
SOAP API Developer Guide

Version 42.0, Spring '18

CONTENTS

GETTING STARTED	1
Chapter 1: Introducing SOAP API	1
When to Use the SOAP API	2
Customize, Integrate, and Extend Your Salesforce Solutions	3
Supported Salesforce Editions	3
Standards Compliance	4
Development Platforms	4
SOAP API Support Policy	4
Choosing a WSDL	5
Related Resources	5
Quick Start	6
Step 1: Obtain a Salesforce Developer Edition Organization	6
Step 2: Generate or Obtain the Web Service WSDL	6
Step 3: Import the WSDL File Into Your Development Platform	7
Step 4: Walk Through the Sample Code	8
Chapter 2: Object Basics	30
Primitive Data Types	31
Field Types	32
Compound Fields	38
Address Compound Fields	38
Geolocation Compound Field	41
Compound Field Considerations and Limitations	42
API Data Types and Salesforce Field Types	44
Core Data Types Used in API Calls	44
sObject	45
API Fault Element	45
ExceptionCode	46
Error	50
StatusCode	50
ExtendedErrorDetails	60
Duplicate Management Data Types	60
System Fields	69
Required Fields	70
Frequently-Occurring Fields	70
API Field Properties	71
Relationships Among Objects	72
Relabeling Fields and Tabs and the API	73

Contents

Tooling API Objects in the Enterprise WSDL	73
Salesforce AppExchange Object Prefixes and the API	74
Custom Objects	74
External Objects	77
Chapter 3: Call Basics	79
Characteristics of API Calls	80
Factors that Affect Data Access	80
Package Version Settings	82
Chapter 4: Error Handling	84
Error Handling for Session Expiration	85
More About Error Handling	85
Chapter 5: Security	86
User Authentication	87
User Profile and Permission Sets Configuration	87
Security Token	87
Sharing	88
Implicit Restrictions for Objects and Fields	89
API Access in Salesforce AppExchange Packages	89
Outbound Port Restrictions	91
Chapter 6: Using the Partner WSDL	92
Obtaining the Partner WSDL File	93
Calls and the Partner WSDL	93
Objects, Fields, and Field Data and the Partner WSDL	94
Queries and the Partner WSDL	94
Namespaces in the Partner WSDL	95
Package Versions and the Partner WSDL	95
User Interface Themes	96
Examples Using the Partner WSDL	96
Sample query and queryMore Calls	100
Sample search Call	102
Sample create Call	105
Sample update Call	108
REFERENCE	111
Chapter 7: Data Model	111
Sales Objects	112
Task and Event Objects	113
Support Objects	114
Document, Note, and Attachment Objects	115
User, Sharing, and Permission Objects	116

Contents

Profile and Permission Objects	117
Record Type Objects	118
Product and Schedule Objects	119
Sharing and Team Selling Objects	120
Customizable Forecasting Objects	120
Forecasts Objects	121
Territory Management 2.0 Objects	121

GETTING STARTED

CHAPTER 1 Introducing SOAP API

In this chapter ...

- [When to Use the SOAP API](#)
- [Customize, Integrate, and Extend Your Salesforce Solutions](#)
- [Supported Salesforce Editions](#)
- [Standards Compliance](#)
- [Development Platforms](#)
- [SOAP API Support Policy](#)
- [Choosing a WSDL](#)
- [Related Resources](#)
- [Quick Start](#)

Salesforce provides programmatic access to your org's information using simple, powerful, and secure application programming interfaces. To use this document, you should have a basic familiarity with software development, Web services, and the Salesforce user interface.

Any functionality described in this guide is available if your organization has the API feature enabled. This feature is enabled by default for Performance, Unlimited, Enterprise, and Developer Editions. Some Professional Edition organizations may also have the API enabled. If you cannot access the features you see in this guide, contact Salesforce.

Note: Salesforce Education Services offers a suite of training courses to enable developers to design, create, integrate, and extend applications built on the Lightning platform. Be sure to visit <http://www.salesforce.com/training> to learn more.

When to Use the SOAP API

The Salesforce prebuilt applications provide powerful CRM functionality. In addition, Salesforce provides the ability to customize the prebuilt applications to fit your organization. However, your organization may have complex business processes that are unsupported by the existing functionality. When this is the case, the Lightning Platform includes a number of ways for advanced administrators and developers to implement custom functionality. These include the SOAP API, Apex, and Visualforce.

SOAP API

Use SOAP API to create, retrieve, update or delete records, such as accounts, leads, and custom objects. With more than 20 different calls, SOAP API also allows you to maintain passwords, perform searches, and much more. Use SOAP API in any language that supports Web services.

REST API

REST API provides a powerful, convenient, and simple REST-based web services interface for interacting with Salesforce. Its advantages include ease of integration and development, and it's an excellent choice of technology for use with mobile applications and web projects. For certain projects, you may want to use REST API with other Salesforce REST APIs. To build UI for creating, reading, updating, and deleting records, including building UI for list views, actions, and dependent picklists, use User Interface API. To build UI for Chatter, communities, or recommendations, use Chatter REST API. If you have many records to process, consider using Bulk API, which is based on REST principles and optimized for large sets of data.

Bulk API

Bulk API is based on REST principles and is optimized for loading or deleting large sets of data. You can use it to query, queryAll, insert, update, upsert, or delete many records asynchronously by submitting batches. Salesforce processes batches in the background.

SOAP API, in contrast, is optimized for real-time client applications that update a few records at a time. You can use SOAP API for processing many records, but when the data sets contain hundreds of thousands of records, SOAP API is less practical. Bulk API is designed to make it simple to process data from a few thousand to millions of records.

Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your org. The most common use is to migrate changes from a sandbox or testing org to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

The easiest way to access the functionality in Metadata API is to use the Force.com IDE or Ant Migration Tool. Both tools are built on top of Metadata API and use the standard Eclipse and Ant tools, respectively, to simplify working with Metadata API.

- Force.com IDE is built on the Eclipse platform, for programmers familiar with integrated development environments. Code, compile, test, and deploy from within the IDE.
- The Ant Migration Tool is ideal if you use a script or the command line for moving metadata between a local directory and a Salesforce org.

Apex

Use Apex if you want to:

- Create Web services.
- Create email services.
- Perform complex validation over multiple objects.
- Create complex business processes that are not supported by workflow.
- Create custom transactional logic (logic that occurs over the entire transaction, not just with a single record or object).
- Attach custom logic to another operation, such as saving a record, so that it occurs whenever the operation is executed, regardless of whether it originates in the user interface, a Visualforce page, or from SOAP API.

For more information, see the [Apex Developer Guide](#).

Visualforce

Visualforce consists of a tag-based markup language that gives developers a more powerful way of building applications and customizing the Salesforce user interface. With Visualforce you can:

- Build wizards and other multistep processes.
- Create your own custom flow control through an application.
- Define navigation patterns and data-specific rules for optimal, efficient application interaction.

For more information, see the [Visualforce Developer's Guide](#).

Customize, Integrate, and Extend Your Salesforce Solutions

The Lightning platform allows you to customize, integrate, and extend your Salesforce organization using the language and platform of your choice:

- **Customize Salesforce** with custom fields, links, objects, page layouts, buttons, record types, s-controls, and tabs to meet specific business requirements.
- **Integrate Salesforce** with your organization's ERP and finance systems, deliver real-time sales and support information to company portals, and populate critical business systems with customer information.
- **Extend Salesforce** in presentation, business logic, and data services with new functionality that reflects the business requirements of your organization.

For more information about Lightning Platform solutions, developer resources, and community resources, go to [Salesforce Developers](#).

Supported Salesforce Editions

To use SOAP API, your organization must use Enterprise Edition, Performance Edition, Unlimited Edition, or Developer Edition. If you are an existing Salesforce customer and want to upgrade to Enterprise, Unlimited, or Performance Edition, contact your account representative.

To develop Web service client applications, it is strongly recommended that you use Developer Sandbox, which is an exact replica of your Salesforce deployment, including all customization and data. For more information, see

<http://www.salesforce.com/products/sandbox.jsp>.

Developer Edition provides access to all of the features available with Enterprise Edition. Developer Edition is constrained only by the number of users and the amount of storage space. Developer Edition provides a development context that allows you to build and test your solutions without affecting your organization's live data. Developer Edition accounts are available for free at

https://developer.salesforce.com/page/Getting_Started.

Standards Compliance

SOAP API is implemented to comply with the following specifications:

Standard Name	Website
Simple Object Access Protocol (SOAP) 1.1	
Web Service Description Language (WSDL) 1.1	http://www.w3.org/TR/2001/NOTE-wsdl-20010315
WS-I Basic Profile 1.1	http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html

Development Platforms

SOAP API works with current SOAP development environments, including, but not limited to, Visual Studio .NET 2005. In this document, we provide examples in Java and C# (.NET). The Java examples are based on WSC 20.0 (WSC) and JDK 6 (Java Platform Standard Edition Development Kit 6). Additional versions of WSC are available at <https://github.com/forcedotcom/wsc> and <http://mvnrepository.com/artifact/com.force.api/force-wsc>. To see a complete list of compatible development platforms and more sample code, go to developer.salesforce.com.

 **Note:** Development platforms vary in their SOAP implementations. Implementation differences in certain development platforms might prevent access to some or all of the features in the API. If you are using Visual Studio for .NET development, we recommend that you use Visual Studio 2003 or higher.

SOAP API Support Policy

Salesforce recommends that your new client applications use the most recent version of the Lightning Platform WSDL file to fully exploit the benefits of richer features and greater efficiency. You can navigate to the most recent WSDL for your organization from Setup by entering *API* in the Quick Find box, then selecting **API**. When a new version is released, use the following steps in [Quick Start](#) to update your WSDL:

- Regenerate the WSDL file (see [Step 2: Generate or Obtain the Web Service WSDL](#))
- Import it into your environment (see [Step 3: Import the WSDL File Into Your Development Platform](#))

Backward Compatibility

Salesforce strives to make backward compatibility easy when using the Lightning platform.

Each new Salesforce release consists of two components:

- A new release of platform software that resides on Salesforce systems
- A new version of SOAP API

For example, the Winter '07 release included SOAP API version 9.0 and the Summer '07 release included SOAP API version 10.0.

We maintain support for each SOAP API version across releases of the platform software. SOAP API is backward compatible in that an application created to work with a given SOAP API version will continue to work with that same SOAP API version in future platform software releases.

Salesforce does not guarantee that an application written against one SOAP API version will work with future SOAP API versions: Changes in method signatures and data representations are often required as we continue to enhance SOAP API. However, we strive to keep SOAP API consistent from version to version with minimal if any changes required to port applications to newer SOAP API versions.

For example, an application written using SOAP API version 9.0 which shipped with the Winter '07 release will continue to work with SOAP API version 9.0 on the Summer '07 release and on future releases beyond that. However, that same application may not work with SOAP API version 10 without modifications to the application.

SOAP API End-of-Life

Salesforce is committed to supporting each SOAP API version for a minimum of three years from the date of first release. In order to improve the quality and performance of SOAP API, versions that are more than three years old may cease to be supported.

When a SOAP API version is scheduled to be unsupported, an advance end-of-life notice will be given at least one year before support for SOAP API version is ended. Salesforce will directly notify customers using SOAP API versions scheduled for end of life.

Choosing a WSDL

There are two Lightning Platform Web services for which you can obtain WSDL files for API access:

- **Lightning Platform Enterprise WSDL**—This API is for most enterprise users who are developing client applications for their organization. The enterprise WSDL file is a strongly typed representation of your organization's data. It provides information about your schema, data types, and fields to your development environment, allowing for a tighter integration between it and the Lightning Platform Web service. This WSDL changes if custom fields or custom objects are added to, renamed, or removed from, your organization's Salesforce configuration. If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL.

Note the following when generating the enterprise WSDL:

- If new custom fields or objects are added to, renamed, or removed from your organization's information, you need to regenerate the WSDL file in order to access them.
 - The generated WSDL contains the objects and fields in your organization, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.
- **Lightning Platform Partner WSDL**—This API is for Salesforce partners who are developing client applications for multiple organizations. As a loosely-typed representation of the Salesforce object model, the [partner WSDL](#) can be used to access data within any organization.

Related Resources

The Salesforce developer website provides a full suite of developer toolkits, sample code, sample SOAP messages, community-based support, and other resources to help you with your development projects. Be sure to visit

https://developer.salesforce.com/page/Getting_Started for more information, or visit

<https://developer.salesforce.com/signup> to sign up for a free Developer Edition account.

You can visit these websites to find out more about Salesforce applications:

- [Salesforce](#) for information about the Salesforce application.
- [Salesforce AppExchange](#) for access to apps created for Salesforce.
- [Salesforce.com Community](#) for services to ensure Salesforce customer success.

Quick Start

Use this quick start to create a sample application in your development environment.

 **Note:** Before you begin building an integration or other client application:

- Install your development platform according to its product documentation.
- Read through all the steps before beginning this quick start. You may also wish to review the rest of this document to familiarize yourself with terms and concepts.

Step 1: Obtain a Salesforce Developer Edition Organization

If you are not already a member of the Lightning Platform developer community, go to developer.salesforce.com/signup and follow the instructions for signing up for a Developer Edition organization. Even if you already have Enterprise Edition, Unlimited Edition, or Performance Edition, use Developer Edition for developing, staging, and testing your solutions against sample data to protect your organization's live data. This is especially true for applications that insert, update, or delete data (as opposed to simply reading data).

If you already have a Developer Edition organization, verify that you have the API Enabled permission. This permission is enabled by default, but may have been changed by an administrator. For more information, see the help in the Salesforce user interface.

Step 2: Generate or Obtain the Web Service WSDL

To access the Lightning Platform Web service, you need a Web Service Description Language (WSDL) file. The WSDL file defines the Web service that is available to you. Your development platform uses this WSDL to generate an API to access the Lightning Platform Web service it defines. You can either obtain the WSDL file from your organization's Salesforce administrator or you can generate it yourself if you have access to the WSDL download page in the Salesforce user interface. You can navigate to the most recent WSDL for your organization from Setup by entering *API* in the Quick Find box, then selecting **API**.

For more information about WSDL, see <http://www.w3.org/TR/wsdl>.

Generating the WSDL File for Your Organization

Any user with the Modify All Data permission can download the Web Services Description Language (WSDL) file to integrate and extend Salesforce using the API. (The System Administrator profile has this permission.)

The WSDL file is dynamically generated based on which type of WSDL file (enterprise or partner) you download. The generated WSDL defines all of the API calls, objects (including standard and custom objects), and fields that are available for API access for your organization.

To generate the WSDL file for your organization:

1. Log in to your Enterprise, Unlimited, Performance, or Developer Edition Salesforce account. You must log in as an administrator or as a user who has the "Modify All Data" permission. Logins are checked to ensure they are from a known IP address. For more information, see "Restrict Where and When Users Can Log In to Salesforce" in the Salesforce online help.
2. From Setup, enter *API* in the Quick Find box, then select **API** to display the WSDL download page.
3. Download the [appropriate WSDL](#):
 - If you're downloading an enterprise WSDL and you have managed packages installed in your org, click **Generate Enterprise WSDL**. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.
 - Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As**.

Step 3: Import the WSDL File Into Your Development Platform

Once you have the WSDL file, you need to import it into your development platform so that your development environment can generate the necessary objects for use in building client Web service applications in that environment. This section provides sample instructions for WSC and Microsoft Visual Studio. For instructions about other development platforms, see your platform's product documentation.

 **Note:** The process for importing WSDL files is identical for the enterprise and partner WSDL files.

Instructions for Java Environments (WSC)

Java environments access the API through Java objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Each SOAP client has its own tool for this process. For WSC, use the `wsd1c` utility.

 **Note:** Before you run `wsd1c`, you must have the WSC JAR file installed on your system and referenced in your classpath.

The basic syntax for `wsd1c` is:

```
java -classpath pathToJAR/wsc-22.jar com.sforce.ws.tools.wsd1c pathToWsd1/Wsd1Filename
pathToOutputJar/OutputJarFilename
```

This command generates an output jar file based on the specified WSDL file. After the output jar file is created, reference it along with the wsc jar file (for example, `wsc-22.jar`) in your Java program to create a client application.

Instructions for Microsoft Visual Studio

Visual Studio languages access the API through objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Once you have the proxy classes for the server-side objects, you need to ensure that you specify whether you have set any values on non-string fields. For more information, see [Implementation Considerations](#).

Visual Studio provides two approaches for importing your WSDL file and generating an XML Web service client: an IDE-based approach and a command line approach. This walkthrough describes how to import your WSDL file through the IDE.

 **Note:** Before you begin, the first step is to create a new application or open an existing application in Visual Studio. In addition, you need to have generated the WSDL file, as described in [Generating the WSDL File for Your Organization](#).

An XML Web service client is any component or application that references and uses an XML Web service. This does not necessarily need to be a client-based application. In fact, in many cases, your XML Web service clients might be other Web applications, such as Web Forms or even other XML Web services. When accessing XML Web services in managed code, a proxy class and the .NET Framework handle all of the infrastructure coding.

To access an XML Web service from managed code:

1. Name your project `walkthrough` or change the `using` directive in the following sample to `your_project_name.web_reference_name`. Then, add a Web reference to your project for the XML Web service that you want to access. The Web reference creates a proxy class with methods that serve as proxies for each exposed method of the XML Web service.
2. Add the namespace for the Web reference.
3. Create an instance of the proxy class and then access the methods of that class as you would the methods of any other class.

You can add either a .NET 2.0 style Web reference, or a .NET 3.0 style Service reference, depending on your version of Visual Studio and preferred developer environment. A .NET 3.0 style reference uses services like `SoapClient` instead of `SforceService`.

To add a Web reference:

 **Note:** These steps may be different depending on the version of Visual Studio that you're using. For more information, see "Adding and Removing Web References" in the Visual Studio documentation.

1. If you are using Visual Studio 2010 or earlier, on the Project menu, choose **Add Web Reference**. For later versions of Visual Studio, on the Project menu, choose **Add Service Reference**, select **Advanced** and then select **Add Web Reference**.
2. In the URL box of the Add Web Reference dialog box, type the URL to obtain the service description of the XML Web service you want to access, such as:

```
c:\WSDLFiles\enterprise.wsdl
```

3. Click **Go** to retrieve information about the XML Web service.
4. In the Web reference name box, rename the Web reference to `sforce`, which is the name you will use for this Web reference.
5. Click **Add Reference** to add a Web reference for the target XML Web service.
6. Visual Studio retrieves the service description and generates a proxy class to interface between your application and the XML Web service.

 **Note:** If you are using Visual Basic .Net 1.1 and the enterprise WSDL, you will need to modify the generated Web service client to overcome a bug in Visual Studio's client generation utility. The API exposes two objects ([Case](#) and [Event](#)) whose names conflict with Visual Basic keywords. When the classes that represent these objects are created, Visual Studio wraps the class names with brackets (`[Case]` and `[Event]`). This is the method by which you can reuse keywords.

Unfortunately, in the definition of the `SObject` class, Visual Studio does not wrap `Case` and `Event` to class references in the `System.Xml.Serialization.XmlIncludeAttribute` that are part of the `SObject` definition. To work around this problem in Visual Studio, you need to edit the `XmlIncludeAttribute` settings for `Case` and `Event` as shown below. This does not apply to C# and only applies when using the enterprise version of the WSDL.

```
System.Xml.Serialization.XmlIncludeAttribute(GetType([Event])), _
System.Xml.Serialization.XmlIncludeAttribute(GetType([Case])), _
```

Step 4: Walk Through the Sample Code

Once you have imported your WSDL file, you can begin building client applications that use the API. Use the following samples to create a basic client application. Comments embedded in the sample explain each section of code.

Java Sample Code

This section walks through a sample Java client application that uses the WSC SOAP client. The purpose of this sample application is to show the required steps for logging into the login server and to demonstrate the invocation and subsequent handling of several API calls.

To run this sample, you must pass the authentication endpoint URL as an argument for your program. You can obtain this URL from the WSDL file. This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds, retrieves user information and writes it to the console along with session information.

3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines [the objects that are available to the logged in user](#). This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The `DescribeGlobalResult` is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string (`"SELECT FirstName, LastName FROM Contact"`), and iterating through the returned `QueryResult`.
6. Calls `logout()` to log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

```
package com.example.samples;

import java.io.BufferedReader;
import java.io.FileNotFoundException;
import java.io.InputStreamReader;
import java.io.IOException;
import com.sforce.soap.enterprise.DeleteResult;
import com.sforce.soap.enterprise.DescribeGlobalResult;
import com.sforce.soap.enterprise.DescribeGlobalSObjectResult;
import com.sforce.soap.enterprise.DescribeSObjectResult;
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.soap.enterprise.Error;
import com.sforce.soap.enterprise.Field;
import com.sforce.soap.enterprise.FieldType;
import com.sforce.soap.enterprise.GetUserInfoResult;
import com.sforce.soap.enterprise.LoginResult;
import com.sforce.soap.enterprise.PicklistEntry;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.subject.Account;
import com.sforce.soap.enterprise.subject.Contact;
import com.sforce.soap.enterprise.subject.SObject;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;

public class QuickstartApiSample {

    private static BufferedReader reader = new BufferedReader(
        new InputStreamReader(System.in));

    EnterpriseConnection connection;
    String authEndPoint = "";

    public static void main(String[] args) {
        if (args.length < 1) {
            System.out.println("Usage: com.example.samples."
                + "QuickstartApiSamples <AuthEndPoint>");

            System.exit(-1);

C# Sample Code

This section walks through a sample C# client application. The purpose of this sample application is to show the required steps for logging in and to demonstrate the invocation and subsequent handling of several API calls.

This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds:
 - Sets the returned `sessionId` into the session header, which is required for session authentication on subsequent API calls.
 - Resets the Lightning Platform endpoint to the returned `serverUrl`, which is the target of subsequent API calls.

All client applications that access the API must complete the tasks in this step before attempting any subsequent API calls.

 - Retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines [the objects that are available to the logged in user](#). This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The `DescribeGlobalResult` is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string (`"SELECT FirstName, LastName FROM Contact"`), and iterating through the returned `QueryResult`.
6. Calls `logout()` to log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

The following code begins the sample C# client application.

```

- [Tooling API Objects in the Enterprise WSDL](#)
- [Salesforce AppExchange Object Prefixes and the API](#)
- [Custom Objects](#)
- [External Objects](#)

Generally speaking, API objects represent database tables that contain your organization's information. For example, the central object in the Salesforce data model represents accounts—companies and organizations involved with your business, such as customers, partners, and competitors. The term “record” describes a particular occurrence of an object (such as a specific account like “IBM” or “United Airlines” that is represented by an Account object). A record is analogous to a row in a database table.

Objects already created for you by Salesforce are called standard objects. Objects you create in your organization are called custom objects. Objects you create that map to data stored outside your organization are called external objects.

While this document describes all of the objects available in the API, your applications work with only the objects that you are authorized to access. Programmatic access to objects is determined by the objects defined in your organization, your organization configuration, your user permissions and access settings (which are configured by your organization's system administrator), your data sharing model, and other factors related specifically to the object.

Most of the objects accessible through the API are read-write objects. However, there are a few objects that are read-only. This fact is noted in the description for the object.

Primitive Data Types

The API uses the following primitive data types:

Value	Details
base64	Base 64-encoded binary data. Fields of this type are used for storing binary files in Attachment records, Document records, and Scontrol records. In these objects, the <code>Body</code> or <code>Binary</code> field contains the (base64 encoded) data, while the <code>BodyLength</code> field defines the length of the data in the <code>Body</code> or <code>Binary</code> field. In the Document object, you can specify a URL to the document instead of storing the document directly in the record.
boolean	Boolean fields have one of these values: <code>true</code> (or 1), or <code>false</code> (or 0).
byte	A set of bits.
date	<p>Date data. Fields of this type contain date values, such as <code>ActivityDate</code> in the Event object. Unlike <code>dateTime</code> fields, date fields contain no time value—the time portion of a date field is not relevant and is always set to midnight in the Coordinated Universal Time (UTC) time zone.</p> <p>If you specify a date value in a query, you can filter on date fields only.</p>
dateTime	<p>Date/time values (timestamps). Fields of this type handle date/time values (timestamps), such as <code>ActivityDateTime</code> in the Event object or the <code>CreatedDate</code>, <code>LastModifiedDate</code>, or <code>SystemModstamp</code> in many objects. Regular <code>dateTime</code> fields are full timestamps with a precision of one second. They are always transferred in the Coordinated Universal Time (UTC) time zone. In your client application, you might need to translate the timestamp to or from a local time zone.</p> <p>If you specify a <code>dateTime</code> value in a query, you can filter on <code>dateTime</code> fields only.</p> <p>Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.</p> <p> Note: The Event object has a <code>DurationInMinutes</code> field that specifies the number of minutes for an event. Even though this is a temporal value, it is an integer type—not a <code>dateTime</code> type.</p>
double	<p>Double values. Fields of this type can contain fractional portions (digits to the right of the decimal place), such as <code>ConversionRate</code> in <code>CurrencyType</code>. In the API, all non-integer values (such as Currency Field Type and Percent Field Type) contain values of type double. Some restrictions may be applied to double values:</p> <ul style="list-style-type: none"> • <code>scale</code>: Maximum number of digits to the right of the decimal place. • <code>precision</code>: Total number of digits, including those to the left and the right of the decimal place <p>The maximum number of digits to the left of the decimal place is equal to <code>precision</code> minus <code>scale</code>. In the online application, <code>precision</code> is defined differently—it is the maximum number of digits allowed to the left of the decimal place.</p> <p>Values can be stored in scientific notation if the number is large enough (or, for negative numbers, small enough), as indicated by the W3C XML Schema Part 2: Datatypes Second Edition specification.</p> <p> Warning: When the user sets the precision in custom fields in the Salesforce application, it displays the precision set by the user, even if the user enters a more precise value than defined for those</p>

Value	Details
	fields. However, when you set the precision in custom fields using the API, no rounding occurs when the user retrieves the number field.
int	Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the <code>NumberOfEmployees</code> in an <code>Account</code> . For integer fields, the <code>digits</code> field specifies the maximum number of digits that an integer can have.
string	Character strings. Fields that are of data type <code>string</code> contain text and some have length restrictions depending on the data being stored. For example, in the <code>Contact</code> object, the <code>FirstName</code> field is 40 characters, the <code>LastName</code> field is 80 characters, the <code>MailingStreet</code> is 255 characters.  Note: For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code <code>STRING_TOO_LONG</code> is returned. <code>AllowFieldTruncationHeader</code> allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: <code>anyType</code> , <code>email</code> , <code>encryptedstring</code> , <code>multipicklist</code> , <code>phone</code> , <code>picklist</code> , <code>string</code> , and <code>textarea</code> .
time	Time values. Fields of this type handle time values, such as <code>FridayEndTime</code> in the <code>BusinessHours</code> object. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.

These data types are used in the SOAP messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these SOAP data types.

The primitive data types are:

- specified in the World Wide Web Consortium's publication *XML Schema Part 2: Data Types* at the following URL: <http://www.w3.org/TR/xmlschema-2/>.
- enumerated in the `SOAPType` field of the Field type, which is described in the `fields` property of the `DescribeSObjectResult`.

Primitive types are used as a standardized way to define, send, receive, and interpret basic data types in the SOAP messages exchanged between client applications and the API. In addition, primitive data types are interpreted in a Salesforce-specific way, which is useful for display formatting and for numeric conversion (adding values of different currencies).

For example, Salesforce chooses to interpret a double value passed via SOAP as a `double` in a number of possible ways, depending on the field definition. If the field type for that data is currency, Salesforce handles the display of the data by prepending it with a currency symbol and inserting a decimal for precision. Similarly, if the field type is percent, Salesforce handles the display of the data by appending a percent sign (%). Regardless of the field type, however, the value is sent in the SOAP message as a double.

The API uses data types called field types that are defined in the WSDLs. For more information, see [Field Types](#).

Field Types

In addition to the primitive data types, the API defines the following data types for fields:

 **Note:** For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. `AllowFieldTruncationHeader` allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: `anyType`, `email`, `encryptedstring`, `multipicklist`, `phone`, `picklist`, `string`, and `textarea`.

Field Type	What the Field Contains
address	A compound data type that contains address field data. See Address Compound Fields .
anyType	Polymorphic data type that returns string, picklist, reference, Boolean, currency, int, double, percent, ID, date, datetime, url, or email data depending on the kind of field involved. See AnyType Field Type .
calculated	Fields that are defined by a formula. See Calculated Field Type .
combobox	A combobox, which includes a set of enumerated values and allows the user to specify a value not in the list. See ComboBox Field Type .
currency	Currency values. See Currency Field Type .
DataCategoryGroupReference	Reference to a data category group or a category unique name. See DataCategoryGroupReference Field Type .
email	Email addresses. See Email Field Type .
encryptedstring	Encrypted text fields contain any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Available in API versions 11.0 and later.
ID	<p>Primary key field for the object. See ID Field Type.</p> <p>Note that most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Please consult your Web services toolkit documentation for more information.</p>
JunctionIdList	<p>A string array of referenced ID values that represent the many-to-many relationship of an underlying junction entity. Query and manipulate the string array to query and manipulate the underlying junction entities in a single API call. See: JunctionIdList Field Type</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
location	A compound data type that contains latitude and longitude values for geolocation fields. See Geolocation Compound Field .
masterrecord	When records are merged, the ID of the record that is saved (the other records are deleted).
multipicklist	Multi-select picklists, which include a set of enumerated values from which multiple values can be selected. See Multi-Select Picklist Field Type .
percent	Percentage values. See Percent Field Type .

Field Type	What the Field Contains
phone	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting. See Phone Field Type .
picklist	Picklists, which include a set of enumerated values from which one value can be selected. See Picklist Field Type .
reference	Cross-references to a different object. Analogous to a foreign key field in SQL. See Reference Field Type .
textarea	String that is displayed as a multiline text field. See Textarea Field Type .
url	URL values. Client applications should commonly display these as hyperlinks. See URL Field Type .

These field types extend [primitive data types](#). While many of these field types follow common data typing conventions that are made explicit in their metadata, certain field types have unique characteristics that you need to understand before using them in your client application.

These field types apply to both standard and custom fields. They are enumerated in the `type` field of the [Field](#) type, which is described in the `fields` property of the `DescribeSObjectResult`.

 **Note:** Some numeric fields have precision and scale limits. In addition, certain text fields have length restrictions. These restrictions are enforced when you `create()` or `update()` objects. However, the API may return data that does not meet these restrictions.

AnyType Field Type

The `anyType` field type is dynamic and returns `string`, `date`, `number`, or `boolean` data depending on the kind of field involved. For example, the element in a SOAP message has an `xsi:type="xsd:string"` attribute if the field is of type `string`. This field type is used in history objects for the `NewValue` and `OldValue` fields. It is also a valid field type for `fieldType` and `soapType`.

 **Note:** Most SOAP toolkits automatically deserialize this element into the correct native type.

Calculated Field Type

Calculated fields are read-only fields in the API. These are fields defined by a formula, which is an algorithm that derives its value from other fields, expressions, or values. You can filter on these fields in SOQL, but you should not replicate these fields. The length of text calculated fields is 3900 characters or less—anything longer will be truncated.

Calculated fields are called formula fields in the Salesforce user interface.

ComboBox Field Type

A combobox is a picklist that also allows users to type a value that is not already specified in the list. A combobox is defined as a string value.

Currency Field Type

Currency fields contain currency values, such as the `ExpectedRevenue` field in a Campaign, and are defined as type `double`.

For organizations that have the multicurrency option enabled, the `CurrencyIsoCode` field is defined for any object that can have currency fields. The `CurrencyIsoCode` field and currency fields are linked in a special way. On any specific record, the `CurrencyIsoCode` field defines the currency of that record, and thus, the values of all currency fields on that record will be expressed in that currency.

For most cases, clients do not need to consider the linking of the `CurrencyIsoCode` field and the currency fields on an object. However, clients may need to consider the following:

- The `CurrencyIsoCode` field exists only for those organizations that have enabled multicurrency support.
- When displaying the currency values in a user interface, it is preferred to prepend each currency value with its `CurrencyIsoCode` value and a space separator.
- The `CurrencyIsoCode` field is a restricted picklist field. The set of allowable values, defined in the `CurrencyType` object, can vary from organization to organization. Attempting to set it to a value that is not defined for an organization causes the operation to be rejected.
- If you update the `CurrencyIsoCode` field on an object, it implicitly converts all currency values on that object to the new currency code, using the conversion rates that are defined for that organization in the Salesforce user interface. If you specify currency values in that same `update()` call, the new currency values you specify are interpreted in the new `CurrencyIsoCode` field value, without conversion.
- The picklist values in a `CurrencyIsoCode` field do not exactly match the labels displayed in Salesforce.

To perform currency conversions, client applications can look up the `CurrencyIsoCode` in the `CurrencyType` object.

DataCategoryGroupReference Field Type

A data category group has categories that classify articles in Salesforce Knowledge and questions in the Answers feature. Every article and question object has two fields of type `DataCategoryGroupReference` which contain the category group and category unique name. You can use the `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` calls to retrieve the category groups and categories associated to these objects.

Email Field Type

Email fields contain email addresses. Client applications are responsible for specifying valid and properly formatted email addresses in `create()` and `update()` calls.

ID Field Type

With rare exceptions, all objects in the API have a field of type `ID` that is named `Id` and contains a unique identifier for each record in the object. It is analogous to a primary key in relational databases. When you `create()` a new record, the Web service generates an `ID` value for the record, ensuring that it is unique within your organization's data. You cannot use the `update()` call on `ID` fields. Because the `ID` value stays constant over the lifetime of the record, you can refer to the record by its `ID` value in subsequent API calls. Also, the `ID` value contains a three-character code that identifies the object type, which client applications can retrieve via the `describeSObjects()` call.

In addition, certain objects, including custom objects, have one or more fields of type `reference` that contain the `ID` value for a related record. These fields have names that end in the suffix `-Id`, for example, `OwnerId` in the account object. `OwnerId` contains the `ID` of the user who owns that object. Unlike the field named `Id`, `reference` fields are analogous to foreign keys and can be changed via the `update()` call. For more information, see [Reference Field Type](#).

Some API calls, such as `retrieve()` and `delete()`, accept an array of IDs as parameters—each array element uniquely identifies the row to retrieve or delete. Similarly, the `update()` call accepts an array of sObject records—each sObject contains an `Id` field that uniquely identifies the sObject.

ID fields in the Salesforce user interface contain 15-character, base-62, case-sensitive strings. Each of the 15 characters can be a numeric digit (0-9), a lowercase letter (a-z), or an uppercase letter (A-Z). Two unique IDs may only be different by a change in case.

Because there are applications like Access which do not recognize that 50130000000014c is a different ID from 50130000000014C, an 18-digit, case-safe version of the ID is returned by all API calls. The 18 character IDs have been formed by adding a suffix to each ID in the Lightning Platform API. 18-character IDs can be safely compared for uniqueness by case-insensitive applications, and can be used in all API calls when creating, editing, or deleting data.

If you need to convert the 18-character ID to a 15-character version, truncate the last three characters. Salesforce recommends that you use the 18-character ID.

 **Note:** Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Please consult your web services toolkit documentation for more information.

JunctionIdList Field Type

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID.

Query `JunctionIdList` fields just like any other field. Here's an example of a SOQL query that includes the `TaskWhoIds` `JunctionIdList` field.

```
SELECT Id, Subject, TaskWhoIds
FROM Task
WHERE LastModifiedDate > LAST_WEEK
```

Multi-Select Picklist Field Type

Multi-select picklist fields contain a list of one or more items from which a user can choose multiple items. One of the items can be configured as the default item. Selections are maintained as a string containing a series of attributes delimited by semicolons. For example, a query might return the values of a multivalue picklist as "first value; second value; third value". For information on querying multi-select picklists, see [Querying Multi-Select Picklists](#) in the *Salesforce SOQL and SOSL Reference Guide*.

Percent Field Type

Percent fields contain percent values. Percent fields are defined as type double.

Phone Field Type

Phone fields contain phone numbers, which can include alphabetic characters. Client applications are responsible for phone number formatting.

Picklist Field Type

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as drop-down lists in the Salesforce user interface. One of the items can be configured as the default item.

In the Field object associated with the DescribeSObjectResult, the `restrictedPicklist` field defines whether the field is a restricted picklist or not. The API does not enforce the list of values for advisory (unrestricted) picklist fields on `create()` or `update()`. When inserting an unrestricted picklist field that does not have a PicklistEntry, the system creates an “inactive” picklist value. This value can be promoted to an “active” picklist value by adding the picklist value in the Salesforce user interface.

When creating new, inactive picklists, the API checks to see if there is a match. This check is case-insensitive.

In the Field object associated with the DescribeSObjectResult, the `picklistValues` field contains an array of items (PicklistEntry objects). Each PicklistEntry defines the item’s label, value, and whether it is the default item in the picklist (a picklist has no more than one default value).

Enumerated fields support localization of the labels to the language of the user. For example, for the `Industry` field on an Account, the value “Agriculture” may be translated to various languages. The enumerated field values are fixed and do not change with a user’s language. However, each value may have a specified “label” field that provides the localized label for that value. You must always use the value when inserting or updating a field. The `query()` call always returns the value, not the label. The corresponding label for a value in the describeSObjectResult should be used when displaying the value to the user in any user interface.

The API supports the retrieval of the certain picklists in the following objects: CaseStatus, ContractStatus, LeadStatus, OpportunityStage, PartnerRole, SolutionStatus, TaskPriority, and TaskStatus. Each object represents a value in the respective picklist. These picklist entries always specify some other piece of information, such as whether the status is converted, and so on. Your client application can invoke the `query()` call on any of these objects (such as CaseStatus) to retrieve the set of values in the picklist, and then use that information while processing other objects (such as Case objects) to find more information about those objects (such as a given case). These objects are read-only via the API. To modify items in picklists, you must use the Salesforce user interface.

Reference Field Type

A reference field contains an `Id` value that points to a unique record (usually the parent record) on another object. This is analogous to the concept of a foreign key in relational databases. The name of a reference field ends, by convention, with the letters `Id` (such as `CaseId` or `OpportunityId`). For example, in the OpportunityCompetitor object, the `OpportunityId` field is a reference field that points to the Opportunity object. It contains an ID value that uniquely identifies an Opportunity record.

In some cases, an object can refer to another object of its same type. For example, an Account can have a parent link that points to another Account.

The Event and Task objects both have `whoId` and `whatId` cross-reference ID fields. Each of these cross-reference fields can point to one of several other objects. The `whoId` field can point to a Contact or Lead, and the `whatId` field can point to an Account, Opportunity, Campaign, or Case. In addition, if the `whoId` field refers to a Lead, then the `whatId` field must be empty.

You can describe and query each cross-referenced object. When you query a cross-reference ID field, it returns an object ID of the appropriate type. You can then query that ID to get additional information about the object, using the ID in the `id` field for that query.

The cross-reference ID field value is either:

- a valid record in your organization, or
- an empty value, which indicates an empty reference

The cross-reference ID field value, if non-null, is guaranteed to be an object in your organization. However, it is not guaranteed that you can query that object. Users with the “View All Data” permission can always query that object. Other users may be restricted from viewing or editing the referenced object.

When specifying a value for a cross-reference ID field in a `create()` or `update()` call, the value must be a valid value of type ID, and the user must have appropriate access to that object. The exact requirements vary from field to field.

Textarea Field Type

Textarea fields contain text that can be longer than 4000 bytes. Unlike string fields, textarea fields cannot be specified in the WHERE clause of a `queryString` of a `query()` call. To filter records on this field, you must do so while processing records in the `QueryResult`. For fields with this restriction, its `filterable` field in the `Field` type (described in the `fields` property of the `DescribeSObjectResult`) is `false`.

URL Field Type

URL fields contain URLs. Client applications are responsible for specifying valid and properly formatted URLs in `create()` and `update()` calls.

Compound Fields

Compound fields group together multiple elements of primitive data types, such as numbers or strings, to represent complex data types, such as a location or an address. Compound fields are an abstraction that can simplify application code that handles the values, leading to more concise, understandable code.

Address compound fields are available in the SOAP and REST APIs in API version 30.0 and later. Geolocation fields are available in the SOAP and REST APIs in API version 26.0 and later, with some limitations on SOAP for API versions below 30.0.

Compound fields are accessible as a single, structured field, or as individual component fields. The values contained within the compound field and the values in individual fields both map to the same underlying data stored in Salesforce; they always have identical values. Code that references individual component fields is unaffected by the new compound fields.

Compound fields are read-only. Changes are performed by writing to the individual component fields. This maintains a single, consistent method for performing updates, and avoids the possibility of conflicts. For example, if both the `BillingAddress` compound field and `BillingCity` individual component field were updated in the same API call, it would be unclear which value should be saved.

Compound fields are available only through the SOAP and REST APIs. Compound fields are described in both the Enterprise and Partner WSDLs. Update your WSDL to at least API 30.0 to access the new compound data types.

Address Compound Fields

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an `Address`, a structured compound data type, as well as individual address elements.

The `Address` type extends the `Location` type, the data type used for compound geolocation fields. Using API 30.0 and later, standard addresses are available in the SOAP and REST APIs as a compound field of type `Address`, a structured data type that combines the following fields.

Field	Type	Description
<code>Accuracy</code>	<code>picklist</code>	Accuracy level of the geocode for the address. For example, this field is known as <code>MailingGeocodeAccuracy</code> on <code>Contact</code> .
<code>City</code>	<code>string</code>	The city detail for the address. For example, this field is known as <code>MailingCity</code> on <code>Contact</code> .
<code>Country</code>	<code>string</code>	The country detail for the address. For example, this field is known as <code>MailingCountry</code> on <code>Contact</code> .

Field	Type	Description
CountryCode	picklist	The ISO country code for the address. For example, this field is known as <code>MailingCountryCode</code> on Contact. <code>CountryCode</code> is always available on compound address fields, whether or not state and country picklists are enabled in your organization.
Latitude	double	Used with <code>Longitude</code> to specify the precise geolocation of the address. For example, this field is known as <code>MailingLatitude</code> on Contact.
Longitude	double	Used with <code>Latitude</code> to specify the precise geolocation of the address. For example, this field is known as <code>MailingLongitude</code> on Contact.
PostalCode	string	The postal code for the address. For example, this field is known as <code>MailingPostalCode</code> on Contact.
State	string	The state detail for the address. For example, this field is known as <code>MailingState</code> on Contact.
StateCode	picklist	The ISO state code for the address. For example, this field is known as <code>MailingStateCode</code> on Contact. <code>StateCode</code> is always available on compound address fields, whether or not state and country picklists are enabled in your organization.
Street	textarea	The street detail for the address. For example, this field is known as <code>MailingStreet</code> on Contact.

Address fields are provided on many standard objects, such as Account, Contact, Quote, and User. Some objects provide fields for multiple addresses. For example, Account provides for four different addresses. In this case, address field names are prefixed with the type of address, for example, `BillingAddress`, `ShippingAddress`, and so on.

 **Note:** Standard address compound fields are read-only, and are only accessible using the SOAP and REST APIs. See [Compound Field Considerations and Limitations](#) on page 42 for additional details of the restrictions this imposes.

When an address is geocoded, its latitude and longitude fields are populated with coordinates. A related geolocation field is also populated. Typically, geocoding service providers geocode addresses, and rate the accuracy of the geocodes.

The accuracy subfield `GeocodeAccuracy` stores the accuracy data for a geocoded location. External geolocation apps can get the accuracy level of a geocoded address via the API. When you retrieve an address via the API, any accuracy data is included. You can also retrieve the accuracy information by itself, if needed.

Like its parent, the compound `Address` field, the `GeocodeAccuracy` field is only available for standard address fields on standard objects.

Retrieving Compound Address Fields

Using compound fields can simplify code that works with addresses, especially for SOQL queries. SOQL `SELECT` clauses can reference addresses directly, instead of all of the individual component fields.

```
SELECT Name, BillingAddress
FROM Account
```

To write code that's compatible with API versions before 30.0, as well as API 30.0 and above, use the individual fields:

```
SELECT Name, BillingStreet, BillingCity, BillingState, BillingPostalCode,
       BillingCountry, BillingLatitude, BillingLongitude
FROM Account
```

Compound address field values are returned as a structured data type, `Address`. Code that works with compound address fields needs to reference the individual components of the returned value. See the code sample below.

Example: Retrieve a Standard Address Compound Field with the SOAP API

The following Java method uses the Salesforce SOAP API to retrieve and display the Mailing Address for a list of contacts.

```
// Modified version of code in the SOAP API QuickStart
private void querySample() {
    String soqlQuery = "SELECT FirstName, LastName, MailingAddress FROM Contact";
    try {
        QueryResult qr = connection.query(soqlQuery);
        boolean done = false;

        if (qr.getSize() > 0) {
            System.out.println("\nLogged-in user can see "
                + qr.getRecords().length + " contact records.");

            while (!done) {
                System.out.println("");
                SObject[] records = qr.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName();
                    String lName = con.getLastName();

                    // Access the compound address field MailingAddress
                    Address addr = (Address) con.getMailingAddress();
                    String streetAddr = "";
                    if (null != addr) streetAddr = addr.getStreet();

                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName +
                            " -- " + streetAddr);
                    } else {
                        System.out.println("Contact " + (i + 1) + ": " + fName +
                            " " + lName +
                            " -- " + streetAddr);
                    }
                }

                if (qr.isDone()) {
                    done = true;
                } else {
                    qr = connection.queryMore(qr.getQueryLocator());
                }
            }
        } else {
            System.out.println("No records found.");
        }
    }
}
```

```

    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}

```

Using Compound Address Fields as Locations

Compound address fields include latitude and longitude fields. Address fields can be used as locations in SOQL `WHERE` and `ORDER BY` clauses. For example, here's a SOQL query that uses the `GEOLOCATION` function to retrieve the 10 accounts closest to San Francisco.

```

SELECT Id, Name, BillingAddress
FROM Account
WHERE DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi') < 20
ORDER BY DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi')
LIMIT 10

```

-  **Note:** In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

Geolocation Compound Field

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

In API versions 26.0 and later, geolocation fields are available in the SOAP and REST APIs as a compound field of type `Location`. This structured data type contains the following fields.

- `latitude`
- `longitude`

-  **Note:** SOAP calls that use API versions earlier than 30.0 return geolocation compound values as strings. See “Returned Geolocation Data Types” later in this topic.

Geolocation fields are provided on many standard objects, such as Account, Contact, Quote, and User, as part of their address field or fields. Geolocation fields can also be added as custom fields to standard or custom objects.

-  **Note:**
- A geolocation compound field is read-only, although its `latitude` and `longitude` subfields are editable. You can only access compound fields using the SOAP or REST API. For more information about working with compound fields and their subfields, see [Compound Field Considerations and Limitations](#) on page 42.
 - Although geolocation fields appear as a single field in the user interface, custom geolocation fields count as *three* custom fields towards your organization's limits: one for latitude, one for longitude, and one for internal use.

Retrieving Compound Geolocation Fields

Using compound fields can simplify code that works with geolocations, especially for SOQL queries. SOQL `SELECT` clauses can reference geolocations directly, instead of the individual component fields.

```
SELECT location__c
FROM Warehouse__c
```

To write code that's compatible with API versions earlier than 26.0 and with API versions 26.0 and later, use the individual latitude and longitude fields.

```
SELECT location__latitude__s, location__longitude__s
FROM Warehouse__c
```

Returned Geolocation Data Types

A compound geolocation field value is returned as the structured data type `Location`. Code that works with compound geolocation fields must reference the individual components of the returned value. See the sample code in [Address Compound Fields](#) on page 40.

In API versions earlier than 30.0, SOAP calls return compound geolocation field values as strings, instead of as a structured data type, for backward compatibility. If you plan to display your latitude and longitude values or pass them to a service that expects strings, use the values that are returned. If you plan to use the values in mathematical calculations or pass them to a map service that expects numbers, cast the results to numbers.

The string value format is:

```
API location: [latitudeValue longitudeValue]
```

An example of a regular expression to parse out the latitude and longitude values is:

```
API location: \[([+-]?\d{1,2}([.]\d+)?) ([+-]?\d{1,3}([.]\d+)?)\]
```

The first capture is the latitude, and the third is the longitude.

Compound Field Considerations and Limitations

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

Both address and geolocation compound fields have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP and REST APIs. The compound versions of fields aren't accessible anywhere in the Salesforce user interface.
- Although compound fields can be queried with the `Location` and `Address` Apex classes, they're editable only as components of the actual field. Read and set geolocation field components by appending "`__latitude__s`" or "`__longitude__s`" to the field name, instead of the usual "`__c`." For example:

```
Double theLatitude = myObject__c.aLocation__latitude__s;
myObject__c.aLocation__longitude__s = theLongitude;
```

You can't access or set the compound value.

- You can't use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.

- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Custom geolocation and location fields on standard addresses aren't supported with email templates.
- You can't use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are `ISBLANK`, `ISCHANGED`, and `ISNULL`. You can't use `BLANKVALUE`, `CASE`, `NULLVALUE`, `PRIORVALUE`, or the equality and comparison operators with compound fields. The equality and comparison operators include `=` and `==` (equal), `<>` and `!=` (not equal), `<` (less than), `>` (greater than), `<=` (less than or equal), `>=` (greater than or equal), `&&` (AND), and `||` (OR).

Address compound fields have the following limitations.

- Compound address fields are available only for address fields that exist as part of the standard objects included in Salesforce. You can't create custom compound address fields.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.
- The accuracy subfield of address fields is populated only when an address is geocoded. Typically, geocoding service providers provide accuracy data for an address's latitude and longitude coordinates.
- Address fields can't be used in `WHERE` statements in SOQL. Address fields aren't filterable, but the `isFilterable()` method of the `DescribeFieldResult` Apex class erroneously returns `true` for address fields.

Geolocation compound fields have the following limitations.

- Geolocation fields aren't supported in custom settings.
- Geolocation fields aren't available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can't be used in filter-based workflow updates and approvals.
- `DISTANCE` formulas are supported in:
 - Entry criteria for workflow rules and approval processes
 - Field update actions in workflow rules and approval processes
 - Custom validation rules
 - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.
- Geolocation fields are supported in SOQL with the following limitations.
 - `DISTANCE` and `GEOLOCATION` are supported in `WHERE` and `ORDER BY` clauses in SOQL, but not in `GROUP BY`. `DISTANCE` is supported in `SELECT` clauses.
 - `DISTANCE` supports only the logical operators `>` and `<`, returning values within (`<`) or beyond (`>`) a specified radius.
 - When using the `GEOLOCATION` function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775, -122.418), 'km')` works but `DISTANCE(GEOLOCATION(37.775, -122.418), warehouse_location__c, 'km')` doesn't work.

- Apex bind variables aren't supported for the units parameter in `DISTANCE` or `GEOLOCATION` functions. This query doesn't work.

```
String units = 'mi';
List<Account> accountList =
    [SELECT ID, Name, BillingLatitude, BillingLongitude
     FROM Account
     WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the [SOQL and SOSL Reference](#).

API Data Types and Salesforce Field Types

Generally, API data types and field types in the user interface have the same names. For example, a date field is represented by a date data type in the API. However, some field types are represented differently depending on whether you are inspecting an object via the API or the user interface. The following table contains the mapping for field types and data types that are different:

API Data Type	Corresponding Field Types in the User Interface
ID	Lookup relationship, master-detail relationship
string	Auto number, email, phone, picklist, multi-select picklist, text, text area, long text area, rich text area, data category group reference and URL. Different maximum lengths are specified in the WSDL for text, text area, and long text area.
boolean	Checkbox
double	Currency, formula, number, percent, and roll-up summary
Varies by type	When formula fields are created in the user interface, a type must be specified. This type corresponds to the API data type of the same name: currency, date, date/time, number, percent, or text.

All other fields that you can create in the user interface fall into one of the following categories:

- The field is not available in both the user interface and the API. For example, the `BusinessHours` object has fields of API data type `time`, but you cannot create a custom field of this type.
- Field types are the same as their corresponding API data type. For example, if you create a date field in the user interface, that field is the date data type in the API.

For more information about API data types, see [Primitive Data Types](#) and [Field Types](#).

Core Data Types Used in API Calls

Many calls in the API use the following data types:

- `sObject`
- ID (String). See [ID Field Type](#).

The API also uses several error handling objects. If an error occurs during a SOAP request, the API returns a SOAP fault message. The message contains different content, depending on the type of error:

- If an error affects the entire request, an [API Fault Element](#), is returned, containing an [ExceptionCode](#) and the associated error message text.
- If the error affects some records and not others, an [Error](#) is returned, containing a [StatusCode](#). These errors typically occur during bulk operations, such as creating, updating, or deleting multiple records with a single call.

sObject

An sObject represents an object, such as an [Account](#) or [Campaign](#). For a list of standard objects, see [Standard Objects](#).

An sObject has the following properties:

Name	Type	Description
<code>fieldsToNull</code>	<code>string[]</code>	Array of one or more field names whose value you want to explicitly set to <code>null</code> . When used with <code>update()</code> or <code>upsert()</code> , you can specify only those fields that you can update and that have the <code>nullable</code> property. When used with <code>create()</code> , you can specify only those fields that you can create and that have the <code>nullable</code> or the <code>default on create</code> property. For example, if specifying an ID field or required field results in a runtime error, you can specify that field name in <code>fieldsToNull</code> . Similarly, if a picklist field has a default value and you want to set the value to <code>null</code> instead, specify the field in <code>fieldsToNull</code> .
<code>ID</code>	<code>ID</code>	Unique ID for this individual object. For the <code>create()</code> call, this value is null. For all other API calls, this value must be specified.

API Fault Element

An `ApiFault` element contains information about a fault that occurs when processing a service request. The `ApiFault` element has the following properties.

Name	Type	Description
<code>exceptionCode</code>	ExceptionCode	A code that characterizes the exception. The full list of exception codes is available in the WSDL file for your org. See Generating the WSDL File for Your Organization .
<code>exceptionMessage</code>	<code>string</code>	Exception message text.
<code>extendedErrorDetails</code>	ExtendedErrorDetails	More details about the exception, including an extended error code and extra error properties, when available. Reserved for future use.

The following table lists the API fault elements that represent all the API faults that can occur.

Fault	Description
<code>ApiQueryFault</code>	The row and column numbers where the problem occurred.
<code>LoginFault</code>	An error occurred during the <code>login()</code> call.
<code>InvalidSObjectFault</code>	An invalid sObject in a <code>describeSObject()</code> , <code>describeSObjects()</code> , <code>describeLayout()</code> , <code>describeDataCategoryGroups()</code> ,

Fault	Description
	<code>describeDataCategoryGroupStructures()</code> , <code>create()</code> , <code>update()</code> , <code>retrieve()</code> , or <code>query()</code> call.
<code>InvalidFieldFault</code>	An invalid field in a <code>retrieve()</code> or <code>query()</code> call.
<code>InvalidOrNullForRestrictedPicklist</code>	An invalid <code>appMenuType</code> in a <code>describeAppMenu()</code> call.
<code>MalformedQueryFault</code>	A problem in the <code>queryString</code> passed in a <code>query()</code> call.
<code>InvalidQueryLocatorFault</code>	A problem in the <code>queryLocator</code> passed in a <code>queryMore()</code> call.
<code>MalformedSearchFault</code>	A problem in the <code>search</code> passed in a <code>search()</code> call.
<code>InvalidIdFault</code>	A specified ID was invalid in a <code>setPassword()</code> or <code>resetPassword()</code> call.
<code>UnexpectedErrorFault</code>	An unexpected error occurred. The error is not associated with any other API fault.

ExceptionCode

The following list of `ExceptionCode` values is defined in your WSDL file. Some codes don't appear in your WSDL, depending on the features you have enabled.

API_CURRENTLY_DISABLED

Because of a system problem, API functionality is temporarily unavailable.

API_DISABLED_FOR_ORG

API access has not been enabled for the org. Contact Salesforce to enable API access.

CANT_ADD_STANDARD_PORTAL_USER_TO_TERRITORY

A user with a standard portal license can't be added to a territory.

CIRCULAR_OBJECT_GRAPH

The request failed because it contained a circular object reference.

CLIENT_NOT_ACCESSIBLE_FOR_USER

The current user does not have permission to access the specified client.

CLIENT_REQUIRE_UPDATE_FOR_USER

The current user is required to use a newer version of the specified client and doesn't have access until the client is updated.

DELETE_REQUIRED_ON_CASCADE

The delete operation triggers a cascade delete on a record, but the logged-in user does not have delete permission on that related object.

DUPLICATE_COMM_NICKNAME

You can't create a user with the same nickname as another user.

DUPLICATE_VALUE

You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_BATCH_SIZE_LIMIT_EXCEEDED

A method tried to process more email records than the maximum batch size.

EMAIL_TO_CASE_INVALID_ROUTING

An email to case record has been submitted for processing but the feature is not enabled.

EMAIL_TO_CASE_LIMIT_EXCEEDED

The daily converted email limit for the Email-to-Case feature has been exceeded.

EMAIL_TO_CASE_NOT_ENABLED

The Email-to-Case feature has not been enabled.

EXCEEDED_ID_LIMIT

Too many IDs were specified in a call. For example, more than 2000 IDs were requested in a `retrieve()` call, or more than 200 session IDs were specified in a `logout()` call.

EXCEEDED_LEAD_CONVERT_LIMIT

Too many IDs were sent to a `convertLead()` call.

EXCEEDED_MAX_SIZE_REQUEST

The size of the message sent to the API exceeded 50 MB.

EXCEEDED_MAX_TYPES_LIMIT

The number of object types to describe is too large.

EXCEEDED_QUOTA

The size limit for org data storage was exceeded during a `create()` call.

FUNCTIONALITY_NOT_ENABLED

Functionality has been temporarily disabled. Other calls continue to work.

INACTIVE_OWNER_OR_USER

The user or record owner is not active.

INACTIVE_PORTAL

The referenced portal is inactive.

INSUFFICIENT_ACCESS

The user does not have sufficient access to perform the operation.

INVALID_ASSIGNMENT_RULE

An invalid `AssignmentRuleHeader` value was specified.

INVALID_BATCH_SIZE

The query options have an invalid batch size value.

INVALID_CLIENT

The client is invalid.

INVALID_CROSS_REFERENCE_KEY

An invalid foreign key can't be set on a field. For example, an object share, such as AccountShare, can't be deleted because the share row is a result of a sharing rule.

INVALID_FIELD

The specified field name is invalid.

INVALID_FILTER_LANGUAGE

The specified language can't be used as a filter.

INVALID_FILTER_VALUE

A SOQL query with `LIKE` specified an invalid character, for example, an incorrectly placed asterisk (*). Correct the query and resubmit.

INVALID_ID_FIELD

The specified ID is correctly formatted but isn't valid. For example, the ID is of the wrong type, or the object it identifies no longer exists.

INVALID_GOOGLE_DOCS_URL

An invalid Salesforce record URL was used when trying to associate a Google Doc to that record. Correct the URL before trying the operation again.

INVALID_LOCATOR

The locator is invalid.

INVALID_LOGIN

The `login()` credentials are not valid, or the maximum number of logins have been exceeded. Contact your administrator for more information.

INVALID_NEW_PASSWORD

The new password does not conform with the password policies of the org.

INVALID_OPERATION

The client application tried to modify a record that is locked by an approval process.

INVALID_OPERATION_WITH_EXPIRED_PASSWORD

Due to password expiration, a valid password must be set using `setPassword()` before the call can be invoked.

INVALID_QUERY_FILTER_OPERATOR

An invalid operator was used in the `query()` filter clause, at least for that field.

INVALID_QUERY_LOCATOR

An invalid `queryLocator` parameter was specified in a `queryMore()` call. It's also possible that you've exceeded the maximum number of calls, which is 10 per user for the API, and 5 for Apex and Visualforce.

INVALID_QUERY_SCOPE

The specified search scope is invalid.

INVALID_REPLICATION_DATE

The date for replication is out of the allowed range, such as before the org was created.

INVALID_SETUP_OWNER

The setup owner must be an Organization, Profile, or User.

INVALID_SEARCH

The `search()` call has invalid syntax or grammar. For more information, see the [Salesforce SOQL and SOSL Reference Guide](#).

INVALID_SEARCH_SCOPE

The specified search scope is invalid.

INVALID_SESSION_ID

The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_SOAP_HEADER

There is an error in the SOAP header. If you are migrating from an earlier version of the API, be advised that the `SaveOptions` header can't be used with API version 6.0 or later. Use `AssignmentRuleHeader` instead.

INVALID_SSO_GATEWAY_URL

The URL provided to configure the Single Sign-On gateway was not a valid URL.

INVALID_TYPE

The specified `sObject` type is invalid.

INVALID_TYPE_FOR_OPERATION

The specified `sObject` type is invalid for the specified operation.

LIMIT_EXCEEDED

An array is too long. For example, there are too many BCC addresses, targets, or email messages.

LOGIN_DURING_RESTRICTED_DOMAIN

The user is not allowed to log in from this IP address.

LOGIN_DURING_RESTRICTED_TIME

The user is not allowed to log in during this time period.

MALFORMED_ID

An invalid ID string was specified. For information about IDs, see [ID Field Type](#).

MALFORMED_QUERY

An invalid query string was specified. For example, the query string was longer than 20,000 characters.

MALFORMED_SEARCH

An invalid search string was specified. For example, the search string was longer than 20,000 characters.

MISSING_ARGUMENT

A required argument is missing.

MIXED_DML_OPERATION

There are limits on what kinds of DML operations can be performed in the same transaction. For more information, see the [Lightning Platform Apex Code Developer's Guide](#).

NOT_MODIFIED

The describe call response has not changed since the specified date.

NO_SOFTPHONE_LAYOUT

If an org has the CTI feature enabled, but no softphone layout has been defined, this exception is returned if a describe call is issued. This exception is most often caused because no call center has been defined. A default softphone layout is created during call center definition.

If an org doesn't have the CTI feature enabled, `FUNCTIONALITY_NOT_ENABLED` is returned instead.

NUMBER_OUTSIDE_VALID_RANGE

The number specified is outside the valid range for the field.

OPERATION_TOO_LARGE

The query has returned too many results. If certain queries are run by a user without the "View All Data" permission and many records are returned, the queries require sharing rule checking. For example, consider queries that are run on objects, such as [Task](#), that use a polymorphic foreign key. These queries return this exception because the operation requires too many resources. To correct, add filters to the query to narrow the scope, or use filters such as date ranges to break the query up into a series of smaller queries.

ORG_LOCKED

The org has been locked. Contact Salesforce to unlock the org.

ORG_NOT_OWNED_BY_INSTANCE

The user tried to log in to the wrong server instance. Choose another server instance or log in at `https://login.salesforce.com`. You can use `http` instead of `https`.

PASSWORD_LOCKOUT

The user has exceeded the allowed number of login attempts. The user must contact an administrator to regain login access.

PORTAL_NO_ACCESS

Access to the specified portal is not available.

QUERY_TIMEOUT

The query has timed out. For more information, see the [Salesforce SOQL and SOSL Reference Guide](#).

QUERY_TOO_COMPLICATED

SOQL query is either selecting too many fields or there are too many filter conditions. Try reducing the number of formula fields referenced in the query.

REQUEST_LIMIT_EXCEEDED

Exceeded either the concurrent request limit or the request rate limit for your org. For details on API request limits, see [API Usage Metering](#).

REQUEST_RUNNING_TOO_LONG

A request has taken too long to be processed.

SERVER_UNAVAILABLE

A server that is necessary for this call is unavailable. Other types of requests could still work.

SSO_SERVICE_DOWN

The service was unavailable, and an authentication call to the org's specified Single Sign-On server failed.

TOO_MANY_APEX_REQUESTS

Too many Apex requests have been issued. If this exception persists, contact Salesforce Customer Support.

TRIAL_EXPIRED

The trial period for the org has expired. A representative from the company must contact Salesforce to re-enable the org.

UNSUPPORTED_API_VERSION

A method call was made that doesn't exist in the accessed API version, for example, trying to use `upsert()` (new in 8.0) against version 5.0.

UNSUPPORTED_CLIENT

This version of the client is no longer supported.

Error

An `Error` contains information about an error that occurred during a `create()`, `merge()`, `process()`, `update()`, `upsert()`, `delete()`, or `undelete()` call. For more information, see [Error Handling](#). An `Error` has the following properties:

Name	Type	Description
<code>statusCode</code>	StatusCode	A code that characterizes the error. The full list of status codes is available in the WSDL file for your org (see Generating the WSDL File for Your Organization).
<code>message</code>	string	Error message text.
<code>fields</code>	string[]	Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
<code>extendedErrorDetails</code>	ExtendedErrorDetails	More details about the error, including an extended error code and extra error properties, when available. Reserved for future use.

Note: If your org has active duplicate rules and a duplicate is detected, the `SaveResult` includes an error with a data type of `DuplicateError`.

StatusCode

The following table lists API status codes that are returned with an error. Some codes don't appear in your WSDL, depending on the features you have enabled.

ALL_OR_NONE_OPERATION_ROLLED_BACK

The bulk operation was rolled back because one of the records wasn't processed successfully. See [AllOrNoneHeader](#).

ALREADY_IN_PROCESS

You can't submit a record that is already in an approval process. Wait for the previous approval process to complete before resubmitting a request with this record.

ASSIGNEE_TYPE_REQUIRED

Designate an assignee for the approval request (ProcessInstanceStep or ProcessInstanceWorkitem).

BAD_CUSTOM_ENTITY_PARENT_DOMAIN

The changes you are trying to make can't be completed because changes to the associated master-detail relationship can't be made.

BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied an email address even though the org's Compliance BCC Email option is enabled. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the Quick Find box, then select **Compliance BCC Email**.

BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied the logged-in user's email address even though the org's BCC COMPLIANCE option is set to true. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the Quick Find box, then select **Compliance BCC Email**.

CANNOT_CASCADE_PRODUCT_ACTIVE

An update to a product caused by a cascade can't be done because the associated product is active.

CANNOT_CHANGE_FIELD_TYPE_OF_APEX_REFERENCED_FIELD

You can't change the type of a field that is referenced in an Apex script.

CANNOT_CREATE_ANOTHER_MANAGED_PACKAGE

You can create only one managed package in an org.

CANNOT_DEACTIVATE_DIVISION

You can't deactivate Divisions if an assignment rule references divisions or if the `DefaultDivision` field on a user record isn't set to null.

CANNOT_DELETE_LAST_DATED_CONVERSION_RATE

If dated conversions are enabled, you must have at least one DatedConversionRate record.

CANNOT_DELETE_MANAGED_OBJECT

You can't modify components that are included in a managed package.

CANNOT_DISABLE_LAST_ADMIN

You must have at least one active administrator user.

CANNOT_ENABLE_IP_RESTRICT_REQUESTS

If you exceed the limit of five IP ranges specified in a profile, you can't enable restriction of login by IP addresses. Reduce the number of specified ranges in the profile and try the request again.

CANNOT_INSERT_UPDATE_ACTIVATE_ENTITY

You do not have permission to create, update, or activate the specified record.

CANNOT_MODIFY_MANAGED_OBJECT

You can't modify components that are included in a managed package.

CANNOT_RENAME_APEX_REFERENCED_FIELD

You can't rename a field that is referenced in an Apex script.

CANNOT_RENAME_APEX_REFERENCED_OBJECT

You can't rename an object that is referenced in an Apex script.

CANNOT_REPARENT_RECORD

You can't define a new parent record for the specified record.

CANNOT_RESOLVE_NAME

A `sendEmail()` call could not resolve an object name.

CANNOT_UPDATE_CONVERTED_LEAD

A converted lead could not be updated.

CANT_DISABLE_CORP_CURRENCY

You can't disable the corporate currency for an org. To disable a currency that is set as the corporate currency, first use the user interface to change the corporate currency to a different currency. Then disable the original currency.

CANT_UNSET_CORP_CURRENCY

You can't change the corporate currency for an org from the API. Use the user interface to change the corporate currency.

CHILD_SHARE_FAILS_PARENT

If you don't have appropriate permissions on a parent record, you can't change the owner of or define sharing rules for a child record. For example, you can't change the owner of a contact record if you can't edit its parent account record.

CIRCULAR_DEPENDENCY

You can't create a circular dependency between metadata objects in your org. For example, public group A can't include public group B, if public group B already includes public group A.

COMMUNITY_NOT_ACCESSIBLE

You do not have permission to access the community that this entity belongs to. You must be given permission to access the community before you can access this entity.

CUSTOM_CLOB_FIELD_LIMIT_EXCEEDED

You can't exceed the maximum size for a CLOB field.

CUSTOM_ENTITY_OR_FIELD_LIMIT

You have reached the maximum number of custom objects or custom fields for your org.

CUSTOM_FIELD_INDEX_LIMIT_EXCEEDED

You have reached the maximum number of indexes on a field for your org.

CUSTOM_INDEX_EXISTS

You can create only one custom index per field.

CUSTOM_LINK_LIMIT_EXCEEDED

You have reached the maximum number of custom links for your org.

CUSTOM_METADATA_LIMIT_EXCEEDED

Your org has reached its custom metadata maximum limit.

CUSTOM_SETTINGS_LIMIT_EXCEEDED

Your org has reached its custom settings maximum limit.

CUSTOM_TAB_LIMIT_EXCEEDED

You have reached the maximum number of custom tabs for your org.

DELETE_FAILED

You can't delete a record because it is in use by another object.

DEPENDENCY_EXISTS

You can't perform the requested operation because of an existing dependency on the specified object or field.

DUPLICATE_CASE_SOLUTION

You can't create a relationship between the specified case and solution because it already exists.

DUPLICATE_CUSTOM_ENTITY_DEFINITION

Custom object or custom field IDs must be unique.

DUPLICATE_CUSTOM_TAB_MOTIF

You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_DEVELOPER_NAME

You can't create a custom object or custom field with a duplicate developer name.

DUPLICATES_DETECTED

Duplicate records have been detected. Used for an Error object with a data type of [DuplicateError](#).

DUPLICATE_EXTERNAL_ID

A user-specified external ID matches more than one record during an upsert.

DUPLICATE_MASTER_LABEL

You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_SENDER_DISPLAY_NAME

A `sendEmail()` call could not choose between `OrgWideEmailAddress.DisplayName` or `senderDisplayName`. Define only one of the two fields.

DUPLICATE_USERNAME

A create, update, or upsert failed because of a duplicate user name.

DUPLICATE_VALUE

You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_ADDRESS_BOUNCED

Emails to one or more recipients have bounced. Check the email addresses to make sure that they are valid.

EMAIL_NOT_PROCESSED_DUE_TO_PRIOR_ERROR

Because of an error earlier in the call, the current email was not processed.

EMAIL_OPTED_OUT

A single email message was sent with the `REJECT` setting in the `optOutPolicy` field to recipients that have opted out from receiving email. To avoid this error, set the `optOutPolicy` field to another value.

EMAIL_TEMPLATE_FORMULA_ERROR

The email template is invalid and can't be rendered. Check the template for incorrectly specified merge fields.

EMAIL_TEMPLATE_MERGEFIELD_ACCESS_ERROR

You don't have access to one or more merge fields in this template. To request access, contact your Salesforce administrator.

EMAIL_TEMPLATE_MERGEFIELD_ERROR

One or more merge fields don't exist. Check the spelling of field names.

EMAIL_TEMPLATE_MERGEFIELD_VALUE_ERROR

One or more merge fields have no value. To provide values, update the records before sending the email.

EMAIL_TEMPLATE_PROCESSING_ERROR

The merge fields in this email template can't be processed. Ensure that your template body is valid.

EMPTY_SCONTROL_FILE_NAME

The Scontrol file name was empty, but the binary was not empty.

ENTITY_FAILED_IFLASTMODIFIED_ON_UPDATE

If the value in a record's `LastModifiedDate` field is later than the current date, you can't update the record.

ENTITY_IS_ARCHIVED

If a record has been archived, you can't access it.

ENTITY_IS_DELETED

You can't reference an object that has been deleted. This status code occurs only in API version 10.0 and later. Previous releases of the API use `INVALID_ID_FIELD` for this error.

ENTITY_IS_LOCKED

You can't edit a record that is locked by an approval process.

ENVIRONMENT_HUB_MEMBERSHIP_CONFLICT

You can't add an org to more than one Environment Hub.

ERROR_IN_MAILER

An email address is invalid, or another error occurred during an email-related transaction.

FAILED_ACTIVATION

The activation of a Contract failed.

FIELD_CUSTOM_VALIDATION_EXCEPTION

You can't define a custom validation formula that violates a field integrity rule.

FIELD_FILTER_VALIDATION_EXCEPTION

You can't violate field integrity rules.

FILTERED_LOOKUP_LIMIT_EXCEEDED

The creation of the lookup filter failed because it exceeds the maximum number of lookup filters allowed per object.

HTML_FILE_UPLOAD_NOT_ALLOWED

Your attempt to upload an HTML file failed. HTML attachments and documents, including HTML attachments to a [Solution](#), can't be uploaded if the `Disallow HTML documents and attachments` checkbox is selected on the HTML Documents and Attachments Settings page.

IMAGE_TOO_LARGE

The image exceeds the maximum width, height, and file size.

INACTIVE_OWNER_OR_USER

The owner of the specified item is an inactive user. To reference this item, either reactivate the owner or reassign ownership to another active user.

INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE

Starting with version 32.0, you can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. Before version 32.0, the code is `INVALID_READ_ONLY_USER_DML`.

INSUFFICIENT_ACCESS_ON_CROSS_REFERENCE_ENTITY

An operation affects an object that is cross-referenced by the specified object, but the logged-in user doesn't have sufficient permissions on the cross-referenced object. For example, a logged-in user attempts to modify an account record, and the update creates a `ProcessInstanceWorkitem`. If the user doesn't have permission to approve, reject, or reassign the `ProcessInstanceWorkitem`, this exception occurs.

INSUFFICIENT_ACCESS_OR_READONLY

You can't perform the specified action because you don't have sufficient permissions.

INVALID_ACCESS_LEVEL

You can't define a new sharing rule that provides less access than the specified org-wide default.

INVALID_ARGUMENT_TYPE

You supplied an argument that is of the wrong type for the operation being attempted.

INVALID_ASSIGNEE_TYPE

You specified an assignee type that is not a valid integer between one and six.

INVALID_ASSIGNMENT_RULE

You specified an assignment rule that is invalid or that isn't defined in the org.

INVALID_BATCH_OPERATION

The specified batch operation is invalid.

INVALID_CONTENT_TYPE

The outgoing email has an `EmailFileAttachment` with an invalid `contentType` property. See [RFC2045 - Internet Message Format](#).

INVALID_CREDIT_CARD_INFO

The specified credit card information is not valid.

INVALID_CROSS_REFERENCE_KEY

The specified value in a relationship field is not valid, or data is not of the expected type.

INVALID_CROSS_REFERENCE_TYPE_FOR_FIELD

The specified cross-reference type is not valid for the specified field.

INVALID_CURRENCY_CONV_RATE

Specify a positive, non-zero value for the currency conversion rate.

INVALID_CURRENCY_CORP_RATE

You can't modify the corporate currency conversion rate.

INVALID_CURRENCY_ISO

The specified [currency ISO code](#) is not valid.

INVALID_EMAIL_ADDRESS

A specified email address is invalid.

INVALID_EMPTY_KEY_OWNER

You can't set the value for `owner` to null.

INVALID_EVENT_SUBSCRIPTION

Invalid parameters were specified when subscribing to an event.

INVALID_FIELD

You specified an invalid field name when trying to update or upsert a record.

INVALID_FIELD_FOR_INSERT_UPDATE

You can't combine a person account record type change with any other field update.

INVALID_FIELD_WHEN_USING_TEMPLATE

You can't use an email template with an invalid field name.

INVALID_FILTER_ACTION

The specified filter action can't be used with the specified object. For example, an alert is not a valid filter action for a Task.

INVALID_ID_FIELD

The specified ID field (`ID`, `ownerId`), or cross-reference field is invalid.

INVALID_INET_ADDRESS

A specified Inet address is not valid.

INVALID_LINEITEM_CLONE_STATE

You can't clone a Pricebook2 or PricebookEntry record that isn't active.

INVALID_MASTER_OR_TRANSLATED_SOLUTION

The solution is invalid. For example, this exception occurs if you try to associate a translated solution with a master solution that's associated with another translated solution.

INVALID_MESSAGE_ID_REFERENCE

The outgoing email's References or In-Reply-To fields are invalid. These fields must contain valid Message-IDs. See [RFC2822 - Internet Message Format](#).

INVALID_OPERATION

There is no applicable approval process for the specified object.

INVALID_OPERATOR

The specified operator is not applicable for the field type when used as a workflow filter.

INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST

You specified an invalid or null value for a restricted picklist.

INVALID_PARTNER_NETWORK_STATUS

The specified partner network status is invalid for the specified template field.

INVALID_PERSON_ACCOUNT_OPERATION

You can't delete a person account.

INVALID_READ_ONLY_USER_DML

Version 31.0 and earlier: You can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. After version 31.0, the code is `INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE`.

INVALID_SAVE_AS_ACTIVITY_FLAG

Specify `true` or `false` for the `saveAsActivity` flag.

INVALID_SESSION_ID

The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_STATUS

The specified org status change is not valid.

INVALID_TYPE

The specified type is not valid for the specified object.

INVALID_TYPE_FOR_OPERATION

The specified type is not valid for the specified operation.

INVALID_TYPE_ON_FIELD_IN_RECORD

The specified value is not valid for the specified field's type.

IP_RANGE_LIMIT_EXCEEDED

The specified IP address is outside the IP range specified for the org.

JIGSAW_IMPORT_LIMIT_EXCEEDED

The number of records you attempted to purchase from Data.com exceeds your available record addition limit.

LICENSE_LIMIT_EXCEEDED

You have exceeded the number of licenses assigned to your org.

LIGHT_PORTAL_USER_EXCEPTION

You attempted an action with a high-volume portal user that's not allowed. For example, trying to add the user to a case team.

LIMIT_EXCEEDED

You have exceeded a limit on a field size or value, license, or other component.

LOGIN_CHALLENGE_ISSUED

An email containing a security token was sent to the user's email address because the user logged in from an untrusted IP address. The user can't log in until the security token is added to the end of the password.

LOGIN_CHALLENGE_PENDING

The user logged in from an untrusted IP address, but a security token has not yet been issued.

LOGIN_MUST_USE_SECURITY_TOKEN

The user must add a security token to the end of the password to log in.

MALFORMED_ID

An ID must be either 15 characters, or 18 characters with a valid case-insensitive extension. There is also an exception code of the same name.

MANAGER_NOT_DEFINED

A manager has not been defined for the specified approval process.

MASSMAIL_RETRY_LIMIT_EXCEEDED

A mass mail retry failed because your org has exceeded its mass mail retry limit.

MASS_MAIL_LIMIT_EXCEEDED

The org has exceeded its daily limit for mass email. Mass email messages can't be sent again until the next day.

MAXIMUM_CCEMAILS_EXCEEDED

You have exceeded the maximum number of specified CC addresses in a workflow email alert.

MAXIMUM_DASHBOARD_COMPONENTS_EXCEEDED

You have exceeded the document size limit for a dashboard.

MAXIMUM_HIERARCHY_LEVELS_REACHED

You have reached the maximum number of levels in a hierarchy.

MAXIMUM_SIZE_OF_ATTACHMENT

You have exceeded the maximum size of an attachment.

MAXIMUM_SIZE_OF_DOCUMENT

You have exceeded the maximum size of a document.

MAX_ACTIONS_PER_RULE_EXCEEDED

You have exceeded the maximum number of actions per rule.

MAX_ACTIVE_RULES_EXCEEDED

You have exceeded the maximum number of active rules.

MAX_APPROVAL_STEPS_EXCEEDED

You have exceeded the maximum number of approval steps for an approval process.

MAX_FORMULAS_PER_RULE_EXCEEDED

You have exceeded the maximum number of formulas per rule.

MAX_RULES_EXCEEDED

You have exceeded the maximum number of rules for an object.

MAX_RULE_ENTRIES_EXCEEDED

You have exceeded the maximum number of entries for a rule.

MAX_TASK_DESCRIPTION_EXCEEDED

The task description is too long.

MAX_TM_RULES_EXCEEDED

You have exceeded the maximum number of rules per Territory.

MAX_TM_RULE_ITEMS_EXCEEDED

You have exceeded the maximum number of rule criteria per rule for a Territory.

MERGE_FAILED

A merge operation failed.

MISSING_ARGUMENT

You did not specify a required argument.

NONUNIQUE_SHIPPING_ADDRESS

You can't insert a reduction order item if the original order shipping address is different from the shipping address of other items in the reduction order.

NO_APPLICABLE_PROCESS

A `process()` request failed because the record submitted does not satisfy the entry criteria of any active approval processes for which the user has permission.

NO_ATTACHMENT_PERMISSION

Your org does not permit email attachments.

NO_INACTIVE_DIVISION_MEMBERS

You can't add members to an inactive Division.

NO_MASS_MAIL_PERMISSION

You don't have permission to send the email. You must have "Mass Email" to send mass mail or "Send Email" to send individual email.

NUMBER_OUTSIDE_VALID_RANGE

The number specified is outside the valid range of values.

NUM_HISTORY_FIELDS_BY_SUBJECT_EXCEEDED

The number of history fields specified for the sObject exceeds the allowed limit.

OP_WITH_INVALID_USER_TYPE_EXCEPTION

The operation you attempted can't be performed for one or more users. For example, you can't add high-volume portal users to a group.

OPTED_OUT_OF_MASS_MAIL

An email can't be sent because the specified User has opted out of mass mail.

PACKAGE_LICENSE_REQUIRED

The logged-in user can't access an object that is in a licensed package without a license for the package.

PORTAL_USER_ALREADY_EXISTS_FOR_CONTACT

A create [User](#) operation failed because you can't create a second portal user under a Contact.

PRIVATE_CONTACT_ON_ASSET

You can't have a private contact on an asset.

RECORD_IN_USE_BY_WORKFLOW

You can't access a record that's in use by a workflow or approval process.

REQUEST_RUNNING_TOO_LONG

A request that has been running too long is canceled.

REQUIRED_FIELD_MISSING

A call requires a field that was not specified.

SELF_REFERENCE_FROM_TRIGGER

You can't recursively update or delete the same object from an Apex trigger. This error often occurs when:

- You try to update or delete an object from within its before trigger.
- You try to delete an object from within its after trigger.

This error occurs with both direct and indirect operations. The following is an example of an indirect operation:

1. A request is submitted to update Object A.
2. A `before update` trigger on object A creates an object B.
3. Object A is updated.
4. An `after insert` trigger on object B queries object A and updates it. This update is an indirect update of object A because of the before trigger of object A, so an error is generated.

SHARE_NEEDED_FOR_CHILD_OWNER

If a parent record has a child record that needs a sharing rule, you can't delete the sharing rule for the parent record.

SINGLE_EMAIL_LIMIT_EXCEEDED

(API version 18.0 and later) The org has exceeded its daily limit for individual emails. Individual email messages can't be sent again until the next day.

STANDARD_PRICE_NOT_DEFINED

Custom prices can't be defined without corresponding standard prices.

STORAGE_LIMIT_EXCEEDED

You have exceeded your org's storage limit.

STRING_TOO_LONG

The specified string exceeds the maximum allowed length.

TABSET_LIMIT_EXCEEDED

You have exceeded the number of tabs allowed for a tabset.

TEMPLATE_NOT_ACTIVE

The template specified is unavailable. Specify another template or make the template available for use.

TERRITORY_REALIGN_IN_PROGRESS

An operation can't be performed because a territory realignment is in progress.

TEXT_DATA_OUTSIDE_SUPPORTED_CHARSET

The specified text uses a character set that is not supported.

TOO_MANY_APEX_REQUESTS

Too many Apex requests have been sent. This error is transient. Resend your request after a short wait.

TOO_MANY_ENUM_VALUE

A request failed because too many values were passed in for a multi-select picklist. You can select a maximum of 100 values for a multi-select picklist.

TRANSFER_REQUIRES_READ

You can't assign the record to the specified User because the user does not have read permission.

UNABLE_TO_LOCK_ROW

A deadlock or timeout condition has been detected.

- A deadlock involves at least two transactions that are attempting to update overlapping sets of objects. If the transaction involves a summary field, the parent objects are locked, making these transactions especially prone to deadlocks. To debug, check your code for deadlocks and correct. Deadlocks are generally not the result of an issue with Salesforce operations.
- A timeout occurs when a transaction takes too long to complete, for example, when replacing a value in a picklist or changing a custom field definition. The timeout state is temporary. No corrective action is needed.

If an object in a batch can't be locked, the entire batch fails with this error. Errors with this status code contain the IDs of the records that couldn't be locked, when available, in the error message.

UNAVAILABLE_RECORDTYPE_EXCEPTION

The appropriate default record type could not be found.

UNDELETE_FAILED

An object could not be undeleted because it does not exist or has not been deleted.

UNKNOWN_EXCEPTION

The system encountered an internal error. Report this problem to Salesforce.

Note: Do not report this exception code to Salesforce if it results from a `sendEmail()` call. The `sendEmail()` call returns this exception code when it is used to send an email to one or more recipients who have the **Email Opt Out** option selected.

UNSPECIFIED_EMAIL_ADDRESS

The specified user does not have an email address.

UNSUPPORTED_APEX_TRIGGER_OPERATION

You can't save recurring events with an Apex trigger.

UNVERIFIED_SENDER_ADDRESS

A `sendEmail()` call attempted to use an unverified email address defined in the `OrgWideEmailAddress` object.

WEBLINK_SIZE_LIMIT_EXCEEDED

The size of a WebLink URL or JavaScript code exceeds the limit.

WEBLINK_URL_INVALID

The WebLink URL has failed the URL string validation check.

WRONG_CONTROLLER_TYPE

The controller type for your Visualforce email template does not match the object type being used.

If you receive a status code not listed in the previous table, contact Customer Support.

ExtendedErrorDetails

Reserved for future use. An `ExtendedErrorDetails` element contains extra detailed information about an error. The `ExtendedErrorDetails` element has the following properties.

Name	Type	Description
<code>extendedErrorCode</code>	<code>ExtendedErrorCode</code>	A code that characterizes the extended error details.
<code>extended error property</code>	Varies	An extended error property that contains more information about the error. The property name and value vary based on the extended error code.

Duplicate Management Data Types

DuplicateError

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Fields

Field	Details
<code>duplicateResult</code>	<p>Type DuplicateResult</p> <p>Description The details of a duplicate rule and duplicate records found by the duplicate rule.</p>
<code>fields</code>	<p>Type <code>string[]</code></p> <p>Description Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.</p>
<code>message</code>	<p>Type <code>string</code></p> <p>Description Error message text.</p>
<code>statusCode</code>	<p>Type StatusCode</p> <p>Description A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization (see Generating the WSDL File for Your Organization).</p>

Usage

`DuplicateError` and its constituent objects are available to organizations that use duplicate rules.

`DuplicateError` is a data type of `Error`.

To process duplicates, loop through all the `Error` objects in the `errors` field on `SaveResult`. An `Error` object with a data type of `DuplicateError` contains information about an error that occurred when an attempt was made to save a duplicate record. To access information about the duplicates, use the `duplicateResult` field.

Java Sample

Here is a sample that shows how to see if there are any errors on the `saveResult` with a data type of `DuplicateError`. If so, duplicates were detected. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
if (!saveResult.isSuccess()) {
    for (Error e : saveResult.getErrors()) {
        if (e instanceof DuplicateError) {
            System.out.println("Duplicate(s) Detected for lead with ID: " +
                leads[i].getId());
            System.out.println("ERROR MESSAGE: " + e.getMessage());
        }
    }
}
```

Field	Details
	<p>Description</p> <p>The error message configured by the administrator to warn users they are potentially creating duplicate records. This message is associated with a duplicate rule.</p>
matchResults	<p>Type</p> <p>MatchResult</p> <p>Description</p> <p>The duplicate records and related match information.</p>

Usage

DuplicateResult and its constituent objects are available to organizations that use duplicate rules.

Java Sample

Here is a sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
package com.doc.example;

import java.io.FileNotFoundException;

import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.sobject.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class SaveResultsWithDupeHeader {

    private PartnerConnection partnerConnection = null;
    static SaveResultsWithDupeHeader tester;

    public static void main(String[] args) {
        tester = new SaveResultsWithDupeHeader();
        try {
            tester.demoDuplicateRuleHeader();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }

    /*
     * Make sure that you have an active lead duplicate rule linked to an active matching
     * rule. This method tries to save
     * an array of leads and inspects whether any duplicates were detected
     */
    public void demoDuplicateRuleHeader() throws FileNotFoundException, ConnectionException
    {
        // Create the configuration for the partner connection
    }
}
```

```

ConnectorConfig config = new ConnectorConfig();
config.setUsername("user@domain.com");
config.setPassword("secret");
config.setAuthEndpoint("authEndPoint");
config.setTraceFile("traceLogs.txt");
config.setTraceMessage(true);
config.setPrettyPrintXml(true);

// Initialize the connection
partnerConnection = new PartnerConnection(config);

// Get the leads that have to be saved
SObject[] leads = getLeadsForInsertOrUpdate();

/* Set a duplicate rule header to return a result if duplicates are detected
 * This sets the allowSave, includeRecordDetails, and runAsCurrentUser flags to
true
 */
partnerConnection.setDuplicateRuleHeader(true, true, true);

// Save the leads
SaveResult[] saveResults = partnerConnection.create(leads);

// Check the results to see if duplicates were detected
for (int i = 0; i < leads.length; i++) {
    SaveResult saveResult = saveResults[i];
    if (!saveResult.isSuccess()) {
        for (Error e : saveResult.getErrors()) {
            // See if there are any errors on the saveResult with a data type of
DuplicateError
            if (e instanceof DuplicateError) {
                System.out.println("Duplicate(s) Detected for lead with ID: " +
leads[i].getId());

                System.out.println("ERROR MESSAGE: " + e.getMessage());
                System.out.println("STATUS CODE: " + e.getStatusCode());
                DuplicateResult dupeResult =
((DuplicateError)e).getDuplicateResult();
                System.out.println("Found the following duplicates...");
                for (MatchResult m : dupeResult.getMatchResults()) {
                    if (m.isSuccess()) {
                        System.out.println("The match rule that was triggered was
" + m.getRule());

                        for (MatchRecord mr : m.getMatchRecords()) {
                            System.out.println("Your record matched " +
mr.getRecord().getId() + " of type "
                                + mr.getRecord().getType());
                            System.out.println("The match confidence is " +
mr.getMatchConfidence());

                            for (FieldDiff f : mr.getFieldDiffs()) {
                                System.out.println("For field " + f.getName() + "
field difference is "
                                    + f.getDifference().name());
                            }
                        }
                    }
                }
            }
        }
    }
}

```

```

    }
    }
    }
    }
    }

    // Clear the duplicate rule header
    partnerConnection.clearDuplicateRuleHeader();
}

/**
 * The assumption here is that this method is retrieving leads from either UI, a data
 source, etc
 */
private SObject[] getLeadsForInsertOrUpdate() {
    return new SObject[0];
}
}
}

```

MatchResult

Represents the duplicate results for a matching rule.

Fields

Field	Details
errors	<p>Type Error[]</p> <p>Description Errors that occurred during matching for the matching rule.</p>
entityType	<p>Type string</p> <p>Description The entity type of the matching rule.</p>
matchEngine	<p>Type string</p> <p>Description The match engine for the matching rule.</p>
matchRecords	<p>Type MatchRecord[]</p> <p>Description Information about the duplicates detected by the matching rule.</p>

Field	Details
rule	<p>Type string</p> <p>Description The developer name of the matching rule that detected duplicates.</p>
size	<p>Type int</p> <p>Description The number of duplicates detected by the matching rule.</p>
success	<p>Type boolean</p> <p>Description true if the matching rule successfully ran. false if there's an error with the matching rule.</p>

Usage

MatchResult and its constituent objects are available to organizations that use duplicate rules.

There is 1 MatchResult for each saved record that has duplicates. The MatchResult contains all duplicates for that saved record.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when leads are saved. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchResult m : dupeResult.getMatchResults()) {
    if (m.isSuccess()) {
        System.out.println("The match rule that was triggered was " + m.getRule());
        for (MatchRecord mr : m.getMatchRecords()) {
            System.out.println("Your record matched " + mr.getRecord().getId() + " of type "
                + mr.getRecord().getType());
            System.out.println("The match confidence is " + mr.getMatchConfidence());
        }
    }
}
```

MatchRecord

Represents a duplicate record detected by a matching rule.

