`. All are instance methods.

IN THIS SECTION:

[getCategories\(\)](#)

Returns all fields in the report type. The fields are organized by section.

[getDivisionInfo\(\)](#)

Returns the default division and a list of all possible divisions that can be applied to this type of report.

[getScopeInfo\(\)](#)

Returns information about the scopes that can be applied to this type of report.

[getStandardDateFilterDurationGroups\(\)](#)

Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.

[getStandardFilterInfos\(\)](#)

Returns information about standard date filters that can be applied to this type of report.

getCategories ()

Returns all fields in the report type. The fields are organized by section.

Syntax

```
public LIST<Reports.ReportTypeColumnCategory> getCategories ()
```

Return Value

Type: [List<Reports.ReportTypeColumnCategory>](#)

getDivisionInfo ()

Returns the default division and a list of all possible divisions that can be applied to this type of report.

Signature

```
public Reports.ReportDivisionInfo getDivisionInfo ()
```

Return Value

Type: [Reports.ReportDivisionInfo](#)

getScopeInfo ()

Returns information about the scopes that can be applied to this type of report.

Signature

```
public Reports.ReportScopeInfo getScopeInfo ()
```

Return Value

Type: [Reports.ReportScopeInfo](#)

getStandardDateFilterDurationGroups ()

Returns information about the standard date filter groupings that can be applied to this type of report. Standard date filter groupings include Calendar Year, Calendar Quarter, Calendar Month, Calendar Week, Fiscal Year, Fiscal Quarter, Day and a custom value based on a user-defined date range.

Signature

```
public List<Reports.StandardDateFilterDurationGroup>  
getStandardDateFilterDurationGroups ()
```

Return Value

Type: [List<Reports.StandardDateFilterDurationGroup>](#)

getStandardFilterInfos ()

Returns information about standard date filters that can be applied to this type of report.

Signature

```
public Map<String, Reports.StandardFilterInfo> getStandardFilterInfos ()
```

Return Value

Type: `Map<String,Reports.StandardFilterInfo>`

SortColumn Class

Contains information about the sort column used in the report.

Namespace

[Reports](#)

IN THIS SECTION:

[SortColumn Methods](#)

SortColumn Methods

The following are methods for `SortColumn`.

IN THIS SECTION:

[getSortColumn\(\)](#)

Returns the column used to sort the records in the report.

[getSortOrder\(\)](#)

Returns the the sort order— ascending or descending—for the sort column.

[setSortColumn\(sortColumn\)](#)

Sets the column used to sort the records in the report.

[setSortOrder\(SortOrder\)](#)

Sets the sort order— ascending or descending—for the sort column.

getSortColumn ()

Returns the column used to sort the records in the report.

Signature

```
public String getSortColumn ()
```

Return Value

Type: [String](#)

getSortOrder ()

Returns the the sort order— ascending or descending—for the sort column.

Signature

```
public Reports.ColumnSortOrder getSortOrder ()
```

Return Value

Type: [Reports.ColumnSortOrder](#)

setSortColumn (sortColumn)

Sets the column used to sort the records in the report.

Signature

```
public void setSortColumn (String sortColumn)
```

Parameters

sortColumn

Type: [String](#)

Return Value

Type: void

setSortOrder (SortOrder)

Sets the sort order— ascending or descending—for the sort column.

Signature

```
public void setSortOrder (Reports.ColumnSortOrder sortOrder)
```

Parameters

sortOrder

Type: [Reports.ColumnSortOrder](#)

Return Value

Type: void

StandardDateFilter Class

Contains information about standard date filter available in the report—for example, the API name, start date, and end date of the standard date filter duration as well as the API name of the date field on which the filter is placed.

Namespace

[Reports](#)

IN THIS SECTION:

[StandardDateFilter Methods](#)

StandardDateFilter Methods

The following are methods for `StandardDateFilter`.

IN THIS SECTION:

[getColumn\(\)](#)

Returns the API name of the standard date filter column.

[getDurationValue\(\)](#)

Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

[getEndDate\(\)](#)

Returns the end date of the standard date filter.

[getStartDate\(\)](#)

Returns the start date for the standard date filter.

[setColumn\(standardDateFilterColumnName\)](#)

Sets the API name of the standard date filter column.

[setDurationValue\(durationName\)](#)

Sets the API name of the standard date filter.

[setEndDate\(endDate\)](#)

Sets the end date for the standard date filter.

[setStartDate\(startDate\)](#)

Sets the start date for the standard date filter.

getColumn ()

Returns the API name of the standard date filter column.

Signature

```
public String getColumn ()
```

Return Value

Type: [String](#)

getDurationValue ()

Returns duration information about a standard date filter, such as start date, end date, and display name and API name of the date filter.

Signature

```
public String getDurationValue ()
```

Return Value

Type: [String](#)

getEndDate ()

Returns the end date of the standard date filter.

Signature

```
public String getEndDate ()
```

Return Value

Type: [String](#)

getStartDate ()

Returns the start date for the standard date filter.

Signature

```
public String getStartDate ()
```

Return Value

Type: [String](#)

setColumn (standardDateFilterColumnName)

Sets the API name of the standard date filter column.

Signature

```
public void setColumn (String standardDateFilterColumnName)
```

Parameters

standardDateFilterColumnName

Type: [String](#)

Return Value

Type: void

setDurationValue (durationName)

Sets the API name of the standard date filter.

Signature

```
public void setDurationValue (String durationName)
```

Parameters

durationName
Type: [String](#)

Return Value

Type: void

setEndDate (endDate)

Sets the end date for the standard date filter.

Signature

```
public void setEndDate (String endDate)
```

Parameters

endDate
Type: [String](#)

Return Value

Type: void

setStartDate (startDate)

Sets the start date for the standard date filter.

Signature

```
public void setStartDate (String startDate)
```

Parameters

startDate
Type: [String](#)

Return Value

Type: void

StandardDateFilterDuration Class

Contains information about each standard date filter—also referred to as a relative date filter. It contains the API name and display label of the standard date filter duration as well as the start and end dates.

Namespace

[Reports](#)

IN THIS SECTION:

[StandardDateFilterDuration Methods](#)

StandardDateFilterDuration Methods

The following are methods for `StandardDateFilterDuration`.

IN THIS SECTION:

[getEndDate\(\)](#)

Returns the end date of the date filter.

[getLabel\(\)](#)

Returns the display name of the date filter. Possible values are relative date filters—like `Current FY` and `Current FQ`—and custom date filters.

[getStartDate\(\)](#)

Returns the start date of the date filter.

[getValue\(\)](#)

Returns the API name of the date filter. Possible values are relative date filters—like `THIS_FISCAL_YEAR` and `NEXT_FISCAL_QUARTER`—and custom date filters.

getEndDate ()

Returns the end date of the date filter.

Signature

```
public String getEndDate ()
```

Return Value

Type: [String](#)

getLabel ()

Returns the display name of the date filter. Possible values are relative date filters—like `Current FY` and `Current FQ`—and custom date filters.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getStartDate ()

Returns the start date of the date filter.

Signature

```
public String getStartDate()
```

Return Value

Type: [String](#)

getValue ()

Returns the API name of the date filter. Possible values are relative date filters—like `THIS_FISCAL_YEAR` and `NEXT_FISCAL_QUARTER`—and custom date filters.

Signature

```
public String getValue()
```

Return Value

Type: [String](#)

StandardDateFilterDurationGroup Class

Contains information about the standard date filter groupings, such as the grouping display label and all standard date filters that fall under the grouping. Groupings include `Calendar Year`, `Calendar Quarter`, `Calendar Month`, `Calendar Week`, `Fiscal Year`, `Fiscal Quarter`, `Day`, and custom values based on user-defined date ranges.

Namespace

[Reports](#)

IN THIS SECTION:

[StandardDateFilterDurationGroup Methods](#)

StandardDateFilterDurationGroup Methods

The following are methods for `StandardDateFilterDurationGroup`.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the display label for the standard date filter grouping.

[getStandardDateFilterDurations\(\)](#)

Returns the standard date filter groupings.

getLabel ()

Returns the display label for the standard date filter grouping.

Signature

```
public String getLabel()
```

Return Value

Type: [String](#)

getStandardDateFilterDurations()

Returns the standard date filter groupings.

Signature

```
public List<Reports.StandardDateFilterDuration> getStandardDateFilterDurations()
```

Return Value

Type: [List<Reports.StandardDateFilterDuration>](#)

For example, a standard filter date grouping might look like this:

```
Reports.StandardDateFilterDuration[endDate=2015-12-31, label=Current FY,
startDate=2015-01-01, value=THIS_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous FY,
startDate=2014-01-01, value=LAST_FISCAL_YEAR],
Reports.StandardDateFilterDuration[endDate=2014-12-31, label=Previous 2 FY,
startDate=2013-01-01, value=LAST_N_FISCAL_YEARS:2]
```

StandardFilter Class

Contains information about the standard filter defined in the report, such as the filter field API name and filter value.

Namespace

[Reports](#)

Usage

Use to get or set standard filters on a report. Standard filters vary by report type. For example, standard filters for reports on the Opportunity object are Show, Opportunity Status, and Probability.

IN THIS SECTION:

[StandardFilter Methods](#)

StandardFilter Methods

The following are methods for `StandardFilter`.

IN THIS SECTION:

[getName\(\)](#)

Return the API name of the standard filter.

[getValue\(\)](#)

Returns the standard filter value.

[setName\(name\)](#)

Sets the API name of the standard filter.

[setValue\(value\)](#)

Sets the standard filter value.

getName ()

Return the API name of the standard filter.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getValue ()

Returns the standard filter value.

Signature

```
public String getValue ()
```

Return Value

Type: [String](#)

setName (name)

Sets the API name of the standard filter.

Signature

```
public void setName (String name)
```

Parameters

name

Type: [String](#)

Return Value

Type: void

setValue (value)

Sets the standard filter value.

Signature

```
public void setValue(String value)
```

Parameters

value

Type: [String](#)

Return Value

Type: void

StandardFilterInfo Class

Is an abstract base class for an object that provides standard filter information.

Namespace

[Reports](#)

IN THIS SECTION:

[StandardFilterInfo Methods](#)

StandardFilterInfo Methods

The following are methods for `StandardFilterInfo`.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the display label of the standard filter.

[getType\(\)](#)

Returns the type of standard filter.

getLabel ()

Returns the display label of the standard filter.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getType ()

Returns the type of standard filter.

Signature

```
public Reports.StandardFilterType getType ()
```

Return Value

Type: [Reports.StandardFilterType](#)

StandardFilterInfoPicklist Class

Contains information about the standard filter picklist, such as the display name and type of the filter field, the default picklist value, and a list of all possible picklist values.

Namespace

[Reports](#)

IN THIS SECTION:

[StandardFilterInfoPicklist Methods](#)

StandardFilterInfoPicklist Methods

The following are methods for `StandardFilterInfoPicklist`.

IN THIS SECTION:

[getDefaultValue\(\)](#)

Returns the default value for the standard filter picklist.

[getFilterValues\(\)](#)

Returns a list of standard filter picklist values.

[getLabel\(\)](#)

Returns the display name of the standard filter picklist.

[getType\(\)](#)

Returns the type of the standard filter picklist.

getDefaultValue ()

Returns the default value for the standard filter picklist.

Signature

```
public String getDefaultValue()
```

Return Value

Type: [String](#)

getFilterValues ()

Returns a list of standard filter picklist values.

Signature

```
public List<Reports.FilterValue> getFilterValues()
```

Return Value

Type: [List<Reports.FilterValue>](#)

getLabel ()

Returns the display name of the standard filter picklist.

Signature

```
public String getLabel()
```

Return Value

Type: [String](#)

getType ()

Returns the type of the standard filter picklist.

Signature

```
public Reports.StandardFilterType getType()
```

Return Value

Type: [Reports.StandardFilterType](#)

StandardFilterType Enum

The `StandardFilterType` enum describes the type of standard filters in a report. The `getType ()` method returns a `Reports.StandardFilterType` enum value.

Namespace

[Reports](#)

Enum Values

The following are the values of the `Reports.StandardFilterType` enum.

Value	Description
PICKLIST	Values for the standard filter type.
STRING	String values.

SummaryValue Class

Contains summary data for a cell of the report.

Namespace

[Reports](#)

SummaryValue Methods

The following are methods for `SummaryValue`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the formatted summary data for a specified cell.

[getValue\(\)](#)

Returns the numeric value of the summary data for a specified cell.

getLabel ()

Returns the formatted summary data for a specified cell.

Syntax

```
public String getLabel ()
```

Return Value

Type: [String](#)

getValue ()

Returns the numeric value of the summary data for a specified cell.

Syntax

```
public Object getValue ()
```

Return Value

Type: Object

ThresholdInformation Class

Contains a list of evaluated conditions for a report notification.

Namespace

[Reports](#)

IN THIS SECTION:

[ThresholdInformation Constructors](#)

[ThresholdInformation Methods](#)

ThresholdInformation Constructors

The following are constructors for `ThresholdInformation`.

IN THIS SECTION:

[ThresholdInformation\(evaluatedConditions\)](#)

Creates a new instance of the `Reports.EvaluatedCondition` class.

ThresholdInformation (evaluatedConditions)

Creates a new instance of the `Reports.EvaluatedCondition` class.

Signature

```
public ThresholdInformation (List<Reports.EvaluatedCondition> evaluatedConditions)
```

Parameters

evaluatedConditions

Type: [List<Reports.EvaluatedCondition>](#)

A list of `Reports.EvaluatedCondition` objects.

ThresholdInformation Methods

The following are methods for `ThresholdInformation`.

IN THIS SECTION:

[getEvaluatedConditions\(\)](#)

Returns a list of evaluated conditions for a report notification.

getEvaluatedConditions ()

Returns a list of evaluated conditions for a report notification.

Signature

```
public List<Reports.EvaluatedCondition> getEvaluatedConditions ()
```

Return Value

Type: [List<Reports.EvaluatedCondition>](#)

TopRows Class

Contains methods and constructors for working with information about a row limit filter.

Namespace

[Reports](#)

IN THIS SECTION:

[TopRows Constructors](#)[TopRows Methods](#)

TopRows Constructors

The following are constructors for `TopRows`.

IN THIS SECTION:

[TopRows\(rowLimit, direction\)](#)

Creates an instance of the `Reports.TopRows` class using the specified parameters.

[TopRows\(\)](#)

Creates an instance of the `Reports.TopRows` class. You can then set values by using the class's `set` methods.

TopRows (rowLimit, direction)

Creates an instance of the `Reports.TopRows` class using the specified parameters.

Signature

```
public TopRows(Integer rowLimit, Reports.ColumnSortOrder direction)
```

Parameters

rowLimit

Type: [Integer](#)

The number of rows returned in the report.

direction

Type: [Reports.ColumnSortOrder](#)

The sort order of the report rows.

TopRows ()

Creates an instance of the `Reports.TopRows` class. You can then set values by using the class's `set` methods.

Signature

```
public TopRows ()
```

TopRows Methods

The following are methods for `TopRows`.

IN THIS SECTION:

[getDirection\(\)](#)

Returns the sort order of the report rows.

[getRowLimit\(\)](#)

Returns the maximum number of rows shown in the report.

[setDirection\(value\)](#)

Sets the sort order of the report's rows.

[setDirection\(direction\)](#)

Sets the sort order of the report's rows.

[setRowLimit\(rowLimit\)](#)

Sets the maximum number of rows included in the report.

[toString\(\)](#)

Returns a string.

getDirection ()

Returns the sort order of the report rows.

Signature

```
public Reports.ColumnSortOrder getDirection ()
```

Return Value

Type: [Reports.ColumnSortOrder](#)

getRowLimit ()

Returns the maximum number of rows shown in the report.

Signature

```
public Integer getRowLimit ()
```

Return Value

Type: [Integer](#)

setDirection (value)

Sets the sort order of the report's rows.

Signature

```
public void setDirection (String value)
```

Parameters

value

Type: [String](#)

For possible values, see [Reports.ColumnSortOrder](#).

Return Value

Type: void

setDirection (direction)

Sets the sort order of the report's rows.

Signature

```
public void setDirection (Reports.ColumnSortOrder direction)
```

Parameters

direction

Type: [Reports.ColumnSortOrder](#)

Return Value

Type: void

setRowLimit (rowLimit)

Sets the maximum number of rows included in the report.

Signature

```
public void setRowLimit(Integer rowLimit)
```

Parameters

rowLimit
Type: [Integer](#)

Return Value

Type: void

toString()

Returns a string.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

Reports Exceptions

The `Reports` namespace contains exception classes.

All exception classes support built-in methods for returning the error message and exception type. See [Exception Class and Built-In Exceptions](#) on page 2483.

The `Reports` namespace contains these exceptions:

Exception	Description	Methods
<code>Reports.FeatureNotSupportedException</code>	Invalid report format	
<code>Reports.InstanceAccessException</code>	Unable to access report instance	
<code>Reports.InvalidFilterException</code>	Filter validation error	<code>List<String> getFilterErrors()</code> returns a list of filter errors
<code>Reports.InvalidReportMetadataException</code>	Missing metadata for filters	<code>List<String> getReportMetadataErrors()</code> returns a list of metadata errors
<code>Reports.InvalidSnapshotDateException</code>	Invalid historical report format	<code>List<String> getSnapshotDateErrors()</code> returns a list of snapshot date errors
<code>Reports.MetadataException</code>	No selected report columns	
<code>Reports.ReportRunException</code>	Error running report	

Exception	Description	Methods
<code>Reports.UnsupportedOperationException</code>	Missing permissions for running reports	

Schema Namespace

The `Schema` namespace provides classes and methods for schema metadata information.

The following are the classes in the `Schema` namespace.

IN THIS SECTION:

[ChildRelationship Class](#)

Contains methods for accessing the child relationship as well as the child `sObject` for a parent `sObject`.

[DataCategory Class](#)

Represents the categories within a category group.

[DataCategoryGroupSubjectTypePair Class](#)

Specifies a category group and an associated object.

[DescribeColorResult Class](#)

Contains color metadata information for a tab.

[DescribeDataCategoryGroupResult Class](#)

Contains the list of the category groups associated with `KnowledgeArticleVersion` and `Question`.

[DescribeDataCategoryGroupStructureResult Class](#)

Contains the category groups and categories associated with `KnowledgeArticleVersion` and `Question`.

[DescribeFieldResult Class](#)

Contains methods for describing `sObject` fields.

[DescribeIconResult Class](#)

Contains icon metadata information for a tab.

[DescribeSObjectResult Class](#)

Contains methods for describing `sObjects`.

[DescribeTabResult Class](#)

Contains tab metadata information for a tab in a standard or custom app available in the Salesforce user interface.

[DescribeTabSetResult Class](#)

Contains metadata information about a standard or custom app available in the Salesforce user interface.

[DisplayType Enum](#)

A `Schema.DisplayType` enum value is returned by the field describe result's `getType` method.

[FieldSet Class](#)

Contains methods for discovering and retrieving the details of field sets created on `sObjects`.

[FieldSetMember Class](#)

Contains methods for accessing the metadata for field set member fields.

[PicklistEntry Class](#)

Represents a picklist entry.

[RecordTypeInfo Class](#)

Contains methods for accessing record type information for an sObject with associated record types.

[SOAPType Enum](#)

A `Schema.SOAPType` enum value is returned by the field describe result `getSoapType` method.

[SObjectField Class](#)

A `Schema.SObjectField` object is returned from the field describe result using the `getController` and `getSObjectField` methods.

[SObjectType Class](#)

A `Schema.SObjectType` object is returned from the field describe result using the `getReferenceTo` method, or from the sObject describe result using the `getSObjectType` method.

ChildRelationship Class

Contains methods for accessing the child relationship as well as the child sObject for a parent sObject.

Namespace

[Schema](#)

Example

A `ChildRelationship` object is returned from the sObject describe result using the `getChildRelationship` method. For example:

```
Schema.DescribeSObjectResult R = Account.SObjectType.getDescribe();
List<Schema.ChildRelationship> C = R.getChildRelationships();
```

ChildRelationship Methods

The following are methods for `ChildRelationship`. All are instance methods.

IN THIS SECTION:

[getChildSObject\(\)](#)

Returns the token of the child sObject on which there is a foreign key back to the parent sObject.

[getField\(\)](#)

Returns the token of the field that has a foreign key back to the parent sObject.

[getRelationshipName\(\)](#)

Returns the name of the relationship.

[isCascadeDelete\(\)](#)

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

[isDeprecatedAndHidden\(\)](#)

Reserved for future use.

[isRestrictedDelete\(\)](#)

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

getChildSObject ()

Returns the token of the child sObject on which there is a foreign key back to the parent sObject.

Signature

```
public Schema.SObjectType getChildSObject ()
```

Return Value

Type: [Schema.SObjectType](#)

getField ()

Returns the token of the field that has a foreign key back to the parent sObject.

Signature

```
public Schema.SObjectField getField ()
```

Return Value

Type: [Schema.SObjectField](#)

getRelationshipName ()

Returns the name of the relationship.

Signature

```
public String getRelationshipName ()
```

Return Value

Type: [String](#)

isCascadeDelete ()

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

Signature

```
public Boolean isCascadeDelete ()
```

Return Value

Type: [Boolean](#)

isDeprecatedAndHidden ()

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: [Boolean](#)

isRestrictedDelete()

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

Signature

```
public Boolean isRestrictedDelete()
```

Return Value

Type: [Boolean](#)

DataCategory Class

Represents the categories within a category group.

Namespace

[Schema](#)

Usage

The `Schema.DataCategory` object is returned by the `getTopCategories` method.

DataCategory Methods

The following are methods for `DataCategory`. All are instance methods.

IN THIS SECTION:

[getChildCategories\(\)](#)

Returns a recursive object that contains the visible sub categories in the data category.

[getLabel\(\)](#)

Returns the label for the data category used in the Salesforce user interface.

[getName\(\)](#)

Returns the unique name used by the API to access to the data category.

getChildCategories()

Returns a recursive object that contains the visible sub categories in the data category.

Signature

```
public Schema.DataCategory getChildCategories ()
```

Return Value

Type: [List<Schema.DataCategory>](#)

getLabel ()

Returns the label for the data category used in the Salesforce user interface.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

Returns the unique name used by the API to access to the data category.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

DataCategoryGroupSubjectTypePair Class

Specifies a category group and an associated object.

Namespace

[Schema](#)

Usage

`Schema.DataCategoryGroupSubjectTypePair` is used by the `describeDataCategory GroupStructures` method to return the categories available to this object.