Fields

Field	Details
<code>additionalInformation</code>	<p>Type AdditionalInformationMap</p> <p>Description Other information about matched records.</p>
<code>fieldDiffs</code>	<p>Type FieldDiff[]</p> <p>Description Matching rule fields and how each field value compares for the duplicate and its matching record.</p>
<code>matchConfidence</code>	<p>Type double</p> <p>Description The ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the <code>minMatchConfidence</code> specified in your request. Returns <code>-1</code> if unused.</p>
<code>record</code>	<p>Type <code>sObject</code></p> <p>Description The fields and field values for the duplicate record.</p>

Usage

`MatchRecord` and its constituent objects are available to organizations that use duplicate rules.

Each `MatchRecord` represents a duplicate detected when a record is saved. There can be multiple `MatchRecord` objects for a saved record if multiple duplicates are detected.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when a lead is saved. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchRecord mr : m.getMatchRecords()) {
    System.out.println("Your record matched " + mr.getRecord().getId() + " of type "
        + mr.getRecord().getType());
    System.out.println("The match confidence is " + mr.getMatchConfidence());
}
```

FieldDiff

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Fields

Field	Details
difference	<p>Type differenceType</p> <p>Description How the values of the matching rule field compare for the duplicate and its matching record. Possible values include:</p> <ul style="list-style-type: none"> • Same: Indicates the field values match exactly. • Different: Indicates that the field values do not match. • Null: Indicates that the field values are a match because both values are blank.
name	<p>Type string</p> <p>Description The name of a field on a matching rule that detected duplicates.</p>

Java Sample

Here is a sample that shows how to display the matching rule field differences when a duplicate is detected. See [DuplicateResult](#) for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (FieldDiff f : mr.getFieldDiffs()) {
    System.out.println("For field " + f.getName() + " field difference is "
        + f.getDifference().name());
}
```

AdditionalInformationMap

Represents other information, if any, about matched records.

Fields

Field	Details
name	<p>Type string</p> <p>Description The name of the element.</p>

Field	Details
value	<p>Type string</p> <p>Description The value of the element.</p>

System Fields

The following fields are read-only fields found on most objects. These fields are automatically updated during API operations. For example, the ID field is automatically generated during a create operation and the LastModifiedDate is automatically updated when a user modifies a record.

Field	Field Type	Description
Id	ID	Globally unique string that identifies a record. For information on IDs, see ID Field Type . Because this field exists in every object, it is not listed in the field table for each object. Id fields have Defaulted on create and Filter access.
IsDeleted	boolean	Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Because this field does not appear in all objects, it is listed in the field table for each object.
Audit Fields		
CreatedById	reference	ID of the User who created this record. <code>CreatedById</code> fields have Defaulted on create and Filter access.
CreatedDate	dateTime	Date and time when this record was created. <code>CreatedDate</code> fields have Defaulted on create and Filter access.
LastModifiedById	reference	ID of the User who last updated this record. <code>LastModifiedById</code> fields have Defaulted on create and Filter access.
LastModifiedDate	dateTime	Date and time when a user last modified this record. <code>LastModifiedDate</code> fields have Defaulted on create and Filter access.
SystemModstamp	dateTime	Date and time when a user or automated process (such as a trigger) last modified this record. <code>SystemModstamp</code> fields have Defaulted on create and Filter access.

If you import data into Salesforce and want to retain the audit field values of the source system, you can set the values for audit fields on the following objects: Account, ArticleVersion, Attachment, CampaignMember, Case, CaseComment, Contact, ContentVersion, Contract, Event, Idea, IdeaComment, Lead, Opportunity, Question, Task, Vote, and custom objects. The only audit field you cannot set a value for is `systemModstamp`.

1. From Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.

- Using the API, create a record and set its audit fields.

Not all standard objects have all audit fields. Check the Enterprise WSDL to verify which audit fields are available for a given object.

Parent Reference Fields

If an object has a relationship to a parent object, two fields are added.

- Parent_Name* contains the object name of the parent. For example, Case has a `Contact` field that contains a reference to the contact parent of the case.
- Parent_NameId* contains the ID of the parent. For example, Case has a `ContactId` field that refers to the contact parent of the case. This field is used in SOQL relationship queries such as the following:

```
SELECT Case.ContactId, Case.Contact.Name FROM Case
```

Even if the object can parent itself, these fields occur. For example, the Campaign object has a `Campaign` and `CampaignId` field for referencing the parent Campaign.

Required Fields

Required fields must have a non-`null` value. This rule affects the create and update calls:

- In a create call, the system automatically populates the data for certain required fields (such as system fields and the object ID fields). Similarly, if a required field has a default value (its `defaultedOnCreate` attribute is set to `true`, as described in Field in a describe result, then the system implicitly assigns a value for this field when the object is created, even if a value for this field is not explicitly passed in on the create call. For all other required fields, such as ID fields that are analogous to foreign keys in SQL, a client application must explicitly assign a value when the object is created (it cannot be `null`).
- In updates, a required field cannot be set to `null`, and many required fields can't be changed.

Any field not specified as required in the object description is optional, that is, it can be `null` when updated or created.

Some required fields for some objects require special handling.

Frequently-Occurring Fields

In addition to system fields, the following fields are found on many objects:

- `OwnerId`
- `RecordTypeId`
- `CurrencyIsoCode`

OwnerId

Objects have an `ownerId` field that is an reference to the user who owns that object. Ownership is an important concept that affects the security model and has other implications throughout the system. Any user can query the owner field for any record they can access. However, setting the `ownerId` field has the following limitations:

- For most users and most objects, this field can't be set directly upon insert. It is implicitly set to the current user when inserting an object.
- When creating or updating a Case or Lead, a client application (that is logged in with sufficient permissions to transfer a record) can set this field to any valid User in the organization or to any valid queue of the appropriate type in the organization.

- Updating this field via the API changes only the owner of that record. The change of ownership does not cascade to associated records as it does when you transfer record ownership in the Salesforce user interface.
- Updating this field on an account deletes the existing sharing information and reapplies the organization-wide sharing defaults and sharing rules.
- To update the `ownerId` field, the user must have the "Transfer Record" permission and Read access to the new owner.

In API version 12.0 and later, if your organization has set up opportunity teams, `OwnerId` fields behave the same for Account and Opportunity objects as for other objects. That is, if you update the `OwnerId` field in either object, any AccountShare or OpportunityShare records with `RowCause` set to Sales Team are kept. In API version 11.0 and earlier, the sharing records are deleted.

RecordTypeId

Record types are used to offer different business processes and subsets of picklist values to different User records based on their Profile settings. (In addition, person accounts use record types to manage a number of additional elements.)

Record types are configured in the user interface or by creating, editing, or deleting the RecordType object in the API. Retrieve the list of valid record type IDs (String) for an object by querying the RecordType object.

The `RecordTypeId` field in an object contains the ID of the RecordType record that is associated with a standard or custom object. You can create or update this field.

 **Note:** You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

When specified in a create or update call, the record type ID (String) must refer to a valid record type for that object.

 **Note:** The `RecordTypeId` field is in your organization's WSDL only if at least one record type is configured for your organization in the Salesforce user interface.

CurrencyIsoCode

For organizations that have multicurrency enabled, the `CurrencyIsoCode` field contains the string representation of the currency ISO code associated with currency values in the object. Note that the User object also has a `DefaultCurrencyIsoCode` field, which is the default currency for that user. For example, a user in France could have a `DefaultCurrencyIsoCode` set to Euros, and that would be their default currency in the application. However, the User object could have currency custom fields stored in a different currency, that will correspond to the organization currency at the time the user record is created.

API Field Properties

Fields on objects represent the details of each object and are analogous to columns in a database table. Each field on each object has one or more of the following properties:

Property	Description
Autonumber	The API creates an autonumber.
Create	Value for the field can be specified during create using the API.
Defaulted on create	When created, a default value is supplied if no other value is specified.
Delete	Value for the field can be deleted using the API.
Filter	Can be used as filter criteria in a SOQL query FROM or WHERE clause.

Property	Description
Group	Can be included in the GROUP BY clause of a SOQL query (<code>true</code>) or not (<code>false</code>). Available in API version 18.0 and later.
idLookup	Can be used to specify a record in an upsert call. The <code>Id</code> field of each object has this property and some <code>Name</code> fields. There are exceptions, so check for the property in any object you wish to upsert.
Nullable	The field can contain a null value.
Query	The field can be queried with SOQL using the API.
Restricted picklist	A picklist whose values are restricted to those values defined by a Salesforce admin. Users can't load unapproved values through the API.
Retrieve	Value of the field can be retrieved using the API.
Sort	Indicates whether a query can sort on this field (<code>true</code>) or not (<code>false</code>).
Update	Can be updated using the API.

Relationships Among Objects

Relationships associate objects with other objects. For example, a relationship can link a custom object to standard object in a related list, such as linking a custom object called Bugs to cases to track product defects associated with customer cases. To view the parent and child relationships among standard objects, see the ERD diagrams in [Data Model](#).

Note:

- You can use parent-child relationships in SOQL queries. For more information, see Relationship Queries in the [Salesforce SOQL and SOSL Reference Guide](#).
- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported. See “External Object Relationships” in the Salesforce Help.

You can define different types of relationships by creating custom relationship fields on an object. The differences between relationship types include how they handle data deletion, record ownership, security, and required fields in page layouts:

- Master-Detail (1:n)** — A parent-child relationship in which the master object controls certain behaviors of the detail object:
 - When a record of the master object is deleted, its related detail records are also deleted.
 - The `Owner` field on the detail object is not available and is automatically set to the owner of its associated master record. Custom objects on the detail side of a master-detail relationship cannot have sharing rules, manual sharing, or queues, as these require the `Owner` field.
 - The detail record inherits the sharing and security settings of its master record.
 - The master-detail relationship field is required on the page layout of the detail record.
 - By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

You can define master-detail relationships between custom objects or between a custom object and a standard object. However, the standard object cannot be on the detail side of a relationship with a custom object. In addition, you cannot create a master-detail relationship in which the User or Lead objects are the master.

When you define a master-detail relationship, the custom object on which you are working is the detail side. Its data can appear as a custom related list on page layouts for the other object.

- **Many-to-many** — You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you create a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. To create a many-to-many relationship, simply create a custom junction object with two master-detail relationship fields, each linking to the objects you want to relate. See the Salesforce online help for details.

Custom objects with two master-detail relationships are supported in API version 11 and later.

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID.

`JunctionIdList` is implemented in the `Task` and `Event` objects.

- **Lookup (1:n)** — This type of relationship links two objects together, but has no effect on deletion or security. Unlike master-detail fields, lookup fields are not automatically required. When you define a lookup relationship, data from one object can appear as a custom related list on page layouts for the other object. See the Salesforce online help for details.

To create relationships, use the user interface or Salesforce Metadata API.

Relabeling Fields and Tabs and the API

The user interface allows you to change the labels on some fields and tabs. Although you cannot relabel fields or tabs using the API, you can retrieve the current values. To do so, issue a `describeSObjects()` call and inspect the `label` field of the returned `DescribeSObjectResult`.

Tooling API Objects in the Enterprise WSDL

Some objects used by the Tooling API are included in the Enterprise and Partner WSDL. Use the objects from these WSDLs instead of the Tooling WSDL if you need field-level security.

The following Tooling API objects are exposed in the Enterprise and Partner WSDL.

- `DataType`
- `EntityDefinition`
- `EntityParticle`
- `FieldDefinition`
- `PicklistValueInfo`
- `Publisher`
- `SearchLayout`
- `Service`
- `ServiceDataType` (Reserved for future use.)
- `ServiceFieldDataType` (Unavailable in version 35.0 and later. Do not use.)
- `RelationshipDomain`
- `RelationshipInfo`

- UserEntityAccess
- UserFieldAccess
- WsdldataType (Reserved for future use.)
- XmlSchema (Reserved for future use.)

For more information, use the *Tooling API Developer's Guide*.

Salesforce AppExchange Object Prefixes and the API

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix_name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the *ISVforce Guide*.

Custom Objects

In the user interface, you can extend your organization's data by defining custom objects. Custom objects are custom database tables that allow you to store information unique to your organization. For custom objects, the `custom` flag—a Boolean field in the describe results—is `true`.

Client applications with sufficient permissions can invoke API calls on existing custom objects. You can create custom objects with the user interface, or by using the metadata WSDL with a client application or using the Force.com IDE. For more information about using the metadata WSDL to create custom objects, see the *Lightning Platform Metadata API Developer's Guide*. For more information about the Force.com IDE, see *Salesforce Developers*.

Use the following topics to understand how the API interacts with custom objects and fields:

- [Naming Conventions for Custom Objects](#)
- [Relationships Among Custom Objects](#)
- [Audit Fields for Custom Objects](#)
- [Sharing and Custom Objects](#)
- [Required Fields in Custom Objects](#)
- [Managed Packages and API Names](#)

Naming Conventions for Custom Objects

Your Salesforce administrator defines an associated name field for each custom object during setup. Custom objects must have unique names within your organization.

In the API, the names of custom objects include a suffix of two underscores followed by a lowercase "c". For example, a custom object labeled "Issue" in the Salesforce user interface is `Issue__c` in that organization's WSDL.

Relationships change the naming convention. See [Relationships Among Custom Objects](#) for more information.

For a custom object record to appear in the Salesforce user interface, its name field must be populated. If you use the API to create a custom object record that doesn't have a name, the record's ID is used as its name.

Relationships Among Custom Objects

Custom objects relate to other objects and behave just like standard objects, as described in [Relationships Among Objects](#). For example, cascading deletes are supported in custom objects in a Master-Detail relationship.

Custom objects require special treatment so that they can participate in Relationship Queries. For the relationship field name of a custom object, `__r` is appended to the name to create the ID. Also, `__c` is appended to the name to create the parent object pointer. For example, if the relationship field name is `MyRel`, the name of the ID becomes `MyRelId__r`, the parent object pointer becomes `MyRel__c`, and the relationship name is `MyRel__r`. For more information, see [Understanding Relationship Names, Custom Objects, and Custom Fields in the *Salesforce SOQL and SOSL Reference Guide*](#).

The following table summarizes whether a standard object can be:

- The master in a master-detail relationship with a custom object. Master-detail relationships involve cascading deletes and sharing rules that the parent controls.
- The lookup in a lookup relationship on a custom object. In other words, whether a custom object can have a lookup to the standard object.
- Extended with custom fields.

Standard Object	Master-Detail	Lookup	Custom Fields
Account	Yes	Yes	Yes
Campaign	Yes	Yes	Yes
Case	Yes	Yes	Yes
Contact	Yes	Yes	Yes
Contract	Yes	Yes	Yes
Event	No	No	Yes
Lead	No	No	Yes
Opportunity	Yes	Yes	Yes
Product2	No	Yes	Yes
Solution	Yes	Yes	Yes
Task	No	No	Yes
User	No	Yes	Yes

Custom objects can also have many-to-many relationships with other custom objects or standard objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For more information, see [Relationships Among Objects](#).

Audit Fields for Custom Objects

Custom objects can have the same audit fields as standard objects. When you create a custom object, the four audit fields, `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate`, are created and populated for the object. These fields are read only. If you import data into Salesforce custom objects and want to retain the audit field values from the source system, you can

set the values when you create the custom objects. The only audit field you cannot set a value for is `systemModstamp`. Your organization must be API enabled, and you must have the “Modify All Data” permission.

1. From Setup, enter *User Interface* in the *Quick Find* box, then select **User Interface** under *Customize*.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Note these restrictions:

- `CreatedDate` can't be greater than the `LastModifiedDate`.
- You can't set any date field to be greater than the current time.

For more information about audit fields, see [System Fields](#).

Sharing and Custom Objects

A sharing rule object is created for each custom object that does not have a master-detail relationship to another object. They are similar to standard object sharing rules, for example `AccountOwnerSharingRule`. If the user creating the custom object has the “Manage Sharing” permission, a sharing rule object is automatically created for it.

Apex sharing reasons can be retrieved describing the custom object's sharing object, and examining the information in the `rowCause` field. The name of a sharing object for each custom object is of the form: *MyObjectName__Share*, similar to `AccountShare` and other standard object sharing objects.

Tags and Custom Objects

When a custom object is created, a Tag object related to it is also created. These object names are of the form: *MyObjectName__Tag*, similar to `AccountTag` and other standard object tag objects.

Required Fields in Custom Objects

In the user interface, you can mark a custom field as required, and this rule is also enforced in the API. Each custom field has a `isRequired` field, with a data type boolean. The default value is `false`. If set to `true`, each request supplies a value (or leaves the current value) to this field. Otherwise, the request fails. When the value is set to `true`, the next time the field is edited or created, the validation applies. If no value is supplied or default value specified, the request fails.

To edit the `isRequired` field, you must log in as a user with the “Customize Application” permission.

If you change a custom object field to be required in an existing client application or integration, be sure that a value is supplied for that field. For example, if the custom picklist field `Education Level` on the contact object is required, supply a default value for that custom field. If a required field does not have a specified or default value, an error with the status code `REQUIRED_FIELD_MISSING` is returned.

Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: *name__c* becomes *prefix__name__c*. To move from an unmanaged package to a managed package version of the same application, export your

data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the [ISVforce Guide](#).

External Objects

External objects are supported in API version 32.0 and later. External objects are similar to custom objects, but external object record data is stored outside your Salesforce organization. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

External objects are available with Salesforce Connect and Files Connect. Each external object is associated with an external data source definition in your Salesforce organization.

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Lightning Platform use to interact with the external data and content.

By accessing record data on demand, external objects always reflect the current state of the external data. You don't have to manage a copy of that data in Salesforce, so you're not wasting storage and resources keeping data in sync.

External objects are best used when you have a large amount of data that you can't or don't want to store in your Salesforce organization, and you need to use only a small amount of data at any one time.

See "Define External Objects" in the Salesforce Help for how to create and modify external objects.

Naming Conventions for External Objects

Object names must be unique across all standard, custom, and external objects in the org.

In the API, the names of external objects are identified by a suffix of two underscores immediately followed by a lowercase "x" character. For example, an external object named "ExtraLogInfo" in the Salesforce user interface is seen as `ExtraLogInfo__x` in that organization's WSDL.

We recommend that you make object labels unique across all standard, custom, and external objects in the org.

External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that's stored outside your Salesforce org often doesn't contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups. See "External Object Relationships" in the Salesforce Help for details.

Feature Support for External Objects

Most of the Salesforce features that support custom objects also support external objects. However, there are exceptions, and some features have special limitations and considerations for external objects. See the following topics in the Salesforce Help.

- [Salesforce Compatibility Considerations for Salesforce Connect—All Adapters](#)
- [Considerations for Salesforce Connect—All Adapters](#)

Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. This table describes the available adapters.

Salesforce Connect Adapter	Description	Where to Find Callout Limits
Cross-org	Uses the Lightning Platform REST API to access data that's stored in other Salesforce orgs.	No callout limits. However, each callout counts toward the API usage limits of the provider org. <i>Salesforce Help:</i> API Usage Considerations for Salesforce Connect—Cross-Org Adapter <i>Salesforce Limits Quick Reference Guide:</i> API Request Limits and Allocations
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that's stored outside Salesforce. The external data must be exposed via OData producers.	<i>Salesforce Help:</i> General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters
Custom adapter created via Apex	You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren't suitable for your needs. A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically.	<i>Apex Developer Guide:</i> Callout Limits and Limitations <i>Apex Developer Guide:</i> Execution Governors and Limits

Files Connect Adapters

Several Files Connect adapters are also available:

- Google Drive
- Box
- SharePoint Online
- OneDrive for Business

For more information about setting up Files Connect adapters see, [The Files Connect Process](#).

For more information about Salesforce Connect, see "Salesforce Connect" in the Salesforce Help.

For details on using the Apex Connector Framework, see "Salesforce Connect" and "DataSource Namespace" in the [Apex Code Developer's Guide](#).

CHAPTER 3 API Call Basics

In this chapter ...

- [Characteristics of API Calls](#)
- [Factors that Affect Data Access](#)
- [Package Version Settings](#)

API calls represent specific operations that your client applications can invoke at runtime to perform tasks, for example:

- Query data in your organization.
- Add, update, and delete data.
- Obtain metadata about your data.
- Run utilities to perform administration tasks.

Using your development environment, you can construct Web service client applications that use standard Web service protocols to programmatically:

- Log in to the login server (`login()`) and receive authentication information to be used for subsequent calls
- Query your organization's information (`query()`, `queryAll()`, `queryMore()`, and `retrieve()` calls)
- Perform text searches across your organization's information (`search()` call)
- Create, update, and delete data (`create()`, `merge()`, `update()`, `upsert()`, `delete()`, and `undelete()` calls)
- Perform administrative tasks, such as retrieving user information (`getUserInfo()` call), changing passwords (`setPassword()` and `resetPassword()` calls), and getting the system time (`getServerTimestamp()` call)
- Replicate data locally (`getDeleted()` and `getUpdated()` calls)
- Obtain and navigate metadata about your organization's data (`describeGlobal()`, `describeSubject()`, `describeSubjects()`, `describeLayout()`, and `describeTabs()` calls)
- Work with approval processes (`process()`)
- Return category groups and categories from your organization (`describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()`).

See [Core Calls](#), [Describe Calls](#), and [Utility Calls](#) for complete details about each call.

Characteristics of API Calls

All API calls are:

- **Service Requests and Responses**—Your client application prepares and submits a service request to the Lightning Platform Web Service via the API, the Lightning Platform Web Service processes the request and returns a response, and the client application handles the response.
- **Synchronous**—Once the API call is invoked, your client application waits until it receives a response from the service. Asynchronous calls are not supported.
- **Committed Automatically Versus Rollback on Error**—By default, every operation that writes to a Salesforce object is committed automatically. This is analogous to the AUTOCOMMIT setting in SQL. For `create()`, `update()`, and `delete()` calls that attempt to write to multiple records for an object, the write operation for each record is treated as a separate transaction. For example, if a client application attempts to create two new accounts, they're created using mutually exclusive insert operations that succeed or fail individually, not as a group.

For API version 20.0 and later, there is an `AllOrNoneHeader` header that allows a call to roll back all changes unless all records are processed successfully. This header is supported by the `create()`, `delete()`, `undelete()`, `update()`, and `upsert()` calls.

- **Note:** The default behavior means that client applications may need to handle some failures: for example, if you create an opportunity that has shipments (a custom object), and the opportunity line item gets created but the shipment creation fails, if your business rules required all opportunities be created with shipment, your client application would need to roll back the opportunity creation. The easiest way to do this is to use `AllOrNoneHeader`.

Factors that Affect Data Access

When using the API, the following factors affect access to your organization's data:

Access

Your organization must be enabled for API access.

Objects may not be available until you contact Salesforce and request access. For example Territory is visible only if territory management has been enabled in the application. Such requirements are in the "Usage" section for each object.

Sometimes a feature must be used once before objects related to it can be accessed with the API. For example, the `recordTypeId`s is available only after at least one record type has been created for your organization in the user interface.

To investigate data access issues, you can start by inspecting the WSDL:

- **Enterprise WSDL:** The generated enterprise WSDL file contains all of the objects that are available to your organization. By using the API, a client application can access objects that are defined in your enterprise WSDL file.
- **Partner WSDL:** When using the generated partner WSDL file, a client application can access objects that are returned in the `describeGlobal()` call.

Object-Level and Field-Level Security

The API respects object-level and field-level security configured in the user interface. You can access objects and fields only if the logged-in user's permissions and access settings allow such access. For example, fields that are not visible to a given user are not returned in a `query()` or `describeObjects()` call. Similarly, read-only fields can't be updated.

User Permissions

A user attempting to access the API must have the permission "API Enabled" selected. It's selected by default.

Your client application logs in as a user called a *logged-in* user. The logged-in user's permissions grant or deny access to specific objects and fields in your organization:

- **Read**—Users can only view objects of this type.
- **Create**—Users can read and create objects of this type.
- **Edit**—Users can read and update objects of this type.
- **Delete**—Users can read, edit, and delete objects of this type.

User permissions do not affect field-level security. If field-level security specifies that a field is hidden, users with “Read” on that object can view only those fields that are not hidden on the record. In addition, users with “Read” on an object can view only those records that sharing settings allow. The one exception is the “Edit Read Only Fields” permission, which gives users the ability to edit fields marked as read only via field-level security.

Sharing

For most API calls, data that is outside of the logged-in user’s sharing model is not returned. Users are granted the most permissive access that is available to them, either through organization-wide defaults or manual record sharing, just as in the application.

User Permissions that Override Sharing

- **View All**—Users can view all records associated with this object, regardless of sharing settings.
- **Modify All**—Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.
- **Modify All Data**—users can read, edit, delete, transfer, and approve all records regardless of sharing settings. This permission is not an object-level permission, unlike “View All” and “Modify All.”

To protect the security of your data, give the logged-in user only the permissions needed to successfully execute all the calls made by the application. For large integration applications, “Modify All Data” may speed up call response times. If you are loading a large number of records, use the [Bulk API](#) instead.

Related Objects

Some objects depend on other objects for permission. For example, AccountTeamMember follows sharing on the associated permission-assigned object such as the Account record. Similarly, a Partner depends on the permissions in the associated .

Ownership changes to a record do not automatically cascade to related records. For example, if ownership changes for a given Account, ownership does not then automatically change for any Contract associated with that Account—each ownership change must be made separately and explicitly by the client application.

Object Properties

To create an object with the `create()` call, the object’s `createable` attribute must be set to `true`. To determine what operations are allowed on a given object, your client application can invoke the `describeSObjects()` call on the object and inspect the properties in the `DescribeSObjectResult`.

 **Note:** `replicable` allows `getUpdated()` and `getDeleted()` calls.

Page Layouts and Record Types

Requirements defined in the Salesforce user interface for page layouts and record types are not enforced by the API:

- Page layouts can specify whether a given field is required, but the API does not enforce such layout-specific field restrictions or validations in `create()` and `update()` calls. It’s up to the client application to enforce any such constraints, if applicable.
- Record types can control which picklist values can be chosen in a given record and which page layouts users with different profiles can see. However, such rules that are configured and enforced in the user interface are not enforced in the API. For example, the API does not validate whether the value in a picklist field is allowed per any record type restrictions associated with the profile of the logged-in user. Similarly, the API does not prevent a client application from adding data to a particular field simply because that field does not appear in a layout associated with the profile of the logged-in user.

Referential Integrity

To ensure referential integrity, the API forces or prevents certain behaviors:

- ID values in [reference fields](#) are validated in `create()` and `update()` calls.

- If a client application deletes a record, then its children are automatically deleted as part of the call if the `cascadeDelete` property on `ChildRelationship` for that child has a value of `true`. For example, if a client application deletes an `Opportunity`, then any associated `OpportunityLineItem` records are also deleted. However, if an `OpportunityLineItem` is not deletable or is currently being used, then deletion of the parent `Opportunity` fails. For example, if a client application deletes an `Invoice_Statement`, then any associated `Line_Item` records are also deleted. However, if a `Line_Item` is not deletable or is currently being used, then deletion of the parent `Invoice_Statement` fails. Use `DescribeObjectResult` to view the `ChildRelationship` value if you want to be sure what will be deleted.

There are certain exceptions that prevent the execution of a `cascadeDelete`. For example, you can't delete an account if it has associated cases, if it has related opportunities that are owned by other users, or if associated contacts are enabled for the Customer Portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you or has active contracts, then the delete request for that record will fail.

Package Version Settings

When your API client is referencing components in managed packages, you can specify the version of each installed package that you want to reference for your integration. This allows your API client to continue to function with specific, known behavior even when you install subsequent versions of a package. You can use the `PackageVersionHeader` SOAP header to set different package versions for different calls, if necessary.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The `PackageVersionHeader` SOAP header.
2. The SOAP endpoint contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 42.0, and `ID` encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, enter *API* in the *Quick Find* box, then select **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a *Package Version* for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

Note: Installing a new version of a package in your organization does not affect the current default settings.

CHAPTER 4 Error Handling

In this chapter ...

- [Error Handling for Session Expiration](#)
- [More About Error Handling](#)

The API calls return error data that your client application can use to identify and resolve runtime errors. If an error occurs during the invocation of most API calls, then the API provides the following types of error handling:

- For errors resulting from badly formed messages, failed authentication, or similar problems, the API returns a SOAP fault message with an associated [ExceptionCode](#).
- For most calls, if the error occurs because of a problem specific to the query, the API returns an [Error](#). For example, if a `create()` request contains more than 200 objects.

Error Handling for Session Expiration

When you sign on via the `login()` call, a new client session begins and a corresponding unique session ID is generated. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking **Security Controls**. The default is 120 minutes (two hours). If you make an API call, the inactivity timer is reset to zero.

When your session expires, the exception code `INVALID_SESSION_ID` is returned. If this happens, you must invoke the `login()` call again.

More About Error Handling

For more information about errors, see the following topics:

- [API Fault Element](#)
- [ExceptionCode](#)
- [Error](#)

CHAPTER 5 Security and the API

In this chapter ...

- [User Authentication](#)
- [User Profile and Permission Sets Configuration](#)
- [Security Token](#)
- [Sharing](#)
- [Implicit Restrictions for Objects and Fields](#)
- [API Access in Salesforce AppExchange Packages](#)
- [Outbound Port Restrictions](#)

Client applications that access your organization's Salesforce data are subject to the same security protections that are used in the Salesforce user interface. Additional protection is available for organizations that install Salesforce AppExchange managed packages if those packages contain components that access Salesforce via the API.

User Authentication

Client applications must log in using valid credentials for an organization. The server authenticates these credentials and, if valid, provides the client application with:

- a `sessionId` that must be set into the session header so that all subsequent calls to the Web service are authenticated
- a URL address (`serverUrl`) for the client application's Web service requests

Salesforce supports only the Transport Layer Security (TLS) protocol and `frontdoor.jsp`. Ciphers must have a key length of at least 128 bits.

User Profile and Permission Sets Configuration

An organization's Salesforce administrator controls the availability of various features and views by configuring profiles and permission sets, and assigning users to them. To access the API (to issue calls and receive the call results), a user must be granted the "API Enabled" permission. Client applications can query or update only those objects and fields to which they have access via the permissions of the logged-in user.

To create, edit, or delete a profile, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** in the Salesforce user interface. To create, edit, or delete a permission set, from Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.

 **Note:** The Web services WSDL files return all available objects and fields for an organization.

Security Token

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce confirms that the login is authorized as follows.

1. Salesforce checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. If the user has the "Two-Factor Authentication for User Interface Logins" permission, Salesforce prompts the user for a second form of authentication upon logging in. If the user's account isn't already connected to a mobile authenticator app such as Salesforce Authenticator, Salesforce first prompts the user to connect the app.
3. If the user has the "Two-Factor Authentication for API Logins" permission and has connected an authenticator app to the account, Salesforce returns an error if the user uses the standard security token. The user has to enter a verification code (time-based one-time password) generated by the authenticator app instead.
4. Salesforce then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, logins from an undesignated IP address are denied, and logins from a specified IP address are allowed. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client applications.
5. If profile-based IP address restrictions are not set, Salesforce checks whether the user is logging in from a device used to access Salesforce before.
 - If the user's login is from a device and browser that Salesforce recognizes, the login is allowed.
 - If the user's login is from an IP address in your org's trusted IP address list, the login is allowed.
 - If the user's login is not from a trusted IP address or a device and browser Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce has to verify the user's identity:

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later), or to enter a verification code.

 **Note:** Users aren't asked for a verification code the first time they log in to Salesforce.

- For access via the API or a client, users must add their security token to the end of their password to log in. Or, if "Two-Factor Authentication on API Logins" is set on the user profile, users enter a verification code generated by an authenticator app.

A security token is an automatically generated key from Salesforce. For example, if a user's password is *mypassword*, and the security token is *XXXXXXXXXX*, the user must enter *mypasswordXXXXXXXXXX* to log in. Or some client applications have a separate field for the security token.

Users can obtain their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

 **Tip:** Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

For more information about tokens, see "Reset Your Security Token" in the Salesforce online help.

When a user's password is changed, the user's security token is automatically reset. The user will experience a blocked login until he or she adds the automatically-generated security token to the end of his or her password or enters the new password after the administrator adds their IP address to the organization's list of trusted IP addresses.

If Single Sign-On (SSO) is enabled for your organization, users who access the API or a desktop client cannot log in to Salesforce unless their IP address is included on your organization's list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. Furthermore, the delegated authentication authority usually handles login lockout policies for users with the "Uses Single Sign-On" permission. However, if the security token is enabled for your organization, then your organization's login lockout settings determine the number of times a user can attempt to log in with an invalid security token before being locked out of Salesforce. For more information, see "Setting Login Restrictions" and "Setting Password Policies" in the online help.

Sharing

In the Salesforce user interface, sharing refers to the act of granting read or write access to a user or group so that they can view or edit a record owned by other users, if the default organization access levels do not otherwise permit such access. All API calls respect the sharing model.

The following table describes the types of access levels.

API Value	Salesforce User Interface Label	API Picklist Label	Description
None	Private	Private	Only the record owner and Users above that role in the hierarchy can view and edit the record.
Read	Read Only	Read Only	All Users and Groups can view the record but not edit it. Only the owner and users above that role in the hierarchy can edit the record.
Edit	Read/Write	Read/Write	All Users and Groups can view and edit the record.

API Value	Salesforce User Interface Label	API Picklist Label	Description
ReadEditTransfer	Read/Write/Transfer	Read/Write/Transfer	All Users and Groups can view, edit, delete, and transfer the record. (Only available for cases and leads as an organization-wide default setting.)
All	Full Access	Owner	All Users and Groups can view, edit, transfer, delete, and share the record. (Only available for campaigns as an organization-wide default setting.)
ControlledByParent	Controlled by Parent	Controlled By Parent	(Contacts only.) All Users and Groups can perform an action (such as view, edit, or delete) on the contact based on whether he or she can perform that same action on the record associated with it.

Not all access levels are available for every object. See the Fields table for each object to learn which access levels are available, as well as other sharing details specific to that object.

For more information about sharing in general, see the Salesforce online help.

 **Note:** In the API, you can create and update objects such as [AccountShare](#) and [OpportunityShare](#) that define sharing entries for records.

Implicit Restrictions for Objects and Fields

Certain objects can be created or deleted only in the Salesforce user interface. Other objects are read-only—client applications cannot [create \(\)](#), [delete \(\)](#), or [update \(\)](#) such objects. Similarly, certain fields within some objects can be specified on [create \(\)](#) but not on [update \(\)](#). Other fields are read-only—client applications cannot specify field values in [create \(\)](#) or [update \(\)](#) calls. For more information, see the respective object descriptions in [Object Basics](#).

API Access in Salesforce AppExchange Packages

The API allows access to objects and calls based on the permissions of the user who logs into the API. To prevent security issues from arising when installed packages have components that access data via the API, Salesforce provides additional security:

- When a developer creates an AppExchange package with components that access the API, the developer can restrict the API access for those components.
- When an administrator installs an AppExchange package, the administrator can accept or reject the access. Rejecting the access cancels the installation.
- After an administrator installs a package, the administrator can restrict the API access of components in the package that access the API.

Editing API access for a package is done in the Salesforce user interface. For more information, see “Manage API and Dynamic Apex Access in Packages” in the Salesforce online help.

API access for a package affects the API requests originating from components within the package; it determines the objects that the API requests can access. If the API access for a package is not defined, then the objects that the API requests have access to are determined by the user's permissions.

The API access for a package never allows users to do more than the permissions granted to the user. API access in a package only reduces what the user's permissions allow.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
 - Author Apex
 - Customize Application
 - Edit HTML Templates
 - Edit Read Only Fields
 - Manage Billing
 - Manage Call Centers
 - Manage Categories
 - Manage Custom Report Types
 - Manage Dashboards
 - Manage Letterheads
 - Manage Package Licenses
 - Manage Public Documents
 - Manage Public List Views
 - Manage Public Reports
 - Manage Public Templates
 - Manage Users
 - Transfer Record
 - Use Team Reassignment Wizards
 - View Setup and Configuration
 - Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.
- A package with `Restricted` API access can't create new users.
- Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user's full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
 - For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
 - For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
 - If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

To manage API access to packages, see “Manage API and Dynamic Apex Access in Packages” in the Salesforce online help.

 **Note:** XML-RPC requests that originate from restricted packages will be denied access.

Outbound Port Restrictions

For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

The port restriction applies to any feature where a port is specified, for example outbound messages, AJAX proxy, or single-sign on.

CHAPTER 6 Using the Partner WSDL

In this chapter ...

- [Obtaining the Partner WSDL File](#)
- [Calls and the Partner WSDL](#)
- [Objects, Fields, and Field Data and the Partner WSDL](#)
- [Queries and the Partner WSDL](#)
- [Namespaces in the Partner WSDL](#)
- [Package Versions and the Partner WSDL](#)
- [User Interface Themes](#)
- [Examples Using the Partner WSDL](#)

The API provides two WSDLs to choose from:

- **Enterprise Web Services WSDL**—Used by enterprise developers to build client applications for a single Salesforce organization. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it when changes are made to the custom objects or fields in their org or when they want to use a different version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter *Generate Enterprise WSDL* in the `Quick Find` box, then select **Generate Enterprise WSDL**.
- **Partner Web Services WSDL**—Used for client applications that are metadata-driven and dynamic in nature. It is particularly—but not exclusively—useful to Salesforce partners who are building client applications for multiple organizations. As a loosely typed representation of the Salesforce data model that works with name-value pairs of field names and values instead of specific data types, it can be used to access data within any organization. This WSDL is most appropriate for developers of clients that can issue a query call to get information about an object before the client acts on the object. The partner WSDL document needs to be downloaded and consumed only once per version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter *Generate Partner WSDL* in the `Quick Find` box, then select **Generate Partner WSDL**.

In general, the enterprise WSDL is more straightforward to use, while the partner WSDL is more flexible and dynamically adaptable to different organizations, allowing you to write a single application that can be used for multiple users and multiple organizations.

Obtaining the Partner WSDL File

To use the partner WSDL, download a copy of the file using either of the following methods:

- Obtain it from your organization's Salesforce administrator, or
- Generate from Setup in Salesforce (enter *API* in the *Quick Find* box, then select **API**) according to the instructions in [Step 2: Generate or Obtain the Web Service WSDL](#).

While the enterprise WSDL file needs to be regenerated whenever custom fields or custom objects are added to an organization's Salesforce information, the partner WSDL file remains the same regardless of underlying changes in the organization's Salesforce data.

Calls and the Partner WSDL

The partner WSDL file defines exactly the same API calls found in the enterprise WSDL file. A client application using the partner WSDL will likely use the following API calls to determine an organization's metadata:

Task / Call	Description
<code>describeGlobal ()</code>	Retrieves a list of available objects for your organization's data.
<code>describeLayout ()</code>	Retrieves metadata about page layouts for the specified object type.
<code>describeSObject ()</code>	<code>describeSObject ()</code> has been superseded by <code>describeSObjects ()</code> .
<code>describeSObjects ()</code>	Use to obtain metadata for a given object. You can first call to retrieve a list of all objects for your organization, then iterate through the list and use to obtain metadata about individual objects.
<code>describeTabs ()</code>	In the user interface, users have access to standard apps (and may also have access to custom apps) as listed in the Lightning Platform app menu at the top of the page. Selecting a standard app or custom app in the user interface allows the user to switch between the listed apps at any time.

To explore an organization's metadata, a client application can:

1. Call `describeGlobal ()` to obtain a list of available objects.
2. In the returned `DescribeGlobalResult` object, retrieve an array of `DescribeGlobalSObjectResult` objects by calling `subjects`.
3. Get the `sObject` type name for each returned `sObject` by calling `name` on the `DescribeGlobalSObjectResult` objects.
4. The `DescribeGlobalSObjectResult` object provides some metadata about the `sObject`, such as whether the `sObject` is createable or updateable. If you want to get more information about particular `sObjects`, like their fields and child relationships, call `describeSObjects ()` by passing it an array of the `sObject` type names that you're interested in obtaining more information about.

sObject Reference Reuse

An `sObject` reference can't be reused within a single operation.

Use a different reference. For example, the following code snippet creates an account and contact with a custom field and an event using two different references:

```
SObject account = new com.sforce.soap.partner.sobject.wsc.SObject ();
    account.setType ("Account");
```

```

account.setField("Name", "myAccount");
account.setField("XID1__c", "1");
SObject refAcc1 = new com.sforce.soap.partner.object.wsc.SObject();
refAcc1.setType("Account");
refAcc1.setField("XID1__c", "1");
SObject refAcc2 = new com.sforce.soap.partner.object.wsc.SObject();
refAcc2.setType("Account");
refAcc2.setField("XID1__c", "1");

SObject contact = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Contact");
contact.setField("LastName", "LName");
contact.setField("XID2__c", "2");
contact.setField("Account", refAcc1);
SObject refCon = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Contact");
contact.setField("XID2__c", "2");

SObject event = new com.sforce.soap.partner.object.wsc.SObject();
contact.setType("Event");
contact.setField("Subject", "myEvent");
contact.setField("ActivityDateTime", Calendar.getInstance());
contact.setField("DurationInMinutes", 60);
contact.setField("Who", refCon);
contact.setField("What", refAcc2);

client.create(new SObject[] { account, contact, event}); // exception thrown here

```

Any call that takes a parameter of the form `sObject[] sObjects` is subject to this limitation.

Objects, Fields, and Field Data and the Partner WSDL

The enterprise WSDL file defines all the specific objects (such as Account and Contact) in a Salesforce org. In contrast, the partner WSDL file defines a single, generic object (`sObject`) that represents all the objects. For a particular object, its type is defined in the `name` field in the returned `DescribeSObjectResult`.

With the partner WSDL, your client application code handles fields as arrays of name-value pairs that represent the field data. When referring to the name of an individual field, use the value in its `name` field of the `Field` type in the `DescribeSObjectResult`.

Languages vary in the way they handle name-value pairs and map typed values to the primitive XML data types defined in SOAP messages. With the enterprise WSDL, the mapping is handled implicitly. With the partner WSDL, however, you manually manage values and data types when building client applications. Specify the object type before you assign field values. When specifying the value of a particular field, use a value that is valid for the field (range, format, and data type). Make sure that you understand the mapping between data types in your programming language and XML primitive data types. See [SOAPType](#) for more information.

Queries and the Partner WSDL

When using the `query()` call with the partner WSDL, consider the following guidelines:

- The `queryString` parameter is case-insensitive. The API will accept field names in the `fieldList` using any combination of uppercase and lowercase letters. However, in the `QueryResult`, the case of field names (both predefined and custom fields) will match exactly

the value in the `name` field of the `Field` type in the `DescribeObjectResult`. It is recommended that you use the proper case when specifying fields in the `fieldList`.

- For the partner WSDL, the ordering of fields in the `QueryResult` is determined by the field order in the `fieldList`, not the field order in the WSDL file.
- The `fieldList` cannot contain duplicate field names. For example:
 - Invalid (returns an error): `"SELECT Firstname, Lastname, Firstname FROM User"`
 - Valid: `"SELECT Firstname, Lastname FROM User"`
- The `QueryResult` always contains all of the fields specified in the `fieldList`, even if some of the fields contain no data (`null`). Although SOAP allows you to omit fields that contain no values in the result set, the API always returns an array containing all fields.
- If you use the partner WSDL, a query that includes ID will return the ID field twice in the SOAP XML response data. Similarly, a query that does not include ID will return a single null ID field in the SOAP XML response data. For example, a query for `SELECT ID, FirstName, LastName FROM Contact` might return a SOAP XML response with records like:

```
<records xsi:type="sf:sObject" xmlns="urn:partner.soap.sforce.com">
  <sf:type>Contact</sf:type>
  <sf:Id>0038000000Frj0BQRW</sf:Id>
  <sf:Id>0038000000Frj0BQRW</sf:Id>
  <sf:FirstName>John</sf:FirstName>
  <sf:LastName>Smith</sf:LastName>
</records>
```

This is expected behavior and something to be aware of if you are accessing the full SOAP XML response data and not using WSC to access the web service response.

Namespaces in the Partner WSDL

In XML, every tag has a defined namespace. In the `enterprise.wsdl`, namespaces are handled implicitly. When using API calls with the partner WSDL, however, you need to explicitly specify the correct namespaces for API calls, objects, and fields, and faults. This rule applies to predefined and custom objects and fields.

For	Namespace
API Calls	<code>urn:partner.soap.sforce.com</code>
sObjects	<code>urn:object.partner.soap.sforce.com</code>
Fields	<code>urn:object.partner.soap.sforce.com</code>
Faults	<code>urn:fault.partner.soap.sforce.com</code>

Package Versions and the Partner WSDL

The partner WSDL is loosely typed. This makes it more flexible for partners who want to integrate with multiple organizations. Default package versions for API calls provide fallback settings if package versions are not provided by an API call.

The behavior of a package in partner API calls is defined by the latest installed package version if the default value (`Not Specified`) is selected for the installed package. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for

an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

An API client developer should communicate with the administrator of the default partner package version settings if these are two different roles in your organization and the developer recommends changing the settings. Alternatively, an API client developer can set the package versions in the [PackageVersionHeader](#) SOAP header for the client.

A partner that is developing a package that references another package should always supply version information for the base package in their partner API calls. This ensures that the extension package is not affected by a component being deprecated in the base package.

The package version information for partner API calls is determined by the first match in the following settings.

1. The [PackageVersionHeader](#) SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls with the partner WSDL, see [Package Version Settings](#).

User Interface Themes

Back in the Winter '06 release, Salesforce started supporting multiple user interface themes, allowing you to use different sets of icons and colors for the user interface. But these user interface themes do not apply when your org is using Lightning Experience.

Two user interface themes match the earlier iterations of Salesforce.

- Theme3—The “Salesforce Classic 2010 user interface theme.” This interface was previously referred to as “Salesforce” or “new user interface theme.” You might also be familiar with it as the Salesforce *Aloha* interface.
- Theme2—The “Salesforce Classic 2005 user interface theme.” This interface was previously referred to as “Salesforce Classic” or the “classic user interface theme.”

The [getUserInfo\(\)](#) call returns a [getUserInfoResult](#) object, which includes the [userUiSkin](#) property. This property informs you of the user’s current user interface theme.

Use the [describeQuickActions\(\)](#), [describeTabs\(\)](#), and [describeTheme\(\)](#) calls and their return types to get information on theme icons and colors.

Style sheets are available to mimic the look and feel of the older user interfaces. For more information, see [Styling Visualforce Pages](#) in the *Visualforce Developer’s Guide*. But if you’re planning to switch to Lightning Experience, consider the Lightning Component framework, our new UI framework. See the “[Lightning Components](#)” module in the [Develop for Lightning Experience](#) Trailhead trail to learn more.

Examples Using the Partner WSDL

This section includes examples in Java and C# for making API calls using the partner WSDL. Before running these samples, perform the following steps in the quick start tutorial to get the partner WSDL file and generate the proxy client code for your development environment.

- [Step 2: Generate or Obtain the Web Service WSDL](#)
- [Step 3: Import the WSDL File Into Your Development Platform](#)

After you generate the proxy client code and set up your development environment, you can start writing your client application. First, your application needs to log into the Salesforce service using the partner authentication endpoint. After a successful login, you can execute the sample methods.

For your convenience, template classes are provided, one in Java and one in C#, that make a login call. You can use them to execute the sample methods provided later in this section.

Sample template class for Java: This sample prompts the user to enter the username, password, and authentication endpoint. Next, it logs the user in. For the authentication endpoint URL, pass in the endpoint found in the partner WSDL file.

```
import com.sforce.soap.partner.PartnerConnection;
import com.sforce.soap.partner.subject.*;
import com.sforce.soap.partner.*;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;
import com.sforce.soap.partner.Error;
import java.io.FileNotFoundException;
import java.io.IOException;
import java.io.InputStreamReader;
import java.io.BufferedReader;
import java.util.*;

public class PartnerSamples {
    PartnerConnection partnerConnection = null;
    private static BufferedReader reader =
        new BufferedReader(new InputStreamReader(System.in));

    public static void main(String[] args) {
        PartnerSamples samples = new PartnerSamples();
        if (samples.login()) {
            // Add calls to the methods in this class.
            // For example:
            // samples.querySample();
        }
    }

    private String getUserInput(String prompt) {
        String result = "";
        try {
            System.out.print(prompt);
            result = reader.readLine();
        } catch (IOException ioe) {
            ioe.printStackTrace();
        }
        return result;
    }

    private boolean login() {
        boolean success = false;
        String username = getUserInput("Enter username: ");
        String password = getUserInput("Enter password: ");
        String authEndPoint = getUserInput("Enter auth end point: ");

        try {
            ConnectorConfig config = new ConnectorConfig();
            config.setUsername(username);
            config.setPassword(password);

            config.setAuthEndpoint(authEndPoint);
```

```

        config.setTraceFile("traceLogs.txt");
        config.setTraceMessage(true);
        config.setPrettyPrintXml(true);

        partnerConnection = new PartnerConnection(config);

        success = true;
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    } catch (FileNotFoundException fnfe) {
        fnfe.printStackTrace();
    }

    return success;
}

//
// Add your methods here.
//
}

```

Sample template class for C#: This sample prompts the user to enter the username and password. Next, it logs the user in. The project name for this sample is assumed to be *TemplatePartner* and the Web reference name *sforce*. If these values are different for your project, make sure to change the using directive to appropriate values for your project: `using your_project_name.web_reference_name;`

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Web.Services.Protocols;
using System.Collections;
using TemplatePartner.sforce;

namespace TemplatePartner
{
    class PartnerSamples
    {
        private SforceService binding;

        static void Main(string[] args)
        {
            PartnerSamples samples = new PartnerSamples();
            if (samples.login())
            {
                // Add calls to the methods in this class.
                // For example:
                // samples.querySample();
            }
        }

        private bool login()
        {
            Console.Write("Enter username: ");

```

```
string username = Console.ReadLine();
Console.Write("Enter password: ");
string password = Console.ReadLine();

// Create a service object
binding = new SforceService();

// Timeout after a minute
binding.Timeout = 60000;

// Try logging in
LoginResult lr;
try
{
    Console.WriteLine("\nLogging in...\n");
    lr = binding.login(username, password);
}

// ApiFault is a proxy stub generated from the WSDL contract when
// the web service was imported
catch (SoapException e)
{
    // Write the fault code to the console
    Console.WriteLine(e.Code);

    // Write the fault message to the console
    Console.WriteLine("An unexpected error has occurred: " + e.Message);

    // Write the stack trace to the console
    Console.WriteLine(e.StackTrace);

    // Return False to indicate that the login was not successful
    return false;
}

// Check if the password has expired
if (lr.passwordExpired)
{
    Console.WriteLine("An error has occurred. Your password has expired.");
    return false;
}

// Set the returned service endpoint URL
binding.Url = lr.serverUrl;

// Set the SOAP header with the session ID returned by
// the login result. This will be included in all
// API calls.
binding.SessionHeaderValue = new SessionHeader();
binding.SessionHeaderValue.sessionId = lr.sessionId;

// Return true to indicate that we are logged in, pointed
// at the right URL and have our security token in place.
```

```

        return true;
    }

    //
    // Add your methods here.
    //
}

```

This partner WSDL samples are:

- [Sample query and queryMore Calls](#)
- [Sample search Call](#)
- [Sample create Call](#)
- [Sample update Call](#)

Sample query and queryMore Calls

The following Java and C# examples show usage of the `query()` and `queryMore()` calls for the partner WSDL. Each example sets the batch size of the query to 250 items returned. It then performs a query call to get the first name and last name of all contacts and iterates through the contact records returned. For each contact, it writes the contact's first name and last name to the output, or only the last name if the first name is null. Finally, if there are more items to be returned by the query, as indicated by a `QueryResult.done` property value of `false`, it calls `queryMore()` to get the next batch of items, and repeats the process until no more records are returned.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void querySample() {
    try {
        // Set query batch size
        partnerConnection.setQueryOptions(250);

        // SQL query to use
        String sqlQuery = "SELECT FirstName, LastName FROM Contact";
        // Make the query call and get the query results
        QueryResult qr = partnerConnection.query(sqlQuery);

        boolean done = false;
        int loopCount = 0;
        // Loop through the batches of returned results
        while (!done) {
            System.out.println("Records in results set " + loopCount++
                + " - ");
            SObject[] records = qr.getRecords();
            // Process the query results
            for (int i = 0; i < records.length; i++) {
                SObject contact = records[i];
                Object firstName = contact.getField("FirstName");
                Object lastName = contact.getField("LastName");
                if (firstName == null) {
                    System.out.println("Contact " + (i + 1) +

```

```

                ": " + lastName
            );
        } else {
            System.out.println("Contact " + (i + 1) + ": " +
                firstName + " " + lastName);
        }
    }
    if (qr.isDone()) {
        done = true;
    } else {
        qr = partnerConnection.queryMore(qr.getQueryLocator());
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
System.out.println("\nQuery execution completed.");
}

```

C# Example

```

public void querySample()
{
    try
    {
        QueryResult qr = null;
        binding.QueryOptionsValue = new sforce.QueryOptions();
        binding.QueryOptionsValue.batchSize = 250;
        binding.QueryOptionsValue.batchSizeSpecified = true;

        qr = binding.query("SELECT FirstName, LastName FROM Contact");

        bool done = false;
        int loopCount = 0;
        while (!done)
        {
            Console.WriteLine("\nRecords in results set " +
                Convert.ToString(loopCount++)
                + " - ");
            // Process the query results
            for (int i = 0; i < qr.records.Length; i++)
            {
                sforce.sObject con = qr.records[i];
                string fName = con.Any[0].InnerText;
                string lName = con.Any[1].InnerText;
                if (fName == null)
                    Console.WriteLine("Contact " + (i + 1) + ": " + lName);
                else
                    Console.WriteLine("Contact " + (i + 1) + ": " + fName
                        + " " + lName);
            }

            if (qr.done)

```

```

        done = true;
    else
        qr = binding.queryMore(qr.queryLocator);
    }
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
Console.WriteLine("\nQuery execution completed.");
}

```

Sample search Call

The following Java and C# examples show how to use the `search()` call for the partner WSDL. Each example accepts a phone number string value that is used in the SOQL query. The search call looks for phone fields that match the passed in phone value in all contacts, leads, and accounts. Next, the example iterates through the returned search results that contain the matching records, adds them to arrays, and writes their field values to the console. The record fields returned correspond to the fields specified in the SOQL query for each record type.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void searchSample(String phoneNumber) {
    try {
        // Example of phoneNumber format: 4155551212
        String soslQuery =
            "FIND {" + phoneNumber + "} IN Phone FIELDS " +
            "RETURNING " +
            "Contact(Id, Phone, FirstName, LastName), " +
            "Lead(Id, Phone, FirstName, LastName)," +
            "Account(Id, Phone, Name)";
        // Perform SOSL query
        SearchResult sResult = partnerConnection.search(soslQuery);
        // Get the records returned by the search result
        SearchRecord[] records = sResult.getSearchRecords();
        // Create lists of objects to hold search result records
        List<SObject> contacts = new ArrayList<SObject>();
        List<SObject> leads = new ArrayList<SObject>();
        List<SObject> accounts = new ArrayList<SObject>();

        // Iterate through the search result records
        // and store the records in their corresponding lists
        // based on record type.
        if (records != null && records.length > 0) {
            for (int i = 0; i < records.length; i++){
                SObject record = records[i].getRecord();
                if (record.getType().toLowerCase().equals("contact")) {
                    contacts.add(record);
                } else if (record.getType().toLowerCase().equals("lead")){

```

```

        leads.add(record);
    } else if (record.getType().toLowerCase().equals("account")) {
        accounts.add(record);
    }
}
// Display the contacts that the search returned
if (contacts.size() > 0) {
    System.out.println("Found " + contacts.size() +
        " contact(s):");
    for (SObject contact : contacts) {
        System.out.println(contact.getId() + " - " +
            contact.getField("FirstName") + " " +
            contact.getField("LastName") + " - " +
            contact.getField("Phone")
        );
    }
}
// Display the leads that the search returned
if (leads.size() > 0) {
    System.out.println("Found " + leads.size() +
        " lead(s):");
    for (SObject lead : leads) {
        System.out.println(lead.getId() + " - " +
            lead.getField("FirstName") + " " +
            lead.getField("LastName") + " - " +
            lead.getField("Phone")
        );
    }
}
// Display the accounts that the search returned
if (accounts.size() > 0) {
    System.out.println("Found " +
        accounts.size() + " account(s):");
    for (SObject account : accounts) {
        System.out.println(account.getId() + " - " +
            account.getField("Name") + " - " +
            account.getField("Phone")
        );
    }
}
} else {
    // The search returned no records
    System.out.println("No records were found for the search.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

C# Example

```

public void searchSample(String phoneNumber)
{

```

```

try
{
    // Example of phoneNumber format: 4155551212
    String soslQuery =
        "FIND {" + phoneNumber + "} IN Phone FIELDS " +
        "RETURNING " +
        "Contact(Id, Phone, FirstName, LastName), " +
        "Lead(Id, Phone, FirstName, LastName)," +
        "Account(Id, Phone, Name)";
    // Perform SOSL query
    SearchResult sResult = binding.search(soslQuery);
    // Get the records returned by the search result
    SearchRecord[] records = sResult.searchRecords;
    // Create lists of objects to hold search result records
    ArrayList contacts = new System.Collections.ArrayList();
    ArrayList leads = new System.Collections.ArrayList();
    ArrayList accounts = new System.Collections.ArrayList();

    // Iterate through the search result records
    // and store the records in their corresponding lists
    // based on record type.
    if ((records != null) && (records.Length > 0))
    {
        for (int i = 0; i < records.Length; i++)
        {
            sObject record = records[i].record;

            if (record.type.ToLower().Equals("contact"))
            {
                contacts.Add(record);
            }
            else if (record.type.ToLower().Equals("lead"))
            {
                leads.Add(record);
            }
            else if (record.type.ToLower().Equals("account"))
            {
                accounts.Add(record);
            }
        }
    }
    // Display the contacts that the search returned
    if (contacts.Count > 0)
    {
        Console.WriteLine("Found " + contacts.Count + " contact(s):");
        for (int i = 0; i < contacts.Count; i++)
        {
            sObject c = (sObject)contacts[i];
            Console.WriteLine(c.Any[0].InnerText + " - " +
                c.Any[2].InnerText + " " +
                c.Any[3].InnerText + " - " + c.Any[1].InnerText);
        }
    }
    // Display the leads that the search returned
    if (leads.Count > 0)

```

```

    {
        Console.WriteLine("Found " + leads.Count + " lead(s):");
        for (int i = 0; i < leads.Count; i++)
        {
            sObject l = (sObject)leads[i];
            Console.WriteLine(l.Any[0].InnerText + " - " +
                l.Any[2].InnerText + " " +
                l.Any[3].InnerText + " - " + l.Any[1].InnerText);
        }
    }
    // Display the accounts that the search returned
    if (accounts.Count > 0)
    {
        Console.WriteLine("Found " + accounts.Count + " account(s):");
        for (int i = 0; i < accounts.Count; i++)

        " Stack trace: " + e.StackTrace);
}
}

```

Sample create Call

The following Java and C# examples show how to use the `create()` call for the partner WSDL. Each example creates a contact record with several fields. It iterates through the results of the create call and checks whether the operation was successful or not. If the create operation was successful, it writes the ID of the contact created to the console. Otherwise, it iterates through the errors and writes details of each error to the console. In this case, the output of the example is the ID of the new contact.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public String createSample() {
    String result = null;
    try {
        // Create a new sObject of type Contact
        // and fill out its fields.
        SObject contact = new SObject();
    }
}

```

```

contact.setType("Contact");
contact.setField("FirstName", "Otto");
contact.setField("LastName", "Jespersen");
contact.setField("Salutation", "Professor");
contact.setField("Phone", "(999) 555-1234");
contact.setField("Title", "Philologist");

// Add this sObject to an array
SObject[] contacts = new SObject[1];
contacts[0] = contact;
// Make a create call and pass it the array of sObjects
SaveResult[] results = partnerConnection.create(contacts);

// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.length; j++) {
    if (results[j].isSuccess()) {
        result = results[j].getId();
        System.out.println(
            "\nA contact was created with an ID of: " + result
        );
    } else {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].getErrors().length; i++) {
            Error err = results[j].getErrors()[i];
            System.out.println("Errors were found on item " + j);
            System.out.println("Error code: " +
                err.getStatusCode().toString());
            System.out.println("Error message: " + err.getMessage());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
return result;
}

```

C# Example

```

public void createSample()
{
    try
    {
        // Create a new sObject of type Contact
        // and fill out its fields.
        sObject contact = new sforce.sObject();
        System.Xml.XmlElement[] contactFields = new System.Xml.XmlElement[6];
    }
}

```

```

// Create the contact's fields
System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
contactFields[0] = doc.CreateElement("FirstName");
contactFields[0].InnerText = "Otto";
contactFields[1] = doc.CreateElement("LastName");
contactFields[1].InnerText = "Jespersen";
contactFields[2] = doc.CreateElement("Salutation");
contactFields[2].InnerText = "Professor";
contactFields[3] = doc.CreateElement("Phone");
contactFields[3].InnerText = "(999) 555-1234";
contactFields[4] = doc.CreateElement("Title");
contactFields[4].InnerText = "Philologist";

contact.type = "Contact";
contact.Any = contactFields;

// Add this sObject to an array
sObject[] contactList = new sObject[1];
contactList[0] = contact;

// Make a create call and pass it the array of sObjects
SaveResult[] results = binding.create(contactList);
// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.Length; j++)
{
    if (results[j].success)
    {
        Console.WriteLine("\nA contact was created with an ID of: "
            + results[j].id);
    }
    else
    {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].errors.Length; i++)
        {
            Error err = results[j].errors[i];
            Console.WriteLine("Errors were found on item " + j.ToString());
            Console.WriteLine("Error code is: " + err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}

```

```

    }
}

```

Sample update Call

The following Java and C# examples show how to use the `update()` call for the Partner WSDL. Each example takes the ID of the contact to update as an argument. It creates two `sObject` records of type `Contact`—one to hold the valid passed in ID and the other has an invalid ID. Next, it sets a new phone number for the valid contact and `null` for the last name of the invalid contact. It then makes the update call and iterates through the results. For a successful update operation, it writes the ID of the contact that got updated. For a failed update operation, it writes the details of all returned errors to the console. In this case, the output is the ID of the contact that was successfully updated and an error for the invalid contact update.

To execute the sample method, you can use the corresponding Java or C# template class provided in [Examples Using the Partner WSDL](#).

Java Example

```

public void updateSample(String id) {
    try {
        // Create an sObject of type contact
        SObject updateContact = new SObject();
        updateContact.setType("Contact");

        // Set the ID of the contact to update
        updateContact.setId(id);
        // Set the Phone field with a new value
        updateContact.setField("Phone", "(415) 555-1212");

        // Create another contact that will cause an error
        // because it has an invalid ID.
        SObject errorContact = new SObject();
        errorContact.setType("Contact");
        // Set an invalid ID on purpose
        errorContact.setId("SLFKJLFKJ");
        // Set the value of LastName to null
        errorContact.setFieldsToNull(new String[] {"LastName"});

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = partnerConnection.update(
            new SObject[] {updateContact, errorContact}
        );
        // Iterate through the results and write the ID of
        // the updated contacts to the console, in this case one contact.
        // If the result is not successful, write the errors
        // to the console. In this case, one item failed to update.
        for (int j = 0; j < saveResults.length; j++) {
            System.out.println("\nItem: " + j);
            if (saveResults[j].isSuccess()) {
                System.out.println("Contact with an ID of " +
                    saveResults[j].getId() + " was updated.");
            }
            else {

```

```

        // There were errors during the update call,
        // go through the errors array and write
        // them to the console.
        for (int i = 0; i < saveResults[j].getErrors().length; i++) {
            Error err = saveResults[j].getErrors()[i];
            System.out.println("Errors were found on item " + j);
            System.out.println("Error code: " +
                err.getStatusCode().toString());
            System.out.println("Error message: " + err.getMessage());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
}

```

For more information about `setFieldsToNull` (or its equivalent in client tools other than WSC), see [fieldsToNull](#) and [Resetting Values to null](#).

C# Example

```

public void updateSample(String id) {
    try
    {
        // Create an sObject of type contact
        sObject updateContact = new sObject();
        updateContact.type = "Contact";

        // Set the ID of the contact to update
        updateContact.Id = id;
        // Set the Phone field to a new value.
        // The Phone field needs to be created as an XML element.
        System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
        System.Xml.XmlElement phoneField = doc.CreateElement("Phone");
        phoneField.InnerText = "(415) 555-1212";

        // Add the Phone field to the contact
        updateContact.Any = new System.Xml.XmlElement[] {phoneField};

        // Create another contact that will cause an error
        // because it has an invalid ID.
        sObject errorContact = new sObject();
        errorContact.type = "Contact";
        // Set an invalid ID on purpose
        errorContact.Id = "SLFKJLFKJ";
        // Set the value of LastName to null
        errorContact.fieldsToNull = new String[] { "LastName" };

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = binding.update(
            new sObject[] {updateContact, errorContact});
        // Iterate through the results and write the ID of
    }
}

```

```
// the updated contacts to the console, in this case one contact.
// If the result is not successful, write the errors
// to the console. In this case, one item failed to update.
for (int j = 0; j < saveResults.Length; j++) {
    Console.WriteLine("\nItem: " + j);
    if (saveResults[j].success)
    {
        Console.WriteLine("Contact with an ID of " +
            saveResults[j].id + " was updated.");
    }
    else
    {
        // There were errors during the update call,
        // go through the errors array and write
        // them to the console.
        for (int i = 0; i < saveResults[j].errors.Length; i++) {
            Error err = saveResults[j].errors[i];
            Console.WriteLine("Errors were found on item " + j.ToString());
            Console.WriteLine("Error code: " +
                err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}
}
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
}
```

REFERENCE

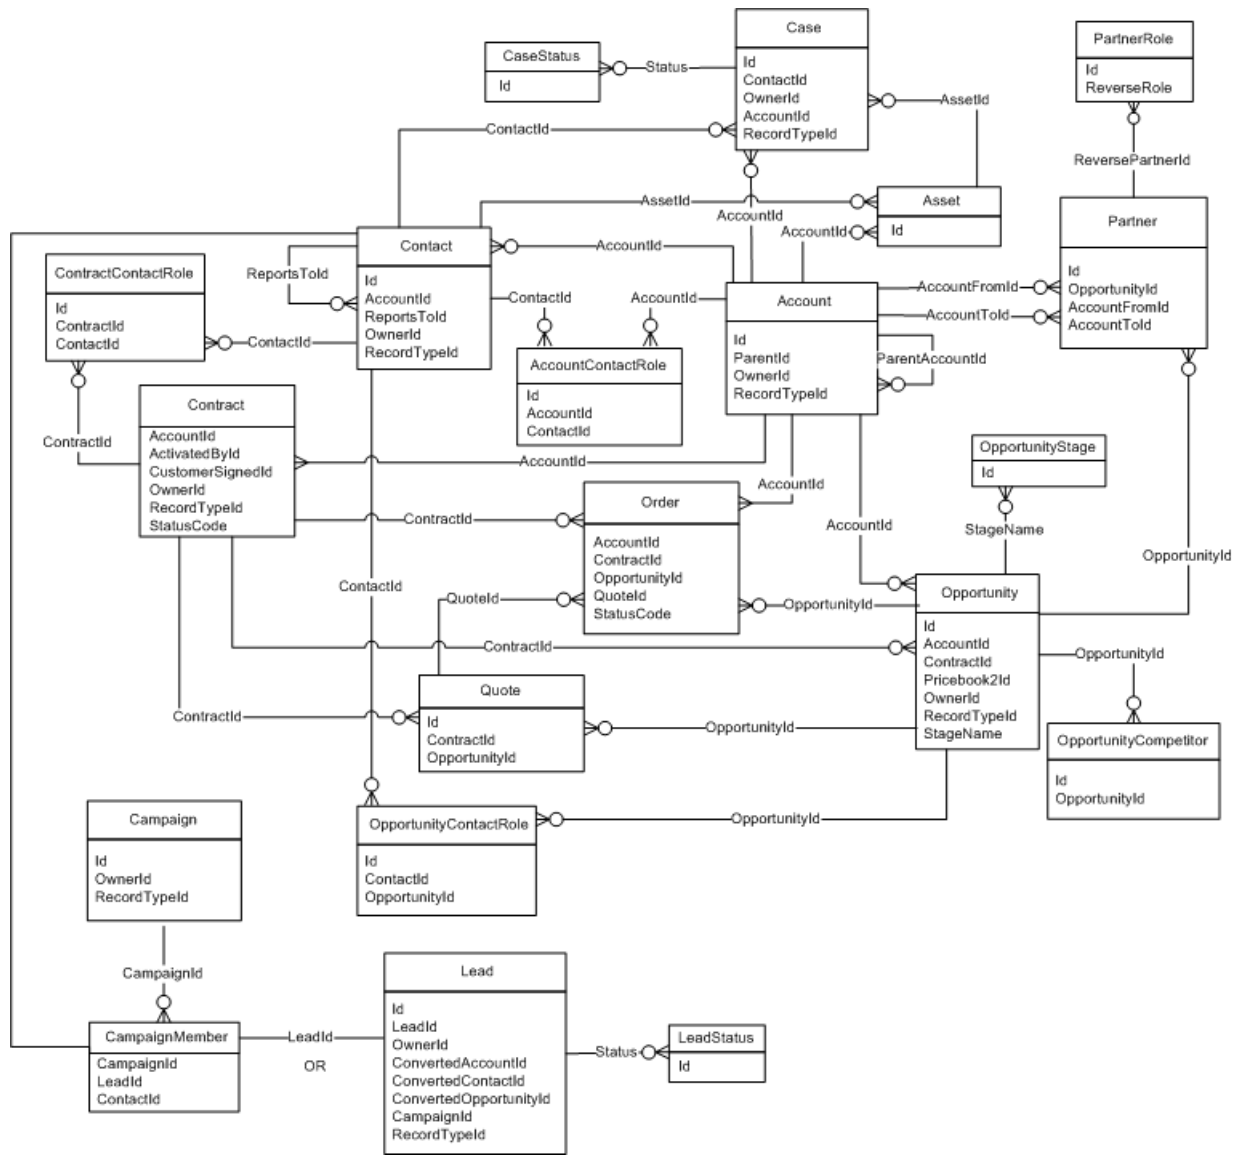

CHAPTER 7 Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. Salesforce ERDs use crow's foot notation. The following ERDs are available.

- [Sales Objects](#)—includes accounts, contacts, opportunities, leads, campaigns, and other related objects
- [Task and Event Objects](#)—includes tasks and events and their related objects
- [Support Objects](#)—includes cases and solutions and their related objects
- [Salesforce Knowledge Objects](#)—includes view and vote statistics, article versions, and other related objects
- [Document, Note, and Attachment Objects](#)—includes documents, notes, and attachments and their related objects
- [User, Sharing, and Permission Objects](#)—includes users, profiles, and roles
- [Profile and Permission Objects](#)—includes users, profiles, permission sets, and related permission objects
- [Record Type Objects](#)—includes record types and business processes and their related objects
- [Product and Schedule Objects](#)—includes opportunities, products, and schedules
- [Sharing and Team Selling Objects](#)—includes account teams, opportunity teams, and sharing objects
- [Customizable Forecasting Objects](#)—includes forecasts and related objects
- [Forecasts Objects](#)—includes objects for Collaborative Forecasts.
- [Territory Management 2.0 Objects](#)—includes territories and related objects associated with Territory Management 2.0
- [Territory Management](#)—includes territories and related objects
- [Process Objects](#)—includes approval processes and related objects
- [Content Objects](#)—includes content and libraries and their related objects
- [Chatter Feed Objects](#)—includes objects related to feeds
- [Work.com Badge and Reward Objects](#)—includes badge and reward objects
- [Work.com Feedback and Performance Cycle Objects](#)—includes feedback and performance cycle objects

Each ERD includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that's being followed, an updated post, or a user status change.
- All feed items have a `ParentId`, which is either:
 - a record
 - a user
 - a group

CHAPTER 8 Standard Objects

This section provides a list of standard objects and their standard fields. Some fields may not be listed for some objects.

To see the system fields for each object, see [System Fields](#).

To verify the complete list of fields for an object, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

[AcceptedEventRelation](#)

Represents invitees with the status `Accepted` for a given event.

[Account](#)

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

[AccountContactRelation](#)

Represents a relationship between a contact and one or more accounts.

[AccountCleanInfo](#)

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

[AccountContactRole](#)

Represents the role that a Contact plays on an Account.

[AccountFeed](#)

Represents a single feed item on an account record detail page. This object is available in API version 18.0 and later.

[AccountHistory](#)

Represents the history of changes to the values in the fields of an account. This object is available in versions 11.0 and later.

[AccountOwnerSharingRule](#)

Represents the rules for sharing an account with a User other than the owner.

[AccountPartner](#)

This read-only object represents a partner relationship between two Account objects. It is automatically created when a Partner object is created for a partner relationship between two accounts.

[AccountShare](#)

Represents a sharing entry on an Account.

[AccountTag](#)

Associates a word or short phrase with an Account.

[AccountTeamMember](#)

Represents a User who is a member of an Account team.

Standard Objects

[AccountTerritoryAssignmentRule](#)

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

[AccountTerritoryAssignmentRuleItem](#)

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

[AccountTerritorySharingRule](#)

Represents the rules for sharing an Account within a Territory.

[ActionLinkGroupTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

[ActionLinkTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

[ActiveScratchOrg](#)

Represents an active scratch org. This object is available in API version 41.0 and later.

[ActivityHistory](#)

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

[AdditionalNumber](#)

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

[Address](#)

Represents a mailing, billing, or home address.

[AgentWork](#)

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

[AllowedEmailDomain](#)

Represents an allowed email domain for users in your organization. You can define a whitelist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

[Announcement](#)

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

[ApexClass](#)

Represents an Apex class.

[ApexComponent](#)

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

[ApexLog](#)

Represents a debug log, containing information about a transaction, including information about Apex, Visualforce, workflow and validation rules. This object is available in API version 19.0 and later.

Standard Objects

[ApexPage](#)

Represents a single Visualforce page.

[ApexTestQueueItem](#)

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

[ApexTestResult](#)

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

[ApexTestResultLimits](#)

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

[ApexTestRunResult](#)

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

[ApexTestSuite](#)

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

[ApexTrigger](#)

Represents an Apex trigger.

[AppExtension](#)

Represents a connection between the Field Service Lightning mobile app and another app, typically for passing record data to the Salesforce app or other apps. This object is available in API version 41.0 and later.

[AppMenuItem](#)

Represents the organization's default settings for items in the app menu or App Launcher.

[Approval](#)

Represents an approval request for a Contract.

[Article Type__DataCategorySelection](#)

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

[Article Type__Feed](#)

Represents a single feed item in the feed displayed on the detail page for an article. This object is available in API version 20.0 and later.

[Asset](#)

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

[AssetFeed](#)

Represents a single feed item in the feed displayed on the detail page for an asset record.

[AssetOwnerSharingRule](#)

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

[AssetRelationship](#)

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

[AssetShare](#)

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

Standard Objects

[AssetTag](#)

Associates a word or short phrase with an Asset.

[AssetTokenEvent](#)

Represents an event associated with an asset token, such as token issuance and registration of a connected device as an Asset. This object is available in API version 39.0 and later.

[AssignedResource](#)

Represents a service resource who is assigned to a service appointment. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

[AssignmentRule](#)

Represents an assignment rule associated with a Case or Lead.

[AssociatedLocation](#)

Represents a link between an account and a location in Field Service Lightning. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

[AsyncApexJob](#)

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`.

[AttachedContentDocument](#)

This read-only object contains all `ContentDocument` objects associated with an object.

[AttachedContentNote](#)

This read-only object contains all `ContentNote` objects associated with an object. This object is available in API version 35.0 and later.

[Attachment](#)

Represents a file that a User has uploaded and attached to a parent object.

[AuraDefinition](#)

Represents a Lightning definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

[AuraDefinitionBundle](#)

Represents a Lightning definition bundle, such as a component or application bundle. A bundle contains a Lightning definition and all its related resources. This object is available in API version 32.0 and later.

[AuthConfig](#)

Represents authentication options for a community or custom domain that was created by using My Domain. This object is available in API version 32.0 and later.

[AuthConfigProviders](#)

Represents an authentication provider that's configured in an organization. This object is a child of the `AuthConfig` object. This object is available in API version 32.0 and later.

[AuthProvider](#)

Represents an authentication provider in your org.

[AuthSession](#)

The `AuthSession` object represents an individual user session in your organization. This object is available in versions 29.0 and later.

[BackgroundOperation](#)

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

Standard Objects

[BackgroundOperationResult](#)

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

[Bookmark](#)

Represents a link between opportunities that share common information.

[BrandTemplate](#)

Letterhead for HTML EmailTemplate.

[BusinessHours](#)

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

[BusinessProcess](#)

Represents a business process.

[CallCenter](#)

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

[Campaign](#)

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

[CampaignFeed](#)

Represents a single feed item in the feed on a campaign record detail page. This object is available in API version 18.0 and later.

[CampaignHistory](#)

Represents the history of changes to the values in the fields of a campaign. This object is available in versions 40.0 and later.

[CampaignInfluence](#)

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

[CampaignInfluenceModel](#)

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

[CampaignMember](#)

Represents the association between a campaign and either a lead or a contact.

[CampaignMemberStatus](#)

One or more member status values defined for a campaign.

[CampaignOwnerSharingRule](#)

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

[CampaignShare](#)

Represents a sharing entry on a Campaign.

[CampaignTag](#)

Associates a word or short phrase with a Campaign.

[Case](#)

Represents a case, which is a customer issue or problem.

[CaseArticle](#)

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

Standard Objects

[CaseComment](#)

Represents a comment that provides additional information about the associated Case.

[CaseContactRole](#)

Represents the role that a given Contact plays on a Case.

[CaseFeed](#)

Represents a single feed item in the feed displayed on the detail page for a case record. A case feed shows recent changes to a case record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to cases. This object is available in API version 18.0 and later.

[CaseHistory](#)

Represents historical information about changes that have been made to the associated Case.

[CaseMilestone](#)

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

[CaseOwnerSharingRule](#)

Represents the rules for sharing a case with users other than the owner.

[CaseShare](#)

Represents a sharing entry on a Case.

[CaseSolution](#)

Represents the association between a Case and a Solution.

[CaseStatus](#)

Represents the status of a Case, such as New, On Hold, or In Process.

[CaseTag](#)

Associates a word or short phrase with a Case

[CaseTeamMember](#)

Represents a case team member, who works with a team of other users to help resolve a case.

[CaseTeamRole](#)

Represents a case team role. Every case team member has a role on a case, such as "Customer Contact" or "Case Manager."

[CaseTeamTemplate](#)

Represents a predefined case team, which is a group of users that helps resolve a case.

[CaseTeamTemplateMember](#)

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

[CaseTeamTemplateRecord](#)

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

[CategoryData](#)

Represents a logical grouping of Solution records.

[CategoryNode](#)

Represents a tree of Solution categories.

[CategoryNodeLocalization](#)

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

Standard Objects

[ChannelProgram](#)

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

[ChannelProgramFeed](#)

Represents a single feed item on a channel program feed. This object is available in API version 41.0 and later.

[ChannelProgramHistory](#)

Represents the history of changes to the values in the fields of a channel program object. Access is read-only. This object is available in API version 41.0 and later.

[ChannelProgramLevel](#)

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

[ChannelProgramLevelFeed](#)

Represents a single feed item on a channel program level feed. This object is available in API version 41.0 and later.

[ChannelProgramLevelHistory](#)

Represents the history of changes to the values in the fields of a channel program level object. Access is read-only. This object is available in API version 41.0 and later.

[ChannelProgramMember](#)

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

[ChannelProgramOwnerSharingRule](#)

Represents a rule for sharing a channel program object with users other than the owner. This object is available in API version 41.0 and later.

[ChannelProgramShare](#)

Represents a sharing entry on a channel program record. This object is available in API version 41.0 and later.

[ChatterActivity](#)

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

[ChatterAnswersActivity](#)

Represents the reputation of a User in Chatter Answers communities. This object is available in API version 25.0 and later.

[ChatterAnswersReputationLevel](#)

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

[ChatterConversation](#)

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

[ChatterConversationMember](#)

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

[ChatterMessage](#)

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

[ClientBrowser](#)

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

[CollaborationGroup](#)

Represents a Chatter group. This object is available in API version 19.0 and later.

Standard Objects

[CollaborationGroupFeed](#)

Represents a single feed item on a Chatter group feed. A group feed shows posts and comments about the group. This object is available in API version 19.0 and later.

[CollaborationGroupMember](#)

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

[CollaborationGroupMemberRequest](#)

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

[CollaborationGroupRecord](#)

Represents the records associated with Chatter groups.

[CollaborationInvitation](#)

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

[CombinedAttachment](#)

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

[Community \(Zone\)](#)

Represents a zone that contains Idea or Question objects.

[ConnectedApplication](#)

Represents a connected app and its details; all fields are read-only.

[Contact](#)

Represents a contact, which is a person associated with an account.

[ContactCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

[ContactFeed](#)

Represents a single feed item in the feed on a contact record detail page. This object is available in API version 18.0 and later.

[ContactHistory](#)

Represents the history of changes to the values in the fields of a contact. This object is available in versions 11.0 and later.

[ContactOwnerSharingRule](#)

Represents the rules for sharing a contact with a User other than the owner.

[ContactShare](#)

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

[ContactTag](#)

Associates a word or short phrase with a Contact.

[ContentAsset](#)

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

[ContentBody](#)

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

Standard Objects

[ContentDistribution](#)

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

[ContentDistributionView](#)

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

[ContentDocument](#)

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

[ContentDocumentFeed](#)

Represents a single feed item associated with ContentDocument. A content document feed shows these content document changes: creating a ContentDocument file and uploading a new ContentDocument. This object is available in versions 20.0 and later.

[ContentDocumentHistory](#)

Represents the history of a document. This object is available in versions 17.0 and later.

[ContentDocumentLink](#)

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

[ContentDocumentSubscription](#)

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

[ContentFolder](#)

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

[ContentFolderItem](#)

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

[ContentFolderLink](#)

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

[ContentFolderMember](#)

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

[ContentHubItem](#)

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

[ContentHubRepository](#)

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

[ContentNote](#)

Represents a note in SalesforceSalesforce. This object is available in API version 32.0 and later.

[ContentNotification](#)

Represents a notification for a file. This object is available in API version 42.0 and later.

[ContentTagSubscription](#)

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

[ContentUserSubscription](#)

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

Standard Objects

[ContentVersion](#)

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

[ContentVersionComment](#)

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

[ContentVersionHistory](#)

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

[ContentVersionRating](#)

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

[ContentWorkspace](#)

Represents a content library. This object is available in versions 17.0 and later.

[ContentWorkspaceDoc](#)

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

[ContentWorkspaceMember](#)

Represents a member of a content library. This object is available in API version 40.0 and later.

[ContentWorkspacePermission](#)

Represents a library permission. This object is available in API version 40.0 and later.

[ContentWorkspaceSubscription](#)

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

[Contract](#)

Represents a contract (a business agreement) associated with an Account.

[ContractContactRole](#)

Represents the role that a given Contact plays on a Contract.

[ContractFeed](#)

Represents a single feed item in the feed on the contract record detail page. This object is available in API version 18.0 and later.

[ContractHistory](#)

Represents the history of changes to the values in the fields of a contract.

[ContractLineItem](#)

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

[ContractLineItemHistory](#)

Represents the history of changes to the values in the fields on a ContractLineItem (items in a customer support agreement). This object is available in API version 18.0 and later.

[ContractStatus](#)

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

[ContractTag](#)

Associates a word or short phrase with a Contract.

Standard Objects

[CorsWhitelistEntry](#)

Cross-Origin Resource Sharing (CORS) enables web browsers to request resources from origins other than their own (cross-origin). For example, using CORS, JavaScript code at `https://www.example.com` could request a resource from `https://www.salesforce.com`. To access supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the origin serving the code to a Salesforce CORS whitelist.

[CronJobDetail](#)

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

[CronTrigger](#)

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

[CurrencyType](#)

Represents the currencies used by an organization for which the multicurrency feature is enabled.

[CustomBrand](#)

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

[CustomBrandAsset](#)

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to a community or to an org using the Salesforce app. This object is available in API version 28.0 and later.

[Custom Metadata Type__mdt](#)

Represents a custom metadata record. This object is available in API version 34.0 and later.

[Custom Object__Feed](#)

Custom Object__Feed is the base object for all record feed objects. For example, AccountFeed is based on *Custom Object__Feed*. The *Custom Object__Feed* object is not, in itself, accessible. Objects based on the *Custom Object__Feed* object are available in API version 18.0 and later.

[CustomPermission](#)

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

[CustomPermissionDependency](#)

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

[DandBCompany](#)

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

[Dashboard](#)

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

[DashboardComponent](#)

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

[DashboardComponentFeed](#)

Represents a single feed item in the feed displayed on a dashboard component. This object is available in API version 21.0 and later.

Standard Objects

[DashboardFeed](#)

Represents a single feed item in the feed displayed on a dashboard. This object is available in API version 20.0 and later.

[DashboardTag](#)

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

[DataAssessmentFieldMetric](#)

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

[DataAssessmentMetric](#)

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

[DataAssessmentValueMetric](#)

Summarizes the number of fields matched for your account records with Data.com account records. This object is available in API version 37.0 and later.

[DatacloudCompany](#)

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

[DatacloudContact](#)

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

[DatacloudDandBCompany](#)

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

[DatacloudOwnedEntity](#)

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

[DatacloudPurchaseUsage](#)

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

[DatacloudSocialHandle](#)

Returns normalized URLs with userids for different social media used by Data.com contacts. The DatacloudSocialHandle object is a child object of the DatacloudContact object. This object is available in API version 30.0 or later.

[DataIntegrationRecordPurchasePermission](#)

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

[DatedConversionRate](#)

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

[DcSocialProfile](#)

The `DcSocialProfile` object is a read-only object accessible only through the Data.com Social Key API. This object is available in API version 32.0 or later.

[DcSocialProfileHandle](#)

The `DcSocialProfileHandle` object, a child object to `DcSocialProfile`, is a read-only object accessible only through the Data.com Social Key API. The `DcSocialProfileHandle` object is a child object of the `DcSocialProfile` object. This object is available in API version 32.0 or later.

[DeclinedEventRelation](#)

Represents invitees with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

Standard Objects

[DigitalSignature](#)

Represents a signature captured on a service report in field service.

[Division](#)

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

[DivisionLocalization](#)

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

[Document](#)

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

[DocumentAttachmentMap](#)

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

[DocumentTag](#)

Associates a word or short phrase with a Document.

[Domain](#)

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

[DomainSite](#)

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

[DuplicateJob](#)

Represents an instance of a job that identifies duplicates among existing records in the system.

[DuplicateJobDefinition](#)

Setup object defining a job that identifies duplicate record items globally.

[DuplicateJobMatchingRule](#)

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

[DuplicateJobMatchingRuleDefinition](#)

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

[DuplicateRecordItem](#)

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

[DuplicateRecordSet](#)

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

[DuplicateRule](#)

Represents a duplicate rule for detecting duplicate records.

[EmailDomainKey](#)

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

[EmailMessage](#)

Represents an email in Salesforce.

Standard Objects

[EmailMessageRelation](#)

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

[EmailServicesAddress](#)

An email service address.

[EmailServicesFunction](#)

An email service.

[EmailStatus](#)

Represents the status of email sent.

[EmailTemplate](#)

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

[EmbeddedServiceDetail](#)

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

[Entitlement](#)

Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

[EntitlementContact](#)

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

[EntitlementFeed](#)

Represents a single feed item in the feed displayed on the detail page for an entitlement. An entitlement feed shows recent changes to an entitlement record for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to entitlements. This object is available in API version 23.0 and later.

[EntitlementHistory](#)

Represents the changes to field values on an Entitlement. This object is available in API version 18.0 and later.

[EntitlementTemplate](#)

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

[EntityHistory](#)

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead: CaseHistory, ContractHistory, LeadHistory, OpportunityFieldHistory, OpportunityHistory, ProcessInstanceHistory, QuantityForecastHistory, RevenueForecastHistory, or SolutionHistory.

[EntityMilestone](#)

Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

[EntitySubscription](#)

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

[EnvironmentHubMember](#)

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

[Event](#)

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

Standard Objects

[EventFeed](#)

Represents a single feed item in the feed on an Event. This object is available in API version 20.0 and later.

[EventLogFile](#)

Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org's operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The `Interval` and `Sequence` fields are available only in API version 37.0 and later.

[EventRelation](#)

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

[EventTag](#)

Associates a word or short phrase with an Event.

[EventWhoRelation](#)

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the [EventRelation](#) on page 1101 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

[ExternalDataSource](#)

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

[ExternalDataUserAuth](#)

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

[FeedAttachment](#)

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

[FeedComment](#)

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

[FeedItem](#)

FeedItem represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces FeedPost.

[FeedLike](#)

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

[FeedPollChoice](#)

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

[FeedPollVote](#)

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

[FeedPost](#)

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

Standard Objects

[FeedRevision](#)

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

[FeedTrackedChange](#)

Represents an individual field change or set of field changes. A `FeedTrackedChange` is a child object of a record feed, such as `AccountFeed`. This object is available in API version 18.0 and later.

[FieldHistoryArchive](#)

Represents field history values for all objects that retain field history. `FieldHistoryArchive` is a big object, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

[FieldPermissions](#)

Represents the enabled field permissions for the parent `PermissionSet`. This object is available in API version 24.0 and later.

[FieldServiceMobileSettings](#)

Represents a configuration of settings that control the Field Service Lightning iOS and Android mobile app experience. This object is available in API version 38.0 and later.

[FiscalYearSettings](#)

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the `Period` object.

[FlexQueueItem](#)

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the `AsyncApexJob`. This object is available in API version 36.0 and later.

[FlowInterview](#)

Represents a flow interview. A *flow interview* is a running instance of a flow.

[FlowInterviewOwnerSharingRule](#)

Represents the rules for sharing a `FlowInterview` with users other than the owner. This object is available in API version 33.0 and later.

[FlowInterviewShare](#)

Represents a sharing entry on a `FlowInterview`. This object is available in API version 33.0 and later.

[FlowRecordRelation](#)

Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the `$Flow.CurrentRecord` system variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

[Folder](#)

Represents a repository for a `Document`, `EmailTemplate`, `Report`, or `Dashboard`. Only one type of item can be contained in a folder.

[FolderedContentDocument](#)

Represents the relationship between a parent and child `ContentFolderItem` in a `ContentWorkspace`.

[ForecastingAdjustment](#)

This object represents an individual sales manager’s adjustment for a subordinate’s forecast via a `ForecastingItem`. Available in API versions 26 and greater. This object is separate from the `ForecastingOwnerAdjustment` object, which represents forecast users’ adjustments of their *own* forecasts.

[ForecastingDisplayedFamily](#)

Represents the table in `Forecasts Settings` where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

Standard Objects

[ForecastingFact](#)

This is a read-only object linking a `ForecastingItem` with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

[ForecastingItem](#)

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

[ForecastingOwnerAdjustment](#)

This object represents an individual forecast user's adjustment of their *own* forecast via a `ForecastingItem`. Available in API versions 33 and greater. This object is separate from the `ForecastingAdjustment` object, which represents managers' adjustments of *subordinates'* forecasts.

[ForecastingQuota](#)

This object represents an individual user's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast role hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates who report to them in the forecast hierarchy.

[ForecastingType](#)

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

[ForecastingUserPreference](#)

Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

[ForecastShare](#)

Represents the sharing of a customizable forecast at a given role and territory.

[Goal](#)

The Goal object represents the components of a goal such as its name, description, and status.

[GoalFeed](#)

Represents a single feed item in the feed displayed for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal.

[GoalHistory](#)

This read-only object contains historical information about changes that have been made to the Goal object.

[GoalLink](#)

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

[GoalShare](#)

Represents a sharing entry on a Goal object.

[GoogleDoc](#)

Represents a link to a Google Document. This object is available in API version 14.0 and later.

[Group](#)

A set of User records.

Standard Objects

[GroupMember](#)

Represents a User or Group that is a member of a public group.

[HashtagDefinition](#)

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

[Holiday](#)

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

[Idea](#)

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

[IdeaComment](#)

Represents a comment that a user has submitted in response to an idea.

[IdeaReputation](#)

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

[IdeaReputationLevel](#)

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

[IdeaTheme](#)

Represents an invitation to community members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

[Individual](#)

Represents a customer's data privacy and protection preferences. Data privacy records based on the Individual object store your customers' preferences. Data privacy records are associated with related leads and contacts. This object is available in API version 42.0 and later.

[IndividualHistory](#)

Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

[IndividualShare](#)

Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access to a record because you own it, the `IndividualAccessLevel` is `All` and `RowCause` is `Owner`. This object is available in API version 42.0 and later.

[KnowledgeableUser](#)

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

[KnowledgeArticle](#)

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

[KnowledgeArticleVersion](#)

Provides a global view of standard article fields across all article types depending on their version. This object is available in API version 18.0 and later.

[KnowledgeArticleVersionHistory](#)

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

Standard Objects

[KnowledgeArticleViewStat](#)

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20 and later.

[KnowledgeArticleVoteStat](#)

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20 and later.

[Lead](#)

Represents a prospect or lead.

[LeadCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a lead record's clean status. Helps you automate the cleaning or related processing of lead records.

[LeadFeed](#)

Represents a single feed item in the feed displayed on the detail page for a lead record. This object is available in API version 18.0 and later.

[LeadHistory](#)

Represents the history of changes to the values in the fields of a lead.

[LeadOwnerSharingRule](#)

Represents the rules for sharing a lead with users other than the owner.

[LeadShare](#)

Represents a sharing entry on a Lead.

[LeadStatus](#)

Represents the status of a Lead, such as Open, Qualified, or Converted.

[LeadTag](#)

Associates a word or short phrase with a Lead.

[LimitAllocationPerApp](#)

Represents a connected app quota for an API limit. This object is available in API version 30.0 and later.

[LineitemOverride](#)

A forecast override of a line item on an Opportunity. This read-only object for customizable forecasting has a child-parent relationship with OpportunityOverride.

[LinkedArticle](#)

Represents a Knowledge article that is attached to a work order or work order line item. This object is available in API version 37.0 and later.

[LinkedArticleFeed](#)

Represents a single feed item on a linked Knowledge article attached to a work order. This object is available in API version 37.0 and later.

[LinkedArticleHistory](#)

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

[ListEmail](#)

Represents a list email in Salesforce. Available in API version 41.0 and later. Has a one-to-many relationship with ListEmailRecipientSource.

[ListEmailRecipientSource](#)

For a list email in Salesforce, represents the source of a recipient's email. Available in API version 41.0 and later.

Standard Objects

[ListView](#)

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

[ListViewChart](#)

Represents a graphical chart that's displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later.

[ListViewChartInstance](#)

Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

[LiveAgentSession](#)

This object is automatically created for each Life Agent session and stores information about the session. This object is available in API versions 28.0 and later.

[LiveAgentSessionHistory](#)

This object is automatically created for each Life Agent session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

[LiveAgentSessionOwnerSharingRule](#)

Represents the rules for sharing a Life Agent session record with users other than the record owner. This object is available in API version 28.0 and later.

[LiveAgentSessionShare](#)

This object is automatically created for each Life Agent session and stores information about the session. This object is available in API versions 28.0 and later.

[LiveChatBlockingRule](#)

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

[LiveChatButton](#)

Represents a button that allows visitors to request chats with Life Agent users. This object is available in API version 24.0 and later.

[LiveChatButtonDeployment](#)

Associates a Live Agent automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

[LiveChatButtonSkill](#)

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

[LiveChatDeployment](#)

Represents the general settings for deploying Life Agent on a website. This object is available in API version 24.0 and later.

[LiveChatSensitiveDataRule](#)

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

[LiveChatTranscript](#)

This object is automatically created for each Life Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

[LiveChatTranscriptEvent](#)

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

Standard Objects

[LiveChatTranscriptHistory](#)

Represents changes to field values on a LiveChatTranscript object. This object is available in API version 24.0 and later.

[LiveChatTranscriptOwnerSharingRule](#)

Represents the rules for sharing a Life Agent chat transcript record with users other than the record owner. This object is available in API version 29.0 and later.

[LiveChatTranscriptShare](#)

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

[LiveChatTranscriptSkill](#)

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

[LiveChatUserConfig](#)

Represents a setting that controls the console settings for Life Agent users. This object is available in API version 24.0 and later.

[LiveChatUserConfigProfile](#)

Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

[LiveChatUserConfigUser](#)

Represents a join between LiveChatUserConfig and User. This object is available in API version 24.0 and later.

[LiveChatVisitor](#)

Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

[Location](#)

Represents a warehouse, service vehicle, work site, or other element of the region where your team performs field service work.

[LocationFeed](#)

Represents a single feed item on a field service location record detail page.

[LoginEvent](#)

Represents a trackable user login event in your org. In the Real-Time Events pilot, only UI logins with username and password are captured. This object is available in API version 36.0 and later.

[LoginGeo](#)

Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

[LoginHistory](#)

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

[LoginIp](#)

Represents a validated IP address. This object is available in version 28.0 and later.

[LogoutEventStream \(Beta\)](#)

LogoutEventStream represents an event associated with a user UI logout. A logout event records a successful user logout from your org's UI. This object is read only, and you can't retrieve it using a SOQL query. This object is available in API version 41.0 and later.

[LookedUpFromActivity](#)

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

[Macro](#)

Represents a macro, which is a set of instructions that tells the system to perform one or more tasks. This object is available in API version 32.0 and later.

Standard Objects

[MacroInstruction](#)

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro's actions. It is a useful way to programmatically define instructions, instead of using the macro widget in the console.

[MailmergeTemplate](#)

Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

[MaintenanceAsset](#)

Represents an asset covered by a maintenance plan in field service. Assets can be associated with multiple maintenance plans.

[MaintenancePlan](#)

Represents a preventive maintenance schedule for one or more assets in field service.

[MatchingRule](#)

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

[MatchingRuleItem](#)

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

[MetadataPackage](#)

Represents a managed or unmanaged package that has been developed in the org you're logged in to.

[MetadataPackageVersion](#)

Represents a package version (managed or unmanaged) that has been uploaded from the org you're logged in to.

[Metric](#)

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

[MetricDataLink](#)

The link between the metric and the data source, such as a report.

[MetricDataLinkHistory](#)

This read-only object contains historical information about changes that have been made to the MetricDataLink object.

[MetricFeed](#)

Represents a single feed item in the feed displayed on a Metric record.

[MetricHistory](#)

This read-only object contains historical information about changes that have been made to the Metric object.

[MetricsDataFile](#)

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

[MetricShare](#)

Represents a sharing entry on a Metric object.

[MilestoneType](#)

Represents a milestone (required step in a customer support process). This object is available in API version 18.0 and later.

[MobileSettingsAssignment](#)

Represents the assignment of a particular field service mobile settings configuration to a user profile. This object is available in API version 41.0 and later.

[Name](#)

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

Standard Objects

[NamedCredential](#)

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

[NamespaceRegistry](#)

Represents a namespace that you can link to scratch orgs that were created from your org's Dev Hub. You use the namespace when developing, packaging, and releasing an app. You can't create this object with the API. Use the **Link Namespace** action in the Dev Hub graphical interface to insert a `NamespaceRegistry` record. This object is available in API version 41.0 and later.

[NavigationLinkSet](#)

Represents the navigation menu in a community. A navigation menu consists of items that users can click to go to other parts of the community. This object is available in API version 35.0 and later.

[NavigationMenuItem](#)

Represents a single menu item in a `NavigationLinkSet`. Use this object to create, delete, or update menu items in your community's navigation menu. This object is available in API version 35.0 and later.

[NavigationMenuItemLocalization](#)

Represents the translated value of a navigation menu item in a community. This object is available in API version 36.0 and later.

[Network](#)

Represents a community, which is a customizable public or private space where employees, end-customers, and partners can collaborate on best practices and business processes. Communities give you the opportunity to share information, records, and files with coworkers and related external stakeholders all in one place. This object is available in API version 26.0 and later.

[NetworkActivityAudit](#)

Represents an audit trail of moderation actions in Communities. This object is available in API version 30.0 and later.

[NetworkAffinity](#)

Represents a junction object that associates a user profile with a `Network` object, that is, with a community. Use `NetworkAffinity` to assign a default community to a user profile. This object is available in API version 41.0 and later.

[NetworkMember](#)

Represents a member of a community. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

[NetworkMemberGroup](#)

Represents a group of members in a community. Members can be either users in your internal organization or external users assigned portal profiles. An administrator adds members to a community by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the community. This object is available in API version 26.0 and later.

[NetworkModeration](#)

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

[NetworkPageOverride](#)

Represents information about custom pages used to override the default pages in communities. You can create Community Builder (Site.com Studio) or Visualforce pages and override the default pages in a community. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

[NetworkSelfRegistration](#)

Represents the account that self-registering community members are associated with by default. Self-registering users in a community are required to be associated with an account, which the administrator must specify while setting up self-registration for the community. If an account isn't specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

Standard Objects

[NetworkUserHistoryRecent](#)

Represents a community user's history of accessed records. This object is available in API version 42.0 and later.

[NewsFeed](#)

Represents a single feed item on a user's home tab. A Chatter feed shows recent changes to records that the user is following.

[Note](#)

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

[OAuthToken](#)

Represents an OAuth access token for connected app authentication and can be used to create a user interface for token management. This object is available in API version 32.0 and later.

[NoteAndAttachment](#)

This read-only object contains all notes and attachments associated with an object.

[NoteTag](#)

Associates a word or short phrase with a Note.

[ObjectPermissions](#)

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

[ObjectTerritory2AssignmentRule](#)

Represents a territory assignment rule that's associated with an object, such as Account. `ObjectTerritory2AssignmentRuleItem` can only be created or deleted if the `BooleanFilter` field on its corresponding `ObjectTerritory2AssignmentRule` is `null`. Available only if Enterprise Territory Management has been enabled for your organization.

[ObjectTerritory2AssignmentRuleItem](#)

A single row of selection criteria for an `ObjectTerritory2AssignmentRule` object. `ObjectTerritory2AssignmentRuleItem` can only be created or deleted if the `BooleanFilter` field on its corresponding `ObjectTerritory2AssignmentRule` object is a `null` value. Available only if Enterprise Territory Management has been enabled for your organization.

[ObjectTerritory2Association](#)

Represents an association (by assignment) between a territory and an object record, such as an account. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

[OpenActivity](#)

This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. `OpenActivity` fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

[OperatingHours](#)

Represents the hours in which a service territory, service resource, or account is available for field service work. This object is available in API version 38.0 and later.

[OperatingHoursFeed](#)

Represents a single feed item on an operating hours record detail page. This object is available in API version 38.0 and later.

[OperatingHoursHistory](#)

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

[Opportunity](#)

Represents an opportunity, which is a sale or pending deal.

[OpportunityCompetitor](#)

Represents a competitor on an Opportunity.

Standard Objects

[OpportunityContactRole](#)

Represents the role that a Contact plays on an Opportunity.

[OpportunityFeed](#)

Represents a single feed item in the feed displayed on the detail page for an opportunity record. This object is available in API version 18.0 and later.

[OpportunityFieldHistory](#)

Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

[OpportunityHistory](#)

Represents the stage history of an Opportunity.

[OpportunityLineItem](#)

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

[OpportunityLineItemSchedule](#)

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

[OpportunityOverride](#)

Represents a forecast override of an Opportunity. This read-only object is specific to customizable forecasting. It has a parent-child relationship with LineitemOverride.

[OpportunityOwnerSharingRule](#)

Represents a rule for sharing an opportunity with users other than the owner.

[OpportunityPartner](#)

This read-only object represents a partner relationship between an Account and an Opportunity. This object is automatically created when a Partner object is created for a partner relationship between an account and an opportunity.

[OpportunityShare](#)

Represents a sharing entry on an Opportunity.

[OpportunitySplit](#)

OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

[OpportunitySplitType](#)

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

[OpportunityStage](#)

Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

[OpportunityTag](#)

Associates a word or short phrase with an Opportunity.

[OpportunityTeamMember](#)

Represents a User on the opportunity team of an Opportunity.

[Order](#)

Represents an order associated with a contract or an account.

[OrderFeed](#)

Represents a single feed item in the feed displayed on an order.

[OrderHistory](#)

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

Standard Objects

[OrderItem](#)

Represents an order product that your organization sells.

[OrderItemFeed](#)

Represents a single feed item in the feed displayed on the detail page for an order product record.

[OrderItemHistory](#)

Represents the history of changes to the values in the fields of an order product.

[OrderOwnerSharingRule](#)

Represents a rule which determines order sharing access for the order's owners.

[Organization](#)

Represents key configuration information for an organization.

[OrgDeleteRequest](#)

Represents a request to delete a developer edition (DE) org. This object is available in API version 42.0 and later. It is available only in Developer and Database.com editions.

[OrgWideEmailAddress](#)

Represents an organization-wide email address for user profiles.

[OutOfOffice](#)

Represents a user-set value on a profile that shows when the user intends to be out of the office. This object is available in API version 41.0 and later.

[OwnedContentDocument](#)

Represents a file owned by a user. This object is available in version 30.0 and later.

[PackageLicense](#)

Represents a license for an installed managed package. This object is available in API version 31.0 and later.

[PackagePushError](#)

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

[PackagePushJob](#)

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

[PackagePushRequest](#)

Represents the push request for upgrading a package in one or many orgs from one version to another version.

[PackageSubscriber](#)

Represents an installation of a package in an org. This object contains installation information for managed packages developed in the org you're logged in to.

[Partner](#)

Represents a partner relationship between two Account records or between an Opportunity and an Account.

[PartnerFundAllocation](#)

Represents allocated funds from a partner marketing budget for channel partners. This object is available in API version 41.0 and later.

[PartnerFundAllocationFeed](#)

Represents a single feed item on a partner fund allocation feed. This object is available in API version 41.0 and later.

Standard Objects

[PartnerFundAllocationHistory](#)

Represents the history of changes to the values in the fields of a partner fund allocation object. Access is read-only. This object is available in API version 41.0 and later.

[PartnerFundAllocationOwnerSharingRule](#)

Represents a rule for sharing a partner fund allocation object with users other than the owner. This object is available in API version 41.0 and later.

[PartnerFundAllocationShare](#)

Represents a sharing entry on a partner fund allocation record. This object is available in API version 41.0 and later.

[PartnerFundClaim](#)

Represents a claim of funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

[PartnerFundClaimFeed](#)

Represents a single feed item on a partner fund claim feed. This object is available in API version 41.0 and later.

[PartnerFundClaimHistory](#)

Represents the history of changes to the values in the fields of a partner fund claim object. Access is read-only. This object is available in API version 41.0 and later.

[PartnerFundClaimOwnerSharingRule](#)

Represents a rule for sharing a partner fund claim object with users other than the owner. This object is available in API version 41.0 and later.

[PartnerFundClaimShare](#)

Represents a sharing entry on a partner fund claim record. This object is available in API version 41.0 and later.

[PartnerFundRequest](#)

Represents a request for funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

[PartnerFundRequestFeed](#)

Represents a single feed item on a partner fund request feed. This object is available in API version 41.0 and later.

[PartnerFundRequestHistory](#)

Represents the history of changes to the values in the fields of a partner fund request object. Access is read-only. This object is available in API version 41.0 and later.

[PartnerFundRequestOwnerSharingRule](#)

Represents a rule for sharing a partner fund request object with users other than the owner. This object is available in API version 41.0 and later.

[PartnerFundRequestShare](#)

Represents a sharing entry on a partner fund request record. This object is available in API version 41.0 and later.

[PartnerMarketingBudget](#)

Represents a budget that provides funds to channel partners for selling and marketing products and services. This object is available in API version 41.0 and later.

[PartnerMarketingBudgetFeed](#)

Represents a single feed item on a partner marketing budget feed. This object is available in API version 41.0 and later.

[PartnerMarketingBudgetHistory](#)

Represents the history of changes to the values in the fields of a partner marketing budget object. Access is read-only. This object is available in API version 41.0 and later.

Standard Objects

[PartnerMarketingBudgetOwnerSharingRule](#)

Represents a rule for sharing a partner marketing budget object with users other than the owner. This object is available in API version 41.0 and later.

[PartnerMarketingBudgetShare](#)

Represents a sharing entry on a partner marketing budget record. This object is available in API version 41.0 and later.

[PartnerNetworkConnection](#)

Represents a Salesforce to Salesforce connection between Salesforce organizations.

[PartnerNetworkRecordConnection](#)

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

[PartnerNetworkSyncLog](#)

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log's twenty most recent entries, and provides a link to the log.

[PartnerRole](#)

Represents a role for an account Partner, such as consultant, supplier, and so on.

[Period](#)

Represents a fiscal period defined in FiscalYearSettings.

[PermissionSet](#)

Represents a set of permissions that's used to grant additional access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

[PermissionSetAssignment](#)

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

[PermissionSetLicense](#)

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

[PermissionSetLicenseAssign](#)

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

[PlatformAction](#)

PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

[PresenceUserConfig](#)

Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

[PresenceUserConfigProfile](#)

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

[PresenceUserConfigUser](#)

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

[Pricebook2](#)

Represents a price book that contains the list of products that your org sells.

Standard Objects

[Pricebook2History](#)

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 42.0 and later.

[PricebookEntry](#)

Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

[ProcessDefinition](#)

Represents the definition of a single approval process.

[ProcessInstance](#)

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

[ProcessInstanceHistory](#)

This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

[ProcessInstanceStep](#)

Represents one work item in an approval process (ProcessInstance).

[ProcessInstanceNode](#)

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

[ProcessInstanceWorkitem](#)

Represents a user's pending approval request.

[ProcessNode](#)

Describes a step in a process definition. Compare to ProcessInstanceNode, which describes the step in a running process.

[Product2](#)

Represents a product that your org sells.

[Product2Feed](#)

Represents a single feed item in the feed displayed on the detail page for a product record. This object is available in API version 18.0 and later.

[ProductConsumed](#)

Represents an item from your inventory that was used to complete a work order or work order line item in field service.

[ProductEntitlementTemplate](#)

Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

[ProductItem](#)

Represents the stock of a particular product at a particular location in field service, such as all bolts stored in your main warehouse.

[ProductItemTransaction](#)

Represents an action taken on a product item in field service. Product item transactions are auto-generated records that help you track when a product item is replenished, consumed, or adjusted.

[ProductRequest](#)

Represents an order for a part or parts in field service.

[ProductRequestFeed](#)

Represents a single feed item on a product request record detail page.

Standard Objects

[ProductRequestHistory](#)

Represents historical information about changes that have been made to the standard fields of the associated product request, or to any custom fields with history tracking enabled.

[ProductRequestLineItem](#)

Represents a request for a part in field service. Product request line items are components of product requests.

[ProductRequestOwnerSharingRule](#)

Represents the rules for sharing a product request with users other than the owner.

[ProductRequestShare](#)

Represents a sharing entry on a product request object.

[ProductRequired](#)

Represents a product that is needed to complete a work order or work order line item in field service.

[ProductTransfer](#)

Represents the transfer of inventory between locations in field service.

[ProductTransferFeed](#)

Represents a single feed item in the feed displayed on the detail page for a product transfer record.

[ProductTransferHistory](#)

Represents historical information about changes that have been made to the standard fields of the associated product transfer, or to any custom fields with history tracking enabled.

[ProductTransferOwnerSharingRule](#)

Represents the rules for sharing a product transfer with users other than the owner.

[ProductTransferShare](#)

Represents a sharing entry on a product transfer object.

[Profile](#)

Represents a profile, which defines a set of permissions to perform different operations, such as querying, adding, updating, or deleting information.

[ProfileSkill](#)

Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

[ProfileSkillEndorsement](#)

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

[ProfileSkillEndorsementFeed](#)

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillEndorsement record. This object is available in API version 34.0 and later.

[ProfileSkillEndorsementHistory](#)

Represents the history of changes to the fields of a ProfileSkillEndorsement.

[ProfileSkillFeed](#)

Represents a single feed item in the feed displayed on the detail page for a profile skill.

[ProfileSkillHistory](#)

Represents the history of changes to the fields of a ProfileSkill.

Standard Objects

[ProfileSkillShare](#)

Represents a sharing entry on a ProfileSkill.

[ProfileSkillUser](#)

Represents a detail relationship of User. The object connects profile skills with users.

[ProfileSkillUserFeed](#)

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillUser record. This object is available in API version 34.0 and later.

[ProfileSkillUserHistory](#)

Represents the history of changes to the fields of a ProfileSkillUser.

[PushTopic](#)

[QuantityForecast](#)

Represents a quantity-based forecast.

[QuantityForecastHistory](#)

Represents historical information about quantity-based forecasts that have been submitted (saved) in the user interface.

[QueueRoutingConfig](#)

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

[Question](#)

Represents a question in a community that users can view and reply to.

[QuestionDataCategorySelection](#)

A data category selection represents a data category that classifies a question.

[QuestionReportAbuse](#)

Represents a user-reported abuse on a Question in a Chatter Answers community. This object is available in API version 24.0 and later.

[QuestionSubscription](#)

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

[QueueSubject](#)

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

[QuickText](#)

This object stores a snippet of text that allows users to send a quick response to a customer. Use quick text to create greetings, answers to common questions, short notes, and more. This object is available in API version 24.0 and later.

[QuickTextHistory](#)

Represents changes to field values on a QuickText object. This object is available in API version 24.0 and later.

[QuickTextOwnerSharingRule](#)

Represents a rule for sharing a QuickText object with users other than the owner.

[QuickTextShare](#)

Represents a sharing entry on a QuickText object. This object is available in API version 24.0 and later.

[Quote](#)

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

[QuoteDocument](#)

Represents a quote in document format. Available in API version 18.0 and later.

Standard Objects

[QuoteFeed](#)

Represents a single feed item on the quote record detail page. This object is available in API version 39.0 and later.

[QuoteLineItem](#)

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

[QuoteOwnerSharingRule](#)

Represents a rule for sharing a Quote with users other than the owner. This object is available in API version 41.0 and later.

[QuoteShare](#)

Represents a sharing entry on a Quote. This object is available in API version 41.0 and later.

[RecentlyViewed](#)

Represents records that the current user has recently viewed or referenced (by viewing a related record).

[RecordType](#)

Represents a record type.

[RecordTypeLocalization](#)

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

[Reply](#)

Represents a reply that a user has submitted to a question in an answers community.

[ReplyReportAbuse](#)

Represents a user-reported abuse on a Reply in a Chatter Answers community. This object is available in API version 24.0 and later.

[Report](#)

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

[ReportFeed](#)

Represents a single feed item in the feed displayed on a report. This object is available in API version 20.0 and later.

[ReportTag](#)

Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

[ReputationLevel](#)

Represents a reputation level defined for a community. This object is available in API version 32.0 and later.

[ReputationLevelLocalization](#)

Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in communities. This object is available in API version 35.0 and later.

[ReputationPointsRule](#)

Represents the reputation point rules for a community. Each rule specifies an action that community members can earn points from and the points associated with those actions in a particular community. This object is available in API version 32.0 and later.

[ResourceAbsence](#)

Represents a time period in which a service resource is unavailable to work. This object is available in API version 38.0 and later.

[ResourceAbsenceFeed](#)

Represents a single feed item on a resource absence record detail page. This object is available in API version 38.0 and later.

[ResourceAbsenceHistory](#)

Represents the history of changes made to tracked fields on a resource absence. This object is available in API version 38.0 and later.

Standard Objects

[ResourcePreference](#)

Represents an account's preference for a specified service resource on field service work.

[ResourcePreferenceFeed](#)

Represents a single feed item on a resource preference record detail page.

[ResourcePreferenceHistory](#)

Represents the history of changes made to tracked fields on a resource preference.

[ReturnOrder](#)

Represents the return or repair of inventory or products in field service. This object is available in API version 42.0 and later.

[ReturnOrderFeed](#)

Represents a single feed item on a return order record detail page. This object is available in API version 42.0 and later.

[ReturnOrderHistory](#)

Represents the history of changes made to tracked fields on a return order. This object is available in API version 42.0 and later.

[ReturnOrderLineItem](#)

Represents a specific product that is returned or repaired as part of a return order in field service. This object is available in API version 42.0 and later.

[ReturnOrderLineItemFeed](#)

Represents a single feed item on a return order line item record detail page. This object is available in API version 42.0 and later.

[ReturnOrderLineItemHistory](#)

Represents the history of changes made to tracked fields on a return order line item. This object is available in API version 42.0 and later.

[ReturnOrderOwnerSharingRule](#)

Represents the rules for sharing a return order with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 42.0 and later.

[ReturnOrderShare](#)

Represents a sharing entry on a return order. This object is available in API version 42.0 and later.

[RevenueForecast](#)

Represents a revenue-based forecast.

[RevenueForecastHistory](#)

Represents historical information about revenue-based forecasts that have been submitted (saved) in the user interface.

[RuleTerritory2Association](#)

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

[SamlSsoConfig](#)

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

[Scontrol](#)

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

[ScontrolLocalization](#)

The translated value of the field label for an s-control.

[ScratchOrgInfo](#)

Represents a scratch org and its audit log. Use this object to create a scratch org and keep a log of its creation and deletion. This object is available in API version 41.0 and later.

Standard Objects

[SearchPromotionRule](#)

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user's search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

[SecureAgent](#)

Represents a Secure Agent that connects Salesforce to on-premises external data sources like SharePoint 2010 and 2013. This object is available in API version 32.0 and later.

[SecureAgentsCluster](#)

Represents a cluster consisting of several Secure Agents on different servers. Clusters provide failover protection if an agent on a particular server becomes inaccessible. This object is available in API version 35.0 and later.

[SecurityCustomBaseline](#)

Provides the ability to read, create, and delete user-defined custom security baselines, which define an org's security standards. This object is available in API version 39.0 and later.

[SelfServiceUser](#)

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

[ServiceAppointment](#)

Represents an appointment to complete field service work for a customer. This object is available in API version 38.0 and later.

[ServiceAppointmentFeed](#)

Represents a single feed item on a service appointment record detail page. This object is available in API version 38.0 and later.

[ServiceAppointmentHistory](#)

Represents the history of changes made to tracked fields on a service appointment. This object is available in API version 38.0 and later.

[ServiceAppointmentOwnerSharingRule](#)

Represents the rules for sharing a service appointment with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

[ServiceAppointmentShare](#)

Represents a sharing entry on a service appointment. This object is available in API version 38.0 and later.

[ServiceAppointmentStatus](#)

Represents a possible status of a service appointment in field service.

[ServiceChannel](#)

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

[ServiceChannelStatus](#)

Represents the status that's associated with a specific service channel. This object is available in API version 32.0 and later.

[ServiceContract](#)

Represents a customer support contract (business agreement). This object is available in API version 18.0 and later.

[ServiceContractFeed](#)

Represents a single feed item in the feed displayed on the detail page for a service contract record. This object is available in API version 23.0 and later.

[ServiceContractHistory](#)

Represents the history of changes to the values in the fields on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

Standard Objects

[ServiceContractOwnerSharingRule](#)

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

[ServiceContractShare](#)

Represents a sharing entry on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

[ServiceCrew](#)

Represents a group of service resources who can be assigned to service appointments as a unit.

[ServiceCrewFeed](#)

Represents a single feed item on a service crew record detail page.

[ServiceCrewHistory](#)

Represents the history of changes made to tracked fields on a service crew.

[ServiceCrewMember](#)

Represents a technician service resource that belongs to a service crew.

[ServiceCrewMemberFeed](#)

Represents a single feed item on a service crew member record detail page.

[ServiceCrewMemberHistory](#)

Represents the history of changes made to tracked fields on a service crew member.

[ServiceCrewOwnerSharingRule](#)

Represents the rules for sharing a service crew with user records other than the owner or anyone above the owner in the role hierarchy.

[ServiceCrewShare](#)

Represents a sharing entry on a service crew.

[ServicePresenceStatus](#)

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

[ServiceReport](#)

Represents a report that summarizes a work order, work order line item, or service appointment.

[ServiceReportLayout](#)

Represents a service report template in field service.

[ServiceResource](#)

Represents a service technician or service crew in field service. This object is available in API version 38.0 and later.

[ServiceResourceCapacity](#)

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

[ServiceResourceCapacityFeed](#)

Represents a single feed item on a service resource capacity record detail page. This object is available in API version 38.0 and later.

[ServiceResourceCapacityHistory](#)

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

[ServiceResourceFeed](#)

Represents a single feed item on a service resource record detail page. This object is available in API version 38.0 and later.

Standard Objects

[ServiceResourceHistory](#)

Represents the history of changes made to tracked fields on a service resource. This object is available in API version 38.0 and later.

[ServiceResourceOwnerSharingRule](#)

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

[ServiceResourceShare](#)

Represents a sharing entry on a service resource. This object is available in API version 38.0 and later.

[ServiceResourceSkill](#)

Represents a skill that a service resource possesses. This object is available in API version 38.0 and later.

[ServiceResourceSkillFeed](#)

Represents a single feed item on a service resource skill record detail page. This object is available in API version 38.0 and later.

[ServiceResourceSkillHistory](#)

Represents the history of changes made to tracked fields on a service resource skill. This object is available in API version 38.0 and later.

[ServiceTerritory](#)

Represents a geographic or functional region in which field service work can be performed. This object is available in API version 38.0 and later.

[ServiceTerritoryFeed](#)

Represents a single feed item on a service territory record detail page. This object is available in API version 38.0 and later.

[ServiceTerritoryHistory](#)

Represents the history of changes made to tracked fields on a service territory. This object is available in API version 38.0 and later.

[ServiceTerritoryLocation](#)

Represents a location associated with a particular service territory in field service.

[ServiceTerritoryMember](#)

Represents a service resource who can be assigned to service appointments in a service territory. This object is available in API version 38.0 and later.

[ServiceTerritoryMemberFeed](#)

Represents a single feed item on a service territory member record detail page. This object is available in API version 38.0 and later.

[ServiceTerritoryMemberHistory](#)

Represents the history of changes made to tracked fields on a service territory member. This object is available in API version 38.0 and later.

[SessionPermSetActivation](#)

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later.

[SetupAuditTrail](#)

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

[SetupEntityAccess](#)

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

Standard Objects

[Shipment](#)

Represents the transport of inventory in field service.

[SignupRequest](#)

Represents a request for a new signup. This object is available in API version 27.0 and later.

[Site](#)

Represents a public website that is integrated with an org. This object is available in API version 16.0 and later.

[SiteDomain](#)

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the [Domain](#) and [DomainSite](#) objects instead.

[SiteHistory](#)

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

[Skill](#)

Represents a category or group that Life Agent users or field service resources can be assigned to. This object is available in API version 24.0 and later.

[SkillProfile](#)

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

[SkillRequirement](#)

Represents a skill that is required to complete a particular task. Skill requirements can be added to work types, work orders, and work order line items in Field Service. This object is available in API version 38.0 and later. You also can add skill requirements to work items in Omni-Channel skills-based routing using API version 42.0 and later.

[SkillRequirementFeed](#)

Represents a single feed item on a skill requirement record detail page. This object is available in API version 38.0 and later.

[SkillRequirementHistory](#)

Represents the history of changes made to tracked fields on a skill requirement. This object is available in API version 38.0 and later.

[SkillUser](#)

Represents a join between Skill and User. This object is available in API version 24.0 and later.

[SlaProcess](#)

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

[Solution](#)

Represents a detailed description of a customer issue and the resolution of that issue.

[SolutionFeed](#)

Represents a single feed item in the feed displayed on the detail page for a solution record. This object is available in API version 18.0 and later.

[SolutionHistory](#)

Represents the history of changes to the values in the fields of a solution.

[SolutionStatus](#)

Represents the status of a Solution, such as Draft, Reviewed, and so on.

[SolutionTag](#)

Associates a word or short phrase with a Solution.

Standard Objects

[SOSDeployment](#)

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

[SOSSession](#)

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

[SOSSessionActivity](#)

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

[SOSSessionHistory](#)

This object is automatically created for each SOS session and stores information about changes made to the session. This object is available in API versions 34.0 and later.

[SOSSessionOwnerSharingRule](#)

Represents the rules for sharing an SOS session record with users other than the record owner. This object is available in API version 34.0 and later.

[SOSSessionShare](#)

Represents a sharing entry on an SOS session. This object is available in API version 34.0 and later.

[Stamp](#)

Represents a User Specialty. This object is available in API version 39.0 and later.

[StampAssignment](#)

Represents assignment of a User Specialty to a user. This object is available in API version 39.0 and later.

[StaticResource](#)

Represents a static resource that can be used in Visualforce markup.

[StreamingChannel](#)

[Survey](#)

Represents a survey.

[SurveyEmailBranding](#)

Represents the configuration settings for invitation emails sent to survey participants for a particular survey.

[SurveyFeed](#)

Represents a single item in the feed displayed on the detail page for the Survey object. This object is available in API version 42.0 and later.

[SurveyInvitation](#)

Represents the invitation sent to a participant to complete the survey.

[SurveyInvitationShare](#)

Represents a sharing entry on a SurveyInvitation object.

[SurveyPage](#)

Represents a page, such as the title page or a question page, in a survey.

[SurveyQuestion](#)

Represents a question in a survey.

[SurveyQuestionChoice](#)

Represents an answer choice that a participant can select for a survey question.

Standard Objects

[SurveyQuestionResponse](#)

Represents a participant's answer to a specific question.

[SurveyResponse](#)

Represents information about a participant's response to a survey, such as the status of the response, the participant's location, and when the survey was completed.

[SurveyShare](#)

Represents a sharing entry on a Survey object.

[SurveyVersion](#)

Represents a version of a survey.

[TagDefinition](#)

Defines the attributes of child Tag objects.

[Task](#)

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

[TaskFeed](#)

Represents a single feed item in the feed on a Task. This object is available in API version 20.0 and later.

[TaskPriority](#)

Represents the importance or urgency of a Task, such as High, Normal, or Low.

[TaskRelation](#)

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

[TaskStatus](#)

Represents the status of a Task, such as Not Started, Completed, or Closed.

[TaskTag](#)

Associates a word or short phrase with a Task.

[TaskWhoRelation](#)

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

[TenantSecret](#)

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

[Territory](#)

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

[Territory2](#)

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

[Territory2Model](#)

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

[Territory2ModelHistory](#)

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

Standard Objects

[Territory2Type](#)

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

[TestSuiteMembership](#)

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

[ThirdPartyAccountLink](#)

Represents the list of external users who authenticated using an Auth. Provider. This object is available in API version 32.0 and later.

[TimeSheet](#)

Represents a schedule of a service resource's time in field service.

[TimeSheetEntry](#)

Represents a span of time that a service resource spends on a field service task.

[TimeSheetEntryFeed](#)

Represents a single feed item on a time sheet entry record detail page.

[TimeSheetEntryHistory](#)

Represents the history of changes made to tracked fields on a time sheet entry in field service.

[TimeSheetFeed](#)

Represents a single feed item on a time sheet record detail page.

[TimeSheetHistory](#)

Represents the history of changes made to tracked fields on a time sheet in field service.

[TimeSheetOwnerSharingRule](#)

Represents the rules for sharing a time sheet with user records other than the owner or anyone above the owner in the role hierarchy.

[TimeSheetShare](#)

Represents a sharing entry on a field service time sheet.

[TimeSlot](#)

Represents a period of time on a specified day of the week during which field service work can be performed. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

[TimeSlotHistory](#)

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

[Topic](#)

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

[TopicAssignment](#)

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

[TopicFeed](#)

Represents a single feed item on a topic page. This object is available in API version 29.0 and later.

[TopicLocalization—Beta](#)

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in communities. This object is available in API version 33.0 and later.

[TopicUserEvent](#)

Represents an action (such as comment, post, like, or share) made by a user on a topic. This object is available in API version 42.0 and later.

Standard Objects

[TwoFactorInfo](#)

Stores a user's secret for two-factor operations. Use this object when customizing two-factor authentication in your organization. This object is available in API version 32.0 and later.

[TwoFactorMethodsInfo](#)

Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

[TwoFactorTempCode](#)

Stores information about a user's temporary identity verification code. This object is available in API version 37.0 and later.

[UndecidedEventRelation](#)

Represents invitees with the status `Not_Responded` for a given event. This object is available in API versions 29.0 and later.

[User](#)

Represents a user in your organization.

[UserAccountTeamMember](#)

Represents a User on the default account team of another User.

[UserAppInfo](#)

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

[UserAppMenuCustomization](#)

Represents an individual user's settings for items in the app menu or App Launcher. This object is available in API version 35.0 and later.

[UserAppMenuCustomizationShare](#)

Represents a sharing entry on a UserAppMenuCustomization record. This object is available in API version 35.0 and later.

[UserAppMenuItem](#)

Represents the organization-wide settings for items in the app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

[UserConfigTransferButton](#)

Represents the association between a Live Agent configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

[UserConfigTransferSkill](#)

Represents the association between a Live Agent configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

[UserCustomBadge](#)

Represents a custom badge for a user. This object is available in API version 38.0 and later.

[UserCustomBadgeLocalization](#)

Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

[UserFeed](#)

Represents a single feed item in the feed displayed on a Chatter user profile feed. A user profile feed shows changes to a user record for fields that are tracked in feeds, and posts and comments about the record. This object is available in API version 18.0 and later.

[UserLicense](#)

Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

Standard Objects

[UserLogin](#)

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

[UserMembershipSharingRule](#)

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

[UserPackageLicense](#)

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

[UserPermissionAccess](#)

Represents the permissions accessibility for a current user. Available in API version 41.0 and later.

[UserPreference](#)

Represents a functional preference for a specific user in your organization.

[UserProfile](#)

Represents a Chatter user profile.

[UserProfileFeed](#)

Represents a user profile feed, which tracks all actions by a user on records that can be tracked in a feed. This feed is displayed on the user profile page.

[UserProvAccount](#)

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

[UserProvAccountStaging](#)

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the `UserProvAccount` object when you click the button to collect and analyze accounts on the target system.

[UserProvMockTarget](#)

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

[UserProvisioningConfig](#)

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

[UserProvisioningLog](#)

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

[UserProvisioningRequest](#)

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

[UserProvisioningRequestOwnerSharingRule](#)

Represents a rule for sharing a `UserProvisioningRequest` object with users other than the owner. This object is available in API version 34.0 and later.

[UserProvisioningRequestShare](#)

Represents a sharing entry on a `UserProvisioningRequest` record. This object is available in API version 34.0 and later.

Standard Objects

[UserRecordAccess](#)

Represents a user's access to a set of records. This object is read only and is available in API version 24.0 and later.

[UserRole](#)

Represents a user role in your organization.

[UserServicePresence](#)

Represents a presence user's real-time presence status. This object is available in API version 32.0 and later.

[UserShare](#)

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

[UserTeamMember](#)

Represents a single User on the default opportunity team of another User.

[UserTerritory](#)

Represents a User who has been assigned to a Territory.

[UserTerritory2Association](#)

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

[VerificationHistory](#)

Represents the past six months of your org users' attempts to verify their identity. This object is available in API version 36.0 and later.

[VisualforceAccessMetrics](#)

Represents summary statistics for Visualforce pages.

[VoiceCall](#)

Represents a Lightning Dialer phone call.

[VoiceCallList](#)

Represents a prioritized list of numbers to call.

[VoiceCallListItem](#)

Represents a single phone number in a prioritized call list.

[VoiceCallListShare](#)

Represents a sharing entry on a VoiceCallList.

[VoiceCallShare](#)

Represents a sharing entry on a VoiceCall object.

[VoiceMailContent](#)

Represents a voicemail message left by a caller to the context user.

[VoiceMailContentShare](#)

Represents a sharing entry on a VoiceMailContent.

[VoiceMailGreeting](#)

Represents a custom greeting message that plays upon reaching a user's voicemail. This object is available in API version 41.0 and later.

[VoiceMailGreetingShare](#)

Represents a sharing entry on a VoiceMailGreeting. This object is available in API version 41.0 and later.

[VoiceMailMessage](#)

Represents a prerecorded voicemail message.

Standard Objects

[VoiceMailMessageShare](#)

Represents a sharing entry on a VoiceMailMessage.

[VoiceUserLine](#)

Represents a user's forwarding phone number.

[VoiceUserLineShare](#)

Represents a sharing entry on a user's phone number.

[VoiceUserPreferences](#)

Represents the number the user displays when making outbound calls. This object is available in API version 41.0 and later.

[VoiceUserPreferencesShare](#)

Represents a sharing entry on a VoiceUserPreferences object. This object is available in API version 41.0 and later.

[VoiceVendorInfo](#)

Represents information about the Lightning Dialer provider's vendor.

[VoiceVendorLine](#)

Represents a user's phone number reserved with the vendor.

[VoiceVendorLineShare](#)

Represents a sharing entry on a vendor's phone number.

[Vote](#)

Represents a vote that a user has made on an Idea or a Reply.

[WebLink](#)

Represents a custom link to a URL or Scontrol.

[WebLinkLocalization](#)

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

[WorkAccess](#)

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

[WorkAccessShare](#)

Used to control Givers of WorkBadgeDefinition records.

[WorkBadge](#)

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

[WorkBadgeDefinition](#)

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

[WorkBadgeDefinitionHistory](#)

Represents the history of changes to the values in the fields of a WorkBadgeDefinition object.

[WorkBadgeDefinitionShare](#)

Represents a sharing entry on a WorkBadgeDefinition object.

[WorkCoaching](#)

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

Standard Objects

[WorkCoachingFeed](#)

Represents a single feed item in the feed on the detail page for a coaching record.

[WorkCoachingHistory](#)

Represents the history of changes to the values in the fields of a WorkCoaching object.

[WorkCoachingShare](#)

Represents a sharing entry on a WorkCoaching object.

[WorkFeedback](#)

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

[WorkFeedbackHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedback object. Access is read-only.

[WorkFeedbackQuestion](#)

Represents a free-form text type or multiple choice question within a set of questions.

[WorkFeedbackQuestionHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedbackQuestion.

[WorkFeedbackQuestionSet](#)

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

[WorkFeedbackQuestionSetHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedbackQuestionSet object. Access is read-only.

[WorkFeedbackQuestionSetShare](#)

Represents a sharing entry on a WorkFeedbackQuestionSet.

[WorkFeedbackQuestionShare](#)

Represents a sharing entry on a WorkFeedbackQuestion.

[WorkFeedbackRequest](#)

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

[WorkFeedbackRequestFeed](#)

Represents a single feed item in the feed displayed on the feedback request detail page.

[WorkFeedbackRequestHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedbackRequest.

[WorkFeedbackRequestShare](#)

Represents a sharing entry on a WorkFeedbackRequest.

[WorkFeedbackShare](#)

Represents a sharing entry on a WorkFeedback object.

[WorkGoal](#)

Represents the components of a goal, such as its description and associated metrics. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

Standard Objects

[WorkGoalCollaborator](#)

Represents collaborators on a WorkGoal object. This doesn't include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

[WorkGoalCollaboratorHistory](#)

Represents the history of changes to the values in the fields in a WorkGoalCollaborator object. Access is read-only.

[WorkGoalFeed](#)

Represents a single feed item in the feed displayed on the goal page for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal, and updates on metrics. This object has been deprecated as of API version 35.0. Use the [GoalFeed](#) object to query information about feed items for Work.com goals.

[WorkGoalHistory](#)

Represents the history of changes to the values in the fields of a WorkGoal. Access is read-only. This object has been deprecated as of API version 35.0. Use the [GoalHistory](#) object to query historical information for Work.com goals.

[WorkGoalLink](#)

Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the [GoalLink](#) object to query information about the relationship between two Work.com goals.

[WorkGoalShare](#)

Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the [GoalShare](#) object to query information about sharing for Work.com goals.

[WorkOrder](#)

Represents field service work to be performed for a customer. This object is available in API version 36.0 and later.

[WorkOrderFeed](#)

Represents a single feed item on a work order record detail page. This object is available in API version 36.0 and later.

[WorkOrderHistory](#)

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

[WorkOrderLineItem](#)

Represents a subtask on a work order in field service. This object is available in API version 36.0 and later.

[WorkOrderLineItemFeed](#)

Represents a single feed item on a work order line item record detail page. This object is available in API version 36.0 and later.

[WorkOrderLineItemHistory](#)

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

[WorkOrderLineItemStatus](#)

Represents a possible status of a work order line item in field service.

[WorkOrderShare](#)

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

[WorkOrderStatus](#)

Represents a possible status of a work order in field service.

[WorkPerformanceCycle](#)

Represents feedback that is gathered to assess the performance of a specific set of employees.

[WorkPerformanceCycleFeed](#)

Represents a single feed item in the feed that is displayed on a Work.com Performance detail page.

Standard Objects

[WorkPerformanceCycleHistory](#)

Represents the history of changes to the values in the fields of a WorkPerformanceCycle object.

[WorkPerformanceCycleShare](#)

Represents a sharing entry on a WorkPerformanceCycle object.

[WorkReward](#)

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

[WorkRewardFund](#)

Represents a Reward Fund and describes the Reward Fund attributes.

[WorkRewardFundHistory](#)

Represents the history of changes to the values in the fields of a WorkRewardFund object.

[WorkRewardFundShare](#)

Share records for WorkRewardFund.

[WorkRewardFundType](#)

Represents the type of WorkRewardFund object.

[WorkRewardFundTypeHistory](#)

Represents the history of changes to the values in the fields of a WorkRewardFundType object.

[WorkRewardFundTypeShare](#)

Represents a sharing entry on a WorkRewardFundType.

[WorkRewardHistory](#)

Represents the history of changes to the fields of a WorkReward.

[WorkRewardShare](#)

Share records for WorkReward object.

[WorkThanks](#)

Represents the source and message of a thanks post.

[WorkThanksShare](#)

Share records for WorkThanks object.

[WorkType](#)

Represents a type of work to be performed. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

[WorkTypeFeed](#)

Represents a single feed item on a work type record detail page. This object is available in API version 38.0 and later.

[WorkTypeHistory](#)

Represents the history of changes made to tracked fields on a work type. This object is available in API version 38.0 and later.

[WorkTypeOwnerSharingRule](#)

Represents the rules for sharing a work type with user records other than the owner or anyone above the owner in the role hierarchy.

[WorkTypeShare](#)

Represents a sharing entry on a work type.

AcceptedEventRelation

Represents invitees with the status `Accepted` for a given event.

This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
EventId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the event.</p>
RelationId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the invitee.</p>
RespondedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the most recent date and time when the invitee accepted an invitation to the event.</p>
Response	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the content of the response field. Label is <code>Comment</code>.</p>

Field Name	Details
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the invitee is a user, lead or contact, or resource.</p>

Usage

Query invitees who have accepted an invitation to an event

```
SELECT eventId, type, response FROM AcceptedEventRelation WHERE eventId='00UTD000000ZH5LA'
```

SEE ALSO:

[DeclinedEventRelation](#)

[UndecidedEventRelation](#)

Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access their own accounts and any account shared with them.

Fields

Field Name	Details
AccountNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description Account number assigned to this account (not the unique, system-generated ID assigned during creation). Maximum size is 40 characters.</p>
AccountSource	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The source of the account record. For example, <i>Advertisement, Data.com, or Trade Show</i>. The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Estimated annual revenue of the account.</p>
BillingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
BillingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 40 characters.</p>
BillingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 80 characters.</p>

Field Name	Details
BillingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the account's billing address.</p>
BillingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the billing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
BillingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLongitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
BillingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLatitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
BillingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 20 characters.</p>
BillingState	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 80 characters.</p>
BillingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the account's billing address.</p>
BillingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for the billing address of this account.</p>
CleanStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the record's clean status as compared with Data.com. Values are: <i>Matched</i>, <i>Different</i>, <i>Acknowledged</i>, <i>NotFound</i>, <i>Inactive</i>, <i>Pending</i>, <i>SelectMatch</i>, or <i>Skipped</i>.</p> <p>Several values for <code>CleanStatus</code> display with different labels on the account record detail page.</p> <ul style="list-style-type: none"> • <i>Matched</i> displays as <i>In Sync</i> • <i>Acknowledged</i> displays as <i>Reviewed</i> • <i>Pending</i> displays as <i>Not Compared</i>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>

Field Name	Details
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Text description of the account. Limited to 32,000 KB.</p>
DunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. Maximum size is 9 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
Fax	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Fax number for the account.</p>
Industry	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description An industry associated with this account. Maximum size is 40 characters.</p>
IsCustomerPortal	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Update</p> <p>Description Indicates whether the account has at least one contact enabled to use the organization's Customer Portal (<code>true</code>) or not (<code>false</code>). This field is available if Customer Portal is enabled OR Communities is enabled and you have Customer Portal licenses.</p> <p>If you change this field's value from <code>true</code> to <code>false</code>, you can disable up to 100 Customer Portal users associated with the account and permanently delete all of the account's Customer Portal roles and groups. You can't restore deleted Customer Portal roles and groups.</p> <p>This field can be updated in API version 16.0 and later.</p> <p> Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPartner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Update</p> <p>Description Indicates whether the account has at least one contact enabled to use the organization's partner portal (<code>true</code>) or not (<code>false</code>). This field is available if partner relationship management (partner portal) is enabled OR Communities is enabled and you have partner portal licenses.</p> <p>If you change this field's value from <code>true</code> to <code>false</code>, you can disable up to 15 partner portal users associated with the account and permanently delete all of the account's partner portal roles and groups. You can't restore deleted partner portal roles and groups.</p> <p>Disabling a partner portal user in the Salesforce user interface or the API does not change this field's value from <code>true</code> to <code>false</code>.</p>

Field Name	Details
	<p>Even if this field's value is <code>false</code>, you can enable a contact on an account as a partner portal user via the API.</p> <p>This field can be updated in API version 16.0 and later.</p> <p> Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p>
IsPersonAccount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Read only. Label is Is Person Account. Indicates whether this account has a record type of Person Account (<code>true</code>) or not (<code>false</code>).</p>
Jigsaw	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description References the ID of a company in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is <code>null</code>, the account was not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is Data.com Key. This field is available on business accounts, not person accounts.</p> <p> Important: The <code>Jigsaw</code> field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify the value in the <code>Jigsaw</code> field.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
MasterRecordId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this object was deleted as the result of a merge, this field contains the ID of the record that was kept. If this object was deleted for any other reason, or has not been deleted, the value is <code>null</code>.</p>
NaicsCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. Maximum size is 8 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
NaicsDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on its NAICS code. Maximum size is 120 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>

Field Name	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Label is Account Name. Name of the account. Maximum size is 255 characters. If the account has a record type of Person Account:</p> <ul style="list-style-type: none"> This value is the concatenation of the <code>FirstName</code>, <code>MiddleName</code>, <code>LastName</code>, and <code>Suffix</code> of the associated person contact. You can't modify this value.
NumberOfEmployees	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Label is Employees. Number of employees working at the company represented by this account. Maximum size is eight digits.</p>
OperatingHoursId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The operating hours associated with the account. Available only if Field Service Lightning is enabled.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who currently owns this account. Default value is the user logged in to the API to perform the create.</p> <p>If you have set up account teams in your organization, updating this field has different consequences depending on your version of the API:</p> <ul style="list-style-type: none"> For API version 12.0 and later, sharing records are kept, as they are for all objects. For API version before 12.0, sharing records are deleted. For API version 16.0 and later, users must have the "Transfer Record" permission in order to update (transfer) account ownership using this field.

Field Name	Details
Ownership	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Ownership type for the account, for example Private, Public, or Subsidiary.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the parent object, if any.</p>
PersonIndividualId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data privacy record associated with this person's account. This field is available if you enabled Data Protection and Privacy in Setup. Available in API version 42.0 and later.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Phone number for this account. Maximum size is 40 characters.</p>
PhotoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Path to be combined with the URL of a Salesforce instance (for example, <code>https://yourInstance.salesforce.com/</code>) to generate a URL to request the social network profile image associated with the account. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the account. Blank if Social Accounts and Contacts isn't enabled for the organization or if Social Accounts and Contacts is disabled for the requesting user.</p>

Field Name	Details
Rating	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account's prospect rating, for example Hot, Warm, or Cold.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Honorific added to the name for use in letters, etc.</p>
ShippingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.</p>
ShippingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. City maximum size is 40 characters</p>
ShippingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description Details of the shipping address for this account. Country maximum size is 80 characters.</p>
ShippingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the account's shipping address.</p>
ShippingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the shipping address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLongitude</code> to specify the precise geolocation of a shipping address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLatitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
ShippingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. Postal code maximum size is 20 characters.</p>

Field Name	Details
ShippingState	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details of the shipping address for this account. State maximum size is 80 characters.</p>
ShippingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the account's shipping address.</p>
ShippingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The street address of the shipping address for this account. Maximum of 255 characters.</p>
Sic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Standard Industrial Classification code of the company's main business categorization, for example, 57340 for Electronics. Maximum of 20 characters. This field is available on business accounts, not person accounts.</p>
SicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on its SIC code. Maximum length is 80 characters. This field is available on business accounts, not person accounts.</p>
Site	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description Name of the account's location, for example <code>Headquarters</code> or <code>London</code>. Label is Account Site. Maximum of 80 characters.</p>
<code>TickerSymbol</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The stock market symbol for this account. Maximum of 20 characters. This field is available on business accounts, not person accounts.</p>
<code>Tradestyle</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". Maximum length is 255 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of account, for example, Customer, Competitor, or Partner.</p>
<code>Website</code>	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The website of this account. Maximum of 255 characters.</p>
<code>YearStarted</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The date when an organization was legally established. Maximum length is 4 characters. This field is available on business accounts, not person accounts.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>

IsPersonAccount Fields

These fields are the subset of person account fields that are contained in the child person contact record of each person account. If the `IsPersonAccount` field has the value `false`, the following fields have a null value and can't be modified. If `true`, the fields can be modified.

Person accounts are not enabled by default.

Field Name	Details
<code>FirstName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>First name of the person for a person account. Maximum size is 40 characters.</p>
<code>LastName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Last name of the person for a person account. Required if the record type is a person account record type. Maximum size is 80 characters.</p>
<code>MiddleName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Middle name of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.</p>
<code>PersonAssistantName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p>

Field Name	Details
	<p>Description The person account's assistant name. Label is Assistant. Maximum size is 40 characters.</p>
PersonAssistantPhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's assistant phone. Label is Asst. Phone. Maximum size is 40 characters.</p>
PersonBirthDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The assistant name. Label is Birthdate.</p> <p> Note: The year portion of the <code>PersonBirthDate</code> field is ignored in filter criteria, including report filters, list view filters, and SOQL queries. For example, the following SOQL query returns person accounts with birthdays later in the year than today:</p> <pre>SELECT FirstName, LastName, PersonBirthDate FROM Account WHERE Birthdate > TODAY</pre>
PersonContactId	<p>Type reference</p> <p>Properties Filter, Nillable, Update</p> <p>Description The ID for the contact associated with this person account. Label is Contact ID.</p>
PersonDepartment	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The department. Label is Department. Maximum size is 80 characters.</p>
PersonEmail	<p>Type email</p> <p>Properties Create, Filter, Nillable, Update</p>

Field Name	Details
	<p>Description Email address for thisperson account. Label is Email.</p>
PersonEmailBouncedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description If bounce management is activated and an email sent to the person account bounces, the date and time the bounce occurred.</p>
PersonEmailBouncedReason	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description If bounce management is activated and an email sent to the person account bounces, the reason the bounce occurred</p>
PersonHasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Indicates whether the person account has opted out of email (<code>true</code>) or not (<code>false</code>). Label is Email Opt Out.</p>
PersonHomePhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The home phone number for this person account. Label is Home Phone.</p>
PersonLeadSource	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's lead source. Label is Lead Source.</p>

Field Name	Details
PersonMailingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the person account mailing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
PersonMailingCity	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details about the person account's mailing city. Labels are Mailing City, Mailing Country, Postal Code, and State. Maximum size for city and country is 40 characters. Maximum size for postal code and state is 20 characters.</p>
PersonMailingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the person's mailing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonMailingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonMailingLongitude</code> to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonMailingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonMailingLatitude</code> to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between -180 and 180 with up</p>

Field Name	Details
	to 15 decimal places. See Compound Field Considerations and Limitations on page 42 for details on geolocation compound fields.
PersonMailingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The mailing street address for this person account. Label is Mailing Street. Maximum size is 255 characters.</p>
PersonMobilePhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The mobile phone number for this person account. Label is Mobile.</p>
<ul style="list-style-type: none"> PersonOtherCity PersonOtherCountry PersonOtherPostalCode PersonOtherState 	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details about the alternate address for this person account. Labels are Other City, Other Country, Other Zip/Postal Code, and Other State.</p>
<ul style="list-style-type: none"> PersonOtherCountryCode PersonOtherStateCode 	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country or state code for the alternate address of the person account.</p>
PersonOtherLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonOtherLongitude</code> to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>

Field Name	Details
PersonOtherLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>PersonOtherLatitude</code> to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.</p>
PersonOtherPhone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The alternate phone number for this person account. Label is Other Phone.</p>
PersonOtherStreet	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's alternate street address. Label is Other Street.</p>
PersonTitle	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The person account's title. Label is Title. Maximum size is 80 characters.</p>
Suffix	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name suffix of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.</p>

 **Note:** If you are importing Account data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use this object to query and manage accounts in your organization. Client applications can create, update, delete, or query Attachment records associated with an account via the API.

Client applications can also create or update account objects by converting a Lead via the `convertLead()` call.

If the values in the `IsPersonAccount` Fields are not null, you can't change `IsPersonAccount` to `false`, or an error occurs.

AccountContactRelation

Represents a relationship between a contact and one or more accounts.

This object is available in API version 37.0. The `AccountContactRelation` object supports person accounts. That means that a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Fields

Field Name	Details
<code>AccountContactRelationshipCurrency</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
<code>AccountId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>ID of the account that is related to the contact. Field can't be modified when updating existing account-contact relationship records.</p>
ContactId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the contact that is related to the account. Field can't be modified when updating existing account-contact relationship records.</p>
EndDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The date a relationship between a contact and account ended. Use with the <code>StartDate</code> to keep a history of the relationship.</p>
IsActive	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether relationship is active (<code>true</code>) or not (<code>false</code>).</p>
IsDirect	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the account associated with the contact is the contact's primary account (<code>true</code>) or not (<code>false</code>).</p>
Roles	<p>Type</p> <p>multipicklist</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The contact's participating role in the account. Values are <code>Business User</code>, <code>Decision Maker</code>, <code>Economic Buyer</code>, <code>Economic Decision</code></p>

Field Name	Details
	Maker, Evaluator, Executive Sponsor, Influencer, Technical Buyer, and Other.
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date a relationship between a contact and account began. Use with the End Date to keep a history of the relationship.</p>

Usage

Use this object to associate a single contact record to multiple account records so you can easily track the relationships between the people and businesses they work with.

AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentState` field. If the `IsDifferentState` field's value is `False`, that means the `State` field value is *the same* on the Salesforce account record and its matched Data.com record.

AccountCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the account record.
- `IsDifferent` indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the account record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Their individual bits are defined here.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique, system-generated ID assigned when the account record was created.</p>
AccountSite	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Information about the account's location, such as single location, headquarters, or branch.</p>
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Estimated annual revenue of the account.</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
CleanedByJob	<p>Type boolean</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description Indicates whether the account record was cleaned by a Data.com Clean job (<code>true</code>) or not (<code>false</code>).</p>
CleanedByUser	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account record was cleaned by a Salesforce user (<code>true</code>) or not (<code>false</code>).</p>
CompanyName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the company.</p>
CompanyStatusDataDotCom	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The status of the company per Data.com. Values are: <code>Company is In Business per Data.com</code> or <code>Company is Out of Business per Data.com</code>.</p>
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
DandBCompanyDunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description The D-U-N-S Number on the D&B Company record (if any) that is linked to the account.</p>
DataDotComId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the company.</p>
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description A description of the account.</p>
DunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.</p>
DunsRightMatchConfidence	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's DUNSRight confidence code.</p>
DunsRightMatchGrade	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's DUNSRight match grade.</p>

Field Name	Details
Fax	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The account's fax number.</p>
Industry	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The industry the account belongs to.</p>
IsDifferentAccountSite	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account's <code>AccountSite</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentAnnualRevenue	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account's <code>AnnualRevenue</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCity	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the account's <code>City</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCompanyName	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>AccountName</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Country</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountryCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Country Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDandBCompanyDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>DandBCompanyID</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Description</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>DunsNumber</code> field value is different from the D-U-N-S Number on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentFax</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Fax</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentIndustry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Industry</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentNaicsCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>NaicsCode</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>

<code>IsReviewedAnnualRevenue</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>AnnualRevenue</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedCompanyName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>CompanyName</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDandBCompanyDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>DandBCompanyID</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDescription</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Description</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>DunsNumber</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedFax</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the account's <code>Fax</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedIndustry</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>Industry</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNaicsCode</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>NaicsCode</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNaicsDescription</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>NaicsDescription</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNumberOfEmployees</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's <code>NumberOfEmployees</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedOwnership</code>	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the account's Ownership field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedPhone	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's Phone field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedSic	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's Sic field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedSicDescription	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's SicDescription field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedTickerSymbol	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the account's TickerSymbol field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedTradestyle	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the account's <code>Tradestyle</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedWebsite</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>Website</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedYearStarted</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the account's <code>YearStarted</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>LastMatchedDate</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Sort</p> <p>Description</p> <p>The date the account record was last matched and linked to a Data.com record.</p>
<code>LastStatusChangedById</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of who or what last changed the record's <code>Clean Status</code> field value: a Salesforce user or a Clean job.</p>
<code>LastStatusChangedDate</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date on which the record's <code>Clean Status</code> field value was last changed.</p>

Field Name	Details
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
NaicsCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy.</p>
NaicsDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A brief description of an organization's line of business, based on its NAICS code.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Field label is Account Clean Info Name. The name of the account. Maximum size is 255 characters.</p>

Field Name	Details
NumberOfEmployees	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of employees working at the account.</p>
Ownership	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Ownership type for the account, for example Private, Public, or Subsidiary.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number for the account.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
Sic	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Standard Industrial Classification code of the company's main business categorization, for example, 57340 for Electronics.</p>
SicDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description A brief description of an organization's line of business, based on its SIC code.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
Street	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the account.</p>
TickerSymbol	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The stock market symbol for the account.</p>
Tradestyle	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A name, different from its legal name, that an organization can use for conducting business. Similar to "Doing business as" (DBA).</p>
Website	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The website of the account.</p>
YearStarted	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The year the company was established or the year when current ownership or management assumed control of the company.</p>

Usage

Administrators can modify a limited set of AccountCleanInfo fields from the Account Clean Info page.

Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the `Clean Status` field on the Account object. If an account record's `Clean Status` field value is `Different` but the record has no `Billing Street` value, the trigger could update the record's status to `Not Compared`.

Create triggers that read AccountCleanInfo fields to help automate the cleaning or related processing of account records. For example:

- Keep account records' status `InSync` if the only difference from matched records is the `Phone` format (for example, `(415) 353-8000` on the account record versus `415 353 8000` on the matched Data.com record).

```
trigger AccountPhoneTrigger on Account (before update) {

    for (Account account: Trigger.new) {
        Account oldAccount = Trigger.oldMap.get(account.ID);
        if (account.CleanStatus == 'Different') {
            List <AccountCleanInfo> cleanInfo = [Select Id, IsDifferentPhone,
            IsReviewedPhone, Phone from AccountCleanInfo where AccountId = :account.Id];
            if (cleanInfo.size() > 0 && cleanInfo[0].IsDifferentPhone &&
            cleanInfo[0].Phone.StartsWith('+')) {
                // if Data.com phone number is marked Different but starts with '+',
            ignore this
                // and set the status to "Reviewed"
                AccountCleanInfo cleanInfoToUpdate = new AccountCleanInfo();
                cleanInfoToUpdate.Id = cleanInfo[0].Id;
                cleanInfoToUpdate.IsReviewedPhone = true;
                update cleanInfoToUpdate;
                account.CleanStatus = 'Reviewed';
            }
        }
    }
}
```

- Create a customized set of `Industry` field values for accounts. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.
- Read the `CleanStatus` field value on the Account object. If that value is `Different`, but a Salesforce record has no street address value, update the record's status to `Not Compared`.

AccountContactRole

Represents the role that a Contact plays on an Account.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Account.</p>
<code>ContactId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Contact associated with this account.</p>
<code>IsDeleted</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
<code>IsPrimary</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Specifies whether the Contact plays the primary role on the Account (<code>true</code>) or not (<code>false</code>). Note that each account has only one primary contact role. Label is Primary. Default value is <code>false</code>.</p>
Role	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Name of the role played by the Contact on this Account, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>AccountId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same account. A contact can play different roles on the same account.</p>

Usage

Use this object to define the role that a Contact plays on a given Account within the context of a specific Opportunity.

AccountFeed

Represents a single feed item on an account record detail page. This object is available in API version 18.0 and later.

An account feed shows changes to an account record for fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to accounts in Salesforce.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Account object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of AccountFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p>

Field	Details
	<p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p>

Field	Details
	<p>Description</p> <p>Date and time when this record was created. This field is a standard system field.</p> <p>Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only.</p> <p>ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>
isRichText	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via SOAP API. Otherwise, the post is rendered as plain text.</p> <p>Rich text supports the following HTML tags:</p> <ul style="list-style-type: none"> • <code><p></code>

Field	Details
	<p data-bbox="613 262 1437 325"> Tip: Though the <code>
</code> tag isn't supported, you can use <code><p>&nbsp; </p></code> to create lines.</p> <ul data-bbox="576 357 706 724" style="list-style-type: none"> • <code></code> • <code><code></code> • <code><i></code> • <code><u></code> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p data-bbox="613 745 1453 808">The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p data-bbox="576 840 1437 945"> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p data-bbox="532 997 665 1060">Type dateTime</p> <p data-bbox="532 1081 868 1144">Properties Defaulted on create, Filter, Sort</p> <p data-bbox="532 1165 1453 1459">Description Date and time when a user last modified this record. This field is a standard system field. When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>. Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p data-bbox="532 1501 600 1564">Type int</p> <p data-bbox="532 1585 738 1648">Properties Filter, Group, Sort</p> <p data-bbox="532 1669 1112 1732">Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p data-bbox="532 1774 600 1837">Type url</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
<code>NetworkScope</code>	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the account record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>

Field	Details
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user's Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply.

Field	Details
	<ul style="list-style-type: none"> • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Visibility

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`Visibility` can have the following values:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `Visibility`:

- For record posts, `Visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `Visibility` only to `AllUsers`.
- On user and group posts, only internal users can set `Visibility` to `InternalUsers`.

Usage

Use this object to track changes for an account record.

SEE ALSO:

[Account](#)

[NewsFeed](#)

[UserProfileFeed](#)

AccountHistory

Represents the history of changes to the values in the fields of an account. This object is available in versions 11.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Account. Label is Account ID.</p>

Field	Details
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to an account.

This object respects field level security on the parent object.

SEE ALSO:

[Account](#)

AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value isn't valid for creating or updating.)
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group for all child cases. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A value that represents the type of access granted to the target Group, UserRole, or User for any associated contacts. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p> Note: When DefaultContactAccess is set to Controlled by Parent, you can't create or update this field.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID representing the source group. An Account owned by a User in the source Group triggers the rule to give access.</p>
OpportunityAccessLevel	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>A value that represents the type of access granted to the target Group for any associated Opportunity. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
Name	<p>Type</p> <p>string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for accounts. General sharing and territory management-related sharing use this object. For example, the following code creates an account owner sharing rule between two public groups, which can also contain portal users.

```
AccountOwnerSharingRule rule = new AccountOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx000000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx000000000001"); // Set the group of users to share records to
rule.setAccountAccessLevel("Edit");
rule.setOpportunityAccessLevel("Read");
rule.setCaseAccessLevel("None");
connection.create(rule);
```

SEE ALSO:

[Account](#)

[Metadata API Developer Guide: SharingRules](#)

AccountPartner

This read-only object represents a partner relationship between two Account objects. It is automatically created when a Partner object is created for a partner relationship between two accounts.

 **Note:** This object is completely distinct and independent of Account records that have been enabled for the partner portal.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AccountFromId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the main Account in the partner relationship.</p>
AccountToId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort,</p> <p>Description ID of the partner Account in the partner relationship.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPrimary	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the AccountPartner is the main account's primary partner (<code>true</code>) or not (<code>false</code>).</p>
OpportunityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the opportunity in a partner relationship with the related account.</p>

Field	Details
Role	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The UserRole that the partner Account has on the main Account. For example, <code>Consultant</code> or <code>Distributor</code>.</p>

Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a `Partner` object and specify the `AccountFromId`), the API automatically creates two `AccountPartner` objects, one for the forward relationship and one for the reverse. For example, if you create a `Partner` object with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`, the API automatically creates two `AccountPartner` objects:

- The forward relationship `AccountPartner` with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`.
- The reverse relationship `AccountPartner` with "Acme Consulting" as the `AccountFromId` and "Acme, Inc." as the `AccountToId`.
- The value of the `Role` field in the reverse relationship `AccountPartner` is set to the `PartnerRole` object `ReverseRole` value associated with the value of the `Role` field in the forward relationship `AccountPartner`.

This mapping allows the API to manage the objects and their relationship efficiently.

[Partner](#)

[OpportunityPartner](#)

AccountShare

Represents a sharing entry on an `Account`.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to the Account. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value isn't valid for create or update calls.) <p>This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, either this field, the <code>OpportunityAccessLevel</code> field, or the <code>CaseAccessLevel</code> field must be set higher than the organization's default access level.</p>
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Account associated with this sharing entry. This field can't be updated.</p>
CaseAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to cases associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default <code>CaseAccessLevel</code>. This field can't be updated via the API if the <code>AccountAccessLevel</code> field is set to <code>All</code>. You can't update this field for the associated account owner via the API. You must update the account owner's <code>CaseAccessLevel</code> via the Salesforce user interface.</p>
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Level of access that the User or Group has to contacts associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default <code>ContactAccessLevel</code>. This field can't be updated via the API if the <code>ContactAccessLevel</code> field is set to "Controlled by Parent." You can't update this field for the associated account owner using the API. You must update the account owner's <code>ContactAccessLevel</code> via the Salesforce user interface.</p>
IsDeleted	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter</p> <p>Description</p> <p>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
OpportunityAccessLevel	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Level of access that the User or Group has to opportunities associated with the Account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default opportunity access level. This field can't be updated via the API if the <code>AccountAccessLevel</code> field is set to <code>All</code>. You can't use the API to update this field for the associated Account owner. You must update the Account owner's <code>opportunityAccessLevel</code> via the Salesforce user interface.</p>
RowCause	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a User with “All” access manually shared the Account with the user or group. • <code>ImplicitParent</code>—The User or Group has access because they’re the owner of or have sharing access to records related to the account, such as opportunities, cases, contacts, contracts, or orders. • <code>Owner</code>—The User is the owner of the Account • <code>Team</code>—The User or Group has team access (is an <code>AccountTeamMember</code>). • <code>Rule</code>—The User or Group has access via an Account sharing rule.
<code>UserOrGroupId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of the User or Group that has been given access to the Account. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view or edit Account records owned by other users.

If you attempt to create an `AccountShare` record that matches an existing record, the request updates any modified fields and returns the existing record.

For example, the following code finds all accounts owned by a user and manually shares them to a portal user.