IN THIS SECTION:

[DataCategoryGroupSubjectTypePair Constructors](#)

[DataCategoryGroupSubjectTypePair Methods](#)

DataCategoryGroupSubjectTypePair Constructors

The following are constructors for `DataCategoryGroupSubjectTypePair`.

IN THIS SECTION:

[DataCategoryGroupSubjectTypePair\(\)](#)

Creates a new instance of the `Schema.DataCategoryGroupSubjectTypePair` class.

DataCategoryGroupSubjectTypePair ()

Creates a new instance of the `Schema.DataCategoryGroupSubjectTypePair` class.

Signature

```
public DataCategoryGroupSubjectTypePair ()
```

DataCategoryGroupSubjectTypePair Methods

The following are methods for `DataCategoryGroupSubjectTypePair`. All are instance methods.

IN THIS SECTION:

[getDataCategoryGroupName\(\)](#)

Returns the unique name used by the API to access the data category group.

[getSubject\(\)](#)

Returns the object name associated with the data category group.

[setDataCategoryGroupName\(name\)](#)

Specifies the unique name used by the API to access the data category group.

[setSubject\(sObjectName\)](#)

Sets the `sObject` associated with the data category group.

getDataCategoryGroupName ()

Returns the unique name used by the API to access the data category group.

Signature

```
public String getDataCategoryGroupName ()
```

Return Value

Type: [String](#)

getSubject ()

Returns the object name associated with the data category group.

Signature

```
public String getObject ()
```

Return Value

Type: [String](#)

setDataCategoryGroupName (name)

Specifies the unique name used by the API to access the data category group.

Signature

```
public String setDataCategoryGroupName (String name)
```

Parameters

name

Type: [String](#)

Return Value

Type: Void

setSubject (sObjectName)

Sets the sObject associated with the data category group.

Signature

```
public Void setSubject (String sObjectName)
```

Parameters

sObjectName

Type: [String](#)

The *sObjectName* is the object name associated with the data category group. Valid values are:

- `KnowledgeArticleVersion`—for article types.
- `Question`—for questions from Answers.

Return Value

Type: Void

DescribeColorResult Class

Contains color metadata information for a tab.

Namespace

[Schema](#)

Usage

The `getColors` method of the `Schema.DescribeTabResult` class returns a list of `Schema.DescribeColorResult` objects that describe colors used in a tab.

The methods in the `Schema.DescribeColorResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `colorResultObj.color` is equivalent to `colorResultObj.getColor()`.

Example

This sample shows how to get the color information in the Sales app for the first tab's first color.

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.DescribeTabs();

// Iterate through each tab set describe for each app and display the info
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
    // Display tab info for the Sales app
    if (tsr.getLabel() == 'Sales') {
        // Get color information for the first tab
        List<Schema.DescribeColorResult> colorDesc = tsr.getTabs()[0].getColors();
        // Display the icon color, theme, and context of the first color returned
        System.debug('Color: ' + colorDesc[0].getColor());
        System.debug('Theme: ' + colorDesc[0].getTheme());
        System.debug('Context: ' + colorDesc[0].getContext());
    }
}

// Example debug statement output
// DEBUG|Color: 1797C0
// DEBUG|Theme: theme4
// DEBUG|Context: primary
```

DescribeColorResult Methods

The following are methods for `DescribeColorResult`. All are instance methods.

IN THIS SECTION:

[getColor\(\)](#)

Returns the Web RGB color code, such as `00FF00`.

[getContext\(\)](#)

Returns the color context. The context determines whether the color is the main color for the tab or not.

[getTheme\(\)](#)

Returns the color theme.

getColor ()

Returns the Web RGB color code, such as 00FF00.

Signature

```
public String getColor ()
```

Return Value

Type: [String](#)

getContext ()

Returns the color context. The context determines whether the color is the main color for the tab or not.

Signature

```
public String getContext ()
```

Return Value

Type: [String](#)

getTheme ()

Returns the color theme.

Signature

```
public String getTheme ()
```

Return Value

Type: [String](#)

Possible theme values include `theme3`, `theme4`, and `custom`.

- `theme3` is the Salesforce theme introduced during Spring '10.
- `theme4` is the Salesforce theme introduced in Winter '14 for the mobile touchscreen version of Salesforce.
- `custom` is the theme name associated with a custom icon.

DescribeDataCategoryGroupResult Class

Contains the list of the category groups associated with KnowledgeArticleVersion and Question.

Namespace

[Schema](#)

Usage

The `describeDataCategoryGroups` method returns a `Schema.DescribeDataCategoryGroupResult` object containing the list of the category groups associated with the specified object.

For additional information and code examples using `describeDataCategoryGroups`, see [Accessing All Data Categories Associated with an sObject](#).

Example

The following is an example of how to instantiate a data category group describe result object:

```
List<String> objType = new List<String>();
objType.add('KnowledgeArticleVersion');
objType.add('Question');

List<Schema.DescribeDataCategoryGroupResult> describeCategoryResult =
    Schema.describeDataCategoryGroups(objType);
```

DescribeDataCategoryGroupResult Methods

The following are methods for `DescribeDataCategoryGroupResult`. All are instance methods.

IN THIS SECTION:

[getCategoryCount\(\)](#)

Returns the number of visible data categories in the data category group.

[getDescription\(\)](#)

Returns the description of the data category group.

[getLabel\(\)](#)

Returns the label for the data category group used in the Salesforce user interface.

[getName\(\)](#)

Returns the unique name used by the API to access to the data category group.

[getSubject\(\)](#)

Returns the object name associated with the data category group.

getCategoryCount ()

Returns the number of visible data categories in the data category group.

Signature

```
public Integer getCategoryCount ()
```

Return Value

Type: [Integer](#)

getDescription ()

Returns the description of the data category group.

Signature

```
public String getDescription()
```

Return Value

Type: [String](#)

getLabel ()

Returns the label for the data category group used in the Salesforce user interface.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

Returns the unique name used by the API to access to the data category group.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getObject ()

Returns the object name associated with the data category group.

Signature

```
public String getObject ()
```

Return Value

Type: [String](#)

DescribeDataCategoryGroupStructureResult Class

Contains the category groups and categories associated with KnowledgeArticleVersion and Question.

Namespace

[Schema](#)

Usage

The `describeDataCategoryGroupStructures` method returns a list of `Schema.DescribeDataCategoryGroupStructureResult` objects containing the category groups and categories associated with the specified object.

For additional information and code examples, see [Accessing All Data Categories Associated with an sObject](#).

Example

The following is an example of how to instantiate a data category group structure describe result object:

```
List<DataCategoryGroupObjectTypePair> pairs =
    new List<DataCategoryGroupObjectTypePair>();

DataCategoryGroupObjectTypePair pair1 =
    new DataCategoryGroupObjectTypePair();
pair1.setSubject('KnowledgeArticleVersion');
pair1.setDataCategoryGroupName('Regions');

DataCategoryGroupObjectTypePair pair2 =
    new DataCategoryGroupObjectTypePair();
pair2.setSubject('Questions');
pair2.setDataCategoryGroupName('Regions');

pairs.add(pair1);
pairs.add(pair2);

List<Schema.DescribeDataCategoryGroupStructureResult>results =
    Schema.describeDataCategoryGroupStructures(pairs, true);
```

DescribeDataCategoryGroupStructureResult Methods

The following are methods for `DescribeDataCategoryGroupStructureResult`. All are instance methods.

IN THIS SECTION:

[getDescription\(\)](#)

Returns the description of the data category group.

[getLabel\(\)](#)

Returns the label for the data category group used in the Salesforce user interface.

[getName\(\)](#)

Returns the unique name used by the API to access to the data category group.

[getSubject\(\)](#)

Returns the name of object associated with the data category group.

[getTopCategories\(\)](#)

Returns a `Schema . DataCategory` object, that contains the top categories visible depending on the user's data category group visibility settings.

getDescription ()

Returns the description of the data category group.

Signature

```
public String getDescription()
```

Return Value

Type: [String](#)

getLabel ()

Returns the label for the data category group used in the Salesforce user interface.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getName ()

Returns the unique name used by the API to access to the data category group.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getSubject ()

Returns the name of object associated with the data category group.

Signature

```
public String getSubject ()
```

Return Value

Type: [String](#)

getTopCategories ()

Returns a `Schema.DataCategory` object, that contains the top categories visible depending on the user's data category group visibility settings.

Signature

```
public List<Schema.DataCategory> getTopCategories ()
```

Return Value

Type: [List<Schema.DataCategory>](#)

Usage

For more information on data category group visibility, see “Data Category Visibility” in the Salesforce online help.

DescribeFieldResult Class

Contains methods for describing sObject fields.

Namespace

[Schema](#)

Example

The following is an example of how to instantiate a field describe result object:

```
Schema.DescribeFieldResult dfr = Account.Description.getDescribe ();
```

DescribeFieldResult Methods

The following are methods for `DescribeFieldResult`. All are instance methods.

IN THIS SECTION:

[getByteLength\(\)](#)

For variable-length fields (including binary fields), returns the maximum size of the field, in bytes.

[getCalculatedFormula\(\)](#)

Returns the formula specified for this field.

[getController\(\)](#)

Returns the token of the controlling field.

[getDefaultValue\(\)](#)

Returns the default value for this field.

[getDefaultValueFormula\(\)](#)

Returns the default value specified for this field if a formula is not used.

[getDigits\(\)](#)

Returns the maximum number of digits specified for the field. This method is only valid with Integer fields.

[getInlineHelpText\(\)](#)

Returns the content of the field-level help.

[getLabel\(\)](#)

Returns the text label that is displayed next to the field in the Salesforce user interface. This label can be localized.

[getLength\(\)](#)

For string fields, returns the maximum size of the field in Unicode characters (not bytes).

[getLocalName\(\)](#)

Returns the name of the field, similar to the `getName` method. However, if the field is part of the current namespace, the namespace portion of the name is omitted.

[getName\(\)](#)

Returns the field name used in Apex.

[getPicklistValues\(\)](#)

Returns a list of `PicklistEntry` objects. A runtime error is returned if the field is not a picklist.

[getPrecision\(\)](#)

For fields of type `Double`, returns the maximum number of digits that can be stored, including all numbers to the left and to the right of the decimal point (but excluding the decimal point character).

[getReferenceTargetField\(\)](#)

Returns the name of the custom field on the parent standard or custom object whose values are matched against the values of the child external object's indirect lookup relationship field. The match is done to determine which records are related to each other.

[getReferenceTo\(\)](#)

Returns a list of `Schema.SObjectType` objects for the parent objects of this field. If the `isNamePointing` method returns `true`, there is more than one entry in the list, otherwise there is only one.

[getRelationshipName\(\)](#)

Returns the name of the relationship.

[getRelationshipOrder\(\)](#)

Returns 1 if the field is a child, 0 otherwise.

[getScale\(\)](#)

For fields of type `Double`, returns the number of digits to the right of the decimal point. Any extra digits to the right of the decimal point are truncated.

[getSOAPType\(\)](#)

Returns one of the `SoapType` enum values, depending on the type of field.

[getSObjectField\(\)](#)

Returns the token for this field.

[getType\(\)](#)

Returns one of the `DisplayType` enum values, depending on the type of field.

[isAccessible\(\)](#)

Returns `true` if the current user can see this field, `false` otherwise.

[isAutoNumber\(\)](#)

Returns `true` if the field is an Auto Number field, `false` otherwise.

[isCalculated\(\)](#)

Returns `true` if the field is a custom formula field, `false` otherwise. Note that custom formula fields are always read-only.

[isCascadeDelete\(\)](#)

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

[isCaseSensitive\(\)](#)

Returns `true` if the field is case sensitive, `false` otherwise.

[isCreateable\(\)](#)

Returns `true` if the field can be created by the current user, `false` otherwise.

[isCustom\(\)](#)

Returns `true` if the field is a custom field, `false` if it is a standard field, such as `Name`.

[isDefaultedOnCreate\(\)](#)

Returns `true` if the field receives a default value when created, `false` otherwise.

[isDependentPicklist\(\)](#)

Returns `true` if the picklist is a dependent picklist, `false` otherwise.

[isDeprecatedAndHidden\(\)](#)

Reserved for future use.

[isExternalID\(\)](#)

Returns `true` if the field is used as an external ID, `false` otherwise.

[isFilterable\(\)](#)

Returns `true` if the field can be used as part of the filter criteria of a `WHERE` statement, `false` otherwise.

[isGroupable\(\)](#)

Returns `true` if the field can be included in the `GROUP BY` clause of a SOQL query, `false` otherwise. This method is only available for Apex classes and triggers saved using API version 18.0 and higher.

[isHtmlFormatted\(\)](#)

Returns `true` if the field has been formatted for HTML and should be encoded for display in HTML, `false` otherwise. One example of a field that returns `true` for this method is a hyperlink custom formula field. Another example is a custom formula field that has an `IMAGE` text function.

[isIdLookup\(\)](#)

Returns `true` if the field can be used to specify a record in an `upsert` method, `false` otherwise.

[isNameField\(\)](#)

Returns `true` if the field is a name field, `false` otherwise.

[isNamePointing\(\)](#)

Returns `true` if the field can have multiple types of objects as parents. For example, a task can have both the `Contact/Lead ID (WhoId)` field and the `Opportunity/Account ID (WhatId)` field return `true` for this method. because either of those objects can be the parent of a particular task record. This method returns `false` otherwise.

[isNillable\(\)](#)

Returns `true` if the field is nillable, `false` otherwise. A nillable field can have empty content. A non-nillable field must have a value for the object to be created or saved.

[isPermissionable\(\)](#)

Returns `true` if field permissions can be specified for the field, `false` otherwise.

[isRestrictedDelete\(\)](#)

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

`isRestrictedPicklist()`

Returns `true` if the field is a restricted picklist, `false` otherwise

`isSearchPrefilterable()`

Returns `true` if a foreign key can be included in prefiltering when used in a SOSL `WHERE` clause, `false` otherwise.

`isSortable()`

Returns `true` if a query can sort on the field, `false` otherwise

`isUnique()`

Returns `true` if the value for the field must be unique, `false` otherwise

`isUpdateable()`

Returns `true` if the field can be edited by the current user, or child records in a master-detail relationship field on a custom object can be reparented to different parent records; `false` otherwise.

`isWriteRequiresMasterRead()`

Returns `true` if writing to the detail object requires read sharing instead of read/write sharing of the parent.

`getByteLength()`

For variable-length fields (including binary fields), returns the maximum size of the field, in bytes.

Signature

```
public Integer getByteLength()
```

Return Value

Type: `Integer`

`getCalculatedFormula()`

Returns the formula specified for this field.

Signature

```
public String getCalculatedFormula()
```

Return Value

Type: `String`

`getController()`

Returns the token of the controlling field.

Signature

```
public Schema.sObjectField getController()
```

Return Value

Type: [Schema.SObjectField](#)

getDefaultValue()

Returns the default value for this field.

Signature

```
public Object getDefaultValue()
```

Return Value

Type: Object

getDefaultValueFormula()

Returns the default value specified for this field if a formula is not used.

Signature

```
public String getDefaultValueFormula()
```

Return Value

Type: [String](#)

getDigits()

Returns the maximum number of digits specified for the field. This method is only valid with Integer fields.

Signature

```
public Integer getDigits()
```

Return Value

Type: [Integer](#)

getInlineHelpText()

Returns the content of the field-level help.

Signature

```
public String getInlineHelpText()
```

Return Value

Type: [String](#)

Usage

For more information, see “Define Field-Level Help” in the Salesforce online help.

getLabel ()

Returns the text label that is displayed next to the field in the Salesforce user interface. This label can be localized.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

Usage

 **Note:** For the `Type` field on standard objects, `getLabel` returns a label different from the default label. It returns a label of the form `Object Type`, where `Object` is the standard object label. For example, for the `Type` field on `Account`, `getLabel` returns `Account Type` instead of the default label `Type`. If the `Type` label is renamed, `getLabel` returns the new label. You can check or change the labels of all standard object fields from Setup by entering *Rename Tabs and Labels* in the *Quick Find* box, then selecting **Rename Tabs and Labels**.

getLength ()

For string fields, returns the maximum size of the field in Unicode characters (not bytes).

Signature

```
public Integer getLength ()
```

Return Value

Type: [Integer](#)

getLocalName ()

Returns the name of the field, similar to the `getName` method. However, if the field is part of the current namespace, the namespace portion of the name is omitted.

Signature

```
public String getLocalName ()
```

Return Value

Type: [String](#)

getName ()

Returns the field name used in Apex.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getPicklistValues ()

Returns a list of PicklistEntry objects. A runtime error is returned if the field is not a picklist.

Signature

```
public List<Schema.PicklistEntry> getPicklistValues ()
```

Return Value

Type: [List<Schema.PicklistEntry>](#)

getPrecision ()

For fields of type Double, returns the maximum number of digits that can be stored, including all numbers to the left and to the right of the decimal point (but excluding the decimal point character).

Signature

```
public Integer getPrecision ()
```

Return Value

Type: [Integer](#)

getReferenceTargetField ()

Returns the name of the custom field on the parent standard or custom object whose values are matched against the values of the child external object's indirect lookup relationship field. The match is done to determine which records are related to each other.

Signature

```
public String getReferenceTargetField ()
```

Return Value

Type: [String](#)

Usage

For information about indirect lookup relationships, see “Indirect Lookup Relationship Fields on External Objects” in the Salesforce Help.

getReferenceTo ()

Returns a list of `Schema.sObjectType` objects for the parent objects of this field. If the `isNamePointing` method returns `true`, there is more than one entry in the list, otherwise there is only one.

Signature

```
public List <Schema.sObjectType> getReferenceTo ()
```

Return Value

Type: `List<Schema.sObjectType>`

getRelationshipName ()

Returns the name of the relationship.

Signature

```
public String getRelationshipName ()
```

Return Value

Type: `String`

Usage

For more information about relationships and relationship names, see [Understanding Relationship Names](#) in the *Force.com SOQL and SOSL Reference*.

getRelationshipOrder ()

Returns 1 if the field is a child, 0 otherwise.

Signature

```
public Integer getRelationshipOrder ()
```

Return Value

Type: `Integer`

Usage

For more information about relationships and relationship names, see [Understanding Relationship Names](#) in the *Force.com SOQL and SOSL Reference*.

getScale ()

For fields of type Double, returns the number of digits to the right of the decimal point. Any extra digits to the right of the decimal point are truncated.

Signature

```
public Integer getScale()
```

Return Value

Type: [Integer](#)

Usage

This method returns a fault response if the number has too many digits to the left of the decimal point.

getSOAPType ()

Returns one of the SoapType enum values, depending on the type of field.

Signature

```
public Schema.SOAPType getSOAPType()
```

Return Value

Type: [Schema.SOAPType](#)

getObjectField ()

Returns the token for this field.

Signature

```
public Schema.sObjectField getObjectField()
```

Return Value

Type: [Schema.SObjectField](#)

getType ()

Returns one of the DisplayType enum values, depending on the type of field.

Signature

```
public Schema.DisplayType getType()
```

Return Value

Type: [Schema.DisplayType](#)

isAccessible()

Returns `true` if the current user can see this field, `false` otherwise.

Signature

```
public Boolean isAccessible()
```

Return Value

Type: [Boolean](#)

isAutoNumber()

Returns `true` if the field is an Auto Number field, `false` otherwise.

Signature

```
public Boolean isAutoNumber()
```

Return Value

Type: [Boolean](#)

Usage

Analogous to a SQL IDENTITY type, Auto Number fields are read-only, non-createable text fields with a maximum length of 30 characters. Auto Number fields are used to provide a unique ID that is independent of the internal object ID (such as a purchase order number or invoice number). Auto Number fields are configured entirely in the Salesforce user interface.

isCalculated()

Returns `true` if the field is a custom formula field, `false` otherwise. Note that custom formula fields are always read-only.

Signature

```
public Boolean isCalculated()
```

Return Value

Type: [Boolean](#)

isCascadeDelete()

Returns `true` if the child object is deleted when the parent object is deleted, `false` otherwise.

Signature

```
public Boolean isCascadeDelete()
```

Return Value

Type: [Boolean](#)

isCaseSensitive()

Returns `true` if the field is case sensitive, `false` otherwise.

Signature

```
public Boolean isCaseSensitive()
```

Return Value

Type: [Boolean](#)

isCreateable()

Returns `true` if the field can be created by the current user, `false` otherwise.

Signature

```
public Boolean isCreateable()
```

Return Value

Type: [Boolean](#)

isCustom()

Returns `true` if the field is a custom field, `false` if it is a standard field, such as Name.

Signature

```
public Boolean isCustom()
```

Return Value

Type: [Boolean](#)

isDefaultedOnCreate()

Returns `true` if the field receives a default value when created, `false` otherwise.

Signature

```
public Boolean isDefaultedOnCreate()
```

Return Value

Type: [Boolean](#)

Usage

If this method returns `true`, Salesforce implicitly assigns a value for this field when the object is created, even if a value for this field is not passed in on the create call. For example, in the Opportunity object, the Probability field has this attribute because its value is derived from the Stage field. Similarly, the Owner has this attribute on most objects because its value is derived from the current user (if the Owner field is not specified).

isDependentPicklist()

Returns `true` if the picklist is a dependent picklist, `false` otherwise.

Signature

```
public Boolean isDependentPicklist()
```

Return Value

Type: [Boolean](#)

isDeprecatedAndHidden()

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: [Boolean](#)

isExternalID()

Returns `true` if the field is used as an external ID, `false` otherwise.

Signature

```
public Boolean isExternalID()
```

Return Value

Type: [Boolean](#)

isFilterable()

Returns `true` if the field can be used as part of the filter criteria of a `WHERE` statement, `false` otherwise.

Signature

```
public Boolean isFilterable()
```

Return Value

Type: [Boolean](#)

isGroupable()

Returns `true` if the field can be included in the `GROUP BY` clause of a SOQL query, `false` otherwise. This method is only available for Apex classes and triggers saved using API version 18.0 and higher.

Signature

```
public Boolean isGroupable()
```

Return Value

Type: [Boolean](#)

isHtmlFormatted()

Returns `true` if the field has been formatted for HTML and should be encoded for display in HTML, `false` otherwise. One example of a field that returns `true` for this method is a hyperlink custom formula field. Another example is a custom formula field that has an `IMAGE` text function.

Signature

```
public Boolean isHtmlFormatted()
```

Return Value

Type: [Boolean](#)

isIdLookup()

Returns `true` if the field can be used to specify a record in an `upsert` method, `false` otherwise.

Signature

```
public Boolean isIdLookup()
```

Return Value

Type: [Boolean](#)

isNameField()

Returns `true` if the field is a name field, `false` otherwise.

Signature

```
public Boolean isNameField()
```

Return Value

Type: [Boolean](#)

Usage

This method is used to identify the name field for standard objects (such as `AccountName` for an `Account` object) and custom objects. Objects can only have one name field, except where the `FirstName` and `LastName` fields are used instead (such as on the `Contact` object).

If a compound name is present, for example, the `Name` field on a person account, `isNameField` is set to `true` for that record.

isNamePointing()

Returns `true` if the field can have multiple types of objects as parents. For example, a task can have both the `Contact/Lead ID (WhoId)` field and the `Opportunity/Account ID (WhatId)` field return `true` for this method. because either of those objects can be the parent of a particular task record. This method returns `false` otherwise.

Signature

```
public Boolean isNamePointing()
```

Return Value

Type: [Boolean](#)

isNillable()

Returns `true` if the field is nillable, `false` otherwise. A nillable field can have empty content. A non-nillable field must have a value for the object to be created or saved.

Signature

```
public Boolean isNillable()
```

Return Value

Type: [Boolean](#)

isPermissionable()

Returns `true` if field permissions can be specified for the field, `false` otherwise.

Signature

```
public Boolean isPermissionable()
```

Return Value

Type: [Boolean](#)

isRestrictedDelete ()

Returns `true` if the parent object can't be deleted because it is referenced by a child object, `false` otherwise.

Signature

```
public Boolean isRestrictedDelete()
```

Return Value

Type: [Boolean](#)

isRestrictedPicklist ()

Returns `true` if the field is a restricted picklist, `false` otherwise

Signature

```
public Boolean isRestrictedPicklist()
```

Return Value

Type: [Boolean](#)

isSearchPrefilterable ()

Returns `true` if a foreign key can be included in prefiltering when used in a SOSL `WHERE` clause, `false` otherwise.

Signature

```
public Boolean isSearchPrefilterable()
```

Return Value

Type: [Boolean](#)

Usage

Prefiltering means to filter by a specific field value before executing the full search query.

isSortable ()

Returns `true` if a query can sort on the field, `false` otherwise

Signature

```
public Boolean isSortable()
```

Return Value

Type: [Boolean](#)

isUnique ()

Returns `true` if the value for the field must be unique, `false` otherwise

Signature

```
public Boolean isUnique ()
```

Return Value

Type: [Boolean](#)

isUpdateable ()

Returns `true` if the field can be edited by the current user, or child records in a master-detail relationship field on a custom object can be reparented to different parent records; `false` otherwise.

Signature

```
public Boolean isUpdateable ()
```

Return Value

Type: [Boolean](#)

isWriteRequiresMasterRead ()

Returns `true` if writing to the detail object requires read sharing instead of read/write sharing of the parent.

Signature

```
public Boolean isWriteRequiresMasterRead ()
```

Return Value

Type: [Boolean](#)

DescribeIconResult Class

Contains icon metadata information for a tab.

Namespace

[Schema](#)

Usage

The `getIcons` method of the `Schema.DescribeTabResult` class returns a list of `Schema.DescribeIconResult` objects that describe colors used in a tab.

The methods in the `Schema.DescribeIconResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `iconResultObj.url` is equivalent to `iconResultObj.getUrl()`.

Example

This sample shows how to get the icon information in the Sales app for the first tab's first icon.