```

QueryResult result = conn.query("SELECT Id FROM Account WHERE OwnerId = '005D0000001LPFB'");
// Create a new AccountShare object
List<AccountShare> shares = new ArrayList<AccountShare>();
for (SObject rec : result.getRecords()) {
    AccountShare share = new AccountShare();
    share.setAccountId(rec.getId());
    //Set the portal user Id to share the accounts with
    share.setUserOrGroupId("003D000000QA8T1");
    share.setAccountAccessLevel("Edit");
    share.setOpportunityAccessLevel("Read");
    share.setCaseAccessLevel("Edit");
    shares.add(share);
}
conn.create(shares.toArray(new AccountShare[shares.size()]));

```

This code shares the accounts that the user owns at the time, but not those accounts that are owned later. For these types of shares, use an owner-based sharing rule, such as [AccountOwnerSharingRule](#).

If an account is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an account for one or more of the following RowCause values, the records in the AccountShare object are compressed into one record with the highest level of access.

- `ImplicitParent`
- `Manual`
- `Owner`

[Account](#)

[CaseShare](#)

[LeadShare](#)

[OpportunityShare](#)

AccountTag

Associates a word or short phrase with an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

AccountTag stores the relationship between its parent TagDefinition and the Account being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AccountTeamMember

Represents a User who is a member of an Account team.

See also `UserAccountTeamMember`, which represents a User who is on the default account team of another user.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- This object is available only for Enterprise, Unlimited, and Performance Edition users who have enabled the account team functionality.
- Customer Portal users can't access this object.

Fields

Field Name	Details
AccountAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to the Account. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All <p>This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, the users's AccountAccessLevel, ContactAccessLevel, OpportunityAccessLevel, or CaseAccessLevel field must be set higher than the organization's default access level.</p>
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Account to which this user is a team member. Must be a valid account ID.</p>
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Level of access that the User has to cases associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p>This field must be set to an access level that is at least equal to the organization's default case access level. In addition, the users's AccountAccessLevel, ContactAccessLevel, OpportunityAccessLevel, or CaseAccessLevel field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.</p>

Field Name	Details

	ContactAccessLevel, OpportunityAccessLevel, or CaseAccessLevel field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.
PhotoURL	<p>Type URL</p> <p>Properties Filter, Nillable, Sort, Group</p> <p>Description Read only. Retrieves the users Chatter photo URL. This field is available in API version 37.0 and later.</p>
TeamMemberRole	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Role associated with this team member. One of the valid team member roles defined for your organization. Label is Team Role.</p>
Title	<p>Type string</p> <p>Properties Filter, Nillable, Sort, Group</p> <p>Description Read only. Retrieves the user's title. This field is available in API version 37.0 and later.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the User who is a member of this account team. Must be a valid User ID.</p>

Usage

Use this object to manage the team members of a particular Account and to specify team member roles for those users on that account.

[Account](#)

AccountTerritoryAssignmentRule

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>BooleanFilter</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Advanced filter conditions that were specified for the rule in the online application. For example, "(1 AND 2) OR 3."</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the rule is active (<code>true</code>) or inactive (<code>false</code>). Via the API, active rules run automatically when new accounts are created and existing accounts are edited. The exception is when the <code>IsExcludedFromRealign</code> field on an account is <code>true</code>, which prevents account assignment rules from evaluating that account.</p>
<code>IsInherited</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the rule is an inherited rule (<code>true</code>) or a local rule (<code>false</code>). An inherited rule also acts upon territories below it in the territory hierarchy. A local rule is created at the immediate territory and only impacts the immediate territory.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Update</p> <p>Description A name for the rule. Limit is 80 characters.</p>
TerritoryId	<p>Type reference</p> <p>Properties Create, Filter, Update</p> <p>Description ID of the territory where accounts that satisfy this rule are assigned.</p>

Usage

A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:

[AccountTerritoryAssignmentRuleItem](#)

[Territory](#)

[UserTerritory](#)

AccountTerritoryAssignmentRuleItem

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

AccountTerritoryAssignmentRuleItem can be created or deleted if the `BooleanFilter` field on its corresponding AccountTerritoryAssignmentRule object is a null value.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
Field	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The standard or custom account field to use as a criteria.</p>
Operation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The criteria to apply, such as "equals" or "starts with."</p>
RuleID	<p>Type reference</p> <p>Properties Create, Filter, Update</p> <p>Description ID of the associated AccountTerritoryAssignmentRule.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Update</p> <p>Description The order in which this row is evaluated compared to other AccountTerritoryAssignmentRuleItem objects for the given AccountTerritoryAssignmentRule.</p>
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The field value(s) to evaluate, such as 94105 if the Field is Billing Zip/Postal Code.</p>

Usage

- Both standard and custom account fields can be used as criteria for account assignment rules.
- A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:

AccountTerritorySharingRule

Represents the rules for sharing an Account within a Territory.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>AccountAccessLevel</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All
<code>CaseAccessLevel</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>A value that represents the type of access granted to the target group for all child cases of the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
ContactAccessLevel	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>A value that represents the type of access granted to the target group for all related contacts on the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit <p> Note: This field is read only.</p>
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p>

Field	Details
	<p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Accounts owned by users in the source territory trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
OpportunityAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target group for all opportunities associated with the account. The possible values are:</p> <ul style="list-style-type: none"> • None • Read • Edit
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the user or group being given access, or, if a territory ID, the users assigned to that territory.</p>

Usage

Use this object to manage the sharing rules for a particular object. General sharing and Territory-related sharing use this object.

ActionLinkGroupTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the “Customize Application” permission can modify or delete this object.

Fields

Field Name	Details
Category	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The location of the action link group within the feed element. Values are:</p> <ul style="list-style-type: none"> Primary—The action link group is displayed in the body of the feed element. Overflow—The action link group is displayed in the overflow menu of the feed element.
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the action link group template to use in code.</p>

Field Name	Details
ExecutionsAllowed	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The number of times an action link can be executed. Values are:</p> <ul style="list-style-type: none"> • <code>Once</code>—An action link can be executed only once across all users. • <code>OncePerUser</code>—An action link can be executed only once for each user. • <code>Unlimited</code>—An action link can be executed an unlimited number of times by each user. If the action link's <code>actionType</code> is <code>Api</code> or <code>ApiAsync</code>, you can't use this value.
HoursUntilExpiration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8,760.</p>
IsPublished	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, the action link group template is published. Action link group templates shouldn't be published until at least one ActionLinkTemplate is associated with it. Once set to <code>true</code>, this can't be set back to <code>false</code>.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the <code>MasterLabel</code>.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The name of the action link group template.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, NamespacePrefix is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

Usage

Define action link templates in Setup and use `ConnectApi` in Apex or Chatter REST API to instantiate action links from the templates and to post feed elements with the action links.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the “Customize Application” permission can modify or delete this object.

Fields

Field Name	Details
ActionLinkGroupTemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the ActionLinkGroupTemplate with which this action link template is associated.</p>
ActionUrl	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The action link URL. For example, a <code>Ui</code> action link URL is a Web page. A <code>Download</code> action link URL is a link to the file to download. <code>Ui</code> and <code>Download</code> action link URLs are provided to clients. An <code>Api</code> or <code>ApiAsync</code> action link URL is a REST resource. <code>Api</code> and <code>ApiAsync</code> action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with <code>https://</code>.</p> <p>Links to resources hosted on Salesforce servers can be relative, starting with a <code>/</code>. All other links must be absolute and start with <code>https://</code>. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>, for example, <code>https://www.example.com/{!Bindings.itemId}</code>. Set the binding variable's value when you instantiate the action link group from the template.</p>
Headers	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Template for the HTTP headers sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>.</p>

Field Name	Details
IsConfirmationRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, a confirmation dialog appears before the action is executed.</p>
IsGroupDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, action links derived from this template are the default or primary action in their action groups. There can be only one default action per action group.</p>
Label	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A custom label to display on the action link button. If none of the <code>LabelKey</code> values make sense for an action link, use a custom label. Set the <code>LabelKey</code> field to <code>None</code> and enter a label name in the <code>Label</code> field.</p> <p>Action links have four states: new, pending, success, and failed. These strings are appended to the label for each state:</p> <ul style="list-style-type: none"> • <i>Label</i> • <i>Label Pending</i> • <i>Label Success</i> • <i>Label Failed</i> <p>For example, if the value of <code>Label</code> is "Call Home," the values of the four action link states are: Call Home, Call Home Pending, Call Home Success, and Call Home Failed.</p> <p>If <code>LabelKey</code> has any value other than <code>None</code>, the <code>Label</code> field is empty.</p>
LabelKey	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Key for the set of labels to display for these action link states: new, pending, success, failed. For example, the Approve set contains these labels: Approve,</p>

Field Name	Details
	<p>Pending, Approved, Failed. For a complete list of keys and labels, see Action Links Labels in the <i>Chatter REST API Developer Guide</i> or the <i>Apex Developer Guide</i>.</p> <p>If none of the label key values make sense for an action link, set this field to <code>None</code> and enter a custom label name in the <code>Label</code> field.</p>
LinkType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of action link. One of these values:</p> <ul style="list-style-type: none"> • <code>Api</code>—The action link calls a synchronous API at the action URL. Salesforce sets the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> based on the HTTP status code returned by your server. • <code>ApiAsync</code>—The action link calls an asynchronous API at the action URL. The action remains in a <code>PendingStatus</code> state until a third party makes a request to <code>/connect/action-links/actionLinkId</code> to set the status to <code>SuccessfulStatus</code> or <code>FailedStatus</code> when the asynchronous operation is complete. • <code>Download</code>—The action link downloads a file from the action URL. • <code>Ui</code>—The action link takes the user to a web page at the action URL.
Method	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description HTTP method for the action URL. One of these values:</p> <ul style="list-style-type: none"> • <code>HttpDelete</code>—Returns HTTP 204 on success. Response body or output class is empty. • <code>HttpGet</code>—Returns HTTP 200 on success. • <code>HttpHead</code>—Returns HTTP 200 on success. Response body or output class is empty. • <code>HttpPatch</code>—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • <code>HttpPost</code>—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • <code>HttpPut</code>—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty. <p><code>Ui</code> and <code>Download</code> action links must use <code>HttpGet</code>.</p>

Field Name	Details
Position	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description An integer specifying the position of the action link template relative to other action links in the group. 0 is the first position.</p>
RequestBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Template for the HTTP request body sent when corresponding action links are invoked. This field can be used only for <code>Api</code> and <code>ApiAsync</code> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>.</p>
UserAlias	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If you selected <code>CustomUser</code> or <code>CustomExcludedUser</code> for <code>UserVisibility</code>, this field is the alias for the custom user. Use the alias in a template binding to specify the custom user when an action link group is created using the template.</p>
UserVisibility	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Who can see the action link. This value is set per action link, not per action link group. One of these values:</p> <ul style="list-style-type: none"> • <code>Creator</code>—Only the creator of the action link can see the action link. • <code>Everyone</code>—Everyone can see the action link. • <code>EveryoneButCreator</code>—Everyone but the creator of the action link can see the action link. • <code>Manager</code>—Only the manager of the creator of the action link can see the action link. • <code>CustomUser</code>—Only the custom user can see the action link.

Field Name	Details
	<ul style="list-style-type: none"> <code>CustomExcludedUser</code>—Everyone but the custom user can see the action link.

Usage

Create action link templates in Setup. Use Apex classes in the `ConnectApi` namespace or Chatter REST API to instantiate action links from templates and to post feed elements with the action links.

For information about action links, see “Working with Action Links” in the *Apex Developer Guide* or the *Chatter REST API Developer Guide*.

ActiveScratchOrg

Represents an active scratch org. This object is available in API version 41.0 and later.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of this scratch org.</p>
Edition	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The org edition of this scratch org. Possible values are <code>Group</code>, <code>Developer</code>, <code>Enterprise</code>, and <code>Professional</code>. This field is read-only.</p>
ExpirationDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description Date when the scratch org expires. This field is read-only.</p>
Features	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The features enabled in this scratch org, such as <code>MultiCurrency</code>. See the <i>Salesforce DX Developer Guide</i> for the full list of valid features. This field is read-only.</p>
HasSampleData	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the scratch org contains sample data. If set to <code>true</code>, the sample data is similar to the data in a Salesforce free trial org.</p>
LastLoginDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The date of the last user login to the scratch org. This field is read-only.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this scratch org was last referenced. This field is read-only.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date this scratch org was last viewed. This field is read-only.</p>
Name	<p>Type string</p>

Field Name	Details
	<p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description The auto-generated ID of this scratch org. This field is read-only.</p>
Namespace	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace associated with this scratch org. This field is read-only.</p>
OrgName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the scratch org. This field is read-only.</p>
OwnerId	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the user who owns this scratch org. This field is read-only.</p>
ScratchOrg	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The org ID of the scratch org. This field is read-only.</p>
ScratchOrgInfoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The id of the associated <code>ScratchOrgInfo</code> object. This field is read-only.</p>
SignupEmail	<p>Type email</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The email address of the Administration user. This field is read-only.</p>
SignupInstance	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Salesforce instance on which this scratch org resides. This field is read-only.</p>
SignupTrialDays	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of days between the scratch org's creation and expiration. This field is read-only.</p>
SignupUsername	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The username of the Administration user of the scratch org. This field is read-only.</p>
Template	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The template used to create this scratch org. This field is read-only.</p>

Usage

Salesforce automatically creates an instance of this object after a `ScratchOrgInfo` record moves to the Active state. The new `ActiveScratchOrg` gets many of its field values from the `ScratchOrgInfo` object with which it is associated.

When you delete an `ActiveScratchOrg` record, its associated scratch org is deleted and its associated `ScratchOrgInfo` record is moved to the Deleted state.

ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

Supported Calls

`describeSObjects()`

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the related account, which is determined as follows:</p> <ul style="list-style-type: none"> • The account associated with the <code>whatId</code>, if it exists; or • The account associated with the <code>whoId</code>, if it exists; otherwise • <code>null</code> <p>For information on IDs, see ID Field Type.</p>
<code>ActivityDate</code>	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates one of the following:</p> <ul style="list-style-type: none"> • The due date of a task • The due date of an event if <code>IsAllDayEvent</code> is set to <code>true</code>

Field	Details
	<p>This field has a time stamp that is always set to midnight in the Universal Time Coordinated (UTC) time zone. The time stamp doesn't represent the time of the activity; don't attempt to alter it to accommodate time zone differences. Label is <code>Date</code>.</p>
<code>ActivitySubtype</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Provides standard subtypes to facilitate creating and searching for specific activity subtypes. This field isn't updateable.</p> <p><code>ActivitySubtype</code> values:</p> <ul style="list-style-type: none"> • Task • Email • Call • Event • List Email
<code>ActivityType</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents one of the following values: <code>Call</code>, <code>Meeting</code>, or <code>Other</code>. Label is <code>Type</code>.</p>
<code>AlternateDetailId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of a record the activity is related to which contains more details about the activity. For example, an activity can be related to an <code>EmailMessage</code> record.</p>
<code>CallDisposition</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents the result of a given call, for example, "we'll call back," or "call unsuccessful." Limit is 255 characters.</p>

Field	Details
CallDurationInSeconds	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Duration of the call in seconds.</p>
CallObject	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of a call center. Limit is 255 characters.</p>
CallType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of call being answered: Inbound, Internal, or Outbound.</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the PartnerNetworkConnection that shared this record with your organization. This field is available only if your organization has enabled Salesforce to Salesforce and only in API versions 28.0 and later.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the PartnerNetworkConnection that your organization shared this record with. This field is available only if your organization has enabled Salesforce to Salesforce, and only in API versions 28.0 and later. The value is always null. You can use the PartnerNetworkRecordConnection object to forward records to connections.</p>

Field	Details
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Contains a description of the event or task. Limit is 32 KB.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
DurationInMinutes	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the duration of the event or task.</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the end date and time of the event or task. Available in versions 27.0 and later. This field is optional, depending on the following:</p> <ul style="list-style-type: none"> • If <code>IsAllDayEvent</code> is true, you can supply a value for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are <code>null</code>, the duration defaults to one day. • If <code>IsAllDayEvent</code> is false, a value must be supplied for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time.
IsAllDayEvent	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the value of this field is set to <code>true</code>, then the activity is an event spanning a full day, and the <code>ActivityDate</code> defines the date of the event. If the value of this field is set to <code>false</code>, then the activity may be an event spanning less than a full day, or it may be a task. Label is <code>All-Day Event</code>.</p>
<code>IsClosed</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a task is closed; value is always <code>true</code>. This field is set indirectly by setting the <code>Status</code> field on the task—each picklist value has a corresponding <code>IsClosed</code> value. Label is <code>Closed</code>.</p>
<code>IsDeleted</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the activity has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <code>Deleted</code>.</p>
<code>IsHighPriority</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates a high-priority task. This field is derived from the <code>Priority</code> field.</p>
<code>IsOnlineMeeting</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the activity represents an online meeting (<code>true</code>) or not (<code>false</code>).</p> <p> Note: This field is not available in API version 16.0 or later.</p>

Field	Details
IsReminderSet	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a reminder is set for an activity (<code>true</code>) or not (<code>false</code>).</p>
IsTask	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If the value of this field is set to <code>true</code>, then the activity is a task. If the value is set to <code>false</code>, then the activity is an event. Label is <code>Task</code>.</p>
IsVisibleInSelfService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description If the value of this field is set to <code>true</code>, then the activity can be viewed in the self-service portal. Label is <code>Visible in Self-Service</code>.</p>
Location	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If the activity is an event, then this field contains the location of the event. If the activity is a task, then the value is <code>null</code>.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the user who owns the activity.</p>
PrimaryAccountId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the <code>AccountId</code> value from the activity record. Available in API versions 30.0 and later to organizations that use Shared Activities.</p>
<code>PrimaryWhoId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the <code>WhoId</code> value from the activity record. Available in API versions 30.0 and later to organizations that have enabled Shared Activities.</p>
<code>Priority</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Indicates the priority of a task, such as high, normal, or low.</p>
<code>ReminderDateTime</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the time when the reminder is scheduled to fire, if <code>IsReminderSet</code> is set to <code>true</code>. If <code>IsReminderSet</code> is set to <code>false</code>, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.</p>
<code>StartDateTime</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the start date and time of the event. Available in versions 29.0 and later. If the event's <code>IsAllDayEvent</code> flag is set to true (indicating an all-day event), then the time stamp in <code>StartDateTime</code> is always set to midnight in the Coordinated Universal Time (UTC) time zone.</p>

Field	Details
	<p> Note: Don't attempt to alter the time stamp to account for any time zone differences.</p> <p>If the event's <code>IsAllDayEvent</code> flag is set to false, then you must translate the time portion of the time stamp in <code>StartDateTime</code> to or from a local time zone for the user or the application, as appropriate. The translation must be in the Coordinated Universal Time (UTC) time zone.</p> <p>If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> either must be null or must match the value of this field.</p> <p>If the activity is a task, <code>StartDateTime</code> is null</p>
Status	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description Indicates the current status of a task, such as in progress or complete. Each predefined status field sets a value for <code>IsClosed</code>. To obtain picklist values, query <code>TaskStatus</code>.</p>
Subject	<p>Type combobox</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Contains the subject of the task or event.</p>
WhatId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The <code>WhatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>WhatIds</code> are polymorphic. Polymorphic means a <code>WhatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>.</p>
WhoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p data-bbox="519 262 1453 304">Description</p> <p data-bbox="519 315 1453 409">The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is Name ID.</p> <p data-bbox="519 430 1453 556">If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID.</p> <p data-bbox="519 577 1453 682">If your organization uses Shared Activities, when you query activities in API version 30.0 or later, the returned value of the whoId field matches the value in the queried object, not necessarily in the activity record itself.</p> <p data-bbox="519 693 1453 766">If Shared Activities is enabled, the value of this field is not populated and the field PrimaryWhoId should be queried instead.</p>

Usage

Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity history; for example:

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistories)
FROM Account
WHERE Name Like 'XYZ%'
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following constraints on users who don't have the "View All Data" permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with "A." Instead, you must reference a single account record.

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistories
   ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC
   LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can't use WHERE.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.

- In the inner clause of the query, you must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

SEE ALSO:

[Task](#)

AdditionalNumber

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CallCenterId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description System field that contains the ID of the user who created the call center associated with this additional number. If value is null, this additional number is displayed in every call center's phone directory.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the additional number, such as Conference Room B. Limit: 255 characters.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the additional number. Limit: 80 characters.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Nillable, Group, Sort, Update</p> <p>Description The phone number that corresponds to this additional number.</p>

Usage

Create an additional number for a call center directory. Use this object if the number is not easily categorized as a User, Contact, Lead, Account, or the other object. Examples include phone queues or conference rooms.

Address

Represents a mailing, billing, or home address.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The full address.</p>

Field Name	Details
AddressType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description Picklist of address types. The values are:</p> <ul style="list-style-type: none">• Mailing• Shipping• Billing• Home
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address city.</p>
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address country.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of the address.</p>
DrivingDirections	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Directions to the address.</p>
GeocodeAccuracy	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates.</p>
Latitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
LocationType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Picklist of location types. The values are:</p> <ul style="list-style-type: none"> • Warehouse (default) • Site • Van • Plant
Longitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of the address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An auto-generated number identifying the address.</p>

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description A lookup field to the parent address. For example, if the address is a billing address, its parents address might be the address of the associated warehouse.</p>
PostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address postal code.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address state.</p>
Street	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The address street.</p>
TimeZone	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Picklist of available time zones.</p>

Usage

 **Important:** “Address” in Salesforce can also refer to the Address compound field found on many standard objects. When referencing the Address object in your Apex code, always use `Schema.Address` instead of `Address` to prevent confusion with the

standard Address compound field. If referencing both the address object and the Address field in the same snippet, you can differentiate between the two by using `System.Address` for the field and `Schema.Address` for the object.

AgentWork

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `getDeleted()`, `getUpdated()`, `retrieve()`, `undelete()`

Fields

Field	Details
AcceptDatetime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was accepted.</p>
ActiveTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time an agent actively worked on the work item. Tracks when the item is open and in focus in the agent's console.</p>
AgentCapacityWhenDeclined	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The agent's capacity when declining work, either explicitly or through push timeout.</p>
AssignedDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was assigned to an agent,</p>

Field	Details
CancelDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was canceled.</p>
CapacityPercentage	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel.</p> <p>When combined work items reach 100% for an agent, the agent won't receive new work items until there is enough open capacity for more work. For example, if you give phone calls a capacity percentage of 100, an agent on a call doesn't receive new work items until the call ends.</p>
CapacityWeight	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The amount of an agent's capacity for work items that's consumed by a work item from this service channel.</p> <p>For example, if cases are assigned a capacity weight of 2, an agent with a capacity of 6 can accept up to 3 cases before the agent is at capacity and can't receive new work items.</p>
CloseDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work item was closed.</p>
CreatedById	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description ID of the User who created this record.</p>

Field	Details
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on createFilter, Sort</p> <p>Description Date and time when this record was created.</p>
DeclineDatetime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date and time when this record was declined by an agent.</p>
DeclineReason	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The provided reason for why an agent declined the work request.</p>
HandleTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time an agent had the work item open. Calculated by <code>Close Time - Accepted Time</code>.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter, Group, idLookup, Sort</p> <p>Description The ID of the AgentWork object.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>
LastModifiedById	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description The ID of the user who last modified this record.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description An automatically generated ID number that identifies the record.</p>
OriginalQueueId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the queue that the work assignment was originally routed to.</p>
PushTimeout	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of seconds set for push timeout. <code>0</code> is returned when push timeout isn't enabled. Available in API version 36.0 and later.</p>
PushTimeoutDateTime	<p>Type dateTime</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the push timeout event occurred. Available in API version 36.0 and later.</p>
RequestDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates when the work was requested.</p>
ServiceChannelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the service channel that's associated with the work assignment.</p>
ShouldSkipCapacityCheck	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether to skip checking an agent's available capacity (<code>true</code>) or not (<code>false</code>) when an externally routed work item is created. This field is used when agents can simultaneously handle work from both Omni-Channel queues and queues using external routing.</p> <p>When <code>true</code>, the receiving agent may exceed their set capacity to accept the item, but they don't receive more Omni-Channel routed work. When <code>false</code>, the receiving agent can't exceed their set capacity and must have enough open capacity to accept the item.</p>
SpeedToAnswer	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time between when the work was requested and when an agent accepted it.</p>
Status	<p>Type picklist</p>

Field	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The working status of the work item. Valid values are:</p> <ul style="list-style-type: none"> • Assigned – The item is assigned to the agent but hasn't been opened. • Opened – The item was opened by the agent. • Unavailable – The item was assigned to the agent but the agent became unavailable (went offline or lost connection). • Declined – The item was assigned to the agent but the agent explicitly declined it. • DeclinedOnPushTimeout – The item was declined because push time-out is enabled and the item request timed out with the agent. • Closed – The item is closed. • Canceled – The item no longer needs to be routed. For example: a chat visitor cancels their Omni-Channel routed chat request before it reaches an agent.
SystemModstamp	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user or automated process (such as a trigger) last modified this record.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the user that the work item was assigned to.</p>
WorkItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the object that's routed to the agent through Omni-Channel.</p>

Usage

AgentWork records can only be deleted if they have the status Closed, Declined, or Unavailable. They can't be deleted if their status is Assigned or Opened because they're active in Omni-Channel.

`AgentWork` records have the status `Assigned` when they're created. Once created, the record is automatically pushed to the assigned agent.

While the metadata for `AgentWork` indicates support for `upsert()` and `update()`, these calls aren't used with `AgentWork` because none of its fields can be updated.

Apex triggers aren't supported with `AgentWork`.

AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define a whitelist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the "Manage Internal Users" user permission to use this object.

Note: If you don't see this object, contact your Salesforce representative to enable it.

Fields

Field	Details
<code>Domain</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description An allowed email domain for users.</p>

Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
ExpirationDate	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Required. The date on which the announcement expires. Announcements display on the group UI until 11:59 p.m. local time on the selected date.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. The ID of the FeedItem that contains the content of the announcement. Announcements are stored as text posts.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the parent CollaborationGroup that the announcement belongs to. An announcement can belong only to a single Chatter group.</p>
SendEmails	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Set to <code>true</code> to email all group members when an announcement is posted to the group. The default is <code>false</code>. This requires the user to have the "Send announcement on email" permission. This field is available in API version 36.0 and later.</p> <p> Note: This field is currently available to select customers through a pilot program. To be nominated to join this pilot program, contact Salesforce. Additional terms and conditions may apply to participate in the pilot program. Please note that pilot programs are subject to change, and as such, we cannot guarantee acceptance into this pilot program or a particular time frame in which this feature can be enabled. Any unreleased</p>

Field Name**Details**

services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

Usage

Group owners, managers, and users with the “Modify All Data” permission can use the Announcement object to create, edit, and delete group announcements. Creating a group announcement is a three-step process.

1. Use the FeedItem object to create a text post with the announcement’s content. Use the CollaborationGroup record you want to post the announcement to as the parent of this feed item.
2. Next, use the feed item ID and an expiration date to create the announcement record.
3. Finally, update the AnnouncementId field in the CollaborationGroup record with the ID of the announcement you created.

To delete the group announcement, simply delete the AnnouncementId value in the CollaborationGroup record. To restore a group announcement, update the AnnouncementId field for a group with the announcement’s ID. The expiration date for the announcement should be in the future and the feed item used to create the announcement should be parented by the same group.

ApexClass

Represents an Apex class.

 **Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Force.com IDE to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field**Details**

ApiVersion

Type

double

Properties

Create, Filter, Sort, Update

Description

The API version for this class. Every class has an API version specified at creation.

Field	Details
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Apex class definition. Limit: 1 million characters.</p>
bodyCrc	<p>Type double</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The CRC (cyclic redundancy check) of the class or trigger file.</p>
IsValid	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether any dependent metadata has changed since the class was last compiled (<code>true</code>) or not (<code>false</code>).</p>
LengthWithoutComments	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Length of the class without comments.</p>
Name	<p>Type string</p> <p>Properties Group, Sort, Create, Filter, Update</p> <p>Description Name of the class. Limit: 255 characters</p>
NamespacePrefix	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The current status of the Apex class. The following string values are valid:</p> <ul style="list-style-type: none"> <code>Active</code>—The class is active. <code>Deleted</code>—The class is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated. <p> Note: The <code>ApexTrigger Status</code> field includes an <code>Inactive</code> option, but it is only supported for <code>ApexTrigger</code>. For more information, see the Metadata API Developer Guide.</p>

[ApexTrigger](#)[Developer Guide: Apex Developer Guide](#)

ApexComponent

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`. For information, see the [Visualforce Developers Guide](#).

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
<code>ApiVersion</code>	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this custom component. Every custom component has an API version specified at creation. If the API version is less than 15.0 and <code>ApiVersion</code> is not specified, <code>ApiVersion</code> defaults to 15.0.</p>
<code>ControllerKey</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identifier for the controller associated with this custom component:</p> <ul style="list-style-type: none"> • If the <code>ControllerType</code> parameter is set to <code>Standard</code> or <code>StandardSet</code>, this value is the name of the sObject that defines the controller. • If the <code>ControllerType</code> parameter is set to <code>Custom</code>, this value is the name of the Apex class that defines the controller.
<code>ControllerType</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of controller associated with this Visualforce custom component. Possible values include:</p> <ul style="list-style-type: none"> • <code>Not Specified</code>, for custom components defined without a value for the <code>controller</code> attribute on the <code><apex:component></code> tag • <code>Standard</code>, a value that can't be used with custom components or errors may occur • <code>StandardSet</code>, a value that can't be used with custom components or errors may occur • <code>Custom</code>, for components that have a value for the <code>controller</code> attribute on the <code><apex:component></code> tag

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the Visualforce custom component.</p>
Markup	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the custom component.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text used to identify the Visualforce custom component in the Setup area of Salesforce. The Label for this field is Label.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Name of this Visualforce custom component.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in

Field	Details
	<p>an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</p> <ul style="list-style-type: none"> In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

Usage

Use custom components to encapsulate a common design pattern and then reuse that pattern several times in one or more Visualforce pages. All users who can view Visualforce pages can view custom components, but the "Customize Application" permission is required to create or update custom components.

ApexLog

Represents a debug log, containing information about a transaction, including information about Apex, Visualforce, workflow and validation rules. This object is available in API version 19.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>Application</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description This value depends on the client type that triggered the log.</p> <ul style="list-style-type: none"> For API clients, this value is the client ID For browser clients, this value is <code>Browser</code>

Field	Details
DurationMilliseconds	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Duration of the transaction in milliseconds.</p>
Location	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies the location of the origin of the log. Values are:</p> <ul style="list-style-type: none"> • Monitoring—log is generated as part of debug log monitoring. These types of logs are maintained until the user or the system overwrites them. • SystemLog—log is generated from the Developer Console. These types of logs are only maintained for 60 minutes or until the user clears them.
LogLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Length of the log in bytes.</p>
LogUserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user whose actions triggered the debug log.</p>
Operation	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the operation that triggered the debug log, such as APEXSOAP, Apex Sharing Recalculation, and so on.</p>
Request	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description Request type. Values are:</p> <ul style="list-style-type: none"> • <code>API</code>—request came from the API • <code>Application</code>—request came from the Salesforce user interface
<code>StartTime</code>	<p>Type <code>dateTime</code></p> <p>Properties Filter, Sort</p> <p>Description Start time of the transaction.</p>
<code>Status</code>	<p>Type <code>string</code></p> <p>Properties Filter, Group, Sort</p> <p>Description Status of the transaction. This value is either <code>Success</code>, or the text of an unhandled Apexw exception.</p>

Usage

You can read information about this object, as well as delete it, but you can't update or insert it.

[ApexClass](#)

[ApexTrigger](#)

[Developer Guide: Apex Developer Guide](#)

ApexPage

Represents a single Visualforce page.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this page. Every page has an API version specified at creation. If the API version is less than 15.0 and <code>ApiVersion</code> is not specified, <code>ApiVersion</code> defaults to 15.0.</p>
ControllerKey	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identifier for the controller associated with this page:</p> <ul style="list-style-type: none"> • If the <code>ControllerType</code> parameter is set to <code>Standard</code> or <code>StandardSet</code>, this value is the name of the sObject that defines the controller. • If the <code>ControllerType</code> parameter is set to <code>Custom</code>, this value is the name of the Apex class that defines the controller.
ControllerType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of controller associated with this Visualforce page. Possible values include:</p> <ul style="list-style-type: none"> • <code>Not Specified</code>, for pages defined with neither a <code>standardController</code> nor a <code>controller</code> attribute on the <code><apex:page></code> tag • <code>Standard</code>, for pages defined with the <code>standardController</code> attribute on the <code><apex:page></code> tag • <code>StandardSet</code>, for pages defined using the <code>standardController</code> and <code>recordSetVar</code> attribute on the <code><apex:page></code> tag • <code>Custom</code>, for pages defined with the <code>controller</code> attribute on the <code><apex:page></code> tag
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Description of the Visualforce page.</p>
isAvailableInTouch	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce app (<code>true</code>) or not (<code>false</code>). (Use of this field for Salesforce Touch is deprecated.) This field is available in API version 27.0 and later.</p> <p>Standard object tabs that are overridden with a Visualforce page aren't supported in the Salesforce app, even if you set this field for the page. The default Salesforce app page for the object is displayed instead of the Visualforce page.</p>
IsConfirmationTokenRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether <code>GET</code> requests for the page require a CSRF confirmation token (<code>true</code>) or not (<code>false</code>). This field is available in API version 28.0 and later.</p> <p>If you change this field's value from <code>false</code> to <code>true</code>, links to the page require a CSRF token to be added to them, or the page will be inaccessible.</p>
Markup	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the page.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text used to identify the Visualforce page in the Setup area of Salesforce. The Label is Label.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Name of this Visualforce page.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

Usage

Use Visualforce pages to add custom content that extends the base Salesforce application functionality. All users in Visualforce-enabled organizations can view Visualforce pages, but the "Customize Application" permission is required to create or update them.

[Developer Guide: Visualforce Developer Guide](#)

ApexTestQueueItem

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

This object is available in API version 23.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Description
ApexClassId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The Apex class whose tests are to be executed.</p>
ExtendedStatus	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The pass rate of the test run. For example: "(4/6)". This means that four out of a total of six tests passed. If the class fails to execute, this field contains the cause of the failure.</p>
ParentJobId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Points to the AsyncApexJob that represents the entire test run. If you insert multiple Apex test queue items in a single bulk operation, the queue items will share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The status of the job. Valid values are:</p> <ul style="list-style-type: none"> • Holding¹

Field Name	Description
	<ul style="list-style-type: none"> • Queued • Preparing • Processing • Aborted • Completed • Failed <p>¹ This status applies to batch jobs in the Apex flex queue.</p>
TestRunResultID	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the associated ApexTestRunResult object.</p>

Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the `ApexTestQueueItem` object and set its `Status` field to `Aborted`.

If you insert multiple Apex test queue items in a single bulk operation, the queue items will share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
ApexClassId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The Apex class whose test methods were executed.</p>
ApexLogId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the ApexLog for this test method execution if debug logging is enabled; otherwise, null.</p>
ApexTestRunResultId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the ApexTestRunResult that represents the entire test run.</p>
AsyncApexJobId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the AsyncApexJob that represents the entire test run. This field points to the same object as ApexTestQueueItem.ParentJobId.</p>
Message	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The exception error message if a test failure occurs; otherwise, null.</p>
MethodName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The test method name.</p>

Field Name	Details
Outcome	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The result of the test method execution. Can be one of these values:</p> <ul style="list-style-type: none">• Pass• Fail• CompileFail• Skip
QueueItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Points to the ApexTestQueueItem which is the class that this test method is part of.</p>
RunTime	<p>Type int</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The time it took the test method to run, in seconds.</p>
StackTrace	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The Apex stack trace if the test failed; otherwise, <code>null</code>.</p>
TestTimestamp	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The start time of the test method.</p>

Usage

You can query the fields of the `ApexTestResult` record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single `ApexTestResult` record. For example, if an Apex test class contains six test methods, six `ApexTestResult` records are created. These records are in addition to the `ApexTestQueueItem` record that represents the Apex class.

Each `ApexTestResult` record has an associated [ApexTestResultLimits](#) on page 302 record, which captures the Apex limits used during execution of the test method.

ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each `ApexTestResult` record. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
<code>ApexTestResultId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated ApexTestResult object.</p>
<code>AsyncCalls</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of asynchronous calls made during the test run.</p>
<code>Callouts</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of callouts made during the test run.</p>

Field Name	Details
Cpu	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The amount of CPU used during the test run, in milliseconds.</p>
Dml	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of DML statements made during the test run.</p>
DmlRows	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of rows accessed by DML statements during the test run.</p>
Email	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The number of email invocations made during the test run.</p>
LimitContext	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates whether the test run was synchronous or asynchronous.</p>
LimitExceptions	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether your org has any limits that differ from the default limits.</p>
MobilePush	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of mobile push calls made during the test run.</p>
QueryRows	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of rows queried during the test run.</p>
Soql	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of SOQL queries made during the test run.</p>
Sosl	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of SOSL queries made during the test run.</p>

Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren't called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
<code>AsyncApexJobId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The parent Apex job ID for the result.</p>
<code>ClassesCompleted</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of classes executed during the test run.</p>
<code>ClassesEnqueued</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The total number of classes enqueued during the test run.</p>
<code>EndTime</code>	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The time at which the test run ended.</p>

Field Name	Details
IsAllTests	<p>Type boolean</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Indicates whether all Apex test classes were run.</p>
JobName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Reserved for future use.</p>
MethodsCompleted	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of methods completed during the test run. This value is updated after each class is run.</p>
MethodsEnqueued	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of methods enqueued for the test run. This value is initialized before the test runs.</p>
MethodsFailed	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of methods that failed during this test run. This value is updated after each class is run.</p>
Source	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The source of the test run, such as the Developer Console.</p>
StartTime	<p>Type dateTime</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The time at which the test run started.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The status of the test run. Values include:</p> <ul style="list-style-type: none">• Queued• Processing• Aborted• Completed• Failed
TestTime	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The time it took the test to run, in seconds.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The user who ran the test run.</p>

ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Description
TestSuiteName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Unique, Update</p> <p>Description</p> <p>The name of the Apex test suite. This label appears in the user interface.</p> <p>This value is case-sensitive and must be unique.</p>

Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'  
      AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

SEE ALSO:

[TestSuiteMembership](#)

ApexTrigger

Represents an Apex trigger.

 **Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Force.com IDE to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
<code>ApiVersion</code>	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this trigger. Every trigger has an API version specified at creation.</p>
<code>Body</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Apex trigger definition. Limit: 1 million characters.</p>
<code>bodyCrc</code>	<p>Type double</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The CRC (cyclic redundancy check) of the class or trigger file.</p>
<code>IsValid</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether any dependent metadata has changed since the trigger was last compiled (<code>true</code>) or not (<code>false</code>).</p>
<code>LengthWithoutComments</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description Length of the trigger without comments</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the trigger. Limit: 255 characters</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation. The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The current status of the Apex trigger. The following string values are valid:</p> <ul style="list-style-type: none"> • <code>Active</code>—The trigger is active. • <code>Inactive</code>—The trigger is inactive, but not deleted. • <code>Deleted</code>—The trigger is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated.

Field	Details
	 Note: <code>Inactive</code> is not valid for ApexClass. For more information, see the Metadata API Developer Guide .
TableEnumOrId	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies the object associated with the trigger, such as Account or Contact.</p>
UsageAfterDelete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after delete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterInsert	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after insert</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterUndelete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after undelete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageAfterUpdate	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is an <code>after update</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
UsageBeforeDelete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field	Details
	<p>Description Specifies whether the trigger is a <code>before delete</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
<code>UsageBeforeInsert</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is a <code>before insert</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
<code>UsageBeforeUpdate</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is a <code>before update</code> trigger (<code>true</code>) or not (<code>false</code>).</p>
<code>UsageIsBulk</code>	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether the trigger is defined as a bulk trigger (<code>true</code>) or not (<code>false</code>).</p> <p> Note: This field is not used for Apex triggers saved using Salesforce API version 10.0 or higher: all triggers starting with that version are automatically considered bulk, and this field will always return <code>true</code>.</p>

AppExtension

Represents a connection between the Field Service Lightning mobile app and another app, typically for passing record data to the Salesforce app or other apps. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
AppExtensionLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The label in the UI for the app extension.</p>
AppExtensionName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The API name of the app extension.</p>
FieldServiceMobileSettingsId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of a set of field service mobile settings.</p>
InstallationUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL that takes the user to the app install location, such as the App Store or Google Play.</p>
LaunchValue	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>A value directing the Field Service Lightning app to the appropriate app extension. The Launch Value can be a static URL or a dynamic value that you can represent with certain tokens. These tokens pass field information from the record that the user is currently viewing. The basic format for these tokens is based on the field names; for example: {!\$Name}.</p>
ScopedToObjectTypes	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Indicates the types of records from which the app extension can be activated. Scoping an app extension to an object lets users activate the app extension from records of the specified type. For example, to scope to both work orders and service appointments you would use the value <i>WorkOrder, ServiceAppointment</i>.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>A picklist of types of app extensions: iOS, Android, Flow, and Lightning Apps</p>

AppMenuItem

Represents the organization's default settings for items in the app menu or App Launcher.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApplicationId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The 15-character ID for the menu item.</p>
CanvasAccessMethod	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The access method for the canvas app. Values can be:</p> <ul style="list-style-type: none"> • OAuth Webflow (GET) • Signed Request (POST)
CanvasEnabled	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates if the app menu item is a canvas app (<code>true</code>) or not (<code>false</code>).</p>
CanvasOptions	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Represents the options enabled for a canvas connected app. The options are:</p> <ul style="list-style-type: none"> • PersonalEnabled—The app is enabled as a canvas personal app. • HideHeader—The publisher header, which contains the “What are you working on?” text, is hidden. • HideShare—The publisher Share button is hidden. <p>This field is available in API version 34.0 and later.</p>
CanvasReferenceId	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The canvas app unique identifier.</p>
CanvasSelectedLocations	<p>Type</p> <p>string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The selected locations for the canvas app which define where the canvas app can appear in the user interface. For example:</p> <div style="border: 1px solid #ccc; padding: 2px; margin: 5px 0;">Chatter, ChatterFeed, Publisher, ServiceDesk</div>
CanvasUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The URL of the canvas app.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A description of this menu item.</p>
IconUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The icon for the menu item's application.</p>
InfoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The URL for more information about the application.</p>
IsAccessible	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the current user is authorized to use the app.</p>

Field	Details
<code>IsUsingAdminAuthorization</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the app is pre-authorized for certain users by the administrator.</p>
<code>IsVisible</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the app is visible to users of the organization, by default.</p>
<code>Label</code>	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description The app's name.</p>
<code>LogoUrl</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The logo for the menu item's application. The default is the initials of the <code>Label</code> value.</p>
<code>MobileStartUrl</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The location mobile users are directed to after they've authenticated. This field is only used with connected apps.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The API name of the item.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
SortOrder	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, idLookup, Sort</p> <p>Description</p> <p>The index value that controls where this item appears in the menu. For example, a menu item with a sort order of 5 appears between items with sort order values of 3 and 9.</p>
StartUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>For a connected app, the location users are directed to after they've authenticated. Otherwise, the application's default start page.</p>
Type	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>The type of application represented by this item. The types are:</p> <ul style="list-style-type: none"> • ConnectedApplication • Network • ServiceProvider • TabSet
UserSortOrder	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 appears between items with sort order values of 3 and 9.</p> <p>This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</p> <pre>SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</pre>

Usage

Use this read-only object to view an entry in the Lightning Platform app menu or the App Launcher. You can create a SOQL query to retrieve all items, even items the user does not see from the user interface.

There are many ways you can use AppMenuItem. Here are some examples:

- Build your own App Launcher or app menu in Salesforce. Create a custom page showing all the apps you have access to and that lets you run them using single sign-on.
- Build your own App Launcher or app menu on a tablet or mobile app. You can have your own app for launching applications on various mobile devices.
- Build an app launcher into your company's intranet. There's no need to have it run on Salesforce because Salesforce APIs let you integrate with Salesforce programmatically and build an app launcher.

Tip: To get metadata information about apps and their tabs, use the Apex `Schema.describeTabs()` method, the REST API `/vXX.X/tabs/` resource, or the SOAP API `describeTabs()` call.

Approval

Represents an approval request for a Contract.

 **Note:** This object is read-only and is specific to approvals on the Contract object. It isn't equal to or involved in the approval processes represented by the ProcessInstance, which is more powerful.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>ApproveComment</code>	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text entered by the user when they approved or rejected this approval request. Required. Limit: 4,000 characters.</p>
<code>IsDeleted</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
<code>OwnerId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the User being asked to approve or reject the approval request. Must be a valid User ID. Required.</p>
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description Required. ID of the Contract associated with this approval request. Must be a valid contract ID.</p>
RequestComment	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text entered by the User who created the approval request. Optional. This field can't be updated after the Approval has been created. Limit: 4,000 characters.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Required. Status of this approval request. One of the following picklist values:</p> <ul style="list-style-type: none"> • Pending—Specified only when the Approval request is created (<code>create ()</code> call) • Approved—Specified only when the Approval request is approved (<code>update ()</code> call) • Rejected—Specified when the Approval request is rejected (<code>update ()</code> call) or when it is created (<code>create ()</code> call) and immediately rejected for archival/historical purposes.

Usage

This object allows client applications to programmatically handle approval requests for a Contract. Initially, to request a Contract approval, a client application might create a new Approval request record, specifying the `ParentId`, `OwnerId` (user approving or rejecting the request), `Status` (Pending), and (optionally) `RequestComment` fields. Note that when a client application creates the first approval request, if the value of the Contract `Status` field is Draft, then the Approval `Status` for this record is automatically changed to In Approval Process (see `ContractStatus` for more information).

A client application might subsequently update an existing Approval request, specifying the `Status` (Approved or Rejected) and an `ApproveComment` (required); the `RequestComment` field can't be updated. Updating an Approval record (either to approve or reject) requires the client application to be logged in with "Approve Contract" permission. To update an Approval request, its `Status` must be Pending—a client application can't update an Approval that has already been Approved or Rejected. To re-submit an approval request for a given Contract, a client application must create a new, separate Approval record and repeat the approval process.

Once a Contract has been approved (not rejected), the Contract `LastApprovedDate` field is automatically updated, however the Contract `Status` field isn't updated, it keeps the value InApproval.

An approved Contract must be activated explicitly. Client applications can activate a Contract by setting the value in its `Status` field to Activated, or a User can activate a Contract via the Salesforce user interface.

A Contract can have multiple approval requests in various states (Pending, Approved, and Rejected). In addition, one User can have multiple approval requests associated with the same Contract.

Client applications can't explicitly delete Approval records. Approval records are deleted automatically if the parent Contract is deleted.

[Object Basics](#)

*Article Type*__DataCategorySelection

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

This object can be used to associate an article with data categories from a data category group or to query the category selections for an article.

The object name is variable and has a syntax of *Article Type*__DataCategorySelection, where *Article Type* is the Object Name for the article type associated with the article. For example, *Offer*__DataCategorySelection represents the association between the *Offer* article type and its data categories. Every article is associated with an article type.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `getDeleted()`, `retrieve()`

Special Access Rules

Users can only access, create or delete data category selection visible to their role, permission set, or profile. If a user has partial visibility on an article's categorization, only the visible categories are returned.

Fields

Field Name	Details
DataCategoryGroupName	<p>Type DataCategoryGroupReference</p> <p>Properties Create</p> <p>Description Unique name of the data category group which has categories associated with the article.</p>
DataCategoryName	<p>Type DataCategoryGroupReference</p> <p>Properties Create</p> <p>Description Unique name of the data category associated with the article.</p>
ParentId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter</p> <p>Description ID of the article associated with the data category selection.</p>

Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use the *Article Type__DataCategorySelection* object to query and manage article categorization in your organization. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

 **Note:** When using *Article Type__DataCategorySelection* to classify an article, you can't select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

Answer communities use *QuestionDataCategorySelection* to classify questions.

SOQL Sample

The following SOQL query returns the data category selections used to classify the article whose ID is `ka0D000000005ApIAI`.

```
SELECT Id,DataCategoryName, ParentId
      FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

This clause only returns category unique names. To retrieve category labels use the following clause:

```
SELECT Id,toLabel(DataCategoryName), ParentId
      FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

 **Tip:** You can also use relationship queries to retrieve categorizations from an article type.

Article Type__Feed

Represents a single feed item in the feed displayed on the detail page for an article. This object is available in API version 20.0 and later.

An article feed shows recent changes to an article record for any fields that are tracked in feeds, and posts and comments about the article. It is a useful way to stay up-to-date with changes made to articles in Salesforce Knowledge. This object is available in API version 20.0 and later. The object name is variable and uses a *Article Type__Feed* syntax, where *Article Type* is the *ObjectName* for the article type associated with the article. For example, *Offer__Feed* represents a feed item on an article based on the *Offer* article type.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of <i>Article Type__Feed</i>. Required when <i>Type</i> is <i>TextPost</i>. Optional when <i>Type</i> is <i>ContentPost</i> or <i>LinkPost</i>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <i>FeedComments</i> associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <i>CommentCount</i> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <i>CommentCount</i>, go through pagination until end of comments is returned.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Required if <i>Type</i> is <i>ContentPost</i>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <i>Type</i> to <i>ContentPost</i>.</p>
ContentDescription	<p>Type textarea</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>ContentType</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>CreatedDate</code>	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDate DESC</code> sorts the feed by the most recent feed item.</p>
<code>FeedPostId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<ul style="list-style-type: none"> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>ID of the article that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The type of feed item:</p> <ul style="list-style-type: none"> • ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • AnnouncementPost—Not used. • ApprovalPost—generated when a user submits an approval. • BasicTemplateFeedItem—Not used. • CanvasPost—a post made by a canvas app posted on a feed. • CollaborationGroupCreated—generated when a user creates a public group. • CollaborationGroupUnarchived—Not used.

Field	Details
	<ul style="list-style-type: none"> • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user’s Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Usage

Use this object to track changes for an article. You can only delete a feed that you created, or if you have the “Modify All Data” permission or “Modify All” permission on the `KnowledgeArticle` object.

[UserProfileFeed](#)

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>AccountId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description (Required) ID of the Account associated with this asset. Must be a valid account ID. Required if <code>ContactId</code> is not specified.</p>
<code>AssetLevel</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The asset's position in an asset hierarchy. If the asset has no parent or child assets, its level is 1. Assets that belong to a hierarchy have a level of 1 for the root asset, 2 for the child assets of the root asset, 3 for their children, and so forth.</p> <p> Note: On assets created before the introduction of this field, the asset level defaults to -1. Once the asset record is updated, the asset level is calculated and automatically updated.</p>
<code>AssetProvidedById</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account that provided the asset, typically a manufacturer.</p>
<code>AssetServicedById</code>	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The account in charge of servicing the asset.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required if <code>AccountId</code> is not specified. ID of the Contact associated with this asset. Must be a valid contact ID that has an account parent (but does not need to match the asset's <code>AccountId</code>).</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the asset.</p>
InstallDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date when the asset was installed.</p>
IsCompetitorProduct	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this Asset represents a product sold by a competitor (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Its UI label is Competitor Asset.</p>
IsInternal	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates that the asset is produced or used internally (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Its UI label is Internal Asset.</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date and time that the asset was last modified. Its UI label is Last Modified Date.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date and time that the asset was last viewed.</p>
LocationId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The asset's location. Typically, this is the place where the asset is stored, such as a warehouse or van.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>(Required) Name of the asset. Label is Asset Name.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The asset's owner. By default, the asset owner is the user who created the asset record. Its UI label is Asset Owner.</p>

Field	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The asset's parent asset. Its UI label is Parent Asset.</p>
Price	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Price paid for this asset.</p>
Product2Id	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description (Optional) ID of the Product2 associated with this asset. Must be a valid Product2 ID. Its UI label is Product.</p>
ProductCode	<p>Type string</p> <p>Properties Filter, Group, Sort, Nillable</p> <p>Description The product code of the related product.</p>
PurchaseDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which this asset was purchased.</p>
Quantity	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Quantity purchased or installed.</p>
RootAssetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Read only) The top-level asset in an asset hierarchy. Depending on where an asset lies in the hierarchy, its root could be the same as its parent. Its UI label is Root Asset.</p>
SerialNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Serial number for this asset.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customizable picklist of values. The default picklist includes the following values:</p> <ul style="list-style-type: none"> • Purchased • Shipped • Installed • Registered • Obsolete
StockKeepingUnit	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The SKU assigned to the related product.</p>
UsageEndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	Description Date when usage for this asset ends or expires.

Usage

Use this object to track products sold to customers. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of up to 10,000 assets.

For example, your organization might want to renew and up-sell opportunities on products sold in the past. Similarly, your organization might want to track competitive products that exist in a customer environment that could potentially be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the `PurchaseDate` or `SerialNumber` could indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the `UsageEndDate` might indicate when the asset was removed from service or when a license or warranty expires.

If an application creates a new `Asset` record, it must specify a `Name` and either an `AccountId`, `ContactId`, or both.

[Object Basics](#)

AssetFeed

Represents a single feed item in the feed displayed on the detail page for an asset record.

An asset feed shows recent changes to an asset record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to assets.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Asset object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the AssetFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p>

Field Name	Details
	<p>Description</p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only.</p> <p>The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only.</p> <p>The file uploaded to the feed. Required if <code>Type</code> is <code>ContentPost</code>. Setting <code>AssetFeed</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentSize</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>ContentType</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>FeedPostId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter. Group, Nullable, Sort</p>

Field Name

Details

Description

This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. Use [FeedItem](#) instead.

The ID of the associated FeedPost. A FeedPost represents the following types of changes in an AssetFeed: status updates, changes to tracked fields, text posts, link posts, and content posts.

InsertedById

Type[reference](#)**Properties**[Group](#), [Nillable](#), [Sort](#)**Description**

ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the logged-in user.

IsDeleted

Type[boolean](#)**Properties**[Defaulted on create](#), [Filter](#), [Group](#), [Sort](#)**Description**

Standard system field. Indicates whether the record has been moved to the Recycle Bin (`true`) or not (`false`).

IsRichText

Type[boolean](#)**Properties**[Defaulted on create](#), [Filter](#), [Group](#), [Sort](#)**Description**

Indicates whether the feed item `Body` contains rich text. Set `IsRichText` to `true` if you post a rich text feed item via SOAP API. Otherwise, the post is rendered as plain text.

Rich text supports the following HTML tags:

- `<p>`

Tip: Though the `
` tag isn't supported, you can use `<p> </p>` to create lines.

- ``
- `<code>`
- `<i>`
- `<u>`

Field Name	Details
	<ul style="list-style-type: none"> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
<code>LastModifiedDate</code>	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on the feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for the <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
<code>LikeCount</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
<code>LinkUrl</code>	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of the <code>LinkPost</code>.</p>
<code>NetworkScope</code>	<p>Type picklist</p>

Field Name	Details
	<p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the FeedItem is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a FeedItem on the <code>NetworkScope</code> field.
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the asset record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion article associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>. For example, set this field to an existing ContentVersion and post it to a feed as an AssetFeed object of <code>Type ContentPost</code>.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The title of the AssetFeed. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL, and this field is the link name.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The type of AssetFeed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <code>Task</code> or <code>Event</code> associated with a case record (excluding email and call logging). For a recurring <code>Task</code> with <code>CaseFeed</code> disabled, one event is generated for the series only. For a recurring <code>Task</code> with <code>CaseFeed</code> enabled, events are generated for the series and each occurrence. • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user's Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply.

Field Name	Details
	<ul style="list-style-type: none"> • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to CaseFeed:</p> <ul style="list-style-type: none"> • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case. • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. • <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case. • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case.
Visibility	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>Visibility</code> can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default.

Field Name	Details
	<ul style="list-style-type: none"> External users can set <code>Visibility</code> only to <code>AllUsers</code>. <code>Visibility</code> can be updated on record posts. The <code>Update</code> property is supported only for feed items posted on records.

Usage

Use this object to track changes for an asset record.

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>AssetAccessLevel</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> Read Edit

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. Target users or groups are given access.</p>

Usage

Use this object to manage the sharing rules for assets. General sharing uses this object.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

AssetRelationship

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

Asset relationships appear in the Primary Assets and Related Assets related lists on asset records in the UI.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>AssetId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The replacement asset.</p>
<code>AssetRelationshipNumber</code>	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An auto-generated number identifying the asset relationship.</p>

Field Name	Details
FromDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The day the replacement asset is installed.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the asset relationship was last modified. Its label in the user interface is <code>Last Modified Date</code>.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date the asset relationship was last viewed.</p>
RelatedAssetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The asset being replaced.</p>
RelationshipType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of relationship between the assets, such as replacement or upgrade. This picklist comes without default values, so create your own.</p>
ToDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name**Details****Description**

The day the replacement asset is uninstalled.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field**Details**

`AssetAccessLevel`

Type

picklist

Properties

Filter, Group, Restricted picklist, Sort

Description

Level of access that the User or Group has to the Asset. The possible values are:

- Read
- Edit
- All This value is not valid for creating or deleting records.

This field must be set to an access level that is higher than the organization's default access level for cases.

`AssetId`

Type

reference

Properties

Filter, Group, Sort

Description

ID of the Asset associated with this sharing entry. This field can't be updated.

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the Asset with them. • <code>Owner</code>—The User is the owner of the Asset. • <code>Rule</code>—The User or Group has access via an Asset sharing rule.
UserOrGroupId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Asset. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AssetTokenEvent

Represents an event associated with an asset token, such as token issuance and registration of a connected device as an Asset. This object is available in API version 39.0 and later.

An asset token event records successful completion of an OAuth 2.0 asset token flow for a connected device. An event is published whenever an access token and actor token (optional) are successfully exchanged for an asset token. This object is designed to support custom business processes, such as automatic logging of a case when an event occurs. Create Apex triggers that subscribe to an event and execute after asset token issuance. This object is read only and can't be retrieved using a SOQL query. Asset token events are not displayed in the Setup user interface for Platform Events.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
<code>ActorTokenPayload</code>	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description If the asset token request included an actor token, the payload portion containing claims about the connected device, asset token, and if applicable, the registered Asset.</p>
<code>AssetId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the Asset record if the Asset was newly created or an existing Asset was linked to in the asset token request.</p>
<code>AssetName</code>	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description If specified in the actor token, the display name of the existing Asset. This value is otherwise <code>null</code>.</p>
AssetSerialNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If specified in the actor token, the serial number of the existing Asset. This value is otherwise <code>null</code>.</p>
ConnectedAppId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the connected app associated with the access token for the device.</p>
DeviceId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the connected device. Value is the <code>d.i.d</code> (device ID) claim specified in the actor token.</p>
DeviceKey	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description If specified in the actor token, the device-specific RSA public key as a JSON Web Key (JWK). Value is the <code>j.w.k</code> claim within the confirmation claim from the actor token.</p>
Expiration	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The expiration time on or after which the asset token JWT must not be accepted for processing. A numeric value representing the number of seconds from 1970-01-01T00:00:00Z UTC until the specified UTC date/time, ignoring leap seconds.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Display name of the asset token.</p>
ReplayId	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>Numeric ID that identifies the asset token event. Each ID is incremented automatically and guaranteed to be higher than the ID of the previous event, but not necessarily contiguous for consecutive events.</p>
UserId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>ID of the user associated with the access token.</p>

Usage

The following example shows how to trigger an action after an asset token event.

```
trigger AssetTokenEventTrigger on AssetTokenEvent (after insert) {
  System.assertEquals(1, Trigger.new.size(), 'One record expected');
  AssetTokenEvent event = Trigger.new[0];
  AssetTokenRecord__c record = new AssetTokenRecord__c();
  record.ConnectedAppId__c = event.ConnectedAppId;
  record.UserId__c = event.UserId;
  record.AssetId__c = event.AssetId;
  record.AssetName__c = event.AssetName;
  record.DeviceId__c = event.DeviceId;
  record.DeviceKey__c = event.DeviceKey;
  record.Expiration__c = event.Expiration;
}
```

```

record.AssetSerialNumber__c = event.AssetSerialNumber;
record.AssetName__c = event.AssetName;
record.ActorTokenPayload__c = event.ActorTokenPayload;
insert(record);
}

```

AssignedResource

Represents a service resource who is assigned to a service appointment. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
ActualTravelTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The number of minutes that the service resource needed to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places.</p>
AssignedResourceNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An auto-generated number identifying the resource assignment.</p>
EstimatedTravelTime	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The estimated number of minutes needed for the service resource to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places.</p>
ServiceAppointmentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The service appointment that the resource is assigned to.</p>
ServiceCrewId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Update, Filter, Group, Sort, Nillable</p> <p>Description</p> <p>The service crew that the resource is assigned to.</p> <p> Note: Since service resources can represent crews or individuals, appointment are typically assigned to crews in the following way:</p> <ol style="list-style-type: none"> 1. Create a service resource of the Crew type that represent the crew. 2. Create an assigned resource on the service appointment and select the crew resource in the <code>ServiceResourceId</code> field. <p>As an alternative, you can assign appointments to crew members separately. This lets you track each member's travel time and see a list of the crew members in the Assigned Resources related list. To take this approach, create an assigned resource for each crew member. List the crew member in the <code>ServiceResourceId</code> field and the crew they belong to in the <code>ServiceCrewId</code> field.</p>
ServiceResourceId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Update, Filter, Group, Sort</p> <p>Description</p> <p>The resource who is assigned to the service appointment.</p>

Usage

You can assign multiple service resources to a service appointment. Service resources who are assigned to service appointments cannot be deactivated until they are removed from the appointments.

AssignmentRule

Represents an assignment rule associated with a Case or Lead.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Special Access Rules

- This object is read only. Assignment rules are created, configured, and deleted in the user interface.
- Customer Portal users can't access this object.

Fields

Field	Details
Active	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this assignment rule is active (<code>true</code>) or not (<code>false</code>).</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of this assignment rule.</p>
SubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Type of assignment rule—Case or Lead.</p>

Usage

Before creating or updating a new Case or Lead, a client application can query (by name) the AssignmentRule to obtain the ID of the assignment rule to use, and then assign that ID to the `assignmentRuleId` field of the AssignmentRuleHeader. The AssignmentRuleHeader can be set using either SOAP API or REST API.

[Object Basics](#)

AssociatedLocation

Represents a link between an account and a location in Field Service Lightning. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
ActiveFrom	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date and time the associated location is active.</p>
ActiveTo	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date and time the associated location stops being active.</p>
AssociatedLocationNumber	<p>Type string</p>

Field Name	Details
	<p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description Auto-generated number identifying the associated location.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date the associated location was last modified.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date the associated location was last viewed.</p>
LocationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The location associated with the address.</p>
ParentRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The account associated with the location.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Picklist of address types. The values are:</p> <ul style="list-style-type: none"> • Bill To • Ship To

AsyncApexJob

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ApexClassID	<p>Type reference,</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the Apex class executing the job. Label is <code>Class ID</code>.</p>
CompletedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the job was completed.</p>
ExtendedStatus	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If one or more errors occurred during the batch processing, this contains a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the last user who modified the batch class. This field is available in API version 19.0 and later.</p>
JobItemsProcessed	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of job items processed. Label is <code>Batches Processed</code>.</p>

Field Name	Details
JobType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of job being processed. Valid values are:</p> <ul style="list-style-type: none"> • Future • SharingRecalculation • ScheduledApex • BatchApex • BatchApexWorker • TestRequest • TestWorker • ApexToken • Queueable
MethodName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the Apex method being executed. Label is <code>Apex Method</code>.</p>
NumberOfErrors	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Total number of batches with a failure. A batch is considered transactional, so any unhandled exceptions constitute an entire failure of the batch. Label is <code>Failures</code>.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status of the job. Valid values are:</p> <ul style="list-style-type: none"> • Holding¹ • Queued • Preparing

Field Name	Details
	<ul style="list-style-type: none"> Processing Aborted Completed Failed <p>¹ This status applies to batch jobs in the Apex flex queue.</p>
TotalJobItems	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Total number of batches processed. Each batch contains a set of records. Label is <code>Total Batches</code>.</p>

Usage

Use this object to query Apex batch jobs in your organization.

AttachedContentDocument

This read-only object contains all `ContentDocument` objects associated with an object.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the attached <code>ContentDocument</code>.</p>
ContentSize	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes.</p>
ContentUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the <code>FileType</code>. This field is available in API version 31.0 and later.</p>
ExternalDataSourceName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 32.0 and later.</p>
ExternalDataSourceType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Type of external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 35.0 and later.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the attached <code>ContentDocument</code>. This field is available in API version 31.0 and later.</p>

Field Name	Details
FileType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of document, determined by the file extension.</p>
LinkedEntityId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the record the <code>ContentDocument</code> is attached to.</p>
SharingOption	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Title of the attached <code>ContentDocument</code>.</p>

Usage

Use this object to list all `ContentDocument` objects attached to an object via a feed post.

To retrieve `ContentDocument` objects, issue a describe call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

AttachedContentNote

This read-only object contains all ContentNote objects associated with an object. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

- Notes must be enabled.
- Chatter must be enabled.

Fields

Field Name	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the attached ContentNote</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the note in bytes.</p>
<code>FileExtension</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the attached ContentNote.</p>
<code>FileType</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Type of file for the note. All notes have a file type of <code>SNOTE</code>.</p>
LinkedEntityId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of the record the <code>ContentNote</code> is attached to.</p>
TextPreview	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>A preview of the note, up to 255 characters.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Title of the note.</p>

Usage

Use this object to list all `ContentNote` objects attached to an object.

To retrieve `ContentNote` objects, issue a `describe` call on an object, which returns a query result for each note created or attached. You can't directly query this object.

Attachment

Represents a file that a User has uploaded and attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Body	<p>Type base64</p> <p>Properties Create, Update</p> <p>Description Required. Encoded file data.</p>
BodyLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the file (in bytes).</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
ContentType	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The content type of the attachment.</p> <p>If the <code>Don't allow HTML uploads as attachments or document records</code> security setting is enabled for your organization, you cannot upload files with</p>

Field	Details
	<p>the following file extensions: <code>.htm</code>, <code>.html</code>, <code>.htt</code>, <code>.htx</code>, <code>.mhtm</code>, <code>.mhtml</code>, <code>.shtm</code>, <code>.shtml</code>, <code>.acgi</code>, <code>.svg</code>.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the attachment. Maximum size is 500 characters. This field is available in API version 18.0 and later.</p>
IsEncrypted	<p> Note: This information is about Shield Platform Encryption and not Classic Encryption.</p> <p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the attachment is encrypted using Shield Platform Encryption (<code>true</code>) or not (<code>false</code>). This field is available in API version 34.0 and later.</p>
IsPartnerShared	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Update</p> <p>Description Indicates whether this record is shared with a connection using Salesforce to Salesforce. Label is <code>Is Shared With Partner</code>.</p>
IsPrivate	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this record is viewable only by the owner and administrators (<code>true</code>) or viewable by all otherwise-allowed users (<code>false</code>). During a create or update call, it is possible to mark an Attachment record as private even if you are not the owner. This can result in a situation in which you can no longer access the record that you just inserted or updated. Label is Private. Attachments on tasks or events can't be marked private.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Name of the attached file. Maximum size is 255 characters. Label is File Name.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the User who owns the attachment. This field was required previous to release 9.0. Beginning with release 9.0, it can be null on create. The owner of an attachment on a task or event must be the same as the owner of the task or event.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the parent object of the attachment. The following objects are supported as parents of attachments:</p> <ul style="list-style-type: none"> • Account • Asset • Campaign • Case • Contact • Contract • Custom objects • EmailMessage • EmailTemplate • Event • Lead • Opportunity • Product2 • Solution • Task

-  **Note:** If you are importing Attachment data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. For example, for compliance reasons, you may prefer to set the `CreatedDate` to the date the record was originally created in your system, rather than the date it was imported into Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

The API sends and receives the binary file attachment data encoded as a `base64Binary` data type. Prior to creating a record, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

The create call restricts these files to a maximum size of 25 MB. For a file attached to a Solution, the limit is 1.5 MB. The maximum email attachment size is 3 MB.

The API supports attachments on email in create, delete, or update calls. The query call does not return attachments parented by email, unless the user performing the query has the "Modify All Data" permission.

 **Note:**

- Attachment records are not searched during text searches.
- When issued by an administrator, the query results include Attachment records from the Recycle Bin.
- When issued by a non-administrator, the `queryAll()` call results do not include Attachment records from the Recycle Bin.

Access to fields depends on the method being used:

- All of the fields are accessible using the `describeSObjects()` and `query()` calls. With the `create()` call, you can insert the `Name`, `ParentId`, `Body`, `IsPrivate`, and `OwnerId` fields.
- To modify existing records, the `update()` call gives you access to change the `Name`, `Body`, `IsPrivate`, and `OwnerId` fields.
- You can access all of the fields using a `query()` call. However, you can't receive the `Body` field for multiple records in a single `query()` call. If your query returns the `Body` field, your client application must ensure that only one row with one Attachment is returned; otherwise, an error occurs. A more effective approach is to return IDs (but not Attachment records in the `Body` field) from a `query()` call and then pass them into `retrieve()` calls that return the `Body` field.
- For information about accessing the attachments of archived activities, see Archived Activities.

SEE ALSO:

[Note](#)

AuraDefinition

Represents a Lightning definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AuraDefinitionBundleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the bundle containing the definition. A bundle contains a Lightning definition and all its related resources.</p>
DefType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The definition type. Valid values are:</p> <ul style="list-style-type: none"> • APPLICATION — Lightning Components app • CONTROLLER — client-side controller • COMPONENT — component markup • EVENT — event definition • HELPER — client-side helper • INTERFACE — interface definition • RENDERER — client-side renderer • STYLE — style (CSS) resource • PROVIDER — reserved for future use • MODEL — deprecated, do not use • TESTSUITE — reserved for future use • DOCUMENTATION — documentation markup • TOKENS — tokens collection • DESIGN — design definition • SVG — SVG graphic resource
Format	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The format of the definition. Valid values are:</p> <ul style="list-style-type: none"> • XML for component markup

Field Name	Details
	<ul style="list-style-type: none"> • JS for JavaScript code • CSS for styles
Source	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The contents of the Lightning definition. This is all the markup or code for the definition.</p>

Usage

For more information, see the [Lightning Components Developer Guide](#).

AuraDefinitionBundle

Represents a Lightning definition bundle, such as a component or application bundle. A bundle contains a Lightning definition and all its related resources. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The API version for this bundle. Every bundle has an API version specified at creation.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The text description of the bundle. Maximum size of 255 characters.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The language of the MasterLabel.</p>
MasterLabel	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Master label for the Lightning bundle. This internal label doesn't get translated.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.</p> <p>The namespace prefix can have one of the following values:</p>

Field Name	Details
	<ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

Usage

For more information, see the [Lightning Components Developer Guide](#).

AuthConfig

Represents authentication options for a community or custom domain that was created by using My Domain. This object is available in API version 32.0 and later.

The fields for this object control the login options that show up on the login page for users of a community or custom domain.

- Logging in with a username and password
- Using SAML for single sign-on
- Authentication provider logins from a third-party service, such as Facebook or Twitter

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

Fields

Field Name	Details
<code>AuthOptionsAuthProvider</code>	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>If <code>true</code>, at least one Auth. Provider is selected to show up on the login page, and this object has child <code>AuthConfigProvider</code> objects for each provider.</p>
<code>AuthOptionsSaml</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description</p> <p>If <code>true</code>, at least one SAML configuration is selected to show up on the login page. If the organization has only one SAML configuration, this value indicates whether that configuration is selected to show up on the login page. If the organization has multiple SAML configurations, see the child <code>AuthConfigProvider</code> objects for each configuration.</p>
<code>AuthOptionsUsernamePassword</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description</p> <p>If <code>true</code>, the login option for a username and password appears on the login page.</p>
<code>DeveloperName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description</p> <p>The name of the domain created using My Domain or, for communities, a concatenated string of <code>community name_community prefix</code>.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Whether this configuration is in use.</p>
<code>Language</code>	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language for the organization.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The text that's used to identify the Visualforce page in Setup.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The organization type for this object.</p> <ul style="list-style-type: none"> • <code>Org</code> (includes custom domains) • <code>Community</code> • <code>Site</code>

Field Name	Details
	<ul style="list-style-type: none"> Portal
Url	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The login URL of the organization for this AuthConfig object. Each URL has only one associated AuthConfig object.</p>

AuthConfigProviders

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

This object links the authentication configuration for an organization to the Auth.Provider through the `AuthOptionsAuthProvider` field of the AuthConfig object. The login page of a Community or custom domain that was created by using My Domain can allow multiple SAML configurations and multiple authentication providers. These configurations can be set to show up as buttons on the login page. Each configuration has an AuthConfigProvider object.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

Fields

Field Name	Details
AuthConfigId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID for this configuration.</p>
AuthProviderId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The ID of the Auth. Provider or SAML configuration.</p>

AuthProvider

Represents an authentication provider in your org.

An authentication provider enables users to log in to your Salesforce org using their login credentials from an external service provider, such as Facebook[®] or Janrain[®].

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the “Customize Application” and “Manage AuthProviders” permissions can access this object.

Fields

Field Name	Details
AuthorizeUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required, but only if <code>ProviderType</code> is <code>OpenIdConnect</code>. The OAuth authorization endpoint URL. Used only with OpenID Connect authentication providers. Available in API version 29.0 and later.</p>
ConsumerKey	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required. The app’s key that is registered at the third-party Single Sign-On provider.</p>

Field Name	Details
ConsumerSecret	<p>Type string</p> <p>Properties Create, Nillable</p> <p>Description Required. The consumer secret of the app that is registered at the third-party Single Sign-On provider. This field cannot be updated. When using <code>create()</code> this field must be encrypted. To create an encrypted form of the consumer secret from plain text:</p> <ol style="list-style-type: none"> 1. Create an authentication provider with the ConsumerSecret plain text value. 2. Save the authentication provider. 3. Create an outbound change set that includes the authentication provider component. <p>The new change set .xml file has an entry in the form <code><consumerSecret>+XYZ+</consumerSecret></code> where <code>+XYZ+</code> is the encrypted secret.</p>
CustomMetadataTypeRecord	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required, but only with custom authentication provider plug-ins, when <code>ProviderType</code> is <code>Custom</code>. The API name of the authentication provider. Available in API version 36.0 and later.</p>
DefaultScopes	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required, but only if <code>ProviderType</code> is <code>OpenIdConnect</code>. The scopes to be sent with the authorization request, if not specified when a flow is started. Used only with OpenID Connect authentication providers. Available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Required. Used when referring to the authentication provider from a program.</p>
ErrorUrl	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A custom error URL for the authentication provider to use to report any errors.</p>
ExecutionUserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The user that runs the Apex handler class. The user must have the “Manage Users” permission. A user is required when you specify a registration handler class.</p>
FriendlyName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. A user-friendly name for the provider.</p>
IconUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The path to an icon to use as a button on the login page. Users click the button to log in with the associated authentication provider.</p>
IdTokenIssuer	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Only available if <code>ProviderType</code> is <code>OpenIdConnect</code>. This value identifies the source of the authentication token in the form <code>https: URI</code>. Used only</p>

Field Name	Details
	<p>with OpenID Connect authentication providers. If provided, Salesforce validates the returned <code>id_token</code> value. The OpenID Connect specification requires an <code>id_token</code> value to be returned with the <code>access_token</code> value. Available in API version 30.0 and later.</p>
LogoutUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Provides a specific destination for users after they log out if they authenticated using social sign-on. The URL must be fully qualified with an <code>http</code> or <code>https</code> prefix, such as <code>https://acme.my.salesforce.com</code>. Available in API version 33.0 and later.</p>
OptionsIncludeOrgIdInId	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Includes the organization ID to differentiate between users with the same user ID from two sources (such as two sandboxes). Only available for Salesforce authentication providers. Once set to <code>true</code>, it can't be set to <code>false</code>. Available in API version 32.0 and later.</p>
OptionsSendAccessTokenInHeader	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Required only if <code>ProviderType</code> is <code>OpenIdConnect</code>. When <code>true</code>, the access token is sent to the <code>UserInfoUrl</code> in a header instead of a query string. Used only with OpenID Connect authentication providers. Available in API version 30.0 and later.</p>
OptionsSendClientCredentialsInHeader	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Required only if <code>ProviderType</code> is <code>OpenIdConnect</code>. When <code>true</code>, the client credentials are sent in a header, instead of a query string, to the <code>tokenUrl</code>.</p>

Field Name	Details
	<p>The credentials are in the standard OpenID Connect Basic Credentials header form, which is <code>Basic <token></code>, where <code><token></code> is the base64-encoded string <code>"clientkey:clientsecret"</code>. Used only with OpenID Connect authentication providers. Available in API version 30.0 and later.</p>
ProviderType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. The third-party Single Sign-On provider to use. Valid values are:</p> <ul style="list-style-type: none"> • Facebook • Salesforce • Janrain • LinkedIn (Available in API version 32.0 and later.) • Twitter (Available in API version 32.0 and later.) • OpenIdConnect (Available in API version 29.0 and later.) <p> Note: This type requires values for the following fields:</p> <ul style="list-style-type: none"> - AuthorizeUrl - DefaultScopes - TokenUrl - UserInfoUrl <ul style="list-style-type: none"> • MicrosoftACS Microsoft Access Control Service typically provides authentication for a Microsoft Office 365 service like SharePoint® Online. (Available in API version 31.0 and later.) • GitHub—Use the GitHub provider to log in users of your Lightning Platform app to GitHub using OAuth. When logged in to GitHub, your app can make calls to GitHub APIs. The GitHub provider isn't available as a single sign-on provider, so users can't log in to your Salesforce org using their GitHub login credentials. (Available in API version 35.0 and later.) • Custom (Available in API version 36.0 and later.)
PluginId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An existing Apex class that extends the <code>Auth.AuthProviderPluginClass</code> abstract class. Available in API version 39.0 and later.</p>

Field Name	Details
RegistrationHandlerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An existing Apex class that implements the <code>Auth.RegistrationHandler</code> interface.</p>
TokenUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required, but only if <code>ProviderType</code> is <code>OpenIdConnect</code>. The OAuth token endpoint URL. Used only with OpenID Connect authentication providers. Available in API version 29.0 and later.</p>
UserInfoUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Required, but only if <code>Provider-type</code> is <code>OpenIdConnect</code>. The OpenID Connect endpoint URL. Used only with OpenID Connect authentication providers. Available in API version 29.0 and later.</p>

AuthSession

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
CreatedDate	<p>Type dateTime</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter, Sort</p> <p>Description The date and time this session was created. This field is a standard system field.</p>
IsCurrent	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If <code>true</code>, the session is a member of the user's current session family. This field is available in API version 37.0 and later.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description The date and time this session was last updated. A session expires when the current date and time equals <code>LastModifiedDate + NumSecondsValid</code>. This field is a standard system field.</p>
LoginGeoId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The 18-character ID for the record of the geographic location of the user for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary. This field is available in API version 34.0 and later.</p>
LoginHistoryId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The 18-character ID for a successful login event. When a session is reused, Salesforce updates the <code>LoginHistoryId</code> with the value from the most recent login. This field is available in API version 33.0 and later.</p>

Field Name	Details
LoginType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of login, for example, Application.</p>
LogoutUrl	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The page or view to display after users log out of a community, or an organization if they authenticated using SAML. This field is available in API version 32.0 and later.</p>
NumSecondsValid	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of seconds before the session expires, starting from the last update time.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn't have a parent, this value is the current session's own ID.</p>
SessionSecurityLevel	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Standard or High, depending upon the authentication method used.</p>
SessionType	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of session. Common ones are UI, Content, API, and Visualforce.</p>
SourceIp	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description IP address of the end user's device from which the session started. This address can be an IPv4 or IPv6 address.</p>
UserType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The kind of user for this session. Types include Standard, Partner, Customer Portal Manager, High Volume Portal, and CSN Only.</p>
UsersId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The user's Salesforce user ID.</p>

Usage

The AuthSession object exposes session data and enables read and delete operations on that data. For example, use this object to create a report showing who is signed in to your organization, or to create a tool to delete a session, ending that user's session. For a user, only their own sessions are available, while administrators can see all sessions.

You can't change user sessions with this object. You can only read and delete them.

BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Error	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The error message for the operation. Applies only if the operation has an error status.</p>
ExecutionGroup	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the execution group.</p>
ExpiresAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description After this time, the operation is removed from the asynchronous job queue. Applies only if the operation has a status of complete, canceled, error, or merged.</p>
FinishedAt	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description When the operation reached the status of completed or error.</p>
GroupLeaderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the operation that's selected as the leader of the execution group.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, idLookup, Sort</p> <p>Description</p> <p>Identifies the background operation.</p>
NumFollowers	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Number of other operations that are in the execution group.</p>
ParentKey	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, idLookup, Nillable, Sort</p> <p>Description</p> <p>Tag that identifies related sets of operations, if any.</p>
ProcessAfter	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The operation is scheduled to be processed after this time.</p>
RetryBackoff	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field Name

Details

Description

Applies only if the operation has an error status. The first retry is attempted immediately. Each subsequent retry is increasingly delayed according to an exponential expression that's multiplied by the `RetryBackoff`, in milliseconds.

Specifically, the delay time is $(2^n - 1) \times R$, where n is the `RetryCount`, and R is the `RetryBackoff`.

The default value for `RetryBackoff` depends on the type of operation. For example, the `RetryBackoff` default for write operations on external objects is 1,000 milliseconds. For write operations, retries are attempted immediately, after 3 seconds, after 7 seconds, after 15 seconds, and so on.

RetryCount

Type

int

Properties

Filter, Group, Nillable, Sort

Description

Number of attempted retries. Applies only if the operation has an error status.

RetryLimit

Type

int

Properties

Filter, Group, Nillable, Sort

Description

Maximum number of retries to attempt. Applies only if the operation has an error status.

SequenceGroup

Type

string

Properties

Filter, Group, Nillable, Sort

Description

Identifies the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.

SequenceNumber

Type

int

Properties

Filter, Group, Nillable, Sort

Field Name	Details
	<p>Description</p> <p>Order position within the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.</p>
StartedAt	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>When the operation started running.</p>
Status	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Status of the background operation. The options are:</p> <ul style="list-style-type: none"> • New • Scheduled • Canceled • Merged • Waiting • Running • Error • Complete
SubmittedAt	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>When the operation was added to the job queue.</p>
Timeout	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Maximum time in milliseconds to wait for results after the operation started running.</p>
WorkerUri	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, idLookup, Nillable, Sort</p> <p>Description</p> <p>URI of the worker that performed the operation.</p> <p>Example for a Salesforce Connect OData operation:</p> <pre>services/data/v35.0/xds/upsert</pre>

Usage

The BackgroundOperation object lets you:

- Monitor the job status of asynchronous operations.
- View errors that are related to the asynchronous operations.
- Extract statistics for the asynchronous job queue.

BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

Each instance of `BackgroundOperationResult` represents one error. The `Message` field stores the text of the error message. The `ParentID` field stores the:

- job ID of the query, in case of Async SOQL
- batch ID for the data import, in case of Bulk API

Bulk API validates data at the time of import, and generates an error message for the first occurrence of invalid data in any row of the data file. The validation performed depends on the type of data being imported.

- **Text**—The length of the input string must be less than or equal to the length of the corresponding text field in the target object.
- **Number**—The input data must be a number, whose scale and precision are compatible with the corresponding number field in the target object.
- **ID**—The input data must be a valid 15- or 18-character ID.
- **DateTime**—The input data must be a valid dateTime value, in the approved format.
- **Lookup**—The lookup value must be a valid 15- or 18-character ID.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
CreatedById	<p>Type ID</p> <p>Properties Nillable</p> <p>Description The user ID of the user initiating the Bulk API or Async SOQL request.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create</p> <p>Description The date and time at which the Bulk API or Async SOQL request was made.</p>
Data	<p>Type string</p> <p>Properties Nillable</p> <p>Description The data that generated the error message. The total length is limited to 2,000 characters, and each column can occupy a maximum of 50 characters. Any data exceeding those limits is truncated.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, idLookup</p> <p>Description The ID of the error message.</p>
Message	<p>Type string</p> <p>Properties Nillable</p> <p>Description The text of the error message.</p>

Field Name	Details
MessageType	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description The type of error message. The possible values are: ERROR, WARNING, or INFO.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Sort</p> <p>Description The batch ID, in case of Bulk API, or the job ID, in case of Async SOQL.</p>

Usage

You can check for errors by querying the `BackgroundOperationResult` object. For example, this query returns details of all errors in a data file imported using Bulk API, whose batch ID is `751xx0000000060AAQ`.

```
SELECT CreatedById, CreatedDate, Id, Message, MessageType, ParentId FROM
BackgroundOperationResult WHERE ParentId = "751xx0000000060AAQ"
```

 **Note:** You can only view errors resulting from Async SOQL or Bulk API requests that you initiated, unless you have the global permission to view all data.

Bookmark

Represents a link between opportunities that share common information.

This object is available to organizations with the Similar Opportunities feature enabled.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ID	<p>Type ID</p> <p>Properties Defaulted on create, Filter</p>

Field	Details
	<p>Description ID of the bookmark. Label is Bookmark ID.</p>
FromId	<p>Type ID</p> <p>Properties Filter</p> <p>Description The originating opportunity. Label is Bookmarked From ID</p>
ToId	<p>Type ID</p> <p>Properties Filter</p> <p>Description The opportunity to which the originating opportunity is linked. Label is Bookmarked To ID.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>

Usage

The Bookmark object works with the Opportunity object only.

Use this read-only object to query the bookmarks between opportunities in your organization. In the online application, users can search for opportunities that share attributes with their opportunity. The user can then bookmark the appropriate opportunities for future reference.

BrandTemplate

Letterhead for HTML EmailTemplate.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the letterhead. Limited to 1000 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Letterhead Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the letterhead is available for use (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the template as it appears in the user interface. Limited to 255 characters. Label is Brand Template Name.</p>

Field	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects. <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p>
Value	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The contents of the letterhead, in HTML, including any logos.</p>

Usage

Use this object to brand EmailTemplate records with your letterhead. You can also set a brand template to active or inactive. For example, if you have five different marketing brands, you can maintain each different brand in one template, and assign to the appropriate EmailTemplate.

[EmailTemplate](#)

BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

If business hours are associated with any Holiday records, then business hours and escalation rules associated with business hours are suspended during the dates and times specified as holidays.

Supported Calls

`create()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`, `describeLayout()`, `search()`

Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view business hours via the API.

Fields

Field	Details
<code>BusinessHoursId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the BusinessHours associated with the SlaProcess.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the business hours is active (<code>true</code>) or not active (<code>false</code>).</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description The name of the business hours.</p>
<code>IsDefault</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the business hours are set as the default business hours (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the business hours were last viewed.</p>
FridayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
FridayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
MondayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
MondayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
SaturdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>

Field	Details
SaturdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
SundayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
SundayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
ThursdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
ThursdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
TimeZoneSidKey	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The time zone of the business hours.</p>

Field	Details
TuesdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
TuesdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>
WednesdayEndTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business closes.</p>
WednesdayStartTime	<p>Type time</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Time that business opens.</p>

Usage

Use this object to specify the business hours at which your support team operates. Escalation rules only run during the business hours with which they are associated. To set business hours to 24-hours a day, set the times from midnight to midnight (00:00:00 ~ 00:00:00) on each day.

By default, business hours are set from 12:00 AM to 12:00 AM in the default time zone specified in your organization's profile.

SEE ALSO:

[Object Basics](#)

BusinessProcess

Represents a business process.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users cannot access this object.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of this business process. Limit: 255 characters.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this business process can be presented to users in the Salesforce user interface (<code>true</code>) or not (<code>false</code>) when creating a new record type or changing the business process of an existing record type.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Name of this business process. Limit: 80 characters.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
TableEnumOrId	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Required. One of the following values: Case, Opportunity, or Solution. Label is Entity Enumeration Or ID.</p>

Usage

Use the `BusinessProcess` object to offer different subsets of picklist values to different users for the `LeadStatus`, `CaseStatus`, and `OpportunityStage` fields. Similar to a `RecordType`, a `BusinessProcess` identifies the type of a row in a Case, Lead, or Opportunity and implies a subset of picklist values for these three fields. The values for the remaining picklist fields are driven off of `RecordType`.

SEE ALSO:

[Object Basics](#)

CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AdapterURL	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description An optional field that specifies the location of where the CTI adapter is hosted. For example, <code>http://localhost:11000</code>. This field is available in API version 23.0 or later.</p>
CustomSettings	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Specifies settings in the call center definition file, such as whether the call center uses the Open CTI, and SoftPhone properties, such as height in pixels. This field is available for Open CTI and in API version 25.0 or later.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter</p> <p>Description System field that uniquely identifies this call center. Label is Call Center ID. This ID is created automatically when the call center is created.</p>
InternalName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The internal name of the call center. Limit is 80 characters.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The name of the call center. Limit is 80 characters.</p>
Version	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The version of the CTI Toolkit used to create the call center (for versions 2.0 and later). This field is available in API version 18.0 and later.</p>

Usage

Create a call center or query an existing call center.

Campaign

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ActualCost	<p>Type currency</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Amount of money spent to run the campaign.</p>
AmountAllOpportunities	<p>Type currency</p> <p>Properties Filter, Sort</p> <p>Description Amount of money in all opportunities associated with the campaign, including closed/won opportunities. Label is Value Opportunities in Campaign.</p>
AmountWonOpportunities	<p>Type currency</p> <p>Properties Filter, Sort</p> <p>Description Amount of money in closed or won opportunities associated with the campaign. Label is Value Won Opportunities in Campaign.</p>
BudgetedCost	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Amount of money budgeted for the campaign.</p>
CampaignImageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the campaign image. Available in API version 42.0 and later.</p>
CampaignMemberRecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record type ID for CampaignMember records associated with the campaign.</p>

Field	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Restricted picklist, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the campaign. Limit: 32 KB. Only the first 255 characters display in reports.</p>
EndDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Ending date for the campaign. Responses received after this date are still counted.</p>
ExpectedResponse	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Percentage of responses you expect to receive for the campaign.</p>
ExpectedRevenue	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Amount of money you expect to generate from the campaign.</p>
HierarchyActualCost	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description Calculated field for the total amount of money spent to run the campaigns in a campaign hierarchy. Label is Total Actual Cost in Hierarchy.</p>
HierarchyBudgetedCost	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Calculated field for the total amount of money budgeted for the campaigns in a campaign hierarchy. Label is Total Budgeted Cost in Hierarchy.</p>
HierarchyExpectedRevenue	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Calculated field for the total amount of money you expect to generate from the campaigns in a campaign hierarchy. Label is Total Expected Revenue in Hierarchy.</p>
HierarchyNumberSent	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for the total number of individuals targeted by the campaigns in a campaign hierarchy. For example, the number of email messages sent. Label is Total Num Sent in Hierarchy.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this campaign is active (<code>true</code>) or not (<code>false</code>). Default value is <code>false</code>. Label is Active.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastReferencedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Required. Name of the campaign. Limit: is 80 characters.</p>
NumberOfContacts	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Number of contacts associated with the campaign. Label is Total Contacts.</p>
NumberOfConvertedLeads	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Number of leads that were converted to an account and contact due to the marketing efforts in the campaign. Label is Converted Leads.</p>

Field	Details
NumberOfLeads	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of leads associated with the campaign. Label is Leads in Campaign.</p>
NumberOfOpportunities	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of opportunities associated with the campaign. Label is Opportunities in Campaign.</p>
NumberOfResponses	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of contacts and unconverted leads with a Member Status equivalent to "Responded" for the campaign. Label is Responses in Campaign.</p>
NumberOfWonOpportunities	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number of closed or won opportunities associated with the campaign. Label is Won Opportunities in Campaign.</p>
NumberSent	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Number of individuals targeted by the campaign. For example, the number of emails sent. Label is Num Sent.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description ID of the user who owns this campaign. Default value is the user logging in to the API to perform the create.</p>
ParentCampaign	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The campaign above the selected campaign in the campaign hierarchy.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the parent Campaign record, if any.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Starting date for the campaign.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Status of the campaign, for example, Planned, In Progress. Limit: 40 characters.</p>
TotalAmountAllOpportunities	<p>Type currency</p>

Field	Details
	<p>Properties Filter</p> <p>Description Calculated field for total amount of all opportunities associated with the campaign hierarchy, including closed/won opportunities. Label is Total Value Opportunities in Hierarchy.</p>
TotalAmountAllWonOpportunities	<p>Type currency</p> <p>Properties Filter</p> <p>Description Calculated field for amount of all closed/won opportunities associated with the campaign hierarchy. Label is Total Value Won Opportunities in Hierarchy.</p>
TotalNumberOfContacts	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for number of contacts associated with the campaign hierarchy. Label is Total Contacts in Hierarchy.</p>
TotalNumberOfConvertedLeads	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for the total number of leads associated with the campaign hierarchy that were converted into accounts, contacts, and opportunities. Label is Total Converted Leads in Hierarchy.</p>
TotalNumberOfLeads	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for total number of leads associated with the campaign hierarchy. This number also includes converted leads. Label is Total Leads in Hierarchy.</p>
TotalNumberOfOpportunities	<p>Type int</p>

Field	Details
	<p>Properties Filter</p> <p>Description Calculated field for the total number of opportunities associated with the campaign hierarchy. Label is Total Opportunities in Hierarchy.</p>
TotalNumberOfResponses	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for number of contacts and unconverted leads that have a <code>Member Status</code> equivalent to "Responded" for the campaign hierarchy. Label is Total Responses in Hierarchy.</p>
TotalNumberOfWonOpportunities	<p>Type int</p> <p>Properties Filter</p> <p>Description Calculated field for the total number of won opportunities associated with the campaign hierarchy. Label is Total Won Opportunities in Hierarchy.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of campaign, for example, Direct Mail or Referral Program. Limit: 40 characters.</p>

Usage

Client applications can create, update, delete, and query Attachment records associated with a campaign via the API.

The Campaign object is defined only for those organizations that have the marketing feature enabled and valid marketing licenses. In addition, it is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the Campaign object.

 **Note:** The main constituent of a campaign is a CampaignMember. You will commonly need to update campaigns with CampaignMember.

[Object Basics](#)

CampaignFeed

Represents a single feed item in the feed on a campaign record detail page. This object is available in API version 18.0 and later.

A campaign feed shows recent changes to a campaign record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to campaigns.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Campaign object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of CampaignFeed. Required when Type is TextPost. Optional when Type is ContentPost or LinkPost. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p>

Field	Details
	<p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
<code>ConnectionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator and the <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
<code>ContentData</code>	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type</p> <p>int</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Defaulted on create, Filter, Sort</p> <p>Description</p> <p>Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only.</p> <p>ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type</p> <p>reference</p>

Field	Details
	<p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field. When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>. Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default <code>community</code>, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization. <code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community.

Field	Details
	<ul style="list-style-type: none"> • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> • Only feed items with a <code>Group</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. • You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the campaign record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>
<code>Title</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <code>Task</code> or <code>Event</code> associated with a case record (excluding email and call logging).

Field	Details
	<p>For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.</p> <ul style="list-style-type: none"> • AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • AnnouncementPost—Not used. • ApprovalPost—generated when a user submits an approval. • BasicTemplateFeedItem—Not used. • CanvasPost—a post made by a canvas app posted on a feed. • CollaborationGroupCreated—generated when a user creates a public group. • CollaborationGroupUnarchived—Not used. • ContentPost—a post with an attached file. • CreatedRecordEvent—generated when a user creates a record from the publisher. • DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold. • DashboardComponentSnapshot—created when a user posts a dashboard snapshot on a feed. • LinkPost—a post with an attached URL. • PollPost—a poll posted on a feed. • ProfileSkillPost—generated when a skill is added to a user’s Chatter profile. • QuestionPost—generated when a user posts a question. • ReplyPost—generated when Chatter Answers posts a reply. • RypplePost—generated when a user creates a Thanks badge in Work.com. • TextPost—a direct text entry on a feed. • TrackedChange—a change or group of changes to a tracked field. • UserStatus—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • CaseCommentPost—generated event when a user adds a case comment for a case object • EmailMessageEvent—generated event when an email related to a case object is sent or received • CallLogPost—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • ChangeStatusPost—generated event when a user changes the status of a case • AttachArticleEvent—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Field	Details
Visibility	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>Visibility can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for a campaign record.

SEE ALSO:

- [Campaign](#)
- [EntitySubscription](#)
- [NewsFeed](#)
- [UserProfileFeed](#)

CampaignHistory

Represents the history of changes to the values in the fields of a campaign. This object is available in versions 40.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
CampaignId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the campaign. Label is Campaign ID.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to a campaign.

This object respects field level security on the parent object.

CampaignInfluence

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

 **Note:** This information applies only to [Customizable Campaign Influence](#) and not to [Campaign Influence 1.0](#).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
CampaignId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated campaign.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the contact on the associated opportunity.</p>
Influence	<p>Type percent</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Sort, Update</p> <p>Description The percentage of the associated opportunity's Amount field attributed to the associated campaign.</p>
ModelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the campaign influence model associated with the record.</p>
OpportunityId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated opportunity.</p>
RevenueShare	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The amount of revenue from the associated opportunity attributed to the associated campaign.</p>

Usage

Use this object to create campaign influence records for your custom campaign influence models. Do not create campaign influence records for the Primary Campaign Source model. Records added to the Primary Campaign Source model via the API are deleted when the model is recalculated.

CampaignInfluenceModel

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

 **Note:** This information applies only to [Customizable Campaign Influence](#) and not to [Campaign Influence 1.0](#).

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
DeveloperName	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The API name of the influence model. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is active. Active models can generate campaign influence records. Deactivating a model deletes its campaign influence records. Custom models are always active and this field is ignored.</p>
IsDefaultModel	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is the default model (<code>true</code>) or not (<code>false</code>). <code>CampaignInfluence</code> records associated with the default model appear in 3 locations.</p> <ul style="list-style-type: none"> • The Campaign Influence related list on opportunities • The Influenced Opportunities related list on campaigns • The Campaign Statistics section on campaigns <p>The value of <code>IsDefaultModel</code> can only be true for 1 model at a time.</p>
IsModelLocked	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the model is locked (<code>true</code>) or not (<code>false</code>). Records for locked models can only be added, updated, or deleted via the API.</p>

Field Name	Details
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the influence model.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label for the influence model.</p>
ModelDescription	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The description of the influence model.</p>
ModelType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates whether the model is the Primary Campaign Source influence model, or a custom model. These values are the allowed.</p> <ul style="list-style-type: none"> • 1: Primary Campaign Source model • 2: custom • 3: First Touch • 4: Last Touch • 5: Even Distribution
RecordPreference	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The value of this field determines when to create campaign influence records.</p> <ul style="list-style-type: none"> • AllRecords: Creates records regardless of the revenue attribution percentage.

Field Name	Details
	<ul style="list-style-type: none"> RecordsWithAttribution: Creates records only when the revenue attribution is greater than 0%.

CampaignMember

Represents the association between a campaign and either a lead or a contact.

Supported Calls

For API version 15.0 and earlier: `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

For API version 16.0 and later: `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CampaignId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Campaign to which this Lead or Contact is associated.</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The city for the address of the lead or contact.</p>
CompanyOrAccount	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The company or account of the lead or contact.</p>

Field	Details
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the Contact who is associated with a Campaign.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Restricted picklist, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The country for the address of the lead or contact.</p>
Description	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The description of the associated lead or contact.</p>
DoNotCall	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the contact does not wish to be called.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Email address for the contact or lead.</p>
Fax	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Fax number for the contact or lead.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The first name of the contact or lead.</p>
FirstRespondedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the date on which the campaign member was first given a responded status.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contact or lead would prefer not to receive email from Salesforce (<code>true</code>) or not (<code>false</code>).</p>
HasOptedOutOfFax	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the contact or lead does not wish to receive faxes.</p>
HasResponded	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the campaign member has responded to the campaign (<code>true</code>) or not (<code>false</code>). Label is Responded.</p>
LastName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The last name of the contact or lead.</p>
LeadId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the Lead who is associated with a Campaign.</p>
LeadOrContactId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the associated lead or contact.</p>
LeadOrContactOwnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the owner of the associated lead or contact.</p>
LeadSource	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The source from which the lead was obtained.</p>

Field	Details
MobilePhone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The mobile phone number of the lead or contact.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description First and last name of the contact or lead with which the campaign member is associated.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number of the lead or contact.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The postal code of the lead or contact.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object. To change the record type, modify the CampaignMemberRecordTypeId field on the associated Campaign.</p>
Salutation	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Salutation for the lead or contact.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The state for the address of the lead or contact.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Controls the <code>HasResponded</code> flag on this object. You can't directly set the <code>HasResponded</code> flag, as it is read-only, but you can set it indirectly by setting this field in a create or update call. Each predefined value implies a <code>HasResponded</code> flag value. Each time you update this field, you implicitly update the <code>HasResponded</code> flag. In the Salesforce user interface, Marketing users can define valid status values for the <code>Status</code> picklist. They can choose one status as the default status. For each <code>Status</code> field value, they can also select which values should be counted as "Responded," meaning that the <code>HasResponded</code> flag will be set to <code>true</code> for those values.</p> <p>40 character limit.</p> <p> Note: When creating or updating campaign members, use the text value for <code>Status</code> instead of the ID from the <code>CampaignMemberStatus</code> object.</p>
Street	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The street for the address of the lead or contact.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Title for the lead or contact.</p>

Field	Details
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the campaign member is a lead or a contact.</p>

 **Note:** If you are importing CampaignMember data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Each record has a unique ID, and must contain either a `ContactId` or a `LeadId`, but can't contain both. Any attempt to create a single record with both results in a successful insert but only the `ContactId` will be inserted. However, you can create two separate records on a Campaign—one for the Lead and one for the Contact.

Standard fields from a Contact or Lead are associated with the CampaignMember object but you can't query them directly. To include a lead's `Phone` in your query, for example, query the field from the Lead object.