```
// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.describeTabs();

// Iterate through each tab set
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
    // Get tab info for the Sales app
    if (tsr.getLabel() == 'Sales') {
        // Get icon information for the first tab
        List<Schema.DescribeIconResult> iconDesc = tsr.getTabs()[0].getIcons();
        // Display the icon height and width of the first icon
        System.debug('Height: ' + iconDesc[0].getHeight());
        System.debug('Width: ' + iconDesc[0].getWidth());
    }
}

// Example debug statement output
// DEBUG|Height: 32
// DEBUG|Width: 32
```

DescribeIconResult Methods

The following are methods for `DescribeIconResult`. All are instance methods.

IN THIS SECTION:

[getContentType\(\)](#)

Returns the tab icon's content type, such as `image/png`.

[getHeight\(\)](#)

Returns the tab icon's height in pixels.

[getTheme\(\)](#)

Returns the tab's icon theme.

[getUrl\(\)](#)

Returns the tab's icon fully qualified URL.

[getWidth\(\)](#)

Returns the tab's icon width in pixels.

getContentType ()

Returns the tab icon's content type, such as `image/png`.

Signature

```
public String getContentType()
```

Return Value

Type: [String](#)

getHeight()

Returns the tab icon's height in pixels.

Signature

```
public Integer getHeight()
```

Return Value

Type: [Integer](#)

Usage

Note: If the icon content type is SVG, the icon won't have a size and its height is zero.

getTheme()

Returns the tab's icon theme.

Signature

```
public String getTheme()
```

Return Value

Type: [String](#)

Possible theme values include `theme3`, `theme4`, and `custom`.

- `theme3` is the Salesforce theme introduced during Spring '10.
- `theme4` is the Salesforce theme introduced in Winter '14 for the mobile touchscreen version of Salesforce.
- `custom` is the theme name associated with a custom icon.

getUrl()

Returns the tab's icon fully qualified URL.

Signature

```
public String getUrl()
```

Return Value

Type: [String](#)

getWidth()

Returns the tab's icon width in pixels.

Signature

```
public Integer getWidth()
```

Return Value

Type: [Integer](#)

Usage

Note: If the icon content type is SVG, the icon won't have a size and its width is zero.

DescribeObjectResult Class

Contains methods for describing sObjects.

Namespace

[Schema](#)

Usage

None of the methods take an argument.

DescribeObjectResult Methods

The following are methods for `DescribeObjectResult`. All are instance methods.

IN THIS SECTION:

[fields](#)

Follow `fields` with a field member variable name or with the `getMap` method.

[fieldSets](#)

Follow `fieldSets` with a field set name or with the `getMap` method.

[getChildRelationships\(\)](#)

Returns a list of child relationships, which are the names of the sObjects that have a foreign key to the sObject being described.

[getHasSubtypes\(\)](#)

Indicates whether the object has subtypes. The Account object, which has subtype PersonAccount, is the only object that will return `true`.

[getKeyPrefix\(\)](#)

Returns the three-character prefix code for the object. Record IDs are prefixed with three-character codes that specify the type of the object (for example, accounts have a prefix of 001 and opportunities have a prefix of 006).

[getLabel\(\)](#)

Returns the object's label, which may or may not match the object name.

[getLabelPlural\(\)](#)

Returns the object's plural label, which may or may not match the object name.

[getLocalName\(\)](#)

Returns the name of the object, similar to the `getName` method. However, if the object is part of the current namespace, the namespace portion of the name is omitted.

[getName\(\)](#)

Returns the name of the object.

[getRecordTypeInfoInfos\(\)](#)

Returns a list of the record types supported by this object. The current user is not required to have access to a record type to see it in this list.

[getRecordTypeInfoInfosById\(\)](#)

Returns a map that matches record IDs to their associated record types. The current user is not required to have access to a record type to see it in this map.

[getRecordTypeInfoInfosByName\(\)](#)

Returns a map that matches record labels to their associated record type. The current user is not required to have access to a record type to see it in this map.

[getObjectType\(\)](#)

Returns the `Schema.SObjectType` object for the `sObject`. You can use this to create a similar `sObject`.

[isAccessible\(\)](#)

Returns `true` if the current user can see this object, `false` otherwise.

[isCreateable\(\)](#)

Returns `true` if the object can be created by the current user, `false` otherwise.

[isCustom\(\)](#)

Returns `true` if the object is a custom object, `false` if it is a standard object.

[isCustomSetting\(\)](#)

Returns `true` if the object is a custom setting, `false` otherwise.

[isDeletable\(\)](#)

Returns `true` if the object can be deleted by the current user, `false` otherwise.

[isDeprecatedAndHidden\(\)](#)

Reserved for future use.

[isFeedEnabled\(\)](#)

Returns `true` if Chatter feeds are enabled for the object, `false` otherwise. This method is only available for Apex classes and triggers saved using SalesforceAPI version 19.0 and later.

[isMergeable\(\)](#)

Returns `true` if the object can be merged with other objects of its type by the current user, `false` otherwise. `true` is returned for leads, contacts, and accounts.

[isMruEnabled\(\)](#)

Returns `true` if Most Recently Used (MRU) list functionality is enabled for the object, `false` otherwise.

[isQueryable\(\)](#)

Returns `true` if the object can be queried by the current user, `false` otherwise.

[isSearchable\(\)](#)

Returns `true` if the object can be searched by the current user, `false` otherwise.

[isUndeleteable\(\)](#)

Returns `true` if the object cannot be undeleted by the current user, `false` otherwise.

[isUpdateable\(\)](#)

Returns `true` if the object can be updated by the current user, `false` otherwise.

fields

Follow `fields` with a field member variable name or with the `getMap` method.

Signature

```
public Schema.SObjectTypeFields fields()
```

Return Value

Type: The return value is a special data type. See the example to learn how to use `fields`.

Usage

 **Note:** When you describe sObjects and their fields from within an Apex class, custom fields of new field types are returned regardless of the API version that the class is saved in. If a field type, such as the geolocation field type, is available only in a recent API version, components of a geolocation field are returned even if the class is saved in an earlier API version.

Example

```
Schema.DescribeFieldResult dfr = Schema.SObjectType.Account.fields.Name;
```

To get a custom field name, specify the custom field name.

SEE ALSO:

[Using Field Tokens](#)

[Describing sObjects Using Schema Method](#)

[Understanding Apex Describe Information](#)

fieldSets

Follow `fieldSets` with a field set name or with the `getMap` method.

Signature

```
public Schema.SObjectTypeFields fieldSets()
```

Return Value

Type: The return value is a special data type. See the example to learn how to use `fieldSets`.

Example

```
Schema.DescribeSObjectResult d =
    Account.sObjectType.getDescribe();
Map<String, Schema.FieldSet> FsMap =
    d.fieldSets.getMap();
```

SEE ALSO:

[Using Field Tokens](#)

[Describing sObjects Using Schema Method](#)

[Understanding Apex Describe Information](#)

getChildRelationships()

Returns a list of child relationships, which are the names of the sObjects that have a foreign key to the sObject being described.

Signature

```
public Schema.ChildRelationship getChildRelationships()
```

Return Value

Type: [List<Schema.ChildRelationship>](#)

Example

For example, the Account object includes `Contacts` and `Opportunities` as child relationships.

getHasSubtypes()

Indicates whether the object has subtypes. The Account object, which has subtype `PersonAccount`, is the only object that will return `true`.

Signature

```
public Boolean getHasSubtypes()
```

Return Value

Type: [Boolean](#)

getKeyPrefix()

Returns the three-character prefix code for the object. Record IDs are prefixed with three-character codes that specify the type of the object (for example, accounts have a prefix of `001` and opportunities have a prefix of `006`).

Signature

```
public String getKeyPrefix()
```

Return Value

Type: [String](#)

Usage

The DescribeSobjectResult object returns a value for objects that have a stable prefix. For object types that do not have a stable or predictable prefix, this field is blank. Client applications that rely on these codes can use this way of determining object type to ensure forward compatibility.

getLabel ()

Returns the object's label, which may or may not match the object name.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

Usage

The object's label might not always match the object name. For example, an organization in the medical industry might change the label for Account to Patient. This label is then used in the Salesforce user interface. See the Salesforce online help for more information.

getLabelPlural ()

Returns the object's plural label, which may or may not match the object name.

Signature

```
public String getLabelPlural ()
```

Return Value

Type: [String](#)

Usage

The object's plural label might not always match the object name. For example, an organization in the medical industry might change the plural label for Account to Patients. This label is then used in the Salesforce user interface. See the Salesforce online help for more information.

getLocalName ()

Returns the name of the object, similar to the `getName` method. However, if the object is part of the current namespace, the namespace portion of the name is omitted.

Signature

```
public String getLocalName ()
```

Return Value

Type: [String](#)

getName ()

Returns the name of the object.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getRecordTypeInfo ()

Returns a list of the record types supported by this object. The current user is not required to have access to a record type to see it in this list.

Signature

```
public List<Schema.RecordTypeInfo> getRecordTypeInfo ()
```

Return Value

Type: [List<Schema.RecordTypeInfo>](#)

getRecordTypeInfoById ()

Returns a map that matches record IDs to their associated record types. The current user is not required to have access to a record type to see it in this map.

Signature

```
public Schema.RecordTypeInfo getRecordTypeInfoById ()
```

Return Value

Type: [Map<ID, Schema.RecordTypeInfo>](#)

getRecordTypeInfoByName ()

Returns a map that matches record labels to their associated record type. The current user is not required to have access to a record type to see it in this map.

Signature

```
public Schema.RecordTypeInfo getRecordTypeInfoByName ()
```

Return Value

Type: [Map<String, Schema.RecordTypeInfo>](#)

getObjectType ()

Returns the `Schema.SObjectType` object for the `sObject`. You can use this to create a similar `sObject`.

Signature

```
public Schema.SObjectType getObjectType ()
```

Return Value

Type: [Schema.SObjectType](#)

isAccessible ()

Returns `true` if the current user can see this object, `false` otherwise.

Signature

```
public Boolean isAccessible ()
```

Return Value

Type: [Boolean](#)

isCreateable ()

Returns `true` if the object can be created by the current user, `false` otherwise.

Signature

```
public Boolean isCreateable ()
```

Return Value

Type: [Boolean](#)

isCustom ()

Returns `true` if the object is a custom object, `false` if it is a standard object.

Signature

```
public Boolean isCustom()
```

Return Value

Type: [Boolean](#)

isCustomSetting()

Returns `true` if the object is a custom setting, `false` otherwise.

Signature

```
public Boolean isCustomSetting()
```

Return Value

Type: [Boolean](#)

isDeletable()

Returns `true` if the object can be deleted by the current user, `false` otherwise.

Signature

```
public Boolean isDeletable()
```

Return Value

Type: [Boolean](#)

isDeprecatedAndHidden()

Reserved for future use.

Signature

```
public Boolean isDeprecatedAndHidden()
```

Return Value

Type: [Boolean](#)

isFeedEnabled()

Returns `true` if Chatter feeds are enabled for the object, `false` otherwise. This method is only available for Apex classes and triggers saved using Salesforce API version 19.0 and later.

Signature

```
public Boolean isFeedEnabled()
```

Return Value

Type: [Boolean](#)

isMergeable()

Returns `true` if the object can be merged with other objects of its type by the current user, `false` otherwise. `true` is returned for leads, contacts, and accounts.

Signature

```
public Boolean isMergeable()
```

Return Value

Type: [Boolean](#)

isMruEnabled()

Returns `true` if Most Recently Used (MRU) list functionality is enabled for the object, `false` otherwise.

Signature

```
public Boolean isMruEnabled()
```

Return Value

Type: [Boolean](#)

isQueryable()

Returns `true` if the object can be queried by the current user, `false` otherwise

Signature

```
public Boolean isQueryable()
```

Return Value

Type: [Boolean](#)

isSearchable()

Returns `true` if the object can be searched by the current user, `false` otherwise.

Signature

```
public Boolean isSearchable()
```

Return Value

Type: [Boolean](#)

isUndeletable ()

Returns `true` if the object cannot be undeleted by the current user, `false` otherwise.

Signature

```
public Boolean isUndeletable()
```

Return Value

Type: [Boolean](#)

isUpdateable ()

Returns `true` if the object can be updated by the current user, `false` otherwise.

Signature

```
public Boolean isUpdateable()
```

Return Value

Type: [Boolean](#)

DescribeTabResult Class

Contains tab metadata information for a tab in a standard or custom app available in the Salesforce user interface.

Namespace

[Schema](#)

Usage

The `getTabs` method of the `Schema.DescribeTabSetResult` returns a list of `Schema.DescribeTabResult` objects that describe the tabs of one app.

The methods in the `Schema.DescribeTabResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `tabResultObj.label` is equivalent to `tabResultObj.getLabel()`. Similarly, for each method starting with `is`, omit the `is` prefix and the ending parentheses `()`. For example, `tabResultObj.isCustom` is equivalent to `tabResultObj.custom`.

DescribeTabResult Methods

The following are methods for `DescribeTabResult`. All are instance methods.

IN THIS SECTION:

[getColors\(\)](#)

Returns a list of color metadata information for all colors associated with this tab. Each color is associated with a theme and context.

[getIconUrl\(\)](#)

Returns the URL for the main 32 x 32-pixel icon for a tab. This icon corresponds to the current theme (theme3) and appears next to the heading at the top of most pages.

[getIcons\(\)](#)

Returns a list of icon metadata information for all icons associated with this tab. Each icon is associated with a theme and context.

[getLabel\(\)](#)

Returns the display label of this tab.

[getMinIconUrl\(\)](#)

Returns the URL for the 16 x 16-pixel icon that represents a tab. This icon corresponds to the current theme (theme3) and appears in related lists and other locations.

[getObjectName\(\)](#)

Returns the name of the sObject that is primarily displayed on this tab (for tabs that display a particular SObject).

[getUrl\(\)](#)

Returns a fully qualified URL for viewing this tab.

[isCustom\(\)](#)

Returns `true` if this is a custom tab, or `false` if this is a standard tab.

getColors ()

Returns a list of color metadata information for all colors associated with this tab. Each color is associated with a theme and context.

Signature

```
public List<Schema.DescribeColorResult> getColors ()
```

Return Value

Type: [List<Schema.DescribeColorResult>](#)

getIconUrl ()

Returns the URL for the main 32 x 32-pixel icon for a tab. This icon corresponds to the current theme (theme3) and appears next to the heading at the top of most pages.

Signature

```
public String getIconUrl ()
```

Return Value

Type: [String](#)

getIcons ()

Returns a list of icon metadata information for all icons associated with this tab. Each icon is associated with a theme and context.

Signature

```
public List<Schema.DescribeIconResult> getIcons ()
```

Return Value

Type: [List<Schema.DescribeIconResult>](#)

getLabel ()

Returns the display label of this tab.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getMiniIconUrl ()

Returns the URL for the 16 x 16-pixel icon that represents a tab. This icon corresponds to the current theme (theme3) and appears in related lists and other locations.

Signature

```
public String getMiniIconUrl ()
```

Return Value

Type: [String](#)

getObjectName ()

Returns the name of the sObject that is primarily displayed on this tab (for tabs that display a particular sObject).

Signature

```
public String getObjectName ()
```

Return Value

Type: [String](#)

getUrl ()

Returns a fully qualified URL for viewing this tab.

Signature

```
public String getUrl ()
```

Return Value

Type: [String](#)

isCustom()

Returns `true` if this is a custom tab, or `false` if this is a standard tab.

Signature

```
public Boolean isCustom()
```

Return Value

Type: [Boolean](#)

DescribeTabSetResult Class

Contains metadata information about a standard or custom app available in the Salesforce user interface.

Namespace

[Schema](#)

Usage

The `Schema.describeTabs` method returns a list of `Schema.DescribeTabSetResult` objects that describe standard and custom apps.

The methods in the `Schema.DescribeTabSetResult` class can be called using their property counterparts. For each method starting with `get`, you can omit the `get` prefix and the ending parentheses `()` to call the property counterpart. For example, `tabSetResultObj.label` is equivalent to `tabSetResultObj.getLabel()`. Similarly, for each method starting with `is`, omit the `is` prefix and the ending parentheses `()`. For example, `tabSetResultObj.isSelected` is equivalent to `tabSetResultObj.selected`.

Example

This example shows how to call the `Schema.describeTabs` method to get describe information for all available apps. This example iterates through each describe result and gets more metadata information for the Sales app.

```
// App we're interested to get more info about
String appName = 'Sales';

// Get tab set describes for each app
List<Schema.DescribeTabSetResult> tabSetDesc = Schema.describeTabs();

// Iterate through each tab set describe for each app and display the info
for(Schema.DescribeTabSetResult tsr : tabSetDesc) {
    // Get more information for the Sales app
    if (tsr.getLabel() == appName) {
        // Find out if the app is selected
        if (tsr.isSelected()) {
```

```

        System.debug('The ' + appName + ' app is selected. ');
    }
    // Get the app's Logo URL and namespace
    String logo = tsr.getLogoUrl();
    System.debug('Logo URL: ' + logo);
    String ns = tsr.getNamespace();
    if (ns == '') {
        System.debug('The ' + appName + ' app has no namespace defined. ');
    }
    else {
        System.debug('Namespace: ' + ns);
    }
    // Get the number of tabs
    System.debug('The ' + appName + ' app has ' + tsr.getTabs().size() + ' tabs. ');
}

// Example debug statement output
// DEBUG|The Sales app is selected.
// DEBUG|Logo URL:
https://https://yourInstance.salesforce.com/img/seasonLogos/2014_winter_aloha.png
// DEBUG|The Sales app has no namespace defined.
// DEBUG|The Sales app has 14 tabs.

```

DescribeTabSetResult Methods

The following are methods for `DescribeTabSetResult`. All are instance methods.

IN THIS SECTION:

[getDescription\(\)](#)

Returns the display description for the standard or custom app.

[getLabel\(\)](#)

Returns the display label for the standard or custom app.

[getLogoUrl\(\)](#)

Returns a fully qualified URL to the logo image associated with the standard or custom app.

[getNamespace\(\)](#)

Returns the developer namespace prefix of a Force.comAppExchange managed package.

[getTabs\(\)](#)

Returns metadata information about the standard or custom app's displayed tabs.

[isSelected\(\)](#)

Returns `true` if this standard or custom app is the user's currently selected app. Otherwise, returns `false`.

getDescription()

Returns the display description for the standard or custom app.

Signature

```
public String getDescription()
```

Return Value

Type: [String](#)

getLabel ()

Returns the display label for the standard or custom app.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

Usage

The display label changes when tabs are renamed in the Salesforce user interface. See the Salesforce online help for more information.

getLogoUrl ()

Returns a fully qualified URL to the logo image associated with the standard or custom app.

Signature

```
public String getLogoUrl ()
```

Return Value

Type: [String](#)

getNamespace ()

Returns the developer namespace prefix of a Force.comAppExchange managed package.

Signature

```
public String getNamespace ()
```

Return Value

Type: [String](#)

Usage

This namespace prefix corresponds to the namespace prefix of the Developer Edition organization that was enabled to allow publishing a managed package. This method applies to a custom app containing a set of tabs and installed as part of a managed package.

getTabs ()

Returns metadata information about the standard or custom app's displayed tabs.

Signature

```
public List<Schema.DescribeTabResult> getTabs ()
```

Return Value

Type: [List<Schema.DescribeTabResult>](#)

isSelected ()

Returns `true` if this standard or custom app is the user's currently selected app. Otherwise, returns `false`.

Signature

```
public Boolean isSelected ()
```

Return Value

Type: [Boolean](#)

DisplayType Enum

A `Schema.DisplayType` enum value is returned by the field describe result's `getType` method.

Namespace

[Schema](#)

Type Field Value	What the Field Object Contains
address	Address values
anytype	Any value of the following types: <code>String</code> , <code>Picklist</code> , <code>Boolean</code> , <code>Integer</code> , <code>Double</code> , <code>Percent</code> , <code>ID</code> , <code>Date</code> , <code>DateTime</code> , <code>URL</code> , or <code>Email</code> .
base64	Base64-encoded arbitrary binary data (of type <code>base64Binary</code>)
<code>Boolean</code>	Boolean (<code>true</code> or <code>false</code>) values
Combobox	Comboboxes, which provide a set of enumerated values and allow the user to specify a value not in the list
Currency	Currency values
DataCategoryGroupReference	Reference to a data category group or a category unique name.
<code>Date</code>	Date values
DateTime	DateTime values
<code>Double</code>	Double values

Type Field Value	What the Field Object Contains
Email	Email addresses
EncryptedString	Encrypted string
ID	Primary key field for an object
Integer	Integer values
MultiPicklist	Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected
Percent	Percent values
Phone	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.
Picklist	Single-select picklists, which provide a set of enumerated values from which only one value can be selected
Reference	Cross-references to a different object, analogous to a foreign key field
String	String values
TextArea	String values that are displayed as multiline text fields
Time	Time values
URL	URL values that are displayed as hyperlinks

Usage

For more information, see [Field Types](#) in the *Object Reference for Salesforce and Force.com*. For more information about the methods shared by all enums, see [Enum Methods](#).

FieldSet Class

Contains methods for discovering and retrieving the details of field sets created on sObjects.

Namespace

[Schema](#)

Usage

Use the methods in the `Schema.FieldSet` class to discover the fields contained within a field set, and get details about the field set itself, such as the name, namespace, label, and so on. The following example shows how to get a collection of field set describe result objects for an sObject. The key of the returned Map is the field set name, and the value is the corresponding field set describe result.