```
SELECT Id, (SELECT Phone FROM Lead)
FROM CampaignMember
```

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the CampaignMember object.

In API version 16.0 and later, a `create()` call only creates a new record; in earlier versions, a `create()` call creates and updates records. The API determines whether a record exists with the specified `CampaignId` and either `ContactId` or `LeadId`.

 **Note:** Only use a `ContactId` or `LeadId`, but not both, unless you want to track lead-based campaign members you convert to contacts.

If the record does not exist for the given `ContactId` or `LeadId`, then a new record is created. If the record exists, an error is returned and no update is made. To update an existing record, specify the ID of the CampaignMember record to update.

In API versions 15.0 and earlier, if you submit multiple records using a single `create` request, and if more than one record matches an existing record, only the first record submitted updates the existing record. If any of the submitted records match each other but do not match existing records, only the last record submitted is created.

The `upsert()` call is not supported in API version 16.0 and later. To use the `upsert()` call on this object, you must first delete all data in ID fields except the record ID.

To delete a record, specify the ID of the CampaignMember record to delete.

When creating or updating records, the `Status` field value specified in the call is verified as a valid status for the given Campaign:

- If the specified `Status` value is a valid status, the value is updated, and the `HasResponded` field is updated to either `true` or `false`, depending on the `Status` value association with `HasResponded`.

- If the specified `Status` value is not a valid status, the API assigns the default status to the `Status` field and updates the `HasResponded` field with the associated value. However, if the given Campaign does not have a default status, the API assigns the value specified in the call to the `Status` field, and the `HasResponded` field is set to `false`.

[Campaign](#)

[CampaignMemberStatus](#)

CampaignMemberStatus

One or more member status values defined for a campaign.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

You can't delete a `CampaignMemberStatus` if that status is designated as the default status or if the status is currently used in a Campaign.

Fields

Field	Details
<code>CampaignId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the campaign associated with this member status.</p>
<code>HasResponded</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this status is equivalent to "Responded" (<code>true</code>) or not (<code>false</code>). Beginning with API version 39.0, at least one <code>CampaignMemberStatus</code> on each campaign must have a <code>hasResponded</code> value of <code>true</code>.</p>

Field	Details
IsDefault	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this status is the default status (<code>true</code>) or not (<code>false</code>). Beginning with API version 39.0, there must be a default CampaignMemberStatus defined for every campaign.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
Label	<p>Type string</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description Label for the status in the picklist. Limited to 765 characters.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update, Nillable</p> <p>Description Order where this campaign member status appears in the picklist.</p>

Usage

Use this object to create picklist items for the member status in a campaign.

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in a `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the CampaignMember object.

CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CampaignAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group, or UserRole. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With</p>

Field	Details
	<p>this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. A Campaign owned by a User in the source Group triggers the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for campaigns.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

CampaignShare

Represents a sharing entry on a Campaign.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
CampaignId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Campaign associated with this sharing entry. This field can't be updated.</p>
CampaignAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to the Campaign. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value is not valid for creating or updating records.) <p>This field must be set to an access level that is higher than the organization's default access level for Campaign.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Rule</code>—The User or Group has access via a Campaign sharing rule. • <code>Manual</code>—The User or Group has access because a User with "All" access manually shared the Campaign with them. • <code>Owner</code>—The User is the owner of the Campaign.

Field	Details
UserOrGroupId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Campaign. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view or edit Campaign records owned by other users.

CampaignTag

Associates a word or short phrase with a Campaign.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>

Field Name	Details
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

CampaignTag stores the relationship between its parent TagDefinition and the Campaign being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Case

Represents a case, which is a customer issue or problem.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the account associated with this case.</p>
BusinessHoursId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the business hours associated with this case.</p>
CaseNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description Assigned automatically when each case is inserted. It can't be set directly, and it can't be modified after the case is created.</p>
ClosedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the case was closed.</p>
CommunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Community (Zone) associated with this case. This field is available in API version 24.0 and later.</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Nillable</p>

Field	Details
	<p>Description</p> <p>ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Nillable</p> <p>Description</p> <p>ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
ContactEmail	<p>Type</p> <p>email</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Email address for the Contact. The Case.ContactEmail field displays the Email field on the contact on page 546 that is referenced by Case.ContactId. Label is <code>Contact Email</code>. This field is available in API version 38.0 and later.</p>
ContactFax	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Fax number for the Contact. Label is <code>Contact Fax</code>. This field is available in API version 38.0 and later.</p>
ContactId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>ID of the associated Contact.</p>
ContactMobile	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Mobile telephone number for the Contact. Label is <code>Contact Mobile</code>. This field is available in API version 38.0 and later.</p>
ContactPhone	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Telephone number for the Contact. Label is <code>Contact Phone</code>. This field is available in API version 38.0 and later.</p>
CreatorFullPhotoUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the user's profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the user's thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
Description	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p>

Field	Details
	<p>Description A text description of the case. Limit: 32 KB.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the question in Chatter associated with the case. This field is available in API version 33.0 and later, and is only accessible in organizations where Question-to-Case is enabled.</p>
HasCommentsUnreadByOwner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a case contains comments that the case owner hasn't read (<code>true</code>) or not (<code>false</code>).</p>
HasSelfServiceComments	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a case has comments added by a Self-Service user (<code>true</code>) or not (<code>false</code>).</p>
IsClosed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case is closed (<code>true</code>) or open (<code>false</code>). This field is controlled by the <code>status</code> field; it can't be set directly. Label is <code>Closed</code>.</p>
IsClosedOnCreate	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case was closed at the same time that it was created (<code>true</code>) or not (<code>false</code>). This flag is read-only and is automatically set when a record is created. It can't be set to <code>true</code> unless the <code>IsClosed</code> flag is also <code>true</code>.</p>

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <code>Deleted</code>.</p>
IsEscalated	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the case has been escalated (<code>true</code>) or not. A case's escalated state does not affect how you can use a case, or whether you can query, delete, or update it. You can set this flag via the API. Label is <code>Escalated</code>.</p>
IsSelfServiceClosed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case is closed for Self-Service users (<code>true</code>) or not (<code>false</code>).</p>
IsStopped	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether an entitlement process on a case is stopped (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInSelfService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the case can be viewed in the Customer Service Portal, Partner Service Portal, and Self-Service Portal (<code>true</code>) or not (<code>false</code>). This field is applied for case visibility in the Partner Relationship Management, Customer Service Portal, and the earlier version of Self Service Portal. The field does not alter sharing and will not prevent usage of a direct URL to a case if a portal user has read or write access.</p>

Field	Details
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Origin	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The source of the case, such as <code>Email</code>, <code>Phone</code>, or <code>Web</code>. Label is <code>Case Origin</code>.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the contact who owns the case.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the parent case in the hierarchy. The label is <code>Parent Case</code>.</p>
Priority	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The importance or urgency of the case, such as <code>High</code>, <code>Medium</code>, or <code>Low</code>.</p>
QuestionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The question in the answers community that is associated with the case. This field does not appear if you don't have an answers community enabled.</p>
Reason	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The reason why the case was created, such as <code>Instructions not clear</code>, or <code>User didn't attend training</code>.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
SlaStartDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Shows the time that the case entered an entitlement process. If you have the "Edit" permission on cases, you can update or reset the time if you have the "Edit" permission on cases. This field is available in API version 18.0 and later.</p>
SourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the social post source.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description The status of the case, such as "New," "Closed," or "Escalated." This field directly controls the <code>IsClosed</code> flag. Each predefined <code>Status</code> value implies an <code>IsClosed</code> flag value. For more information, see <code>CaseStatus</code>.</p>
StopStartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description The date and time an entitlement process was stopped on the case. This field is available in API version 18.0 and later.</p>
Subject	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The subject of the case. Limit: 255 characters.</p>
SuppliedCompany	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The company name that was entered when the case was created. This field can't be updated after the case has been created. Label is <code>Company</code>.</p>
SuppliedEmail	<p>Type email</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The email address that was entered when the case was created. This field can't be updated after the case has been created. Label is <code>Email</code>. If your organization has an active auto-response rule, <code>SuppliedEmail</code> is required when creating a case via the API. Auto-response rules use the email in the contact specified by <code>ContactId</code>. If no email address is in the contact record, the email specified here is used.</p>

Field	Details
SuppliedName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The name that was entered when the case was created. This field can't be updated after the case has been created. Label is <code>Name</code>.</p>
SuppliedPhone	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The phone number that was entered when the case was created. This field can't be updated after the case has been created. Label is <code>Phone</code>.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The type of case, such as <code>Feature Request</code> or <code>Question</code>.</p>

 **Note:** If you are importing Case data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use the Case object to manage cases for your organization. Client applications can query, update, and delete Attachment records associated with a case via the API.

Assignment Rules

When you query or update a case, your client application can have the case automatically assigned to one or more User records based on assignment rules that have been configured in the user interface. To use this feature, your client application must set either of the following options (but not both) in the `AssignmentRuleHeader` used in the create or update:

Field	Field Type	Details
<code>assignmentRuleId</code>	reference	ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is <code>true</code> , then the default assignment rule is used. To find the ID for a given

Field	Field Type	Details
		assignment rule, query the AssignmentRule object (specifying <code>RuleType="caseAssignment"</code>), iterate through the returned AssignmentRule objects, find the one you want to use, retrieve its ID, and then specify its ID in this field in the AssignmentRuleHeader.
<code>useDefaultRule</code>	boolean	Specifies whether to use the default rule for rule-based assignment (<code>true</code>) or not (<code>false</code>). The default rule is assigned by users in the Salesforce user interface.

For a code example that shows setting the AssignmentRuleHeader for a Lead (which is similar to setting the AssignmentRuleHeader for a Case), see [Lead](#).

Separating Accounts from Contacts in Cases

In releases before 8.0, the `AccountId` could not be specified, it was derived from the contact's account. This behavior will continue to be supported in future releases, but you can also now specify an `AccountId`. If you do not specify the `AccountId` during the creation of a case, the value will default to the contact's `AccountId`.

 **Note:** When a record is updated, if the `ContactId` has not changed, then the `AccountId` is not regenerated. This prevents the API from overwriting a value previously changed in the Salesforce user interface. However, if an API call changes the `ContactId` and the `AccountId` field is empty, then the `AccountId` is generated using the contact's account.

Using `_case` with Java

Depending on the development tool you use, you might need to write your application using `_case` instead of `Case`, because `case` is a reserved word in Java.

[CaseMilestone](#)

CaseArticle

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Special Access Rules

Access to this object is controlled by the parent Case and KnowledgeArticle. However, when querying, access is only controlled by the parent Case.

Customer Portal users can't access this object.

Fields

Field	Details
ArticleLanguage	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The language of the article associated with the case.</p>
ArticleVersionNumber	<p>Type int</p> <p>Properties Create, Group, Nillable</p> <p>Description The number assigned to a version of an article. This field is available in API version 24.0 and later.</p>
CaseId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the Case associated with the KnowledgeArticle.</p>
IsSharedByEmail	<p>Type int</p> <p>Properties Create, Group, Nillable</p> <p>Description Indicates that the article has been shared with the customer through an email.</p>
KnowledgeArticleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the KnowledgeArticle associated with the Case.</p>

Usage

This object represents the association of a knowledge article with a Case. An article is associated with a case when it's relevant to a specific issue, when it helps an agent solve the case, or when the agent sends the article to a customer.

You can use this object to include case-article associations in Apex and Visualforce.

You can't update this object via the API. If you attempt to create a record that matches an existing record, the create request simply returns the existing record.

SEE ALSO:

[Case](#)

[KnowledgeArticle](#)

CaseComment

Represents a comment that provides additional information about the associated Case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>CommentBody</code>	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Text of the CaseComment. The maximum size of the comment body is 4,000 bytes. Label is Body.</p>
<code>ConnectionReceivedId</code>	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
<code>ConnectionSentId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
CreatorFullPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>

Field	Details
IsPublished	<p>Type boolean</p> <p>Properties Defaulted on create, Create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the CaseComment is visible to customers in the Self-Service portal (<code>true</code>) or not (<code>false</code>). Label is Published. This is the only CaseComment field that can be updated via the API.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort,</p> <p>Description Required. ID of the parent Case of the CaseComment.</p>

 **Note:** If you are importing CaseComment data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

In the Salesforce user interface, comments are generally entered by a User working on a Case. All users have access to create and view CaseComment in the Salesforce user interface and when using the API. In the API, CaseComment records can't be modified after insertion unless the user has the "Modify All" object-level permission for Cases or the "Modify All Data" permission. If not, users can only update the `IsPublished` field, and can't delete CaseComment.

SEE ALSO:

[Object Basics](#)

CaseContactRole

Represents the role that a given Contact plays on a Case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CasesId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the cases associated with this contact.</p>
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the contact.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
Role	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name of the role played by the contact on this contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>ContractId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract.</p>

Usage

Use this object to define the role that a given Case plays on a given Contact. For example, you can use this object to be able to see all contacts who are associated to a case, or, given a contact, be able to query all cases that they are associated with, even if they are not the primary contact on the case.

CaseFeed

Represents a single feed item in the feed displayed on the detail page for a case record. A case feed shows recent changes to a case record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to cases. This object is available in API version 18.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Case object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the CaseFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your</p>

Field	Details
	<p>comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
<code>ConnectionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator and the <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
<code>ContentData</code>	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The file uploaded to the feed. Required if <code>Type</code> is <code>ContentPost</code>. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>

Field	Details
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter. Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. Use FeedItem instead.</p> <p>The ID of the associated FeedPost. A FeedPost represents the following types of changes in a CaseFeed: status updates, changes to tracked fields, text posts, link posts, and content posts.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>the <code>CreatedDate</code> for the <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
<code>LikeCount</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
<code>LinkURL</code>	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of the <code>LinkPost</code>.</p>
<code>NetworkScope</code>	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the case record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordID	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion article associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>. For example, set this field to an existing <code>ContentVersion</code> and post it to a feed as a <code>CaseFeed</code> object of <code>Type ContentPost</code>.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the CaseFeed. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkURL</code> is the URL, and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of CaseFeed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <code>Task</code> or <code>Event</code> associated with a case record (excluding email and call logging). For a recurring <code>Task</code> with <code>CaseFeed</code> disabled, one event is generated for the series only. For a recurring <code>Task</code> with <code>CaseFeed</code> enabled, events are generated for the series and each occurrence. • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval.

Field	Details
	<ul style="list-style-type: none"> • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user's Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to CaseFeed:</p> <ul style="list-style-type: none"> • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case. • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. • <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case. • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case.

Field	Details
Visibility	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>Visibility can have the following values:</p> <ul style="list-style-type: none">• <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item.• <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none">• For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default.• External users can set <code>Visibility</code> only to <code>AllUsers</code>.• <code>Visibility</code> can be updated on record posts.• The <code>Update</code> property is supported only for feed items posted on records.

Usage

Use this object to track changes for a case record.

SEE ALSO:

[Case](#)
[EntitySubscription](#)
[NewsFeed](#)
[FeedItem](#)
[UserProfileFeed](#)

CaseHistory

Represents historical information about changes that have been made to the associated Case.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object is always read-only.

Fields

Field	Details
CaseId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Case associated with this record.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Name of the case field that was modified, or a special value to indicate some other modification to the case. The possible values, in addition to the case field names, are:</p> <ul style="list-style-type: none"> • ownerAssignment—The owner of the case was changed. • ownerAccepted—A user took ownership of a case from a queue. • ownerEscalated—The owner of the case was changed due to case escalation. • external—A user made the case visible to customers in the Customer Self-Service Portal.
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description New value of the modified case field. Maximum of 255 characters.</p>

Field	Details
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description Previous value of the modified case field. Maximum of 255 characters.</p>

Usage

Case history entries are indirectly created each time a case is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

SEE ALSO:

[Object Basics](#)

CaseMilestone

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

Supported Calls

`describeCompactLayouts()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
BusinessHoursId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the BusinessHours associated with the CaseMilestone.</p>
CaseId	<p>Type reference</p>

Field	Details
	<p>Properties Filter</p> <p>Description ID of the case.</p>
CompletionDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Update</p> <p>Description The date and time the milestone was completed.</p>
ElapsedTimeInDays	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in days.</p>
ElapsedTimeInHrs	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in hours.</p>
ElapsedTimeInMins	<p>Type int</p> <p>Properties Filter, Nillable</p> <p>Description The time required to complete a milestone in minutes.</p>
IsCompleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the milestone is completed (<code>true</code>) or not (<code>false</code>).</p>
IsViolated	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the milestone is violated (<code>true</code>) or not (<code>false</code>).</p>
MilestoneTypeId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description The ID of the milestone on the case.</p>
StartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Update</p> <p>Description The date and time the milestone started on the case.</p>
TargetDate	<p>Type dateTime</p> <p>Properties Filter</p> <p>Description The date and time the milestone must be completed.</p>
TargetResponseInDays	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time to complete the milestone in days.</p>
TargetResponseInHrs	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description The time to complete the milestone in hours.</p>
TargetResponseInMins	<p>Type int</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description The time to complete the milestone in minutes.</p>
TimeSinceTargetInMins	<p>Type text</p> <p>Properties Nillable</p> <p>Description The time elapsed since the milestone target. The format is minutes and seconds.</p>
TimeRemainingInMins	<p>Type text</p> <p>Properties Nillable</p> <p>Description Time remaining to reach the milestone target. The format is minutes and seconds.</p>

Usage

This object lets you view a milestone on a case. It also lets you view if the milestone was completed and when it must be completed.

[SlaProcess](#)

CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CaseAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. Target users or groups are given access.</p>

Usage

Use this object to manage the sharing rules for cases. General sharing and territory management-related sharing use this object.

SEE ALSO:

[Case](#)

[CaseShare](#)

[Metadata API Developer Guide: SharingRules](#)

CaseShare

Represents a sharing entry on a Case.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
CaseAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to the Case. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All This value is not valid for creating or deleting records. <p>This field must be set to an access level that is higher than the organization's default access level for cases.</p>
CaseId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Case associated with this sharing entry. This field can't be updated.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p>

Field	Details
	<ul style="list-style-type: none"> <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the Case with them. <code>Owner</code>—The User is the owner of the Case. <code>ImplicitChild</code>—User or Group has access to the Case on the Account associated with this Case. <code>Rule</code>—The User or Group has access via a Case sharing rule.
<code>UserOrGroupId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Case. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view and edit Case records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

SEE ALSO:

[AccountShare](#)

[LeadShare](#)

[OpportunityShare](#)

CaseSolution

Represents the association between a Case and a Solution.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
<code>CaseId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Case associated with the Solution.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
SolutionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Solution associated with the case.</p>

Usage

You can't update this object via the API. If you attempt to create a record that matches an existing record, the request simply returns the existing record.

SEE ALSO:

[CaseShare](#)

[SolutionStatus](#)

CaseStatus

Represents the status of a Case, such as New, On Hold, or In Process.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Uniquely identifies a picklist value so it can be retrieved without using an id or master label.</p>
IsClosed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this case status value represents a closed Case (<code>true</code>) or not (<code>false</code>). Multiple case status values can represent a closed Case.</p>
IsDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this is the default case status value (<code>true</code>) or not (<code>false</code>) in the picklist.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Master label for this case status value. This display value is the internal label that does not get translated.</p>
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number used to sort this value in the case status picklist. These numbers are not guaranteed to be sequential, as some previous case status values might have been deleted.</p>

Usage

This object represents a value in the case status picklist. The case status picklist provides additional information about the status of a Case, such as whether a given `Status` value represents an open or closed case. Query the `CaseStatus` object to retrieve the set of values in the case status picklist, and then use that information while processing Case records to determine more information about a given case. For example, the application could test whether a given case is open or closed based on its `Status` value and the value of the `IsClosed` property in the associated `CaseStatus` object.

[Object Basics](#)

CaseTag

Associates a word or short phrase with a Case

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ItemId</code>	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new <code>TagDefinition</code> is created and becomes the parent of this <code>Tag</code> object. Otherwise, a <code>TagDefinition</code> with the same name becomes the parent of this <code>Tag</code> object. Parent relationships are created automatically.</p>
<code>TagDefinitionId</code>	<p>Type reference</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Restricted picklist</p> <p>Description</p> <p>Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

CaseTag stores the relationship between its parent TagDefinition and the Case being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CaseTeamMember

Represents a case team member, who works with a team of other users to help resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
MemberId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID of the user or contact who is a member on a case team.</p>

Field	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the case with which the case team member is associated.</p>
TeamRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the case team role with which the case team member is associated.</p>
TeamTemplateMemberId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the team member included in a predefined case team.</p>

CaseTeamRole

Represents a case team role. Every case team member has a role on a case, such as "Customer Contact" or "Case Manager."

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group for cases. The possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • None • Read • Edit
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the case team role.</p>
PreferencesVisibleInCSP	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Indicates whether or not the case team role is visible to Customer Portal users.</p>

CaseTeamTemplate

Represents a predefined case team, which is a group of users that helps resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A text description of the predefined case team.</p>
Name	<p>Type string</p>

Field	Details
	<p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the predefined case team.</p>

CaseTeamTemplateMember

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
MemberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the user or contact who is a team member on a predefined case team.</p>
TeamRoleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the predefined case team member's case team role.</p>
TeamTemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the predefined case team's template.</p>

CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
<code>ParentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the case with which the case team template record is associated.</p>
<code>TeamTemplateId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the predefined case team with which the case team template record is associated.</p>

CategoryData

Represents a logical grouping of Solution records.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
CategoryNodeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the CategoryNode associated with the solution.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RelatedSubjectId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the solution related to the category.</p>

Usage

This object allows you to assign one or more categories to a Solution. It is an intermediate data table with two foreign keys that defines the relationship between a CategoryNode and a Solution record.

CategoryData has two foreign keys:

- The first foreign key, `CategoryNodeId`, refers to the ID of a CategoryNode.
- The other foreign key, `RelatedSubjectId`, refers to a Solution ID.

This is a many-to-many relationship, so there can be multiple rows returned with a `CategoryNodeId`. A Solution can be associated with multiple categories.

SEE ALSO:

[Object Basics](#)

CategoryNode

Represents a tree of Solution categories.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer Portal users can't access this object.
- Attempting to delete a CategoryNode that has children (referred by CategoryNode.Parent), or is referred to elsewhere, causes a failure.

Fields

Field	Details
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label for the category node.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the parent of this node, if any.</p>
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the sort order of child CategoryNode objects.</p>
SortStyle	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Indicates whether the sort order is alphabetical or custom.</p>

Usage

A `CategoryNode` defines a category of solutions. In the user interface, you can edit category definitions from Setup by entering *Solution Categories* in the `Quick Find` box, then selecting **Solution Categories**.

SEE ALSO:

[CategoryData](#)

[Solution](#)

CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the `CategoryNodeLocalization` object provides the translation of the label of a solution category.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

Fields

Field	Details
<code>CategoryNodeId</code>	<p>Type reference</p> <p>Properties Create, Filter, Nillable</p> <p>Description The ID of the solution <code>CategoryNode</code> that is being translated.</p>
<code>LanguageLocaleKey</code>	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist</p> <p>Description This field is available in API version 16.0 and earlier. It is the same as the <code>Language</code> field.</p>

Language

Type

picklist

Properties

Create, Filter, Nillable, Restricted picklist

Description

This field is available in API version 17.0 and later. The combined language and locale ISO code, which controls the language for labels displayed in an application.

This picklist contains the following fully-supported languages:

- Chinese (Simplified): zh_CN
- Chinese (Traditional): zh_TW
- Danish: da
- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX
- Swedish: sv
- Thai: th

The following end-user only languages are available.

- Arabic: ar
- Bulgarian: bg
- Croatian: hr
- Czech: cs
- English (UK): en_GB
- Greek: el
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Polish: pl
- Portuguese (European): pt_PT

Field**Details**

- Romanian: `ro`
- Slovak: `sk`
- Slovenian: `sl`
- Turkish: `tr`
- Ukrainian: `uk`
- Vietnamese: `vi`

The following platform languages are available for organizations that use Salesforce exclusively as a platform.

- Albanian: `sq`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`

ChannelProgram

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field Name	Details
Category	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Category of the channel program. Categories group channel programs by type. For example, a reseller category would include all the different regional reseller channel programs.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the channel program.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the channel program is active. New channel programs are inactive by default.</p>
LastReferencedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Name of the channel program.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the owner of the channel program.</p>

ChannelProgramFeed

Represents a single feed item on a channel program feed. This object is available in API version 41.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the feed item. Required when <code>Type</code> is <code>TextPost</code> or <code>AdvancedTextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedComments</code> associated with this feed item.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsRichText	<p>Type boolean</p>

Field Name	Details
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. Values are:</p> <ul style="list-style-type: none"> • <code>NetworkId</code>—The ID of the community in which the feed item is available. If left empty, the feed item is only available in the default community. • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>.</p> <ul style="list-style-type: none"> • Only feed items with a <code>CollaborationGroup</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>.
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the channel program.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. For Work.com thanks posts, it's the ID of the <code>WorkThanks</code> object associated with a <code>RypplePost</code>. This field is typically null for all posts except <code>ContentPost</code> and <code>RypplePost</code>.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>

Field Name	Details
Type	<p data-bbox="641 262 706 294">Type</p> <p data-bbox="673 294 755 325">picklist</p> <p data-bbox="641 336 755 367">Properties</p> <p data-bbox="673 367 1112 399">Filter, Group, Nillable, Restricted picklist, Sort</p> <p data-bbox="641 420 771 451">Description</p> <p data-bbox="673 451 998 483">The type of feed item. Values are:</p> <ul data-bbox="673 504 1458 1858" style="list-style-type: none"> <li data-bbox="673 504 1458 640">• ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. <li data-bbox="673 777 1458 871">• AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. <li data-bbox="673 892 1079 924">• AnnouncementPost—Not used. <li data-bbox="673 934 1356 966">• ApprovalPost—generated when a user submits an approval. <li data-bbox="673 976 1161 1008">• BasicTemplateFeedItem—Not used. <li data-bbox="673 1018 1356 1050">• CanvasPost—a post made by a canvas app posted on a feed. <li data-bbox="673 1060 1458 1134">• CollaborationGroupCreated—generated when a user creates a public group. <li data-bbox="673 1144 1266 1176">• CollaborationGroupUnarchived—Not used. <li data-bbox="673 1186 1185 1218">• ContentPost—a post with an attached file. <li data-bbox="673 1228 1458 1302">• CreatedRecordEvent—generated when a user creates a record from the publisher. <li data-bbox="673 1312 1458 1386">• DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold. <li data-bbox="673 1396 1458 1470">• DashboardComponentSnapshot—created when a user posts a dashboard snapshot on a feed. <li data-bbox="673 1480 1144 1512">• LinkPost—a post with an attached URL. <li data-bbox="673 1522 1096 1554">• PollPost—a poll posted on a feed. <li data-bbox="673 1564 1458 1638">• ProfileSkillPost—generated when a skill is added to a user’s Chatter profile. <li data-bbox="673 1648 1323 1680">• QuestionPost—generated when a user posts a question. <li data-bbox="673 1690 1339 1722">• ReplyPost—generated when Chatter Answers posts a reply. <li data-bbox="673 1732 1458 1806">• RypplePost—generated when a user creates a Thanks badge in Work.com. <li data-bbox="673 1816 1144 1848">• TextPost—a direct text entry on a feed. <li data-bbox="673 1858 1404 1890">• TrackedChange—a change or group of changes to a tracked field.

Field Name**Details**

- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

- `AttachArticleEvent`—generated event when a user attaches an article to a case.
- `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- `CaseCommentPost`—generated event when a user adds a case comment for a case object.
- `ChangeStatusPost`—generated event when a user changes the status of a case.
- `ChatTranscriptPost`—generated event when Live Agent transcript is saved to a case.
- `EmailMessageEvent`—generated event when an email related to a case object is sent or received.
- `FacebookPost`—generated when a Facebook post is created from a case. Deprecated.
- `MilestoneEvent`—generated when a case milestone is completed or reaches violation status.
- `SocialPost`—generated when a social post is created from a case.

 **Note:** If you set `type` to `ContentPost`, also specify `ContentData` and `ContentFileName`.

Visibility**Type**

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. Values are:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `Visibility`.

- For record posts, `Visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `Visibility` only to `AllUsers`.
- On user and group posts, only internal users can set `Visibility` to `InternalUsers`.

ChannelProgramHistory

Represents the history of changes to the values in the fields of a channel program object. Access is read-only. This object is available in API version 41.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
ChannelProgramId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the channel program.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Name of the field that was changed.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description New value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description Old value of the field that was changed.</p>

ChannelProgramLevel

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Description of the channel program level.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the channel program level.</p>

Field Name	Details
ProgramId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the channel program.</p>
Rank	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An integer associated with the level. For example, 1 represents the lowest level, 2 the next level up, etc.</p>

ChannelProgramLevelFeed

Represents a single feed item on a channel program level feed. This object is available in API version 41.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p>

Field Name	Details
	<ul style="list-style-type: none"> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default <code>community</code>, a specific community, or all communities. Values are:</p> <ul style="list-style-type: none"> • <code>NetworkId</code>—The ID of the community in which the feed item is available. If left empty, the feed item is only available in the default community. • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>.</p> <ul style="list-style-type: none"> • Only feed items with a <code>CollaborationGroup</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>.
ParentId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the channel program level.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a <code>ContentPost</code>. For Work.com thanks posts, it's the ID of the WorkThanks object associated with a <code>RypplePost</code>. This field is typically null for all posts except <code>ContentPost</code> and <code>RypplePost</code>.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item. Values are:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <code>Task</code> or <code>Event</code> associated with a case record (excluding email and call logging). For a recurring <code>Task</code> with <code>CaseFeed</code> disabled, one event is generated for the series only. For a recurring <code>Task</code> with <code>CaseFeed</code> enabled, events are generated for the series and each occurrence. • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used.

Field Name

Details

- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to [CaseFeed](#):

- `AttachArticleEvent`—generated event when a user attaches an article to a case.
- `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- `CaseCommentPost`—generated event when a user adds a case comment for a case object.
- `ChangeStatusPost`—generated event when a user changes the status of a case.
- `ChatTranscriptPost`—generated event when Live Agent transcript is saved to a case.
- `EmailMessageEvent`—generated event when an email related to a case object is sent or received.
- `FacebookPost`—generated when a Facebook post is created from a case. Deprecated.
- `MilestoneEvent`—generated when a case milestone is completed or reaches violation status.

Field Name	Details
	<ul style="list-style-type: none"> • <code>SocialPost</code>—generated when a social post is created from a case. <p> Note: If you set <code>type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>
Visibility	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available to all users or internal users only. Values are:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>.</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

ChannelProgramLevelHistory

Represents the history of changes to the values in the fields of a channel program level object. Access is read-only. This object is available in API version 41.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ChannelProgramLevelId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the channel program level.</p>

Field Name	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Name of the field that was changed.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description New value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description Old value of the field that was changed.</p>

ChannelProgramMember

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
LevelId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the channel program level.</p>

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description Name of the channel program member.</p>
PartnerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the partner.</p>
ProgramId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the channel program.</p>

ChannelProgramOwnerSharingRule

Represents a rule for sharing a channel program object with users other than the owner. This object is available in API version 41.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AccessLevel	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Determines the level of access users have to channel program records. Values are:</p> <ul style="list-style-type: none"> • Read Only • Read/Write
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the sharing rule. Maximum length is 1000 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the source group. Channel program records that are owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the UI. Maximum length is 80 characters.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group that you are granting access to.</p>

SEE ALSO:

[ChannelProgram](#)[ChannelProgramShare](#)[Metadata API Developer Guide: SharingRules](#)

ChannelProgramShare

Represents a sharing entry on a channel program record. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The level of access allowed, for example, read or write.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description ID of the parent record, if any.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that the sharing entry exists. Values may include:</p> <ul style="list-style-type: none"> • Manual—The user or group has access because a user with All access manually shared the channel program record with them. • Owner—The user is the owner of the channel program record or is in a role above the channel program record owner in the role hierarchy.
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group that has been given access to the channel program record.</p>

ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments made by the ParentId.</p>

Field Name	Details
CommentReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments received by the ParentId.</p>
InfluenceRawRank	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Number indicating the ParentId's Chatter influence rank, which is calculated based on the ParentId's ChatterActivity statistics, relative to the other users in the organization. This field is available in API version 26.0 and later.</p>
LikeReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes received by the ParentId.</p>
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Identifier of the community to which the ChatterActivity belongs. This field is available only if Salesforce Communities is enabled in your organization. This field is available in API version 26.0 and later.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Identifier of the object type to which the ChatterActivity is related. In API version 42.0, the ParentId must be a <code>UserId</code> or <code>SelfServiceUser ID</code>.</p>
PostCount	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The number of FeedItems made by the ParentId.</p>

Usage

- Use this object to reference the Chatter activity statistics, which include the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user.
- You can directly query for ChatterActivity.

```
SELECT Id, PostCount, LikeReceivedCount
FROM ChatterActivity
WHERE ParentId = UserId
```

 **Note:** To query ChatterActivity, you must provide the ParentId. In API version 42.0, the ParentId must be a UserId or SelfServiceUser ID.

- A ChatterActivity record is created for users the first time they post or comment. Users who have never posted or commented don't have ChatterActivity records. If users make only one post and then delete it, they do have ChatterActivity records. In both cases, the user interface displays zeros for their Chatter activity.
- Use the InfluenceRawRank field to reference a user's Chatter influence rank. This field is available in API version 26.0 and later.

ChatterAnswersActivity

Represents the reputation of a User in Chatter Answers communities. This object is available in API version 25.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
BestAnswerReceivedCount	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of best answers the User has received from other users.</p>
BestAnswerSelectedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of best answers the User has selected.</p>
QuestionsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Question records posted by the User.</p>
QuestionSubscrCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Question records the User has selected to follow.</p>
QuestionSubscrReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of users following Question records posted by the User.</p>
QuestionUpVotesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has marked on Question records posted by other users.</p>

Field Name	Details
QuestionUpVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has received from other users on the Question records he or she has posted.</p>
RepliesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of Reply records posted by the User.</p>
ReplyDownVotesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes the User has marked on Reply records posted by other users.</p>
ReplyDownVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes the User has received from other users on the Reply records he or she has posted.</p>
ReplyUpVotesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has marked on the Reply records posted by other users.</p>

Field Name	Details
ReplyUpVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes the User has received from other users on the Reply records he or she has posted.</p>
ReportAbuseOnQuestionsCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses that the User has reported on Question records posted by other users.</p>
ReportAbuseOnRepliesCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses that the User has reported on Reply records posted by other users.</p>
ReportAbuseReceivedOnQnCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of abuses reported by other users on the Question records posted by the User.</p>
ReportAbuseReceivedOnReCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description the number of abuses reported by other users on the Reply records posted by the User.</p>

Field Name	Details
UserId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The User ID associated with this reputation.</p>
CommunityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID for the zone associated with this reputation.</p>

Usage

Use this object to view metrics on User activity in Chatter Answers. For example, you can use the ChatterAnswersActivity object to view the number of Question records a user is following in Chatter Answers communities.

SEE ALSO:

- [Question](#)
- [Reply](#)
- [User](#)

ChatterAnswersReputationLevel

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
CommunityID	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>ID of the zone for which you're creating the reputation level.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Name of the reputation level.</p>
Value	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Minimum number of points for this level.</p>

Usage

Use to create or edit reputation levels for the zone.

ChatterConversation

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
Id	<p>Type</p> <p>ID</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the conversation.</p>

Usage

Use this object to identify private conversations in Chatter. Users can access this object if they have the “Manage Chatter Messages and Direct Messages” permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

[ChatterConversationMember](#)

[ChatterMessage](#)

ChatterConversationMember

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ConversationId</code>	Type reference Properties Filter, Group, Sort Description ID of the associated ChatterConversation.
<code>MemberId</code>	Type reference Properties Filter, Group, Sort Description ID of the conversation member.

Usage

Use this object to view members of private conversations in Chatter. Users can access this object if they have the “Manage Chatter Messages and Direct Messages” permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

[ChatterConversation](#)

[ChatterMessage](#)

ChatterMessage

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Update</p> <p>Description Text of the message.</p>
ConversationId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the conversation that the ChatterMessage is associated with.</p>
SenderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the sender.</p>

Field Name	Details
SenderNetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the community from which the message was sent. This field is available only if Salesforce Communities is enabled in your organization. This field is available in API version 32.0 and later.</p>
SentDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description Date the message was sent.</p>

Usage

Use this object to view and delete messages sent or received via private conversations in Chatter. Users can access this object if they have the “Manage Chatter Messages and Direct Messages” permission. Users with the “Moderate Communities Chatter Messages” permission can access this object in communities they’re a member of, only if the message has been flagged as inappropriate. This object is provided to allow administrators to view and delete users’ Chatter messages, for example, for compliance purposes.

Messages are hard deleted. They aren’t sent to the recycle bin.

Deleting a message that resulted from sharing a file with someone does not delete the file itself.

SEE ALSO:

[ChatterConversation](#)

[ChatterConversationMember](#)

ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`

Fields

Field	Details
FullUserAgent	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Detailed information about the client (browser). For example, <code>Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9.0.1) Gecko/2008070208 Firefox/3.0.1</code></p>
LastUpdate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Represents the last time the cookie was changed.</p>
ProxyInfo	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The browser's current proxy information.</p>
UsersId	<p>Type reference</p> <p>Properties Nillable, Group, Sort</p> <p>Description The ID of the user associated with this item.</p>

Usage

At every login, the device the login request is from is checked against the known devices using ClientBrowser. A match means a cookie was found on the browser that matches an entry in the ClientBrowser table, so the device is known. No match means that no matching cookie was found, so the device is unknown, and the user is asked to confirm their identity.

CollaborationGroup

Represents a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

The visibility of information in groups depends on the type of group and the user's permissions.

- **Members:** Any user with the "Create and Own New Chatter Groups" permission can create public, private, and unlisted groups, including in any communities they belong to.
- **Owners and managers:** Users can modify group details for any group they own or manage. Owners can also delete groups they own.
- **Nonmembers:** These user permissions allow group access regardless of group membership.
 - "View All Data"—Allows users to view all public and private groups across their organization and its communities. Users with this permission can't view unlisted group information, unless they have the "Modify Unlisted Groups" permission as well.
 - "Modify All Data"—Allows users to view, modify, and delete all public and private groups across their organization and its communities. Users with this permission can't view or modify unlisted group information, unless they have the "Manage Unlisted Groups" permission as well.
 - "Create and Customize Communities"—Allows users to view, modify, and delete all public and private groups in communities.
 - "Manage Unlisted Groups"—Allows users to search for, access, and modify any unlisted group in an organization and its communities.
 - "Data Export"—Allows users to export any data from Salesforce, including private and unlisted group data from an organization and its communities.
- **Apex and Visualforce:** Apex code runs in system mode, which means that the permissions of the current user aren't taken into account.
 - Visualforce pages that display groups might expose unlisted or private group data to users who aren't members.
 - Because system mode disregards the user's permissions, all users who are accessing a Visualforce page that's showing a group can act as an owner of that group.
 - AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren't members.

To limit and manage access to the unlisted and private groups in your organization:

- Explicitly filter out unlisted and private group information from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of groups. In Setup, enter *Group Triggers* in the Quick Find box, then select **Group Triggers** to add triggers.

Fields

Field	Details
<code>AnnouncementId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Contains the ID of the Announcement last associated with the group. This field is available in API version 30.0 and later.</p>
BannerPhotoUrl	<p>Type</p> <p>url</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The URL for the group's banner photo.</p> <p>The URL is updated every time a photo is uploaded and reflects the most recent photo. The URL returned for an older photo is not guaranteed to return a photo if a newer photo has been uploaded. You should always query this field for the URL of the most recent photo.</p> <p>This field is available in API version 36.0 and later.</p>
CanHaveGuests	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>If set to <code>true</code>, indicates that a group allows customers. Chatter customers are people outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.</p> <p>This field is available starting in API version 23.0, but groups that allow customers are accessible from earlier API versions. However, when accessed from earlier API versions, groups that allow customers aren't distinguishable from private groups. We strongly recommend that you upgrade to the latest API version. If you must use an earlier version, name groups that allow customers to indicate that they include customers.</p>
CollaborationType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The type of Chatter group. Available values are:</p> <ul style="list-style-type: none"> • <code>Public</code>—Anyone can see and post updates. Anyone can join a public group. • <code>Private</code>—Only members can see the group feed and post updates. Non-members can only see the group name and a few other details in list views, search, and on the group page. The group's owner or managers must add members who request to join the group.

Field	Details
	<ul style="list-style-type: none"> <code>Unlisted</code>—Only members and users with the “Manage Unlisted Groups” permission can see the group and post updates. Other users can’t access the group or see it in lists, search, and feeds.
<code>Description</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the group.</p>
<code>FullPhotoUrl</code>	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The URL for the group's profile photo.</p> <p>The URL is updated every time a photo is uploaded and reflects the most recent photo. The URL returned for an older photo is not guaranteed to return a photo if a newer photo has been uploaded. You should always query this field for the URL of the most recent photo.</p> <p>This field is available in API version 20.0 and later.</p>
<code>GroupEmail</code>	<p>Type email</p> <p>Properties Group, Nillable, Sort</p> <p>Description The email address for posting to the group. For private groups, only visible to members and users with “Modify All Data” or “View All Data” permissions.</p> <p>This field is available in API version 29.0 and later.</p>
<code>HasPrivateFieldsAccess</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description If set to <code>true</code>, indicates that a user can see the <code>InformationBody</code> and <code>InformationTitle</code> fields in a private group. This field is set to <code>true</code> for members of a private group and users with “Modify All Data” or “View All Data” permissions.</p>
<code>InformationBody</code>	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description The text of the Information section. For private groups, only visible to members and users with "Modify All Data" or "View All Data" permissions.</p>
InformationTitle	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The title of the Information section. For private groups, only visible to members and users with "Modify All Data" or "View All Data" permissions.</p>
IsArchived	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the group is archived (<code>true</code>) or not (<code>false</code>).</p>
IsAutoArchiveDisabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether automatic archiving is disabled for the group (<code>true</code>) or not (<code>false</code>).</p>
IsBroadcast	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the group is a broadcast group (<code>true</code>) or not (<code>false</code>). This field is available in API version 36.0 and later.</p>
LastFeedModifiedDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p>

Field	Details
	<p>Description The date of the last post or comment on the group.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
MediumPhotoUrl	<p>Type url</p> <p>Properties Filter Nillable Sort</p> <p>Description The URL for the larger, cropped photo size.</p>
MemberCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of members in the group.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the group. Group names must be unique across public and private groups. Unlisted groups don't require unique names.</p>

Field	Details
NetworkId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the community that this group is part of. This field is available only if Salesforce Communities is enabled in your organization.</p> <p>You can only add a <code>NetworkId</code> when creating a group. You can't change or add a <code>NetworkId</code> for an existing group. This field is available in API version 26.0 and later.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of the group. Only the current group owner or people with the "Modify All Data" permission can update the <code>OwnerId</code>.</p>
SmallPhotoUrl	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The URL for a thumbnail of the group's profile photo.</p> <p>The URL is updated every time a photo is uploaded and reflects the most recent photo. The URL returned for an older photo is not guaranteed to return a photo if a newer photo has been uploaded. You should always query this field for the URL of the most recent photo.</p> <p>This field is available in API version 20.0 and later.</p>

Usage

Use this object to create, edit, or delete groups in an organization or in a community. Deleting a group permanently deletes all posts and comments to the group. It also deletes all files and links posted to the group and removes the files from other locations where they were shared.

As a Chatter group member, you can post to the group using the `CollaborationGroupFeed` object. As a Chatter group owner or manager, you can add or remove group members using the `CollaborationGroupMember` object, post announcements to the group using the `Announcement` object, and accept or decline requests to join private groups using the `CollaborationGroupMemberRequest` object. Additionally, the group owner, manager, or your Salesforce system administrator can invite people to join the group using the [CollaborationInvitation](#) object.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

SEE ALSO:

[CollaborationGroupFeed](#)

[CollaborationGroupMember](#)

[CollaborationGroupMemberRequest](#)

CollaborationGroupFeed

Represents a single feed item on a Chatter group feed. A group feed shows posts and comments about the group. This object is available in API version 19.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of CollaborationGroupFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>

Field	Details
ContentFileName	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDate DESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an <code>FeedItem</code>: changes to tracked fields, text posts, link posts, and content posts.</p>

Field	Details
	 Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community.

Field	Details
	<ul style="list-style-type: none"> • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> • Only feed items with a <code>Group</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. • You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the group that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>
<code>Title</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item. Except for <code>ContentPost</code>, <code>LinkPost</code>, and <code>TextPost</code>, don't create feed item types directly from the API.</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also

Field

Details

occurs when a user or the API adds or updates a [Task](#) or [Event](#) associated with a case record (excluding email and call logging).

For a recurring [Task](#) with [CaseFeed](#) disabled, one event is generated for the series only. For a recurring [Task](#) with [CaseFeed](#) enabled, events are generated for the series and each occurrence.

- [AdvancedTextPost](#)—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.
- [AnnouncementPost](#)—Not used.
- [ApprovalPost](#)—generated when a user submits an approval.
- [BasicTemplateFeedItem](#)—Not used.
- [CanvasPost](#)—a post made by a canvas app posted on a feed.
- [CollaborationGroupCreated](#)—generated when a user creates a public group.
- [CollaborationGroupUnarchived](#)—Not used.
- [ContentPost](#)—a post with an attached file.
- [CreatedRecordEvent](#)—generated when a user creates a record from the publisher.
- [DashboardComponentAlert](#)—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- [DashboardComponentSnapshot](#)—created when a user posts a dashboard snapshot on a feed.
- [LinkPost](#)—a post with an attached URL.
- [PollPost](#)—a poll posted on a feed.
- [ProfileSkillPost](#)—generated when a skill is added to a user's Chatter profile.
- [QuestionPost](#)—generated when a user posts a question.
- [ReplyPost](#)—generated when Chatter Answers posts a reply.
- [RypplePost](#)—generated when a user creates a Thanks badge in Work.com.
- [TextPost](#)—a direct text entry on a feed.
- [TrackedChange](#)—a change or group of changes to a tracked field.
- [UserStatus](#)—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to [CaseFeed](#):

- [AttachArticleEvent](#)—generated event when a user attaches an article to a case.
- [CallLogPost](#)—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- [CaseCommentPost](#)—generated event when a user adds a case comment for a case object.
- [ChangeStatusPost](#)—generated event when a user changes the status of a case.
- [ChatTranscriptPost](#)—generated event when Live Agent transcript is saved to a case.
- [EmailMessageEvent](#)—generated event when an email related to a case object is sent or received.

Field	Details
	<ul style="list-style-type: none"> • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case. <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>
Visibility	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>Visibility can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for a group.

SEE ALSO:

- [CollaborationGroup](#)
- [CollaborationGroupMember](#)
- [NewsFeed](#)

CollaborationGroupMember

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
<code>CollaborationGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the associated <code>CollaborationGroup</code>.</p>
<code>CollaborationRole</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The role of a group member. Group owners and managers can change roles for members of their groups. The valid values are:</p> <ul style="list-style-type: none"> <code>Standard</code>—Indicates that a user is a group member. Members can post and comment in the group. <code>Admin</code>—Indicates that a user is a group manager. Managers can post and comment, change member roles, edit group settings, add and remove members, delete posts and comments, and edit the group information field. <p> Note: To change the group owner, use the <code>ownerId</code> field on the <code>CollaborationGroup</code> object.</p>
<code>LastFeedAccessDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date and time when a group member last accessed the group's feed. The value is only updated when a member explicitly consumes the group's feed, not when the member sees group posts in other feeds, like the profile feed.</p>
<code>MemberId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>ID of the group member.</p>
NotificationFrequency	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Required. The frequency at which Salesforce sends Chatter group email digests to this member. Can only be set by the member or users with the “Modify All Data” permission. The valid values are:</p> <ul style="list-style-type: none"> • D—Daily • W—Weekly • N—Never • E—On every post <p>The default value is specified by the member in their Chatter email settings. In communities, the <code>Email on every post</code> option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to <code>Daily digests</code>.</p>

Usage

Use this object to view, create, and delete Chatter group members. You must be a group owner or manager to create members for private Chatter groups.

SEE ALSO:

[CollaborationGroup](#)

[CollaborationGroupFeed](#)

[CollaborationGroupMemberRequest](#)

CollaborationGroupMemberRequest

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CollaborationGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the private Chatter group.</p>
RequesterId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user requesting to join the group; must be the ID of the context user.</p>
ResponseMessage	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description Optional message to be included in the notification email when <code>Status</code> is <code>Declined</code>.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The status of the request. Available values are:</p> <ul style="list-style-type: none"> • Accepted • Declined • Pending

Usage

This object represents a request to join a private Chatter group, and can be used to accept or decline requests to join private groups you own or manage. On create, an email is sent to the owner and managers of the private group to be accepted or declined. When the `Status` is `Accepted` or `Declined`, an email is sent to notify the requester. When the `Status` is `Declined`, a `ResponseMessage` is optionally included to provide additional details.

Note the following when working with requests:

- Users with the “Modify All Data” or “View All Data” permission can view records for all groups, regardless of membership.
- A user can be a member of 300 groups. Requests to join groups count against this limit.
- `Status` can't be specified on create.
- You can only update a request when the `Status` is `Pending`.
- You can't delete or update a request with a `Status` of `Accepted` or `Declined`.

SEE ALSO:

[CollaborationGroup](#)

[CollaborationGroupMember](#)

CollaborationGroupRecord

Represents the records associated with Chatter groups.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`, `undelete()`

Fields

Field	Details
<code>CollaborationGroupId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Chatter group.</p>
<code>NetworkId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Optional. The ID of the community that the group belongs to. Available from API version 34.0.</p>
<code>RecordId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description Required. The ID of the record associated with the Chatter group.</p>

CollaborationInvitation

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Invitations are available if “Allow Invitations” is enabled for your organization.

Invitations are limited to your allowed domain(s) unless the invite is sent from a private group that allows customers. Allowed domains are set by the administrator.

Invitations to customers are available if “Allow Customer Invitations” is enabled for your organization. Users must have the “Invite Customers to Chatter” permission to send invitations to people outside their Chatter domain.

Fields

Field	Details
<code>InvitedUserEmail</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The email address for the user invited to join Chatter. Label is <code>Invited Email</code>.</p>
<code>InvitedUserEmailNormalized</code>	<p>Type email</p> <p>Properties Filter, Group, Sort</p> <p>Description A normalized version of the <code>InvitedUserEmail</code> entered. Label is <code>Invited Email (Normalized)</code>.</p>
<code>InviterId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The person that initiated the invitation.</p>
OptionalMessage	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description An optional message from the person sending the invitation to the person receiving it.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Used when the email address on the invitation is different than the one entered when the invitee accepts the invitation.</p>
SharedEntityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group associated with this invitation.</p> <ul style="list-style-type: none"> • If the invitation is to join Chatter, the <code>SharedEntityId</code> is the ID of the User that created the invitation. The invitee will auto-follow the inviter. • If the invitation is to join a group within Chatter, the <code>SharedEntityId</code> is the ID of the Chatter CollaborationGroup. • To invite a customer, set <code>SharedEntityId</code> to the ID of the private CollaborationGroup with Allow Customers turned on.
Status	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status of the invitation. Possible values are:</p> <ul style="list-style-type: none"> • Sent • Accepted

Field	Details
	<ul style="list-style-type: none"> • Canceled

Usage

Use this object to create or delete (cancel) invitations to join Chatter. You can either invite a user to join Chatter directly or as part of a CollaborationGroup.

 **Note:** To invite someone to join a CollaborationGroup, you must be either the owner or a manager of the group or a Salesforce system administrator.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

When the person accepts your CollaborationGroup invitation, they join the CollaborationGroup and Chatter as well.

 **Note:** You can't send invitations to users of the organization the invite was sent from.

Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

If your organization allows groups with customers, owners and managers of private groups with the "Allow Customers" setting, as well as system administrators, can use this object to invite customers.

Java Samples

The following example shows how to send an invitation to join Chatter:

```
public void invitePeople(String inviterUserId, String invitedEmail) throws Exception {
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(inviterUserId); //pass the userId of the inviter
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

The following example shows how to send an invitation to a customer user from a group that allows customers:

```
public void inviteToGroup(String groupName, String invitedEmail) throws Exception {
    QueryResult qr = query("select id from collaborationgroup where name = '" +
        groupName); //pass the group name
    String groupId = qr.getRecords()[0].getId();
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(groupId); //pass the groupId
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

Apex Samples

```
String emailAddress = 'bob@external.com';
CollaborationGroup chatterGroup = [SELECT Id
    FROM CollaborationGroup
    WHERE Name='All acme.com'
    LIMIT 1];
```

```

CollaborationInvitation inv = New CollaborationInvitation();
inv.SharedEntityId = chatterGroup.id;
inv.InvitedUserEmail = emailAddress;

try {
    Insert inv;
} catch (DMLException e) {
    System.debug('There was an error with the invite: '+e);
}

```

CombinedAttachment

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes.</p>
ContentUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the <code>FileType</code>. This field is available in API version 31.0 and later.</p>

Field Name	Details
	<p>Description</p> <p>The parent object type.</p>
SharingOption	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Title of the attached file.</p>

Usage

Use this object to list all notes, attachments, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter for a record, such as a related list on a detail page.

To determine if an object supports the `CombinedAttachment` object, call `describeSObject()` on the object. For example, `describeSObject('Account')` returns all the child relationships of the `Account` object, including `CombinedAttachment`. You can then query the `CombinedAttachment` child relationship.

```
SELECT Name, (SELECT Title FROM CombinedAttachments)
FROM Account
```

You can't directly query `CombinedAttachment`.

Community (Zone)

Represents a zone that contains `Idea` or `Question` objects.

 **Note:** Starting with the Summer '13 release, Chatter Answers and Ideas "communities" have been renamed to "zones." In API version 28, the API object label has changed to `zone`, but the API type is still `Community`.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>CanCreateCase</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether users can ask private questions in the zone using Chatter Answers.</p>
<code>DataCategoryName</code>	<p>Type string</p> <p>Properties Filter, Nillable, Group, Sort</p> <p>Description The data category associated with the zone.</p>
<code>Description</code>	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text description of the zone.</p>
<code>HasChatterService</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether Chatter Answers is available in the zone.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the zone is active or inactive. An idea or question can only be posted to an active zone.</p>

Field	Details
IsPublished	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the zone is available in portals.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the zone.</p>
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the Chatter community that this zone is associated with. This field is available only if Salesforce Communities is enabled in your org. This field is available in API version 42.0 and later.</p>

Usage

Use this object to create a zone in Ideas, Chatter Answers, or Answers. Zones help organize ideas and questions into logical groups and are shared by the Ideas, Answers, and Chatter Answers.

ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Connected apps link client applications, third-party services, other Salesforce organizations, apps and resources to your organization. The connected app configuration specifies authorization and security settings for these resources. This object exposes the settings for a specified connected app.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
MobileSessionTimeout	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Length of time after which the system logs out inactive mobile users.</p>
MobileStartUrl	<p>Type url</p> <p>Properties Filter, idLookup, Nillable, Sort</p> <p>Description Users are directed to this URL after they've authenticated when the app is accessed from a mobile device.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name for this object.</p>
OptionsAllowAdminApprovedUsersOnly	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether access is limited to users granted approval to use the connected app by an administrator. Manage profiles for the app by editing each profile's Access list.</p>
OptionsHasSessionLevelPolicy	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Specifies whether the connected app requires a High Assurance level session.</p>

Field Name	Details
OptionsRefreshTokenValidityMetric	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Specifies whether the refresh token validity is based on duration or inactivity. If <code>true</code>, the token validity is measured based on the last use of the token; otherwise, it is based on the token duration.</p>
PinLength	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description For mobile apps, this is the PIN length requirement for users of the connected app. Valid values are 5, 6, 7, 8 or 9.</p>
RefreshTokenValidityPeriod	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The duration of an authorization token until it expires in hours, months or days as set in the connected app management page.</p>
StartUrl	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description If the app is not accessed from a mobile device, users are directed to this URL after they've authenticated.</p>

Contact

Represents a contact, which is a person associated with an account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access only portal-enabled contacts.

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the account that's the parent of this contact. We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.</p>
AssistantName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The assistant's name.</p>
AssistantPhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The assistant's telephone number.</p>
Birthdate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's birthdate.</p>

Field	Details
	<p>Filter criteria for report filters, list view filters, and SOQL queries ignore the year portion of the <code>Birthdate</code> field. For example, these SOQL query returns contacts with birthdays later in the year than today:</p> <pre>SELECT Name, Birthdate FROM Contact WHERE Birthdate > TODAY</pre>
<code>CanAllowPortalSelfReg</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether this contact can self-register for your Customer Portal (<code>true</code>) or not (<code>false</code>).</p>
<code>CleanStatus</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the record's clean status as compared with Data.com. Values include: <code>Matched</code>, <code>Different</code>, <code>Acknowledged</code>, <code>NotFound</code>, <code>Inactive</code>, <code>Pending</code>, <code>SelectMatch</code>, or <code>Skipped</code>.</p> <p>Several values for <code>CleanStatus</code> appear with different labels on the contact record.</p> <ul style="list-style-type: none"> • <code>Matched</code> appears as <code>In Sync</code> • <code>Acknowledged</code> appears as <code>Reviewed</code> • <code>Pending</code> appears as <code>Not Compared</code>
<code>ConnectionReceivedId</code>	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the <code>PartnerNetworkConnection</code> that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
<code>ConnectionSentId</code>	<p>Type reference</p> <p>Properties Filter, Nillable</p>

Field	Details
	<p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
Department	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's department.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description A description of the contact. Label is Contact Description up to 32 KB.</p>
DoNotCall	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates that the contact does not want to receive calls.</p>
Email	<p>Type email</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort, Update</p> <p>Description The contact's email address.</p>
EmailBouncedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the contact bounces, the date and time of the bounce.</p>

Field	Details
EmailBouncedReason	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the contact bounces, the reason for the bounce.</p>
Fax	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's fax number. Label is Business Fax.</p>
FirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's first name up to 40 characters.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the contact prohibits receiving email from Salesforce (<code>true</code>) or not (<code>false</code>). Label is Email Opt Out.</p>
HasOptedOutOfFax	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the contact prohibits receiving faxes.</p>
HomePhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The contact's home telephone number.</p>
IndividualId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data privacy record associated with this contact. This field is available if Data Protection and Privacy is enabled.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsEmailBounced	<p>Type boolean</p> <p>Properties Filter, Group, Sort</p> <p>Description If bounce management is activated and an email is sent to a contact, indicates whether the email bounced (<code>true</code>) or not (<code>false</code>).</p>
IsPersonAccount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Read only. Indicates whether this account has a record type of Person Account (<code>true</code>) or not (<code>false</code>). Label is Is Person Account.</p>
Jigsaw	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description References the company's ID in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is <code>null</code>, the account was</p>

Field	Details
	<p>not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is Data.com Key.</p> <p> Important: The <code>Jigsaw</code> field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify this value.</p>
<code>LastActivityDate</code>	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is the most recent of either:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
<code>LastName</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Last name of the contact up to 80 characters.</p>
<code>LastReferencedDate</code>	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
<code>LastViewedDate</code>	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
<code>LeadSource</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description The lead's source.</p>
MailingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the mailing address. Read-only. For details on compound address fields, see Address Compound Fields.</p>
<ul style="list-style-type: none"> MailingCity MailingState MailingCountry MailingPostalCode 	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Mailing address details.</p>
<ul style="list-style-type: none"> MailingStateCode MailingCountryCode 	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the mailing address's state and country.</p>
MailingStreet	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for mailing address.</p>
MailingGeocodeAccuracy	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the mailing address. For details on geolocation compound field, see Compound Field Considerations and Limitations.</p>
MailingLatitude	<p>Type double</p>

Field	Details
	<p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>MailingLongitude</code> to specify the precise geolocation of a mailing address. Acceptable values are numbers between -90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>MailingLongitude</code>	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>MailingLatitude</code> to specify the precise geolocation of a mailing address. Acceptable values are numbers between -180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>MasterRecordId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this record was deleted as the result of a merge, this field contains the ID of the record that remains. If this record was deleted for any other reason, or has not been deleted, the value is <code>null</code>.</p>
<code>MiddleName</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The contact's middle name up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>
<code>MobilePhone</code>	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Contact's mobile phone number.</p>
<code>Name</code>	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description Concatenation of <code>FirstName</code>, <code>MiddleName</code>, <code>LastName</code>, and <code>Suffix</code> up to 121 characters.</p>
<code>OtherAddress</code>	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the other address. Read-only. For details on compound address fields, see Address Compound Fields.</p>
<ul style="list-style-type: none"> <code>OtherCity</code> <code>OtherCountry</code> <code>OtherPostalCode</code> <code>OtherState</code> 	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Alternate address details.</p>
<ul style="list-style-type: none"> <code>OtherCountryCode</code> <code>OtherStateCode</code> 	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO codes for the alternate address's state and country.</p>
<code>OtherGeocodeAccuracy</code>	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the other address. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>OtherLatitude</code>	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Used with <code>OtherLongitude</code> to specify the precise geolocation of an alternate address. Acceptable values are numbers between -90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>OtherLongitude</code>	<p>Type</p> <p>double</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Used with <code>OtherLatitude</code> to specify the precise geolocation of an alternate address. Acceptable values are numbers between -180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
<code>OtherPhone</code>	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Telephone for alternate address.</p>
<code>OtherStreet</code>	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Street for alternate address.</p>
<code>OwnerId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The ID of the owner of the account associated with this contact.</p>
<code>Phone</code>	<p>Type</p> <p>phone</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Telephone number for the contact. Label is Business Phone.</p>

Field	Details
PhotoUrl	<p>Type url</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Path to be combined with the URL of a Salesforce instance (<i>Example:</i> <code>https://yourInstance.salesforce.com/</code>) to generate a URL to request the social network profile image associated with the contact. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the contact. Empty if Social Accounts and Contacts isn't enabled or if Social Accounts and Contacts is disabled for the requesting user.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
ReportsToId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description This field doesn't appear if <code>IsPersonAccount</code> is <code>true</code>.</p>
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Honorific abbreviation, word, or phrase to be used in front of name in greetings, such as Dr. or Mrs.</p>
Suffix	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Name suffix of the contact up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>

Field	Details
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Title of the contact, such as CEO or Vice President.</p>

 **Note:** If you are importing contact data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Use this object to manage individual people who are associated with an account. You can create, query, delete, or update any attachment associated with a contact.

Create or update contacts by converting a lead with the `convertLead()` call.

ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentEmail` field. If the `IsDifferentEmail` field's value is `False`, that means the `Email` field value is *the same* on the Salesforce contact record and its matched Data.com record.

ContactCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the contact record.
- `IsDifferent` indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the contact record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
CleanedByJob	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact record was cleaned by a Data.com Clean job (<code>true</code>) or not (<code>false</code>).</p>
CleanedByUser	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact record was cleaned by a Salesforce user (<code>true</code>) or not (<code>false</code>).</p>
ContactId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique, system-generated ID assigned when the contact record was created.</p>

Field Name	Details
ContactStatusDataDotCom	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The status of the contact per Data.com. Values are: Contact is Active per Data.com, Phone is Wrong per Data.com , Email is Wrong per Data.com, Phone and Email are Wrong per Data.com, Contact Not at Company per Data.com, Contact is Inactive per Data.com, Company this contact belongs to is out of business per Data.com, Company this contact belongs to never existed per Data.com or Email address is invalid per Data.com.</p>
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the contact.</p>
DataDotComID	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the contact.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The email address for the contact.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The contact's first name.</p>

Field Name	Details
IsDifferentCity	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>City</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCountry	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Country</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCountryCode	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Country Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentEmail	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Email</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentFirstName	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>First Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentLastName	<p>Type boolean</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Last Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPhone</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Phone</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPostalCode</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>Postal Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentState</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>State</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStateCode</code>	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the contact's <code>State Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStreet</code>	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the contact's <code>Street</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the contact's <code>Title</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAddress</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Address</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongEmail</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Email</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the contact's <code>Name</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the contact's <code>Phone</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongTitle</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Title</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsInactive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contact has been reported to Data.com as <i>Inactive</i> (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedAddress</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Address</code> field value is in a <i>Reviewed</i> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedEmail</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Email</code> field value is in a <i>Reviewed</i> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedName</code>	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the contact's <code>Name</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedPhone</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Phone</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedTitle</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the contact's <code>Title</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>LastMatchedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date the contact record was last matched and linked to a Data.com record.</p>
<code>LastName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The contact's last name.</p>
<code>LastStatusChangedById</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of who or what last changed the record's <code>Clean Status</code> field value: a Salesforce user or a Clean job.</p>

Field Name	Details
LastStatusChangedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date on which the record's <code>Clean Status</code> field value was last changed.</p>
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Field label is Contact Clean Info Name. The name of the contact. Maximum size is 255 characters.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The phone number for the contact.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>Details for the billing address of the contact.</p>
State	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Details for the billing address of the contact.</p>
Street	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Details for the billing address of the contact.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The contact's title.</p>

Usage

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.

Create a customized set of `Title` field values. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

ContactFeed

Represents a single feed item in the feed on a contact record detail page. This object is available in API version 18.0 and later.

A contact feed shows recent changes to a contact record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to Contact records.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Contact object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of ContactFeed. Required when Type is TextPost. Optional when Type is ContentPost or LinkPost. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, CommentCount isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through CommentCount, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type</p> <p>base64</p> <p>Properties</p> <p>Nullable</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type</p> <p>int</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type</p> <p>string</p>

Field	Details
	<p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the contact record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>

Field	Details
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • AnnouncementPost—Not used. • ApprovalPost—generated when a user submits an approval. • BasicTemplateFeedItem—Not used. • CanvasPost—a post made by a canvas app posted on a feed. • CollaborationGroupCreated—generated when a user creates a public group. • CollaborationGroupUnarchived—Not used. • ContentPost—a post with an attached file. • CreatedRecordEvent—generated when a user creates a record from the publisher. • DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold.

Field	Details
	<ul style="list-style-type: none"> • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user’s Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Visibility

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`Visibility` can have the following values:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `Visibility`:

- For record posts, `Visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `Visibility` only to `AllUsers`.

Field	Details
	<ul style="list-style-type: none"> On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for a contact record.

[UserProfileFeed](#)

ContactHistory

Represents the history of changes to the values in the fields of a contact. This object is available in versions 11.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>

Field	Details
ContactId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Contact. Label is Contact ID.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to a contact.

This object respects field level security on the parent object.

[Contact](#)

ContactOwnerSharingRule

Represents the rules for sharing a contact with a User other than the owner.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ContactAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of access granted to the target Group, UserRole, or User for Contacts. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>The ID representing the source group. A Contact owned by a User in the source Group triggers the rule to give access.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The ID representing the User or Group being granted access.</p>

Usage

Use this object to manage the sharing rules for contacts.

SEE ALSO:

[Contact](#)

[ContactShare](#)

[Metadata API Developer Guide: SharingRules](#)

ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ContactId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Contact associated with this sharing entry. This field can't be updated.</p>
ContactAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to cases associated with the account Contact. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All This value is not valid for create or update. <p>This field must be set to an access level that is higher than the organization's default access level for contacts.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default). There are many possible values, including:</p> <ul style="list-style-type: none"> • <code>Rule</code>—The User or Group has access via a Contact sharing rule. • <code>ImplicitChild</code>—The User or Group has access to the Contact via sharing access on the associated Account.

Field	Details
	<ul style="list-style-type: none"> <code>Manual</code>—The User or Group has access because a User with “All” access manually shared the Contact with them. <code>Owner</code>—The User is the owner of the Contact.
<code>UserOrGroupId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Contact. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view or edit Contact records owned by other users.

SEE ALSO:

[AccountShare](#)

ContactTag

Associates a word or short phrase with a Contact.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>ItemId</code>	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter</p>

Field Name	Details
	<p>Description</p> <p>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Restricted picklist</p> <p>Description</p> <p>Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

ContactTag stores the relationship between its parent TagDefinition and the Contact being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

ContentAsset

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Only admin users can create, edit, or delete ContentAssets.
- It isn't necessary to create asset files for regular, collaborative use of Salesforce Files. "Assetize" files only when they're used in setup and configuration situations.
- Neither the file (ContentDocument) nor the asset settings record (ContentAssets) can be deleted if the asset file is referenced by another component.
- ContentAsset doesn't support search or most recently used (MRU) lists.
- ContentAsset doesn't support Apex triggers.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the document.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the asset file in the API. ContentAsset.DeveloperName:</p> <ul style="list-style-type: none"> • must be 40 characters or fewer • must begin with a letter • can contain only underscores and alphanumeric characters • can't include spaces • can't end with an underscore • can't contain 2 consecutive underscores <p>In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>
isVisibleByExternalUsers	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether unauthenticated users can see the asset file.</p>

Field	Details
Language	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language for this document. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as <code>de_DE</code> or <code>en_GB</code>. For more information on locales, see the <code>Language</code> field on the <code>CategoryNodeLocalization</code> object.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The master label for the asset file. This internal label doesn't get translated.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p>

ContentBody

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

Cannot be queried, inserted, updated, or deleted directly.

Fields

Field	Details
Id	<p>Type ID</p> <p>Properties , Filter, Group, idLookup, Sort</p> <p>Description ID of the file body.</p>

Usage

ContentBody is intended for internal Salesforce use. If you need to access the file content body, please use ContentVersion.

ContentDistribution

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- Users can query the `DistributionPublicUrl` and `Password` fields only if they are the file owner, if the file is shared with them, or if the `RelatedRecordId` specifies a record that the users can access.
- If the shared document is deleted, the delete cascades to any associated ContentDistribution. The ContentDistribution is still queryable by using the `QueryAll` verb.
- If the shared document is archived, the only fields that users can edit are `ExpiryDate` and `PreferencesExpires`.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

Fields

Field Name	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the shared document.</p>
ContentDownloadUrl	<p>Type string</p> <p>Properties , SortNillable</p> <p>Description The link for downloading the file. This field is available in API version 40.0 and later.</p>
ContentVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the shared document version.</p>
DistributionPublicUrl	<p>Type string</p> <p>Properties Nillable, Sort</p> <p>Description URL of the link to the shared document.</p>
ExpiryDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date when the shared document becomes inaccessible.</p>
FirstViewDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field Name	Details
	<p>Description Date when the shared document is first viewed.</p>
LastViewDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date when the shared document was last viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the content delivery.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the user who owns the shared document.</p>
PdfDownloadUrl	<p>Type string</p> <p>Properties , SortNillable</p> <p>Description The link for downloading the file as a PDF. This field is available in API version 40.0 and later.</p>
Password	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description A password that allows access to a shared document.</p>
PreferencesAllowOriginalDownload	<p>Type boolean</p>

Field Name	Details
	<p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the shared document can be downloaded as the file type that it was uploaded as.</p> <p>When <code>false</code>, download availability depends on whether a preview of the file exists. If a preview exists, the file can't be downloaded. If a preview doesn't exist, the file can still be downloaded.</p> <p>If the shared document is a link, it can't be downloaded.</p>
PreferencesAllowPDFDownload	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the shared document can be downloaded as a PDF if the original file type is PDF or if a PDF preview has been generated.</p>
PreferencesAllowViewInBrowser	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, a preview of the shared document can be viewed in a Web browser.</p>
PreferencesExpires	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, access to the shared document expires on the date that's specified by <code>ExpiryDate</code>.</p>
PreferencesLinkLatestVersion	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, users see the most recent version of a shared document. When <code>false</code>, users see the version of the document that's shared, even if it isn't the most recent version.</p>

Field Name	Details
PreferencesNotifyOnVisit	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the owner of the shared document is emailed the first time that someone views or downloads the shared document.</p>
PreferencesNotifyRndtnComplete	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, the owner of the shared document is emailed when renditions of the shared document that can be previewed in a Web browser are generated.</p>
PreferencesPasswordRequired	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description When <code>true</code>, a password, specified by <code>Password</code>, is required to access the shared document.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the record, such as an Account, Campaign, or Case, that the shared document is related to.</p>
ViewCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of times that the shared document has been viewed.</p>

Usage

Use this object to create, update, delete, or query information about a document shared externally via a link or via Salesforce CRM Content delivery.

The ContentDistribution object supports triggers before and after these operations: insert, update, delete. It supports triggers after undelete.

Example: The VP of Marketing wants file authors to specify whether their files can be shared with external people using content delivery. He also wants some files to have a password. You can add a custom field `DeliveryPolicy` on the ContentVersion object. Make the custom field a picklist with the values, `Allowed`, `Blocked`, and `Password required`. Add the field to the ContentVersion layout so that the user can set the delivery policy per file. Then, add an insert trigger for the ContentDistribution object to enforce the rules based on the delivery policy set in the file.

Note: The `ContentVersionId` for ContentDistribution must be unique.

This trigger for the ContentDistribution object enforces the delivery policy rules for each file:

```
trigger deliveryPolicy on ContentDistribution (before insert) {
    for (ContentDistribution cd : trigger.new) {
        String versionId = DeliveryPolicyHelper.getContentVersionId(cd);
        ContentVersion version = [select DeliveryPolicy__c from ContentVersion where
Id = :versionId];
        String policy = version.DeliveryPolicy__c;
        if (policy.equals('Blocked')) {
            cd.addError('This file is not allowed to be delivered.');
```

The trigger calls this helper class:

```
public class DeliveryPolicyHelper {
    public static String getContentVersionId(ContentDistribution cd) {
        if (cd.ContentVersionId != null) {
            return cd.ContentVersionId;
        } else {
            String versionId = [select LatestPublishedVersionId from ContentDocument
where Id = :cd.ContentDocumentId].get(0).LatestPublishedVersionId;
            return versionId;
        }
    }

    public static boolean requirePassword(ContentDistribution cd) {
        return cd.PreferencesPasswordRequired;
    }
}
```

Important: Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- ContentDistributionView can be deleted by an admin.
- If the shared document is deleted, the delete cascades to any associated ContentDistributionView. The ContentDistributionView is still queryable by using the `QUERYALL` verb.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

Fields

Field Name	Details
DistributionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the content delivery that the document is part of.</p>
IsDownload	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description <code>true</code> if the shared document is downloaded; <code>false</code> if the shared document is viewed.</p>
IsInternal	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description <code>true</code> if the shared document is viewed by a user in the same organization; <code>false</code> if viewed by an external user.</p>
ParentViewId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of this instance of accessing the shared document.</p>

Usage

Use this read-only object to query information about users who are accessing shared documents.

ContentDocument

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

The maximum number of documents that can be published is 30,000,000. Archived files count toward this limit and toward storage usage limits.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period.
- Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- Users (including users with the “View All Data” permission) can only query files they have access to, including:
 - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
 - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).

- A Salesforce CRM Content document can be deleted if any of the following are true:
 - The document is published into a personal library or is in the user's upload queue.
 - The document is published into a public library, the user is a member of that library with the “Add Content” library privilege enabled, and the user trying to delete the document is the owner.
 - The document is published into a public library that has the “Delete Content” or “Manage Library” permission enabled, and the user trying to delete the document is not the owner.

For API version 25.0 and later, you can change ownership of Salesforce Files and Salesforce CRM Content documents.

- The following must be true to change ownership of a Salesforce CRM Content document:
 - The Salesforce CRM Content app must be enabled.
 - The user who is becoming the owner of the document must have a Salesforce CRM Content feature license.
- A user can change ownership of a Salesforce CRM Content document or Salesforce file if any of the following are true:
 - The user is the current owner, or has either the “Modify All Data” or “Manage Salesforce CRM Content” permission enabled.
 - The user has the “Manage Library” permission enabled for the library containing the document.

Note:

- The user who is becoming the owner of the document must be a visible user who is active, but the original owner can be inactive.
- A document's owner can be changed to a user who doesn't have access to the library that contains the document. Library administrators may need to give the new owner membership to the library.

Fields

Field	Details
ArchivedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the user who archived the document. This field is available in API version 24.0 and later.</p>
ArchivedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The date when the document was archived. This field is available in API version 24.0 and later.</p>

Field	Details
ContentAssetId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description If the ContentDocument is an asset file, this field points to the asset. For most entities, the value of this field is null. This field is available in API version 38.0 and later.</p>
ContentModifiedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date the document was modified. ContentModifiedDate updates when, for example, the document is renamed or a new document version is uploaded. When you're uploading the first version of a document, ContentModifiedDate can be set to the current time or any time in the past. This field is available in API version 32.0 and later.</p>
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The size of the document in bytes. This field is available in API version 31.0 and later.</p>
Description	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description A description of the document. This field is available in API version 31.0 and later.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
FileExtension	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>File extension of the document.</p> <p>This field is available in API version 31.0 and later.</p>
FileType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Type of document, determined by the file extension.</p> <p>This field is available in API version 31.0 and later.</p>
IsArchived	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the document has been archived (<code>true</code>) or not (<code>false</code>).</p>
LastReferencedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LatestPublishedVersionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>ID of the latest document version (<code>ContentVersion</code>).</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort, Update</p> <p>Description</p> <p>ID of the owner of this document.</p>
ParentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>ID of the library that owns the document. Created automatically when inserting a <code>ContentVersion</code> via the API for the first time.</p> <p>This field is available in API version 24.0 and later when Salesforce CRM Content is enabled.</p>
PublishStatus	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Indicates if and how the document is published. Valid values are:</p> <ul style="list-style-type: none"> • P—The document is published to a public library and is visible to other users. Label is Public. • R—The document is published to a personal library and is not visible to other users. Label is Personal Library. • U—The document is not published because publishing was interrupted. Label is Upload Interrupted.

Field	Details
SharingOption	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
SharingPrivacy	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others.</p> <p>This field is available in API versions 41.0 and later.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The title of a document.</p>

Usage

- Use this object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file. Use the `ContentVersion` object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file.
- The `query()` call doesn't return archived documents. The `queryAll()` call returns archived documents.
- You can't add new versions of archived documents.
- To query a file that is shared only with a record, you must specify the content ID of the file.
- To create a document, create a new version via the `ContentVersion` object without setting the `ContentDocumentId`. This process automatically creates a parent document record. When adding a new version of the document, you must specify an existing `ContentDocumentId` which initiates the revision process for the document. When the latest version is published, the title, owner, and publish status fields are updated in the document.

- When you delete a document, all versions of that document are deleted, including ratings, comments, and tags.
- You can't create, edit, or delete content packs via the API.
-  **Note:** Content metadata, such as tags, custom fields, and content owners are tracked at the version level rather than at the document level.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- A document record is a container for multiple version records. You create a new version to add a document to the system. The new version contains the actual file data which allows the document to have multiple versions. The version stores the body of the uploaded document.
- Assign topics to ContentDocument using `TopicAssignment` in API version 37.0 or later.

[ContentVersion](#)

ContentDocumentFeed

Represents a single feed item associated with ContentDocument. A content document feed shows these content document changes: creating a ContentDocument file and uploading a new ContentDocument. This object is available in versions 20.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the ContentDocument object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The content of ContentDocumentFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ContentData	<p>Type</p> <p>base64</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nillable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type</p> <p><code>int</code></p> <p>Properties</p> <p><code>Group, Nillable, Sort</code></p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type</p> <p><code>string</code></p> <p>Properties</p> <p><code>Group, Nillable, Sort</code></p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type</p> <p><code>dateTime</code></p> <p>Properties</p> <p>Defaulted on create, Filter, Sort</p> <p>Description</p> <p>Date and time when this record was created. This field is a standard system field.</p> <p>Ordering by <code>CreatedDate DESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type</p> <p><code>reference</code></p> <p>Properties</p> <p><code>Filter, Group, Nillable, Sort</code></p> <p>Description</p> <p>This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only.</p> <p>ID of the associated <code>FeedPost</code>. A <code>FeedPost</code> represents the following types of changes in an <code>FeedItem</code>: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type</p> <p><code>reference</code></p>

Field	Details
	<p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Create, Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default <code>community</code>, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community.

Field	Details
	<ul style="list-style-type: none"> • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> • Only feed items with a <code>Group</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. • You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the document that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. For Work.com thanks posts, it's the ID of the <code>WorkThanks</code> object associated with a <code>RypplePost</code>. This field is typically null for all posts except <code>ContentPost</code> and <code>RypplePost</code>.</p> <p>For example, set this field to an existing <code>ContentVersion</code> and post it to a feed as a <code>FeedItem</code> object of Type <code>ContentPost</code>.</p>
<code>Title</code>	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort, Update</p> <p>Description The title of the <code>FeedItem</code>. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name. The <code>Title</code> field can be updated on posts of Type <code>QuestionPost</code>.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p>

Field

Details

Description

The type of `FeedItem`. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create `FeedItem` types directly from the API.

- `ActivityEvent`—indirectly generated event when a user or the API adds a `Task` associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a `Task` or `Event` associated with a case record (excluding email and call logging).

For a recurring `Task` with `CaseFeed` disabled, one event is generated for the series only. For a recurring `Task` with `CaseFeed` enabled, events are generated for the series and each occurrence.

- `AdvancedTextPost`—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

- `AttachArticleEvent`—generated event when a user attaches an article to a case.
- `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- `CaseCommentPost`—generated event when a user adds a case comment for a case object.

Field	Details
	<ul style="list-style-type: none"> • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. • <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case. • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case. <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Visibility

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`visibility` can have the following values:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `visibility`:

- For record posts, `visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `visibility` only to `AllUsers`.
- On user and group posts, only internal users can set `visibility` to `InternalUsers`.

Usage

Use this object to track changes for a `ContentDocument` object.

SEE ALSO:

[ContentDocument](#)

ContentDocumentHistory

Represents the history of a document. This object is available in versions 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

Fields

Field	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the document.</p>
<code>Division</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as “North America,” “Healthcare,” or “Consulting.” Available only if the organization has the Division permission enabled.</p>
<code>Field</code>	<p>Type picklist</p> <p>Properties Filter, Group, Sort, Restricted picklist</p> <p>Description The name of the field that was changed. Possible values include:</p> <ul style="list-style-type: none"> • <code>contentDocPublished</code>—The document is published into a library.

Field	Details
	<ul style="list-style-type: none"> • <code>contentDocUnpublished</code>—The document is archived or removed from a library, either directly or when the owning library is changed. • <code>contentDocRepublished</code>—The document is removed from the archive. • <code>contentDocFeatured</code>—The document is featured. • <code>contentDocSubscribed</code>—The document is subscribed to. • <code>contentDocUnsubscribed</code>—The document is no longer subscribed to.
<code>NewValue</code>	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
<code>OldValue</code>	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this read-only object to query the history of a document.

[ContentDocument](#)

ContentDocumentLink

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- Users (including users with the “View All Data” permission) can only query files they have access to, including:
 - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
 - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).
- In API versions 33.0 and later, you can create and delete ContentDocumentLink objects with a `LinkedEntityId` of any record type that can be tracked in the feed, even if feed tracking is disabled for that record type.
- In API versions 25.0 and later, you can create ContentDocumentLink objects with a `LinkedEntityId` of type `User`, `CollaborationGroup`, or `Organization`.
- In API versions 21.0 and later, users with explicit Viewer access (the file has been directly shared with the user) to a file can delete ContentDocumentLink objects between the file and other users who have Viewer access. In the same API versions, any user with Viewer access to a file can delete ContentDocumentLink objects between the file and organizations or groups of which they are a member.
- For organizations with Communities enabled, a document can only be shared with users and groups that are a part of the [community](#) the file was created in.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the document.</p>
LinkedEntityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the linked object. Can include Chatter users, groups, records (any that support Chatter feed tracking including custom objects), and Salesforce CRM Content libraries.</p>
ShareType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Required. The permission granted to the user of the shared file in a library. This is determined by the permission the user already has in the library. This field is available in API version 25.0 and later.</p> <p>V</p> <p>Viewer permission. The user can explicitly view but not edit the shared file.</p> <p>C</p> <p>Collaborator permission. The user can explicitly view and edit the shared file.</p> <p>I</p> <p>Inferred permission. The user's permission is determined by the related record. For shares with a library, this is defined by the permissions the user has in that library.</p>
Visibility	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Specifies whether this file is available to all users, internal users, or shared users. This field is available in API version 26.0 and later.</p> <p>Visibility can have the following values.</p> <ul style="list-style-type: none"> • AllUsers—The file is available to all users who have permission to see the file. • InternalUsers—The file is available only to internal users who have permission to see the file. • SharedUsers—The file is available to all users who can see the feed to which the file is posted. SharedUsers is used only for files shared with users, and is available only when an org has private org-wide sharing on by default. The SharedUsers value is available in API version 32.0 and later. <p>Note the following exceptions for Visibility.</p> <ul style="list-style-type: none"> • AllUsers & InternalUsers values apply to files posted on standard and custom object records, but not to users, groups, or content libraries. • For posts to a record feed, Visibility is set to InternalUsers for all internal users by default. • External users can set Visibility only to AllUsers. • On user and group posts, only internal users can set Visibility to InternalUsers. • For posts to a user feed, if the organization-wide default for user sharing is set to private, Visibility is set to SharedUsers. <p>The visibility setting onContentDocumentLink determines a file's visibility on a record post. When a file has multiple references posted in a feed, the file's visibility is determined by the most visible setting.</p>

Usage

Use this object to query the locations where a file is shared or query which files are linked to a particular location. For example, the following query returns a particular document shared with a Chatter group:

```
SELECT ContentDocument.title FROM ContentDocumentLink WHERE ContentDocumentId =
'069D00000000so2' AND LinkedEntityId = '0D5000000089123'
```

- You can't run a query without filters against ContentDocumentLink.
- You can't filter on ContentDocument fields if you're filtering by ContentDocumentId. You can only filter on ContentDocument fields if you're filtering by LinkedEntityId.
- You can't filter on the related object fields. For example, you can't filter on the properties of the account to which a file is linked. You can filter on the properties of the file, such as the title field.

A SOQL query must filter on one of Id, ContentDocumentId, or LinkedEntityId.

The ContentDocumentLink object supports triggers before and after these operations: insert, update, delete.

 **Example:** This trigger for the ContentDocumentLink object prevents public XLSX files from being shared.

```
trigger NoShareXLSX on ContentDocumentLink (after insert) {
    for (ContentDocumentLink cdl : trigger.new) {
        if (!CDLHelper.isSharingAllowed(cdl)) {
            cdl.addError('Sorry, you cannot share this file.');
        }
    }
}
```

The trigger calls this helper class.

```
public class CDLHelper {

    /**
     * Gets FileExtension of the inserted content.
     */
    public static String getFileExtension(ContentDocumentLink cdl) {
        String fileExtension;
        String docId = cdl.ContentDocumentId;
        FileExtension = [select FileExtension from ContentVersion where ContentDocumentId
= :docId].get(0).FileExtension;
        return FileExtension;
    }

    /**
     * Checks the file's PublishStatus and FileExtension to decide whether user can
share the file with others.
     * PublishStatus 'P' means the document is in a public library.
     */
    public static boolean isSharingAllowed(ContentDocumentLink cdl) {
        String docId = cdl.ContentDocumentId;
        ContentVersion version = [select PublishStatus,FileExtension from ContentVersion
where ContentDocumentId = :docId].get(0);
        if (version.PublishStatus.equals('P') && (version.FileExtension != null &&
version.FileExtension.equals('xlsx'))) {
            return false;
        }
    }
}
```

```

        return true;
    }

    /**
     * Gets the parent account name if the file is linked to an account.
     */
    public static String getAccountName(ContentDocumentLink cdl) {
        String name;
        String id = cdl.LinkedEntityId;
        if (id.substring(0,3) == '001') {
            name = [select Name from Account where Id = :id].get(0).Name;
        }
        return name;
    }
}

```

 **Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

SEE ALSO:

[ContentDocument](#)

ContentDocumentSubscription

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the file.</p>

Field	Details
IsCommentSub	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the user made comments on the file.</p>
IsDocumentSub	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether the user follows the file.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user following or commenting on the file.</p>

ContentFolder

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolder.
- All users with a content feature license can modify folders in their personal library.
- To modify a folder, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the folder.</p>
ParentContentFolderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the ParentFolder.</p>

ContentFolderItem

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Fields

Field Name	Details
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The file or folder size of the ContentFolderItem.</p>

Field Name	Details
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Specifies the file extension if the ContentFolderItem is a file.</p>
FileType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Specifies the type of file if ContentFolderItem is a file.</p>
IsFolder	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the ContentFolderItem is a folder, and not a file.</p>
ParentContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the ContentFolder that the ContentFolderItem resides in.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the file or folder.</p>

Usage

ContentFolderLink

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Salesforce CRM Content must be enabled to access ContentFolderLink.
- ContentFolderLink is read-only in the context of a library.

Fields

Field Name	Details
ContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the folder.</p>
EnableFolderStatus	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Indicates the status of enabling folders for the library. Valid values are:</p> <ul style="list-style-type: none"> • C — Completed folder enablement • S — Started folder enablement • F — Failed folder enablement <p>This field is available in API version 39.0 and later.</p>
ParentEntityId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field Name	Details
	Description Name of the entity the folder hierarchy is linked to.

ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolderMember.
- All users with a content feature license can modify folders in their personal library.
- To modify ContentFolderMember, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
ChildRecordId	Type reference Properties Filter, Group, Sort Description ID of the file.
ParentContentFolderId	Type reference Properties Filter, Group, Sort, Update Description ID of the folder the file is in.

ContentHubItem

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Fields

Field Name	Details
<code>ContentHubRepositoryId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable</p> <p>Description The ID for the related external data source described by the ContentHubRepository object.</p>
<code>ContentModifiedDate</code>	<p>Type dateTime</p> <p>Properties Nillable</p> <p>Description Date the file or folder content last changed.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Group, Nillable</p> <p>Description File or folder size.</p>
<code>Description</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description Explanation of item in external data source.</p>
<code>ExternalContentUrl</code>	<p>Type url</p>

Field Name	Details
	<p>Properties Group, Nillable</p> <p>Description The URL of the document content in the external data source.</p>
ExternalDocumentUrl	<p>Type url</p> <p>Properties Group, Nillable</p> <p>Description The URL of the detail page in the external data source.</p>
ExternalId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID for the file or folder in the external data source.</p>
FileExtension	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description File format extension, such as .doc or .pdf</p>
FileType	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description Complete file type, such as "Microsoft Word Document."</p>
IsFolder	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether item is a folder or file.</p>
MimeType	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable</p> <p>Description MIME type of the content.</p>
Name	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Name of the file or folder in the external data source.</p>
Owner	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description Username of the content owner in the external data source.</p>
ParentId	<p>Type string</p> <p>Properties Filter, Group, Nillable</p> <p>Description The ID of the parent folder for the record.</p> <p>This field isn't returned in queries or searches of the ContentHubItem object. It supports only WHERE clauses, such as the following:</p> <pre>WHERE ContentHubRepositoryId = <ID of external source> and ParentId = <ID of parent folder or record>.</pre> <p>Or specify WHERE ParentId = <name of root folder> to return the children of the root folder.</p> <p> Tip: The ParentId field supports both Salesforce IDs (in the format "0CHxxx") and external IDs.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable</p>

Field Name	Details
	<p>Description</p> <p>The title that appears in the content, which often differs from the <code>Name</code> of the containing file or folder.</p>
UpdatedBy	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable</p> <p>Description</p> <p>Username for the person who last updated the file.</p>

Usage

The following SOQL query examples show how to retrieve files and folders from a Files Connect external data source. These examples use placeholders for ID values for the repository ID and folder IDs. Before running these queries, replace the placeholders with valid ID values for your external data source and folders.

! **Important:** You must filter queries and searches on ContentHubItem with the ContentHubRepositoryId field; for example, `SELECT Id FROM ContentHubItem WHERE ContentHubRepositoryId = <ID of external data source>`.

Example 1: Get the ID and name of the root folder in an external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = NULL
```

Example 2: List all folders and files under the specified root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
```

Example 3: List all external file data sources by querying ContentHubRepository.

```
SELECT DeveloperName
FROM ContentHubRepository
```

Example 4: List all files and folders in a given folder and external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<parent folder ID>'
```

Example 5: To return only folders in the result set, add `IsFolder = true` in the `WHERE` clause to a query that returns files and folders. For example, the following query lists all folders under the root folder.

```
SELECT Id, Name
FROM ContentHubItem
```

```
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
AND IsFolder = true
```

Example 6: Retrieve a link that is used to open the specified document in an external source.

```
SELECT ExternalDocumentUrl
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND Id = '<document ID>'
```

SOSL Example: Retrieve the ID and name of all documents that contain the search string. The result set is limited to the first 10 documents.

```
FIND {<search string>}
RETURNING ContentHubItem(Id, Name
                        WHERE ContentHubRepositoryId = '<repository ID>')
LIMIT 10
```

ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>

Field Name	Details
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Master label for the external data source. This display value is the internal label and does not get translated.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The data source type. Possible values are:</p> <ul style="list-style-type: none"> • contenthubGoogleDrive • contenthubOffice365 • contenthubOneDrive • contenthubSharepoint • contenthubBox • contenthubQuip

ContentNote

Represents a note in SalesforceSalesforce. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- Notes must be enabled.

Fields

Field	Details
Content	<p>Type base64</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the <code>Content</code> field must be escaped. You can escape special characters by calling <code>content.escapeHtml4()</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the note in bytes.</p>
CreatedById	<p>Type reference</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on createFilter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description ID of the user who created the note.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description Date the note was created.</p>
FileExtension	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the note.</p>
FileType	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of file for the note. All notes have a file type of <code>SNOTE</code>.</p>
Id	<p>Type id</p> <p>Properties Defaulted on createFilter, Group, Nillable, Sort</p> <p>Description ID of the note.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the note has been deleted.</p>
IsReadOnly	<p>Type boolean</p> <p>Properties Defaulted on create, Group, Sort</p> <p>Description Indicates whether the note is read only.</p>
LastModifiedById	<p>Type reference</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description The ID of the user who last modified the note.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description Date the note was last modified. Updates when the <code>Title</code> or <code>Content</code> of the note are updated.</p>

Field	Details
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable Sort</p> <p>Description Date the note was last viewed. This field is available in API version 35.0 and later.</p>
LatestPublishedVersionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the ContentVersion for the latest published version of the note.</p>
OwnerId	<p>Type reference</p> <p>Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission)</p> <p>Description ID of the owner of the note.</p>
SharingPrivacy	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others. This field is available in API versions 41.0 and later.</p>
TextPreview	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A preview of the note's content. This field is available in API version 35.0 and later.</p>

Field	Details
Title	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Namefield, Sort, Update</p> <p>Description Title of the note.</p>

Usage

- The ContentNote object represents notes created with the enhanced note taking tool, released in Winter '16.
- Use ContentNote to create, query, retrieve, search, edit, and update notes.
- ContentNote is built on ContentVersion, and so it has many of the same usages.
- Not all fields can be set for notes. Only the `Content` and `Title` fields can be updated.
- The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
- You can convert old Note records to Lightning Experience, so users can view and edit notes from the Notes & Attachments related list in Lightning Experience. Users can edit their converted notes, which are accessible from the Notes related list and Notes tab. Copy old Note records to newly created ContentNote records. Users assigned the Set Audit Fields Upon Creation permission can set the owner, created date, and last modified date on ContentNote records.
- SOQL and SOSL queries on the ContentNote return only the most recent version of the note.
- To relate a note to a record, use [ContentDocumentLink](#).

For example, the following Apex code creates a note and escapes any special characters so they are converted to their HTML equivalents.

 **Note:** Apex code doesn't need to be encoded to base64 before it is uploaded and downloaded.

```
ContentNote cn = new ContentNote();
cn.Title = 'test1';
String body = 'Hello World. Before insert/update, escape special characters such as ", ',
    &, and other standard escape characters.';
cn.Content = Blob.valueOf(body.escapeHTML4());
insert(cn);
```

In this example, the following code creates a note using text that is already formatted as HTML, so it does not need to be escaped.

```
ContentNote cn = new ContentNote();
cn.Title = 'test2';
String body = '<b>Hello World. Because this text is already formatted as HTML, it does not
    need to be escaped.
    Special characters such as &quot;;, etc. must already use their HTML equivalents.</b>';
cn.Content = body;
insert(cn);
```

ContentNotification

Represents a notification for a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
<code>EntityIdentifierId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the object with the notification.</p>
<code>EntityType</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of object with the notification. One of the following.</p> <ul style="list-style-type: none"> • <code>ContentDocument</code> • <code>ContentTagName</code> • <code>ContentVersion</code> • <code>ContentWorkspace</code> • <code>ContentWorkspacePermission</code> • <code>User</code>
<code>Nature</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Type of notification.</p>

Field	Details
Subject	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Subject of the notification.</p>
Text	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Text of the notification.</p>
UsersId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who received the notification.</p>

ContentTagSubscription

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
UserId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user following the tag on the file.</p>

ContentUserSubscription

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
SubscribedToUserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who is followed by another user.</p>
SubscriberUserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who follows another user.</p>

ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

The maximum number of versions that can be published in a 24-hour period is 200,000.

Note: Depending on how files are shared, queries on `ContentDocument` and `ContentVersion` without specifying an ID won't return all files a user has access to. For example, if a user only has access to a file because they have access to a record that the file is shared with, the file won't be returned in a query such as "SELECT Id FROM ContentDocument."

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- Customer and Partner Portal users must have the "View Content in Portal" permission to query content in libraries where they have access.
- Customer and Partner Portal users can only publish, version, or edit documents if they have a Salesforce CRM Content feature license.
- All users with a content feature license can create versions in their personal library.
- Users (including users with the "View All Data" permission) can only query files they have access to, including:
 - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
 - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).
- All users can update versions in their personal library.
- The owner of a version or document can update the document if they are a member of the library, regardless of library permissions.
- To update a Salesforce CRM Content document, the user must be a member of the library with one of these library privileges enabled:
 - "Add Content"
 - "Add Content On Behalf of Others"
 - "Manage Library"
- `FileType` is defined by either `ContentUrl` for links or `PathOnClient` for documents, but not both.
- In API version 34.0 and later, any file can be shared with libraries, whether the file originated in Chatter or in Salesforce CRM Content.
- In API version 39.0 and later, custom Apex download handlers can be created that can control access to documents. See the [Apex Developer Guide](#) for more information.

Fields

Field	Details
Checksum	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description MD5 checksum for the file.</p>

Field	Details
ContentBodyId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Allows inserting a file version independently of the file blob being uploaded. This field is available for query and insert only. It can only point to a ContentBody record. This field is available in API version 40.0 and later.</p>
ContentDocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the document.</p>
ContentLocation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Origin of the document. Valid values are:</p> <ul style="list-style-type: none">• S—Document is located within Salesforce. Label is Salesforce.• E—Document is located outside of Salesforce. Label is External.• L—Document is located on a social network and accessed via Social Customer Service. Label is Social Customer Service.
ContentModifiedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user who modified the document.</p>
ContentModifiedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description Date the document was modified.</p>

Field	Details
	<p><code>ContentModifiedDate</code> updates when, for example, the document is renamed or a new document version is uploaded. When uploading the first version of a document, <code>ContentModifiedDate</code> can be set to the current time or any time in the past.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Size of the document in bytes. Always zero for links.</p>
<code>ContentUrl</code>	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description URL for links. This is only set for links. One of the fields that determines the <code>FileType</code>. The character limit in API versions 42.0 and later is 1,300. The character limit in API versions 32.0 and earlier was 255.</p>
<code>Description</code>	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the content version.</p>
<code>Division</code>	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
<code>ExternalDataSourceId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>ID of the external document referenced in the <code>ExternalDataSource</code> object.</p>
<code>ExternalDocumentInfo1</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Stores the URL of the file in the external content repository. The integration from the external source determines the content for this string. After the reference or copy is created, the URL of the external file is updated when you:</p> <ul style="list-style-type: none"> • Republish a file reference in Lightning Experience • Open the document • Create a file reference in the Chatter REST API with <code>reuseReference</code> set to true. <p>When the file is updated, the shared link is updated to the most current version.</p>
<code>ExternalDocumentInfo2</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Contains the external file ID. Salesforce determines the content for this string, which is private. The content can change without notice, depending on the external system. After the file reference is created, this field isn't updated, even if the file path changes.</p>
<code>FeaturedContentBoost</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read only. Designates a document as featured.</p>
<code>FeaturedContentDate</code>	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Date the document was featured.</p>
<code>FileExtension</code>	<p>Type</p> <p>string</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the document. This field is available in API version 31.0 and later.</p>
FileType	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Type of content determined by <code>ContentUrl</code> for links or <code>PathOnClient</code> for documents.</p>
FirstPublishLocationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the location where the version was first published. If the version is first published into a user's personal library or My Files, the field will contain the ID of the user who owns the personal library or My Files. If the first version is published into a public library, the field will contain the ID of that library. Accepts all record IDs supported by <code>ContentDocumentLink</code> (anything a file can be attached to, like records and groups). Setting <code>FirstPublishLocationId</code> allows you to create a file and share it with an initial record/group in a single transaction, and have the option to create more links to share the file with other records or groups later. When a file is created, it's automatically linked to the record, and <code>PublishStatus</code> will change to <code>Public</code> from <code>Pending/Personal</code>. This field is only set the first time a version is published via the API. <code>FirstPublishLocationId</code> can't be set to another ID when a new content version is inserted.</p>
IsAssetEnabled	<p>Type boolean</p> <p>Properties Create, Group, Defaulted on create</p> <p>Description Can be specified on insert of <code>ContentVersion</code> to automatically convert a <code>ContentDocument</code> file into a <code>ContentAsset</code>. This field can be SOQL queried, but it can't be edited. This field is available in API version 38.0 and later.</p>

Field	Details
IsEncrypted	<p> Note: This information is about Shield Platform Encryption and not Classic Encryption.</p> <p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether files are encrypted using Shield Platform Encryption (<code>true</code>) or not (<code>false</code>). This field is available in API version 34.0 and later.</p>
IsLatest	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this is the latest version of the document (<code>true</code>) or not (<code>false</code>).</p>
IsMajorVersion	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description <code>true</code> if the document is a major version; <code>false</code> if the document is a minor version. Major versions can't be replaced.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description The language for this document. This field defaults to the user's language unless the organization is multi-language enabled. Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as <code>de_DE</code> or <code>en_GB</code>. For more information on locales, see the Language field on the CategoryNodeLocalization object.</p>
NegativeRatingCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Read only. The number of times different users have given the document a thumbs down.</p>

Field	Details
	<p>Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-down votes, and Version 2 receives 2 thumbs-down votes, the <code>NegativeRatingCount</code> on Version 2 is 12. However, rating counts are not retroactive for prior versions. The <code>NegativeRatingCount</code> on Version 1 is 10.</p>
<code>NetworkId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the community that this file originated from. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>You can only add a <code>NetworkId</code> when creating a file. You can't change or add a <code>NetworkId</code> for an existing file.</p>
<code>Origin</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The source of the content version. Valid values are:</p> <ul style="list-style-type: none"> • C—Content document from the user's personal library. Label is Content. The <code>FirstPublishLocationId</code> must be the user's ID. If <code>FirstPublishLocationId</code> is left blank, it defaults to the user's ID. • H—Salesforce file from the user's My Files. Label is Chatter. The <code>FirstPublishLocationId</code> must be the user's ID. If <code>FirstPublishLocationId</code> is left blank, it defaults to the user's ID. Origin can only be set to H if Chatter is enabled for your organization. <p>This field defaults to C. Label is Content Origin.</p>
<code>OwnerId</code>	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of this document.</p>
<code>PathOnClient</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The complete path of the document. One of the fields that determines the <code>FileType</code>.</p> <p> Note: Specify a complete path including the path extension in order for the document to be visible in the Preview tab.</p>
<code>PositiveRatingCount</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read only. The number of times different users have given the document a thumbs up.</p> <p>Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-up votes, and Version 2 receives 2 thumbs-up votes, the <code>PositiveRatingCount</code> on Version 2 is 12. However, rating counts are not retroactive for prior versions. The <code>PositiveRatingCount</code> on Version 1 is 10.</p>
<code>PublishStatus</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description</p> <p>Indicates if and how the document is published. Valid values are:</p> <ul style="list-style-type: none"> • P—The document is published to a public library and is visible to other users. Label is Public. • R—The document is published to a personal library and is not visible to other users. Label is Personal Library. • U—The document is not published because publishing was interrupted. Label is Upload Interrupted.
<code>RatingCount</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read only. Total number of positive and negative ratings.</p>
<code>ReasonForChange</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The reason why the document was changed. This field can only be set when inserting a new version (revising) a document.</p>
RecordTypeId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>ID of the record type of the version.</p> <p>Custom fields are restricted in <code>RecordTypeId</code>. When an administrator creates a custom field via the API it must be added to at least one page layout:</p> <ul style="list-style-type: none"> • If the custom field is added to the page layout associated with the General record type, the <code>RecordTypeId</code> that corresponds to that record type does not have to be set on the version record. • If the custom field is added to the page layout associated with a custom record type, the <code>RecordTypeId</code> that corresponds to that record type must be set on the version record.
SharingOption	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p>
SharingPrivacy	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Visible to Anyone With Record Access</code>. When set to <code>Private on Records</code>, the file is private on records but can be shared selectively with others.</p> <p>This field is available in API versions 41.0 and later.</p>

Field	Details
TagCsv	<p>Type textarea</p> <p>Properties Create, Nillable, Sort, Update</p> <p>Description Text used to apply tags to a content version via the API.</p>
TextPreview	<p>Type string</p> <p>Properties Nillable, Filter, Group, Sort</p> <p>Description A preview of a document. Available in API version 35.0 and later.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The title of a document.</p>
VersionData	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description</p> <p>The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the <code>Content</code> field must be escaped. You can escape special characters by calling <code>content.escapeHtml4()</code>.</p> <p>This field can't be set for links.</p> <p>The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in <code>VersionData</code>. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.</p> <p>If a custom Apex download handler is active, this field is accessed from the API, and the download is not allowed, Salesforce will return a <code>CONTENT_CUSTOMIZED_DOWNLOAD_EXCEPTION</code> error.</p>

Field	Details
VersionNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The version number. The number increments with each version of the document, for example, 1, 2, 3.</p>

Usage

- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file.
 - Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a Salesforce file.
 - To query a file that is shared only with a record, you must specify the content ID of the file.
 - Not all fields can be set for Salesforce Files.
 - You can only update a version if it is the latest version and if it is published.
 - You can't archive versions.
 - Using API version 32.0 and later, you can update record types on versions.
 - You can't delete a version via the API.
 - The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
 - To download a document via the API, you must export the `VersionData` of the document. This does not increase the download count.
 - When you upload a document from your local drive using the Data Loader, you must specify the actual path in both `VersionData` and `PathOnClient`. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
 - SOQL queries on the ContentVersion object return all versions of the document. SOSL searches on the ContentVersion object return only the most recent version of the document.
 - If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
 - Documents published into a personal library assume the default record type that is set for the user profile of the person publishing the document (General, if no default is set for the user profile).
-  **Note:** An administrator can rename the default (*Content Version Layout*) page layout.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.
 - Custom validation rules can prevent an update of documents published into a personal library via the API.