```
Map<String, Schema.FieldSet> FsMap =
    Schema.SObjectType.Account.fieldSets.getMap();
```

Field sets are also available from sObject describe results. The following lines of code are equivalent to the prior sample:

```
Schema.DescribeSObjectResult d =
    Account.sObjectType.getDescribe();
Map<String, Schema.FieldSet> FsMap =
    d.fieldSets.getMap();
```

To work with an individual field set, you can access it via the map of field sets on an sObject or, when you know the name of the field set in advance, using an explicit reference to the field set. The following two lines of code retrieve the same field set:

```
Schema.FieldSet fs1 = Schema.SObjectType.Account.fieldSets.getMap().get('field_set_name');
Schema.FieldSet fs2 = Schema.SObjectType.Account.fieldSets.field_set_name;
```

Example: Displaying a Field Set on a Visualforce Page

This sample uses `Schema.FieldSet` and `Schema.FieldSetMember` methods to dynamically get all the fields in the Dimensions field set for the Merchandise custom object. The list of fields is then used to construct a SOQL query that ensures those fields are available for display. The Visualforce page uses the `MerchandiseDetails` class as its controller.

```
public class MerchandiseDetails {

    public Merchandise__c merch { get; set; }

    public MerchandiseDetails() {
        this.merch = getMerchandise();
    }

    public List<Schema.FieldSetMember> getFields() {
        return SObjectType.Merchandise__c.FieldSets.Dimensions.getFields();
    }

    private Merchandise__c getMerchandise() {
        String query = 'SELECT ';
        for(Schema.FieldSetMember f : this.getFields()) {
            query += f.getFieldPath() + ', ';
        }
        query += 'Id, Name FROM Merchandise__c LIMIT 1';
        return Database.query(query);
    }
}
```

The Visualforce page using the above controller is simple:

```
<apex:page controller="MerchandiseDetails">
    <apex:form >

        <apex:pageBlock title="Product Details">
            <apex:pageBlockSection title="Product">
                <apex:inputField value="{!merch.Name}"/>
            </apex:pageBlockSection>

            <apex:pageBlockSection title="Dimensions">
                <apex:repeat value="{!fields}" var="f">
                    <apex:inputField value="{!merch[f.fieldPath]}"
                        required="{!OR(f.required, f.dbrequired)}/>
                </apex:repeat>
            </apex:pageBlockSection>
        </apex:pageBlock>
    </apex:form >
</apex:page>
```

```
        </apex:repeat>
    </apex:pageBlockSection>

    </apex:pageBlock>

</apex:form>
</apex:page>
```

One thing to note about the above markup is the expression used to determine if a field on the form should be indicated as being a required field. A field in a field set can be required by either the field set definition, or the field's own definition. The expression handles both cases.

FieldSet Methods

The following are methods for `FieldSet`. All are instance methods.

IN THIS SECTION:

`getDescription()`

Returns the field set's description.

`getFields()`

Returns a list of `Schema.FieldSetMember` objects for the fields making up the field set.

`getLabel()`

Returns the text label that is displayed next to the field in the Salesforce user interface.

`getName()`

Returns the field set's name.

`getNamespace()`

Returns the field set's namespace.

`getObjectType()`

Returns the `Schema.sObjectType` of the `sObject` containing the field set definition.

`getDescription()`

Returns the field set's description.

Signature

```
public String getDescription()
```

Return Value

Type: `String`

Usage

Description is a required field for a field set, intended to describe the context and content of the field set. It's often intended for administrators who might be configuring a field set defined in a managed package, rather than for end users.

getFields ()

Returns a list of `Schema.FieldSetMember` objects for the fields making up the field set.

Signature

```
public List<FieldSetMember> getFields ()
```

Return Value

Type: [List<Schema.FieldSetMember>](#)

getLabel ()

Returns the text label that is displayed next to the field in the Salesforce user interface.

Signature

```
public String getLabel ()
```

Return Value

Type: `String`

getName ()

Returns the field set's name.

Signature

```
public String getName ()
```

Return Value

Type: `String`

getNamespace ()

Returns the field set's namespace.

Signature

```
public String getNamespace ()
```

Return Value

Type: `String`

Usage

The returned namespace is an empty string if your organization hasn't set a namespace, and the field set is defined in your organization. Otherwise, it's the namespace of your organization, or the namespace of the managed package containing the field set.

`getSObjectType()`

Returns the `Schema.SObjectType` of the `sObject` containing the field set definition.

Signature

```
public Schema.SObjectType getSObjectType()
```

Return Value

Type: `Schema.SObjectType`

FieldSetMember Class

Contains methods for accessing the metadata for field set member fields.

Namespace

[Schema](#)

Usage

Use the methods in the `Schema.FieldSetMember` class to get details about fields contained within a field set, such as the field label, type, a dynamic SOQL-ready field path, and so on. The following example shows how to get a collection of field set member describe result objects for a specific field set on an `sObject`:

```
List<Schema.FieldSetMember> fields =  
    Schema.SObjectType.Account.fieldSets.getMap().get('field_set_name').getFields();
```

If you know the name of the field set in advance, you can access its fields more directly using an explicit reference to the field set:

```
List<Schema.FieldSetMember> fields =  
    Schema.SObjectType.Account.fieldSets.field_set_name.getFields();
```

SEE ALSO:

[FieldSet Class](#)

FieldSetMember Methods

The following are methods for `FieldSetMember`. All are instance methods.

IN THIS SECTION:

[getDBRequired\(\)](#)

Returns `true` if the field is required by the field's definition in its `sObject`, otherwise, `false`.

[getFieldPath\(\)](#)

Returns a field path string in a format ready to be used in a dynamic SOQL query.

[getLabel\(\)](#)

Returns the text label that's displayed next to the field in the Salesforce user interface.

getRequired()

Returns `true` if the field is required by the field set, otherwise, `false`.

getType()

Returns the field's Apex data type.

getDBRequired()

Returns `true` if the field is required by the field's definition in its sObject, otherwise, `false`.

Signature

```
public Boolean getDBRequired()
```

Return Value

Type: `Boolean`

getFieldPath()

Returns a field path string in a format ready to be used in a dynamic SOQL query.

Signature

```
public String getFieldPath()
```

Return Value

Type: `String`

Example

See [Displaying a Field Set on a Visualforce Page](#) for an example of how to use this method.

getLabel()

Returns the text label that's displayed next to the field in the Salesforce user interface.

Signature

```
public String getLabel()
```

Return Value

Type: `String`

getRequired()

Returns `true` if the field is required by the field set, otherwise, `false`.

Signature

```
public Boolean getRequired()
```

Return Value

Type: `Boolean`

getType ()

Returns the field's Apex data type.

Signature

```
public Schema.DisplayType getType()
```

Return Value

Type: `Schema.DisplayType`

PicklistEntry Class

Represents a picklist entry.

Namespace

[Schema](#)

Usage

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as drop-down lists in the Salesforce user interface. One of the items can be configured as the default item.

A `Schema.PicklistEntry` object is returned from the field describe result using the `getPicklistValues` method. For example:

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
List<Schema.PicklistEntry> P = F.getPicklistValues();
```

PicklistEntry Methods

The following are methods for `PicklistEntry`. All are instance methods.

IN THIS SECTION:

[getLabel\(\)](#)

Returns the display name of this item in the picklist.

[getValue\(\)](#)

Returns the value of this item in the picklist.

[isActive\(\)](#)

Returns `true` if this item must be displayed in the drop-down list for the picklist field in the user interface, `false` otherwise.

isDefaultValue()

Returns `true` if this item is the default value for the picklist, `false` otherwise. Only one item in a picklist can be designated as the default.

getLabel ()

Returns the display name of this item in the picklist.

Signature

```
public String getLabel ()
```

Return Value

Type: [String](#)

getValue ()

Returns the value of this item in the picklist.

Signature

```
public String getValue ()
```

Return Value

Type: [String](#)

isActive ()

Returns `true` if this item must be displayed in the drop-down list for the picklist field in the user interface, `false` otherwise.

Signature

```
public Boolean isActive ()
```

Return Value

Type: [Boolean](#)

isDefaultValue ()

Returns `true` if this item is the default value for the picklist, `false` otherwise. Only one item in a picklist can be designated as the default.

Signature

```
public Boolean isDefaultValue ()
```

Return Value

Type: [Boolean](#)

RecordTypeInfo Class

Contains methods for accessing record type information for an sObject with associated record types.

Namespace

[Schema](#)

Usage

A RecordTypeInfo object is returned from the sObject describe result using the `getRecordTypeInfos` method. For example:

```
Schema.DescribeSObjectResult R = Account.SObjectType.getDescribe();
List<Schema.RecordTypeInfo> RT = R.getRecordTypeInfos();
```

In addition to the `getRecordTypeInfos` method, you can use the `getRecordTypeInfosById` and the `getRecordTypeInfosByName` methods. These methods return maps that associate RecordTypeInfo with record IDs and record labels, respectively.

Example

The following example assumes at least one record type has been created for the Account object:

```
RecordType rt = [SELECT Id,Name FROM RecordType WHERE SubjectType='Account' LIMIT 1];
Schema.DescribeSObjectResult d = Schema.SObjectType.Account;
Map<Id,Schema.RecordTypeInfo> rtMapById = d.getRecordTypeInfosById();
Schema.RecordTypeInfo rtById = rtMapById.get(rt.id);
Map<String,Schema.RecordTypeInfo> rtMapByName = d.getRecordTypeInfosByName();
Schema.RecordTypeInfo rtByName = rtMapByName.get(rt.name);
System.assertEquals(rtById,rtByName);
```

RecordTypeInfo Methods

The following are methods for `RecordTypeInfo`. All are instance methods.

IN THIS SECTION:

[getName\(\)](#)

Returns the name of this record type.

[getRecordTypeId\(\)](#)

Returns the ID of this record type.

[isAvailable\(\)](#)

Returns `true` if this record type is available to the current user, `false` otherwise. Use this method to display a list of available record types to the user when he or she is creating a new record.

[isDefaultRecordTypeMapping\(\)](#)

Returns `true` if this is the default record type mapping, `false` otherwise.

isMaster()

Returns **true** if this is the master record type and **false** otherwise. The master record type is the default record type that's used when a record has no custom record type associated with it.

getName ()

Returns the name of this record type.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getRecordTypeId ()

Returns the ID of this record type.

Signature

```
public ID getRecordTypeId ()
```

Return Value

Type: [ID](#)

isAvailable ()

Returns **true** if this record type is available to the current user, **false** otherwise. Use this method to display a list of available record types to the user when he or she is creating a new record.

Signature

```
public Boolean isAvailable ()
```

Return Value

Type: [Boolean](#)

isDefaultRecordTypeMapping ()

Returns **true** if this is the default record type mapping, **false** otherwise.

Signature

```
public Boolean isDefaultRecordTypeMapping ()
```

Return Value

Type: [Boolean](#)

isMaster()

Returns `true` if this is the master record type and `false` otherwise. The master record type is the default record type that's used when a record has no custom record type associated with it.

Signature

```
public Boolean isMaster()
```

Return Value

Type: [Boolean](#)

SOAPType Enum

A `Schema.SOAPOType` enum value is returned by the field describe result `getSOAPType` method.

Namespace

[Schema](#)

Type Field Value	What the Field Object Contains
<code>anytype</code>	Any value of the following types: <code>String</code> , <code>Boolean</code> , <code>Integer</code> , <code>Double</code> , <code>ID</code> , <code>Date</code> or <code>DateTime</code> .
<code>base64binary</code>	Base64-encoded arbitrary binary data (of type <code>base64Binary</code>)
<code>Boolean</code>	Boolean (<code>true</code> or <code>false</code>) values
<code>Date</code>	Date values
<code>DateTime</code>	DateTime values
<code>Double</code>	Double values
<code>ID</code>	Primary key field for an object
<code>Integer</code>	Integer values
<code>String</code>	String values
<code>Time</code>	Time values

Usage

For more information, see [SOAPTypes](#) in the *SOAP API Developer's Guide*. For more information about the methods shared by all enums, see [Enum Methods](#).

SObjectField Class

A `Schema.sObjectField` object is returned from the field describe result using the `getController` and `getSObjectField` methods.

Namespace

[Schema](#)

Example

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
Schema.sObjectField T = F.getSObjectField();
```

sObjectField Methods

The following are instance methods for `sObjectField`.

IN THIS SECTION:

[getDescribe\(\)](#)

Returns the describe field result for this field.

getDescribe()

Returns the describe field result for this field.

Signature

```
public Schema.DescribeFieldResult getDescribe()
```

Return Value

Type: [Schema.DescribeFieldResult](#)

SObjectType Class

A `Schema.sObjectType` object is returned from the field describe result using the `getReferenceTo` method, or from the sObject describe result using the `getSObjectType` method.

Namespace

[Schema](#)

Usage

```
Schema.DescribeFieldResult F = Account.Industry.getDescribe();
List<Schema.sObjectType> P = F.getReferenceTo();
```

SObjectType Methods

The following are methods for `SObjectType`. All are instance methods.

IN THIS SECTION:

[getDescribe\(\)](#)

Returns the describe sObject result for this field.

[newSObject\(\)](#)

Constructs a new sObject of this type.

[newSObject\(id\)](#)

Constructs a new sObject of this type, with the specified ID.

[newSObject\(recordTypeId, loadDefaults\)](#)

Constructs a new sObject of this type, and optionally, of the specified record type ID and with default custom field values.

getDescribe ()

Returns the describe sObject result for this field.

Signature

```
public Schema.DescribeSObjectResult getDescribe ()
```

Return Value

Type: [Schema.DescribeSObjectResult](#)

newSObject ()

Constructs a new sObject of this type.

Signature

```
public sObject newSObject ()
```

Return Value

Type: [sObject](#)

Example

For an example, see [Dynamic sObject Creation Example](#).

newSObject (id)

Constructs a new sObject of this type, with the specified ID.

Signature

```
public sObject newSObject (ID id)
```

Parameters

*id*Type: [ID](#)

Return Value

Type: [sObject](#)

Usage

For the argument, pass the ID of an existing record in the database.

After you create a new `sObject`, the `sObject` returned has all fields set to `null`. You can set any updateable field to desired values and then update the record in the database. Only the fields you set new values for are updated and all other fields which are not system fields are preserved.

`newSObject(recordTypeId, loadDefaults)`

Constructs a new `sObject` of this type, and optionally, of the specified record type ID and with default custom field values.

Signature

```
public sObject newSObject(ID recordTypeId, Boolean loadDefaults)
```

Parameters

*recordTypeId*Type: [ID](#)

Specifies the record type ID of the `sObject` to create. If no record type exists for this `sObject`, use `null`. If the `sObject` has record types and you specify `null`, the default record type is used.

*loadDefaults*Type: [Boolean](#)

Specifies whether to populate custom fields with their predefined default values (`true`) or not (`false`).

Return Value

Type: [sObject](#)

Usage

- For required fields that have no default values, make sure to provide a value before inserting the new `sObject`. Otherwise, the insertion results in an error. An example is the Account Name field or a master-detail relationship field.
- Since picklists and multi-select picklists can have default values specified per record type, this method populates the default value corresponding to the record type specified.
- If fields have no predefined default values and the `loadDefaults` argument is `true`, this method creates the `sObject` with field values of `null`.
- If the `loadDefaults` argument is `false`, this method creates the `sObject` with field values of `null`.
- This method populates read-only custom fields of the new `sObject` with default values. You can then insert the new `sObject` with the read-only fields, even though these fields cannot be edited after they're inserted.

- If a custom field is marked as unique and also provides a default value, inserting more than one new sObject will cause a run-time exception because of duplicate field values.

To learn more about default field values, see “Default Field Values” in the Salesforce online help.

Example: Creating New sObject with Default Values

This sample creates an account with any default values populated for its custom fields, if any, using the `newSObject` method. It also creates a second account for a specific record type. For both accounts, the sample sets the Name field, which is a required field that doesn't have a default value, before inserting the new accounts.

```
// Create an account with predefined default values
Account acct = (Account)Account.sObjectType.newSObject(null, true);
// Provide a value for Name
acct.Name = 'Acme';
// Insert new account
insert acct;

// This is for record type RT1 of Account
ID rtId = [SELECT Id FROM RecordType WHERE sObjectType='Account' AND Name='RT1'].Id;
Account acct2 = (Account)Account.sObjectType.newSObject(rtId, true);
// Provide a value for Name
acct2.Name = 'Acme2';
// Insert new account
insert acct2;
```

Search Namespace

The `Search` namespace provides classes for getting search results and suggestion results.

The following are the classes in the `Search` namespace.

IN THIS SECTION:

[KnowledgeSuggestionFilter Class](#)

Filter settings that narrow the results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL search query contains a `KnowledgeArticleVersion` object.

[QuestionSuggestionFilter Class](#)

The `Search.QuestionSuggestionFilter` class filters results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL search query contains a `FeedItem` object.

[SearchResult Class](#)

A wrapper object that contains an sObject and search metadata.

[SearchResults Class](#)

Wraps the results returned by the `Search.find(String)` method.

[SuggestionOption Class](#)

Options that narrow record and article suggestion results returned from a call to `System.Search.suggest(String, String, Search.SuggestionOption)`.

[SuggestionResult Class](#)

A wrapper object that contains an sObject.

[SuggestionResults Class](#)

Wraps the results returned by the `Search.suggest(String, String, Search.SuggestionOption)` method.

SEE ALSO:

[find\(searchQuery\)](#)

[suggest\(searchQuery, sObjectType, suggestions\)](#)

KnowledgeSuggestionFilter Class

Filter settings that narrow the results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL search query contains a KnowledgeArticleVersion object.

Namespace

[Search](#)

KnowledgeSuggestionFilter Methods

The following are methods for `KnowledgeSuggestionFilter`.

IN THIS SECTION:

[addArticleType\(articleType\)](#)

Adds a filter that narrows suggestion results to display the specified article type. This filter is optional.

[addDataCategory\(dataCategoryGroupName, dataCategoryName\)](#)

Adds a filter that narrows suggestion results to display articles in the specified data category. This filter is optional.

[addTopic\(topic\)](#)

Specifies the article topic to return. This filter is optional.

[setChannel\(channelName\)](#)

Sets a channel to narrow the suggestion results to articles in the specified channel. This filter is optional.

[setDataCategories\(dataCategoryFilters\)](#)

Adds filters that narrow suggestion results to display articles in the specified data categories. Use this method to set multiple data category group and name pairs in one call. This filter is optional.

[setLanguage\(localeCode\)](#)

Sets a language to narrow the suggestion results to display articles in that language. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

[setPublishStatus\(publishStatus\)](#)

Sets a publish status to narrow the suggestion results to display articles with that status. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

[setValidationStatus\(validationStatus\)](#)

Sets a validation status to narrow the suggestion results to display articles with that status. This filter is optional.

addArticleType (articleType)

Adds a filter that narrows suggestion results to display the specified article type. This filter is optional.

Signature

```
public void addArticleType(String articleType)
```

Parameters

articleType

Type: [String](#)

A three-character ID prefix indicating the desired article type.

Return Value

Type: void

Usage

To add more than 1 article type, call the method multiple times.

addDataCategory(dataCategoryGroupName, dataCategoryName)

Adds a filter that narrows suggestion results to display articles in the specified data category. This filter is optional.

Signature

```
public void addDataCategory(String dataCategoryGroupName, String dataCategoryName)
```

Parameters

dataCategoryGroupName

Type: [String](#)

The name of the data category group

dataCategoryName

Type: [String](#)

The name of the data category.

Return Value

Type: void

Usage

To set multiple data categories, call the method multiple times. The name of the data category group and name of the data category for desired articles, expressed as a mapping, for example,

```
Search.KnowledgeSuggestionFilter.addDataCategory('Regions', 'Asia').
```

addTopic(topic)

Specifies the article topic to return. This filter is optional.

Signature

```
public void addTopic(String topic)
```

Parameters

addTopic

Type: [String](#)

The name of the article topic.

Return Value

Type: void

Usage

To add more than 1 article topic, call the method multiple times.

setChannel (channelName)

Sets a channel to narrow the suggestion results to articles in the specified channel. This filter is optional.

Signature