Applying Tags to ContentVersion Records

Tags can be applied to ContentVersion records using either Enterprise or Partner API.

To apply tags to a ContentVersion record, set a value in the `TagCsv` field. For example, setting this field to `one, two, three` creates and associates three tags to that version.

- The maximum length of the `TagCsv` field is 2,000 characters.
- The maximum length of an individual tag is 100 characters.
- When tags are applied to a version, the content is indexed automatically and the tags are searchable.
- You can't apply tags to a `TagCsv` that is published into a personal library.
- You can't apply tags using the ContentDocument object.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different uppercase and lowercase letters. The case of the original tag is always used.

To delete tags from a ContentVersion record, perform a standard API update, and remove any values from the `TagCsv` field that you want to delete. For example, if the original `TagCsv` is `one, two, three`, perform an API update specifying `one, three` in the `TagCsv` field to delete `two`. To delete all tags from a ContentVersion you perform a standard API update by setting the field to `null`.

If you create a ContentVersion record and want to revise it via the API, you insert another ContentVersion record but associate it to the same ContentDocument record as the original. This has an impact on tagging:

- If you insert the revision and do not set any value in the `TagCsv` field, any tags applied to the previous version are automatically applied to the new version.
- If you insert the revision and specify a new `TagCsv` field, no tags transfer over and the tags you specify are applied instead.

When you perform a SOQL query for a ContentVersion record and select the `TagCsv` field, all the tags associated with that record are returned. The tags in the string are always ordered alphabetically even if they were inserted in a different order. You can't use the `TagCsv` field as part of a filter in a SOQL query. You can't query all tags in your organization.

Library tagging rules:

- API tagging respects the tagging restrictions that exist on any library that the document is published into. For example, if the library is in restricted tagging mode and only allows tags `one, three`, you can't save a version with a `TagCsv` of `one, two, three`.
- If the library is in guided tagging mode, you can apply tags to the ContentVersion. You can't query the value of guided tags on a library, but you can query the tagging model of a library.

SEE ALSO:

[ContentDocument](#)

[ContentVersionHistory](#)

ContentVersionComment

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the file.</p>
ContentVersionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the version of the file.</p>
UserComment	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description ID of the user who commented on the file.</p>

ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

Fields

Field	Details
ContentVersionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the version.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed. Possible values include:</p> <ul style="list-style-type: none"> • <code>contentVersionCreated</code>—A new version is created. • <code>contentVersionUpdated</code>—The title, description, or any custom field on the version is changed. • <code>contentVersionDownloaded</code>—A version is downloaded. • <code>contentVersionViewed</code>—The version details are viewed. • <code>contentVersionRated</code>—The version is rated. • <code>contentVersionCommented</code>—The version receives a comment. • <code>contentVersionDataReplaced</code>—The new version replaces the previous version, which can happen only when the new version is uploaded immediately after the previous version.
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The new value of the field that was changed.</p>
OldValue	<p>Type</p> <p>anyType</p> <p>Properties</p> <p>Nullable, Sort</p> <p>Description</p> <p>The latest value of the field before it was changed.</p>

Usage

Use this read-only object to query the history of a document version.

SEE ALSO:

[ContentVersion](#)

ContentVersionRating

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
ContentVersionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of the version of the file.</p>

Field	Details
Rating	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Rating of the file.</p>
UserComment	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Comment made by the user who rated the file.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who rated the file.</p>

ContentWorkspace

Represents a content library. This object is available in versions 17.0 and later.

 **Note:** This object does not apply to personal libraries.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

 **Note:** `create()`, `update()` and `delete()` on `ContentWorkspace` are supported in API version 40.0 and later only.

Special Access Rules

- The Access Libraries user permission allows orgs to make libraries available to users without requiring that they have the legacy Salesforce CRM Content license. This permission is available for profiles and permission sets on most standard user licenses, and is not available for High Volume Customer Portal, Customer Community, or Chatter Free licenses. Available in API versions 40.0 and later.
- Users with the Create Libraries user perm or the Manage Salesforce CRM Content administrator permission can create libraries (ContentWorkspaces) from the Libraries tab in Salesforce Classic and from the API.

- Customer and Partner Portal users can only edit the library document object if they have a Salesforce CRM Content feature license.
- Customer and Partner Portal users can query this object if they have the “View Content in Portal” permission. A user can query all public libraries where they are members, regardless of library permissions.

Fields

Field	Details
DefaultRecordTypeId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the default content type for the library. Content types are the containers for custom fields in Salesforce CRM Content.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Text description of the content library.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Although libraries are not a packageable entity, references to libraries with a developer name will be included in the package when asset files are packaged. These links can then be restored in the target org.</p> <p>This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Label is Unique Name.</p> <p>This field is available in API version 39.0 and later.</p>
IsRestrictContentTypes	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p>

Field	Details
	<p>Description Read only. Indicates whether content types have been restricted (<code>true</code>) or not (<code>false</code>).</p>
<code>IsRestrictLinkedContentTypes</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Read only. Indicates whether linked content types have been restricted (<code>true</code>) or not (<code>false</code>).</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Name of the library.</p>
<code>NamespacePrefix</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Limit: 15 characters. This field is available in API version 39.0 and later.</p>
<code>RootContentFolderId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of root folder of the library. This field is available in API version 39.0 and later.</p>
<code>ShouldAddCreatorMembership</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Group</p>

Field	Details
	<p>Description</p> <p>Automatically create a library membership for the user creating the library. Please note this field is not meant for query and always returns false in query. This field is available in API version 40.0 and later.</p>
TagModel	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Filter, Nillable, Restricted picklist</p> <p>Description</p> <p>The type of tagging assigned to a library. Valid values are:</p> <ul style="list-style-type: none"> • U — Unrestricted. No restrictions on tagging. Users can enter any tag when publishing or editing content. • G — Guided. Users can enter any tag when publishing or editing content, but they are also offered a list of suggested tags. • R — Restricted. Users must choose from a list of suggested tabs.
WorkspaceType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Differentiates between different types of libraries. Valid values are:</p> <ul style="list-style-type: none"> • R — Regular library • B — Org asset library <p>This field is available in API version 39.0 and later.</p>

Usage

Use this object to query libraries to find out where documents can be published.

If the content type is not specified when publishing a new version into a library, it will be determined by the `DefaultRecordTypeId` of the primary library.

As of 40.0, you can create, update, or delete a library via the API.

SEE ALSO:

[ContentWorkspaceDoc](#)

ContentWorkspaceDoc

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

 **Note:** This object does not apply to documents and versions in a personal library.

Supported Calls

`create()`, `delete()`, `describeSObjects()` `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission in order to query and obtain content in libraries where they have access.
- Customer and Partner Portal users can only edit documents if they have a Salesforce CRM Content feature license.
- To create a ContentWorkspaceDoc, you must be a member of the library with one of these library privileges enabled:
 - “Add Content”
 - “Add Content On Behalf of Others”
 - “Manage Library”
- To query all library documents in a library, a user must be a member of that library, regardless of library permissions.

Fields

Field	Details
ContentDocumentId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Read only. ID of the library document.</p>
ContentWorkspaceId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Read only. ID of the library.</p>
IsOwner	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Read only. Indicates whether the library owns the document and determines permissions for that document (<code>true</code>) or not (<code>false</code>). Documents can belong to</p>

Field	Details
	more than one library, but only one library owns the document and determines its permissions.

Usage

- Use this object to link a document to one or more libraries.
- To share a document with additional libraries, create additional ContentWorkspaceDoc records which join the document to the additional libraries.
- Inserting a ContentWorkspaceDoc triggers the publish process for public libraries.
- A document can be published into many public libraries, but it will always be owned by one library which controls the security of the document.
- A document can only be published into the document owner's personal library. You can't publish into another user's personal library. Personal libraries are not visible via the API.
- To publish a document into a personal library, you must specify your user ID as the first publish location ID. If you leave the first publish location ID blank, it defaults to the current user's ID.
- A document can be published from a personal library into a public library, but once it has been published into the public library, it can't be published into the personal library again.
- You can't publish a document from a personal library into a public library that has restricted content types.
- You can't update or delete a library document via the API.

[ContentWorkspace](#)

ContentWorkspaceMember

Represents a member of a content library. This object is available in API version 40.0 and later.

Manage library membership from the API.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Special Access Rules

A user can create/update/delete memberships if they have the Manage Salesforce CRM Content admin perm or the Manage Library permission for the library concerned.

Fields

Field	Details
ContentWorkspaceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the library.</p>
ContentWorkspacePermissionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The id of the library permission or role.</p>
MemberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Namepointing, Sort</p> <p>Description ID of the library member (the member is either a user or a group).</p>
MemberType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of library member. Valid values are:</p> <ul style="list-style-type: none"> • G - Group • U - User

Usage

Use this object to create, update, or delete members from a library.

ContentWorkspacePermission

Represents a library permission. This object is available in API version 40.0 and later.

A library permission is a group of privileges assigned to each content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

 **Note:** Library permissions do not apply to personal libraries. All library users can save files in their personal libraries.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Special Access Rules

The ability to create permissions requires either the Manage Salesforce CRM Content admin perm or the Manage Content Permissions user perm.

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Namefield, Sort, Update</p> <p>Description Name of the library.</p>
PermissionsAddComment	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.</p>
PermissionsAddContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field	Details
	<p>Description Permission for user to publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.</p>
PermissionsAddContentOBO	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to choose an author when publishing content in the library.</p>
PermissionsArchiveContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to archive and restore any content in the library.</p>
PermissionsChatterSharing	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to make content from this library accessible outside of the library, sharing with a record or in Chatter. From a record or from Chatter, select a file from the library and attach it to a record or a post.</p>
PermissionsDeleteContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to delete any content in the library. Authors can undelete their own content from the Recycle Bin.</p>
PermissionsDeliverContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to share content outside the org via a content delivery or public link.</p>

Field	Details
PermissionsFeatureContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to identify any content in the library as “featured.”</p>
PermissionsManageWorkspace	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to perform any action in the library. This privilege is required to edit a library’s name and description, add or remove library members, or delete a library. Manage Library is a super permission which provides all other permission options listed except Deliver Content. Creating a library requires the Manage Salesforce CRM Content app permission or Create Libraries system permission.</p>
PermissionsModifyComments	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to edit or delete comments made to any content in the library.</p>
PermissionsOrganizeFileAndFolder	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to create, rename, and delete folders in libraries.</p>
PermissionsTagContent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Permission for user to add tags when publishing content or editing content details in the library.</p>
PermissionsViewComments	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Filter, Update</p> <p>Description Permission for user to view comments.</p>
Type	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Provides the type of access a user has to a library. Valid values are:</p> <ul style="list-style-type: none"> • Library Administrator • Author • Viewer • Custom

ContentWorkspaceSubscription

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
ContentWorkspaceId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the library.</p>

Field	Details
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user following the library.</p>

Contract

Represents a contract (a business agreement) associated with an Account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Account associated with this contract.</p>
ActivatedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the User who activated this contract.</p>
ActivatedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description Date and time when this contract was activated.</p>

Field	Details
BillingAddress	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.</p>
BillingCity	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address. Maximum size is 40 characters.</p>
BillingCountry	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 80 characters.</p>
BillingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the contract's billing address.</p>
BillingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>BillingLongitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
BillingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description Used with <code>BillingLatitude</code> to specify the precise geolocation of a billing address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>
<code>BillingPostalCode</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address of this account. Maximum size is 20 characters.</p>
<code>BillingState</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Details for the billing address. Maximum size is 80 characters.</p>
<code>BillingStateCode</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the contract's billing address.</p>
<code>BillingStreet</code>	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street address for the billing address.</p>
<code>CompanySignedDate</code>	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which the contract was signed by your organization.</p>
<code>CompanySignedId</code>	<p>Type reference</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the User who signed the contract.</p>
ContractNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description Number of the contract.</p>
ContractTerm	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Number of months that the contract is valid.</p>
CustomerSignedDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Date on which the customer signed the contract.</p>
CustomerSignedId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Contact who signed this contract.</p>
CustomerSignedTitle	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Title of the customer who signed the contract.</p>
Description	<p>Type textarea</p>

Field	Details
	<p>Properties Create, Nillable, Update</p> <p>Description Description of the contract.</p>
EndDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort,</p> <p>Description Read-only. Calculated end date of the contract. This value is calculated by adding the <code>ContractTerm</code> to the <code>StartDate</code>.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
LastActivityDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value is one of the following, whichever is the most recent:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastApprovedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Last date the contract was approved.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
OwnerExpirationNotice	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Number of days ahead of the contract end date (15, 30, 45, 60, 90, and 120). Used to notify the owner in advance that the contract is ending.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the user who owns the contract.</p>
Pricebook2Id	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the pricebook, if any, associated with this contract.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
ShippingAddress	<p>Type address</p>

Field	Details
	<p>Properties Filter, Nillable</p> <p>Description The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.</p>
ShippingCity	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details of the shipping address. City maximum size is 40 characters.</p>
ShippingCountry	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details of the shipping address. Country maximum size is 80 characters.</p>
ShippingCountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the contract's shipping address.</p>
ShippingLatitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLongitude</code> to specify the precise geolocation of a shipping address. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>
ShippingLongitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>ShippingLatitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.</p>

Field	Details
ShippingPostalCode	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details of the shipping address. Postal code maximum size is 20 characters.</p>
ShippingState	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Details of the shipping address. State maximum size is 80 characters.</p>
ShippingStateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the contract's shipping address.</p>
ShippingStreet	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The street address of the shipping address. Maximum of 255 characters.</p>
SpecialTerms	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Special terms that apply to the contract.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Start date for this contract. Label is Contract Start Date.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The picklist of values that indicate order status. Each value is within one of two status categories defined in <code>StatusCode</code>. For example, the status picklist may contain: Ready to Ship, Shipped, Received as values within the Activated <code>StatusCode</code>.</p>
StatusCode	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The status category for the contract. A contract can be Draft, InApproval, or Activated. Label is Status Category.</p>

Usage

The Contract object represents a business agreement.

The `Status` field specifies the current state of a contract. Status strings (defined in the ContractStatus object) represent its current state (Draft, InApproval, or Activated).

Client applications must initially create a Contract in a non-Activated state. Client applications can subsequently activate a Contract by updating it and setting the value in its `Status` field to Activated; however, the `Status` field is the only field you can update when activating the Contract.

Once a Contract has been activated, your client application can't change its status; however, prior to activation, your client application can change the status value from Draft to InApproval via the API. Also, your client application can delete contracts whose status is Draft or InApproval but not when a contract status is Activated.

Client applications can use the API to create, update, delete, and query any Attachment associated with a contract.

[ContractContactRole](#)

[ContractHistory](#)

[ContractStatus](#)

ContractContactRole

Represents the role that a given Contact plays on a Contract.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the Contact associated with this Contract.</p>
ContractId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Contract.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsPrimary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Specifies whether this Contact plays the primary role on this Contract (<code>true</code>) or not (<code>false</code>). Note that each contract has only one primary contact role. Default is <code>false</code>. Label is Primary.</p>
Role	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Name of the role played by the Contact on this Contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>ContractId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract.</p>

Usage

Use the `ContractContactRole` object to define the role that a given Contact plays on a given Contract within the context of a specific Opportunity.

SEE ALSO:

[ContractStatus](#)

ContractFeed

Represents a single feed item in the feed on the contract record detail page. This object is available in API version 18.0 and later.

A contract feed shows recent changes to a contract record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to contracts in Salesforce.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Contract object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nullable, Sort</p>

Field	Details
	<p>Description</p> <p>The content of ContractFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
<code>CommentCount</code>	<p>Type</p> <p><code>int</code></p> <p>Properties</p> <p><code>Filter</code>, <code>Group</code>, <code>Sort</code></p> <p>Description</p> <p>The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
<code>ConnectionId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p><code>Filter</code>, <code>Group</code>, <code>Nillable</code>, <code>Sort</code></p> <p>Description</p> <p>When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
<code>ContentData</code>	<p>Type</p> <p>base64</p> <p>Properties</p> <p><code>Nillable</code></p> <p>Description</p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type</p> <p>textarea</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>ContentType</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>CreatedDate</code>	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
<code>FeedPostId</code>	<p>Type reference</p>

Field	Details
	<ul style="list-style-type: none"> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p>

Field	Details
	<p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the FeedItem is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a FeedItem on the <code>NetworkScope</code> field.
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the contract record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>

Field	Details
Type	<p data-bbox="527 262 592 294">Type</p> <p data-bbox="568 304 641 336">picklist</p> <p data-bbox="527 346 649 378">Properties</p> <p data-bbox="568 388 998 420">Filter, Group, Nillable, Restricted picklist, Sort</p> <p data-bbox="527 430 657 462">Description</p> <p data-bbox="568 472 787 504">The type of feed item:</p> <ul data-bbox="568 514 1453 1732" style="list-style-type: none"> <li data-bbox="568 514 1453 651">• ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. <li data-bbox="568 787 1453 850">• AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. <li data-bbox="568 861 974 892">• AnnouncementPost—Not used. <li data-bbox="568 903 1250 934">• ApprovalPost—generated when a user submits an approval. <li data-bbox="568 945 1047 976">• BasicTemplateFeedItem—Not used. <li data-bbox="568 987 1242 1018">• CanvasPost—a post made by a canvas app posted on a feed. <li data-bbox="568 1029 1453 1060">• CollaborationGroupCreated—generated when a user creates a public group. <li data-bbox="568 1071 1153 1102">• CollaborationGroupUnarchived—Not used. <li data-bbox="568 1113 1071 1144">• ContentPost—a post with an attached file. <li data-bbox="568 1155 1453 1186">• CreatedRecordEvent—generated when a user creates a record from the publisher. <li data-bbox="568 1197 1453 1270">• DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold. <li data-bbox="568 1281 1453 1354">• DashboardComponentSnapshot—created when a user posts a dashboard snapshot on a feed. <li data-bbox="568 1365 1039 1396">• LinkPost—a post with an attached URL. <li data-bbox="568 1407 990 1438">• PollPost—a poll posted on a feed. <li data-bbox="568 1449 1453 1480">• ProfileSkillPost—generated when a skill is added to a user’s Chatter profile. <li data-bbox="568 1491 1209 1522">• QuestionPost—generated when a user posts a question. <li data-bbox="568 1533 1234 1564">• ReplyPost—generated when Chatter Answers posts a reply. <li data-bbox="568 1575 1380 1606">• RypplePost—generated when a user creates a Thanks badge in Work.com. <li data-bbox="568 1617 1031 1648">• TextPost—a direct text entry on a feed. <li data-bbox="568 1659 1299 1690">• TrackedChange—a change or group of changes to a tracked field. <li data-bbox="568 1701 1396 1732">• UserStatus—automatically generated when a user adds a post. Field	Details
	<ul style="list-style-type: none"> • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>
<p><code>Visibility</code></p>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>Visibility</code> can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for a contract record.

SEE ALSO:

[Contract](#)

[EntitySubscription](#)

[NewsFeed](#)

[UserProfileFeed](#)

ContractHistory

Represents the history of changes to the values in the fields of a contract.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ContractId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Contract. Label is Contract ID.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to a contract.

This object respects field level security on the parent object.

SEE ALSO:

[ContractStatus](#)

ContractLineItem

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssetId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Required. ID of the Asset associated with the contract line item. Must be a valid asset ID.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the contract line item.</p>

Field	Details
Discount	<p>Type percent</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The discount for the product as a percentage.</p> <p>When updating, if you specify <code>Discount</code> without specifying <code>TotalPrice</code>, the <code>TotalPrice</code> will be adjusted to accommodate the new <code>Discount</code> value, and the <code>UnitPrice</code> will be held constant.</p> <p>If you specify both <code>Discount</code> and <code>Quantity</code>, you must also specify either <code>TotalPrice</code> or <code>UnitPrice</code> so the system can determine which one to automatically adjust.</p>
EndDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The last day the contract line item is in effect.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LineItemNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Update</p> <p>Description Automatically-generated number that identifies the contract line item.</p>

Field	Details
ListPrice	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description Corresponds to the <code>UnitPrice</code> on the <code>PricebookEntry</code> that is associated with this line item, which can be in the standard pricebook or a custom pricebook. A client application can use this information to show whether the unit price (or sales price) of the line item differs from the pricebook entry list price.</p>
ParentContractLineItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The line item's parent line item, if it has one.</p>
PricebookEntryId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the associated <code>PricebookEntry</code>. Only exists if <code>Product2</code> is enabled.</p>
Product2Id	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The product related to the contract line item.</p>
Quantity	<p>Type double</p> <p>Properties Create, Filter, Update</p> <p>Description Number of units of the contract line item (product) included in the associated service contract.</p>
RootContractLineItemId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Read only) The top-level line item in a contract line item hierarchy. Depending on where a line item lies in the hierarchy, its root could be the same as its parent.</p>
ServiceContractId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the ServiceContract associated with the contract line item. Must be a valid asset ID.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The first day the contract line item is in effect.</p>
Status	<p>Type picklist</p> <p>Properties Filter, Nillable</p> <p>Description Status of the contract line item.</p>
Subtotal	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description Contract line item's sales price multiplied by the <code>Quantity</code>.</p>
TotalPrice	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description This field is available only for backward compatibility. It represents the total price of the ContractLineItem</p>

Field	Details
	<p>If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>UnitPrice</code> is required.</p> <p>This field is nillable, but you can't set both <code>TotalPrice</code> and <code>UnitPrice</code> to null in the same update request. To insert the <code>TotalPrice</code> for a contract line item via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity.</p>
<code>UnitPrice</code>	<p>Type currency</p> <p>Properties Create, Filter, Update</p> <p>Description The unit price for the contract line item. In the user interface, this field's value is calculated by dividing the total price of the contract line item by the quantity listed for that line item. Label is Sales Price.</p> <p>This field or <code>TotalPrice</code> is required. You can't specify both.</p> <p>If you specify <code>Discount</code> and <code>Quantity</code>, this field or <code>TotalPrice</code> is required.</p>

SEE ALSO:

[ContractLineItemHistory](#)

ContractLineItemHistory

Represents the history of changes to the values in the fields on a `ContractLineItem` (items in a customer support agreement). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
<code>ContractLineItemId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. ID of the <code>ContractLineItem</code>.</p>

Field	Details
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to a contract line item.

This object respects field level security on the parent object.

SEE ALSO:

[ContractLineItem](#)

ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Uniquely identifies a picklist value so it can be retrieved without using an id or master label.</p>
IsDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this is the default contract status value (<code>true</code>) or not (<code>false</code>) in the picklist.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Master label for this contract status value. This display value is the internal label that does not get translated.</p>

Field	Details
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number used to sort this value in the contract status picklist. These numbers are not guaranteed to be sequential, as some previous contract status values might have been deleted.</p>
StatusCode	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Code indicating the status of a contract. One of the following values:</p> <ul style="list-style-type: none"> • Draft • InApproval • Activated <p>Two other values (<code>Terminated</code> and <code>Expired</code>) are defined but are not available for use via the API.</p>

Usage

This object represents a value in the contract status picklist. The contract status picklist provides additional information about the status of a Contract, such as its current state (`Draft`, `InApproval`, or `Activated`). You can query these records to retrieve the set of values in the contract status picklist, and then use that information while processing Contract objects to determine more information about a given contract. For example, the application could test whether a given contract is activated based on its `Status` value and the value of the `StatusCode` property in the associated `ContractStatus` object.

SEE ALSO:

[ContractContactRole](#)

ContractTag

Associates a word or short phrase with a Contract.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

ContractTag stores the relationship between its parent TagDefinition and the Contract being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CorsWhitelistEntry

Cross-Origin Resource Sharing (CORS) enables web browsers to request resources from origins other than their own (cross-origin). For example, using CORS, JavaScript code at `https://www.example.com` could request a resource from `https://www.salesforce.com`. To access supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the origin serving the code to a Salesforce CORS whitelist.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `upsert()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description This picklist contains the following fully-supported languages:</p> <ul style="list-style-type: none"> • Chinese (Simplified): <code>zh_CN</code> • Chinese (Traditional): <code>zh_TW</code> • Danish: <code>da</code> • Dutch: <code>n1_NL</code> • English: <code>en_US</code>

Field Name	Details
	<ul style="list-style-type: none"> • Finnish: <code>fi</code> • French: <code>fr</code> • German: <code>de</code> • Italian: <code>it</code> • Japanese: <code>ja</code> • Korean: <code>ko</code> • Norwegian: <code>no</code> • Portuguese (Brazil): <code>pt_BR</code> • Russian: <code>ru</code> • Spanish: <code>es</code> • Spanish (Mexico): <code>es_MX</code> • Swedish: <code>sv</code> • Thai: <code>th</code>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Master label for the CORS whitelist entry.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description For managed packages, this field is the namespace prefix assigned to the package. For unmanaged packages, this field is blank.</p>
UrlPattern	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The origin URL pattern must include the HTTPS protocol (unless you're using your localhost) and a domain name, and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, <code>https://*.example.com</code> adds all subdomains of <code>example.com</code> to the whitelist. The origin URL pattern can be an IP address. However, an IP address and a domain that resolve to the same address are not the same origin, and you must add them to the CORS whitelist as separate entries.</p>

Usage

CORS is a W3C recommendation that enables web browsers to request resources from origins other than their own (cross-origin request). For example, using CORS, a JavaScript script at `https://www.example.com` could request a resource from `https://www.salesforce.com`.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS whitelist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin is not included in the whitelist, Salesforce returns HTTP status code 403.

Important: CORS does not support requests for unauthenticated resources, including OAuth endpoints. You must pass an OAuth token with requests that require it.

CronJobDetail

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
JobType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of the associated scheduled job. The following are the available job types. Each job type label is listed with its value in parenthesis. Use the job type value when querying for a specific job type.</p> <ul style="list-style-type: none"> • Data Export (0) • Weekly Export (1) • Test (2) • Dashboard Refresh (3) • Reporting Snapshot (4) • System (5) • Scheduled Apex (7) • Report Run (8) • Batch Job (9) • Analytics Notification (A) • Duns Right Async Batch Monitor (B)

Field	Details
	<ul style="list-style-type: none"> Scheduled ELT Dataflow (C) Sitemap Generation (E)
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort,</p> <p>Description The name of the associated scheduled job.</p>

Usage

Use this object to query additional information about a scheduled job, such as the job's name and type.

CronTrigger

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
CronExpression	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The cron expression used to initiate the schedule. Syntax:</p> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p><i>Seconds Minutes Hours Day_of_month Month Day_of_week Optional_year</i></p> </div> <p>See <code>schedule(jobName, cronExpression, schedulableClass)</code> in the <i>Apex Developer Guide</i>.</p>

Field	Details
CronJobDetailId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the CronJobDetail record containing more details about this scheduled job.</p>
EndTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when the job either finished or will finish.</p>
NextFireTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The next date and time the job is scheduled to run. null if the job is not scheduled to run again.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Owner of the job.</p>
PreviousFireTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The most recent date and time the job ran. null if the job has not run before current local time.</p>
StartTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The date and time when the most recent iteration of the scheduled job started.</p>
State	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The current state of the job. The job state is managed by the system. Possible values are:</p> <ul style="list-style-type: none"> • WAITING—The job is waiting for execution. • ACQUIRED—The job has been picked up by the system and is about to execute. • EXECUTING—The job is executing. • COMPLETE—The trigger has fired and is not scheduled to fire again. • ERROR—The trigger definition has an error. • DELETED—The job has been deleted. • PAUSED—A job can have this state during patch and major releases. After the release has finished, the job state is automatically set to WAITING or another state. • BLOCKED—Execution of a second instance of the job is attempted while one instance is running. This state lasts until the first job instance is completed. • PAUSED_BLOCKED—A job has this state due to a release occurring. When the release has finished and no other instance of the job is running, the job's status is set to another state.
TimesTriggered	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of times this job has been triggered.</p>
TimeZoneSidKey	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Returns the timezone ID. For example, <i>America/Los_Angeles</i>.</p>

Usage

Use this object to query scheduled jobs in your organization.

CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

Supported Calls

`create()`, `describeSObjects()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- This object is not available in single-currency organizations.
- You need the “Customize Application” permission to edit this object.
- Your client application can't delete this object.
- Customer Portal users can't access this object.

Fields

Field	Details
<code>ConversionRate</code>	<p>Type double</p> <p>Properties Filter</p> <p>Description Required. Conversion rate of this currency type against the corporate currency.</p>
<code>DecimalPlaces</code>	<p>Type int</p> <p>Properties Filter</p> <p>Description Required. For this currency, specifies the number of digits to the right of the decimal point, such as zero (0) for JPY or 2 for USD.</p>
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether this currency type is active (<code>true</code>) or not (<code>false</code>). Inactive currency types do not appear in picklists in the user interface. Label is Active. This field defaults to <code>false</code> if no value is provided when updating or inserting a record.</p>

Field	Details
IsCorporate	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether this currency type is the corporate currency (<code>true</code>) or not (<code>false</code>). Label is Corporate Currency. All other currency conversion rates are applied against this corporate currency. If a currency is already defined as the corporate currency in the user interface, it can't be unset. When a non-corporate currency is set to a corporate currency, the system reconfigures all conversion rates based on the new corporate currency.</p>
IsoCode	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as <code>USD</code>, <code>GBP</code>, or <code>JPY</code>. Must be unique within your organization. Label is Currency ISO Code.</p>

Usage

This object is for multicurrency organizations only. Use this object to define the currencies your organization uses.

When updating an existing record, make sure to provide values for all fields to avoid undesired changes to the `CurrencyType`. For example, if a value for `IsActive` is not provided, the default (`false`) is used, which could result in a currently active `CurrencyType` becoming inactive.

SEE ALSO:

[DatedConversionRate](#)

[Object Basics](#)

CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

Fields

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the parent entity that this branding applies to. The parent entity can be either a network, organization, topic, or reputation level.</p> <p>The branding applies to the entity that the <code>ParentId</code> references. For example, if the <code>ParentId</code> references a network ID, the branding applies to that network (community) only, and if the <code>ParentId</code> references an organization ID, the branding applies to the organization that it is accessed through, and so on. Label is <code>Branded Entity ID</code>.</p>

Usage

Use this object along with [CustomBrandAsset](#) to apply a custom branding scheme to your community. The branding scheme for the community shows in both the user interface and in the Salesforce app. You must have “Create and Manage Communities” to customize community branding.

You can also use this object to apply a custom branding scheme to your organization when it is accessed through the Salesforce app.

SEE ALSO:

[Network](#)

CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A `CustomBrandAsset` can apply to a community or to an org using the Salesforce app. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

Fields

Field Name	Details
AssetCategory	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Values include:</p> <ul style="list-style-type: none"> <p>MotifZerenaryColor—The background color for the header. Label is <code>Zerenary motif color</code>.</p> <p>If this CustomBrandAsset is for a network, this is the header color for the network. If it is for an org, this is the header color when users access the Salesforce app.</p> <p>MotifPrimaryColor—The color used for the active tab. Usage

Use this object to add basic branding elements—color scheme, header or footer images, login page logo, or footer text—to the branding scheme ([CustomBrand](#)) for your Network. You must have “Create and Manage Communities” to customize community branding.

If you’re using communities in the Salesforce app, the loading page shows the logo.

[Network](#)

Custom Metadata Type__mdt

Represents a custom metadata record. This object is available in API version 34.0 and later.

The object name is a variable with the syntax *Custom Metadata Type__mdt*, where *Custom Metadata Type* is the `ObjectName` for the custom metadata type associated with the custom metadata record. For example, `PicklistUsage__mdt` represents a custom metadata record based on the `PicklistUsage` custom metadata type.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`

Fields

Field	Details
<code>Custom Field__c</code>	<p>Type Any Type</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A custom field on the record.</p>
<code>DeveloperName</code>	<p>Type string</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>
<code>isProtected</code>	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description When a custom metadata type's records are released in a managed package, access to them is limited in specific ways.</p> <ul style="list-style-type: none"> Code that's in the same managed package as custom metadata records can read the records.

Field	Details
	<ul style="list-style-type: none"> • Code that's in the same managed package as custom metadata types can read the records that belong to that type. • Code that's in a managed package that doesn't contain either the type or the protected record can't read the protected records. • Code that the subscriber creates and code that's in an unmanaged package can't read the protected records. • The developer can modify protected records only with a package upgrade. The subscriber can't read or modify protected records. The developer name of a protected record can't be changed after release. <p>Records that are hidden by these access rules are also unavailable to REST, SOAP, SOQL, and Setup.</p>
Label	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The custom metadata record label. This label value is always the same as the <code>MasterLabel</code> value.</p>
Language	<p>Type string</p> <p>Properties Filter, Group, restrictedPicklist, Sort</p> <p>Description The language of the custom metadata record. This value is always the default language of the developing organization.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The master label for the custom metadata record.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can</p>

Field	Details
	refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.
QualifiedApiName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A concatenation of the namespace prefix and developer name. The format is <i>NamespacePrefix__DeveloperName</i>.</p>

Custom Object__Feed

Custom Object__Feed is the base object for all record feed objects. For example, *AccountFeed* is based on *Custom Object__Feed*. The *Custom Object__Feed* object is not, in itself, accessible. Objects based on the *Custom Object__Feed* object are available in API version 18.0 and later.

Here is a table with links to Custom Object Feed types

Custom Feed Type	Custom Feed Type	Custom Feed Type	Custom Feed Type
AccountFeed	Article Type__Feed	AssetFeed	CampaignFeed
CaseFeed	CollaborationGroupFeed	ContactFeed	ContentDocumentFeed
ContractFeed	DashboardComponentFeed	DashboardFeed	EntitlementFeed
EventFeed	GoalFeed	LeadFeed	LinkedArticleFeed
MetricFeed	NewsFeed	OpportunityFeed	—
OrderFeed	OrderItemFeed	Product2Feed	ProductRequestFeed
ProductTransferFeed	ProfileSkillEndorsementFeed	ProfileSkillFeed	ProfileSkillUserFeed
QuoteFeed	ReportFeed	ResourceAbsenceFeed	ServiceAppointmentFeed
ServiceContractFeed	ServiceResourceCapacityFeed	ServiceResourceFeed	ServiceResourceSkillFeed
ServiceResourceSkillFeed	ServiceTerritoryFeed	ServiceTerritoryMemberFeed	SkillRequirementFeed
SolutionFeed	TaskFeed	TopicFeed	UserFeed
UserProfileFeed	WorkCoachingFeed	WorkFeedbackRequestFeed	WorkGoalFeed
WorkOrderFeed	WorkOrderLineItemFeed	WorkPerformanceCycleFeed	WorkTypeFeed

A custom object feed shows posts and comments about the object as well as recent changes to the object's tracked fields. Feeds offer a useful way to stay up-to-date with changes made to a custom object. The object name is variable and uses a *Custom Object__Feed* syntax, where *Custom Object* is the *Object Name* for the custom object. For example, *Article Type__Feed* represents a feed object for the custom object named *Article Type*.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Usage

Use this object to track changes for a custom object. A record of this object type is automatically created when a user enables feed tracking for a custom object.

CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
Description	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A description of the custom permission. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the custom permission in the API. This name can contain only underscores and alphanumeric characters and must be unique in your</p>

Field Name**Details**

organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to **Name** in the user interface. Limit: 80 characters.

Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

Language**Type**

picklist

Properties

Filter, Group, Restricted picklist, Sort

Description

The language of the custom permission. Valid values are:

- Chinese (Simplified): zh_CN
- Chinese (Traditional): zh_TW
- Danish: da
- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX
- Swedish: sv
- Thai: th

MasterLabel**Type**

string

Properties

Filter, Group, Sort

Description

The custom permission label, which corresponds to **Label** in the user interface. Limit: 80 characters.

Field Name	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

Usage

Use the CustomPermission object to determine users' access to custom permissions.

For example, to query all permission sets where the Button1 permission is enabled:

```
SELECT Id, DeveloperName,
(select Id, Parent.Name, Parent.Profile.Name from SetupEntityAccessItems)
FROM CustomPermission
WHERE DeveloperName = 'Button1'
```

To query all permission sets and profiles with custom permissions:

```
SELECT Assignee.Name, PermissionSet.Id,
PermissionSet.Profile.Name,
PermissionSet.isOwnedByProfile,
PermissionSet.Label
FROM PermissionSetAssignment
WHERE PermissionSetId
IN (SELECT ParentId
FROM SetupEntityAccess
WHERE SetupEntityType =
'CustomPermission')
```

To query for all SetupEntityAccess rows with custom permissions:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
```

```
WHERE SetupEntityType='CustomPermission'
AND ParentId
IN (SELECT Id
    FROM PermissionSet
    WHERE isOwnedByProfile = false)
```

SEE ALSO:

[CustomPermissionDependency](#)[PermissionSet](#)[Profile](#)[SetupEntityAccess](#)

CustomPermissionDependency

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
CustomPermissionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the custom permission that requires the permission that's specified in RequiredCustomPermissionId.</p>
RequiredCustomPermissionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the custom permission that must be enabled when CustomPermissionId is enabled.</p>

Usage

The following Apex class contains a method that returns the IDs of all custom permissions that are required for the given custom permission ID. To use this class, save it in your organization.

```
public class CustomPermissionUtil {
    public String[] getAllRequiredCustomPermissions(String customPermId) {
        return getAllRequiredHelper(new String[]{customPermId});
    }

    private String[] getAllRequiredHelper(String[] customPerms) {
        CustomPermissionDependency[] requiredPerms = [SELECT RequiredCustomPermissionId
                                                    FROM CustomPermissionDependency
                                                    WHERE CustomPermissionId
                                                    IN :customPerms];

        String[] requiredPermIds = new String[]{};
        for (CustomPermissionDependency cpd : requiredPerms) {
            requiredPermIds.add(cpd.RequiredCustomPermissionId);
        }
        if (requiredPermIds.size() > 0) {
            customPerms.addAll(getAllRequiredHelper(requiredPermIds));
            return customPerms;
        } else {
            return customPerms;
        }
    }
}
```

For more information about using Apex classes, see the [Lightning Platform Apex Code Developer's Guide](#).

[CustomPermission](#)

DandBCompany

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

Warning: You can update fields in the DandBCompany object; however, field changes may be overwritten by Data.com Clean jobs or by using the Data.com Clean button.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Only organizations with Data.com Premium Prospector or Data.com Premium Clean can access this object.

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The city where a company is physically located. Maximum size is 40 characters.</p>
CompanyCurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar. Maximum size is 3 characters.</p>
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The country where a company is physically located. Maximum size is 40 characters.</p>

SixthSic8	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
SixthSic8Desc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
SixthSicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
SmallBusiness	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government. Available values include:</p> <ul style="list-style-type: none"> • Y—Small business site • N—Not small business site
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The state where a company is physically located. Maximum size is 20 characters.</p>
StockExchange	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The corresponding exchange for a company's stock symbol. For example: NASDAQ or NYSE. Maximum size is 16 characters.</p>
StockSymbol	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The abbreviation used to identify publicly traded shares of a particular stock. Maximum size is 6 characters.</p>
Street	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The street address where a company is physically located. Maximum size is 255 characters.</p>
Subsidiary	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates whether a company is more than 50 percent owned by another organization. Available values include:</p> <ul style="list-style-type: none"> • 0—Not subsidiary of another organization • 3—Subsidiary of another organization
ThirdNaics	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.</p>
ThirdNaicsDesc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p>

Field Name**Details**

Field Name	Details
	<p>Description A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.</p>
ThirdSic	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
ThirdSic8	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
ThirdSic8Desc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
ThirdSicDesc	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
TradeStyle1	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". Maximum size is 255 characters.</p>
TradeStyle2	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle3	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle4	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
TradeStyle5	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An additional tradestyle used by the organization. Maximum size is 255 characters.</p>
URL	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An organization's primary website address. Maximum size is 104 characters.</p>
UsTaxId	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. Maximum size is 9 characters.</p>
WomenOwned	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates whether a company is more than 50 percent owned or controlled by a woman. Available values include:</p> <ul style="list-style-type: none"> • Y—Owned by a woman • N—Not owned by a woman, or unknown
YearStarted	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The year the company was established or the year when current ownership or management assumed control of the company. Maximum size is 4 characters.</p>

Usage

Use this object to manage D&B Company records in your organization.

Dashboard

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Fields

Field	Details
BackgroundDirection	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the direction of the background fade. Available values are:</p> <ul style="list-style-type: none"> • Top to Bottom • Left to Right • Diagonal (default value) <p>Label is Background Fade Direction.</p>
BackgroundEnd	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the ending fade color in hexadecimal. Label is Ending Color.</p>
BackgroundStart	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the starting fade color in hexadecimal. Label is Starting Color.</p>
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Returns the description of the dashboard. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It</p>

Field

Details

must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is `Dashboard Unique Name`.

Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

FolderId

Type

reference

Properties

Filter, Group, Sort

Description

Required. Returns the ID of the Folder that contains the dashboard. See Folder.

FolderName

Type

string

Properties

Filter, Nillable, Sort

Description

Name of the folder that contains the dashboard. Available in API version 35.0 and later.

IsDeleted

Type

boolean

Properties

Defaulted on create, Filter

DescriptionIndicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.

LastReferencedDate

Type

date

Properties

Filter, Nillable, Sort, Update

Description

The timestamp for when the current user last viewed a record related to this record.

LastViewedDate

Type

date

Field	Details
	<p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LeftSize	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the size of the left column of the dashboard. Available values are:</p> <ul style="list-style-type: none"> • Narrow • Medium • Wide
MiddleSize	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Returns the size of the middle column of the dashboard. Available values are:</p> <ul style="list-style-type: none"> • Narrow • Medium • Wide
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values:</p>

Field	Details
	<ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
<code>RightSize</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the size of the right column in the dashboard.</p> <p>Available values are:</p> <ul style="list-style-type: none"> Narrow Medium Wide
<code>RunningUserId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the ID of the running user specified for the dashboard.</p> <p>If the dashboard was created in Lightning Experience and is configured to run as the viewing user, returns the user ID of the dashboard creator.</p> <p>If the dashboard was created in Salesforce Classic and is configured to run as the logged-in user, returns the user ID of the last specified running user.</p>
<code>TextColor</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the body text color in hexadecimal. Label is <code>Text Color</code>.</p>
<code>Title</code>	<p>Type string</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description Returns the title of the dashboard. Limit: 80 characters.</p>
TitleColor	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the title text color in hexadecimal. Label is <code>Title Color</code>.</p>
TitleSize	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Returns the title font size in points. Label is <code>Title Size</code>.</p>
Type	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description Returns the dashboard type. Available values are:</p> <ul style="list-style-type: none"> • <code>SpecificUser</code>—The dashboard displays data according to the access level of one specific running user. • <code>LoggedInUser</code>—The dashboard displays data according to the access level of the logged-in user. • <code>MyTeamUser</code>—The dashboard displays data according to the access level of the logged-in user, and managers can view dashboards from the point of view of users beneath them in the role hierarchy.

Supported Query Scopes

Use these scopes to help specify the data that your SOQL query returns.

allPrivate

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and [Enhanced Analytics Folder Sharing](#). If your organization was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

created

Records created by the user running the query.

everything

All records except records saved in other users' private folders.

mine

Records saved in the private folder of the user running the query.

Usage

Provides read only access to the current values in the dashboard fields.

Example: Dashboards in an Inactive User's Private Folder

This SOQL query returns dashboards saved in a specific user's private folder.

```
SELECT Id FROM Dashboard USING SCOPE allPrivate WHERE CreatedById = '005A0000000Bc2deFG'
```

SEE ALSO:

[DashboardFeed](#)

[DashboardTag](#)

[Report](#)

DashboardComponent

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
<code>CustomReportId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Requires the user permission "Manage All Private Reports and Dashboards." The ID of the report that provides data for the dashboard component. See Report.</p>

Field	Details
DashboardId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the dashboard that contains the dashboard component. See Dashboard.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the dashboard component.</p>

Usage

Provides read only access to the current values in dashboard component fields.

DashboardComponentFeed

Represents a single feed item in the feed displayed on a dashboard component. This object is available in API version 21.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of DashboardComponentFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Create, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p>

Field	Details
	<p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDate DESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>
IsRichText	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via SOAP API. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags:</p> <ul style="list-style-type: none"> • <code><p></code> •  Tip: Though the <code>
</code> tag isn't supported, you can use <code><p>&nbsp;p;</p></code> to create lines. • <code></code> • <code><code></code> • <code><i></code> • <code><u></code> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p>

Field	Details
	<p>Description</p> <p>Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type</p> <p><code>int</code></p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type</p> <p><code>url</code></p> <p>Properties</p> <p>Create, Nillable, Sort</p> <p>Description</p> <p>The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type</p> <p><code>picklist</code></p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.

Field	Details
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the dashboard that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. For Work.com thanks posts, it's the ID of the WorkThanks object associated with a RypplePost. This field is typically null for all posts except ContentPost and RypplePost. For example, set this field to an existing ContentVersion and post it to a feed as a FeedItem object of Type ContentPost.</p>
Title	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort, Update</p> <p>Description The title of the FeedItem. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name. The Title field can be updated on posts of Type QuestionPost.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of FeedItem. Except for ContentPost, LinkPost, and TextPost, don't create FeedItem types directly from the API.</p> <ul style="list-style-type: none"> • ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). <p>For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.</p>

Field	Details
	<ul style="list-style-type: none"> • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user’s Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to CaseFeed:</p> <ul style="list-style-type: none"> • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case. • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. • <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case. • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case.

Field	Details
	 Note: If you set <code>Type</code> to <code>ContentPost</code> , also specify <code>ContentData</code> and <code>ContentFileName</code> .
Visibility	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>Visibility can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • <code>Visibility</code> can be updated on record posts. • The <code>Update</code> property is supported only for feed items posted on records.

Usage

Use this object to retrieve the current contents of the feed fields, such as type of feed or feed ID.

DashboardFeed

Represents a single feed item in the feed displayed on a dashboard. This object is available in API version 20.0 and later.

Shows changes to dashboard fields tracked in feeds, and posts and comments about the dashboard.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

 **Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of DashboardFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with “CanApproveFeedPostAndComment” or “ModifyAllData” permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p>

Field	Details
	<p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>
IsRichText	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via SOAP API. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags:</p>

Field	Details
	<p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
<code>NetworkScope</code>	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the dashboard that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>

Field	Details
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user's Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply.

Field	Details
	<ul style="list-style-type: none"> • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Visibility

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`Visibility` can have the following values:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `Visibility`:

- For record posts, `Visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `Visibility` only to `AllUsers`.
- On user and group posts, only internal users can set `Visibility` to `InternalUsers`.

Usage

Use this object to retrieve the current contents of the feed fields, such as type of feed or feed ID.

SEE ALSO:

[Dashboard](#)

DashboardTag

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSOObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

DashboardTag stores the relationship between its parent TagDefinition and the Dashboard being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

DataAssessmentFieldMetric

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Child Relationships

DataAssessmentFieldMetric is a child object of [DataAssessmentMetric](#) object.

Fields

Field Name	Details
DataAssessmentMetricId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description A unique number that identifies the parent DataAssessmentMetric record.</p>

Field Name	Details
FieldName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the assessed field.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
NumMatchedBlanks	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that contain blank fields.</p>
NumMatchedDifferent	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that have a different value for this field.</p>
NumMatchedInSync	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records that have the same value for this field.</p>
NumUnmatchedBlanks	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of unmatched records that contain blank fields.</p>

DataAssessmentMetric

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
NumDuplicates	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of duplicate records.</p>
NumMatched	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of matched records.</p>
NumMatchedDifferent	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of records in your org matched with a Data.com record that have different fields.</p>

Field Name	Details
NumProcessed	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of records processed in the data assessment.</p>
NumTotal	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of records available for data assessment processing.</p>
NumUnmatched	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of records not matched.</p>

DataAssessmentValueMetric

Summarizes the number of fields matched for your account records with Data.com account records. This object is available in API version 37.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Child Relationships

DataAssessmentValueMetric is a child of [DataAssessementFieldMetric](#).

Fields

Field Name	Details
DataAssessmentFieldMetricId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>A unique number that identifies the parent DataAssesmentFieldMetric record.</p>
FieldValue	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The value in the matched field.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Autonumber, Defaulted on create, Filter, Sort</p> <p>Description</p> <p>An optional field used to name your record.</p>
ValueCount	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The number of times this value appears in this field.</p>

DatacloudCompany

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`

Fields

Field Name	Details
ActiveContacts	<p>Type</p> <p>int</p> <p>Properties</p> <p>Nillable</p>

Field Name	Details
	<p>Description</p> <p>The number of active contacts that are associated with a company.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Filter, Nillable</p> <p>Description</p> <p>The amount of money that the company makes in 1 year. Annual revenue is measured in US dollars.</p>
City	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description</p> <p>The name of the city where the company is located.</p>
CompanyId	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description</p> <p>A unique numerical identifier for the company and theData.com identifier for a company.</p>
Country	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description</p> <p>A string that represents the standard abbreviation for the country where the company is located.</p>
CountryCode	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist</p> <p>Description</p> <p>A standardized name for countries of the world.</p>

Field Name	Details
Description	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief synopsis of the company that provides a general overview of the company and what it does.</p>
DunsNumber	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.</p>
EmployeeQuantityGrowthRate	<p>Type double</p> <p>Properties Nillable</p> <p>Description The yearly growth rate of the number of employees in a company expressed as a decimal percentage. The data includes the total employee growth rate for the past two years.</p>
ExternalId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description A unique numerical identifier for the company. The ExternalId is a system-generated number.</p>
Fax	<p>Type phone</p> <p>Properties Nillable</p> <p>Description The telephone number that's used to send and receive faxes.</p>

Field Name	Details
FortuneRank	<p>Type int</p> <p>Properties Defaulted on create, Group, Nillable</p> <p>Description The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.</p>
FullAddress	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description The complete address of a company, including Street, City, State, and Zip.</p>
IncludedInSnP500	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A true or false value. If <code>true</code>, the company is listed in the S&P 500 Index. If <code>false</code>, the company isn't listed in the S&P 500 Index.</p>
Industry	<p>Type string</p> <p>Properties Nillable</p> <p>Description A description of the type of industry such as Telecommunications, Agriculture, or Electronics.</p>
IsInCrm	<p>Type boolean</p> <p>Properties Defaulted on create, Group</p> <p>Description Whether the record is in Salesforce (true) or not (false).</p>
IsInactive	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter</p> <p>Description A true or false response. True, the company record is not active. False, the company record is active.</p>
IsOwned	<p>Type boolean</p> <p>Properties Defaulted on create</p> <p>Description A true or false value. True, your organization owns the record. False, your organization doesn't own the record.</p>

Name	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The company's name.</p>
NumberOfEmployees	<p>Type int</p>

Field Name	Details
	<p>Properties Filter, Nillable</p> <p>Description The number of employees working for the company.</p>
Ownership	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The type of ownership of the company:</p> <ul style="list-style-type: none"> • Public • Private • Government • Other
Phone	<p>Type phone</p> <p>Properties Nillable</p> <p>Description A numeric string containing the primary telephone number for the company.</p>
PremisesMeasure	<p>Type int</p> <p>Properties Group, Nillable</p> <p>Description A numeric value for the measurement of the premises.</p>
PremisesMeasureReliability	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A descriptive accuracy of the measurement such as actual, estimated, or modeled.</p>
PremisesMeasureUnit	<p>Type string</p>

Field Name	Details
	<p>Properties Group, Nillable</p> <p>Description A descriptive measurement unit such as acres, square meters, or square feet.</p>
PriorYearEmployees	<p>Type int</p> <p>Properties Group, Nillable</p> <p>Description The total number of employees for the prior year.</p>
PriorYearRevenue	<p>Type double</p> <p>Properties Nillable</p> <p>Description The annual revenue for the prior year.</p>
SalesTurnoverGrowthRate	<p>Type double</p> <p>Properties Nillable</p> <p>Description The increase in annual revenue from the previous value for an equivalent period expressed as a decimal percentage.</p>
Sic	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description A numeric value that represents the Standard Industrial Codes (SIC). SIC is a numbering convention that indicates what type of service a business provides. It is a four-digit value.</p>
SicCodeDesc	<p>Type string</p> <p>Properties Group, Nillable</p>

Field Name	Details
	<p>Description The SIC numeric code and descscption for a company.</p>
SicDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A description of the SIC classification.</p>
Site	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist</p> <p>Description An organizational status of the company.</p> <ul style="list-style-type: none"> • Branch: a secondary location to a headquarter location • Headquarter: a parent company with branches or subsidiaries • Single Location: a single business with no subsidiaries or branches
State	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The two-letter standard abbreviation for a state.</p>
StateCode	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist</p> <p>Description A standard two-letter abbreviation for states and territories of the United States. The state where the company is located. The abbreviation can also be a province or other equivalent to a state, depending on the country where the company is located.</p>
Street	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description A postal address for the company.</p>
TickerSymbol	<p>Type string</p> <p>Properties Nillable</p> <p>Description The symbol that uniquely identifies companies that are traded on public stock exchanges.</p>
TradeStyle	<p>Type string</p> <p>Properties Nillable</p> <p>Description A legal name under which a company conducts business.</p>
UpdatedDate	<p>Type dateTime</p> <p>Properties Nillable, Sort</p> <p>Description The last date and time when the information for this company was updated.</p>
Website	<p>Type url</p> <p>Properties Nillable</p> <p>Description The standard URL for the company's home page.</p>
YearStarted	<p>Type string</p> <p>Properties Nillable</p> <p>Description The year when the company was founded.</p>

Field Name	Details
Zip	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description A numeric postal code that's designated for the address.</p>

Usage

Use the DatacloudCompany object to search the Data.com database for companies with the specific criteria that you enter. Use this object to find company records that you are interested in purchasing for your organization. Data.com APIs use the term "company," which is similar to Salesforce term "accounts."

Important: DatacloudCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudContact

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
City	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The city where the company is located.</p>
CompanyId	<p>Type string</p> <p>Properties Filter, Nillable</p>

Field Name	Details
	<p>Description</p> <p>The unique numerical identifier for the company and the Data.com company identification number or Data.com Key.</p>
CompanyName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the company.</p>
ContactId	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The unique numeric identifier for this contact.</p>
Country	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The standard abbreviation or name for the country where the company is located.</p> <p> Note: You can enter a comma-separated list of countries; however, for a country that uses a comma in its name, leave out the comma. For example, enter "Taiwan, ROC" as Taiwan ROC.</p>
Department	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist</p> <p>Description The department in the company that the contact is affiliated with. The values of this field are fixed enumerated values.</p> <ul style="list-style-type: none"> • Engineering • Finance • Human Resources • IT

Field Name	Details
	<ul style="list-style-type: none"> • Marketing • Operations • Other • Sales • Support
Email	<p>Type email</p> <p>Properties Filter, Nillable</p> <p>Description A business email address for the contact.</p>
ExternalId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description A unique system-generated numerical identifier for the contact.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The first name of the contact.</p>
IsInCrm	<p>Type boolean</p> <p>Properties Defaulted on create, Group</p> <p>Description Whether the record is in Salesforce (true) or not (false).</p>
IsInactive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Whether the record is active (false) or not (true).</p>

Field Name	Details
IsOwned	<p>Type boolean</p> <p>Properties Defaulted on create</p> <p>Description</p> <ul style="list-style-type: none">• <code>True</code>: You own this record.• <code>False</code>: You do not own this record.
LastName	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The last name of the contact.</p>

Industry	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description</p> <p>A description of the type of industry such as Telecommunications, Agriculture, or Electronics.</p>
IsOwned	<p>Type boolean</p> <p>Properties Defaulted on create</p> <p>Description</p> <p>A true or false value. True, your organization owns the record. False, your organization doesn't own the record.</p>
IsParent	<p>Type boolean</p> <p>Properties Defaulted on create,</p>

Field Name**Details****Description**

A true or false value. True, the company is a parent company. False, the company isn't a parent company. A parent company owns other companies.

Latitude

Type

string

Properties

Nillable

Description

Used with longitude to specify a precise location, which is used to assess the Geocode Accuracy.

LegalStatus

Type

picklist

Properties

Nillable, Restricted picklist

Description

Identifies the legal structure of an organization. Available values include *Cooperative, Nonprofit organization, Local government body, Partnership of unknown type, and Foreign company.*

LocationStatus

Type

picklist

Properties

Filter, Nillable, Restricted picklist

Description

Identifies the organizational status of a company. A numeric value represents each value.

Organizational status	Numeric value
<i>Single location:</i> The business has no branches or subsidiaries.	0
<i>Headquarters/Parent:</i> A parent company that owns more than 50 percent of another company. When the company also has branches, it's the headquarters.	1
<i>Branch:</i> A secondary location of a business.	2

Field Name	Details
	 Note: Only the numeric value is accepted in an API request.
Longitude	<p>Type string</p> <p>Properties Nillable</p> <p>Description Used with latitude to specify a precise location, which is used to assess the Geocode Accuracy.</p>
MailingCity	<p>Type string</p> <p>Properties Nillable</p> <p>Description The city where a company has its mail delivered.</p>
MailingCountry	<p>Type string</p> <p>Properties Nillable</p> <p>Description The country where a company has its mail delivered.</p>
MailingState	<p>Type string</p> <p>Properties Nillable</p> <p>Description The state where a company has its mail delivered.</p>
MailingStreet	<p>Type string</p> <p>Properties Nillable</p> <p>Description The street address where a company has its mail delivered.</p>
MailingZip	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description The postal zip code for the company.</p>

SixthSic8Desc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
SixthSicDesc	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>A brief description of an organization's line of business, based on the corresponding SIC code.</p>
SmallBusiness	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Nillable, Restricted picklist</p> <p>Description</p> <p>Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government.</p>
State	<p>Type</p> <p>string</p> <p>Properties</p> <p>Nillable</p> <p>Description</p> <p>The state where a company is physically located.</p>

Field Name	Details
StockExchange	<p>Type string</p> <p>Properties Nillable</p> <p>Description The corresponding exchange for a company's stock symbol, for example, NASDAQ or NYSE.</p>
StockSymbol	<p>Type string</p> <p>Properties Nillable</p> <p>Description The abbreviation that's used to identify publicly traded shares of a particular stock.</p>
Street	<p>Type string</p> <p>Properties Nillable</p> <p>Description The street address where a company is physically located.</p>
Subsidiary	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether a company is more than 50 percent owned by another organization.</p>
ThirdNaics	<p>Type string</p> <p>Properties Nillable</p> <p>Description A NAICS code used to further classify an organization by industry.</p>
ThirdNaicsDesc	<p>Type string</p>

Field Name	Details
	<p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding NAICS code.</p>
ThirdSic	<p>Type string</p> <p>Properties Nillable</p> <p>Description A SIC code used to further classify an organization by industry.</p>
ThirdSic8	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.</p>
ThirdSic8Desc	<p>Type string</p> <p>Properties Group, Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.</p>
ThirdSicDesc	<p>Type string</p> <p>Properties Nillable</p> <p>Description A brief description of an organization's line of business, based on the corresponding SIC code.</p>
TradeStyle1	<p>Type string</p> <p>Properties Nillable</p>

Field Name	Details
	<p>Description</p> <p>A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA".</p>
TradeStyle2	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
TradeStyle3	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
TradeStyle4	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
TradeStyle5	<p>Type string</p> <p>Properties Nillable</p> <p>Description A tradestyle used by the organization.</p>
UsTaxId	<p>Type string</p> <p>Properties Nillable</p> <p>Description The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number.</p>

Field Name	Details
Website	<p>Type url</p> <p>Properties Filter, Group, Nillable</p> <p>Description An organization's primary website address.</p>
WomenOwned	<p>Type picklist</p> <p>Properties Nillable, Restricted picklist</p> <p>Description Indicates whether a company is more than 50 percent owned or controlled by a woman.</p>
YearStarted	<p>Type string</p> <p>Properties Nillable</p> <p>Description The year when the company was established or the year when current ownership or management assumed control of the company.</p>
Zip	<p>Type string</p> <p>Properties Nillable</p> <p>Description A five or nine-digit code that's used to help sort mail.</p>

Usage

Use this object to return D&B Company information. These fields are read-only.

Important: DatacloudDandBCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudOwnedEntity

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
DataDotComKey	<p>Type string</p> <p>Properties Create, Filter, Sort</p> <p>Description The Data.com contact or company record identification number used by the DatacloudPurchaseUsage object to keep track of purchased records. This is equivalent to the Data.com record ID for a contact or company.</p>
DatacloudEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist, Sort</p> <p>Description The type of Data.com record you want to purchase.</p> <ul style="list-style-type: none"> • 0—contact • 1—company
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
PurchaseType	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>A read only field set by the API to identify the purchase type.</p> <ul style="list-style-type: none"> • Added • Export • API
PurchaseUsageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The unique identification number for the DatacloudPurchaseUsage object created by making a REST POST request.</p> <ul style="list-style-type: none"> • 0—contact • 1—company
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description</p> <p>A unique identifier for the user making the purchase.</p>

Usage

The Datacloud object that tracks records that are purchased and owned by a specific user.

DatacloudPurchaseUsage

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
DatacloudEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of Data.com record you want to purchase.</p> <ul style="list-style-type: none"> • 0—indicates contact entity type. • 1—indicates company entity type.
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description An optional field. You can add a description for your purchase.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An optional field used to name your record.</p>
PurchaseType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A read only field set by the API to identify the purchase type.</p> <ul style="list-style-type: none"> • Added • Export • API
Usage	<p>Type double</p> <p>Properties Filter, Sort</p>

Field Name	Details
	<p>Description</p> <p>A read only field set by the API. It is used to track the points used to purchase records.</p>
UserId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>A read only field set by the API that identifies the user purchasing the records.</p>
UserType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>A read only field set by the API with 2 user types.</p> <ul style="list-style-type: none"> • Monthly Usage • List Pool User

Usage

The DatacloudPurchaseUsage object allows you to track Data.com record purchases for CRM users.

DatacloudSocialHandle

Returns normalized URLs with userids for different social media used by Data.com contacts. The DatacloudSocialHandle object is a child object of the DatacloudContact object. This object is available in API version 30.0 or later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
DatacloudContactId	<p>Type</p> <p>string</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The unique numeric identifier for a Data.com contact record.</p>
ProviderName	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The name of the social media provider.</p>
SocialId	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The normalized userid for the user on this social media.</p>
Url	<p>Type url</p> <p>Properties Filter, Nillable, Sort</p> <p>Description A normalized URL and userid for the website of the social media provider.</p>

Usage

Returns social handles with Data.com contacts from the DatacloudContact object. Social handle fields are read only fields and can't be used to filter results.

DataIntegrationRecordPurchasePermission

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
ExternalObject	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the name of the data service record matched to the Salesforce record.</p>
UserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Indicates the ID of a user to whom purchase credits are assigned.</p>
UserRecordPurchaseLimit	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Represents the number of purchase credits assigned to a user.</p>

DatedConversionRate

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`,

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ConversionRate	<p>Type double</p> <p>Properties Filter, Update</p> <p>Description Required. Conversion rate of this currency type against the corporate currency.</p>
IsoCode	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBP, or JPY. Must be unique within your organization. Label is Currency ISO Code.</p>
NextStartDate	<p>Type date</p> <p>Properties Filter, Nillable</p> <p>Description Read only. The date on which the next effective dated exchange rate will start. Effectively the day after the end date for this exchange rate.</p>
StartDate	<p>Type date</p> <p>Properties Filter</p> <p>Description The date on which the effective dated exchange rate starts.</p>

Usage

This object is for multicurrency organizations with advanced currency management enabled. Use this object to define the exchange rates your organization uses for a date range. This object is not available in single-currency organizations, nor is it available if the organization does not have advanced currency management enabled.

DcSocialProfile

The `DcSocialProfile` object is a read-only object accessible only through the Data.com Social Key API. This object is available in API version 32.0 or later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

This is a read-only object that is accessed by only the Data.com Social Key API

Fields

Field Name	Details
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the city where the company is located.</p>
CompanyName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the company at which the contact works.</p>
ContactId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The unique numerical identifier for a contact.</p>
Country	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description A string that represents the standard abbreviation for the country where the contact works.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description An email address for this contact.</p>
FirstName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The first name of a contact.</p>
LastName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The last name of a contact.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The two-letter standard abbreviation for a state.</p>

Usage

Provides social handle information to the Data.com Social Key API.

DcSocialProfileHandle

The `DcSocialProfileHandle` object, a child object to `DcSocialProfile`, is a read-only object accessible only through the Data.com Social Key API. The `DcSocialProfileHandle` object is a child object of the `DcSocialProfile` object. This object is available in API version 32.0 or later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

This is a read-only object that is accessed by only the Data.com Social Key API

Fields

Field Name	Details
<code>DcSocialProfileId</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A unique identifier for a contacts social handles.</p>
<code>Handle</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A normalized social handle for a contact.</p>
<code>ProviderName</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the social media provider.</p>

Usage

Provides social handle information to the Data.com Social Key API.

DeclinedEventRelation

Represents invitees with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
EventId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the event.</p>
RelationId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the invitee.</p>
RespondedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Indicates the most recent date and time when the invitee declined an invitation to the event.</p>
Response	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the content of the response field. Label is <code>Comment</code>.</p>
Type	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the invitee is a user, lead or contact, or resource.</p>

Usage

Query invitees who have declined an invitation to an event

```
SELECT eventId, type, response FROM DeclinedEventRelation WHERE eventId='00UTD000000ZH5LA'
```

[UndecidedEventRelation](#)

DigitalSignature

Represents a signature captured on a service report in field service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
DigitalSignatureNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description An auto-generated number identifying the signature.</p>
DocumentBody	<p>Type base64</p>

Field Name	Details
	<p>Properties Create</p> <p>Description The captured signature image.</p>
DocumentContentType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The data type of the captured signature.</p>
DocumentLength	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The length of the captured signature.</p>
DocumentName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The name of the captured signature image.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the service appointment, work order, or work order line item that the service report is generated for.</p>
Place	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The place where the report was signed.</p>

Field Name	Details
SignatureType	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description The role of the person signing the service report. Your org comes with one signature type, <code>Default</code>. A service report template can only contain one signature per type. If you plan to collect multiple signatures on service reports, create additional values for the Signature Type field.</p> <p>Create at least one value for every role that might need to sign a service report. For example, <code>Technician</code>, <code>Customer</code>, <code>Supervisor</code>, or <code>Supplier</code>. If some service reports will be signed by multiple people in one role—for example, all technicians present at an appointment—create numbered types: <code>Technician 1</code>, <code>Technician 2</code>, and so forth.</p> <p> Note: You can create up to 1,000 signature types. You can't delete signature types, but you can deactivate them so they can't be used in service report templates. When you deactivate a type, it still appears on service report templates that used it, but you can't use it on new service report templates.</p>
SignedBy	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The name of the person signing.</p>
SignedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The date and time of the signing.</p>

Usage

Add signature blocks to service report templates to determine which signatures need to be gathered on reports that use the template. Service report templates can contain up to 20 signatures, and each signature must use a different Signature Type. For example, create a standard service report template that contains a customer signature and a technician signature.

To learn more about digital signatures, see [Guidelines for Using Signatures on Service Reports](#).

Division

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Divisions must be enabled for your organization to access this object. To discover whether divisions have been enabled for an organization, inspect the User or Group object for the `DefaultDivision` field—if it is present, then divisions have been enabled, and this field (the field is named `Division` in objects other than User and Group) will be available in all relevant objects.
- Customer Portal users can't access this object.

Fields

Field	Details
<code>IsActive</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the division is active (<code>true</code>) or not (<code>false</code>). Label is Active.</p>
<code>IsGlobalDivision</code>	<p>Type boolean</p> <p>Properties Defaulted on createFilter</p> <p>Description Indicates whether the division is your organization's global default division (<code>true</code>) or not (<code>false</code>). Label is Global Division.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Update</p> <p>Description A descriptive name for the division. Limit: 80 characters.</p>

Field	Details
SortOrder	<p>Type int</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The order in which this division name appears in the Division picklist field when creating or editing users in the Salesforce user interface.</p>

Usage

The values available for that field are the global division ID for the organization, created when divisions are first enabled, and any other division IDs that have been created. The division ID associated with a user is populated in the objects owned or created by the user.

You can use the division ID to make searches, reports, and list views run more quickly and return more relevant results if an organization has very large data sets. For more information, see the Salesforce online help, in the Fields description for the object.

You can use WITH in SOSL to pre-filter results based on division. This is faster than specifying the division in a WHERE clause.

Note: The User object has a `Division` field that is unrelated to this object. The `Division` field is a standard text field similar to Company or Department that has no special properties. Do not confuse it with the `DefaultDivision` field, which does relate to this object.

SEE ALSO:

[Object Basics](#)

DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

Fields

Field	Details
Language	<p>Type string</p> <p>Properties Create, Filter, Nillable, Restricted picklist</p> <p>Description The language for this translated label.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Nillable</p> <p>Description The ID of the Division associated with the label that is being translated.</p>
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The actual translated label for the division. Label is Translation.</p>

Usage

Use this object to translate the labels of your divisions into the different languages supported by Salesforce.

Document

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You must have the "Edit" permission on documents and the appropriate access to the Folder that contains a document in order to create or update a document in that Folder.

Fields

Field	Details
AuthorId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the User who is responsible for the Document.</p>
Body	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description Required. Encoded file data. If specified, then do not specify a URL.</p>
BodyLength	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description Size of the file (in bytes).</p>

Field	Details
ContentType	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Type of content. Label is Mime Type. Limit: 120 characters.</p> <p>If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Text description of the Document. Limit: 255 characters.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Document Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
FolderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. ID of the Folder that contains the document.</p>
IsBodySearchable	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the contents of the object can be searched using a SOSL <code>FIND</code> call. The <code>ALL FIELDS</code> search group includes the content as a searchable field.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsInternalUseOnly	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the object is only available for internal use (<code>true</code>) or not (<code>false</code>). Label is Internal Use Only.</p>
IsPublic	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the object is available for external use (<code>true</code>) or not (<code>false</code>). Label is Externally Available.</p>
Keywords	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Keywords. Limit: 255 characters.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. Name of the document. Label is Document Name.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Sort, Nillable</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
Type	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>File type of the Document. In general, the values match the file extension for the type of Document (such as pdf or jpg). Label is File Extension.</p>
Url	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Group, Sort, Update</p> <p>Description</p> <p>URL reference to the file (instead of storing it in the database). If specified, do not specify the <code>Body</code> or <code>BodyLength</code>.</p>

Usage

When creating or updating a document, you can specify a value in either the `Body` or `Url` fields, but not both.

Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

Maximum Document Size

You can only create or update documents to a maximum size of 5 MB.

SEE ALSO:

[Object Basics](#)

DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
DocumentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the document that this object tracks.</p>
DocumentSequence	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Represents the order that the attachments will be included in the email defined by the EmailTemplate specified by the DocumentId. Label is Attachment Sequence. The first attachment is given a value of 0, and each subsequent attachment is given a value incremented by 1.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the EmailTemplate parent. The attachment identified by DocumentId is attached to the EmailTemplate specified in this field.</p>

Usage

Use this object to map the relationship of an EmailTemplate to its attachments, and to specify the order of the attachments.

SEE ALSO:

[EmailTemplate](#)

DocumentTag

Associates a word or short phrase with a Document.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

DocumentTag stores the relationship between its parent TagDefinition and the Document being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the Domain and [DomainSite](#) objects.

Fields

Field	Description
Domain	<p>Type string</p> <p>Properties Filter, Sort</p> <p>Description The branded custom Web address within the global namespace identified by this domain's type. In the Domain Name System (DNS) global namespace, this field is the custom Web address that you registered with a third-party domain name registrar. The custom Web address can be used to access the site of this domain.</p>
DomainType	<p>Type picklist</p> <p>Properties Filter, Group, Sort</p> <p>Description The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS.</p> <p>DomainType can have the following values:</p> <ul style="list-style-type: none"> • Domain Name System (DNS)

Field	Description
	<ul style="list-style-type: none"> Facebook Page
OptionsExternalHttps	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the domain supports secure connections (true) or not (false) via a non-Salesforce content delivery network (CDN) or endpoint. The value of this field is used only if the domain is not pointing to the <code>yourdomain.your18characterOrgId.live.siteforce.com</code> CNAME target.</p>

Usage

Use this read-only object to query the domains that are associated with each website in your organization.

DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the [Domain](#) and DomainSite objects.

Fields

Field	Description
DomainId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field	Description
	<p>Description</p> <p>The ID of the associated Domain.</p>
PathPrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>Shows where a site's root exists on a domain. Can only be set for custom Web addresses. Always begins with a /.</p>
SiteId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The ID of the associated Site.</p>

Usage

Use this read-only object to query or retrieve information about your Lightning Platform site.

DuplicateJob

Represents an instance of a job that identifies duplicates among existing records in the system.

This object is available in API versions 42.0 and later.

A duplicate job is the parent of the DuplicateRecordSet instances that it generates. The duplicate record items in a set generated by a duplicate job are of one object type.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
DuplicateJobDefinitionId	<p>Type</p> <p>reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort, Update</p> <p>Description The ID of the corresponding duplicate job definition.</p>
DuplicateJobStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The current status of a duplicate job. Valid values are Not Started, In Progress, Completed, Canceled, Failed, Results Deleted.</p>
EndDateTime	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time when a duplicate job was completed.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when a duplicate job was last referenced.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when a duplicate job was last viewed.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort, Update</p> <p>Description The name of a duplicate job.</p>

Field Name	Details
NumDuplicateRecordItems	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The total number of duplicate records identified as a result of invoking a duplicate job.</p>
NumDuplicateRecordSets	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of duplicate record sets identified as a result of invoking a duplicate job.</p>
NumRecordsScanned	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of records scanned as a result of invoking a duplicate job.</p>
ResultListViewId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description List view metadata for displaying the duplicate record sets identified as result of invoking a duplicate job.</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date and time when a duplicate job was invoked.</p>

DuplicateJobDefinition

Setup object defining a job that identifies duplicate record items globally.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the user who created a duplicate job.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language in the user's personal settings.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label of the duplicate job.</p>
SubjectSubtype	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The object subtype. Valid values are <code>Person</code>, <code>Account</code> or <code>None</code>.</p>
SubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field Name**Details****Description**

The object type: account, contact, or lead.

DuplicateJobMatchingRule

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name**Details**

DuplicateJobId

Type

reference

Properties

Filter, Group, Sort

Description

The ID of the corresponding DuplicateJob.

DuplicateJobMatchRuleDefId

Type

reference

Properties

Filter, Group, Sort

Description

The ID of the matching rule defined for the corresponding DuplicateJobMatchingRuleDefinition.

MatchingRuleBooleanFilter

Type

textarea

Properties

Filter, Sort

Description

Boolean logic of the MatchingRule for this DuplicateJobMatchingRule.

MatchingRuleDescription

Type

textarea

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Description of the matching rule for this DuplicateJobMatchingRule.</p>
MatchingRuleName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the matching rule defined for this particular DuplicateJob invocation.</p>

DuplicateJobMatchingRuleDefinition

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Fields

Field Name	Details
DuplicateJobDefinitionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of DuplicateJobDefinition (master) for this DuplicateJobMatchingRuleDefinition (detail).</p>
MatchingRuleId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the MatchingRule to be used with this DuplicateJobMatchingRuleDefinition.</p>

DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, enable Duplicate Management. A Salesforce admin can grant access to any user with a Sales Cloud or CRM user license.

Fields

Field Name	Details
DuplicateRecordSetId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The duplicate record set that the duplicate record item is assigned to.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated name that's given to the Duplicate Record Item. Label is Duplicate Record Item Name.</p>
RecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the record as it appears on the record's detail page.</p>

DuplicateRecordSet

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, enable Duplicate Management. Users must be given read and write access by a Salesforce admin.

Fields

Field Name	Details
<code>DuplicateRuleId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The duplicate rule used to identify this list of duplicate records.</p> <p>Label Duplicate Rule ID</p>
<code>LastReferencedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
<code>LastViewedDate</code>	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The autogenerated name that's given to the duplicate record set. Label is Duplicate Record Set Name.</p>
RecordCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of record items in the set.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ParentId represents the parent of a duplicate rule or duplicate job. A ParentId is polymorphic. The label is Parent. This field is available in API versions 42.0 and later.</p>
SubjectType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The object that the duplicate rule and all the record items in the set apply to.</p>

DuplicateRule

Represents a duplicate rule for detecting duplicate records.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Fields

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The developer name for the duplicate rule.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether a duplicate rule is active (<code>true</code>) or not (<code>false</code>). This field is read only.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language for the duplicate rule.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The label for the duplicate rule.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values:</p>

Field Name	Details
	<ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
<code>SubjectType</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of object the duplicate rule is defined for. For example, account, contact, or lead.</p>

Usage

`DuplicateRule` is available to organizations that use duplicate rules.

You can only view details of a duplicate rule using the API. You must use the full Salesforce site to create, edit, and delete duplicate rules.

EmailDomainKey

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>Domain</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The organization's domain name that the DKIM key is generated for.</p>
DomainMatch	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The specificity of match required on the sending domain name before signing with this DKIM key. Valid values are:</p> <ul style="list-style-type: none"> • <code>DomainOnly</code>—Sign if sending domain matches at the domain level only (example.com but not mail.example.com) • <code>SubdomainsOnly</code>—Sign if sending domain matches at the subdomain level only (mail.example.com but not example.com) • <code>DomainAndSubdomains</code>—Sign if sending domain matches at the domain and subdomain levels (example.com and mail.example.com)
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether this DKIM key is active (<code>true</code>) or not (<code>false</code>). You can set <code>IsActive</code> to <code>true</code> on create if you specify an existing key pair.</p>
PrivateKey	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description</p> <p>The private portion of the DKIM key pair used to encrypt mail headers from your domain. Salesforce generates an encrypted <code>PrivateKey</code> if you don't specify a value when creating the DKIM key. If you do specify a value, it must be an existing valid <code>PrivateKey</code> from another <code>EmailDomainKey</code> object.</p> <p>This field doesn't contain the actual private key, but a value that represents the key in our system. Therefore:</p> <ul style="list-style-type: none"> • The actual private key can't be leaked. • You can't use the value to do your own email signing.
PublicKey	<p>Type textarea</p>

Field Name	Details
	<p>Properties Create, Nillable, Update</p> <p>Description Part of the domain key pair that mail recipients retrieve to decrypt the DKIM header and verify your domain. Add the <code>PublicKey</code> value to your domain's DNS records before you start signing with this domain key. Otherwise, mail recipients may reject your email.</p>
Selector	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Text used to distinguish the DKIM key from any other DKIM keys your organization uses for the specified domain.</p>

Usage

Use this object to define a DomainKeys Identified Mail (DKIM) key, which is used to authenticate outbound email that Salesforce sends on your organization's behalf. When you create a DKIM key, Salesforce generates a public and private key pair. You must publish the public key in the DNS, which tells recipients that you, as the owner of the domain, have authorized the use of this key to sign your mail. Salesforce uses the private key to create DKIM signature headers on your outgoing email. Then, recipients of the mail, can compare the signature header with the public key in the DNS to determine that the mail was signed with an authorized key. If your domain also publishes a Domain-based Message Authentication, Reporting and Conformance (DMARC) policy, recipients can use the DKIM signature to verify that the mail conforms to DMARC.

For each domain key you create, we recommend this sequence:

1. Insert the `Domain`, `DomainMatch`, and `Selector`.
2. Update your domain's DNS records.
 - a. Locate the DNS record at `selector._domainkey.domain`. For example, `mail._domainkey.mail.example.com`.
 - b. Add the `PublicKey` value, like this: `V=DKIM1; p=public_key`.
DKIM Signing Outbound Email
 - a. In addition, you can optionally put the record in testing mode, which instructs recipients to not make decisions based on the email signature. Add parameter `t=y` to the DNS entry, like this: `V=DKIM1; t=y; p=public_key`.
3. Update the key via the API or UI to be active.

Consider the following when using domain keys.

- Make sure you add the public key to your DNS record before you make your key active in Salesforce and start DKIM signing. DKIM signing is active whenever your DKIM key is in the active state.
- You can't have more than one active DKIM key per domain name. You might have multiple active DKIM keys if your organization mails from more than a single domain or if you use subdomains under your organizational domain and have specified domain matching at the subdomain level.

- If you want to use the same DKIM key for multiple organizations, you can. Create the key and ensure it's working for one organization first. Then using the API or UI create the key in your other organizations by setting the corresponding fields in the new key to the same values as the original.
- When you insert or update a DKIM key, it's possible that the change affects existing domain keys. For example, if you've set `DomainMatch` to `DomainAndSubdomains` for the `example.com` domain, and you then set `DomainMatch` to `SubdomainsOnly` for the `mail.example.com` domain, either key could be used. Here's how we resolve conflicts in the case when DKIM keys overlap.
 - If two keys are equally specific about matching for the same domain, the new key replaces and deactivates the existing key.
 - If a new key is more specific about matching than an existing key, the new key is used and the existing key is modified to inactive.
 - If multiple keys have different domains that match the sending domain, the key with the longest domain name is used. In case of a tie, the most specific key is used. For example, because `DomainOnly` and `SubdomainsOnly` are more specific than `DomainAndSubdomains`, a new `DomainOnly` key would change the `DomainMatch` for an existing `DomainAndSubdomains` key to become `SubdomainsOnly`. In case of a tie, the most specific key is used.

EmailMessage

Represents an email in Salesforce.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

EmailMessage is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

To use reply and forward functionality, `FromAddress` must specify an email address that exists in `EmailMessageRelation`, with a `RelationType` of `FromAddress`.

Customer Portal users have read access to EmailMessage if the value for the `ParentID` field is associated with a case. Otherwise, access is determined by sharing access of the associated task.

`update()` is supported only on records whose `Status` is `Draft`. When a record's `Status` is *not* `Draft`, `update()` is supported only for the `IsExternallyVisible` field and custom fields.

Fields

Field	Details
<code>ActivityId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>ID of the activity that is associated with the email. Usually represents an open task that is created for the case owner when a new unread email message is received. <code>ActivityId</code> can only be specified for emails on cases. It's auto-created for other entities.</p>
BccAddress	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>A string array of email addresses for recipients who were sent a blind carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>BccIds</code> field instead of adding their email address to the <code>BccAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p>
BccIds	<p>Type</p> <p>JunctionIdList</p> <p>Properties</p> <p>Create, Update</p> <p>Description</p> <p>A string array of IDs for contacts, leads, and users who were sent a blind carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
CcAddress	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>A string array of email addresses for recipients who were sent a carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>CcIds</code> field instead of adding their email address to the <code>CcAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p>

Field	Details
CcIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for contacts, leads, and users who were sent a carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
ContentDocumentIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for content documents, such as files and attachments, that are associated with an email. Each ID is linked to a <code>ContentDocumentLink</code> record, which represents the relationship between an email message and a content document record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
FromAddress	<p>Type email</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The address that originated the email. When using this field, specify an email address that exists in <code>EmailMessageRelation</code>, with a <code>RelationType</code> of <code>FromAddress</code>.</p>
FromName	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The sender's name. When using this field, specify an email address that exists in <code>EmailMessageRelation</code>, with a <code>RelationType</code> of <code>FromAddress</code>.</p>

Field	Details
HasAttachment	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the email was sent with an attachment (<code>true</code>) or not (<code>false</code>).</p>
Headers	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Internet message headers of the incoming email. Used for debugging and tracing purposes. Does not apply to outgoing emails.</p>
HtmlBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The body of the email in HTML format.</p>
Incoming	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter</p> <p>Description Indicates whether the email was received (<code>true</code>) or sent (<code>false</code>).</p>
IsClientManaged	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group</p> <p>Description If <code>EmailMessage</code> is created with <code>IsClientManaged</code> set to true, users can modify <code>EmailMessage.ContentDocumentIds</code> to link file attachments even when the <code>Status</code> of the <code>EmailMessage</code> is not set to <code>Draft</code>.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p>

Field	Details
	<p>Description</p> <p>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
<code>IsExternallyVisible</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Update</p> <p>Description</p> <p>If the community case feed is enabled, <code>IsExternallyVisible</code> controls the external visibility of emails in communities. When <code>IsExternallyVisible</code> is set to <code>true</code>—its default value—email messages are visible to external users in the case feed.</p> <p>Only emails with the <code>ParentId</code> field populated are available to be externally visible in communities.</p> <p>This field can't be updated if the email's <code>Status</code> is set to <code>Draft</code>.</p>
<code>MessageDate</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The date the email was created.</p>
<code>MessageIdentifier</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the email message.</p>
<code>ParentId</code>	<p>Type</p> <p>ID</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>ID of the case that's associated with the email.</p>
<code>RelatedToId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The <code>RelatedToId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>RelatedTolds</code> are polymorphic. Polymorphic means a <code>RelatedTold</code> is equivalent to the ID of a related object.</p>
<code>ReplyToEmailMessageId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the inbound or outbound <code>EmailMessage</code> the current <code>EmailMessage</code> is a reply to. It's not possible to reply to a message whose <code>Status</code> is <code>Draft</code>.</p>
<code>Status</code>	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist, Update</p> <p>Description Read only. The status of the email. For example, <code>New</code>, <code>Read</code>, <code>Replied</code>, <code>Sent</code>, <code>Forwarded</code>, or <code>Draft</code>.</p>
<code>Subject</code>	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The subject line of the email.</p>
<code>ThreadId</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the email thread the email message belongs to.</p>
<code>TextBody</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The body of the email, in plain text format. If <code>TextBody</code> is not set, then it is extracted from <code>HtmlBody</code>.</p>

Field	Details
ToAddress	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description A string array of email addresses for recipients who were sent the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>ToIds</code> field instead of adding their email address to the <code>ToAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p>
ToIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of IDs for contacts, leads, and users who were sent the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>

Usage

If your organization uses Email-to-Case, a case is created when an email is sent to one of your company's addresses. The email, which is related to the case by the `ParentID` field, is stored as an `EmailMessage` record. When users view the email, they see the `EmailMessage` record.

If your organization uses Enhanced Email, each email is stored as an `EmailMessage` record and a `Task` record. When users view an email, they see the `EmailMessage` record.

Sample Code—Apex

This sample logs email activity in Salesforce.

```
// if EnhancedEmail Perm is not enabled, continue logging the email as a task

// if EnhancedEmail Perm is enabled, create an EmailMessage object
EmailMessage emailMessage = new EmailMessage();
emailMessage.status = '3'; // email was sent
emailMessage.relatedToId = '006B0000003weZGIAY'; // related to record e.g. an opportunity
emailMessage.fromAddress = 'sender@example.com'; // from address
emailMessage.fromName = 'Dan Perkins'; // from name
emailMessage.subject = 'This is the Subject!'; // email subject
```

```

emailMessage.htmlBody = '<html><body><b>Hello</b></body></html>'; // email body
// Contact, Lead or User Ids of recipients
String[] toIds = new String[]{'003B000000AxcEjIAJ'};
emailMessage.toIds = toIds;
// additional recipients who don't have a corresponding contact, lead or user id in the
Salesforce org (optional)
emailMessage.toAddress = 'emailnotinsalesforce@toexample.com, anotherone@toexample.com';
insert emailMessage; // insert

// Add Email Message Relation for id of the sender
EmailMessageRelation emr = new EmailMessageRelation();
emr.emailMessageId = emailMessage.id;
emr.relationId = '005B0000003qHvOIAU'; // user id of the sender
emr.relationType = 'FromAddress';
insert emr;

```

SEE ALSO:[Case](#)[Object Basics](#)

EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later

Special Access Rules

EmailMessageRelation is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
EmailMessageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the EmailMessage record.</p>
RelationAddress	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The email address of the sender or recipient.</p> <p> Note: If a record relates an email to an existing contact, lead, or user record in Salesforce, the value of <code>RelationAddress</code> is null.</p>
RelationId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The <code>RecordId</code> of the sender or recipient.</p> <p> Note: If a record relates an email to an email address that's not associated with an existing contact, lead, or user record in Salesforce, the value of <code>RelationId</code> is null.</p>
RelationObjectType	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The API name of the object type of the <code>RecordId</code> in the <code>RelationId</code> field. It can be a contact, lead, or user.</p>
RelationType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of relationship the contact, lead, or user has with the email message. Possible values include:</p> <ul style="list-style-type: none"> • <code>ToAddress</code> • <code>CcAddress</code> • <code>BccAddress</code> • <code>FromAddress</code>

Usage

EmailMessageRelation allows an email to be related to contacts, leads, and users.

EmailServicesAddress

An email service address.

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AuthorizedSenders	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Configures the email service address to only accept messages from the email addresses or domains listed in this field. If the email service address receives a message from an unlisted email address or domain, the email service performs the action specified in the <code>AuthorizationFailureAction</code> field of its associated email service. Leave this field blank if you want the email service address to receive email from any email address.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This 25-character field must be unique among other EmailServicesAddress records under the same EmailServiceFunction parent.</p> <p>In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance might be slow while Salesforce generates one for each record.</p>

Field	Details
EmailDomainName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description A read only field you can query that contains the system-generated domain part of this email service address. The system generates a unique domain-part for each email service address to ensure that no two email service addresses are identical.</p>
FunctionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the email service for which the email service address receives messages.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this object is active (true) or not (false).</p>
LocalPart	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The local-part of the email service address. The local-part of the address is the string that comes before the @ symbol. For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: ! # \$ % & amp; ' * / = ? ^ _ + - ` { } ~ , The dot character (.) is also valid as long as it's not the first or last character. Email addresses aren't case-sensitive.</p>
RunAsUserId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>The username of the user whose permissions the email service assumes when processing messages sent to this address.</p>

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

[EmailServicesFunction](#)

EmailServicesFunction

An email service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
<code>AddressInactiveAction</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates what the email service does with messages received at an email address that is inactive.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.)

Field	Details
	<ul style="list-style-type: none"> Requeue—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
ApexClassId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Required. The ID of the Apex class that the email service uses to process inbound messages. This field is required for API version 12.0 and later.</p>
AttachmentOption	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Indicates the types of attachments the email service accepts. One of the following values:</p> <ul style="list-style-type: none"> None—The email service accepts the message but discards any attachment. (In API version 41.0 and earlier, the value specified for this choice is 0.) NoContent—The attachment metadata (filename, MIME type, and so on) is provided to the Apex class, but the body is set to <code>null</code>. There was no previous numeric value for this choice. TextOnly—The email service only accepts the following types of attachments: <ul style="list-style-type: none"> Attachments with a Multipurpose Internet Mail Extension (MIME) type of text. Attachments with a MIME type of application/octet-stream and a file name that ends with either a <code>.vcf</code> or <code>.vcs</code> extension. These are saved as <code>text/x-vcard</code> and <code>text/calendar</code> MIME types, respectively. (In API version 41.0 and earlier, the value specified for this choice is 1.) BinaryOnly—The email service only accepts binary attachments, such as image, audio, application, and video files. (In API version 41.0 and earlier, the value specified for this choice is 2.) All—The email service accepts any type of attachment. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthenticationFailureAction	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates what the email service does with messages that fail or do not support any of the authentication protocols if the <code>IsAuthenticationRequired</code> field is true.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthorizationFailureAction	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Defaulted on create, Group, Sort, Create, Filter, Nillable, Restricted picklist, Update</p> <p>Description</p> <p>Indicates what the email service does with messages received from senders who are not listed in the <code>AuthorizedSenders</code> field on either the email service or email service address.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
AuthorizedSenders	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Configures the email service to only accept messages from the email addresses or domains listed in this field. If the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the <code>AuthorizationFailureAction</code> field. Leave this field blank if you want the email service to receive email from any email address.</p>
<code>ErrorRoutingAddress</code>	<p>Type</p> <p>email</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The destination email address for error notification email messages when <code>IsErrorRoutingEnabled</code> is <code>true</code>.</p>
<code>FunctionInactiveAction</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates what the email service does with messages it receives when the email service itself is inactive.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
<code>FunctionName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The name of the email service.</p>

Field	Details
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this object is active (<code>true</code>) or not (<code>false</code>).</p>
IsAuthenticationRequired	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Configures the email service to verify the legitimacy of the sending server before processing a message. The email service uses the SPF, SenderId, and DomainKeys protocols to verify the sender's legitimacy: If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the <code>AuthenticationFailureAction</code> field.</p>
IsErrorRoutingEnabled	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description When incoming email messages can't be processed, indicates whether error notification email messages are routed to a chosen address or to the senders.</p>
IsTextAttachmentsAsBinary	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, text attachments are supplied to the Apex code as a <code>Messaging.BinaryAttachment</code> instead of as a <code>Messaging.TextAttachment</code>. This means that the body is supplied as an Apex Blob instead of as an Apex String.</p>
IsTextTruncated	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>This field is deprecated. It is not available as of API version 23.0 and is deprecated and hidden in versions 17.0 through 22.0. In all API versions, the email service now accepts inbound email messages up to the 10 MB size limit, without truncating the text. Previously, it indicated whether the email service truncated and accepted email messages with HTML body text, plain body text, and text attachments over approximately 100,000 characters (<code>true</code>) or rejected these email messages and notified the sender (<code>false</code>).</p>
IsTlsRequired	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Not currently in use.</p>
OverLimitAction	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization.</p> <p>One of the following values:</p> <ul style="list-style-type: none"> • <code>UseSystemDefault</code>—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • <code>Bounce</code>—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • <code>Discard</code>—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • <code>Requeue</code>—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.) <p>The system calculates the limit by multiplying the number of user licenses by 1,000.</p>

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

[EmailTemplate](#)

EmailTemplate

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

Note: You can't send a mass email using a Visualforce email template.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
ApiVersion	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The API version for this class. Every class has an API version specified at creation.</p>
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Content of the email. Limit: 384 KB.</p>
BrandTemplateId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the BrandTemplate associated with this email template. The brand template supplies letterhead information for the email template.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Description of the template, for example, Promotion Mass Mailing.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not</p>

Field	Details
	<p>include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Template Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
Encoding	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Character set encoding for the template.</p>
EntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort,</p> <p>Description When <code>UiType</code> is 2 (Lightning Experience) or 3 (Lightning ExperienceSample), <code>EntityType</code> indicates which entities this template can be used with (for example, an account, lead, and so on). Valid values are standard object ID prefixes: 001 for account, 003 for contact, 006 for opportunity, and 00Q for lead, 500 for case, and 701 for campaign. This field has been deprecated in API version 39.0. Use <code>RelatedEntityType</code> instead.</p>
FolderId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the folder that contains the template.</p>
HtmlValue	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description This field contains the content of the email message, including HTML coding to render the email message. Limit: 384 KB.</p>

Field	Details
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates that this template is active if <code>true</code>, or inactive if <code>false</code>.</p>
LastUsedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Date and time when this EmailTemplate was last used.</p>
Markup	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The Visualforce markup, HTML, Javascript, or any other Web-enabled code that defines the content of the template.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the template. Label is Email Template Name.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the

Field	Details
	<p>installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</p> <ul style="list-style-type: none"> In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects. <p>This field cannot be accessed unless the logged-in user has the "Customize Application" permission.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of the template.</p>
RelatedEntityType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort,</p> <p>Description When <code>UiType</code> is 2 (Lightning Experience) or 3 (Lightning ExperienceSample), <code>RelatedEntityType</code> indicates which entities this template can be used with. Valid values are the entity API name: "Account" for account, "Contact" for contact, "Opportunity" for opportunity, "Lead" for lead, and so on. The value can be any entity the user has read access to (including custom entities) but not virtual entities, setup entities, or platform entities. No restrictions exist at the schema level.</p>
Subject	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort, Update</p> <p>Description Content of the subject line.</p>
TemplateStyle	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Style of the template, such as <code>formalLetter</code> or <code>freeform</code>.</p>

Field	Details
TemplateType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Type of template, either HTML, text, or custom templates, or those templates generated by Visualforce.</p>
TimesUsed	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number of times this template has been used.</p>
UIType	<p>Type picklist</p> <p>Properties Create, Filter, Group, , Restricted picklist, Sort,</p> <p>Description Indicates the user interface where this template is usable. Valid values are: 1 (Salesforce Classic), 2 (Lightning Experience), and 3 (Lightning Experience Sample).</p>

Usage

To retrieve this object, issue a describe call on an object, which returns a query result for each activity since the object was created. You can't query these records.

EmbeddedServiceDetail

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

Supported SOAP Calls

`describeSObjects()`, `query()`

Supported REST HTTP Methods

GET

Fields

Field	Details
<code>ContrastPrimaryColor</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value of the <code>ContrastPrimaryColor</code> field in the <code>EmbeddedServiceBranding</code> setup object.</p>
<code>CustomPrechatComponent</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The custom Lightning Component that's used for the pre-chat page in this Snap-ins Chat deployment.</p>
<code>DurableID</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Developer name for the <code>EmbeddedServiceConfig</code>.</p>
<code>Font</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Font used in the chat text of the Snap-ins chat widget.</p>
<code>IsLiveAgentEnabled</code>	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Specifies whether Live Agent is enabled for this Snap-ins deployment (<code>true</code>) or not (<code>false</code>).</p>
IsPreChatEnabled	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Value of the <code>PreChatEnabled</code> field in the <code>EmbeddedServiceLiveAgent</code> setup object.</p>
NavBarColor	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value of the <code>NavBarColor</code> field in the <code>EmbeddedServiceBranding</code> setup object.</p>
PrimaryColor	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Value of the <code>PrimaryColor</code> field in the <code>EmbeddedServiceBranding</code> setup object.</p>
SecondaryColor	<p>Type string</p> <p>Properties Filter, Group, Nillable Sort</p> <p>Description Value of the <code>SecondaryColor</code> field in the <code>EmbeddedServiceBranding</code> setup object.</p>
Site	<p>Type string</p> <p>Properties Filter, Group, Nillable Sort</p> <p>Description Value of the <code>Site</code> field in the <code>EmbeddedServiceConfig</code> setup object.</p>

The following fields are visible but unusable.

- AvatarImg
- ContrastInvertedColor
- FontSize
- HeaderBackgroundImg
- PrechatBackgroundImg
- SmallCompanyLogoImg
- WaitingStateBackgroundImg

The following fields are visible but unavailable except for Snap-ins Appointment Booking pilot users:

- CancelApptBookingFlowName
- FieldServiceConfirmCardImg
- FieldServiceHomeImg
- FieldServiceLogoImg
- FlowDeveloperName
- IsFieldServiceEnabled
- ModifyApptBookingFlowName
- ShouldShowExistingAppointment
- ShouldShowNewAppointment

Entitlement

Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the Account associated with the entitlement.</p>
AssetId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the Asset associated with the entitlement. Must be a valid asset ID.</p>
BusinessHoursId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the BusinessHours associated with the entitlement. Must be a valid business hours ID.</p>
CasesPerEntitlement	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total number of cases the entitlement supports. This field is only available if <code>IsPerIncident</code> is <code>true</code>.</p>
ContractLineItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Required. ID of the ContractLineItem associated with the entitlement. Must be a valid ID.</p>
EndDate	<p>Type date</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The last day the entitlement is in effect.</p>
IsPerIncident	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Update</p>

Field	Details
	<p>Description Indicates whether the entitlement is limited to supporting a specific number of cases (<code>true</code>) or not (<code>false</code>).</p>
<code>LastReferencedDate</code>	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
<code>LastViewedDate</code>	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
<code>Name</code>	<p>Type string</p> <p>Properties Create, Filter, Update</p> <p>Description Required. Name of the entitlement.</p>
<code>SvcApptBookingWindowsId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Nillable, Update</p> <p>Description The operating hours that the entitlement's work orders should respect. The label in the user interface is <code>Operating Hours</code>. Available only if Field Service Lightning is enabled.</p>
<code>RemainingCases</code>	<p>Type int</p> <p>Properties Create, Filter, Nillable, Update</p>

Field	Details
	<p>Description</p> <p>The number of cases the entitlement can support. This field decreases in value by one each time a case is created with the entitlement.</p> <p>This field is only available if <code>IsPerIncident</code> is selected.</p>
<code>ServiceContractId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>Required. ID of the <code>ServiceContract</code> associated with the entitlement. Must be a valid ID.</p>
<code>SlaProcessId</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>ID of the <code>SlaProcess</code> associated with the entitlement. This field is available in version 19.0 and later.</p>
<code>StartDate</code>	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>The first date the entitlement is in effect.</p>
<code>Status</code>	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Nillable</p> <p>Description</p> <p>Status of the entitlement, such as <code>Expired</code>.</p>
<code>SvcApptBookingWindows</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Nillable, Update</p> <p>Description</p> <p>The operating hours of the entitlement. This field is visible only if Field Service Lightning is enabled.</p>

Field	Details
Type	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description The type of entitlement, such as Web or phone support.</p>

SEE ALSO:

[EntitlementContact](#)[EntitlementHistory](#)[SlaProcess](#)

EntitlementContact

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Fields

Field	Details
ContactId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Contact associated with the entitlement. Must be a valid ID.</p>
EntitlementId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the Entitlement associated with the entitlement contact. Must be a valid ID.</p>

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Nillable</p> <p>Description Required. Name of the entitlement contact.</p>

Usage

Use to query and manage entitlement contacts.

EntitlementFeed

Represents a single feed item in the feed displayed on the detail page for an entitlement. An entitlement feed shows recent changes to an entitlement record for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to entitlements. This object is available in API version 23.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Entitlement object
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the EntitlementFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedComments</code> associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p>

Field Name	Details
	<p>Description</p> <p>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only.</p> <p>The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only.</p> <p>The file uploaded to the feed. Required if <code>Type</code> is <code>ContentPost</code>. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentSize</code>	<p>Type</p> <p>int</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>ContentType</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nullable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
<code>InsertedById</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Group, Nullable, Sort</p>

Field Name	Details
	<p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on the feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for the <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of the <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default <code>community</code>, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a <code>Group</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the entitlement record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost. For example, set this field to an existing ContentVersion and post it to a feed as an EntitlementFeed object of Type ContentPost.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the EntitlementFeed. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of EntitlementFeed item:</p> <ul style="list-style-type: none"> • ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). <p>For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.</p>

Field Name	Details
	<ul style="list-style-type: none"> • <code>AdvancedTextPost</code>—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • <code>AnnouncementPost</code>—Not used. • <code>ApprovalPost</code>—generated when a user submits an approval. • <code>BasicTemplateFeedItem</code>—Not used. • <code>CanvasPost</code>—a post made by a canvas app posted on a feed. • <code>CollaborationGroupCreated</code>—generated when a user creates a public group. • <code>CollaborationGroupUnarchived</code>—Not used. • <code>ContentPost</code>—a post with an attached file. • <code>CreatedRecordEvent</code>—generated when a user creates a record from the publisher. • <code>DashboardComponentAlert</code>—generated when a dashboard metric or gauge exceeds a user-defined threshold. • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user’s Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case. • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. • <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case.

Field Name	Details
	<ul style="list-style-type: none"> • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. • <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. • <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. • <code>SocialPost</code>—generated when a social post is created from a case.
<p><code>Visibility</code></p>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>Visibility</code> can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • <code>Visibility</code> can be updated on record posts. • The <code>Update</code> property is supported only for feed items posted on records.

Usage

Use this object to track changes for an entitlement record.

- [FeedItem](#)

EntitlementHistory

Represents the changes to field values on an Entitlement. This object is available in API version 18.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
EntitlementId	<p>Type reference</p> <p>Properties Filter</p> <p>Description Required. ID of the Entitlement.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description The latest value of the field before it was changed.</p>

Usage

This object respects field-level security on the parent object.

SEE ALSO:

[Entitlement](#)

[EntitlementContact](#)

EntitlementTemplate

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view entitlement templates via the API.

Fields

Field	Details
<code>BusinessHoursId</code>	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the BusinessHours associated with the entitlement template. Must be a valid business hours ID.</p>
<code>CasesPerEntitlement</code>	<p>Type int</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The total number of cases the entitlement template supports. This field is only available if <code>IsPerIncident</code> is true.</p>
<code>IsPerIncident</code>	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the entitlement template is limited to supporting a specific number of cases (<code>true</code>) or not (<code>false</code>).</p>
Name	<p>Type string</p> <p>Properties Create, Filter, idLookup, Update</p> <p>Description Required. Name of the entitlement template.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects. <p>Available in version 34.0 and later.</p>
SlaProcessId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the SlaProcess associated with the entitlement template. This field is available in API version 19.0 and later.</p>

Field	Details
Term	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description Number of days that the entitlement template is valid.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The type of entitlement template, such as Web or phone support.</p>

Usage

Use this object to manage entitlement templates.

EntityHistory

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead: CaseHistory, ContractHistory, LeadHistory, OpportunityFieldHistory, OpportunityHistory ProcessInstanceHistory, QuantityForecastHistory, RevenueForecastHistory, or SolutionHistory.

Supported Calls

`describeSObjects()`, `getUpdated()`, `getDeleted()`, `query()`, `retrieve()`

Fields

Field	Details
FieldName	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description ID of the standard or custom field.</p>

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description New value of the modified field.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description Previous value of the modified field.</p>
ParentId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the object that contains the field.</p>
ParentSubjectType	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The kind of object that contains the field.</p>

Usage

In API version 7.0 and later, this object works with Case, Contract, and Solution objects:

- This object is always read-only in the online application.

- When a field is modified, this object records both the old and new field values. There are exceptions to this behavior for certain fields such as long text areas and multi-select picklists. These fields appear in this object to indicate that the field was changed, but the old and new values are not recorded.
- Two rows are added to this object when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, “Jane Doe” is recorded as the name of a contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.
- Up to a total of twenty fields (standard or custom) can be tracked for a given object.
- In the online application, you can specify which fields are tracked or not tracked at any time.
- As soon as tracking is turned on for a field, all changes to its value are recorded in the database.
- Turning off tracking for a field stops further changes from being recorded, but the history data is not deleted.
- Be advised that deleting a custom field also permanently deletes the history data for that custom field.

EntityMilestone

Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term “object milestone.” This object is available in API version 37.0 and later.

 **Note:** Milestones on cases use the [CaseMilestone](#) object type.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Special Access Rules

- Entitlement management must be enabled.
- Work orders or Field Service Lightning must be enabled.

Fields

Field Name	Details
<code>ActualElapsedTimeInDays</code>	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of days that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time)</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>

Field Name	Details
ActualElapsedTimeInHrs	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of hours that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time)</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>
ActualElapsedTimeInMins	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of minutes that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time)</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>
BusinessHoursId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The business hours on the milestone. If business hours aren't specified, the entitlement process business hours are used. If business hours are also not specified on the entitlement process, the business hours on the record are used.</p>
CompletionDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The date and time the milestone was completed.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
ElapsedTimeInDays	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of days it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).</p>
ElapsedTimeInHrs	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of hours it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).</p>
ElapsedTimeInMins	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of minutes it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).</p>
IsCompleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Icon (✔) that indicates a milestone completion.</p>
IsViolated	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Icon (🚫) that indicates a milestone violation.</p>
MilestoneTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the milestone (for instance, First Response).</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The name of the milestone.</p>
ParentEntityId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the record—for example, a work order—that contains the milestone.</p>
SlaProcessId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The entitlement process associated with the milestone.</p>
StartDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The date and time that milestone tracking started.</p>

Field Name	Details
StoppedTimeInDays	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of days that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information.</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>
StoppedTimeInHrs	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of hours that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information.</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>
StoppedTimeInMins	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of minutes that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information.</p> <p> Note: To display this field, select Enable stopped time and actual elapsed time on the Entitlement Settings page and add the field to the object milestone page layout.</p>
TargetDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time to complete the milestone.</p>

Field Name	Details
TargetResponseInDays	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of days to complete the milestone. Automatically calculated to include the business hours on the record.</p>
TargetResponseInHrs	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The number of hours to complete the milestone. Automatically calculated to include the business hours on the record.</p>
TargetResponseInMins	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of minutes to complete the milestone. Automatically calculated to include the business hours on the record.</p>
TimeRemainingInDays	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The days that remain before a milestone violation. Automatically calculated to include the business hours on the record.</p>
TimeRemainingInHrs	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The hours that remain before a milestone violation. Automatically calculated to include the business hours on the record.</p>
TimeRemainingInMins	<p>Type string</p>

Field Name	Details
	<p>Properties Group, Nillable, Sort</p> <p>Description The minutes that remain before a milestone violation. Automatically calculated to include the business hours on the record.</p>
TimeSinceTargetInDays	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The days that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.</p>
TimeSinceTargetInHrs	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The hours that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.</p>
TimeSinceTargetInMins	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The minutes that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.</p>

Usage

When you create an entitlement process, you select its type based on the type of record that you want the process to run on: Case or Work Order. Processes created before Summer '16 use the Case type. When a Work Order entitlement process runs on a work order, the resulting milestones on the work order are object milestones. Conversely, when a Case entitlement process runs on a case, the resulting milestones are case milestones, a separate standard object.

Tip: If an entitlement has an entitlement process associated with it, don't use the entitlement for multiple types of support records. An entitlement process works only on records that match the process's type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with that entitlement. If a work order is also associated with the entitlement, the process doesn't run on the work order. To ensure that the milestones you set up work as expected, associate a customer's work orders and cases with different entitlements.

Customize page layouts, validation rules, and more for object milestones from the Object Milestones node in Setup under Entitlement Management.

EntitySubscription

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
NetworkId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description ID of the community that this file originated from. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the record or user which the user is following.</p>
SubscriberId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the User who is following the record or user.</p>

Usage

Consider this when following records and users:

- Users can only follow records that they can see.
- Users can see which records other users are following, unless they don't have access to the records.
- Administrators and users with the "Modify All Users" permission can configure a user to follow records that the user has read access to.
- Administrators and users with the "Modify All Users" permission can configure users to stop following records.
- Following topics is available in API version 29.0 and later. For this reason, a topic ID is now a supported value for the `ParentId` field.
- If you deactivate a user, any `EntitySubscription` where the user is associated with the `ParentId` or `SubscriberId` field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user `EntitySubscription` is deleted twice (double deleted). Such subscriptions can't be restored upon user reactivation.

When using `query()` with `EntitySubscription`,

- Note the following SOQL restriction. No SOQL limit if logged-in user has "View All Data" permission. If not, specify a `LIMIT` clause of 1,000 records or fewer.
- A query using a `WHERE` clause can only filter by fields on the `EntitySubscription` object.
- If user sharing is enabled and the querying user is not an administrator, a SOQL query must be constrained either by the `ParentId` or `SubscriberId`. Otherwise, the query behavior at run time is undefined, meaning the result set can be incomplete or inconsistent from invocation to invocation. For an unconstrained query, the sharing check limits imposed on a non-administrative user are likely to be exceeded before the query completes, because access checks are run against both parent and subject, for each row of the result set. We recommend using the Chatter REST API to query `EntitySubscription` data instead of running a SOQL query.
- Users without the "View All Data" permission
 - Need read access on the object associated with the `ParentId` field to see which users are following records for the object.
 - Can use an `ORDER BY` clause in a query only to order by fields on the `EntitySubscription` object. For example, if the subscription relates to an `Account` record, the query can `ORDER BY ParentId`, but it can't `ORDER BY Account.Name`.
 - Don't always get all matching subscriptions when running a query. For these users, a query evaluates visibility criteria on a maximum of 500 records to reduce the prospect of long-running queries. If a user runs a query to see the CEO's subscriptions, it might scan a large number of records. The query only returns matches within the first 500 records scanned. It is possible that there are more subscriptions that are visible to the user, but they are not returned. To mitigate this, we recommend using a `WHERE` clause, if possible, to reduce the scope of the query.

Sample—SOQL

The following SOQL query returns subscriptions for all the accounts that a subscriber is following that have more than 10 employees:

```
SELECT Id
FROM EntitySubscription
WHERE SubscriberId = '005U0000000Rg2CIAS'
AND ParentId IN (
  SELECT Id FROM Account
  WHERE NumberOfEmployees > 10
```

```
)
LIMIT 200
```

EnvironmentHubMember

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

Note: You can only create 20 member orgs per day. If you need to create additional orgs, log a case in the Partner Community.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Fields

Field Name	Details
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description System field that specifies the date and time when this record was created.</p>
Description	<p>Type string</p> <p>Properties Nillable, Update</p> <p>Description A brief description of this organization.</p>
DisplayName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The name that the user has specified for this member organization.</p>
EnvironmentHubId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The Organization ID of this member's Environment Hub organization.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter, Group, idLookup, Sort</p> <p>Description System field that uniquely identifies this record.</p>
IsFedIdSsoMatchAllowed	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if single sign-on has been enabled based on matching Federation ID. The default value is <code>false</code>.</p>
IsSandbox	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates if the member organization is a sandbox (<code>true</code>) or not (<code>false</code>). This field is available in API version 36.0 and later.</p>
MemberEntity	<p>Type string</p> <p>Properties Filter, Group, idLookup, Sort</p> <p>Description The unique Organization ID of the member organization for this record.</p>
MemberType	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of member organization for this record. Possible values include <code>Branch Org</code>, <code>Patch Org</code>, <code>Release Org</code>, <code>Sandbox Org</code>, <code>Trialforce Management Org</code>, and <code>Trialforce Source Org</code>.</p> <p> Note: Only one member type at a time is stored. Member type is determined according to this hierarchy: (1) Sandbox, (2) Release, (3) Trialforce Source Org (TSO), (4) Patch, (5) Branch, and (6) Trialforce Management Org (TMO). For example, if an org is both a sandbox and a TMO, the value of <code>MemberType</code> is <code>Sandbox Org</code>.</p>
Name	<p>Type string</p> <p>Properties Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the member organization for this record.</p>
OrgEdition	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The organization's edition, for example, Enterprise Edition or Unlimited Edition.</p>
OrgStatus	<p>Type picklist</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description The licensing or creation status of this organization. Possible values include <code>Active</code>, <code>Demo</code>, <code>Deleted</code>, <code>Free</code>, <code>Inactive</code>, and <code>Trial</code>.</p>
Origin	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The method by which this organization was added to the Environment Hub. Possible values are <code>Auto Discovered</code>, <code>User Added</code>, and <code>Provisioned</code>.</p>

Field Name	Details
ServiceProviderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the service provider for this member organization. This field is available in API version 36.0 and later.</p>
ShouldAddRelatedOrgs	<p>Type boolean</p> <p>Properties Defaulted on create, Update</p> <p>Description If related organizations should be automatically connected to the hub when this member organization is added. The default value is <code>true</code>.</p>
ShouldEnableSSO	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If SSO should be enabled when this member organization is added. The default value is <code>false</code>.</p>
SSOMappedUsers	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The total number of mapped users in this member organization. This field is available in API version 36.0 and later.</p>
SsoStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If single sign-on has been enabled for this organization. Possible values are:</p> <ul style="list-style-type: none"> • <code>Enabled</code>—Single sign-on is enabled. • <code>Disabled</code>—Single sign-on is disabled. • <code>Pending</code>—Single sign-on is in the process of being enabled.

Field Name	Details
	<ul style="list-style-type: none"> Failed—Single sign-on enablement failed. Contact Salesforce support for assistance.
<code>SsoUsernameFormula</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description The custom formula for matching users in the hub and member organizations.</p>

Usage

Use this object to access and modify settings of member organizations in the Environment Hub.

Event

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

Note:

- An `EventRelation` object can't be related to a child event, and child events don't include the invitee related list.
- `query()`, `delete()`, and `update()` aren't allowed with events related to more than one contact in API versions 25.0 and earlier.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
<code>AcceptedEventInviteeIds</code>	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of contact or lead IDs who accepted this event. This <code>JunctionIdList</code> is linked to the <code>AcceptedEventRelation</code> child relationship.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>

Field	Details
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents the ID of the related Account. The <code>AccountId</code> is determined as follows.</p> <p>If the value of <code>whatId</code> is any of the following objects, then Salesforce uses that object's <code>AccountId</code>.</p> <ul style="list-style-type: none"> • Account • Opportunity • Contract • Custom object that is a child of Account <p>If the value of the <code>whatId</code> field is any other object, and the value of the <code>whoId</code> field is a Contact object, then Salesforce uses that contact's <code>AccountId</code>. (If your organization uses Shared Activities, Salesforce uses the <code>AccountId</code> of the primary contact.)</p> <p>Otherwise, Salesforce sets the value of the <code>AccountId</code> field to <code>null</code>.</p> <p>For information on IDs, see ID Field Type.</p>
ActivityDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Contains the event's due date if the <code>IsAllDayEvent</code> flag is set to <code>true</code>. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences. Label is Due Date Only.</p> <p>This field is required in versions 12.0 and earlier if the <code>IsAllDayEvent</code> flag is set to <code>true</code>.</p> <p>The value for this field and <code>StartDateTime</code> must match, or one of them must be <code>null</code>.</p>
ActivityDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Contains the event's due date if the <code>IsAllDayEvent</code> flag is set to <code>false</code>. This field is a regular Date/Time field with a relevant time portion. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is Due Date Time.</p>

Field	Details
	<p>This field is required in versions 12.0 and earlier if the <code>IsAllDayEvent</code> flag is set to <code>false</code>.</p> <p>The value for this field and <code>StartDateTime</code> must match, or one of them must be <code>null</code>.</p>
ClientGuid	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The client globally unique identifier identifies the external API client used to create the event. Label is Client GUID.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
DeclinedEventInviteeIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of contact, lead, or user IDs who declined this event. This <code>JunctionIdList</code> is linked to the <code>DeclinedEventRelation</code> child relationship.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Contains a text description of the event. Limit: 32,000 characters.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
DurationInMinutes	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Contains the event length, in minutes. Even though this field represents a temporal value, it is an integer type—not a Date/Time type.</p> <p>Required in versions 12.0 and earlier if <code>IsAllDayEvent</code> is false.</p> <p>In versions 13.0 and later, this field is optional, depending on the following:</p> <ul style="list-style-type: none"> • If <code>IsAllDayEvent</code> is true, you can supply a value for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are <code>null</code>, the duration defaults to one day. • If <code>IsAllDayEvent</code> is false, a value must be supplied for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. <p>If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the <code>DurationInMinutes</code> field. API versions 12.0 and earlier can't access event objects whose <code>DurationInMinutes</code> is greater than 1440. For more information, see Multiday Events.</p> <p>Depending on your API version, errors with the <code>DurationInMinutes</code> and <code>EndDateTime</code> fields may appear in different places.</p> <ul style="list-style-type: none"> • Versions 38.0 and before—Errors always appear in the <code>DurationInMinutes</code> field. • Versions 39.0 and later—If there's no value for the <code>DurationInMinutes</code> field, errors appear in the <code>EndDateTime</code> field. Otherwise, they appear in the <code>DurationInMinutes</code> field.
EndTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>Available in versions 13.0 and later. This field is a regular Date/Time field with a relevant time portion. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.</p> <p>This field is optional, depending on the following:</p>

Field	Details
	<ul style="list-style-type: none"> If <code>IsAllDayEvent</code> is true, you can supply a value for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are <code>null</code>, the duration defaults to one day. If <code>IsAllDayEvent</code> is false, a value must be supplied for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. <p>Depending on your API version, errors with the <code>DurationInMinutes</code> and <code>EndDateTime</code> fields may appear in different places.</p> <ul style="list-style-type: none"> Versions 38.0 and before—Errors always appear in the <code>DurationInMinutes</code> field. Versions 39.0 and later—If there's no value for the <code>DurationInMinutes</code> field, errors appear in the <code>EndDateTime</code> field. Otherwise, they appear in the <code>DurationInMinutes</code> field.
EventSubtype	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Provides standard subtypes to facilitate creating and searching for events. This field isn't updateable.</p>
EventWhoIds	<p>Type JunctionIdList</p> <p>Properties Create, Update</p> <p>Description A string array of contact or lead IDs used to create many-to-many relationships with a shared event. <code>EventWhoIds</code> is available when the shared activities setting is enabled. The first contact or lead ID in the list becomes the primary <code>whoId</code> if you don't specify a primary <code>whoId</code>. If you set the <code>EventWhoIds</code> field to null, all entries in the list are deleted and the value of <code>whoId</code> is added as the first entry.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
GroupEventType	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Read-only. Available in API versions 19.0 and later. The possible values are:</p> <ul style="list-style-type: none"> 0 (Non-group event)—An event with no invitees.

Field	Details
	<ul style="list-style-type: none"> 1 (Group event)—An event with invitees. 2 (Proposed event)—An event created when a user requests a meeting with a contact, lead, or person account using the Salesforce user interface. When the user confirms the meeting, the proposed event becomes a group event. You can't create, edit, or delete proposed events in the API. This value is no longer used in API version 41.0 and later.
IsAllDayEvent	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the <code>ActivityDate</code> field (<code>true</code>) or the <code>ActivityDateTime</code> field (<code>false</code>) is used to define the date or time of the event. Label is All-Day Event. See also DurationInMinutes and EndDateTime.</p>
IsArchived	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the event has been archived.</p>
IsChild	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the event is a child of another event (<code>true</code>) or not (<code>false</code>). For a child event, you can update <code>IsReminderSet</code> and <code>ReminderDateTime</code> only. You can query and delete a child event. If the objects related to the child event are different from those related to the parent event (this difference is possible if you use API version 25.0 or earlier) and one of the objects related to the child event is deleted, the objects related to the parent event are updated to ensure data integrity.</p>
IsClientManaged	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the event is managed by an external client. If the value of this field is false, the event isn't owned or managed by an external client, and Salesforce can be used to update it. If the value is true, Salesforce can be used to change only noncritical fields on the event. Label is Is Client Managed.</p>

Field	Details
IsGroupEvent	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the event is a group event—that is, whether it has invitees (<code>true</code>) or not (<code>false</code>).</p>
IsPrivate	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether users other than the creator of the event can (<code>false</code>) or can't (<code>true</code>) see the event details when viewing the event user's calendar. However, users with the View All Data or Modify All Data permission can see private events in reports and searches, or when viewing other users' calendars. Private events can't be associated with opportunities, accounts, cases, campaigns, contracts, leads, or contacts. Label is Private.</p>
IsRecurrence	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the event is scheduled to repeat itself (<code>true</code>) or only occurs once (<code>false</code>). This is a read-only field when updating records, but not when creating them. If this field value is <code>true</code>, then <code>RecurrenceEndDateOnly</code>, <code>RecurrenceStartDateTime</code>, <code>RecurrenceType</code>, and any recurrence fields associated with the given recurrence type must be populated. Label is Create recurring series of events.</p>
IsReminderSet	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the activity is a reminder (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInSelfService	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>Indicates whether an event associated with an object can be viewed in the Customer Portal (<code>true</code>) or not (<code>false</code>).</p> <p>If your organization has enabled Communities, events marked <code>IsVisibleInSelfService</code> are visible to any external user in the community, as long as the user has access to the record the event was created on.</p> <p>This field is available when Customer Portal or partner portal are enabled OR Communities is enabled and you have Customer Portal or partner portal licenses.</p>
Location	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Contains the location of the event.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Contains the ID of the user who owns the event. Label is Assigned to ID.</p>
RecurrenceActivityId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Read-only. Not required on create. Contains the ID of the main record of the recurring event. Subsequent occurrences have the same value in this field.</p>
RecurrenceDayOfMonth	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Indicates the day of the month on which the event repeats.</p>
RecurrenceDayOfWeekMask	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates the day or days of the week on which the event repeats. This field contains a bitmask. The values are as follows:</p> <ul style="list-style-type: none"> • Sunday = 1 • Monday = 2 • Tuesday = 4 • Wednesday = 8 • Thursday = 16 • Friday = 32 • Saturday = 64 <p>Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.</p>
RecurrenceEndDateOnly	<p>Type</p> <p>date</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Indicates the last date on which the event repeats. For multiday recurring events, this is the day on which the last occurrence starts. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences.</p>
RecurrenceInstance	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Indicates the frequency of the event's recurrence. For example, 2nd or 3rd.</p>
RecurrenceInterval	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Indicates the interval between recurring events.</p>
RecurrenceMonthOfYear	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Field	Details
	<p>Description Indicates the month in which the event repeats.</p>
RecurrenceStartDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the date and time when the recurring event begins. The value must precede the <code>RecurrenceEndDateOnly</code>. This field is a regular Date/Time field with a relevant time portion. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.</p>
RecurrenceTimeZoneSidKey	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the time zone associated with a recurring event. For example, "UTC-8:00" for Pacific Standard Time.</p>
RecurrenceType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates how often the event repeats. For example, daily, weekly, or every nth month (where "nth" is defined in <code>RecurrenceInstance</code>).</p>
ReminderDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Represents the time when the reminder is scheduled to fire, if <code>IsReminderSet</code> is set to <code>true</code>. If <code>IsReminderSet</code> is set to <code>false</code>, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.</p>
ShowAs	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates how this event appears when another user views the calendar: Busy, Out of Office, or Free. Label is Show Time As.</p>
StartDateTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the start date and time of the event. Available in versions 13.0 and later.</p> <p>If the Event <code>IsAllDayEvent</code> flag is set to true (indicating that it is an all-day Event), then the event start date information is contained in the <code>StartDateTime</code> field. This field is a regular Date/Time field with a relevant time portion. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.</p> <p>If the Event <code>IsAllDayEvent</code> flag is set to false (indicating that it is not an all-day event), then the event start date information is contained in the <code>StartDateTime</code> field. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. You need to translate the time portion to or from a local time zone for the user or the application, as appropriate.</p> <p>If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> must either be <code>null</code> or match the value of this field.</p>
Subject	<p>Type combobox</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The subject line of the event, such as Call, Email, or Meeting. Limit: 255 characters.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Indicates the event type, such as Call, Email, or Meeting.</p>
UndecidedEventInviteeIds	<p>Type JunctionIdList</p>

Field	Details
	<p>Properties Create, Update</p> <p>Description A string array of contact, lead, or user IDs who are undecided about this event. This <code>JunctionIdList</code> is linked to the <code>UndecidedEventRelation</code> child relationship.</p> <p> Warning: Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p>
WhatCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Available if your organization has enabled Shared Activities. Represents the count of related <code>EventRelations</code> pertaining to the <code>whatId</code>. The count of the <code>whatId</code> must be 1 or less.</p>
WhatId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The <code>whatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>whatIds</code> are polymorphic. Polymorphic means a <code>whatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>.</p>
WhoCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Available to organizations that have Shared Activities enabled. Represents the count of related <code>EventRelations</code> pertaining to the <code>whoId</code>.</p>
WhoId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The <code>WhoId</code> represents a human such as a lead or a contact. <code>WhoId</code>s are polymorphic. Polymorphic means a <code>WhoId</code> is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.</p>

Field	Details
	<p>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the <code>WhoId</code> field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is <code>Name ID</code>.</p> <p>If the <code>JunctionIdList</code> field is used, all <code>WhoIds</code> are included in the relationship list.</p> <p>Beginning in API version 37.0, if the contact or lead ID in the <code>WhoId</code> field is not in the <code>EventWhoIds</code> list, no error occurs and the ID is added to the <code>EventWhoIds</code> as the primary <code>WhoId</code>. If <code>WhoId</code> is set to null, an arbitrary ID from the existing <code>EventWhoIds</code> list is promoted to the primary position.</p>

Usage

Use Event to manage calendar appointments.

Querying and Filtering Events

Queries on events will be denied before they time out if they involve amounts of data that are deemed too large. In such cases, the exception code `OPERATION_TOO_LARGE` is returned. If you receive `OPERATION_TOO_LARGE`, refactor your query to return or scan a smaller amount of data.

When querying for events with a specific due date, you must filter on both the `ActivityDateTime` and `ActivityDate` fields. For example to find all events with a due date of February 14, 2003, you need two filters:

- One filter with the `ActivityDate` field equal to the Coordinated Universal Time (UTC) time zone on February 14, 2003.
- One filter with the `ActivityDateTime` field greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

Alternatively, in version 13.0 and later, you can find events with a specific due date by filtering on `StartDateTime`. For example, to find all events with a due date of February 14, 2003, filter with the `StartDateTime` greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

The `EventId` field of an `EventRelation` object always points to the master record. An invitee on a group event can query the `EventRelation` object to view the master record.

Multiday Events

- Multiday events are available in version 13.0 and later. Also, in earlier versions SOQL queries do not return multiday events.
- Multiday events are enabled through the user interface from Setup by entering *Activity Settings* in the `Quick Find` box, then selecting **Activity Settings**.
- If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can't access event objects whose `DurationInMinutes` is greater than 1440.
- Multiday events can't exceed 14 days.

Recurring Events

- Recurring events are available in version 7.0 and later.
- After an event is created, it can't be changed from recurring to nonrecurring or vice versa.
- When you delete a recurring event series through the API, all past and future events in the series are removed. However, when you delete a recurring event series through the user interface, only future occurrences are removed.

- When creating a recurring event series, the duration of the event must be 24 hours or less (either the `DurationInMinutes` or the difference between `RecurrenceStartDateTime` and `EndDateTime` must be greater than 24 hours). Once the recurring event series is created, you can extend the length of individual occurrences beyond 24 hours if Multiday events are enabled; see **Multiday Events**.
- If `IsRecurrence` is `true`, then `RecurrenceStartDateTime`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the following table) must be populated.
- When updating a recurring event series, it's not possible to update the `EventRelation` for the event series object and the `EventRelation` for the series object occurrences at the same time.

The following table describes the usage of recurrence fields. Each recurrence type must have all of its properties set. All unused properties must be set to null.

RecurrenceType Value	Properties	Example Pattern
RecursDaily	RecurrenceInterval	Every second day
RecursEveryWeekday	RecurrenceDayOfWeekMask	Every weekday - can't be Saturday or Sunday
RecursMonthly	RecurrenceDayOfMonth RecurrenceInterval	Every second month, on the third day of the month
RecursMonthlyNth	RecurrenceInterval RecurrenceInstance RecurrenceDayOfWeekMask	Every second month, on the last Friday of the month
RecursWeekly	RecurrenceInterval RecurrenceDayOfWeekMask	Every three weeks on Wednesday and Friday
RecursYearly	RecurrenceDayOfMonth RecurrenceMonthOfYear	Every March on the twenty-sixth day of the month
RecursYearlyNth	RecurrenceDayOfWeekMask RecurrenceInstance RecurrenceMonthOfYear	The first Saturday in every October

JunctionIdList

To create an event using `JunctionIdList`, IDs are pulled from the related contacts and both the event and the `EventRelation` records are created in one API call. If the `EventRelation` fails, the event is rolled back because it's all done in a single API call.

```
public void createEventNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {
        contactIds[i] = contacts[i].getID();
    }
    Event event = new Event();
    event.setSubject("New Event");
    event.setEventWhoIds(contactIds);
    SaveResult[] results = null;
    try {
        results = connection.create(new Event[] {
            task
        });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

```
}
}
```

[Archived Activities](#)[Object Basics](#)

EventFeed

Represents a single feed item in the feed on an Event. This object is available in API version 20.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of EventFeed. Required when Type is TextPost. Optional when Type is ContentPost or LinkPost. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p>

Field	Details
	<p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
<code>ConnectionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
<code>ContentData</code>	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type</p> <p>int</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Defaulted on create, Filter, Sort</p> <p>Description</p> <p>Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only.</p> <p>ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type</p> <p>reference</p>

Field	Details
	<p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of <code>FeedLikes</code> associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community.

Field	Details
	<ul style="list-style-type: none"> • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> • Only feed items with a <code>Group</code> or <code>User</code> parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. • You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
<code>ParentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the event record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
<code>RelatedRecordId</code>	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the <code>ContentVersion</code> object associated with a <code>ContentPost</code>. This field is null for all posts except <code>ContentPost</code>.</p>
<code>Title</code>	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL and this field is the link name.</p>
<code>Type</code>	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <code>Task</code> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <code>Task</code> or <code>Event</code> associated with a case record (excluding email and call logging).

Field	Details
	<p data-bbox="609 254 1458 352">For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.</p> <ul data-bbox="574 380 1458 1329" style="list-style-type: none"> <li data-bbox="574 380 1458 443">• AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. <li data-bbox="574 457 976 485">• AnnouncementPost—Not used. <li data-bbox="574 499 1252 527">• ApprovalPost—generated when a user submits an approval. <li data-bbox="574 541 1052 569">• BasicTemplateFeedItem—Not used. <li data-bbox="574 583 1243 611">• CanvasPost—a post made by a canvas app posted on a feed. <li data-bbox="574 625 1458 653">• CollaborationGroupCreated—generated when a user creates a public group. <li data-bbox="574 667 1157 695">• CollaborationGroupUnarchived—Not used. <li data-bbox="574 709 1073 737">• ContentPost—a post with an attached file. <li data-bbox="574 751 1458 779">• CreatedRecordEvent—generated when a user creates a record from the publisher. <li data-bbox="574 793 1458 863">• DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold. <li data-bbox="574 877 1458 947">• DashboardComponentSnapshot—created when a user posts a dashboard snapshot on a feed. <li data-bbox="574 961 1036 989">• LinkPost—a post with an attached URL. <li data-bbox="574 1003 987 1031">• PollPost—a poll posted on a feed. <li data-bbox="574 1045 1458 1073">• ProfileSkillPost—generated when a skill is added to a user’s Chatter profile. <li data-bbox="574 1087 1214 1115">• QuestionPost—generated when a user posts a question. <li data-bbox="574 1129 1230 1157">• ReplyPost—generated when Chatter Answers posts a reply. <li data-bbox="574 1171 1377 1199">• RypplePost—generated when a user creates a Thanks badge in Work.com. <li data-bbox="574 1213 1036 1241">• TextPost—a direct text entry on a feed. <li data-bbox="574 1255 1295 1283">• TrackedChange—a change or group of changes to a tracked field. <li data-bbox="574 1297 1393 1325">• UserStatus—automatically generated when a user adds a post. CTI calls also generate this event. <li data-bbox="574 1675 1458 1703">• ChangeStatusPost—generated event when a user changes the status of a case <li data-bbox="574 1717 1458 1734">• AttachArticleEvent—generated event when a user attaches an article to a case <p data-bbox="574 1755 1458 1818"> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Field	Details
Visibility	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p>Visibility can have the following values:</p> <ul style="list-style-type: none"> • <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. • <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> • For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. • External users can set <code>Visibility</code> only to <code>AllUsers</code>. • On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for an event record. You can only delete a feed if you created it, or if you have the “Modify All Data” permission.

EventLogFile

Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org’s operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The `Interval` and `Sequence` fields are available only in API version 37.0 and later.

You can interact with event monitoring data by querying fields on the `EventLogFile` object (like `EventType` and `LogDate`). To view the underlying event data, query the `LogFile` field. The `EventType` determines the schema of this field. For more information, see [EventLogFile Supported Event Types](#).

 **Note:** Log data schema for each `EventType` can change. With each new release, use the `LogFileFieldNames` and `LogFileFieldTypes` fields to validate the schema changes. In the unlikely case where no log files are generated for 24 hours, contact Salesforce.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer’s Guide](#).

Special Access Rules

Accessing this object requires View Event Log Files and API Enabled user permissions. Users with View All Data permission can view event log files.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
EventType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The event type—API, Login, Report, URI, and so forth. Use to determine which files were generated for your org. For the corresponding <code>LogFile</code> schema, see EventLogFile Supported Event Types.</p>
Interval	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description This field is available as part of the Hourly Event Monitoring beta program. The generation schedule for the event log file. Possible values are:</p> <ul style="list-style-type: none"> • Daily • Hourly <p>This field is available in API version 37.0 and later.</p>
LogDate	<p>Type dateTime</p> <p>Properties Filter, Sort</p> <p>Description The date and time of the log file's creation. For Hourly Event Monitoring, indicates the hour in which the log file was generated. For example, for events that occur between 11:00 AM and 12:00 PM on 3/7/2016, this field's value is 2016-03-07T11:00:00.000Z.</p> <p> Note: For Hourly Event Monitoring, we recommend using <code>CreatedDate</code> to query the date and time that an <code>EventLogFile</code> object was created.</p>

Field	Details
LogFile	<p>Type base64</p> <p>Description Encoded file data in .csv format. The EventType field defines the schema for this data.</p>
LogFileContentType	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The content type of the log file; always .csv.</p>
LogFileFieldNames	<p>Type string</p> <p>Properties Nillable</p> <p>Description The ordered list of fields in the log file data.</p> <p> Note: LogFileFieldNames and LogFileFieldTypes are specific to each EventType. For example, LogFileFieldNames has a different value for an API EventType and a Login EventType.</p>
LogFileFieldTypes	<p>Type string</p> <p>Properties Nillable</p> <p>Description The ordered list of field types in the log file data (String, Id, and so forth).</p> <p> Note: LogFileFieldNames and LogFileFieldTypes are specific to each EventType. For example, LogFileFieldTypes has a different value for an API EventType and a Login EventType.</p>
LogFileLength	<p>Type double</p> <p>Properties Filter, Sort</p> <p>Description The log file length in bytes. You can use this field to plan storage needs for your log files.</p>
Sequence	<p>Type int</p>

Field	Details
	<p>Properties Filter, Group, Sort</p> <p>Description This field is available as part of the Hourly Event Monitoring beta program. The number for the portion of the event log file data captured in an hour. For 24-hour event log file generation, the value of this field is 0. For hourly event log file generation, the initial value is 1 and increases by 1 when events are added in the same hour after the latest event log file is created. The value resets to 1 in the subsequent hour. For example, you have activity between 2:00 and 3:00 PM. Two log files are generated that contain the event log data for that hour, with <code>Sequence</code> values of 1 and 2. For event log data that occurs at 3:01 PM, the <code>Sequence</code> value resets to 1. This field is available in API version 37.0 and later.</p>

[EventLogFile Supported Event Types](#)

The `EventType` field in the EventLogFile object supports these events. Some common fields, such as `CPU_TIME` and `RUN_TIME`, can have null or zero values depending on how the events are generated for a given feature.

EventLogFile Supported Event Types

The `EventType` field in the EventLogFile object supports these events. Some common fields, such as `CPU_TIME` and `RUN_TIME`, can have null or zero values depending on how the events are generated for a given feature.

-  **Note:** The Insecure External Assets, Login, and Logout events are available in supported Salesforce editions at no additional cost. Contact Salesforce to purchase the remaining event types.

[Apex Callout Event Type](#)

Apex Callout events contain details about callouts (external requests) during Apex code execution.

[Apex Execution Event Type](#)

Apex Execution events contain details about Apex classes that are used.

[Apex SOAP Event Type](#)

Apex SOAP events contain details about Web Services API calls.

[Apex Trigger Event Type](#)

Apex Trigger events contain details about triggers that fire in an organization.

[API Event Type](#)

API events contain details about your organization's Web Services API activity.

[Asynchronous Report Run Event Type](#)

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

[Bulk API Event Type](#)

Bulk API events contain details about Bulk API requests.

[Change Set Operation Event Type](#)

Change Set Operation events contain information from change set migrations.

[Console Event Type](#)

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

[Content Distribution Event Type](#)

Content Distribution events contain information about content distributions and deliveries to users.

[Content Document Link Event Type](#)

Content Document Link events contain sharing information for content documents.

[Content Transfer Event Type](#)

Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews. This information includes events performed on files and attachments to records.

[Dashboard Event Type](#)

Dashboard events contain details about dashboards that users view.

[Document Attachment Downloads Event Type](#)

Document Attachment Downloads events contain details of document and attachment downloads.

[External Cross-Org Callout Event Type](#)

External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

[External Custom Apex Callout Event Type](#)

External Custom Apex Callout events represent external data callouts via custom adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

[External OData Callout Event Type](#)

External OData Callout events represent external data callouts via the OData 2.0 and OData 4.0 adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

[Insecure External Assets Event Type](#)

Insecure External Assets events contain information about external assets, such as images or videos, accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain insecure assets hosted on third-party sites that your users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. This event type is available in the EventLogFile object in API version 42.0 and later.

[Knowledge Article View Event Type](#)

Knowledge Article View events contain user activity with your knowledge base.

[Lightning Error Event Type](#)

Lightning Error events represent errors that occurred during user interactions with Lightning Experience. This event type is available in the EventLogFile object in API version 39.0 and later.

[Lightning Interaction Event Type](#)

Lightning Interaction events track user interactions with Lightning Experience. This event type is available in the EventLogFile object in API version 39.0 and later.

[Lightning Page View Event Type](#)

Lightning Page View events represent information about the page on which the event occurred in Lightning Experience. This event type is available in the EventLogFile object in API version 39.0 and later.

[Lightning Performance Event Type](#)

Lightning Performance events track trends in your Lightning Experience performance. This event type is available in the EventLogFile object in API version 39.0 and later.

[Login Event Type](#)

Login events contain details about your org's user login history.

[Login As Event Type](#)

Login As events contain details about what a Salesforce admin did while logged in as another user.

[Logout Event Type](#)

Logout events contain details of user logouts.

[Metadata API Operation Event Type](#)

Metadata API Operation events contain details of Metadata API retrieval and deployment requests.

[Multiblock Report Event Type](#)

Multiblock Report events contain details about Joined Report reports.

[Package Install Event Type](#)

Package Install events contain details about package installation in the organization.

[Platform Encryption Event Type](#)

Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

[Queued Execution Event Type](#)

Queued Execution events contain details about queued executions—for example, batch Apex.

[Report Event Type](#)

Report events contain information about what happened when a user ran a report.

[Report Export Event Type](#)

Report Export events contain details about reports that a user exported.

[REST API Event Type](#)

REST API events contain details about REST-specific requests.

[Sandbox Event Type](#)

Sandbox events contain details about sandbox copies.

[Search Event Type](#)

Search events contain details about the user's search query. All searches within the app, including Communities, are included. However, unauthenticated users won't have a unique Salesforce user ID.

[Search Click Event Type](#)

Search Click events contain details about the user's interaction with the search results. All searches within the app, including Communities, are included. However, unauthenticated users won't have a unique Salesforce user ID.

[Sites Event Type](#)

Sites events contain details of Site.com requests. Requests can originate from the browser (UI).

[Time-Based Workflow Event Type](#)

Time-Based Workflow events contain details about queue activity monitoring.

[Transaction Security Event Type](#)

Transaction Security events contain details about policy execution.

[URI Event Type](#)

URI events contain details about user interaction with the web browser UI.

[Visualforce Event Type](#)

Visualforce events contain details of Visualforce requests. Requests can originate from the browser (UI).

[Wave Change Event Type](#)

Wave Change events represent route or page changes made in the Salesforce Analytics user interface.

[Wave Interaction Event Type](#)

Wave Interaction events track user interactions with the Analytics user interface made via the browser.

[Wave Performance Event Type](#)

Wave Performance events help you track trends in your Analytics performance.

SEE ALSO:

[EventLogFile](#)

Apex Callout Event Type

Apex Callout events contain details about callouts (external requests) during Apex code execution.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

METHOD

Type

String

Description

The HTTP method of the callout.

Example

GET, POST, PUT, and so on.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

REQUEST_SIZE

Type

Number

Description

The size of the callout request body, in bytes.

RESPONSE_SIZE

Type

Number

Description

The size of the callout response, in bytes.

RUN_TIME

Type

Number

DescriptionNot used for this event type. Use the `TIME` field instead.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

SUCCESS

Type

Boolean

Description

1 if the request was successful, and 0 if not.

TIME

Type

Number

Description

The amount of time that the request took in milliseconds (ms).

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

TYPE

Type

String

Description

The type of Apex callout.

URI	<p>Example REST or AJAX</p>
URI_ID_DERIVED	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URL	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p> <hr/> <p>Type String</p> <p>Description The callout endpoint URL.</p> <p>Example www.salesforce.com</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 005900000000I1SNIA0</p>

SEE ALSO:

[EventLogFile Supported Event Types](#)
[EventLogFile](#)

Apex Execution Event Type

Apex Execution events contain details about Apex classes that are used.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CALLOUT_TIME	<p>Type Number</p> <p>Description The execution time of the external Apex calls.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_TOTAL_TIME	<p>Type Number</p> <p>Description The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.</p>
ENTRY_POINT	<p>Type String</p> <p>Description The entry point for this Apex execution.</p> <p>Example</p> <ul style="list-style-type: none"> <code>GeneralCloner.cloneAndInsertRecords</code>

- VF- /apex/CloneUser

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

EXEC_TIME

Type

Number

Description

The end-to-end Apex execution time.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

NUMBER_SOQL_QUERIES

Type

Number

Description

The number of SOQL queries that were executed during the event.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

QUIDDITY

Type

String

Description

The type of outer execution associated with this event.

Example

- A-Old Batch

- C–Scheduled Apex
- E–Inbound Email Service
- F–Future
- H–Apex REST
- I–Invocable Action
- K–Quick Action
- L–Aura
- M–Remote Action
- P–Parallel Batch Apex
- Q–Queueable
- R–Synchronous
- S–Serial Batch Apex
- T–Apex Tests
- V–Visualforce
- W–SOAP Webservices
- X–Execute Anonymous

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

	<p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p>

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)[EventLogFile](#)

Apex SOAP Event Type

Apex SOAP events contain details about Web Services API calls.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLASS_NAME	<p>Type String</p> <p>Description The Apex class name. If the class is part of a managed package, this string includes the package namespace.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CLIENT_NAME	<p>Type String</p> <p>Description The name of the client that's using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn't specify a client in the CallOptions header.</p>
CPU_TIME	<p>Type Number</p>

	<p>Description</p> <p>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_TOTAL_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</p>
EVENT_TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>The type of event.</p> <p>Example</p> <p>ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LIMIT_USAGE_PERCENT	<p>Type</p> <p>Number</p> <p>Description</p> <p>The percentage of Apex SOAP calls that were made against the organization's limit.</p>
LOGIN_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example</p> <p>GeJCsym5eyvtEK2I</p>
METHOD_NAME	<p>Type</p> <p>String</p> <p>Description</p> <p>The name of the calling Apex method.</p>
ORGANIZATION_ID	<p>Type</p> <p>Id</p>

	<p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
<p>QUERY</p>	<p>Type String</p> <p>Description The SOQL query, if one was performed.</p>
<p>REQUEST_ID</p>	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
<p>REQUEST_STATUS</p>	<p>Type String</p> <p>Description The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • S: Success • F: Failure • U: Undefined • A: Authorization Error • R: Redirect • N: Not Found
<p>RUN_TIME</p>	<p>Type Number</p> <p>Description The amount of time that the request took in milliseconds.</p>
<p>SESSION_KEY</p>	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p>

	<p>Example d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p>

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Apex Trigger Event Type

Apex Trigger events contain details about triggers that fire in an organization.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_TOTAL_TIME	<p>Type Number</p> <p>Description The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</p>

ENTITY_NAME

Type

String

Description

The name of the object affected by the trigger.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

EXEC_TIME

Type

Number

Description

The end-to-end Apex execution time.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKf5DV

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

TRIGGER_ID

Type

String

Description

The 15-character ID of the trigger that was fired.

TRIGGER_NAME

Type

String

Description

The name of the trigger that was fired.

TRIGGER_TYPE

Type

String

Description

The type of this trigger.

Possible Values

- AfterInsert
- AfterUpdate
- BeforeInsert
- BeforeUpdate

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

API Event Type

API events contain details about your organization's Web Services API activity.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
API_TYPE	<p>Type String</p> <p>Description The type of API request.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • D: Apex Class • E: SOAP Enterprise • I: SOAP Cross Instance • M: SOAP Metadata • O: Old SOAP • P: SOAP Partner • S: SOAP Apex • T: SOAP Tooling • X: XmlRPC • F: Feed • L: Live Agent • P: SOAP ClientSync
API_VERSION	<p>Type String</p> <p>Description The version of the API that's being used.</p>

	Example 36.0
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CLIENT_NAME	<p>Type String</p> <p>Description The name of the client that's using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn't specify a client in the CallOptions header.</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_BLOCKS	<p>Type Number</p> <p>Description Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.</p>
DB_CPU_TIME	<p>Type Number</p> <p>Description Allows you to monitor trends in database uptime.</p>
DB_TOTAL_TIME	<p>Type Number</p>

	<p>Description</p> <p>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.</p>
<p>ENTITY_NAME</p>	<p>Type</p> <p>Set</p> <p>Description</p> <p>API objects that are accessed.</p> <p>Example</p> <p>Account, Opportunity, Contact, and so on.</p>
<p>EVENT_TYPE</p>	<p>Type</p> <p>String</p> <p>Description</p> <p>The type of event.</p> <p>Example</p> <p>ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
<p>LOGIN_KEY</p>	<p>Type</p> <p>String</p> <p>Description</p> <p>The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example</p> <p>GeJCsym5eyvtEK2l</p>
<p>METHOD_NAME</p>	<p>Type</p> <p>String</p> <p>Description</p> <p>The name of the calling Apex method.</p>
<p>ORGANIZATION_ID</p>	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the organization.</p> <p>Example</p> <p>00D000000000123</p>
<p>QUERY</p>	<p>Type</p> <p>String</p>

REQUEST_ID	<p>Description The SOQL query, if one was performed.</p>
REQUEST_SIZE	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDik0FKfF5DV</p>
REQUEST_STATUS	<p>Type Number</p> <p>Description The size of the callout request body, in bytes.</p> <p>Type String</p> <p>Description The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • S: Success • F: Failure • U: Undefined • A: Authorization Error • R: Redirect • N: Not Found
RESPONSE_SIZE	<p>Type Number</p> <p>Description The size of the callout response, in bytes.</p>
ROWS_PROCESSED	<p>Type Number</p> <p>Description The number of rows that were processed in the request.</p> <p>Example 150</p>

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Asynchronous Report Run Event Type

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field

AVERAGE_ROW_SIZE

Details**Type**

Number

Description

The average row size of all rows in the Asynchronous Report Run event, in bytes. A large average size, coupled with a high ROW_COUNT, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.

Example

700

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DASHBOARD_ID

Type

String

Description

The 15-character ID of the dashboard that was run.

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

DB_BLOCKS

Type

Number

Description

Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

DB_CPU_TIME

Type

Number

Description

Allows you to monitor trends in database uptime.

DISPLAY_TYPE

Type

String

Description

The report display type, indicating the run mode of the report.

Possible Values

- D: Dashboard
- S: Show Details
- H: Hide Details

ENTITY_NAME

Type

String

Description

The name of the object affected by the trigger.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2I

NUMBER_BUCKETS

Type

Number

Description

The number of buckets that were used in the report.

NUMBER_COLUMNS

Type

Number

Description

The number of columns in the report.

NUMBER_EXCEPTION_FILTERS

Type

Number

Description

The number of exception filters that are used in the report.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

RENDERING_TYPE

Type

String

Description

The report rendering type, describing the format of the report output.

Possible Values

- w: Web (HTML)
 - E: Email
 - P: Printable
 - x: Excel
 - C: Comma-separated values (CSV)
 - J: JavaScript Object Notation (JSON)
-

REPORT_ID

Type

Id

Description

The 15-character ID of the report that was run.

REPORT_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the report that was run.

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKfF5DV

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

ROW_COUNT

Type

Number

Description

The number of rows that were processed in the Asynchronous Report Run event. High row counts, coupled with a high AVERAGE_ROW_SIZE, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.

Example

150

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

SORT

Type

String

Description

The sort column and order that was used in the report.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

[EventLogFile Supported Event Types](#)[EventLogFile](#)

Bulk API Event Type

Bulk API events contain details about Bulk API requests.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
BATCH_ID	<p>Type String</p> <p>Description The 15-character ID of the Bulk API batch.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
ENTITY_TYPE	<p>Type String</p> <p>Description The type of entity that the Bulk API used.</p>

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

JOB_ID

Type

String

Description

The 15-character ID of the Bulk API job.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

MESSAGE

Type

EscapedString

Description

Any success or error message that's associated with the request.

NUMBER_FAILURES

Type

Number

Description

The number of failures that were returned with the request.

OPERATION_TYPE

Type

String

Description

The type of Bulk API operation that was performed.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

ROWS_PROCESSED

Type

Number

Description

The number of rows that were processed in the request.

Example

150

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

SUCCESS

Type

Boolean

Description

Whether the batch was successful.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

Change Set Operation Event Type

Change Set Operation events contain information from change set migrations.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CHANGE_SET_NAME	<p>Type String</p> <p>Description The name of the change set.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p>

	<p>Example GeJCsym5eyvtEK2l</p>
OPERATION	<p>Type String</p> <p>Description The operation that's being performed.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • DELETE • DEPLOY • UPLOAD • VALIDATE
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
RUN_TIME	<p>Type Number</p> <p>Description The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example d7DEq/ANa7nNZZVD</p>

TARGET_ORG_ID

Type

Id

Description

The 15-character ID of the organization that's receiving the change set.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Console Event Type

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
COMPONENT_ID	<p>Type Id</p> <p>Description The 15-character ID of the component.</p>
COMPONENT_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character, case-insensitive ID of the component.</p>

CONSOLE_ID

Type
Id**Description**

The 15-character ID of the console.

CONSOLE_ID_DERIVED

Type
Id**Description**

The 18-character, case-insensitive ID of the console.

CPU_TIME

Type
Number**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB_TOTAL_TIME

Type
Number**Description**

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

EVENT_TYPE

Type
String**Description**

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LICENSE_CONTEXT

Type
String**Description**

The license context in which a user is using a console.

Example

service, salesandservice, sales

LOGIN_KEY

Type
String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

RECORD_ID

Type

Id

Description

The 15-character ID of the record that's associated with the console.

RECORD_ID_DERIVED

Type

Id

Description

The 18-character, case-insensitive ID of the record that's associated with the console.

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.

Example

3nWgxWbDKWWDIk0FKfF5DV

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
 - F: Failure
-

- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

	<p>Description</p> <p>The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
USER_ID_DERIVED	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>

Content Distribution Event Type

Content Distribution events contain information about content distributions and deliveries to users.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
ACTION	<p>Type</p> <p>String</p> <p>Description</p> <p>The action that's used when a delivery is viewed.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • VIEW • INSERT • UPDATE

DELIVERY_ID

Type

Id

Description

The 15-character ID of the content delivery.

DELIVERY_LOCATION

Type

String

Description

The location of the delivery.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

RELATED_ENTITY_ID

Type

Id

Description

The 15-character ID of the record that's associated with the delivery distribution.

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKfF5DV

TIMESTAMP

Type

String

	<p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>
VERSION_ID	<p>Type Id</p> <p>Description The 15-character ID of the content version.</p>

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Content Document Link Event Type

Content Document Link events contain sharing information for content documents.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
DOCUMENT_ID	<p>Type Id</p> <p>Description The 15-character ID of the document that's being shared.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
SHARED_WITH_ENTITY_ID	<p>Type Id</p> <p>Description Who the document was shared with.</p>
SHARING_OPERATION	<p>Type String</p> <p>Description The type of sharing operation on the document.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • INSERT

- UPDATE
- DELETE

SHARING_PERMISSION

Type

String

Description

What permissions the document was shared with.

Possible Values

- V: Viewer
- C: Collaborator
- I: Inferred—that is, the sharing permissions were inferred from a relationship between the viewer and document. For example, a document's owner has a sharing permission to the document itself. Or, a document can be a part of a content collection, and the viewer has sharing permissions to the collection rather than explicit permissions to the document directly.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

Content Transfer Event Type

Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews. This information includes events performed on files and attachments to records.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
DOCUMENT_ID	<p>Type Id</p> <p>Description The 15-character ID of the document that's being shared.</p>
DOCUMENT_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the document that's being shared.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
FILE_PREVIEW_TYPE	<p>Type String</p> <p>Description The content type of the file version.</p>

FILE_TYPE

Type

String

Description

The content type of the file preview.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKfF5DV

SIZE_BYTES

Type

Number

Description

The size of the file transfer, in bytes.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

TRANSACTION_TYPE

Type

String

Description

The operation that was performed, including operations on files and attachments to records. For example, you can track operations in the Attachments related list on a case.

Possible Values

- `VersionDownloadAction` and `VersionDownloadApi` represent downloads via the user interface and API respectively.
- `VersionRenditionDownload` represents a file preview action.
- `saveVersion` represents a file that's being uploaded.

 USER_ID
Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

 USER_ID_DERIVED
Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

 VERSION_ID
Type

Id

Description

The 15-character ID of the content version.

 VERSION_ID_DERIVED
Type

Id

Description

The 18-character case insensitive ID of the content version.

Dashboard Event Type

Dashboard events contain details about dashboards that users view.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DASHBOARD_COMPONENT_ID	<p>Type Id</p> <p>Description The 15-character ID of the dashboard component.</p>
DASHBOARD_ID	<p>Type String</p> <p>Description The 15-character ID of the dashboard that was run.</p>
DASHBOARD_ID_DERIVED	<p>Type String</p> <p>Description The 18-character case insensitive ID of the dashboard that was run.</p>
DASHBOARD_TYPE	<p>Type String</p>

	<p>Description The type of dashboard.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • R: Run as running user • C: Run as context user • S: Run as specific user
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
IS_SCHEDULED	<p>Type Boolean</p> <p>Description The value is <code>true</code> if the dashboard is a scheduled dashboard.</p>
IS_SUCCESS	<p>Type Boolean</p> <p>Description 1 if the dashboard component ran successfully, 0 if it didn't.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REPORT_ID	<p>Type Id</p>

REPORT_ID_DERIVED	<p>Description The 15-character ID of the report that was run.</p>
	<p>Type Id</p>
	<p>Description The 18-character case insensitive ID of the report that was run.</p>
REQUEST_ID	<p>Type String</p>
	<p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p>
	<p>Example 3nWgxWbDKWWDIK0FKfF5DV</p>
RUN_TIME	<p>Type Number</p>
	<p>Description The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type String</p>
	<p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p>
	<p>Example d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type String</p>
	<p>Description The access time of Salesforce services.</p>
	<p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p>
	<p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p>

URI	<p>Example 2015-07-27T11:32:59.555Z</p> <hr/> <p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>

External Cross-Org Callout Event Type

External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer Guide](#).

Note: For the cross-org adapter for Salesforce Connect, event monitoring currently doesn't track search callouts.

We provide Salesforce Connect Callout Event Monitoring to customers through a public pilot program. The pilot event types are available in orgs that use Salesforce Connect and Event Monitoring. If your org doesn't have these features, contact your Salesforce account executive to participate in the pilot. Salesforce Connect Callout Event Monitoring is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements.

We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis

of generally available products and features. You can provide feedback and suggestions for Salesforce Connect Callout Event Monitoring in the [Salesforce Connect group in the Trailblazer Community](#).

Fields

Field	Details
ACTION	<p>Type String</p> <p>Description Action performed by the callout.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • query • upsert • delete
ENTITY	<p>Type String</p> <p>Description Name of the external object being accessed.</p> <p>Example Order</p>
EVENT_TYPE	<p>Type String</p> <p>Description Type of event. Value is always ExternalCrossOrgCallout.</p>
EXECUTE_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later.</p> <p>Example 1</p>
FETCH_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later.</p> <p>Example 452</p>

Field	Details
FILTER	<p>Type Text</p> <p>Description Field expressions to filter which rows to return. Corresponds to <code>WHERE</code> in SOQL queries.</p> <p>Example <code>WHERE CustomerId='123456'</code></p>
HAVING	<p>Type Text</p> <p>Description Reserved for future use.</p>
LIMIT	<p>Type Number</p> <p>Description Maximum number of rows to return for a query. Corresponds to <code>LIMIT</code> in SOQL queries.</p> <p>Example 200</p>
MESSAGE	<p>Type String</p> <p>Description Error or warning message associated with the failed query callout. Value is always empty for upsert and delete callouts.</p> <p>Example System.UnexpectedException: Query is either selecting too many fields or the filter conditions are too complicated</p>
OFFSET	<p>Type Number</p> <p>Description Number of rows to skip when paging through a result set. Corresponds to <code>OFFSET</code> in SOQL queries. If a SOQL query doesn't define an <code>OFFSET</code>, the value is -1.</p> <p>Example 0 (default)</p>
ORDERBY	<p>Type String</p> <p>Description Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to <code>ORDER BY</code> in SOQL queries.</p>

Field	Details
	<p>Examples</p> <ul style="list-style-type: none"> • ORDER BY ShipName • ORDER BY ShipName DESC
ORGANIZATION_ID	<p>Type Id</p> <p>Description 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID.</p> <p>Example 4A13-HSKv3CKs-0FKfceaV</p>
ROWS	<p>Type Number</p> <p>Description Total number of records in the result set. Value is always 0 for upsert and delete callouts.</p> <p>Example 200</p>
ROWS_FETCHED	<p>Type Number</p> <p>Description Reserved for future use.</p>
SELECT	<p>Type String</p> <p>Description Comma-separated list of fields being queried. Corresponds to <code>SELECT</code> in SOQL queries.</p> <p>Example SELECT Id,Name,CustomerId,OrderDate</p>
STATUS	<p>Type Boolean</p>

Field	Details
	<p>Description Whether the query was successful. Value is always empty for upsert and delete callouts.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • 1—Success • 0—Failed
SUBQUERIES	<p>Type Number</p> <p>Description The number of subqueries that the query is split into.</p>
THROUGHPUT	<p>Type Number</p> <p>Description Reserved for future use.</p>
TIMESTAMP	<p>Type String</p> <p>Description When the event occurred.</p> <p>Example 20150101000000.000</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description When the event occurred in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).</p> <p>Example 2015-07-27T11:32:59.555Z</p>
TOTAL_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results.</p> <p>Example 453</p>
USER_ID	<p>Type Id</p>

Field	Details
	<p>Description 15-character ID of the user accessing the external system.</p> <p>Example 00530000009M943</p>
USING_MRU	<p>Type Boolean</p> <p>Description Reserved for future use.</p>

Fields

Field	Details
ACTION	<p>Type String</p> <p>Description Action performed by the callout.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • query • upsert • delete

Field	Details
ENTITY	<p>Type String</p> <p>Description Name of the external object being accessed.</p> <p>Example Order</p>
EVENT_TYPE	<p>Type String</p> <p>Description Type of event. Value is always ExternalCustomApexCallout.</p>
EXECUTE_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later.</p> <p>Example 102</p>
FETCH_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later.</p> <p>Example 607</p>
FILTER	<p>Type Text</p> <p>Description Field expressions to filter which rows to return. Corresponds to <code>WHERE</code> in SOQL queries.</p> <p>Example Filter:[columnName=CustomerID, columnValue=537, subfilters=null, tableName=Order, type=EQUALS]</p>
LIMIT	<p>Type Number</p> <p>Description Maximum number of rows to return for a query. Corresponds to <code>LIMIT</code> in SOQL queries.</p> <p>Example 200</p>

Field	Details
MESSAGE	<p>Type String</p> <p>Description Error or warning message associated with the failed call.</p> <p>Example System.UnexpectedException: Query is either selecting too many fields or the filter conditions are too complicated</p>
OFFSET	<p>Type Number</p> <p>Description Number of rows to skip when paging through a result set. Corresponds to <code>OFFSET</code> in SQL queries.</p> <p>Example 0 (default)</p>
ORDERBY	<p>Type String</p> <p>Description Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to <code>ORDER BY</code> in SQL queries.</p> <p>Examples (Order:[columnName=OrderDate, direction=ASCENDING, tableName=Order])</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same <code>REQUEST_ID</code>.</p> <p>Example 4A13-HSKv3CKs-0FKfceaV</p>
ROWS	<p>Type Number</p>

Field	Details
	<p>Description Total number of records in the result set.</p> <p>The value is always -1 if the custom adapter's <code>DataSource.Provider</code> class doesn't declare the <code>QUERY_TOTAL_SIZE</code> capability.</p> <p>Example 200</p>
ROWS_FETCHED	<p>Type Number</p> <p>Description Number of rows fetched by the callout. Available in API version 42.0 and later.</p> <p>Example 200</p>
SELECT	<p>Type String</p> <p>Description Comma-separated list of fields being queried. Corresponds to <code>SELECT</code> in SOQL queries.</p> <p>Example (ColumnSelection:[aggregation=NONE, columnName=Name, tableName=Order], ColumnSelection:[aggregation=NONE, columnName=CustomerID, tableName=Order], ColumnSelection:[aggregation=NONE, columnName=OrderDate, tableName=Order])</p>
STATUS	<p>Type Boolean</p> <p>Description Whether the query was successful.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • 1—Success • 0—Failed • Empty—Failed with no logged status or message
THROUGHPUT	<p>Type Number</p> <p>Description Number of records retrieved in one second.</p> <p>Example 302.57</p>
TIMESTAMP	<p>Type String</p>

Field	Details
	<p>Description When the event occurred.</p> <p>Example 20150101000000.000</p>
SUBQUERIES	<p>Type Number</p> <p>Description Reserved for future use.</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description When the event occurred in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).</p> <p>Example 2015-07-27T11:32:59.555Z</p>
TOTAL_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results.</p> <p>Example 709</p>
USER_ID	<p>Type Id</p> <p>Description 15-character ID of the user accessing the external system.</p> <p>Example 00530000009M943</p>

Salesforce Connect Callout Event Monitoring is subject to change and isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for Salesforce Connect Callout Event Monitoring in the [Salesforce Connect group in the Trailblazer Community](#).

Fields

Field	Details
ACTION	<p>Type String</p> <p>Description Action performed by the callout.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • query • upsert • delete
BYTES	<p>Type Number</p> <p>Description Size of the result set in bytes.</p>
ENTITY	<p>Type String</p> <p>Description Name of the external object being accessed.</p> <p>Example Order</p>
EVENT_TYPE	<p>Type String</p> <p>Description Type of event. Value is always ExternalODataCallout.</p>
EXECUTE_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later.</p>

Field	Details
	Example 21
EXPAND	Type String Description Reserved for future use.
FETCH_MS	Type Number Description How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later. Example 127
FILTER	Type Text Description Field expressions to filter which rows to return. Corresponds to <code>WHERE</code> in SOQL queries and <code>\$filter</code> in OData queries. Example CustomerID eq 12345
LIBRARY	Type String Description Reserved for future use.
LIMIT	Type Number Description Maximum number of rows to return for a query. Corresponds to <code>LIMIT</code> in SOQL queries and <code>\$top</code> in OData queries. Example 200
MESSAGE	Type String Description Error or warning message associated with the failed call.

Field	Details
	<p>Example</p> <p>The OData query result was too large, so the external data didn't load.</p>
NEXT_LINK	<p>Type</p> <p>String</p> <p>Description</p> <p>OData next link that the callout used to request a subsequent page of rows. A next link is provided in a previous response from the OData producer when the response includes only part of the result set.</p> <p>Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18.</p> <p>Example</p> <p><code>http://services.example.org/Warehouse.svc/Orders?\$count=true&\$select=CustomerID,OrderID,RequiredDate,ShippedDate&\$top=301&\$skiptoken=10447</code></p>
OFFSET	<p>Type</p> <p>Number</p> <p>Description</p> <p>Number of rows to skip when paging through a result set.</p> <p>Corresponds to <code>OFFSET</code> in SOQL queries and <code>\$skip</code> in OData queries.</p> <p>Example</p> <p>10</p>
ORDERBY	<p>Type</p> <p>String</p> <p>Description</p> <p>Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to <code>ORDER BY</code> in SOQL queries and <code>\$orderby</code> in OData queries.</p> <p>Examples</p> <ul style="list-style-type: none"> • ShipName • ShipName desc
ORGANIZATION_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>15-character ID of the organization.</p> <p>Example</p> <p>00D000000000123</p>
PARENT_CALLOUT	<p>Type</p> <p>String</p>

Field	Details
	<p>Description</p> <p>If the callout requested a subsequent page of rows, this field identifies the initial callout whose request resulted in the multi-page result set.</p> <p>Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18.</p> <p>Example</p> <p>4EoZtuBzzRIXSk-ysRdf1F-1</p>
PROVIDER_TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>Whether the OData 2.0 or OData 4.0 adapter made the callout.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • OData—OData 2.0 adapter • OData4—OData 4.0 adapter
RATE_LIMIT_USAGE_PERCENT	<p>Type</p> <p>Number</p> <p>Description</p> <p>Consumed percentage of the org's limit of OData callouts per hour.</p> <p>Example</p> <p>2.5—2.5% of the hourly callout limit has been consumed</p>
REQUEST_ID	<p>Type</p> <p>String</p> <p>Description</p> <p>Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID.</p> <p>Example</p> <p>4A13-HSKv3CKs-0FKfceaV</p>
REQUESTS	<p>Type</p> <p>Number</p> <p>Description</p> <p>Reserved for future use.</p>
ROWS	<p>Type</p> <p>Number</p> <p>Description</p> <p>Total number of records in the result set. Available in API version 42.0 and later.</p>

Field	Details
	<p>Example 830</p>
ROWS_FETCHED	<p>Type Number</p> <p>Description Number of records fetched by the callout. The records fetched by a callout can be a subset of a large result set.</p> <p>Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18.</p> <p>Example 200</p>
SEARCH	<p>Type String</p> <p>Description Search query string. Corresponds to condition expressions in SOSL.</p> <p>Example contains(CustomerID,'10248') eq true or contains(ShipName,'10248') eq true</p>
SELECT	<p>Type String</p> <p>Description Comma-separated list of fields being queried. Corresponds to <code>SELECT</code> in SOQL queries and <code>\$select</code> in OData queries.</p> <p>Example CustomerID,OrderDate,OrderID,ShipCity,ShipCountry</p>
STATUS	<p>Type Boolean</p> <p>Description Whether the query was successful.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • 1—Success • 0—Failed
THROUGHPUT	<p>Type Number</p> <p>Description Number of records retrieved in one second.</p>

Field	Details
	<p>Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18.</p> <p>Example 3025.67</p>
TIMESTAMP	<p>Type String</p> <p>Description When the event occurred.</p> <p>Example 20150101000000.000</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description When the event occurred in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).</p> <p>Example 2015-07-27T11:32:59.555Z</p>
TOTAL_MS	<p>Type Number</p> <p>Description How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results.</p>
USER_ID	<p>Type Id</p> <p>Description 15-character ID of the user accessing the external system.</p> <p>Example 00530000009M943</p>

[EventLogFile](#)

Insecure External Assets Event Type

Insecure External Assets events contain information about external assets, such as images or videos, accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain insecure assets hosted on third-party sites that your users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. This event type is available in the EventLogFile object in API version 42.0 and later.

Assets over HTTP can be manipulated through man-in-the-middle and other types of attacks. The attacks can trick users into sending their Salesforce credentials to malicious sites. We recommend that you use HTTPS in your custom code and templates for any asset you're loading from external sites.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or the [REST API Developer's Guide](#).

Fields

Field	Details
ASSET_TYPE	<p>Type String</p> <p>Description Type of insecure asset.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • Base URI • Connect • Font • Frame Ancestor: External page that embeds the Salesforce page in an iframe • Frame • Image • Media • Object • Other • Plugin Types • Script • Style
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>

Field	Details
DOCUMENT_URI	<p>Type String</p> <p>Description URL of the page that contains the insecure asset, excluding the query parameter.</p> <p>Example https://company.my.salesforce.com/00XXXXXXXXX</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
INSECURE_URI	<p>Type String</p> <p>Description Insecure external asset URL.</p> <p>Example http://pbs.twimg.com/profile_images/5699091412070816/Z4Stwts_normal.jpeg</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type String</p> <p>Description The 15-character ID of the org.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p>

Field	Details
	<p>Example</p> <p>3nWgxWbDKWWDIK0FKfF5DV</p>
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>Type of Salesforce page.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • <code>Appserver</code>: Page without My Domain subdomain (for example, <code>https://na44.salesforce.com</code>) • <code>Communities</code>: Customer community • <code>Email</code>: Email preview • <code>Login</code>: Login page (for example, <code>https://login.salesforce.com</code>)

Field	Details
	<ul style="list-style-type: none"> • <code>Mydomain</code>: Page on My Domain subdomain (for example, <code>https://mycompany.my.salesforce.com</code>) • <code>Sites</code>: Customer site • <code>Static</code>: Static content (for example, <code>https://sfdcstatic.com</code>) • <code>Unknown</code>: other type of page
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example <code>/home/home.jsp</code></p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example <code>005300000009M943</code></p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example <code>00590000000I1SNIA0</code></p>

Knowledge Article View Event Type

Knowledge Article View events contain user activity with your knowledge base.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
ARTICLE_ID	<p>Type Id</p> <p>Description The 15-character ID of the article.</p> <p>Example 00Dxx0000001gEb</p>
ARTICLE_STATUS	<p>Type Character</p> <p>Possible Values D= Draft O=Online A=Archived</p>
ARTICLE_VERSION	<p>Type Number</p> <p>Description Article version number</p> <p>Example 2</p>
ARTICLE_VERSION_ID	<p>Type Id</p> <p>Description The 15-character ID of the article version.</p> <p>Example ka0R00000005rt6</p>
CONTEXT	<p>Type String</p> <p>Description Context of the request.</p> <p>Possible Values Apex API Empty String</p>
ENTITY	<p>Type String</p>

	<p>Description Entity requested.</p> <p>Example Knowledge__kav</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LANGUAGE	<p>Type String</p> <p>Description iso-code of the language</p> <p>Example en_US</p>
LAST_VERSION	<p>Type Boolean</p> <p>Description true if it is the last version</p> <p>Possible Values True False</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDik0FKfF5DV</p>

SESSION_ID

Type

String

Description

Session ID of the request.

ExamplegV7pCSW2vGaaJNFi3GSpuPjJNbKVbSxRvx34LJslvuc=

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example2015-07-27T11:32:59.555Z

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example00530000009M943

USER_TYPE

Type

Character

Description

User type of the request

Possible Values

A = App

C =Customer Portal

P = Partner Portal

G = guest

Lightning Error Event Type

Lightning Error events represent errors that occurred during user interactions with Lightning Experience. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
APP_NAME	<p>Type String</p> <p>Description The name of the application that the user accessed.</p>
BROWSER_NAME	<p>Type String</p> <p>Description The name of the browser that the user accessed.</p> <p>Example Chrome, IE, Safari, Gecko</p>
BROWSER_VERSION	<p>Type String</p> <p>Description The version of the browser that the user accessed in <code>major.minor version</code> format. Some browsers don't provide a minor version.</p>
CLIENT_ID	<p>Type String</p> <p>Description The API client ID.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CONNECTION_TYPE	<p>Type String</p>

Field	Details
	<p>Description The type of connection.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • CDMA1x • CDMA • EDGE • EVDO0 • EVDOA • EVDOB • GPRS • HRPD • HSDPA • HSUPA • LTE • WIFI
DEVICE_ID	<p>Type String</p> <p>Description The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.</p>
DEVICE_MODEL	<p>Type String</p> <p>Description The name of the device model.</p> <p>Example iPad, iPhone</p>
DEVICE_PLATFORM	<p>Type String</p> <p>Description The type of application experience in <code>name:experience:form</code> format.</p> <p>Possible Values Name</p> <ul style="list-style-type: none"> • APP_BUILDER • CUSTOM • S1 • SFX <p>Experience</p>

Field	Details
	<ul style="list-style-type: none"> • BROWSER • HYBRID <p>Form</p> <ul style="list-style-type: none"> • DESKTOP • PHONE • TABLET
DEVICE_SESSION_ID	<p>Type Id</p> <p>Description The unique identifier of the user's session based on page load time. If the user reloads a page, it starts a new session.</p> <p>Example 321a1ddfaf924803a075f1e69fc87bc06f53ccd0</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type String</p> <p>Description The 15-character ID of the org.</p> <p>Example 00D000000000123</p>
OS_NAME	<p>Type String</p>

Field	Details
	<p>Description The operating system name, derived from USER_AGENT.</p> <p>Example Android, iOS, OSX, Windows</p>
OS_VERSION	<p>Type String</p> <p>Description The operating system version, derived from USER_AGENT.</p>
PAGE_START_TIME	<p>Type Number</p> <p>Description The time when the page was initially loaded, measured in milliseconds.</p> <p>Example 1471564788642</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDik0FKfF5DV</p>
SDK_APP_TYPE	<p>Type String</p> <p>Description The mobile SDK application type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	<p>Type String</p> <p>Description The mobile SDK application version number.</p>

Field	Details
	<p>Example 5.0</p>
SDK_VERSION	<p>Type String</p> <p>Description The mobile SDK version number.</p> <p>Example 2.1.0</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example cdd09305cb6babf34059e27f70e47f1b11dec868</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
UI_EVENT_ID	<p>Type String</p> <p>Description ID of the Lightning event type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • ltng:error • ltng:interaction • ltng:pageView

Field	Details
	<ul style="list-style-type: none"> ltng:performance
UI_EVENT_SEQUENCE_NUM	<p>Type Number</p> <p>Description An auto-incremented sequence number of the current event since the session started.</p>
UI_EVENT_SOURCE	<p>Type String</p> <p>Description Event source of the error.</p> <p>Example AuraError</p>
UI_EVENT_TIMESTAMP	<p>Type Number</p> <p>Description The time at which this event occurred, measured in milliseconds.</p> <p>Example 1479769912796</p>
UI_EVENT_TYPE	<p>Type String</p> <p>Description The type of error.</p> <p>Example Error, warning, information</p>
USER_AGENT	<p>Type String</p> <p>Description The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string.</p>
USER_ID	<p>Type String</p> <p>Description The 15-character ID of the user accessing Salesforce services through the UI or API.</p> <p>Example 00530000009M943</p>

Field	Details
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000011SNIA0</p>
USER_TYPE	<p>Type String</p> <p>Description The category of user license of the user accessing Salesforce services through the UI or API.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • A: Automated Process • b: High Volume Portal • C: Customer Portal User • D: External Who • E: Self Service • G: Guest • I: Package License Manager • N: Salesforce to Salesforce • n: CSN Only • O: Power Custom • o: Custom • P: Partner • p: Customer Portal Manager • S: Standard • X: Black Tab User

Lightning Page View Event Type

Lightning Page View events represent information about the page on which the event occurred in Lightning Experience. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
APP_NAME	<p>Type String</p> <p>Description The name of the application that the user accessed.</p>
BROWSER_NAME	<p>Type String</p>

Field	Details
	<p>Description The name of the browser that the user accessed.</p> <p>Example Chrome, IE, Safari, Gecko</p>
BROWSER_VERSION	<p>Type String</p> <p>Description The version of the browser that the user accessed in <code>major.minor version</code> format. Some browsers don't provide a minor version.</p>
CLIENT_ID	<p>Type String</p> <p>Description The API client ID.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CONNECTION_TYPE	<p>Type String</p> <p>Description The type of connection.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • CDMA1x • CDMA • EDGE • EVDO0 • EVDOA • EVDOB • GPRS • HRPD • HSDPA • HSUPA • LTE

Field	Details
	<ul style="list-style-type: none"> • WIFI
DEVICE_ID	<p>Type String</p> <p>Description The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.</p>
DEVICE_MODEL	<p>Type String</p> <p>Description The name of the device model.</p> <p>Example iPad, iPhone</p>
DEVICE_PLATFORM	<p>Type String</p> <p>Description The type of application experience in <code>name:experience:form</code> format.</p> <p>Possible Values Name</p> <ul style="list-style-type: none"> • APP_BUILDER • CUSTOM • S1 • SFX <p>Experience</p> <ul style="list-style-type: none"> • BROWSER • HYBRID <p>Form</p> <ul style="list-style-type: none"> • DESKTOP • PHONE • TABLET
DEVICE_SESSION_ID	<p>Type Id</p> <p>Description The unique identifier of the user's session based on page load time. When the user reloads a page, a new session is started.</p> <p>Example 321a1ddfaf924803a075f1e69fc87bc06f53ccd0</p>

Field	Details
DURATION	<p>Type Number</p> <p>Description The duration in milliseconds since the page start time.</p>
EFFECTIVE_PAGE_TIME	<p>Type Number</p> <p>Description The effective page time, indicating how long it took for the page to load.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
GRANDPARENT_UI_ELEMENT	<p>Type String</p> <p>Description The grandparent scope of the page element where the event occurred.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type String</p> <p>Description The 15-character ID of the org.</p> <p>Example 00D000000000123</p>
OS_NAME	<p>Type String</p> <p>Description The operating system name, derived from USER_AGENT.</p>

Field	Details
	<p>Example Android, iOS, OSX, Windows</p>
OS_VERSION	<p>Type String</p> <p>Description The operating system version, derived from USER_AGENT.</p>
PAGE_CONTEXT	<p>Type String</p> <p>Description The context of the page where the event occurred.</p>
PAGE_ENTITY_ID	<p>Type Id</p> <p>Description The unique entity identifier of the event.</p> <p>Example 001300000013zJAAZ</p>
PAGE_ENTITY_TYPE	<p>Type String</p> <p>Description The entity type of the event.</p> <p>Example Task, contacts</p>
PAGE_START_TIME	<p>Type Number</p> <p>Description The time when the page was initially loaded, measured in milliseconds.</p> <p>Example 1471564788642</p>
PARENT_UI_ELEMENT	<p>Type String</p> <p>Description The parent scope of the page element where the event occurred.</p>
PREVPAGE_CONTEXT	<p>Type String</p>

Field	Details
	<p>Description The context of the previous page where the event occurred.</p>
PREVPAGE_ENTITY_ID	<p>Type Id</p> <p>Description The unique previous page entity identifier of the event.</p>
PREVPAGE_ENTITY_TYPE	<p>Type String</p> <p>Description The previous page entity type of the event.</p> <p>Example Task, contacts</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDik0FKff5DV</p>
SDK_APP_TYPE	<p>Type String</p> <p>Description The mobile SDK application type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	<p>Type String</p> <p>Description The mobile SDK application version number.</p> <p>Example 5.0</p>

Field	Details
SDK_VERSION	<p>Type String</p> <p>Description The mobile SDK version number.</p> <p>Example 2.1.0</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When the user logs out and logs in again, a new session is started.</p> <p>Example cdd09305cb6babf34059e27f70e47f1b11dec868</p>

TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
UI_EVENT_ID	<p>Type String</p> <p>Description Id of the Lightning event type.</p>

Field	Details
	<p>Possible Values</p> <ul style="list-style-type: none"> • ltng:error • ltng:interaction • ltng:pageView • ltng:performance
UI_EVENT_SEQUENCE_NUM	<p>Type Number</p> <p>Description An auto-incremented sequence number of the current event since the session started.</p>
UI_EVENT_SOURCE	<p>Type String</p> <p>Description The event source of the error.</p> <p>Example AuraError</p>
UI_EVENT_TIMESTAMP	<p>Type Number</p> <p>Description The time at which this event occurred, measured in milliseconds.</p> <p>Example 1479769912796</p>
USER_AGENT	<p>Type String</p> <p>Description The numeric code for the type of client used to make the request (for example, the browser, application, or API) as a string.</p>
USER_ID	<p>Type String</p> <p>Description The 15-character ID of the user accessing Salesforce services through the UI or API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p>

Field	Details
	<p>Description</p> <p>The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000011SNIA0</p>
USER__TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>The category of user license of the user accessing Salesforce services through the UI or API.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • A: Automated Process • b: High Volume Portal • C: Customer Portal User • D: External Who • F: Self Service • G: Guest • I: Package License Manager • N: Salesforce to Salesforce • n: CSN Only • O: Power Custom • o: Custom • P: Partner • p: Customer Portal Manager • S: Standard • X: Black Tab User

[EventLogFile](#)

Lightning Performance Event Type

Lightning Performance events track trends in your Lightning Experience performance. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
APP_NAME	<p>Type String</p> <p>Description The name of the application that the user accessed.</p>
BROWSER_NAME	<p>Type String</p> <p>Description The name of the browser that the user accessed.</p> <p>Example Chrome, IE, Safari, Gecko</p>
BROWSER_VERSION	<p>Type String</p> <p>Description The version of the browser that the user accessed in <code>major.minor version</code> format. Some browsers don't provide a minor version.</p>
CLIENT_ID	<p>Type String</p> <p>Description The API client ID.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CONNECTION_TYPE	<p>Type String</p> <p>Description The type of connection.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • CDMA1x • CDMA • EDGE • EVDO0

Field	Details
	<ul style="list-style-type: none"> • EVDOA • EVDOB • GPRS • HRPD • HSDPA • HSUPA • LTE • WIFI
DEVICE_ID	<p>Type String</p> <p>Description The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.</p>
DEVICE_MODEL	<p>Type String</p> <p>Description The name of the device model.</p> <p>Example iPad, iPhone</p>
DEVICE_PLATFORM	<p>Type String</p> <p>Description The type of application experience in name:experience:form format.</p> <p>Possible Values</p> <p>Name</p> <ul style="list-style-type: none"> • APP_BUILDER • CUSTOM • S1 • SFX <p>Experience</p> <ul style="list-style-type: none"> • BROWSER • HYBRID <p>Form</p> <ul style="list-style-type: none"> • DESKTOP • PHONE • TABLET

Field	Details
DEVICE_SESSION_ID	<p>Type Id</p> <p>Description The unique identifier of the user's session based on page load time. When the user reloads a page, a new session is started.</p> <p>Example 321a1ddfaf924803a075f1e69fc87bc06f53ccd0</p>
DURATION	<p>Type Number</p> <p>Description The duration in milliseconds since the page start time.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type String</p> <p>Description The 15-character ID of the org.</p> <p>Example 00D000000000123</p>
OS_NAME	<p>Type String</p> <p>Description The operating system name, derived from USER_AGENT.</p> <p>Example Android, iOS, OSX, Windows</p>

Field	Details
OS_VERSION	<p>Type String</p> <p>Description The operating system version, derived from USER_AGENT.</p>
PAGE_START_TIME	<p>Type Number</p> <p>Description The time when the page was initially loaded, measured in milliseconds.</p> <p>Example 1471564788642</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDik0FKff5DV</p>
SDK_APP_TYPE	<p>Type String</p> <p>Description The mobile SDK application type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	<p>Type String</p> <p>Description The mobile SDK application version number.</p> <p>Example 5.0</p>
SDK_VERSION	<p>Type String</p>

Field	Details
	<p>Description The mobile SDK version number.</p> <p>Example 2.1.0</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When the user logs out and logs in again, a new session is started.</p> <p>Example cdd09305cb6babf34059e27f70e47f1b11dec868</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
UI_EVENT_ID	<p>Type String</p> <p>Description Id of the Lightning event type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • ltng:error • ltng:interaction • ltng:pageView • ltng:performance
UI_EVENT_SOURCE	<p>Type String</p>

Field	Details
	<p>Description The event source of the error.</p> <p>Example AuraError</p>
UI_EVENT_TIMESTAMP	<p>Type Number</p> <p>Description The time at which this event occurred, measured in milliseconds.</p> <p>Example 1479769912796</p>
UI_EVENT_TYPE	<p>Type String</p> <p>Description The type of interaction.</p> <p>Example User, system, error</p>
USER_AGENT	<p>Type String</p> <p>Description The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string.</p>
USER_ID	<p>Type String</p> <p>Description The 15-character ID of the user accessing Salesforce services through the UI or API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000011SNIA0</p>
USER_TYPE	<p>Type String</p>

Field	Details
	<p>Description</p> <p>The category of user license of the user accessing Salesforce services through the UI or API.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • A: Automated Process • b: High Volume Portal • C: Customer Portal User • D: External Who • E: Self Service • G: Guest • I: Package License Manager • N: Salesforce to Salesforce • n: CSN Only • O: Power Custom • o: Custom • P: Partner • p: Customer Portal Manager • S: Standard • x: Black Tab User

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Login Event Type

Login events contain details about your org's user login history.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
API_TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>The type of API request.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • D: Apex Class • E: SOAP Enterprise

- I: SOAP Cross Instance
- M: SOAP Metadata
- o: Old SOAP
- P: SOAP Partner
- S: SOAP Apex
- T: SOAP Tooling
- x: XmlRPC
- f: Feed
- l: Live Agent
- p: SOAP ClientSync

API_VERSION

Type

String

Description

The version of the API that's being used.