```
public void setChannel(String channelName)
```

Parameters

channelName

Type: [String](#)

The name of a channel. Valid values are:

- `AllChannels`—Visible in all channels the user has access to
- `App`—Visible in the internal Salesforce Knowledge application
- `Pkb`—Visible in the public knowledge base
- `Csp`—Visible in the Customer Portal
- `Prm`—Visible in the Partner Portal

If `channel` isn't specified, the default value is determined by the type of user.

- `Pkb` for a guest user
- `Csp` for a Customer Portal user
- `Prm` for a Partner Portal user
- `App` for any other type of user

If `channel` is specified, the specified value may not be the actual value requested, because of certain requirements.

- For guest, Customer Portal, and Partner Portal users, the specified value must match the default value for each user type. If the values don't match or `AllChannels` is specified, then `App` replaces the specified value.
- For all users other than guest, Customer Portal, and Partner Portal users:
 - If `Pkb`, `Csp`, `Prm`, or `App` are specified, then the specified value is used.

- If `AllChannels` is specified, then `App` replaces the specified value.

Return Value

Type: void

setDataCategories (dataCategoryFilters)

Adds filters that narrow suggestion results to display articles in the specified data categories. Use this method to set multiple data category group and name pairs in one call. This filter is optional.

Signature

```
public void setDataCategories(Map dataCategoryFilters)
```

Parameters

dataCategoryFilters

Type: [Map](#)

A map of data category group and data category name pairs.

Return Value

Type: void

setLanguage (localeCode)

Sets a language to narrow the suggestion results to display articles in that language. This filter value is required in calls to `System.Search.suggest (String, String, Search.SuggestionOption)`.

Signature

```
public void setLanguage (String localeCode)
```

Parameters

localeCode

Type: [String](#)

A locale code. For example, `'en_US'` (English–United States), or `'es'` (Spanish).

Return Value

Type: void

SEE ALSO:

[Supported Locales](#)

setPublishStatus (publishStatus)

Sets a publish status to narrow the suggestion results to display articles with that status. This filter value is required in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`.

Signature

```
public void setPublishStatus(String publishStatus)
```

Parameters

publishStatus

Type: [String](#)

A publish status. Valid values are:

- `Draft`—Articles aren't published in Salesforce Knowledge.
- `Online`—Articles are published in Salesforce Knowledge.
- `Archived`—Articles aren't published and are available in Archived Articles view.

setValidationStatus (validationStatus)

Sets a validation status to narrow the suggestion results to display articles with that status. This filter is optional.

Signature

```
public void setValidationStatus(String validationStatus)
```

Parameters

validationStatus

Type: [String](#)

An article validation status. These values are available in the `ValidationStatus` field on the `KnowledgeArticleVersion` object.

Return Value

Type: void

QuestionSuggestionFilter Class

The `Search.QuestionSuggestionFilter` class filters results from a call to `System.Search.suggest(searchQuery, sObjectType, options)` when the SOSL `searchQuery` contains a `FeedItem` object.

Namespace

[Search](#)

IN THIS SECTION:

[QuestionSuggestionFilter Methods](#)

QuestionSuggestionFilter Methods

The following are methods for `QuestionSuggestionFilter`.

IN THIS SECTION:

[addGroupId\(groupId\)](#)

Adds a filter to display questions associated with the single specified group whose ID is passed in as an argument. This filter is optional.

[addNetworkId\(networkId\)](#)

Adds a filter to display questions associated with the single specified network whose ID is passed in as an argument. This filter is optional.

[addUserId\(userId\)](#)

Adds a filter to display questions belonging to the single specified user whose ID is passed in as an argument. This filter is optional.

[setGroupIds\(groupIds\)](#)

Sets a new list of groups to replace the current list of groups where the group IDs are passed in as an argument. This filter is optional.

[setNetworkIds\(networkIds\)](#)

Sets a new list of networks to replace the current list of networks where the network IDs are passed in as an argument. This filter is optional.

[setTopicId\(topicId\)](#)

Sets a filter to display questions associated with the single specified topic whose ID is passed in as an argument. This filter is optional.

[setUserIds\(userIds\)](#)

Sets a new list of users to replace the current list of users where the users IDs are passed in as an argument. This filter is optional.

addGroupId(groupId)

Adds a filter to display questions associated with the single specified group whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addGroupId(String groupId)
```

Parameters

groupId

Type: `String`

The ID for a group.

Return Value

Type: `void`

Usage

To add more than one group, call the method multiple times.

addNetworkId (networkId)

Adds a filter to display questions associated with the single specified network whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addNetworkId(String networkId)
```

Parameters

networkId

Type: [String](#)

The ID of the community about which you're retrieving this information.

Return Value

Type: void

Usage

To add more than one network, call the method multiple times.

addUserId (userId)

Adds a filter to display questions belonging to the single specified user whose ID is passed in as an argument. This filter is optional.

Signature

```
public void addUserId(String userId)
```

Parameters

userId

Type: [String](#)

The ID for the user.

Return Value

Type: void

Usage

To add more than one user, call the method multiple times.

setGroupIds (groupIds)

Sets a new list of groups to replace the current list of groups where the group IDs are passed in as an argument. This filter is optional.

Signature

```
public void setGroupIds(List<String> groupIds)
```

Parameters

groupIds

Type: [List<String>](#)

A list of group IDs.

Return Value

Type: void

setNetworkIds (networkIds)

Sets a new list of networks to replace the current list of networks where the network IDs are passed in as an argument. This filter is optional.

Signature

```
public void setNetworkIds (List<String> networkIds)
```

Parameters

networkIds

Type: [List<String>](#)

A list of network IDs.

Return Value

Type: void

setTopicId (topicId)

Sets a filter to display questions associated with the single specified topic whose ID is passed in as an argument. This filter is optional.

Signature

```
public void setTopicId (String topicId)
```

Parameters

topicId

Type: [String](#)

The ID for a topic.

Return Value

Type: void

setUserIds (userIds)

Sets a new list of users to replace the current list of users where the users IDs are passed in as an argument. This filter is optional.

Signature

```
public void setUserIds (List<String> userIds)
```

Parameters

*userId*s

Type: [List<String>](#)

A list of user IDs.

Return Value

Type: void

SearchResult Class

A wrapper object that contains an sObject and search metadata.

Namespace

[Search](#)

SearchResult Methods

The following are methods for `SearchResult`.

IN THIS SECTION:

[getSObject\(\)](#)

Returns an sObject from a SearchResult object.

[getSnippet\(fieldName\)](#)

Returns a snippet from a Case, Feed, or Knowledge Article SearchResult object based on the specified field name.

[getSnippet\(\)](#)

Returns a snippet from a SearchResult object based on the default field.

getSObject ()

Returns an sObject from a SearchResult object.

Signature

```
public SObject getSObject ()
```

Return Value

Type: [SObject](#)

SEE ALSO:

[find\(searchQuery\)](#)

[Dynamic SOSL](#)

getSnippet (fieldName)

Returns a snippet from a Case, Feed, or Knowledge Article SearchResult object based on the specified field name.

Signature

```
public String getSnippet (String fieldName)
```

Parameters

fieldName

Type: [String](#)

The field name to use for creating the snippet.

Valid values: `Case.Casenumbrer`, `FeedPost.Title`, `KnowledgeArticleVersion.Title`

Return Value

Type: [String](#)

SEE ALSO:

[find\(searchQuery\)](#)

[Dynamic SOSL](#)

getSnippet ()

Returns a snippet from a SearchResult object based on the default field.

Signature

```
public String getSnippet ()
```

Return Value

Type: [String](#)

SEE ALSO:

[find\(searchQuery\)](#)

[Dynamic SOSL](#)

SearchResults Class

Wraps the results returned by the `Search.find(String)` method.

Namespace

[Search](#)

SearchResults Methods

The following are methods for `SearchResults`.

IN THIS SECTION:

[get\(sObjectType\)](#)

Returns a list of `Search.SearchResult` objects that contain an sObject of the specified type.

get (sObjectType)

Returns a list of `Search.SearchResult` objects that contain an sObject of the specified type.

Signature

```
public List<Search.SearchResult> get(String sObjectType)
```

Parameters

sObjectType

Type: [String](#)

The name of an sObject in the dynamic SOSL query passed to the `Search.find(String)` method.

Return Value

Type: [List<Search.SearchResult>](#)

Usage

SOSL queries passed to the `Search.find(String)` method can return results for multiple objects. For example, the query `Search.find('FIND \'map\' IN ALL FIELDS RETURNING Account, Contact, Opportunity')` includes results for 3 objects. You can call `get(string)` to retrieve search results for 1 object at a time. For example, to get results for the Account object, call `Search.SearchResults.get('Account')`.

SEE ALSO:

[find\(searchQuery\)](#)

[SearchResult Methods](#)

[Dynamic SOSL](#)

SuggestionOption Class

Options that narrow record and article suggestion results returned from a call to `System.Search.suggest (String, String, Search.SuggestionOption)`.

Namespace

[Search](#)

SuggestionOption Methods

The following are methods for `SuggestionOption`.

IN THIS SECTION:

[setFilter\(knowledgeSuggestionFilter\)](#)

Set filters that narrow Salesforce Knowledge article results in a call to `System.Search.suggest (String, String, Search.SuggestionOption)`.

[setLimit\(limit\)](#)

The maximum number of record or article suggestions to retrieve.

setFilter (knowledgeSuggestionFilter)

Set filters that narrow Salesforce Knowledge article results in a call to `System.Search.suggest (String, String, Search.SuggestionOption)`.

Signature

```
public void setFilter(Search.KnowledgeSuggestionFilter knowledgeSuggestionFilter)
```

Parameters

knowledgeSuggestionFilter

Type: [KnowledgeSuggestionFilter](#)

An object containing filters that narrow the search results.

Return Value

Type: void

Usage

```
Search.KnowledgeSuggestionFilter filters = new Search.KnowledgeSuggestionFilter();
filters.setLanguage('en_US');
filters.setPublishStatus('Online');
filters.setChannel('app');

Search.SuggestionOption options = new Search.SuggestionOption();
options.setFilter(filters);
```

```
Search.SuggestionResults suggestionResults = Search.suggest('all', 'KnowledgeArticleVersion',
    options);

for (Search.SuggestionResult searchResult : suggestionResults.getSuggestionResults()) {

    KnowledgeArticleVersion article = (KnowledgeArticleVersion)result.getSObject();
    System.debug(article.title);
}
```

setLimit(limit)

The maximum number of record or article suggestions to retrieve.

Signature

```
public void setLimit(Integer limit)
```

Parameters

limit

Type: [Integer](#)

The maximum number of record or article suggestions to retrieve.

Return Value

Type: void

Usage

By default, the `System.Search.suggest(String, String, Search.SuggestionOption)` method returns the 5 most relevant results. However, if your query is broad, it could match more than 5 results. If `Search.SuggestionResults.hasMoreResults()` returns `true`, there are more than 5 results. To retrieve them, call `setLimit(Integer)` to increase the number of suggestions results.

```
Search.SuggestionOption option = new Search.SuggestionOption();
option.setLimit(10);
Search.suggest('my query', 'mySObjectType', option);
```

SuggestionResult Class

A wrapper object that contains an sObject.

Namespace

[Search](#)

SuggestionResult Methods

The following are methods for `SuggestionResult`.

IN THIS SECTION:

[getSObject\(\)](#)

Returns the sObject from a SuggestionResult object.

getSObject ()

Returns the sObject from a SuggestionResult object.

Signature

```
public SObject getSObject ()
```

Return Value

Type: [SObject](#)

SuggestionResults Class

Wraps the results returned by the `Search.suggest (String, String, Search.SuggestionOption)` method.

Namespace

[Search](#)

SuggestionResults Methods

The following are methods for `SuggestionResults`.

IN THIS SECTION:

[getSuggestionResults\(\)](#)

Returns a list of SuggestionResult objects from the response to a call to `Search.suggest (String, String, Search.SuggestionOption)`.

[hasMoreResults\(\)](#)

Indicates whether a call to `System.Search.suggest (String, String, Search.SuggestionOption)` has more results available than were returned.

getSuggestionResults ()

Returns a list of SuggestionResult objects from the response to a call to `Search.suggest (String, String, Search.SuggestionOption)`.

Signature

```
public List<Search.SuggestionResult> getSuggestionResults ()
```

Return Value

Type: [List<SuggestionResult>](#)

hasMoreResults ()

Indicates whether a call to `System.Search.suggest(String, String, Search.SuggestionOption)` has more results available than were returned.

Signature

```
public Boolean hasMoreResults ()
```

Return Value

Type: [Boolean](#)

Usage

If a limit isn't specified, 5 records are returned in calls to `System.Search.suggest(String, String, Search.SuggestionOption)`. If there are more suggested records than the limit specified, a call to `hasMoreResults ()` returns `true`.

Sfc Namespace

The Sfc namespace contains classes used in Salesforce Files.

The following are the classes in the Sfc namespace.

IN THIS SECTION:

[ContentDownloadContext Enum](#)

This enum specifies the download context.

[ContentDownloadHandler Class](#)

Use ContentDownloadHandler to define a custom download handler that controls how content is downloaded.

[ContentDownloadHandlerFactory Interface](#)

Use this interface to provide a class factory that Salesforce can call to create instances of your custom ContentDownloadHandler.

ContentDownloadContext Enum

This enum specifies the download context.

Enum Values

The following are the values of the `Sfc.ContentDownloadContext` enum.

Value	Description
CHATTER	Download from Chatter.
CONTENT	Default value. Downloads from the Salesforce CRM Content product.
DELIVERY	Download of a content delivery.
MOBILE	Download from a mobile device.

Value	Description
REST_API	Download from the Connect API (/connect/files/{fileId}/content endpoint).
RETRIEVE	Retrieve VersionData from SObject API.
S1	Download from Salesforce1.
SOQL	Select VersionData from SOQL.

ContentDownloadHandler Class

Use ContentDownloadHandler to define a custom download handler that controls how content is downloaded.

Namespace

[Sfc](#) on page 2308

IN THIS SECTION:

[ContentDownloadHandler Properties](#)

ContentDownloadHandler Properties

The following are properties for ContentDownloadHandler.

IN THIS SECTION:

[downloadErrorMessage](#)

A customized error message explaining why the download isn't allowed.

[isDownloadAllowed](#)

Indicates whether or not download is allowed.

[redirectUrl](#)

The URL the user should be redirected to, for applying Information Rights Management (IRM) control, virus scanning, or other behavior.

downloadErrorMessage

A customized error message explaining why the download isn't allowed.

Signature

```
public String downloadErrorMessage {get; set;}
```

Property Value

Type: [String](#)

This message is used if a `redirectUrl` is not provided. If the download is not allowed, Salesforce will throw a `ContentCustomizedDownloadException` exception that contains the `downloadErrorMessage`.

isDownloadAllowed

Indicates whether or not download is allowed.

Signature

```
public Boolean isDownloadAllowed {get; set;}
```

Property Value

Type: [Boolean](#)

redirectUrl

The URL the user should be redirected to, for applying Information Rights Management (IRM) control, virus scanning, or other behavior.

Signature

```
public String redirectUrl {get; set;}
```

Property Value

Type: [String](#)

The URL must be a valid relative URL. For example, the redirect can be a custom Visualforce page such as `"/apex/IRMControl"`. URLs with no path, such as `"www.domain.com"`, will result in an `InvalidParameterValueException`.

ContentDownloadHandlerFactory Interface

Use this interface to provide a class factory that Salesforce can call to create instances of your custom `ContentDownloadHandler`.

Namespace

[Sfc](#) on page 2308

Usage

```
ContentDownloadHandler getContentDownloadHandler(List<ID> ids, ContentDownloadContext context);
```

IN THIS SECTION:

[ContentDownloadHandlerFactory Methods](#)

[ContentDownloadHandlerFactory Example Implementation](#)

ContentDownloadHandlerFactory Methods

The following are methods for `ContentDownloadHandlerFactory`.

IN THIS SECTION:

[getContentDownloadHandler\(var1, var2\)](#)

Returns a ContentDownloadHandler for a given list of content IDs and a download context.

getContentDownloadHandler (var1, var2)

Returns a ContentDownloadHandler for a given list of content IDs and a download context.

Signature

```
public Sfc.ContentDownloadHandler getContentDownloadHandler(List<Id> var1,
Sfc.ContentDownloadContext var2)
```

Parameters

var1

Type: List<Id>

var2

Type: [Sfc.ContentDownloadContext](#) on page 2308

Return Value

Type: [Sfc.ContentDownloadHandler](#) on page 2309

ContentDownloadHandlerFactory Example Implementation

This example creates a class that implements the `Sfc.ContentDownloadHandlerFactory` interface and returns a download handler that blocks downloading content to mobile devices.

```
// Allow customization of the content Download experience
public class ContentDownloadHandlerFactoryImpl implements Sfc.ContentDownloadHandlerFactory
{
    public Sfc.ContentDownloadHandler getContentDownloadHandler(Id id,
Sfc.ContentDownloadContext context) {
        Sfc.ContentDownloadHandler contentDownloadHandler = new Sfc.ContentDownloadHandler();

        if(context == Sfc.ContentDownloadContext.MOBILE) {
            contentDownloadHandler.isDownloadAllowed = false;
            contentDownloadHandler.downloadErrorMessage = 'Downloading a file from a mobile
device isn't allowed.';
            return contentDownloadHandler;
        }
        contentDownloadHandler.isDownloadAllowed = true;
        return contentDownloadHandler;
    }
}
```

Site Namespace

The `Site` namespace provides an interface for rewriting Sites URLs.

The following is the interface in the `Site` namespace.

IN THIS SECTION:

[UrlRewriter Interface](#)

Enables rewriting Sites URLs.

[Site Exceptions](#)

The `Site` namespace contains an exception class.

UrlRewriter Interface

Enables rewriting Sites URLs.

Namespace

[Site](#)

Usage

Sites provides built-in logic that helps you display user-friendly URLs and links to site visitors. Create rules to rewrite URL requests typed into the address bar, launched from bookmarks, or linked from external websites. You can also create rules to rewrite the URLs for links within site pages. URL rewriting not only makes URLs more descriptive and intuitive for users, it allows search engines to better index your site pages.

For example, let's say that you have a blog site. Without URL rewriting, a blog entry's URL might look like this:

```
http://myblog.force.com/posts?id=003D000000Q0PcN
```

To rewrite URLs for a site, create an Apex class that maps the original URLs to user-friendly URLs, and then add the Apex class to your site.

UrlRewriter Methods

The following are methods for `UrlRewriter`. All are instance methods.

IN THIS SECTION:

[generateUrlFor\(salesforceUrls\)](#)

Maps a list of Salesforce URLs to a list of user-friendly URLs.

[mapRequestUrl\(userFriendlyUrl\)](#)

Maps a user-friendly URL to a Salesforce URL.

generateUrlFor(salesforceUrls)

Maps a list of Salesforce URLs to a list of user-friendly URLs.

Signature

```
public System.PageReference[] generateUrlFor (System.PageReference[] salesforceUrls)
```

Parameters

salesforceUrls

Type: [System.PageReference\[\]](#)

Return Value

Type: [System.PageReference\[\]](#)

Usage

You can use `List<PageReference>` instead of `PageReference []`, if you prefer.

 **Important:** The size and order of the input list of Salesforce URLs must exactly correspond to the size and order of the generated list of user-friendly URLs. The `generateUrlFor` method maps input URLs to output URLs based on the order in the lists.

mapRequestUrl (userFriendlyUrl)

Maps a user-friendly URL to a Salesforce URL.

Signature

```
public System.PageReference mapRequestUrl (System.PageReference userFriendlyUrl)
```

Parameters

userFriendlyUrl

Type: [System.PageReference](#)

Return Value

Type: [System.PageReference](#)

Site Exceptions

The `Site` namespace contains an exception class.

All exception classes support built-in methods for returning the error message and exception type. See [Exception Class and Built-In Exceptions](#).

The `Site` namespace contains this exception:

Exception	Description	Methods
<code>Site.ExternalUserCreateException</code>	Unable to create external user	Use the <code>String</code> <code>getMessage ()</code> to get the error message and write it to debug log. Use <code>List<String></code> <code>getDisplayMessages ()</code> to get a list of errors displayed to the end user.

Exception	Description	Methods
		This exception can't be subclassed or thrown in code.

Support Namespace

The `Support` namespace provides an interface used for Case Feed.

The following is the interface in the `Support` namespace.

IN THIS SECTION:

[EmailTemplateSelector Interface](#)

The `Support.EmailTemplateSelector` interface enables providing default email templates in Case Feed. With default email templates, specified email templates are preloaded for cases based on criteria such as case origin or subject.

[MilestoneTriggerTimeCalculator Interface](#)

The `Support.MilestoneTriggerTimeCalculator` interface calculates the time trigger for a milestone.

EmailTemplateSelector Interface

The `Support.EmailTemplateSelector` interface enables providing default email templates in Case Feed. With default email templates, specified email templates are preloaded for cases based on criteria such as case origin or subject.

Namespace

[Support](#)

To specify default templates, you must create a class that implements `Support.EmailTemplateSelector`.

When you implement this interface, provide an empty parameterless constructor.

IN THIS SECTION:

[EmailTemplateSelector Methods](#)

[EmailTemplateSelector Example Implementation](#)

EmailTemplateSelector Methods

The following are methods for `EmailTemplateSelector`.

IN THIS SECTION:

[getDefaultTemplateId\(caseId\)](#)

Returns the ID of the email template to preload for the case currently being viewed in the case feed using the specified case ID.

getDefaultTemplateId(caseId)

Returns the ID of the email template to preload for the case currently being viewed in the case feed using the specified case ID.

Signature

```
public ID getDefaultTemplateId(ID caseId)
```

Parameters

caseId
Type: ID

Return Value

Type: ID

EmailTemplateSelector Example Implementation

This is an example implementation of the `Support.EmailTemplateSelector` interface.

The `getDefaultEmailTemplateId` method implementation retrieves the subject and description of the case corresponding to the specified case ID. Next, it selects an email template based on the case subject and returns the email template ID.

```
global class MyCaseTemplateChooser implements Support.EmailTemplateSelector {
    // Empty constructor
    global MyCaseTemplateChooser() { }

    // The main interface method
    global ID getDefaultEmailTemplateId(ID caseId) {
        // Select the case we're interested in, choosing any fields that are relevant to
our decision
        Case c = [SELECT Subject, Description FROM Case WHERE Id=:caseId];

        EmailTemplate et;

        if (c.subject.contains('LX-1150')) {
            et = [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1150_template'];
        } else if (c.subject.contains('LX-1220')) {
            et = [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1220_template'];
        }

        // Return the ID of the template selected
        return et.id;
    }
}
```

The following example tests the above code:

```
@isTest
private class MyCaseTemplateChooserTest {

    static testMethod void testChooseTemplate() {

        MyCaseTemplateChooser chooser = new MyCaseTemplateChooser();

        // Create a simulated case to test with
        Case c = new Case();
        c.Subject = 'I\'m having trouble with my LX-1150';
    }
}
```

```

Database.insert(c);

// Make sure the proper template is chosen for this subject
Id actualTemplateId = chooser.getDefaultEmailTemplateId(c.Id);
EmailTemplate expectedTemplate =
    [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1150_template'];
Id expectedTemplateId = expectedTemplate.Id;
System.assertEquals(actualTemplateId, expectedTemplateId);

// Change the case properties to match a different template
c.Subject = 'My LX1220 is overheating';
Database.update(c);

// Make sure the correct template is chosen in this case
actualTemplateId = chooser.getDefaultEmailTemplateId(c.Id);
expectedTemplate =
    [SELECT id FROM EmailTemplate WHERE DeveloperName = 'LX1220_template'];
expectedTemplateId = expectedTemplate.Id;
System.assertEquals(actualTemplateId, expectedTemplateId);
    }
}

```

MilestoneTriggerTimeCalculator Interface

The `Support.MilestoneTriggerTimeCalculator` interface calculates the time trigger for a milestone.

Namespace

Support

Implement the `Support.MilestoneTriggerTimeCalculator` interface to calculate a dynamic time trigger for a milestone based on the milestone type, the properties of the case, and case-related objects. To implement the `Support.MilestoneTriggerTimeCalculator` interface, you must first declare a class with the `implements` keyword as follows:

```
global class Employee implements Support.MilestoneTriggerTimeCalculator {
```

Next, your class must provide an implementation for the following method:

```
global Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId)
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

[MilestoneTriggerTimeCalculator Methods](#)

[MilestoneTriggerTimeCalculator Example Implementation](#)

MilestoneTriggerTimeCalculator Methods

The following are instance methods for `MilestoneTriggerTimeCalculator`.

IN THIS SECTION:

[calculateMilestoneTriggerTime\(caseId, milestoneTypeId\)](#)

Calculates the milestone trigger time based on the specified case and milestone type and returns the time in minutes.

calculateMilestoneTriggerTime(caseId, milestoneTypeId)

Calculates the milestone trigger time based on the specified case and milestone type and returns the time in minutes.

Syntax

```
public Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId)
```

Parameters

caseId

Type: String

ID of the case the milestone is applied to.

milestoneTypeId

Type: String

ID of the milestone type.

Return Value

Type: Integer

The calculated trigger time in minutes.

MilestoneTriggerTimeCalculator Example Implementation

This sample class demonstrates the implementation of the `Support.MilestoneTriggerTimeCalculator` interface. In this sample, the case's priority and the milestone `m1` determine that the time trigger is 18 minutes.

```
global class myMilestoneTimeCalculator implements Support.MilestoneTriggerTimeCalculator
{
    global Integer calculateMilestoneTriggerTime(String caseId, String milestoneTypeId) {

        Case c = [SELECT Priority FROM Case WHERE Id=:caseId];
        MilestoneType mt = [SELECT Name FROM MilestoneType WHERE Id=:milestoneTypeId];
        if (c.Priority != null && c.Priority.equals('High')) {
            if (mt.Name != null && mt.Name.equals('m1')) { return 7; }
            else { return 5; }
        }
        else {
            return 18;
        }
    }
}
```

This test class can be used to test the implementation of `Support.MilestoneTriggerTimeCalculator`.

```
@isTest
private class MilestoneTimeCalculatorTest {
```

```

static testMethod void testMilestoneTimeCalculator() {

    // Select an existing milestone type to test with
    MilestoneType[] mtLst = [SELECT Id, Name FROM MilestoneType LIMIT 1];
    if(mtLst.size() == 0) { return; }
    MilestoneType mt = mtLst[0];

    // Create case data.
    // Typically, the milestone type is related to the case,
    // but for simplicity, the case is created separately for this test.
    Case c = new Case(priority = 'High');
    insert c;

    myMilestoneTimeCalculator calculator = new myMilestoneTimeCalculator();
    Integer actualTriggerTime = calculator.calculateMilestoneTriggerTime(c.Id, mt.Id);

    if(mt.name != null && mt.Name.equals('m1')) {
        System.assertEquals(actualTriggerTime, 7);
    }
    else {
        System.assertEquals(actualTriggerTime, 5);
    }

    c.priority = 'Low';
    update c;
    actualTriggerTime = calculator.calculateMilestoneTriggerTime(c.Id, mt.Id);
    System.assertEquals(actualTriggerTime, 18);
}
}

```

System Namespace

The `System` namespace provides classes and methods for core Apex functionality.

The following are the classes in the `System` namespace.

IN THIS SECTION:

[Address Class](#)

Contains methods for accessing the component fields of address compound fields.

[Answers Class](#)

Represents zone answers.

[ApexPages Class](#)

Use `ApexPages` to add and check for messages associated with the current page, as well as to reference the current page.

[Approval Class](#)

Contains methods for processing approval requests and setting approval-process locks and unlocks on records.

[Blob Class](#)

Contains methods for the `Blob` primitive data type.

[Boolean Class](#)

Contains methods for the Boolean primitive data type.

[BusinessHours Class](#)

Use the `BusinessHours` methods to set the business hours at which your customer support team operates.

[Cases Class](#)

Use the `Cases` class to interact with case records.

[Comparable Interface](#)

Adds sorting support for Lists that contain non-primitive types, that is, Lists of user-defined types.

[Continuation Class](#)

Use the `Continuation` class to make callouts asynchronously to a SOAP or REST Web service.

[Cookie Class](#)

The `Cookie` class lets you access cookies for your Force.com site using Apex.

[Crypto Class](#)

Provides methods for creating digests, message authentication codes, and signatures, as well as encrypting and decrypting information.

[Custom Settings Methods](#)

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

[Database Class](#)

Contains methods for creating and manipulating data.

[Date Class](#)

Contains methods for the Date primitive data type.

[Datetime Class](#)

Contains methods for the Datetime primitive data type.

[Decimal Class](#)

Contains methods for the Decimal primitive data type.

[Double Class](#)

Contains methods for the Double primitive data type.

[EncodingUtil Class](#)

Use the methods in the `EncodingUtil` class to encode and decode URL strings, and convert strings to hexadecimal format.

[Enum Methods](#)

An enum is an abstract data type with values that each take on exactly one of a finite set of identifiers that you specify. Apex provides built-in enums, such as `LoggingLevel`, and you can define your own enum.

[EventBus Class](#)

Contains methods for publishing platform events.

[Exception Class and Built-In Exceptions](#)

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

[FlexQueue Class](#)

Contains methods that reorder batch jobs in the Apex flex queue.

[Http Class](#)

Use the `Http` class to initiate an HTTP request and response.

[HttpCalloutMock Interface](#)

Enables sending fake responses when testing HTTP callouts.

[HttpRequest Class](#)

Use the `HttpRequest` class to programmatically create HTTP requests like GET, POST, PUT, and DELETE.

[HttpResponse Class](#)

Use the `HttpResponse` class to handle the HTTP response returned by the `Http` class.

[Id Class](#)

Contains methods for the ID primitive data type.

[Ideas Class](#)

Represents zone ideas.

[InstallHandler Interface](#)

Enables custom code to run after a managed package installation or upgrade.

[Integer Class](#)

Contains methods for the Integer primitive data type.

[JSON Class](#)

Contains methods for serializing Apex objects into JSON format and deserializing JSON content that was serialized using the `serialize` method in this class.

[JSONGenerator Class](#)

Contains methods used to serialize objects into JSON content using the standard JSON encoding.

[JSONParser Class](#)

Represents a parser for JSON-encoded content.

[JSONToken Enum](#)

Contains all token values used for parsing JSON content.

[Limits Class](#)

Contains methods that return limit information for specific resources.

[List Class](#)

Contains methods for the List collection type.

[Location Class](#)

Contains methods for accessing the component fields of geolocation compound fields.

[Long Class](#)

Contains methods for the Long primitive data type.

[Map Class](#)

Contains methods for the Map collection type.

[Matcher Class](#)

Matchers use Patterns to perform match operations on a character string.

[Math Class](#)

Contains methods for mathematical operations.

[Messaging Class](#)

Contains messaging methods used when sending a single or mass email.

[MultiStaticResourceCalloutMock Class](#)

Utility class used to specify a fake response using multiple resources for testing HTTP callouts.

[Network Class](#)

Represents a community.

[PageReference Class](#)

A PageReference is a reference to an instantiation of a page. Among other attributes, PageReferences consist of a URL and a set of query parameter names and values.

[Pattern Class](#)

Represents a compiled representation of a regular expression.

[Queueable Interface](#)

Enables the asynchronous execution of Apex jobs that can be monitored.

[QueueableContext Interface](#)

Represents the parameter type of the `execute()` method in a class that implements the `Queueable` interface and contains the job ID. This interface is implemented internally by Apex.

[QuickAction Class](#)

Use Apex to request and process actions on objects that allow custom fields, on objects that appear in a Chatter feed, or on objects that are available globally.

[RemoteObjectController](#)

Use `RemoteObjectController` to access the standard Visualforce Remote Objects operations in your Remote Objects override methods.

[ResetPasswordResult Class](#)

Represents the result of a password reset.

[RestContext Class](#)

Contains the `RestRequest` and `RestResponse` objects.

[RestRequest Class](#)

Represents an object used to pass data from an HTTP request to an Apex RESTful Web service method.

[RestResponse Class](#)

Represents an object used to pass data from an Apex RESTful Web service method to an HTTP response.

[SandboxPostCopy Interface](#)

To make your sandbox environment business ready, automate data manipulation or business logic tasks. Extend this interface and add methods to perform post-copy tasks, then specify the class during sandbox creation.

[Schedulable Interface](#)

The class that implements this interface can be scheduled to run at different intervals.

[SchedulableContext Interface](#)

Represents the parameter type of a method in a class that implements the `Schedulable` interface and contains the scheduled job ID. This interface is implemented internally by Apex.

[Schema Class](#)

Contains methods for obtaining schema describe information.

[Search Class](#)

Use the methods of the Search class to perform dynamic SOSL queries.

SelectOption Class

A `SelectOption` object specifies one of the possible values for a Visualforce `selectCheckboxes`, `selectList`, or `selectRadio` component.

Set Class

Represents a collection of unique elements with no duplicate values.

Site Class

Use the `Site` Class to manage your Force.com sites.

sObject Class

Contains methods for the `sObject` data type.

StaticResourceCalloutMock Class

Utility class used to specify a fake response for testing HTTP callouts.

String Class

Contains methods for the `String` primitive data type.

StubProvider Interface

`StubProvider` is a callback interface that you can use as part of the Apex stub API to implement a mocking framework. Use this interface with the `Test.createStub()` method to create stubbed Apex objects for testing.

System Class

Contains methods for system operations, such as writing debug messages and scheduling jobs.

Test Class

Contains methods related to Visualforce tests.

Time Class

Contains methods for the `Time` primitive data type.

TimeZone Class

Represents a time zone. Contains methods for creating a new time zone and obtaining time zone properties, such as the time zone ID, offset, and display name.

Trigger Class

Use the `Trigger` class to access run-time context information in a trigger, such as the type of trigger or the list of `sObject` records that the trigger operates on.

Type Class

Contains methods for getting the Apex type that corresponds to an Apex class and for instantiating new types.

UninstallHandler Interface

Enables custom code to run after a managed package is uninstalled.

URL Class

Represents a uniform resource locator (URL) and provides access to parts of the URL. Enables access to the Salesforce instance URL.

UserInfo Class

Contains methods for obtaining information about the context user.

Version Class

Use the `Version` methods to get the version of a managed package of a subscriber and to compare package versions.

WebServiceCallout Class

Enables making callouts to SOAP operations on an external Web service. This class is used in the Apex stub class that is auto-generated from a WSDL.

[WebServiceMock Interface](#)

Enables sending fake responses when testing Web service callouts of a class auto-generated from a WSDL.

[XmlStreamReader Class](#)

The `XmlStreamReader` class provides methods for forward, read-only access to XML data. You can pull data from XML or skip unwanted events. You can parse nested XML content that's up to 50 nodes deep.

[XmlStreamWriter Class](#)

The `XmlStreamWriter` class provides methods for writing XML data.

Address Class

Contains methods for accessing the component fields of address compound fields.

Namespace

[System](#)

Usage

Each of these methods is also equivalent to a read-only property. For each getter method, you can access the property using dot notation. For example, `myAddress.getCity()` is equivalent to `myAddress.city`.

You can't use dot notation to access compound fields' subfields directly on the parent field. Instead, assign the parent field to a variable of type `Address`, and then access its components. For example, to access the `City` field in `myAccount.BillingAddress`, do the following:

```
Address addr = myAccount.BillingAddress;
String acctCity = addr.City;
```

Example

```
// Select and access Address fields.
// Call the getDistance() method in different ways.
Account[] records = [SELECT id, BillingAddress FROM Account LIMIT 10];
for(Account acct : records) {
    Address addr = acct.BillingAddress;
    Double lat = addr.latitude;
    Double lon = addr.longitude;
    Location loc1 = Location.newInstance(30.1944,-97.6682);
    Double apexDist1 = addr.getDistance(loc1, 'mi');
    Double apexDist2 = loc1.getDistance(addr, 'mi');
    System.assertEquals(apexDist1, apexDist2);
    Double apexDist3 = Location.getDistance(addr, loc1, 'mi');
    System.assertEquals(apexDist2, apexDist3);
}
```

IN THIS SECTION:

[Address Methods](#)

Address Methods

The following are methods for `Address`.

IN THIS SECTION:

[getCity\(\)](#)

Returns the city field of this address.

[getCountry\(\)](#)

Returns the text-only country name component of this address.

[getCountryCode\(\)](#)

Returns the country code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

[getDistance\(toLocation, unit\)](#)

Returns the distance from this location to the specified location using the specified unit.

[getGeocodeAccuracy\(\)](#)

When using geolocation data for a given address, this method gives you relative location information based on latitude and longitude values. For example, you can find out if the latitude and longitude values point to the middle of the street, instead of the exact address.

[getLatitude\(\)](#)

Returns the latitude field of this address.

[getLongitude\(\)](#)

Returns the longitude field of this address.

[getPostalCode\(\)](#)

Returns the postal code of this address.

[getState\(\)](#)

Returns the text-only state name component of this address.

[getStateCode\(\)](#)

Returns the state code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

[getStreet\(\)](#)

Returns the street field of this address.

getCity()

Returns the city field of this address.

Signature

```
public String getCity()
```

Return Value

Type: [String](#)

getCountry()

Returns the text-only country name component of this address.

Signature

```
public String getCountry()
```

Return Value

Type: [String](#)

getCountryCode ()

Returns the country code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

Signature

```
public String getCountryCode()
```

Return Value

Type: [String](#)

getDistance (toLocation, unit)

Returns the distance from this location to the specified location using the specified unit.

Signature

```
public Double getDistance(Location toLocation, String unit)
```

Parameters

toLocation

Type: [Location](#)

The `Location` to which you want to calculate the distance from the current `Location`.

unit

Type: [String](#)

The distance unit you want to use: `mi` or `km`.

Return Value

Type: [Double](#)

getGeocodeAccuracy ()

When using geolocation data for a given address, this method gives you relative location information based on latitude and longitude values. For example, you can find out if the latitude and longitude values point to the middle of the street, instead of the exact address.

Signature

```
public String getGeocodeAccuracy()
```

Return Value

Type: [String](#)

The `getGeocodeAccuracy()` return value tells you more about the location at a latitude and longitude for a given address. For example, `zip` means the latitude and longitude point to the center of the zip code area, in case a match for an exact street address can't be found.

Accuracy Value	Description
Address	In the same building
NearAddress	Near the address
Block	Midway point of the block
Street	Midway point of the street
ExtendedZip	Center of the extended zip code area
Zip	Center of the zip code area
Neighborhood	Center of the neighborhood
City	Center of the city
County	Center of the county
State	Center of the state
Unknown	No match for the address was found

Geocodes are added only for some standard addresses.

- `Billing Address` on accounts
- `Shipping Address` on accounts
- `Mailing Address` on contacts
- `Address` on leads

Person accounts are not supported.

 **Note:** For `getGeocodeAccuracy()` to work, set up and activate the geocode data integration rules for the related address fields.

getLatitude()

Returns the latitude field of this address.

Signature

```
public Double getLatitude()
```

Return Value

Type: [Double](#)

getLongitude ()

Returns the longitude field of this address.

Signature

```
public Double getLongitude ()
```

Return Value

Type: [Double](#)

getPostalCode ()

Returns the postal code of this address.

Signature

```
public String getPostalCode ()
```

Return Value

Type: [String](#)

getState ()

Returns the text-only state name component of this address.

Signature

```
public String getState ()
```

Return Value

Type: [String](#)

getStateCode ()

Returns the state code of this address if state and country picklists are enabled in your organization. Otherwise, returns `null`.

Signature

```
public String getStateCode ()
```

Return Value

Type: [String](#)

getStreet ()

Returns the street field of this address.

Signature

```
public String getStreet ()
```

Return Value

Type: [String](#)

Answers Class

Represents zone answers.

Namespace

[System](#)

Usage

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

For more information on answers, see “Answers Overview” in the Salesforce online help.

Example

The following example finds questions in an internal zone that have similar titles as a new question:

```
public class FindSimilarQuestionController {

    public static void test() {
        // Instantiate a new question
        Question question = new Question ();

        // Specify a title for the new question
        question.title = 'How much vacation time do full-time employees get?';

        // Specify the communityID (INTERNAL_COMMUNITY) in which to find similar questions.
        Community community = [ SELECT Id FROM Community WHERE Name = 'INTERNAL_COMMUNITY' ];

        question.communityId = community.id;

        ID[] results = Answers.findSimilar(question);
    }
}
```

The following example marks a reply as the best reply:

```
ID questionId = [SELECT Id FROM Question WHERE Title = 'Testing setBestReplyId' LIMIT 1].Id;
ID replyID = [SELECT Id FROM Reply WHERE QuestionId = :questionId LIMIT 1].Id;
Answers.setBestReply(questionId, replyId);
```

Answers Methods

The following are methods for `Answers`. All methods are static.

IN THIS SECTION:

[findSimilar\(yourQuestion\)](#)

Returns a list of similar questions based on the title of the specified question.

[setBestReply\(questionId, replyId\)](#)

Sets the specified reply for the specified question as the best reply. Because a question can have multiple replies, setting the best reply helps users quickly identify the reply that contains the most helpful information.

findSimilar (yourQuestion)

Returns a list of similar questions based on the title of the specified question.

Signature

```
public static ID[] findSimilar(Question yourQuestion)
```

Parameters

yourQuestion
Type: `Question`

Return Value

Type: `ID[]`

Usage

Each `findSimilar` call counts against the SOSL statements governor limit allowed for the process.

setBestReply (questionId, replyId)

Sets the specified reply for the specified question as the best reply. Because a question can have multiple replies, setting the best reply helps users quickly identify the reply that contains the most helpful information.

Signature

```
public static Void setBestReply(String questionId, String replyId)
```

Parameters

questionId
Type: `String`

replyId
Type: `String`

Return Value

Type: Void

ApexPages Class

Use `ApexPages` to add and check for messages associated with the current page, as well as to reference the current page.

Namespace

[System](#)

Usage

In addition, `ApexPages` is used as a namespace for the [PageReference Class](#) and the [Message Class](#).

ApexPages Methods

The following are methods for `ApexPages`. All are instance methods.

IN THIS SECTION:

[addMessage\(message\)](#)

Add a message to the current page context.

[addMessages\(exceptionThrown\)](#)

Adds a list of messages to the current page context based on a thrown exception.

[currentPage\(\)](#)

Returns the current page's `PageReference`.

[getMessages\(\)](#)

Returns a list of the messages associated with the current context.

[hasMessages\(\)](#)

Returns `true` if there are messages associated with the current context, `false` otherwise.

[hasMessages\(severity\)](#)

Returns `true` if messages of the specified severity exist, `false` otherwise.

addMessage (message)

Add a message to the current page context.

Signature

```
public Void addMessage (ApexPages.Message message)
```

Parameters

message

Type: [ApexPages.Message](#)

Return Value

Type: Void

addMessages (exceptionThrown)

Adds a list of messages to the current page context based on a thrown exception.

Signature

```
public Void addMessages(Exception exceptionThrown)
```

Parameters

exceptionThrown
Type: [Exception](#)

Return Value

Type: Void

currentPage ()

Returns the current page's PageReference.

Signature

```
public System.PageReference currentPage()
```

Return Value

Type: [System.PageReference](#)

Example

This code segment returns the id parameter of the current page.

```
public MyController() {  
    account = [  
        SELECT Id, Name, Site  
        FROM Account  
        WHERE Id =  
            :ApexPages.currentPage().  
                getParameters().  
                get('id')  
    ];  
}
```

getMessages ()

Returns a list of the messages associated with the current context.

Signature

```
public ApexPages.Message[] getMessages ()
```

Return Value

Type: [ApexPages.Message\[\]](#)

hasMessages ()

Returns `true` if there are messages associated with the current context, `false` otherwise.

Signature

```
public Boolean hasMessages ()
```

Return Value

Type: [Boolean](#)

hasMessages (severity)

Returns `true` if messages of the specified severity exist, `false` otherwise.

Signature

```
public Boolean hasMessages (ApexPages.Severity severity)
```

Parameters

sev

Type: [ApexPages.Severity](#)

Return Value

Type: [Boolean](#)

Approval Class

Contains methods for processing approval requests and setting approval-process locks and unlocks on records.

Namespace

[System](#)

Usage

Salesforce admins can edit locked records. Depending on your approval process configuration settings, an assigned approver can also edit locked records. Locks and unlocks that are set programmatically use the same record editability settings as other approval-process locks and unlocks.

Record locks and unlocks are treated as DML. They're blocked before a callout, they count toward your DML limits, and if a failure occurs, they're rolled back along with the rest of your transaction. To change this rollback behavior, use an `allOrNone` parameter.

Approval is also used as a namespace for the `ProcessRequest` and `ProcessResult` classes.

SEE ALSO:

[Approval Process Considerations](#)

Approval Methods

The following are methods for `Approval`. All methods are static.

IN THIS SECTION:

[isLocked\(id\)](#)

Returns `true` if the record with the ID `id` is locked, or `false` if it's not.

[isLocked\(ids\)](#)

Returns a map of record IDs and their lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

[isLocked\(subject\)](#)

Returns `true` if the `subject` record is locked, or `false` if it's not.

[isLocked\(subjects\)](#)

Returns a map of record IDs to lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

[lock\(recordId\)](#)

Locks an object, and returns the lock results.

[lock\(recordIds\)](#)

Locks a set of objects, and returns the lock results, including failures.

[lock\(recordToLock\)](#)

Locks an object, and returns the lock results.

[lock\(recordsToLock\)](#)

Locks a set of objects, and returns the lock results, including failures.

[lock\(recordId, allOrNothing\)](#)

Locks an object, with the option for partial success, and returns the lock result.

[lock\(recordIds, allOrNothing\)](#)

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

[lock\(recordToLock, allOrNothing\)](#)

Locks an object, with the option for partial success, and returns the lock result.

[lock\(recordsToLock, allOrNothing\)](#)

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

[process\(approvalRequest\)](#)

Submits a new approval request and approves or rejects existing approval requests.

[process\(approvalRequests, allOrNone\)](#)

Submits a new approval request and approves or rejects existing approval requests.

[process\(approvalRequests\)](#)

Submits a list of new approval requests, and approves or rejects existing approval requests.

[process\(approvalRequests, allOrNone\)](#)

Submits a list of new approval requests, and approves or rejects existing approval requests.

[unlock\(recordId\)](#)

Unlocks an object, and returns the unlock results.

[unlock\(recordIds\)](#)

Unlocks a set of objects, and returns the unlock results, including failures.

[unlock\(recordToUnlock\)](#)

Unlocks an object, and returns the unlock results.

[unlock\(recordsToUnlock\)](#)

Unlocks a set of objects, and returns the unlock results, including failures.

[unlock\(recordId, allOrNothing\)](#)

Unlocks an object, with the option for partial success, and returns the unlock result.

[unlock\(recordIds, allOrNothing\)](#)

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

[unlock\(recordToUnlock, allOrNothing\)](#)

Unlocks an object, with the option for partial success, and returns the unlock result.

[unlock\(recordsToUnlock, allOrNothing\)](#)

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

isLocked(id)

Returns `true` if the record with the ID `id` is locked, or `false` if it's not.

Signature

```
public static Boolean isLocked(Id id)
```

Parameters

id

Type: `Id`

The ID of the record whose lock or unlock status is in question.

Return Value

Type: `Boolean`

isLocked(ids)

Returns a map of record IDs and their lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

Signature

```
public static Map<Id, Boolean> isLocked(List<Id> ids)
```

Parameters

ids

Type: [List<Id>](#)

The IDs of the records whose lock or unlock statuses are in question.

Return Value

Type: [Map<Id, Boolean>](#)

isLocked (subject)

Returns `true` if the `subject` record is locked, or `false` if it's not.

Signature

```
public static Boolean isLocked(SObject subject)
```

Parameters

subject

Type: [SObject](#)

The record whose lock or unlock status is in question.

Return Value

Type: [Boolean](#)

isLocked (subjects)

Returns a map of record IDs to lock statuses. If the record is locked the status is `true`. If the record is not locked the status is `false`.

Signature

```
public static Map<Id, Boolean> isLocked(List<SObject> subjects)
```

Parameters

subjects

Type: [List<SObject>](#)

The records whose lock or unlock statuses are in question.

Return Value

Type: [Map<Id, Boolean>](#)

lock (recordId)

Locks an object, and returns the lock results.

Signature

```
public static Approval.LockResult lock(Id recordId)
```

Parameters

recordId

Type: [Id](#)

ID of the object to lock.

Return Value

Type: [Approval.LockResult](#)

lock (recordIds)

Locks a set of objects, and returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<Id> ids)
```

Parameters

ids

Type: [List<Id>](#)

IDs of the objects to lock.

Return Value

Type: [List<Approval.LockResult>](#)

lock (recordToLock)

Locks an object, and returns the lock results.

Signature

```
public static Approval.LockResult lock(SObject recordToLock)
```

Parameters

recordToLock

Type: [SObject](#)

Return Value

Type: [Approval.LockResult](#)

lock(recordsToLock)

Locks a set of objects, and returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<SObject> recordsToLock)
```

Parameters

recordsToLock

Type: [List<SObject>](#)

Return Value

Type: [List<Approval.LockResult>](#)

lock(recordId, allOrNothing)

Locks an object, with the option for partial success, and returns the lock result.

Signature

```
public static Approval.LockResult lock(Id recordId, Boolean allOrNothing)
```

Parameters

recordId

Type: [Id](#)

ID of the object to lock.

allOrNothing

Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [Approval.LockResult](#)

lock(recordIds, allOrNothing)

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<Id> recordIds, Boolean allOrNothing)
```

Parameters

*recordIds*Type: [List<Id>](#)

IDs of the objects to lock.

*allOrNothing*Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [List<Approval.LockResult>](#)**lock(recordToLock, allOrNothing)**

Locks an object, with the option for partial success, and returns the lock result.

Signature

```
public static Approval.LockResult lock(SObject recordToLock, Boolean allOrNothing)
```

Parameters

*recordToLock*Type: [SObject](#)*allOrNothing*Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [Approval.LockResult](#)**lock(recordsToLock, allOrNothing)**

Locks a set of objects, with the option for partial success. It returns the lock results, including failures.

Signature

```
public static List<Approval.LockResult> lock(List<SObject> recordsToLock, Boolean allOrNothing)
```

Parameters

*recordsToLock*Type: [List<SObject>](#)

allOrNothing

Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [List<Approval.LockResult>](#)

process (approvalRequest)

Submits a new approval request and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult process (Approval.ProcessRequest approvalRequest)
```

Parameters

approvalRequest

Type: [Approval.ProcessRequest](#)

Return Value

Type: [Approval.ProcessResult](#)

Example

```
// Insert an account
Account a = new Account (Name='Test',
                        annualRevenue=100.0);

insert a;

// Create an approval request for the account
Approval.ProcessSubmitRequest req1 =
    new Approval.ProcessSubmitRequest ();
req1.setObjectId(a.id);

// Submit the approval request for the account
Approval.ProcessResult result =
    Approval.process (req1);
```

process (approvalRequests, allOrNone)

Submits a new approval request and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult process (Approval.ProcessRequest approvalRequests,
Boolean allOrNone)
```

Parameters

approvalRequests
Approval.ProcessRequest

allOrNone
Type: Boolean

The optional *allOrNone* parameter specifies whether the operation allows for partial success. If you specify `false` for this parameter and an approval fails, the remainder of the approval processes can still succeed.

Return Value

Approval.ProcessResult

process (approvalRequests)

Submits a list of new approval requests, and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult [] process (Approval.ProcessRequest []
approvalRequests)
```

Parameters

approvalRequests
Approval.ProcessRequest []

Return Value

Approval.ProcessResult []

process (approvalRequests, allOrNone)

Submits a list of new approval requests, and approves or rejects existing approval requests.

Signature

```
public static Approval.ProcessResult [] process (Approval.ProcessRequest []
approvalRequests, Boolean allOrNone)
```

Parameters

approvalRequests
Approval.ProcessRequest []

allOrNone

Type: [Boolean](#)

The optional *allOrNone* parameter specifies whether the operation allows for partial success. If you specify `false` for this parameter and an approval fails, the remainder of the approval processes can still succeed.

Return Value

[Approval.ProcessResult](#) []

unlock (recordId)

Unlocks an object, and returns the unlock results.

Signature

```
public static Approval.UnlockResult unlock(Id recordId)
```

Parameters

recordId

Type: [Id](#)

ID of the object to unlock.

Return Value

Type: [Approval.UnlockResult](#)

unlock (recordIds)

Unlocks a set of objects, and returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<Id> recordIds)
```

Parameters

recordIds

Type: [List<Id>](#)

IDs of the objects to unlock.

Return Value

Type: [List<Approval.UnlockResult>](#)

unlock (recordToUnlock)

Unlocks an object, and returns the unlock results.

Signature

```
public static Approval.UnlockResult unlock(SObject recordToUnlock)
```

Parameters

recordToUnlock
Type: [SObject](#)

Return Value

Type: [Approval.UnlockResult](#)

unlock (recordsToUnlock)

Unlocks a set of objects, and returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<SObject> recordsToUnlock)
```

Parameters

recordsToUnlock
Type: [List<SObject>](#)

Return Value

Type: [List<Approval.UnlockResult>](#)

unlock (recordId, allOrNothing)

Unlocks an object, with the option for partial success, and returns the unlock result.

Signature

```
public static Approval.UnlockResult unlock(Id recordId, Boolean allOrNothing)
```

Parameters

recordId
Type: [Id](#)
ID of the object to lock.

allOrNothing
Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [Approval.UnlockResult](#)

unlock(recordIds, allOrNothing)

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<Id> recordIds, Boolean allOrNothing)
```

Parameters

recordIds

Type: [List<Id>](#)

IDs of the objects to unlock.

allOrNothing

Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [List<Approval.UnlockResult>](#)

unlock(recordToUnlock, allOrNothing)

Unlocks an object, with the option for partial success, and returns the unlock result.

Signature

```
public static Approval.UnlockResult unlock(SObject recordToUnlock, Boolean allOrNothing)
```

Parameters

recordToUnlock

Type: [SObject](#)

allOrNothing

Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [Approval.UnlockResult](#)

unlock(recordsToUnlock, allOrNothing)

Unlocks a set of objects, with the option for partial success. It returns the unlock results, including failures.

Signature

```
public static List<Approval.UnlockResult> unlock(List<SObject> recordsToUnlock, Boolean allOrNothing)
```

Parameters

recordsToUnlock
Type: [List<SObject>](#)

allOrNothing
Type: [Boolean](#)

Specifies whether this operation allows partial success. If you specify `false` and a record fails, the remainder of the DML operation can still succeed. This method returns a result object that you can use to verify which records succeeded, which failed, and why.

Return Value

Type: [List<Approval.UnlockResult>](#)

Blob Class

Contains methods for the Blob primitive data type.

Namespace

[System](#)

Usage

For more information on Blobs, see [Primitive Data Types](#) on page 26.

Blob Methods

The following are methods for [Blob](#).

IN THIS SECTION:

[size\(\)](#)

Returns the number of characters in the Blob.

[toPdf\(stringToConvert\)](#)

Creates a binary object out of the given string, encoding it as a PDF file.

[toString\(\)](#)

Casts the Blob into a String.

[valueOf\(stringToBlob\)](#)

Casts the specified String to a Blob.

size ()

Returns the number of characters in the Blob.

Signature

```
public Integer size ()
```

Return Value

Type: [Integer](#)

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueOf(myString);
Integer size = myBlob.size ();
```

toPdf (stringToConvert)

Creates a binary object out of the given string, encoding it as a PDF file.

Signature

```
public static Blob toPdf (String stringToConvert)
```

Parameters

stringToConvert
Type: [String](#)

Return Value

Type: [Blob](#)

Example

```
String pdfContent = 'This is a test string';
Account a = new account (name = 'test');
insert a;
Attachment attachmentPDF = new Attachment ();
attachmentPdf.parentId = a.id;
attachmentPdf.name = a.name + '.pdf';
attachmentPdf.body = blob.toPDF (pdfContent);
insert attachmentPDF;
```

toString ()

Casts the Blob into a String.

Signature

```
public String toString()
```

Return Value

Type: [String](#)

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueOf(myString);
System.assertEquals('StringToBlob', myBlob.toString());
```

valueOf(stringToBlob)

Casts the specified String to a Blob.

Signature

```
public static Blob valueOf(String stringToBlob)
```

Parameters

stringToBlob

Type: [String](#)

Return Value

Type: [Blob](#)

Example

```
String myString = 'StringToBlob';
Blob myBlob = Blob.valueOf(myString);
```

Boolean Class

Contains methods for the Boolean primitive data type.

Namespace

[System](#)

Boolean Methods

The following are methods for [Boolean](#). All methods are static.

IN THIS SECTION:

[valueOf\(stringToBoolean\)](#)

Converts the specified string to a Boolean value and returns `true` if the specified string value is `true`. Otherwise, returns `false`.

[valueOf\(fieldValue\)](#)

Converts the specified object to a Boolean value. Use this method to convert a history tracking field value or an object that represents a Boolean value.

valueOf (stringToBoolean)

Converts the specified string to a Boolean value and returns `true` if the specified string value is `true`. Otherwise, returns `false`.

Signature

```
public static Boolean valueOf(String stringToBoolean)
```

Parameters

stringToBoolean

Type: [String](#)

Return Value

Type: [Boolean](#)

Usage

If the specified argument is null, this method throws an exception.

Example

```
Boolean b = Boolean.valueOf('true');
System.assertEquals(true, b);
```

valueOf (fieldValue)

Converts the specified object to a Boolean value. Use this method to convert a history tracking field value or an object that represents a Boolean value.

Signature

```
public static Boolean valueOf(Object fieldValue)
```

Parameters

fieldValue

Type: [Object](#)

Return Value

Type: [Boolean](#)

Usage

Use this method with the `OldValue` or `NewValue` fields of history sObjects, such as `AccountHistory`, when the field type corresponds to a Boolean type, like a checkbox field.

Example

```
List<AccountHistory> ahlist =
    [SELECT Field,OldValue,NewValue
     FROM AccountHistory];
for(AccountHistory ah : ahlist) {
    System.debug('Field: ' + ah.Field);
    if (ah.field == 'IsPlatinum__c') {
        Boolean oldValue =
            Boolean.valueOf(ah.OldValue);
        Boolean newValue =
            Boolean.valueOf(ah.NewValue);
    }
}
```

BusinessHours Class

Use the `BusinessHours` methods to set the business hours at which your customer support team operates.

Namespace

[System](#)

BusinessHours Methods

The following are methods for `BusinessHours`. All methods are static.

IN THIS SECTION:

[add\(businessHoursId, startDate, intervalMilliseconds\)](#)

Adds an interval of time from a start Datetime traversing business hours only. Returns the result Datetime in the local time zone.

[addGmt\(businessHoursId, startDate, intervalMilliseconds\)](#)

Adds an interval of milliseconds from a start Datetime traversing business hours only. Returns the result Datetime in GMT.

[diff\(businessHoursId, startDate, endDate\)](#)

Returns the difference in milliseconds between a start and end Datetime based on a specific set of business hours.

[isWithin\(businessHoursId, targetDate\)](#)

Returns `true` if the specified target date occurs within business hours. Holidays are included in the calculation.

[nextStartDate\(businessHoursId, targetDate\)](#)

Starting from the specified target date, returns the next date when business hours are open. If the specified target date falls within business hours, this target date is returned.

add(businessHoursId, startDate, intervalMilliseconds)

Adds an interval of time from a start Datetime traversing business hours only. Returns the result Datetime in the local time zone.

Signature

```
public static Datetime add(String businessHoursId, Datetime startDate, Long intervalMilliseconds)
```

Parameters

businessHoursId

Type: [String](#)

startDate

Type: [Datetime](#)

intervalMilliseconds

Type: [Long](#)

Interval value should be provided in milliseconds, however time precision smaller than one minute is ignored.

Return Value

Type: [Datetime](#)

addGmt(businessHoursId, startDate, intervalMilliseconds)

Adds an interval of milliseconds from a start Datetime traversing business hours only. Returns the result Datetime in GMT.

Signature

```
public static Datetime addGmt(String businessHoursId, Datetime startDate, Long intervalMilliseconds)
```

Parameters

businessHoursId

Type: [String](#)

startDate

Type: [Datetime](#)

intervalMilliseconds

Type: [Long](#)

Return Value

Type: [Datetime](#)

diff(businessHoursId, startDate, endDate)

Returns the difference in milliseconds between a start and end Datetime based on a specific set of business hours.

Signature

```
public static Long diff(String businessHoursId, Datetime startDate, Datetime endDate)
```

Parameters

businessHoursId

Type: [String](#)

startDate

Type: [Datetime](#)

endDate

Type: [Datetime](#)

Return Value

Type: [Long](#)

isWithin (businessHoursId, targetDate)

Returns `true` if the specified target date occurs within business hours. Holidays are included in the calculation.

Signature

```
public static Boolean isWithin(String businessHoursId, Datetime targetDate)
```

Parameters

businessHoursId

Type: [String](#)

The business hours ID.

targetDate

Type: [Datetime](#)

The date to verify.

Return Value

Type: [Boolean](#)

Example

The following example finds whether a given time is within the default business hours.

```
// Get the default business hours
BusinessHours bh = [SELECT Id FROM BusinessHours WHERE IsDefault=true];

// Create Datetime on May 28, 2013 at 1:06:08 AM in the local timezone.
Datetime targetTime = Datetime.newInstance(2013, 5, 28, 1, 6, 8);

// Find whether the time is within the default business hours
Boolean isWithin= BusinessHours.isWithin(bh.id, targetTime);
```

nextStartDate (businessHoursId, targetDate)

Starting from the specified target date, returns the next date when business hours are open. If the specified target date falls within business hours, this target date is returned.

Signature

```
public static Datetime nextStartDate(String businessHoursId, Datetime targetDate)
```

Parameters

businessHoursId

Type: [String](#)

The business hours ID.

targetDate

Type: [Datetime](#)

The date used as a start date to obtain the next date.

Return Value

Type: [Datetime](#)

Example

The following example finds the next date starting from the target date when business hours reopens. If the target date is within the given business hours, the target date is returned. The returned time is in the local time zone.

```
// Get the default business hours
BusinessHours bh = [SELECT Id FROM BusinessHours WHERE IsDefault=true];

// Create Datetime on May 28, 2013 at 1:06:08 AM in the local timezone.
Datetime targetTime = Datetime.newInstance(2013, 5, 28, 1, 6, 8);
// Starting from the targetTime, find the next date when business hours reopens. Return
the target time.

// if it is within the business hours. The returned time will be in the local time zone
Datetime nextStart = BusinessHours.nextStartDate(bh.id, targetTime);
```

Cases Class

Use the `Cases` class to interact with case records.

Namespace

[System](#)

Cases Methods

The following are static methods for `Cases`.

IN THIS SECTION:

[getCaseIdFromEmailThreadId\(emailThreadId\)](#)

Returns the case ID corresponding to the specified email thread ID.

getCaseIdFromEmailThreadId (emailThreadId)

Returns the case ID corresponding to the specified email thread ID.

Signature

```
public static ID getCaseIdFromEmailThreadId(String emailThreadId)
```

Parameters

emailThreadId

Type: [String](#)

Return Value

Type: [ID](#)

Usage

The *emailThreadId* argument should have the following format: `_00Dxx1gEW._500xxYktg`. Other formats, such as `ref:_00Dxx1gEW._500xxYkt1:ref` and `[ref:_00Dxx1gEW._500xxYkt1:ref]`, are invalid.

Comparable Interface

Adds sorting support for Lists that contain non-primitive types, that is, Lists of user-defined types.

Namespace

[System](#)

Usage

To add List sorting support for your Apex class, you must implement the `Comparable` interface with its `compareTo` method in your class.

To implement the `Comparable` interface, you must first declare a class with the `implements` keyword as follows:

```
global class Employee implements Comparable {
```

Next, your class must provide an implementation for the following method:

```
global Integer compareTo(Object compareTo) {  
    // Your code here  
}
```

The implemented method must be declared as `global` or `public`.

IN THIS SECTION:

[Comparable Methods](#)[Comparable Example Implementation](#)

SEE ALSO:

[List Class](#)

Comparable Methods

The following are methods for `Comparable`.

IN THIS SECTION:

[compareTo\(objectToCompareTo\)](#)

Returns an Integer value that is the result of the comparison.

compareTo (objectToCompareTo)

Returns an Integer value that is the result of the comparison.

Signature

```
public Integer compareTo (Object objectToCompareTo)
```

Parameters

objectToCompareTo

Type: Object

Return Value

Type: [Integer](#)

Usage

The implementation of this method should return the following values:

- 0 if this instance and *objectToCompareTo* are equal
- > 0 if this instance is greater than *objectToCompareTo*
- < 0 if this instance is less than *objectToCompareTo*

Comparable Example Implementation

This is an example implementation of the `Comparable` interface. The `compareTo` method in this example compares the employee of this class instance with the employee passed in the argument. The method returns an Integer value based on the comparison of the employee IDs.

```
global class Employee implements Comparable {
```

```

public Long id;
public String name;
public String phone;

// Constructor
public Employee(Long i, String n, String p) {
    id = i;
    name = n;
    phone = p;
}

// Implement the compareTo() method
global Integer compareTo(Object compareTo) {
    Employee compareToEmp = (Employee)compareTo;
    if (id == compareToEmp.id) return 0;
    if (id > compareToEmp.id) return 1;
    return -1;
}
}

```

This example tests the sort order of a list of `Employee` objects.

```

@isTest
private class EmployeeSortingTest {
    static testmethod void test1() {
        List<Employee> empList = new List<Employee>();
        empList.add(new Employee(101, 'Joe Smith', '4155551212'));
        empList.add(new Employee(101, 'J. Smith', '4155551212'));
        empList.add(new Employee(25, 'Caragh Smith', '4155551000'));
        empList.add(new Employee(105, 'Mario Ruiz', '4155551099'));

        // Sort using the custom compareTo() method
        empList.sort();

        // Write list contents to the debug log
        System.debug(empList);

        // Verify list sort order.
        System.assertEquals('Caragh Smith', empList[0].Name);
        System.assertEquals('Joe Smith', empList[1].Name);
        System.assertEquals('J. Smith', empList[2].Name);
        System.assertEquals('Mario Ruiz', empList[3].Name);
    }
}

```

Continuation Class

Use the `Continuation` class to make callouts asynchronously to a SOAP or REST Web service.

Namespace

[System](#)

Example

For a code example, see [Make Long-Running Callouts from a Visualforce Page](#).

IN THIS SECTION:

[Continuation Constructors](#)

[Continuation Properties](#)

[Continuation Methods](#)

Continuation Constructors

The following are constructors for `Continuation`.

IN THIS SECTION:

[Continuation\(timeout\)](#)

Creates an instance of the `Continuation` class by using the specified timeout in seconds. The timeout maximum is 120 seconds.

Continuation(timeout)

Creates an instance of the `Continuation` class by using the specified timeout in seconds. The timeout maximum is 120 seconds.

Signature

```
public Continuation(Integer timeout)
```

Parameters

timeout

Type: `Integer`

The timeout for this continuation in seconds.

Continuation Properties

The following are properties for `Continuation`.

IN THIS SECTION:

[continuationMethod](#)

The name of the callback method that is called after the callout response returns.

[timeout](#)

The timeout of the continuation in seconds. Maximum: 120 seconds seconds.

[state](#)

Data that is stored in this continuation and that can be retrieved after the callout is finished and the callback method is invoked.

continuationMethod

The name of the callback method that is called after the callout response returns.

Signature

```
public String continuationMethod {get; set;}
```

Property Value

Type: [String](#)

Usage

Note: If the `continuationMethod` property is not set for a Continuation, the same action method that made the asynchronous callout is called again when the callout response returns.

timeout

The timeout of the continuation in seconds. Maximum: 120 seconds seconds.

Signature

```
public Integer timeout {get; set;}
```

Property Value

Type: [Integer](#)

state

Data that is stored in this continuation and that can be retrieved after the callout is finished and the callback method is invoked.

Signature

```
public Object state {get; set;}
```

Property Value

Type: [Object](#)

Example

This example shows how to save state information for a continuation in a controller.

```
// Declare inner class to hold state info
private class StateInfo {
    String msg { get; set; }
    List<String> urls { get; set; }
    StateInfo(String msg, List<String> urls) {
        this.msg = msg;
        this.urls = urls;
    }
}
```

```
// Then in the action method, set state for the continuation
continuationInstance.state = new StateInfo('Some state data', urls);
```

Continuation Methods

The following are methods for `Continuation`.

IN THIS SECTION:

[addHttpRequest\(request\)](#)

Adds the HTTP request for the callout that is associated with this continuation.

[getRequests\(\)](#)

Returns all labels and requests that are associated with this continuation as key-value pairs.

[getResponse\(requestLabel\)](#)

Returns the response for the request that corresponds to the specified label.

addHttpRequest (request)

Adds the HTTP request for the callout that is associated with this continuation.

Signature

```
public String addHttpRequest(System.HttpRequest request)
```

Parameters

request

Type: [HttpRequest](#)

The HTTP request to be sent to the external service by this continuation.

Return Value

Type: [String](#)

A unique label that identifies the HTTP request that is associated with this continuation. This label is used in the map that [getRequests\(\)](#) returns to identify individual requests in a continuation.

Usage

You can add up to three requests to a continuation.

 **Note:** The timeout that is set in each passed-in request is ignored. Only the global timeout maximum of 120 seconds applies for a continuation.

getRequests ()

Returns all labels and requests that are associated with this continuation as key-value pairs.

Signature

```
public Map<String, System.HttpRequest> getRequests ()
```

Return Value

Type: `Map<String,HttpRequest>`

A map of all requests that are associated with this continuation. The map key is the request label, and the map value is the corresponding HTTP request.

getResponse (requestLabel)

Returns the response for the request that corresponds to the specified label.

Signature

```
public static HttpResponse getResponse (String requestLabel)
```

Parameters

requestLabel

Type: `String`

The request label to get the response for.

Return Value

Type: `HttpResponse`

Usage

The status code is returned in the `HttpResponse` object and can be obtained by calling `getStatusCode ()` on the response. A status code of 200 indicates that the request was successful. Other status code values indicate the type of problem that was encountered.

Sample of Error Status Codes

When a problem occurs with the response, some possible status code values are:

- 2000: The timeout was reached, and the server didn't get a chance to respond.
- 2001: There was a connection failure.
- 2002: Exceptions occurred.
- 2003: The response hasn't arrived (which also means that the Apex asynchronous callout framework hasn't resumed).
- 2004: The response size is too large (greater than 1 MB).

Cookie Class

The `Cookie` class lets you access cookies for your Force.com site using Apex.

Namespace

`System`

Usage

Use the `setCookies` method of the [PageReference Class](#) to attach cookies to a page.

Important:

- Cookie names and values set in Apex are URL encoded, that is, characters such as @ are replaced with a percent sign and their hexadecimal representation.
- The `setCookies` method adds the prefix "apex__" to the cookie names.
- Setting a cookie's value to `null` sends a cookie with an empty string value instead of setting an expired attribute.
- After you create a cookie, the properties of the cookie can't be changed.
- Be careful when storing sensitive information in cookies. Pages are cached regardless of a cookie value. If you use a cookie value to generate dynamic content, you should disable page caching. For more information, see "Caching Force.com Sites Pages" in the Salesforce online help.

Consider the following limitations when using the `Cookie` class:

- The `Cookie` class can only be accessed using Apex that is saved using the Salesforce API version 19 and above.
- The maximum number of cookies that can be set per Force.com domain depends on your browser. Newer browsers have higher limits than older ones.
- Cookies must be less than 4K, including name and attributes.

For more information on sites, see "Force.com Sites" in the Salesforce online help.

Example

The following example creates a class, `CookieController`, which is used with a Visualforce page (see markup below) to update a counter each time a user displays a page. The number of times a user goes to the page is stored in a cookie.

```
// A Visualforce controller class that creates a cookie
// used to keep track of how often a user displays a page
public class CookieController {

    public CookieController() {
        Cookie counter = ApexPages.currentPage().getCookies().get('counter');

        // If this is the first time the user is accessing the page,
        // create a new cookie with name 'counter', an initial value of '1',
        // path 'null', maxAge '-1', and isSecure 'false'.
        if (counter == null) {
            counter = new Cookie('counter', '1', null, -1, false);
        } else {
            // If this isn't the first time the user is accessing the page
            // create a new cookie, incrementing the value of the original count by 1
            Integer count = Integer.valueOf(counter.getValue());
            counter = new Cookie('counter', String.valueOf(count+1), null, -1, false);
        }

        // Set the new cookie for the page
        ApexPages.currentPage().setCookies(new Cookie[]{counter});
    }

    // This method is used by the Visualforce action {!count} to display the current
    // value of the number of times a user had displayed a page.
```

```
// This value is stored in the cookie.
public String getCount() {
    Cookie counter = ApexPages.currentPage().getCookies().get('counter');
    if(counter == null) {
        return '0';
    }
    return counter.getValue();
}
}
```

```
// Test class for the Visualforce controller
@isTest
private class CookieControllerTest {
    // Test method for verifying the positive test case
    static testMethod void testCounter() {
        //first page view
        CookieController controller = new CookieController();
        System.assert(controller.getCount() == '1');

        //second page view
        controller = new CookieController();
        System.assert(controller.getCount() == '2');
    }
}
```

The following is the Visualforce page that uses the `CookieController` Apex controller above. The action `{!count}` calls the `getCount` method in the controller above.

```
<apex:page controller="CookieController">
You have seen this page {!count} times
</apex:page>
```

IN THIS SECTION:

[Cookie Constructors](#)

[Cookie Methods](#)

Cookie Constructors

The following are constructors for `Cookie`.

IN THIS SECTION:

[Cookie\(name, value, path, maxAge, isSecure\)](#)

Creates a new instance of the `Cookie` class using the specified name, value, path, age, and the secure setting.

Cookie(name, value, path, maxAge, isSecure)

Creates a new instance of the `Cookie` class using the specified name, value, path, age, and the secure setting.

Signature

```
public Cookie(String name, String value, String path, Integer maxAge, Boolean isSecure)
```

Parameters

*name*Type: [String](#)The cookie name. It can't be `null`.*value*Type: [String](#)

The cookie data, such as session ID.

*path*Type: [String](#)

The path from where you can retrieve the cookie.

*maxAge*Type: [Integer](#)

A number representing how long a cookie is valid for in seconds. If set to less than zero, a session cookie is issued. If set to zero, the cookie is deleted.

*isSecure*Type: [Boolean](#)A value indicating whether the cookie can only be accessed through HTTPS (`true`) or not (`false`).

Cookie Methods

The following are methods for `Cookie`. All are instance methods.

IN THIS SECTION:

[getDomain\(\)](#)

Returns the name of the server making the request.

[getMaxAge\(\)](#)Returns a number representing how long the cookie is valid for, in seconds. If set to `< 0`, a session cookie is issued. If set to `0`, the cookie is deleted.[getName\(\)](#)Returns the name of the cookie. Can't be `null`.[getPath\(\)](#)Returns the path from which you can retrieve the cookie. If `null` or blank, the location is set to root, or `"/"`.[getValue\(\)](#)

Returns the data captured in the cookie, such as Session ID.

[isSecure\(\)](#)Returns `true` if the cookie can only be accessed through HTTPS, otherwise returns `false`.

getDomain ()

Returns the name of the server making the request.

Signature

```
public String getDomain ()
```

Return Value

Type: [String](#)

getMaxAge ()

Returns a number representing how long the cookie is valid for, in seconds. If set to < 0 , a session cookie is issued. If set to 0 , the cookie is deleted.

Signature

```
public Integer getMaxAge ()
```

Return Value

Type: [Integer](#)

getName ()

Returns the name of the cookie. Can't be `null`.

Signature

```
public String getName ()
```

Return Value

Type: [String](#)

getPath ()

Returns the path from which you can retrieve the cookie. If `null` or blank, the location is set to root, or `"/`.

Signature

```
public String getPath ()
```

Return Value

Type: [String](#)

getValue ()

Returns the data captured in the cookie, such as Session ID.

Signature

```
public String getValue ()
```

Return Value

Type: [String](#)

isSecure ()

Returns `true` if the cookie can only be accessed through HTTPS, otherwise returns `false`.

Signature

```
public Boolean isSecure ()
```

Return Value

Type: [Boolean](#)

Crypto Class

Provides methods for creating digests, message authentication codes, and signatures, as well as encrypting and decrypting information.

Namespace

[System](#)

Usage

The methods in the `Crypto` class can be used for securing content in Force.com, or for integrating with external services such as Google or Amazon WebServices (AWS).

Encrypt and Decrypt Exceptions

The following exceptions can be thrown for these methods:

- `decrypt`
- `encrypt`
- `decryptWithManagedIV`
- `encryptWithManagedIV`

Exception	Message	Description
<code>InvalidParameterValue</code>	Unable to parse initialization vector from encrypted data.	Thrown if you're using managed initialization vectors, and the cipher text is less than 16 bytes.
<code>InvalidParameterValue</code>	Invalid algorithm <code>algoName</code> . Must be AES128, AES192, or AES256.	Thrown if the algorithm name isn't one of the valid values.
<code>InvalidParameterValue</code>	Invalid private key. Must be <code>size</code> bytes.	Thrown if size of the private key doesn't match the specified algorithm.
<code>InvalidParameterValue</code>	Invalid initialization vector. Must be 16 bytes.	Thrown if the initialization vector isn't 16 bytes.

Exception	Message	Description
<code>InvalidParameterValue</code>	Invalid data. Input data is <i>size</i> bytes, which exceeds the limit of 1048576 bytes.	Thrown if the data is greater than 1 MB. For decryption, 1048608 bytes are allowed for the initialization vector header, plus any additional padding the encryption added to align to block size.
<code>NullPointerException</code>	Argument cannot be null.	Thrown if one of the required method arguments is null.
<code>SecurityException</code>	Given final block not properly padded.	Thrown if the data isn't properly block-aligned or similar issues occur during encryption or decryption.
<code>SecurityException</code>	<i>Message Varies</i>	Thrown if something goes wrong during either encryption or decryption.

Crypto Methods

The following are methods for `Crypto`. All methods are static.

IN THIS SECTION:

[decrypt\(algorithmName, privateKey, initializationVector, cipherText\)](#)

Decrypts the Blob *cipherText* using the specified algorithm, private key, and initialization vector. Use this method to decrypt blobs encrypted using a third party application or the `encrypt` method.

[decryptWithManagedIV\(algorithmName, privateKey, IVAndCipherText\)](#)

Decrypts the Blob *IVAndCipherText* using the specified algorithm and private key. Use this method to decrypt blobs encrypted using a third party application or the `encryptWithManagedIV` method.

[encrypt\(algorithmName, privateKey, initializationVector, clearText\)](#)

Encrypts the Blob *clearText* using the specified algorithm, private key and initialization vector. Use this method when you want to specify your own initialization vector.

[encryptWithManagedIV\(algorithmName, privateKey, clearText\)](#)

Encrypts the Blob *clearText* using the specified algorithm and private key. Use this method when you want Salesforce to generate the initialization vector for you.

[generateAesKey\(size\)](#)

Generates an Advanced Encryption Standard (AES) key.

[generateDigest\(algorithmName, input\)](#)

Computes a secure, one-way hash digest based on the supplied input string and algorithm name.

[generateMac\(algorithmName, input, privateKey\)](#)

Computes a message authentication code (MAC) for the input string, using the private key and the specified algorithm.

[getRandomInteger\(\)](#)

Returns a random Integer.

[getRandomLong\(\)](#)

Returns a random Long.

[sign\(*algorithmName*, *input*, *privateKey*\)](#)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied private key.

[signWithCertificate\(*algorithmName*, *input*, *certDevName*\)](#)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied certificate and key pair.

[signXML\(*algorithmName*, *node*, *idAttributeName*, *certDevName*\)](#)

Envelops the signature into an XML document.

[signXML\(*algorithmName*, *node*, *idAttributeName*, *certDevName*, *refChild*\)](#)

Inserts the signature envelope before the specified child node.

decrypt(*algorithmName*, *privateKey*, *initializationVector*, *cipherText*)

Decrypts the Blob *cipherText* using the specified algorithm, private key, and initialization vector. Use this method to decrypt blobs encrypted using a third party application or the `encrypt` method.

Signature

```
public static Blob decrypt(String algorithmName, Blob privateKey, Blob
initializationVector, Blob cipherText)
```

Parameters

algorithmName

Type: [String](#)

privateKey

Type: [Blob](#)

initializationVector

Type: [Blob](#)

cipherText

Type: [Blob](#)

Return Value

Type: [Blob](#)

Usage

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

The initialization vector must be 128 bits (16 bytes.)

Example

```

Blob exampleIv = Blob.valueOf('Example of IV123');
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encrypt('AES128', key, exampleIv, data);

Blob decrypted = Crypto.decrypt('AES128', key, exampleIv, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);

```

decryptWithManagedIV(algorithmName, privateKey, IVAndCipherText)

Decrypts the Blob *IVAndCipherText* using the specified algorithm and private key. Use this method to decrypt blobs encrypted using a third party application or the `encryptWithManagedIV` method.

Signature

```

public static Blob decryptWithManagedIV(String algorithmName, Blob privateKey, Blob
IVAndCipherText)

```

Parameters

algorithmName

Type: [String](#)

privateKey

Type: [Blob](#)

IVAndCipherText

Type: [Blob](#)

The first 128 bits (16 bytes) of *IVAndCipherText* must contain the initialization vector.

Return Value

Type: [Blob](#)

Usage

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encryptWithManagedIV('AES128', key, data);

Blob decrypted = Crypto.decryptWithManagedIV('AES128', key, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

encrypt(*algorithmName*, *privateKey*, *initializationVector*, *clearText*)

Encrypts the Blob *clearText* using the specified algorithm, private key and initialization vector. Use this method when you want to specify your own initialization vector.

Signature

```
public static Blob encrypt(String algorithmName, Blob privateKey, Blob
initializationVector, Blob clearText)
```

Parameters

algorithmName

Type: [String](#)

privateKey

Type: [Blob](#)

initializationVector

Type: [Blob](#)

clearText

Type: [Blob](#)

Return Value

Type: [Blob](#)

Usage

The initialization vector must be 128 bits (16 bytes.) Use either a third-party application or the `decrypt` method to decrypt blobs encrypted using this method. Use the `encryptWithManagedIV` method if you want Salesforce to generate the initialization vector for you. It is stored as the first 128 bits (16 bytes) of the encrypted Blob.

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob exampleIv = Blob.valueOf('Example of IV123');
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encrypt('AES128', key, exampleIv, data);

Blob decrypted = Crypto.decrypt('AES128', key, exampleIv, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

encryptWithManagedIV(algorithmName, privateKey, clearText)

Encrypts the Blob *clearText* using the specified algorithm and private key. Use this method when you want Salesforce to generate the initialization vector for you.

Signature

```
public static Blob encryptWithManagedIV(String algorithmName, Blob privateKey, Blob clearText)
```

Parameters

algorithmName

Type: [String](#)

privateKey

Type: [Blob](#)

clearText

Type: [Blob](#)

Return Value

Type: [Blob](#)

Usage

The initialization vector is stored as the first 128 bits (16 bytes) of the encrypted Blob. Use either third-party applications or the `decryptWithManagedIV` method to decrypt blobs encrypted with this method. Use the `encrypt` method if you want to generate your own initialization vector.

Valid values for *algorithmName* are:

- AES128
- AES192
- AES256

These are all industry standard Advanced Encryption Standard (AES) algorithms with different size keys. They use cipher block chaining (CBC) and PKCS5 padding.

The length of *privateKey* must match the specified algorithm: 128 bits, 192 bits, or 256 bits, which is 16, 24, or 32 bytes, respectively. You can use a third-party application or the `generateAesKey` method to generate this key for you.

Example

```
Blob key = Crypto.generateAesKey(128);
Blob data = Blob.valueOf('Data to be encrypted');
Blob encrypted = Crypto.encryptWithManagedIV('AES128', key, data);

Blob decrypted = Crypto.decryptWithManagedIV('AES128', key, encrypted);
String decryptedString = decrypted.toString();
System.assertEquals('Data to be encrypted', decryptedString);
```

generateAesKey(size)

Generates an Advanced Encryption Standard (AES) key.

Signature

```
public static Blob generateAesKey(Integer size)
```

Parameters

size

Type: [Integer](#)

The key's size in bits. Valid values are:

- 128
- 192
- 256

Return Value

Type: [Blob](#)

Example

```
Blob key = Crypto.generateAesKey(128);
```

generateDigest(algorithmName, input)

Computes a secure, one-way hash digest based on the supplied input string and algorithm name.

Signature

```
public static Blob generateDigest(String algorithmName, Blob input)
```

Parameters

algorithmName

Type: [String](#)

Valid values for *algorithmName* are:

- MD5

- SHA1
- SHA-256
- SHA-512

input

Type: [Blob](#)

Return Value

Type: [Blob](#)

Example

```
Blob targetBlob = Blob.valueOf('ExampleMD5String');
Blob hash = Crypto.generateDigest('MD5', targetBlob);
```

generateMac(algorithmName, input, privateKey)

Computes a message authentication code (MAC) for the input string, using the private key and the specified algorithm.

Signature

```
public static Blob generateMac(String algorithmName, Blob input, Blob privateKey)
```

Parameters

algorithmName

Type: [String](#)

The valid values for *algorithmName* are:

- hmacMD5
- hmacSHA1
- hmacSHA256
- hmacSHA512

input

Type: [Blob](#)

privateKey

Type: [Blob](#)

The value of *privateKey* does not need to be in decoded form. The value cannot exceed 4 KB.

Return Value

Type: [Blob](#)

Example

```
String salt = String.valueOf(Crypto.getRandomInteger());
String key = 'key';
```

```
Blob data = crypto.generateMac('HmacSHA256',  
Blob.valueOf(salt), Blob.valueOf(key));
```

getRandomInteger ()

Returns a random Integer.

Signature

```
public static Integer getRandomInteger ()
```

Return Value

Type: [Integer](#)

Example

```
Integer randomInt = Crypto.getRandomInteger ();
```

getRandomLong ()

Returns a random Long.

Signature

```
public static Long getRandomLong ()
```

Return Value

Type: [Long](#)

Example

```
Long randomLong = Crypto.getRandomLong ();
```

sign (algorithmName, input, privateKey)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied private key.

Signature

```
public static Blob sign (String algorithmName, Blob input, Blob privateKey)
```

Parameters

algorithmName

Type: [String](#)

The algorithm name. The valid values for *algorithmName* are RSA-SHA1, RSA-SHA256, or RSA.

RSA-SHA1 is an RSA signature (with an asymmetric key pair) of a SHA1 hash.

RSA-SHA256 is an RSA signature of a SHA256 hash.

RSA is the same as RSA-SHA1.

input

Type: [Blob](#)

The data to sign.

privateKey

Type: [Blob](#)

The value of *privateKey* must be decoded using the `EncodingUtil.base64Decode` method, and should be in RSA's [PKCS #8 \(1.2\) Private-Key Information Syntax Standard](#) form. The value cannot exceed 4 KB.

Return Value

Type: [Blob](#)

Example

The following snippet shows how to call the `sign` method.

```
String algorithmName = 'RSA';
String key = '';
Blob privateKey = EncodingUtil.base64Decode(key);
Blob input = Blob.valueOf('12345qwerty');
Crypto.sign(algorithmName, input, privateKey);
```

signWithCertificate(algorithmName, input, certDevName)

Computes a unique digital signature for the input string, using the specified algorithm and the supplied certificate and key pair.

Signature

```
public static Blob signWithCertificate(String algorithmName, Blob input, String certDevName)
```

Parameters

algorithmName

Type: [String](#)

The algorithm name. The valid values for *algorithmName* are RSA-SHA1, RSA-SHA256, or RSA.

RSA-SHA1 is an RSA signature (with an asymmetric key pair) of a SHA1 hash.

RSA-SHA256 is an RSA signature of a SHA256 hash.

RSA is the same as RSA-SHA1.

input

Type: [Blob](#)

The data to sign.

certDevName

Type: [String](#)

The `Unique Name` for a certificate stored in the Salesforce organization's Certificate and Key Management page to use for signing. To access the Certificate and Key Management page from Setup, enter *Certificate and Key Management* in the Quick Find box, then select **Certificate and Key Management**.

Return Value

Type: [Blob](#)

Example

The following snippet is an example of the method for signing the content referenced by `data`.

```
Blob data = Blob.valueOf('12345qwerty');
System.Crypto.signWithCertificate('RSA-SHA256', data, 'signingCert');
```

signXML(*algorithmName*, *node*, *idAttributeName*, *certDevName*)

Envelops the signature into an XML document.

Signature

```
public Void signXML(String algorithmName, Dom.XmlNode node, String idAttributeName,
String certDevName)
```

Parameters

algorithmName

Type: [String](#)

The algorithm name. Valid names are RSA-SHA1, RSA-SHA256, or RSA.

RSA-SHA1 is an RSA signature (with an asymmetric key pair) of an SHA1 hash.

RSA-SHA256 is an RSA signature of an SHA256 hash.

RSA is the same as RSA-SHA1.

node

Type: [Dom.XmlNode](#)

The XML node to sign and insert the signature into.

idAttributeName

Type: [String](#)