Example

36.0

BROWSER_TYPE

Type

String

Description

The browser used for login.

Example Values

- 10011000: Internet Explorer Desktop 11
 - 10011001: Internet Explorer Mobile 11
 - 11035000: Firefox Desktop 35
 - 11035001: Firefox Mobile 35
 - 13050000: Chrome Desktop 50
 - 13050001: Chrome Mobile 50
 - 14012000: Safari Desktop 12
 - 14012001: Safari Mobile 12
-

CIPHER_SUITE

Type

String

Description

The TLS cipher suite used for the login. Values are OpenSSL-style cipher suite names, with hyphen delimiters. For more information, see [OpenSSL Cryptography and SSL/TLS Toolkit](#).

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

LOGIN_STATUS

Type

String

Description

The status of the login attempt. For successful logins, the value is LOGIN_NO_ERROR. All other values indicate errors or

authentication issues. For details, see [Login Event Type — LOGIN_STATUS Values](#) on page 1017.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D00000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKf5DV

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
 - F: Failure
 - U: Undefined
 - A: Authorization Error
 - R: Redirect
 - N: Not Found
-

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

	<p>Example d7DEq/ANa7nNZZVD</p>
SOURCE_IP	<p>Type IP</p> <p>Description The source IP of the login request.</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
TLS_PROTOCOL	<p>Type String</p> <p>Description The TLS protocol used for the login.</p> <p>Example There are 3 possible values.</p> <ul style="list-style-type: none"> • 1.0 • 1.1 • 1.2
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p>

	<p>Description</p> <p>The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
USER_ID_DERIVED	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>
USER_NAME	<p>Type</p> <p>String</p> <p>Description</p> <p>The username that's used for login.</p>

[Login Event Type — LOGIN_STATUS Values](#)

When users attempt to log in to your org, the success or failure of their login attempts is tracked in event log file data. Specifically, the LOGIN_STATUS field in the Login event type contains the result of these login attempts. The data in LOGIN_STATUS can help you determine whether your users' login attempts were successful. This field is available in the Login event type in the EventLogFile object in API version 39.0 and later.

LOGIN_OAUTH_INVALID_DEVICE	Failed: Device Id missing or not registered
LOGIN_OAUTH_INVALID_DS	Failed: Activation secret invalid
LOGIN_OAUTH_INVALID_DSIG	Failed: Signature Invalid
LOGIN_OAUTH_INVALID_IP	Failed: IP Address Not Allowed
LOGIN_OAUTH_INVALID_NONCE	Failed: Invalid Nonce
LOGIN_OAUTH_INVALID_SIG_METHOD	Failed: Invalid Signature Method
LOGIN_OAUTH_INVALID_TIMESTAMP	Failed: Invalid Timestamp
LOGIN_OAUTH_INVALID_TOKEN	Failed: Invalid Token
LOGIN_OAUTH_INVALID_VERIFIER	Failed: Invalid Verifier
LOGIN_OAUTH_INVALID_VERSION	Failed: Version Not Supported
LOGIN_OAUTH_MISSING_DS	Activation secret missing
LOGIN_OAUTH_NO_CALLBACK_URL	Failed: Invalid Callback URL
LOGIN_OAUTH_NO_CONSUMER	Missing Consumer Key Parameter
LOGIN_OAUTH_NO_TOKEN	Missing OAuth Token Parameter

API Error Code	Details (If Available)
LOGIN_OAUTH_NONCE_REPLAY	Failed: Nonce Replay Detected
LOGIN_OAUTH_PACKAGE_MISSING	Package for this consumer is not installed in your organization
LOGIN_OAUTH_PACKAGE_OLD	Installed package for this consumer is out of date
LOGIN_OAUTH_UNEXPECTED_PARAM	Failed: Unexpected parameter
LOGIN_ORG_TRIAL_EXP	Trial Expired
LOGIN_READONLY_CANNOT_VALIDATE	
LOGIN_SAML_INVALID_AUDIENCE	Failed: Audience Invalid
LOGIN_SAML_INVALID_CONFIG	Failed: Configuration Error/Perm Disabled
LOGIN_SAML_INVALID_FORMAT	Failed: Assertion Invalid
LOGIN_SAML_INVALID_IN_RES_TO	Failed: InResponseTo Invalid
LOGIN_SAML_INVALID_ISSUER	Failed: Issuer Mismatched
LOGIN_SAML_INVALID_ORG_ID	Failed: Invalid Organization Id
LOGIN_SAML_INVALID_PORTAL_ID	Failed: Invalid Portal Id
LOGIN_SAML_INVALID_RECIPIENT	Failed: Recipient Mismatched
LOGIN_SAML_INVALID_SESSION_LEVEL	
LOGIN_SAML_INVALID_SIGNATURE	Failed: Signature Invalid
LOGIN_SAML_INVALID_SITE_URL	Failed: Invalid Site URL
LOGIN_SAML_INVALID_STATUS	Failed: Status Invalid
LOGIN_SAML_INVALID_SUB_CONFIRM	Failed: Subject Confirmation Error
LOGIN_SAML_INVALID_TIMESTAMP	Failed: Assertion Expired
LOGIN_SAML_INVALID_USERNAME	Failed: Username Or SSO Id Invalid
LOGIN_SAML_INVALID_VERSION	
LOGIN_SAML_MISMATCH_CERT	Failed: Signature Invalid/Configured Certificate Mismatch
LOGIN_SAML_MISSING_ORG_ID	Failed: Missing Organization Id for Portal login
LOGIN_SAML_MISSING_PORTAL_ID	Failed: Missing Portal Id
LOGIN_SAML_PROVISION_ERROR	Failed: SAML Provision Error
LOGIN_SAML_REPLAY_ATTEMPTED	Failed: Replay Detected
LOGIN_SAML_SITE_INACTIVE	Failed: Specified Site is Inactive
LOGIN_TWOFACOR_REQ	Two-factor required

Usage

Use LOGIN_STATUS to determine whether your users' login attempts were successful. For example, you can determine whether a departed employee attempted to log in successfully or unsuccessfully.

A	B	C	D	E	F	G	H	I	J	K
EVENT_TYPE	CLIENT_IP	URI	SESSION_KEY	LOGIN_KEY	REQUEST_STATUS	USER_NAME	TIMESTAMP_DERIVED	USER_ID_DERIVED	URI_ID_DERIVED	LOGIN_STATUS
Login	1.2.3.4	/my/uri/path/005B0000000GSwO	sidHash_basic	loginHash_basic	requestStatus_common	userName_L	2015-01-01T00:00:00.000	001xx0000000useAAA	005B0000000GSwOIAW	LOGIN_NO_ERROR

Login As Event Type

Login As events contain details about what a Salesforce admin did while logged in as another user.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DELEGATED_USER_ID	<p>Type Id</p>

	<p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.</p>
DELEGATED_USER_ID_DERIVED	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.</p>
DELEGATED_USER_NAME	<p>Type</p> <p>String</p> <p>Description</p> <p>The username of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.</p>
EVENT_TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>The type of event.</p> <p>Example</p> <p>ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example</p> <p>GeJCsym5eyvtEK2I</p>
ORGANIZATION_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the organization.</p> <p>Example</p> <p>00D000000000123</p>

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

	<p>Example</p> <p>/home/home.jsp</p>
<p>URI_ID_DERIVED</p>	<p>Type</p> <p>ID</p> <p>Description</p> <p>The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
<p>USER_ID</p>	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
<p>USER_ID_DERIVED</p>	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>

Logout Event Type

Logout events contain details of user logouts.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
<p>API_TYPE</p>	<p>Type</p> <p>String</p> <p>Description</p> <p>The type of API request.</p>

Possible Values

- D: Apex Class
- E: SOAP Enterprise
- I: SOAP Cross Instance
- M: SOAP Metadata
- O: Old SOAP
- P: SOAP Partner
- S: SOAP Apex
- T: SOAP Tooling
- X: XmlRPC
- F: Feed
- L: Live Agent
- P: SOAP ClientSync

API_VERSION

Type

String

Description

The version of the API that's being used.

Example

36.0

APP_TYPE

Type

Number

Description

The application type that was in use upon logging out.

Example Values

- 1007: SFDC Application
- 1014: Live Agent
- 2501: CTI
- 2514: OAuth
- 3475: SFDC Partner Portal

BROWSER_TYPE

Type

String

Description

The browser used for login.

Example Values

- 10011000: Internet Explorer Desktop 11
- 10011001: Internet Explorer Mobile 11
- 11035000: Firefox Desktop 35

- 11035001: Firefox Mobile 35
- 13050000: Chrome Desktop 50
- 13050001: Chrome Mobile 50
- 14012000: Safari Desktop 12
- 14012001: Safari Mobile 12

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CLIENT_VERSION

Type

Number

Description

The version of the client that was in use upon logging out.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

PLATFORM_TYPE

Type

Number

Description

The code for the client platform. If a timeout caused the logout, this field is null.

Example Values

- 1000: Windows
- 2003: Macintosh/Apple OSX

- 5005: Android
- 5006: iPhone
- 5007: iPad

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKf5DV

RESOLUTION_TYPE

Type

Number

Description

The screen resolution of the client. If a timeout caused the logout, this field is null.

SESSION_LEVEL

Type

String

Description

The security level of the session that was used when logging out.

Possible Values

- 1: Standard Session
- 2: High-Assurance Session

SESSION_TYPE

Type

String

Description

The session type that was used when logging out.

Possible Values

- A: API
- I: APIOnlyUser
- N: ChatterNetworks
- Z: ChatterNetworksAPIOnly
- C: Content
- P: OauthApprovalUI
- O: Oauth2
- T: SiteStudio
- R: SitePreview

- S: SubstituteUser
- B: TempContentExchange
- G: TempOauthAccessTokenFrontdoor
- Y: TempVisualforceExchange
- F: TempUIFrontdoor
- U: UI
- E: UserSite
- V: Visualforce
- W: WDC_API

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)

Example

2015-07-27T11:32:59.555Z

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

USER_INITIATED_LOGOUT

Type

Boolean

Description

The value is 1 if the user intentionally logged out of the organization by clicking the **Logout** button. If the user's session timed out due to inactivity or another implicit logout action, the value is 0.

USER_TYPE

Type

String

Description

The category of user license of the user that logged out.

Possible Values

- S: Standard
- P: Partner
- p: Customer Portal Manager
- C: Customer Portal User
- O: Power Custom
- o: Custom
- L: Package License Manager
- N: Salesforce to Salesforce
- G: Guest
- D: External Who
- A: Automated Process
- b: High Volume Portal
- n: CSN Only
- E: Self-Service

Metadata API Operation Event Type

Metadata API Operation events contain details of Metadata API retrieval and deployment requests.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field**Details**

API_VERSION

Type

String

	<p>Description The version of the API that's being used.</p> <p>Example 36.0</p>
CLIENT_ID	<p>Type String</p> <p>Description The API client ID.</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2I</p>

OPERATION

Type

String

Description

The operation that's being performed.

Possible Values

- meta_deploy
 - meta_list
 - meta_retrieve
 - meta_synchronous_create
 - meta_synchronous_read
 - meta_synchronous_upsert
-

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

Multiblock Report Event Type

Multiblock Report events contain details about Joined Report reports.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_TOTAL_TIME	<p>Type Number</p> <p>Description The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</p>
EVENT_TYPE	<p>Type String</p>

	<p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
HAS_CHART	<p>Type Boolean</p> <p>Description True if the report has a chart.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
MASTER_REPORT_ID	<p>Type String</p> <p>Description The 15-character ID of the master report.</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
REQUEST_STATUS	<p>Type String</p>

	<p>Description</p> <p>The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • S: Success • F: Failure • U: Undefined • A: Authorization Error • R: Redirect • N: Not Found
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
URI	<p>Type</p> <p>String</p>

	<p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>

SEE ALSO:[EventLogFile Supported Event Types](#)[EventLogFile](#)

Package Install Event Type

Package Install events contain details about package installation in the organization.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p>

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

FAILURE_TYPE

Type

String

Description

A general categorization of any error that's encountered.

IS_MANAGED

Type

Boolean

Description

True if the operation is performed on a managed package.

IS_PUSH

Type

Boolean

Description

True if the package was installed as a result of a push upgrade.

IS_RELEASED

Type

Boolean

Description

True if the operation is performed on a released package.

IS_SUCCESSFUL

Type

Boolean

Description

True if the package was successfully installed.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

OPERATION_TYPE

Type

String

Description

The type of package operation.

Possible Values

- INSTALL
- UPGRADE
- EXPORT
- UNINSTALL
- VALIDATE_PACKAGE
- INIT_EXPORT_PKG_CONTROLLER

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

PACKAGE_NAME

Type

String

Description

The name of the package that's being installed.

REQUEST_ID

Type

String

	<p>Description</p> <p>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same <code>REQUEST_ID</code>.</p> <p>Example</p> <p>3nWgxWbDKWWDik0FKfF5DV</p>
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
URI	<p>Type</p> <p>String</p> <p>Description</p> <p>The URI of the page that's receiving the request.</p> <p>Example</p> <p>/home/home.jsp</p>

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

Platform Encryption Event Type

Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field**Details**

ACTION

Type

String

Description

The name and type of the event.

Possible Values

- TS Imported: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, imported by a customer.
- TS Generated: A tenant secret generated by the Shield Key Management Service (KMS).
- Key Derived: An encryption key derived from a tenant secret for encryption or decryption.
- TS Wrapped: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, encrypted for storage.
- Key Delivered: A data encryption key delivered for encryption or decryption.
- TS Stored: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, stored encrypted in the database.
- TS Read: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted customer-supplied key material, that is loaded for encryption or decryption.
- TS Unwrapped: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted customer-supplied key material, unwrapped for use by the KMS.
- TS Exported: An encrypted tenant secret exported by a customer.
- TS Destroyed: A tenant secret and related data encryption key destroyed by a customer.

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the

app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

EVENT_TYPE

Type

String

Description

The type of event. The value is always PlatformEncryption.

KEY_ID

Type

String

Description

The 15-character ID of the tenant secret.

Example

02GD000000096Cb

KEY_ID_DERIVED

Type

String

Description

The 18-character ID of the derived encryption key.

Example

02GD000000096CbMAI

KEY_TYPE

Type

String

Description

The type of tenant secret.

Possible Values

- Data
- DeterministicData
- EinsteinAnalytics
- SearchIndex

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2I

METHOD

Type

String

Description

The string that identifies a change in tenant secret Active state. For example, tenant secrets become active when they are created, and are made inactive when they are exported.

Examples

- TS Exported: User ID
- TS Generated: HSM or BYOK
- TS Unwrapped: Tenant Secret or BYOK

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

DateTime

	<p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 005900000000I1SNIA0</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p>

Example

005900000000I1SNIA0

Queued Execution Event Type

Queued Execution events contain details about queued executions—for example, batch Apex.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds that it took to complete the batch apex request. This field indicates the amount of activity taking place in the app server layer, allowing you to identify pieces of Apex or Visualforce code that need refactoring.</p>
DB_TOTAL_TIME	<p>Type Number</p> <p>Description The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</p>
ENTRY_POINT	<p>Type String</p>

Field	Details
	<p>Description The name of the Apex class that serves as the execution point for the batch job.</p> <p>Example TaskPhoneExtensionBatchUpdate</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
JOB_ID	<p>Type String</p> <p>Description The ID of the batch Apex job.</p> <p>Example 7073000000IDquo</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p>

Field	Details
	<p>Description</p> <p>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same <code>REQUEST_ID</code>.</p> <p>Example</p> <p>3nWgxWbDKWWDik0FKfF5DV</p>
REQUEST_STATUS	<p>Type</p> <p>String</p> <p>Description</p> <p>The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • S: Success • F: Failure • U: Undefined • A: Authorization Error • R: Redirect • N: Not Found
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>

Field	Details
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Report Event Type

Report events contain information about what happened when a user ran a report.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
AVERAGE_ROW_SIZE	<p>Type Number</p> <p>Description The average row size of all rows in the Report event, in bytes. A large average size, coupled with a high <code>ROW_COUNT</code>, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.</p> <p>Example 700</p>
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_BLOCKS	<p>Type Number</p> <p>Description Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.</p>

DB_CPU_TIME

Type

Number

Description

Allows you to monitor trends in database uptime.

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

DISPLAY_TYPE

Type

String

Description

The report display type, indicating the run mode of the report.

Possible Values

- D: Dashboard
 - S: Show Details
 - H: Hide Details
-

ENTITY_NAME

Type

String

Description

The name of the object affected by the trigger.

EVENT_TYPE

Type

String

Description

The type of event.

Example

`ReportExport`, `URI`, `API`, `RestApi`, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

`GeJCsym5eyvtEK2I`

NUMBER_BUCKETS

Type

Number

Description

The number of buckets that were used in the report.

NUMBER_COLUMNS

Type

Number

Description

The number of columns in the report.

NUMBER_EXCEPTION_FILTERS

Type

Number

Description

The number of exception filters that are used in the report.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

RENDERING_TYPE

Type

String

Description

The report rendering type, describing the format of the report output.

Possible Values

- w: Web (HTML)
- E: Email
- P: Printable
- X: Excel
- C: Comma-separated values (CSV)
- J: JavaScript Object Notation (JSON)

REPORT_ID

Type

Id

Description

The 15-character ID of the report that was run.

REPORT_ID_DERIVED

Type

Id

	Description The 18-character case insensitive ID of the report that was run.
REQUEST_ID	Type String Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same <code>REQUEST_ID</code> . Example 3nWgxWbDKWWDik0FKfF5DV
REQUEST_STATUS	Type String Description The status of the request for a page view or user interface action. Possible Values <ul style="list-style-type: none">• S: Success• F: Failure• U: Undefined• A: Authorization Error• R: Redirect• N: Not Found
ROW_COUNT	Type Number Description The number of rows that were processed in the Report event. High row counts, coupled with a high <code>AVERAGE_ROW_SIZE</code> , can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor. Example 150
RUN_TIME	Type Number Description The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

SORT

Type

String

Description

The sort column and order that was used in the report.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

Usage

Example: Identify Large Report Exports by User

Get Report event type data from the EventLogFile object using REST:

```
/services/data/v40.0/query?q=SELECT+Id+,+EventType+,+LogFile+,+LogDate+,+LogFileLength+FROM+EventLogFile+WHERE+
  LogDate+>+Yesterday+AND+EventType+=+'Report '
```

After you download the report data to a ReportData database table, query it and filter on reports that were exported with high row counts and size:

```
SELECT USER_ID FROM ReportData WHERE (RENDERING_TYPE=C OR RENDERING_TYPE=X OR
  RENDERING_TYPE=P) AND ROW_COUNT>150000 AND AVERAGE_ROW_SIZE>1500
```

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Report Export Event Type

Report Export events contain details about reports that a user exported.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field**Details**

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CLIENT_INFO

Type

String

Description

Information about the client that's using Salesforce services.

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

	<p>Example</p> <p>00D000000000123</p>
REPORT_DESCRIPTION	<p>Type</p> <p>String</p> <p>Description</p> <p>Information about the report that was run.</p>
REQUEST_ID	<p>Type</p> <p>String</p> <p>Description</p> <p>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example</p> <p>3nWgxWbDKWWDIk0FKfF5DV</p>
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p>

URI	<p>Example 2015-07-27T11:32:59.555Z</p> <hr/> <p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>

SEE ALSO:[EventLogFile Supported Event Types](#)[EventLogFile](#)

REST API Event Type

REST API events contain details about REST-specific requests.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
DB_BLOCKS	<p>Type Number</p> <p>Description Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.</p>
DB_CPU_TIME	<p>Type Number</p> <p>Description Allows you to monitor trends in database uptime.</p>
DB_TOTAL_TIME	<p>Type Number</p> <p>Description The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</p>
ENTITY_NAME	<p>Type Set</p> <p>Description API objects that are accessed.</p>

Example

Account, Opportunity, Contact, and so on.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

MEDIA_TYPE

Type

String

Description

The media type of the response.

METHOD

Type

String

Description

The HTTP method of the request—GET, POST, PUT, and so on.

NUMBER_FIELDS

Type

Number

Description

The number of fields or columns, where applicable.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

REQUEST_SIZE

Type

Number

Description

The size of the callout request body, in bytes.

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
 - F: Failure
 - U: Undefined
 - A: Authorization Error
 - R: Redirect
 - N: Not Found
-

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKfF5DV

RESPONSE_SIZE

Type

Number

Description

The size of the callout response, in bytes.

ROWS_PROCESSED

Type

Number

Description

The number of rows that were processed in the request.

Example

150

RUN_TIME

Type

Number

	<p>Description The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example d7DEq/ANa7nNZZVD</p>
STATUS_CODE	<p>Type Number</p> <p>Description The HTTP status code for the response.</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p>

	<p>Description</p> <p>The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_AGENT	<p>Type</p> <p>Number</p> <p>Description</p> <p>The numeric code for the type of client used to make the request (for example, the browser, application, or API).</p>
USER_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
USER_ID_DERIVED	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Sandbox Event Type

Sandbox events contain details about sandbox copies.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CURRENT_SANDBOX_ORG_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the current sandbox organization.</p>

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

PENDING_SANDBOX_ORG_ID

Type

Id

Description

The 15-character ID of the target sandbox org.

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDik0FKfF5DV

SANDBOX_ID

Type

Id

Description

The 15-character ID of the sandbox organization.

STATUS

Type

String

Description

The status of the sandbox copy.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

	<p>Example</p> <p>20130715233322.670</p>
<p>TIMESTAMP_DERIVED</p>	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
<p>USER_ID</p>	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
<p>USER_ID_DERIVED</p>	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Search Event Type

Search events contain details about the user's search query. All searches within the app, including Communities, are included. However, unauthenticated users won't have a unique Salesforce user ID.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
<p>EVENT_TYPE</p>	<p>Type</p> <p>String</p>

	Description The type of event. Value is always Search. For details, see EventLogFile Supported Event Types .
NUM_RESULTS	Type Number Description Number of results returned by the search query. Possible Values <ul style="list-style-type: none">• 0• 25• 1000
ORGANIZATION_ID	Type Id Description The 15-character ID of the organization. Example 00D000000000123
PREFIXES_SEARCHED	Type String Description Space-separated list of key prefixes that were searched. Example 001 006 ka0
QUERY_ID	Type String Description Unique ID of the search query. Example -2vx8relit08r
REQUEST_ID	Type String Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. Example 3nWgxWbDKWWDIk0FKfF5DV

SEARCH_QUERY

Type

String

Description

The first 100 characters of the search query.

Example

Salesforce

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

USER_ID

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)[EventLogFile](#)

Search Click Event Type

Search Click events contain details about the user's interaction with the search results. All searches within the app, including Communities, are included. However, unauthenticated users won't have a unique Salesforce user ID.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLICKED_RECORD_ID	<p>Type String</p> <p>Description The 15-character ID of the result the user clicked in the search results page.</p> <p>Example a07B00000031pRV</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event. Value is always SearchClick. For details, see EventLogFile Supported Event Types.</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
QUERY_ID	<p>Type String</p> <p>Description Unique ID of the search query.</p> <p>Example -2vx8relit08r</p>
RANK	<p>Type Number</p> <p>Description Ranking of the result clicked in the search results page.</p> <p>Example 2</p>
REQUEST_ID	<p>Type String</p>

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.

Example

3nWgxWbDKWWDik0FKfF5DV

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

USER_ID

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Sites Event Type

Sites events contain details of Site.com requests. Requests can originate from the browser (UI).

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
-------	---------

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

HTTP_HEADERS

Type

String

Description

The HTTP headers that were sent in the request.

HTTP_METHOD

Type

String

Description

The HTTP method of the request—GET, POST, PUT, and so on.

IS_API

Type

Boolean

	Description True if this page was an API or Web Services request.
IS_ERROR	Type Boolean Description True if this page was an error page.
IS_FIRST_REQUEST	Type Boolean Description 1 if this page is the first Visualforce transaction in the request, or 0 if it isn't.
IS_GUEST	Type Boolean Description True if this page was a guest (unauthenticated) request.
IS_SECURE	Type Boolean Description True if this request is secure.
LOGIN_KEY	Type String Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. Example GeJCsym5eyvtEK2I
ORGANIZATION_ID	Type Id Description The 15-character ID of the organization. Example 00D000000000123
PAGE_NAME	Type String

	<p>Description The name of the Visualforce page that was requested.</p>
QUERY	<p>Type String</p> <p>Description The SOQL query, if one was performed.</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIK0FKfF5DV</p>
REQUEST_STATUS	<p>Type String</p> <p>Description The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • S: Success • F: Failure • U: Undefined • A: Authorization Error • R: Redirect • N: Not Found
REQUEST_TYPE	<p>Type String</p> <p>Description The request type.</p> <p>Possible Values</p> <ul style="list-style-type: none"> • page: a normal request for a page • content_UI: a content request for a page that originated in the user interface • content_apex: a content request initiated by an Apex call • PDF_UI: a request for a page in PDF format through the user interface

- `PDF_apex`: a request for PDF format by an Apex call (usually a Web Service call)

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

SITE_ID

Type

Id

Description

The 15-character ID of the Site.com site.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

Time-Based Workflow Event Type

Time-Based Workflow events contain details about queue activity monitoring.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or the [REST API Developer's Guide](#).

Fields

Field**Details**

DATA

Type

String

Description

The record details of time queue activity.

EVENT_TYPE

Type

String

	<p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOG_GROUP_ID	<p>Type String</p> <p>Description Marks log records that are committed or rolled back.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
NUMBER_OF_RECORDS	<p>Type Number</p> <p>Description The number of processed records.</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
SESSION_KEY	<p>Type String</p>

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

TYPE

Type

String

Description

The type of time-based workflow event.

- **UIDEL**—An entry was deleted from the Time-Based Workflow page in Setup.
- **ERRDEL**—An entry was deleted from the workflow queue, because there was an error reading the record that triggered the workflow rule. The associated time-dependent actions weren't processed.
- **DELETE**—An entry was deleted from the workflow queue, because it's no longer relevant. For example, the criteria are no longer met by the associated record. If the evaluation date for the entry changed, the entry is re-added with the updated evaluation date.
- **PROC**—An entry was deleted from the workflow queue after processing a time-dependent action.

Transaction Security Event Type

Transaction Security events contain details about policy execution.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVALUATION_TIME_MS	<p>Type Number</p> <p>Description The time in milliseconds used to evaluate the policy.</p>
EVENT_TIMESTAMP	<p>Type String</p> <p>Description The time at which the Transaction Security event was generated in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). This value might be earlier than TIMESTAMP_DERIVED by the amount of time taken to log the event.</p> <p>Example 2015-07-27T11:32:59.555Z</p>
EVENT_TYPE	<p>Type String</p>

	<p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>
POLICY_ID	<p>Type Id</p> <p>Description The 15-character ID of the policy being evaluated.</p> <p>Example 00530000009M943</p>
POLICY_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case-insensitive ID of the policy being evaluated.</p> <p>Example 00590000000I1SNIA0</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p>

RESULT	<p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>
	<p>Type String</p> <p>Description The outcome of evaluating the policy.</p> <p>Example TRIGGERED or NOT TRIGGERED</p>
RUN_TIME	<p>Type Number</p> <p>Description The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type Datetime</p> <p>Description The time the event was logged in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). This value might be later than EVENT_TIMESTAMP by the amount of time between when the event occurred and when it was logged.</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p>

	<p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>

SEE ALSO:[EventLogFile Supported Event Types](#)[EventLogFile](#)

URI Event Type

URI events contain details about user interaction with the web browser UI.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p>

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB_BLOCKS

Type

Number

Description

Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

DB_CPU_TIME

Type

Number

Description

Allows you to monitor trends in database uptime.

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.

EVENT_TYPE

Type

String

Description

The type of event.

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

	<p>Description</p> <p>The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example</p> <p>GeJCsym5eyvtEK2I</p>
ORGANIZATION_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the organization.</p> <p>Example</p> <p>00D000000000123</p>
REFERRER_URI	<p>Type</p> <p>String</p> <p>Description</p> <p>The referring URI of the page that's receiving the request.</p>
REQUEST_ID	<p>Type</p> <p>String</p> <p>Description</p> <p>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example</p> <p>3nWgxWbDKWWDik0FKfF5DV</p>
REQUEST_STATUS	<p>Type</p> <p>String</p> <p>Description</p> <p>The status of the request for a page view or user interface action.</p> <p>Possible Values</p> <ul style="list-style-type: none">• S: Success• F: Failure• U: Undefined• A: Authorization Error• R: Redirect• N: Not Found
RUN_TIME	<p>Type</p> <p>Number</p>

	<p>Description The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type String</p> <p>Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type String</p> <p>Description The access time of Salesforce services.</p> <p>Example 20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type DateTime</p> <p>Description The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example 2015-07-27T11:32:59.555Z</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request. For more granular URI information for Lightning Experience and the Salesforce app, see the Lightning Error, Lightning Interaction, Lightning Page View, and Lightning Performance event types.</p> <p>Examples /aura (Lightning Experience), /app/one.app (Lightning Experience), /home/home.jsp (Salesforce Classic)</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

005900000000I1SNIA0

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Visualforce Event Type

Visualforce events contain details of Visualforce requests. Requests can originate from the browser (UI).

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field**Details**

CLIENT_IP

Type

String

Description

The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

Example

96.43.144.26

CONTROLLER_TYPE

Type

Number

Description

The type of controller that's used by the requested Visualforce page.

CPU_TIME

Type

Number

Description

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB_BLOCKS

Type

Number

Description

Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

DB_CPU_TIME

Type

Number

Description

Allows you to monitor trends in database uptime.

DB_TOTAL_TIME

Type

Number

Description

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

EVENT_TYPE

Type

String

Description

The type of event.

Example

`ReportExport`, `URI`, `API`, `RestApi`, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

HTTP_METHOD

Type

String

Description

The HTTP method of the request—`GET`, `POST`, `PUT`, and so on.

IS AJAX REQUEST

Type

Boolean

Description

The value is `true` if the request is a partial page request.

IS_FIRST_REQUEST

Type

Boolean

Description

1 if this page is the first Visualforce transaction in the request, or 0 if it isn't.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

MANAGED_PACKAGE_NAMESPACE

Type

String

Description

If the page is part of a managed package, the namespace of that package.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

PAGE_NAME

Type

String

Description

The name of the Visualforce page that was requested.

QUERY

Type

String

Description

The SOQL query, if one was performed.

REQUEST_ID

Type

String

Description

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

Example

3nWgxWbDKWWDIk0FKf5DV

REQUEST_SIZE

Type

Number

Description

The size of the request body, in bytes.

REQUEST_STATUS

Type

String

Description

The status of the request for a page view or user interface action.

Possible Values

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

REQUEST_TYPE

Type

String

Description

The request type.

Possible Values

- page: a normal request for a page
- content_UI: a content request for a page that originated in the user interface
- content_apex: a content request initiated by an Apex call
- PDF_UI: a request for a page in PDF format through the user interface
- PDF_apex: a request for PDF format by an Apex call (usually a Web Service call)

RESPONSE_SIZE

Type

Number

Description

The size of the response, in bytes.

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.SSSZ)

Example

2015-07-27T11:32:59.555Z

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_AGENT

Type

Number

Description

The numeric code for the type of client used to make the request (for example, the browser, application, or API).

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

VIEW_STATE_SIZE

Type

Number

Description

The size of the Visualforce view state, in bytes.

Wave Change Event Type

Wave Change events represent route or page changes made in the Salesforce Analytics user interface.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field**Details**

CLIENT_IP

Type

String

	<p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p> <p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p>
IS_NEW	<p>Type Boolean</p> <p>Description If the change routes to a new page, the value of this field is true. If it routes to an existing page, this field is false.</p>
LOGIN_KEY	<p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2I</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D000000000123</p>

RECORD_ID

Type

String

Description

The Salesforce ID of the Analytics object.

REOPEN_COUNT

Type

Number

DescriptionIf `IS_NEW` is false, the number of times that an existing page opens.

REQUEST_ID

Type

String

DescriptionThe unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.**Example**

3nWgxWbDKWWDik0FKf5DV

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

	<p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
TYPE	<p>Type</p> <p>String</p> <p>Description</p> <p>The Analytics object type.</p>
URI	<p>Type</p> <p>String</p> <p>Description</p> <p>The URI of the page that's receiving the request.</p> <p>Example</p> <p>/home/home.jsp</p>
URI_ID_DERIVED	<p>Type</p> <p>ID</p> <p>Description</p> <p>The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00530000009M943</p>
USER_ID_DERIVED	<p>Type</p> <p>Id</p> <p>Description</p> <p>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example</p> <p>00590000000I1SNIA0</p>
WAVE_SESSION_ID	<p>Type</p> <p>String</p>

Description

The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.

WAVE_TIMESTAMP

Type

Number

Description

The time at which this log line was generated.

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

Wave Interaction Event Type

Wave Interaction events track user interactions with the Analytics user interface made via the browser.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p>

Example

ReportExport, URI, API, RestApi, and so on. For details, see [EventLogFile Supported Event Types](#) on page 906.

LOGIN_KEY

Type

String

Description

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

Example

GeJCsym5eyvtEK2l

NUM_CLICKS

Type

Number

Description

The number of clicks performed on a page in the Wave user interface.

NUM_SESSIONS

Type

Number

Description

The number of times a user returned to a particular page.

ORGANIZATION_ID

Type

Id

Description

The 15-character ID of the organization.

Example

00D000000000123

READ_TIME

Type

Number

Description

The amount of time a user spent on a particular tab.

RECORD_ID

Type

String

Description

The Salesforce ID of the Analytics object.

REQUEST_ID

Type

String

	<p>Description</p> <p>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same <code>REQUEST_ID</code>.</p> <p>Example</p> <p>3nWgxWbDKWWDik0FKfF5DV</p>
RUN_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The amount of time that the request took in milliseconds.</p>
SESSION_KEY	<p>Type</p> <p>String</p> <p>Description</p> <p>The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</p> <p>Example</p> <p>d7DEq/ANa7nNZZVD</p>
TIMESTAMP	<p>Type</p> <p>String</p> <p>Description</p> <p>The access time of Salesforce services.</p> <p>Example</p> <p>20130715233322.670</p>
TIMESTAMP_DERIVED	<p>Type</p> <p>DateTime</p> <p>Description</p> <p>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)</p> <p>Example</p> <p>2015-07-27T11:32:59.555Z</p>
TOTAL_TIME	<p>Type</p> <p>Number</p> <p>Description</p> <p>The total amount of time a tab was open in milliseconds.</p>
TYPE	<p>Type</p> <p>String</p>

	<p>Description The Analytics object type.</p>
URI	<p>Type String</p> <p>Description The URI of the page that's receiving the request.</p> <p>Example /home/home.jsp</p>
URI_ID_DERIVED	<p>Type ID</p> <p>Description The 18-character case insensitive ID of the URI of the page that's receiving the request.</p>
USER_ID	<p>Type Id</p> <p>Description The 15-character ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00530000009M943</p>
USER_ID_DERIVED	<p>Type Id</p> <p>Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.</p> <p>Example 00590000000I1SNIA0</p>
WAVE_SESSION_ID	<p>Type String</p> <p>Description The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.</p>
WAVE_TIMESTAMP	<p>Type Number</p>

Description

The time at which this log line was generated.

Wave Performance Event Type

Wave Performance events help you track trends in your Analytics performance.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

Fields

Field	Details
CLIENT_IP	<p>Type String</p> <p>Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".</p> <p>Example 96.43.144.26</p>
CPU_TIME	<p>Type Number</p> <p>Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</p>
EPT	<p>Type Number</p> <p>Description The experienced page time in milliseconds.</p>
EVENT_TYPE	<p>Type String</p> <p>Description The type of event.</p>

LOGIN_KEY	<p>Example ReportExport, URI, API, RestApi, and so on. For details, see EventLogFile Supported Event Types on page 906.</p> <hr/> <p>Type String</p> <p>Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.</p> <p>Example GeJCsym5eyvtEK2l</p>
NAME	<p>Type String</p> <p>Description The asset title or query string.</p>
ORGANIZATION_ID	<p>Type Id</p> <p>Description The 15-character ID of the organization.</p> <p>Example 00D0000000000123</p>
QUERY_ID	<p>Type String</p> <p>Description The ID of the Wave query.</p>
RECORD_ID	<p>Type String</p> <p>Description The Salesforce ID of the Analytics object.</p>
REQUEST_ID	<p>Type String</p> <p>Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p>Example 3nWgxWbDKWWDIk0FKfF5DV</p>

RUN_TIME

Type

Number

Description

The amount of time that the request took in milliseconds.

SESSION_KEY

Type

String

Description

The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Example

d7DEq/ANa7nNZZVD

TAB_ID

Type

String

Description

The ID of the particular Wave tab in the user interface.

TIMESTAMP

Type

String

Description

The access time of Salesforce services.

Example

20130715233322.670

TIMESTAMP_DERIVED

Type

DateTime

Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

Example

2015-07-27T11:32:59.555Z

TYPE

Type

String

Description

The Analytics object type.

UI_RENDER_TIME

Type

String

Description

The amount of time that it took for the user interface to render.

URI

Type

String

Description

The URI of the page that's receiving the request.

Example

/home/home.jsp

URI_ID_DERIVED

Type

ID

Description

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID

Type

Id

Description

The 15-character ID of the user who's using Salesforce services through the UI or the API.

Example

00530000009M943

USER_ID_DERIVED

Type

Id

Description

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Example

00590000000I1SNIA0

WAVE_SESSION_ID

Type

String

Description

The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.

WAVE_TIMESTAMP

Type

Number

Description

The time at which this log line was generated.

SEE ALSO:

[EventLogFile Supported Event Types](#)

[EventLogFile](#)

EventRelation

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

EventRelation allows a variable number of relationships and handles deleted events differently, depending on whether Shared Activities is enabled.

A non-recurring event can have up to 1,000 invitees. A recurring event can have up to 100 invitees.

If Shared Activities Isn't Enabled

- EventRelation records only represent invitees (contacts, users, and resources).
- An event can be related to one contact or lead.

If Shared Activities Is Enabled

- EventRelation records can represent:
 - Invitees (`IsInvitee` is set to `true`)
 - OR
 - Related contacts or lead (`IsParent` is set to `true`)
- An event can be related to up to 50 contacts or one lead. These people may or may not be invitees. The number of allowed invitees is not affected by the number of related contacts. If a contact or lead is also an invitee, there is one EventRelation record for that person with `IsInvitee` and `IsParent` are set to `true`.
- An event can be related to a lead, contact, resource, account, or opportunity.
- An event can be related to a custom object that has the `HasActivities` attribute set to `true`.
- If you delete an event, then relations between the event and any specified contacts, leads, and other records are also deleted.
- If you delete the EventRelation record representing a relation then the corresponding relation field may be cleared on the event.
- If you delete the EventRelation record representing the `WhoId` on an event, then another Who, if any, from the event's `EventWhoIds` field will be promoted to the `WhoId`.
- If you restore a deleted event, relations between the event and any specified contacts, leads, and records are also restored. The `WhoId`, `WhatId`, and `AccountId` field values are recalculated using the field values on EventRelation.

Whether or not Shared Activities is enabled, an event can be related to one other kind of record, such as an account, an opportunity, or a custom object.

 **Note:**

- With API versions 26.0 and later, the EventRelation object replaces the EventAttendee object, and the EventAttendee object is no longer visible. You can still query the EventAttendee object using packages that support API versions 25.0 and earlier, or by using Apex.
- An EventRelation object can't be created for a child event.
- EventRelation includes deactivated users.
- In API versions 25.0 and earlier, you can't use `query()`, `delete()`, or `update()` with events related to more than one contact.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `queryAll()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the Account ID of the relation. For information on IDs, see ID Field Type. <code>AccountId</code> is visible when Shared Activities is enabled.</p>
EventId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Contains the ID of the event. This value can't be changed after it's been specified.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <code>Deleted</code>.</p>
IsInvitee	<p>Type boolean</p>

Field	Details
	<p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the relation is an invitee.</p> <ul style="list-style-type: none"> • <code>IsInvitee</code> is visible while Shared Activities is being enabled, after it has been enabled, and while it is being disabled. • <code>IsInvitee</code> defaults to <code>true</code> while Shared Activities is being enabled, after it has been enabled, and while it is being disabled if <code>IsInvitee</code>, <code>IsParent</code>, and <code>IsWhat</code> are not set. This configuration ensures compatibility when Shared Activities isn't enabled and EventRelation represents event invitees only. • <code>IsInvitee</code> defaults to <code>false</code> when Shared Activities is enabled if <code>IsParent</code> is set to <code>true</code>.
<code>IsParent</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description <code>IsParent</code> is visible only when Shared Activities is enabled. When <code>false</code>, indicates that the relation is an invitee (a contact, lead, or user). When <code>true</code>, indicates that the relation is a Who or What, as determined by <code>IsWhat</code> field.</p>
<code>IsWhat</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description <code>IsWhat</code> is visible only when Shared Activities is enabled. The value is relevant only if <code>IsParent</code> is <code>true</code>. When <code>IsWhat</code> is <code>true</code>, the relation specified by <code>RelationId</code> is a What (an account, opportunity, custom object, etc.). When <code>IsWhat</code> is <code>false</code>, the relation specified by <code>RelationId</code> is a Who (a contact, lead, or user).</p>
<code>RelationId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Contains the ID of the person (User, Contact, or Lead) or the resource invited to an event. When Shared Activities is enabled, <code>RelationId</code> can also contain the ID of an account, opportunity, or other object related to an event.</p> <p>This value can't be changed after it's been specified.</p>

Field	Details
RespondedDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Indicates the most recent date and time when the invitee responded to an invitation to an event.</p>
Response	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Contains optional text that the invitee can enter when responding to an invitation to an event.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the invitee status with one of the following values:</p> <ul style="list-style-type: none"> • New: Invitee has received the invitation but hasn't yet responded. This value is the default. • Declined: Invitee has declined the invitation. • Accepted: Invitee has accepted the invitation. <p> Note: Uninvited and Maybe aren't currently supported.</p>

Usage

- Invitee related lists display slightly different content. In the Salesforce app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in the Salesforce app, use the following API queries.

If you use Shared Activities in your Salesforce org, use this query:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId=' [Event_Id] '
```

where *Event_Id* is the child event's ID.

If you don't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId=' [Event_Id] '
```

These queries get the main event's relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

Send email notifications

To send email notifications for a given event, query `EventRelation` for the event, iterate through the list, examine the status, and send email notifications to every person who accepted the invitation.

Determine what events a given invitee is attending

To determine all the events that a particular person is attending during a given time period (for example, next week), you can have a client application query the `Event` object for a given date range, iterate through the results, and, for each event, query the `EventRelation` object to determine whether the particular person (`RelationId`) has accepted an invitation to that event.

Create an invitee if Shared Activities is enabled (or during the process of enabling it or rolling back)

If the invitee is already a contact or lead, update `IsInvitee` to `true`.

If the invitee is not already a contact or lead, create an `EventRelation` object for the invitee with `IsInvitee` set to `true`.

Create an invitee if Shared Activities is not enabled

Create an `EventRelation` object for the invitee.

Query relations to a contact or a lead

```
List<EventRelation> whoRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD000005zizD' AND isParent = true AND isWhat =
    false];
```

Query invitee relations

```
List<EventRelation> inviteeRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD000005zizD' AND isInvitee = true];
```

Update an invitee relation to a contact or lead invitee relation

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD000005zizD' AND isInvitee = true and isParent = false LIMIT 1];
er.isParent = true;
update er;
```

Update a contact or lead relation to a contact or lead invitee relation

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD000005zizD' AND isParent = true and isInvitee = false LIMIT 1];
er.isInvitee = true;
update er;
```

Insert a contact or lead relation

```
EventRelation er = new EventRelation(EventId = '00UD000005zizD',
    RelationId = '003D00000Q8aeV', isParent = true, isInvitee = false);
insert er;
```

Insert an invitee relation

If `isParent`, `isWhat` and `IsInvitee` are not set, and `RelationId` is a contact, lead, user, or calendar, `IsInvitee` defaults to `true`. This means if an `EventRelation` isn't specifically inserted as a relation to a contact or lead, it's treated as an Invitee relation by default.

```
EventRelation er = new EventRelation(EventId = '00UD0000005zizjH',
    RelationId = '003D000000Q8adV');
insert er;
```

Reproduce invitee related list functionality in the Salesforce app

Invitee related lists display slightly different content in the Salesforce app and the full site. In the app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner.

If you use Shared Activities in your Salesforce org, use the following query to reproduce the full site functionality in the Salesforce app:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where `Event_Id` is the child event's ID.

If you don't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event's relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

SEE ALSO:

[Event](#)

[EventWhoRelation](#)

[Object Basics](#)

EventTag

Associates a word or short phrase with an Event.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p>

Field Name	Details
	<p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag. Valid values:</p> <ul style="list-style-type: none"> • <code>Public</code>—The tag can be viewed and manipulated by all users in an organization. • <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

EventTag stores the relationship between its parent TagDefinition and the Event being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

EventWhoRelation

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the [EventRelation](#) on page 1101 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

EventWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

 **Note:** EventWhoRelation objects aren't created for child events.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
EventId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the event.</p>
RelationId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates the ID of the contacts or lead related to the event.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the person related to the event is a contact or lead.</p>

Usage

Apex example that queries relations to a contact or lead

```
List<EventWhoRelation> whoRelations = [SELECT Id, Relation.Name FROM
EventWhoRelation WHERE EventId = '00UD0000005z1jD'];
```

SEE ALSO:

[Event](#)

[EventRelation](#)

ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>AuthProviderId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Salesforce ID of the authentication provider, which defines the service that provides the login process and approves access to the external system. Only users with the “Customize Application” and “Manage AuthProviders” permissions can view this field. This field is available in API version 39.0 and later.</p>
<code>CustomConfiguration</code>	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description A JSON-encoded configuration string that defines parameters specific to the type of external data source.</p>

Field Name	Details
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
Endpoint	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description The URL of the external system, or if that URL is defined in a named credential, the named credential URL.</p> <p>A named credential URL contains the scheme <code>callout:</code>, the name of the named credential, and an optional path. For example: <code>callout:My_Named_Credential/some_path</code>. You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: <code>callout:My_Named_Credential/some_path?format=json</code>.</p>
isWritable	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Query, Sort</p> <p>Description Lets the Lightning platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only.</p> <p>Available only for Salesforce Connect external data sources. Available in API version 35.0 and later. However, with the cross-org adapter for Salesforce Connect, you can set this field to <code>true</code> only in API version 39.0 and later.</p>
Language	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the <code>MasterLabel</code>.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Master label for the external data source. This internal label doesn't get translated.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p>
PrincipalType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Specifies whether the org uses one set (<code>NamedUser</code>), multiple sets (<code>PerUser</code>), or no (<code>Anonymous</code>) credentials to access the external system. Each set of credentials corresponds to a login account on the external system. Corresponds to <code>Identity Type</code> in the user interface.</p>
Protocol	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Specifies whether to use OAuth, password authentication, or no authentication to access the external system.</p> <p>Some types of external data sources support only one value.</p> <ul style="list-style-type: none"> For cloud-based Files Connect external systems, select OAuth 2.0. For on-premises systems, select Password Authentication.

Field Name	Details
	<ul style="list-style-type: none"> For Simple URL data sources, select No Authentication.
Repository	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Used for SharePoint Online. An optional name of the repository in the data source. Not applicable to all data source types.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Specifies the adapter that connects to the external system.</p>

Usage

Define an external data source to connect to data or content that's stored outside the Salesforce org. Then create external objects, which map to the external system's data and behave similarly to custom objects.

SEE ALSO:

[ExternalDataUserAuth](#)

[NamedCredential](#)

ExternalDataUserAuth

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AuthProviderId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description Salesforce ID of the authentication provider, which defines the service that provides the login process and approves access to the external system.</p> <p>Only users with the “Customize Application” and “Manage AuthProviders” permissions can view this field.</p> <p>This field is available in API version 39.0 and later.</p>
ExternalDataSourceId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Salesforce ID of the external data source or named credential that defines the external system.</p>
Password	<p>Type encrypted string</p> <p>Properties Create, Nillable, Update</p> <p>Description Password portion of the credentials for the Salesforce user to access the external system.</p>
Protocol	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether to use OAuth, password authentication, or no authentication when the user accesses the external system.</p>
UserId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the Salesforce user who’s accessing the external system.</p>
Username	<p>Type string</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Username portion of the credentials for the Salesforce user to access the external system.</p>

Usage

These authentication settings enable a Salesforce user to access an external system. The external system is defined in Salesforce as one of the following.

- External data source—Provides access to external objects, whose data is stored outside the Salesforce organization.
- Named credential—Enables the user’s actions to trigger authenticated callouts to the endpoint that’s specified in the named credential.

If you grant users access to the external data source or named credential via permission sets or profiles, those users can manage their own authentication settings. See “Store Authentication Settings for External Systems” in the Salesforce Help.

SEE ALSO:

[ExternalDataSource](#)

[NamedCredential](#)

FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- You can read, create, update, or delete a FeedAttachment only if you have the corresponding access to the associated FeedItem.
- Inline images aren’t creatable, updatable, or deletable through SOAP API.

Fields

Field Name	Details
FeedEntityId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the associated feed entity that contains this attachment. Currently, the only feed entity supported is FeedItem.</p>
RecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the record that this feed attachment contains. For inline images, RecordId is a ContentDocument ID. For content attachments, RecordId is a ContentVersion ID.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The title of this feed attachment. When Type is Link, Title value is the label for the attachment link. Otherwise, Title value isn't used.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of this feed attachment. Valid values are:</p> <ul style="list-style-type: none"> • Content—A content attachment. • FeedEntity—A feed entity, for example, a post that is shared. Available in API version 39 and later in Lightning Experience. • InlineImage—An inline image. The system creates an inline image attachment when an image is added to the body of the associated FeedItem. You can't add an inline image directly by using FeedAttachment. • Link—A link.
Value	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The string value of this FeedAttachment. This field is optional. If the feed attachment is a Link FeedAttachment, the value is the link URL string.</p>

Usage

- This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

```
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

- You can only create one link attachment (FeedAttachment of type `Link`) per feed item.
- If the feed item type is one of the following, you can add content or link feed attachments to a FeedItem.
 - AdvancedTextPost
 - TextPost
 - ContentPost
 - LinkPost
 - QuestionPost
- When a FeedAttachment is added or removed from a feed item, Salesforce updates the type of the feed item to its most appropriate value, as follows.
 - If all content feed attachments are removed from a feed item of type `ContentPost`, the type of this feed item is updated to `TextPost`.
 - Conversely, if a content feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `ContentPost`.
 - If all link feed attachments are removed from a feed item of type `LinkPost`, the type of this feed item is updated to `TextPost`.
 - Conversely, if a link feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `LinkPost`.
 - The type of all other feed items, such as `QuestionPost` or `AdvancedTextPost` feed items, doesn't change when any feed attachments are added or removed.
 - If a content feed attachment is added to a feed item of type `LinkPost`, the feed item type is updated to `ContentPost`.

- If all content attachments are removed from a feed item of type `ContentPost`, but there's also a link attachment, the feed item type is updated to `LinkPost`.
- Those without administrator privileges can't retrieve a `FeedAttachment` by its ID in a SOQL query. They can retrieve attachments by specifying the associated `FeedEntityId`, as follows:

```
SELECT Id FROM FeedAttachment WHERE FeedEntityId = 'some_feedItem_id'
```

- Alternatively, retrieve attachments by using a SOQL query on `FeedItem` with a subquery on the `FeedAttachments` child relationship, as follows.

```
SELECT Body, (SELECT RecordId, Title, Type, Value FROM FeedAttachments)
FROM FeedItem
WHERE Id = 'some_feedItem_id'
```

- `FeedAttachment` is not a triggerable object. You can access feed attachments in `FeedItem` *update* triggers by retrieving them through a SOQL query. For a trigger example, and to learn about trigger considerations for `FeedAttachment`, see [Triggers for Chatter Objects](#) in the *Apex Developer Guide*.

FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

Note the following when working with feed comments.

- You must have read access to the feed's parent type to see a `FeedComment` record.
- You must have access to the feed to add a comment.
- If the comment is related to a user record, the user can delete the comment. For example, if John Smith makes a comment about Sasha Jones, Sasha can delete the comment.
- If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the object associated with the feed and delete permission on the parent feed
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"
- Only users with this permission can delete items in unlisted groups.

Fields

Field	Details
CommentBody	<p>Type textarea</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The text in the comment.</p>
CommentType	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of comment:</p> <ul style="list-style-type: none"> • ContentComment—an uploaded file on a comment • TextComment—a direct text entry on a comment <p>Before API version 24.0, a text entry was required on a comment. As of version 24.0, a text entry is optional if the CommentType is ContentComment.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the feed containing the comment.</p>
InsertedById	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the InsertedBy value is set to the ID of the logged-in user.</p>
IsRichText	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
LastEditDate	<p>Type datetime</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The date the feed comment was last edited.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of a record associated with the feed comment. For example, if you are commenting on a change to a field on Account, <code>ParentId</code> is set to the account ID.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a <code>ContentComment</code>. This field is null for all comments except <code>ContentComment</code>. For example, set this field to an existing ContentVersion and post it to a comment as a <code>FeedComment</code> object of <code>CommentTypeContentComment</code>.</p>
Revision	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The number of times the comment was revised.</p>
Status	<p>Type picklist</p> <p>Properties Create, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed comment is published and visible to all who have access to the parent feed item. To make changes to a comment's status, the comment's parent feed item must be in a published state. This field is available in API version 38.0 and later. Possible values are:</p>

Field	Details
	<ul style="list-style-type: none"> • Published—The comment is visible to all who have access to the parent feed item. • PendingReview—The comment is visible to its author and to users who can see the parent feed item and have "ViewAllData" or "CanApproveFeedPostAndComment" permission. The comment can be deleted by its author and users who can see the comment and have "CanApproveFeedPostAndComment" or "ModifyAllData" permission. If the parent feed item is published, the comment can be edited by its author and users who can see the comment and have "CanApproveFeedPostAndComment" or "ModifyAllData" permission. Comment status can be changed from Published to PendingReview and from PendingReview to Published by users who have "CanApproveFeedPostAndComment" or "ModifyAllData" permission. <p>Some actions are blocked when a feed comment is pending review:</p> <ul style="list-style-type: none"> – Select as Best—When a feed comment that is marked as best answer becomes unpublished, it's removed as the best answer. If the comment is published, its best answer status is not restored. – Like and unlike
SystemModstamp	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter</p> <p>Description Date and time when a user or automated process (such as a trigger) last modified this record. SystemModstamp is a read-only system field, available in FeedComment as of API version 37.0.</p>

Usage

- As of API version 23.0 and later, if you have "View All Data" permission, you can query FeedComment records directly without an ID filter. If you don't have "View All Data" permission, you can't query FeedComment records directly, with or without an ID filter.

For example, the following query returns general information about a feed:

```
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName,
       CreatedBy.LastName, ParentId, Parent.Name, Body
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC, Id DESC
```

- You can search for text in comments using SOSL. For example, the following Java class uses `search()` to find the string "foo" in any field of a record:

```
public void searchSample() {
    try {
        SearchResult sr = connection.search("find {foo} in all fields " +
            "returning feedcomment(Id, FeedItemId, CommentBody)");
        // Put the results into an array of SearchRecords
    }
}
```

```

SearchRecord[] records = sr.getSearchRecords();
// Check the length of the returned array of records to see
// if the search found anything
if (records != null && records.length > 0) {
    System.out.println("Found " + records.length + " comments: ");
    // Display each comment
    for (SearchRecord record : records) {
        FeedComment comment = (FeedComment) record.getRecord();
        System.out.println(comment.getId() + ": " +
            comment.getCommentBody());
    }
} else {
    System.out.println("No records were found for the search.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

- If you use an Apex trigger to modify the `Body` of a `FeedComment` object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.

 **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

[UserProfileFeed](#)

FeedItem

`FeedItem` represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces `FeedPost`.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

Only users with the “Modify All Data” permission can delete a FeedItem of Type TrackedChange.

If the logged-in user has the “Insert System Field Values for Chatter Feeds” user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

Fields

Field Name	Details
BestCommentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Id of the comment marked as best answer on a question post.</p>
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Sort, Update on page 72</p> <p>Description The content of the FeedItem. Required when Type is TextPost or AdvancedTextPost. Optional when Type is ContentPost or LinkPost. This field is the message that appears in the feed.</p> <p>Although a value for Body is not required for the ContentPost type, an attachment is required. If an attachment isn’t present, the type changes to TextPost or AdvancedTextPost, depending on the API version. TextPost and AdvancedTextPost do require a value for Body.</p> <p> Tip: See the <code>IsRichText</code> field for a list of HTML tags supported in the body of rich text posts.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, CommentCount isn’t updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there’s only one. In a moderated feed, your comment isn’t counted until it’s approved by an admin or a person with “CanApproveFeedPostAndComment” or “ModifyAllData” permission.</p>

Field Name	Details
	<p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
<code>ConnectionId</code>	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>
<code>ContentData</code>	<p>Type base64</p> <p>Properties Create, Nillable</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
<code>ContentDescription</code>	<p>Type textarea</p> <p>Properties Create, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The description of the file specified in <code>ContentData</code>.</p>
<code>ContentFileName</code>	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>

Field Name	Details
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is the size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is the MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
HasContent	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the feed item has content.</p>
HasFeedEntity	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the feed item has a feed entity, for example, a post, as an attachment. Available in API version 39 and later when sharing a feed entity in Lightning Experience.</p>
HasLink	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Indicates whether the feed item has a link attached.</p>
HasVerifiedComment	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Determines whether a question has an answer that is marked as Company Verified.</p> <p>This field is available in API version 41.0 and later.</p>
InsertedById	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p> <p>Description</p> <p>Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>
IsRichText	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Create, Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the object type to which the <code>FeedItem</code> object is related. For example, set this field to a <code>UserId</code> to post to someone's profile feed, or an <code>AccountId</code> to post to a specific account.</p>

Field Name	Details
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. For Work.com thanks posts, it's the ID of the WorkThanks object associated with a RypplePost. This field is typically null for all posts except ContentPost and RypplePost.</p> <p>For example, set this field to an existing ContentVersion and post it to a feed as a FeedItem object of Type ContentPost.</p>
Revision	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The revision number of the feed item.</p>
Status	<p>Type picklist</p> <p>Properties Create, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Specifies whether this feed item is published and visible to all who have access to the feed. This field is available in API version 37.0 and later.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Published—The feed item is visible to all who have access to the feed. PendingReview—The feed item is visible to its author and to users who can see the item and have "ViewAllData" or "CanApproveFeedPostAndComment" permission. The feed item can be deleted and edited by its author and users who can see the item and have "CanApproveFeedPostAndComment" or "ModifyAllData" permission. <p>Some actions are blocked when a feed item is pending review:</p> <ul style="list-style-type: none"> – Comment – Like/unlike – Bookmark – Share
Title	<p>Type string</p>

Field Name

Details

Properties

[Create](#), [Group](#), [Nillable](#), [Sort](#), [Update](#)

Description

The title of the FeedItem. When the `Type` is `LinkPost`, the `LinkUrl` is the URL and this field is the link name. The `Title` field can be updated on posts of `Type` `QuestionPost`.

Type

Type

[picklist](#)

Properties

[Create](#), [Filter](#), [Group](#), [Nillable](#), [Restricted picklist](#), [Sort](#)

Description

The type of FeedItem. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create FeedItem types directly from the API.

- `ActivityEvent`—indirectly generated event when a user or the API adds a `Task` associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a `Task` or `Event` associated with a case record (excluding email and call logging).

For a recurring `Task` with `CaseFeed` disabled, one event is generated for the series only. For a recurring `Task` with `CaseFeed` enabled, events are generated for the series and each occurrence.

- `AdvancedTextPost`—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.

Field Name

Details

- `ProfileSkillPost`—generated when a skill is added to a user’s Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

- `AttachArticleEvent`—generated event when a user attaches an article to a case.
- `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- `CaseCommentPost`—generated event when a user adds a case comment for a case object.
- `ChangeStatusPost`—generated event when a user changes the status of a case.
- `ChatTranscriptPost`—generated event when Live Agent transcript is saved to a case.
- `EmailMessageEvent`—generated event when an email related to a case object is sent or received.
- `FacebookPost`—generated when a Facebook post is created from a case. Deprecated.
- `MilestoneEvent`—generated when a case milestone is completed or reaches violation status.
- `SocialPost`—generated when a social post is created from a case.

Note: If you set `Type` to `ContentPost`, also specify `ContentData` and `ContentFileName`.

Visibility

Type

picklist

Properties

[Create](#), [Filter](#), [Group](#), [Nillable](#), [Restricted picklist](#), [Sort](#), [Update](#)

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`Visibility` can have the following values:

Field Name	Details
	<ul style="list-style-type: none"> <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item. <code>InternalUsers</code>—The feed item is available to internal users only. <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default. External users can set <code>Visibility</code> only to <code>AllUsers</code>. <code>Visibility</code> can be updated on record posts. The <code>Update</code> property is supported only for feed items posted on records.

Usage

- This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

```
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

- If you are using API version 23.0 or later and have “View All Data” permission, you can directly query for a `FeedItem`. The following example returns the 20 most recent feed items.

```
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName, CreatedBy.LastName, ParentId,
  Parent.Name, Body,
  (SELECT ID, FieldName, OldValue, NewValue FROM FeedTrackedChanges ORDER BY ID DESC)
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC
```

- If you are using an earlier API version than version 23.0, query `FeedItem` objects through a feed (such as [AccountFeed](#) or [OpportunityFeed](#)). The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedItem.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

 **Note:** Provide the `ParentId` for API version 22.0 and earlier.

- A `FeedItem` of type `UserStatus` is automatically created when a user adds a post to update the status. You can't explicitly create a `FeedItem` of type `UserStatus`.
- The `FeedItem` object doesn't support aggregate functions in queries.
- If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.
- The size limit for an attachment on a profile or news feed is 25 MB.
- The size limit for an attachment on a record feed is 5 MB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.
- Deleting a `FeedItem` via the API also deletes the associated content. Likewise, undeleting a `FeedItem` restores associated content.

 **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in a `FeedItem` object appear as `null` in a SOQL query.
- You can't explicitly create or delete a `FeedTrackedChange` record.
- If you insert a `FeedItem` or `FeedComment` of `Type ContentPost` on a `User` or `Group` to create a file, the `NetworkScope` field value of the `FeedItem` is passed to the file.
- If you use an Apex trigger to modify the `Body` of a `FeedItem` object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.
- If you insert rich text into the feed item body, make sure that the case of the opening and closing HTML tags matches. For example, `This is bold text` generates an error.
- To check file sharing with Apex triggers, write triggers on `ContentDocumentLink` instead of `FeedItem`. For a `ContentDocumentLink` trigger example, see [ContentDocumentLink](#).
- In API version 36.0 and later, use `FeedAttachment` to attach one or more content items to a `FeedItem`. As a result of multiple attachment support through `FeedAttachment`, all fields related to content attachments have been removed. These fields are: `ContentData`, `ContentDescription`, `ContentFileName`, `ContentSize`, and `ContentType`.

FeedLike

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

`FeedLike` records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API. A `FeedLike` is a child object of an associated `FeedItem`, `FeedTrackedChange`, or object feed, such as `AccountFeed`.

Supported Calls

`create()`, `delete()`, `describeObjects()`

Special Access Rules

If the logged-in user has the “Insert System Field Values for Chatter Feeds” user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

Fields

Field Name	Details
FeedItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the feed item that the user liked.</p>
FeedEntityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The Id of a feed item or feed comment the user liked. If the user liked a comment, FeedEntityId is set to the ID of the comment. If the user liked a feed item, FeedEntityId is set to the ID of the feed item. FeedEntityId is an optional field. The default value is the ID of the feed item.</p>
InsertedById	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>

Usage

You can't query FeedLike records directly. They can only be queried via the entity feed, such as `AccountFeed`.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API.

FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

`query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"
 -  **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.
- "Manage Unlisted Groups"
 - Only users with this permission can delete items in unlisted groups.

Fields

Field Name	Details
ChoiceBody	<p>Type string</p> <p>Properties Group</p> <p>Description A choice in the poll.</p>
FeedItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the feed item for the poll.</p>
Position	<p>Type int</p> <p>Properties Group, Sort</p> <p>Description Shows the position of the poll choice.</p>

Usage

Use this object to query all of the choices associated with a particular poll. To view how people voted on the poll, see the FeedPollVote object.

FeedPollVote

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

`query()`, `retrieve()`

Fields

Field Name	Details
ChoiceId	<p>Type reference</p> <p>Properties Filter, Group</p> <p>Description Indicates which choice a user selected on a poll posted in a feed.</p>
FeedItemId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the feed item for the poll.</p>

Usage

Use this object to query how users voted on a particular poll.

FeedPost

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `search()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Only users with the "Modify All Data" permission can delete a `FeedItem` of `Type TrackedChange`.

If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

Fields

Field	Details
Body	<p>Type string</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The content of the <code>FeedPost</code>. Required when <code>Type</code> is <code>TextPost</code> or <code>AdvancedTextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
ContentData	<p>Type base64</p> <p>Properties Create, Nillable</p> <p>Description This field is required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type string</p> <p>Properties Create, Nillable, Sort</p> <p>Description The description of the file specified in <code>ContentData</code>.</p>

Field	Details
ContentFileName	<p>Type string</p> <p>Properties Create, Group, Nillable, Sort</p> <p>Description This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description This field is the size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description This field is the MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
FeedItemId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the feed containing the <code>FeedPost</code>.</p>
InsertedById	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). This field is a standard system field.</p>
LinkUrl	<p>Type url</p> <p>Properties Create, Filter, Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the object type to which the <code>FeedPost</code> is related. For example, set this field to a <code>UserId</code> to post to someone's profile feed, or an <code>AccountId</code> to post to a specific account.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The title of the <code>FeedPost</code>. When the <code>Type</code> is <code>LinkPost</code>, the <code>Body</code> is the URL and the <code>Title</code> is the label for the link.</p>
Type	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description The type of <code>FeedPost</code>:</p> <ul style="list-style-type: none">• <code>UserStatus</code>—automatically generated when a user updates their status• <code>TrackedChange</code>—ignore• <code>TextPost</code>—a direct text entry on a feed

Field	Details
	<ul style="list-style-type: none"> • <code>LinkPost</code>—a URL posting on a feed • <code>ContentPost</code>—an uploaded file on a feed <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, you must specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Usage

- You can't directly query for a `FeedPost`. `FeedPosts` are always associated with a feed item, so you can query for them through the feeds. The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedPost.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

- A `FeedPost` of type `UserStatus` is automatically created when a user adds a post to update the current status. You can't explicitly create a `FeedPost` of type `UserStatus`.
- The size limit for an attachment on a profile, news, or record feed is 2 GB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.
- Deleting a `FeedPost` via the API also deletes the associated content and `FeedPost` objects. Likewise, undeleting a `FeedPost` restores associated content and `FeedPost` objects.
-  **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.
- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in `FeedPost` appear as `null` in a SOQL query.
- You can't explicitly create or delete a `FeedTrackedChange` record.

FeedRevision

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

<code>Action</code>	Type <p><code>picklist</code></p>

Field Name	Details
	<ul style="list-style-type: none"> • <code></code> • <code><code></code> • <code><i></code> • <code><u></code> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p> <p> Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p>
OriginNetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the community in which a user modified the feed item or comment. This field is only available, if Salesforce Communities is enabled for your organization.</p>
Revision	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The revision number of the feed item or comment.</p>
Value	<p>Type textarea</p> <p>Properties Nillable</p> <p>Description Identifies the value of the <code>EditedAttribute</code> field before the update.</p>

Usage

This object tracks the changes made to a feed item or feed comment and stores a list of attributes that changed for each revision.

- To query the FeedRevision object, users need the “View All Data” permission or supply a WHERE clause on the `FeedEntityId`.

FeedTrackedChange

Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later..

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Defaulted on create, Group, Restricted picklist, Sort</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the field, if <code>FieldName</code> is a currency field.</p>
FeedItemId	<p>Type reference</p> <p>Properties Group, Sort, Filter</p> <p>Description ID of the parent feed that tracks the field change.</p>
FieldName	<p>Type string</p> <p>Properties Group, Sort</p> <p>Description The name of the field that was changed.</p> <p> Note: This field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of <code>LeadConverted</code> indicates that a lead has been converted to an opportunity. For a full list of values, see Tracking of Special Events.</p>

Field	Details
newValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
oldCurrencyIsoCode	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the <code>oldValue</code> field, if <code>fieldName</code> is a currency field.</p>
oldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The last value of the field before it was changed.</p>

Usage

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

If you move a custom field to the Recycle Bin, all `FeedTrackedChange` records that track historical changes to the custom field are automatically deleted and are not restored if the custom-field is undeleted.

The following sections outline the difference between standard feeds and custom feeds.

Standard Feeds

A standard feed is a record feed, such as `AccountFeed`. `FeedTrackedChange` records for standard feeds can only be queried via the parent feed object.

Note the following when working with standard feed items:

- Feed items for standard feeds are read only in the API.
- A `FeedTrackedChange` record is visible when you have read access on the record feed, and when the field in the `FeedTrackedChange` is visible in the field-level security settings.

Custom Feeds

If you want more control over the information provided in a record feed, such as `AccountFeed`, you can create a custom feed. A custom feed can replace or augment an existing record feed. For example, you might want to:

- Disable the standard account record feed and use an Apex trigger to generate `FeedTrackedChange` records for the events that you want to track in the feed instead.
- Augment the standard contact record feed by writing an API client that inserts feed items for events that are not tracked in the standard feed.

Tracking of Special Events

The `FieldName` field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of `leadConverted` indicates that a lead has been converted to an opportunity.

Valid values for the `FieldName` field for multiple objects:

- `created`
- `ownerAccepted`
- `ownerAssignment`

Additional valid values for the `FieldName` field for individual objects:

Account

- `accountCreatedFromLead`
- `accountMerged`
- `accountUpdatedByLead`
- `personAccountUpdatedByLead`

Case

- `closed`
- `ownerEscalated`

Contact

- `contactCreatedFromLead`
- `contactMerged`
- `contactUpdatedByLead`

Contract

- `contractActivation`
- `contractApproval`
- `contractConversion`
- `contractExpiration`
- `contractTermination`

Lead

- `leadConverted`
- `leadMerged`

Opportunity

- `opportunityCreatedFromLead`

SEE ALSO:

[NewsFeed](#)[UserProfileFeed](#)

FieldHistoryArchive

Represents field history values for all objects that retain field history. `FieldHistoryArchive` is a big object, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

Each instance of the `FieldHistoryArchive` object represents a single change in the value of a field. `FieldHistoryArchive` stores history for both standard and custom fields.

The `Field` field returns the name of the field unless the parent field or object is deleted, in which case it returns the field ID. You can use the ID to retrieve the old field and object name from the `FieldNameAfterArchival` and `ParentNameAfterArchival` fields, respectively.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
<code>ArchiveFieldName</code>	<p>Type string</p> <p>Properties Nillable</p> <p>Description The name of the field at the time the data was archived. If the field name changed, the name is sometimes not the same for all records related to a single field.</p>
<code>ArchiveParentName</code>	<p>Type string</p> <p>Properties Nillable</p> <p>Description The name of the parent object at the time the data was archived. If the object name changed, the name is sometimes not the same for all records related to a single field.</p>

Field Name	Details
ArchiveParentType	<p>Type string</p> <p>Properties Nillable</p> <p>Description The type of the field at the time the data was archived. If the field type changed, the type is sometimes not the same for all records related to a single field.</p>
ArchiveTimestamp	<p>Type dateTime</p> <p>Properties Nillable</p> <p>Description The date and time at which the data was archived.</p>
CreatedById	<p>Type reference</p> <p>Properties Nillable</p> <p>Description The user ID of the user who created the original record.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Nillable, Sort</p> <p>Description The date and time at which the original record was created.</p>
Field	<p>Type picklist</p> <p>Properties Filter, Nillable, Restricted picklist</p> <p>Description The name of the field that was changed. If the field is deleted from the parent object, the <code>Field</code> field contains the field ID instead.</p>
FieldHistoryType	<p>Type picklist</p> <p>Properties Nillable, Sort, Restricted picklist</p>

Field Name	Details
	<p>Description The name of the object that contains the field history (for example, Account).</p>
HistoryId	<p>Type reference</p> <p>Properties Filter, Sort</p> <p>Description The ID of the relevant history object (for example, AccountHistory). This field is available in versions 42.0 and later.</p>
Id	<p>Type ID</p> <p>Properties Defaulted on create, Filter, idLookup</p> <p>Description The ID of the archived record. It's useful to have a field's ID for fields that you've deleted. (Field names aren't retained in history when you delete fields from Salesforce.)</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description The new value of the modified field.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable</p> <p>Description The previous value of the modified field.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The ID of the object that contains the field (the parent object).</p>

Usage

When sorting fields, order them as follows:

1. `FieldHistoryType` ASC
2. `ParentID` ASC
3. `CreatedDate` DESC

FieldPermissions

Represents the enabled field permissions for the parent `PermissionSet`. This object is available in API version 24.0 and later.

To grant a user access to a field, associate a `FieldPermissions` record with a `PermissionSet` that's assigned to a user. `FieldPermissions` records are only supported in `PermissionSet`, not in `Profile`.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>Field</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The field's API name. This name must be prefixed with the <code>ObjectType</code>. For example, <code>Merchandise__c.Description__c</code></p>
<code>ParentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The <code>Id</code> of the field's parent PermissionSet.</p>
<code>PermissionsEdit</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, users assigned to the parent <code>PermissionSet</code> can edit this field. Requires <code>PermissionsRead</code> for the same field to be <code>true</code>.</p>

Field Name	Details
PermissionsRead	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description If <code>true</code>, users assigned to the parent PermissionSet can view this field. A FieldPermissions record must have at minimum <code>PermissionsRead</code> set to <code>true</code>, or it will be deleted.</p>
SubjectType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The object's API name. For example, <code>Merchandise__c</code>.</p>

Usage

FieldPermissions work similarly to ObjectPermissions. However, FieldPermissions includes a `Field` attribute to return the name of the field.

For example, the following query returns all FieldPermissions records that have at least the "Read" permission. The results include the field, object, and permission set names.

```
SELECT SubjectType, Field, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE PermissionsRead = True
```

Include the field's parent object when querying FieldPermissions. For example, to find all rows that match the Account object's `Type` field, create the following query:

```
SELECT Id, SubjectType, Field
FROM FieldPermissions
WHERE Field = 'Account.Type' AND SubjectType = 'Account'
```

To find which permission sets are backed by profiles with the Account object, you can use a query similar to this:

```
SELECT Id, ParentId, SubjectType, Field, PermissionsEdit, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE SubjectType = 'Account' and Parent.IsOwnedByProfile = true
ORDER BY SubjectType, Field
```

Both `SubjectType` and `Field` must be included in the `SELECT` line of the query. You must also provide the full API name of the field in the form of `SubjectType.Field` when querying for a field.

 **Note:** When using the FieldPermission object to download records, depending on the SOQL query you use, you might not receive all expected records. Results might also appear incomplete. However, all records do download; fields that don't support field security and rows for entities not visible to the org are hidden.

Special Properties for Field Permissions

The auto-number and formula fields have special rules for how field permissions work. Both have FieldPermissions records, but inserting and updating is limited to `PermissionsRead`. `PermissionsEdit` isn't allowed for either field type, since these fields must be read-only for users.

The following field types don't return a FieldPermissions record because they are assumed to always be readable.

- `Id`
- `CreatedById`
- `CreatedDate`
- `IsDeleted`
- `LastModifiedById`
- `LastModifiedDate`
- `SystemModStamp`

The following field types don't return a FieldPermissions record because they are assumed to always be readable and writable.

- `OwnerId`
- Master-detail custom (relationship) fields
- Universally required custom fields

As a result, the following query returns no records, even though users do have some access to some of the fields.

```
SELECT Field, SubjectType, PermissionsRead
FROM FieldPermissions
WHERE Field='Id'
```

To determine if a field can return a FieldPermissions record, you can call a `describeSObject()` on the field. For example, `describeSObject('Merchandise__c')`, returns all the properties of the Merchandise custom object, including field properties. If you're using a field whose `permissionable` property is `false` (such as any of the field types listed in this section), you can't query, insert, update, or delete any field permissions records, because none exist.

Working with Custom Activity Fields

While tasks and events are considered separate objects, they share a common set of activity custom fields. As a result, when a custom task field is created, a custom event field is also created, and vice versa. You can display the custom field on the event layout, task layout, or both event and task layouts.

Although custom activity fields are shared between tasks and events, you'll see separate FieldPermissions records for the task and event. However, changes made to one field permission record are automatically made to the other. For example, if you create a custom activity field, assign field permissions to it in a permission set, and run the following query, the query will return two records with the same permission value.

```
SELECT Field, Id, ParentId, PermissionsEdit, PermissionsRead, SubjectType
FROM FieldPermissions
WHERE SubjectType = 'event' OR SubjectType = 'task'
```

If you then update one of the records with a different set of field permission values and run the query again, the same permission values for both records are returned.

Nesting Field Permissions

You can nest FieldPermissions in a PermissionSet query. For example, the following returns any permission sets where “Edit Read Only Fields” is true. Additionally, the result set will include both the “Read” and “Edit” field permission on the Merchandise object. This is done by nesting the SOQL with a field permission query using the relationship name for field permissions: FieldPerms.

```
SELECT PermissionsEditReadOnlyFields,
  (SELECT SubjectType, Field, PermissionsRead, PermissionsEdit
   FROM FieldPerms
   WHERE SubjectType = 'Merchandise__c')
 FROM PermissionSet
 WHERE PermissionsEditReadOnlyFields = true
```

As a result, it's possible to traverse the relationship between the PermissionSet and any child related objects (in this case, FieldPermissions). You can do this from the PermissionSet object by using the child relationship (ObjectPerms, FieldPerms, and so on) or from the child object by referencing the PermissionSet with `Parent.permission_set_attribute`.

It's important to consider when to use a conditional WHERE statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```
SELECT PermissionsEditReadOnlyFields,
  (SELECT SubjectType, Field, PermissionsRead, PermissionsEdit
   FROM FieldPerms
   WHERE SubjectType = 'Merchandise__c')
 FROM PermissionSet
 WHERE PermissionsEditReadOnlyFields = true
```

versus:

```
SELECT SubjectType, Field, PermissionsRead, PermissionsEdit, Parent.Name,
  Parent.PermissionsEditReadOnlyFields
 FROM FieldPermissions
 WHERE SObjectType='Merchandise__c'
```

FieldServiceMobileSettings

Represents a configuration of settings that control the Field Service Lightning iOS and Android mobile app experience. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Field Service Lightning must be enabled.

Fields

Field Name	Details
BgGeoLocationAccuracy	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Controls the accuracy of geolocation tracking of services resources while the app is running in the background. Lowering accuracy reduces battery consumption for mobile devices. Available in API version 41.0 and later. Picklist options:</p> <ol style="list-style-type: none"> 1. Medium: Accurate to within about 100 meters. The API name for this value is <code>Medium</code>. 2. Coarse: Accurate to within about 1 kilometer. The API name for this value is <code>Coarse</code>. 3. Very Coarse: Accurate to within about 3 kilometers. The API name for this value is <code>VeryCoarse</code>.
BgGeoLocationMinUpdateFreqMins	<p>Type int</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Controls the frequency of geolocation poling of services resources while the app is running in the background. Less frequent poling decreases battery consumption for mobile devices. The label in the UI is Minimum Update Frequency of Geo Location in Minutes (Background). Available in API version 41.0 and later.</p>
BrandInvertedColor	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The color of toasts and the contrast color of the floating action button.</p>

TimeIntervalSetupMins	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Controls the spacing of picklist options for time values such as when creating resource absences.</p>
UpdateScheduleTimeMins	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The number of minutes between attempts to update a user's schedule.</p>

Usage

Field Service Mobile settings allow you to create sets of settings to apply to different field service mobile users. The settings apply to both the Android and iOS versions of the app.

For example, suppose you want to accommodate workers that are color blind, or who work in particularly dark or bright conditions. You can choose different branding options for different workers to suit their needs, and assign them to their profiles.

FiscalYearSettings

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
Description	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Description of the setting.</p>
EndDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description End date of the fiscal year.</p>
IsStandardYear	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the fiscal year is a standard calendar year (<code>true</code>) or a custom fiscal year (<code>false</code>).</p>

Field	Details
Name	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description A name for the fiscal year. Limit: 80 characters.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the associated fiscal period.</p>
PeriodLabelScheme	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The numbering scheme used for fiscal periods.</p>
PeriodPrefix	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description The prefix of fiscal periods. For example, if p is the prefix, then the first period is "P1."</p>
QuarterLabelScheme	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The numbering scheme used for fiscal quarters.</p>
QuarterPrefix	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>The prefix of fiscal quarters. For example, if "Q" is the prefix, then the fourth quarter would be "Q4."</p>
StartDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Start date of the fiscal year.</p>
WeekLabelScheme	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The numbering scheme used for weeks.</p>
WeekStartDay	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The name of the day that starts the week, for example Monday or Sunday</p>
YearType	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Indicates one of two types of fiscal years, Standard or Custom. Standard denotes the standard Gregorian calendar, while Custom means a fiscal year with a custom structure.</p>

[Period](#)

[Object Basics](#)

FlexQueueItem

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the `AsyncApexJob`. This object is available in API version 36.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Description
<code>AsyncApexJobId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of an AsyncApexJob that's waiting in the flex queue.</p>
<code>FlexQueueItemId</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The primary key for this <code>FlexQueueItem</code>.</p>
<code>JobPosition</code>	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The position in the flex queue of the waiting job. The highest-priority job in the queue is at position 0.</p>
<code>JobType</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of the job. Valid values are:</p> <ul style="list-style-type: none">• <code>ApexToken</code>

Field Name	Description
	<ul style="list-style-type: none"> • BatchApex • BatchApexWorker • Future • Queueable • ScheduledApex • SharingRecalculation • TestRequest • TestWorker
	Currently, queries are supported only on BatchApex jobs.

Usage

To find the position of an AsyncApexJob in the flex queue, query `JobPosition`. For example:

```
SELECT JobPosition FROM FlexQueueItem WHERE JobType = 'BatchApex' AND AsyncApexJobId = '707xx000000DABC'
```

To find the job at a given position, query `AsyncApexJobId`. For example:

```
SELECT AsyncApexJobId FROM FlexQueueItem WHERE JobType = 'BatchApex' AND JobPosition = '2'
```

To find all batch jobs in the flex queue, query `JobType`. To get other information about the jobs, include `AsyncApexJob` in your query. For example:

```
SELECT JobType, JobPosition, AsyncApexJob.ApexClass.Name, AsyncApexJob.CreatedDate, AsyncApexJob.CreatedBy FROM FlexQueueItem WHERE JobType='BatchApex' AND AsyncApexJob.ApexClass.Name LIKE '%BatchAJob%' ORDER BY JobPosition DESC
```

FlowInterview

Represents a flow interview. A *flow interview* is a running instance of a flow.

Supported Calls

`delete()`, `describeLayout()`, `describeSObject()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

To delete a flow interview, you must have the “Manage Flow” user permission. All other calls require the “Run Flows” user permission or the `Flow User` field enabled on the user detail page.

Fields

Field Name	Details
CurrentElement	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The flow element at which the interview is currently paused or waiting.</p>
Guid	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Globally unique identifier for the interview.</p>
InterviewLabel	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Label for the interview. This label helps users and administrators differentiate interviews from the same flow.</p> <p>In the user interface, this label appears in the Paused Flow Interviews component on the user's Home tab and in the Paused and Waiting Interviews list on the flow management page.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name for the interview.</p>
OwnerId	<p>Type ID</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the user who owns the interview. Only this user or an admin can resume the interview.</p>

Field Name	Details
PauseLabel	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Information about why the interview was paused. This string is entered by the user who paused the flow interview. The label is Why Paused</p>

FlowInterviewOwnerSharingRule

Represents the rules for sharing a FlowInterview with users other than the owner. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit—In API version 42.0 and later, when Let users resume shared flow interviews is enabled for your org, users can resume all flow interviews that they have edit access to.
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters.</p>

Field	Details
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group that's given access.</p>

Usage

Use this object to manage the sharing rules for FlowInterview records. General sharing uses this object.

In API version 42.0 and later, when **Let users resume shared flow interviews** is enabled for your org, users can resume all flow interviews that they have edit access to. When that setting is disabled, only the owner or a flow admin can resume a flow interview. To disable this setting, go to your org's Process Automation Settings in Setup.

FlowInterviewShare

Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to the FlowInterview. The possible values are:</p> <ul style="list-style-type: none"> • <code>Read</code> • <code>Edit</code>—In API version 42.0 and later, when Let users resume shared flow interviews is enabled for your org, users can resume all flow interviews that they have edit access to. • <code>All</code>—This value is not valid for creating or deleting records.
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the FlowInterview associated with this sharing entry.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p>

Field	Details
	<p>Description</p> <p>Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to <code>Manual</code> (default).</p> <p>Valid values include:</p> <ul style="list-style-type: none"> <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the FlowInterview with them. <code>Owner</code>—The User is the owner of the FlowInterview. <code>Rule</code>—The User or Group has access via a FlowInterview sharing rule.
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the User or Group that has been given access to the FlowInterview. This field can't be updated.</p>

Usage

This object lets you determine which users and groups can view and edit flow interviews that are owned by other users.

In API version 42.0 and later, when **Let users resume shared flow interviews** is enabled for your org, users can resume all flow interviews that they have edit access to. When that setting is disabled, only the owner or a flow admin can resume a flow interview. To disable this setting, go to your org's Process Automation Settings in Setup.

FlowRecordRelation

Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the `$Flow.CurrentRecord` system variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
Name	<p>Type</p> <p>string</p>

Field Name	Details
	<p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The auto-generated ID of this relation.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The flow interview that the record is related to.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The record that the flow interview is related to. Make sure that this field contains only one ID, and that the ID is for a valid object. Custom objects and most standard objects are supported. To confirm whether an object is supported, see the Reference To property for this field in Workbench.</p>

Folder

Represents a repository for a Document, EmailTemplate, Report, or Dashboard. Only one type of item can be contained in a folder.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- You must have the “Modify All Data” permission to create, update, or delete document folders and email template folders.
- Customer Portal users can’t access this object.
- To query this object, no special permissions are needed.
- As of API version 35.0, when a folder is shared with a role, it is only visible to users in that role. Superior roles in the role hierarchy don’t gain visibility.
- If analytics folder sharing is turned on, then users need these permissions to create and manage report folders and dashboard folders:
 - “Create Dashboard Folders”

- "Create Report Folders"

Fields

Field	Details
AccessType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Required. Indicates who can access the Folder. Available values include:</p> <ul style="list-style-type: none"> • <code>Hidden</code>—Folder is hidden from everyone. • <code>Public</code>—Folder is accessible by all users. • <code>Shared</code>—Folder is accessible only by a User in a particular Group or UserRole. The API doesn't allow you to view, insert, or update which group or Role the Folder is shared with. <p> Note: If analytics folder sharing is turned on for your organization, then this field is present but not used.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is Folder Unique Name.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
IsReadOnly	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether this Folder is read-only (<code>true</code>) or editable (<code>false</code>). Label is <i>Read Only</i>.</p>

Field	Details
	 Note: If analytics folder sharing is turned on for your organization, then this field is present but not used.
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the folder as it appears in the user interface. Label is Document Folder Label.</p>
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects. <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Required. Type of objects contained in the Folder. This field can't be updated. Available values include:</p> <ul style="list-style-type: none"> • Dashboard • Document • Email template • Report

Usage

Only one type of item can be contained in a folder, either Document, EmailTemplate, Report, or Dashboard.

[Object Basics](#)

FolderedContentDocument

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
<code>ContentDocumentId</code>	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the ContentDocument that can be in a folder.</p>
<code>ContentSize</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File size of the ContentDocument.</p>
<code>FileExtension</code>	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description File extension of the ContentDocument.</p>
<code>FileType</code>	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description File type of the ContentDocument.</p>
IsFolder	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates that the FolderedContentDocument is a folder, rather than a file.</p>
ParentContentFolderId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the ContentFolder the ContentDocument resides in.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Name of the file or folder in a ContentFolder.</p>

ForecastingAdjustment

This object represents an individual sales manager's adjustment for a subordinate's forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users' adjustments of their *own* forecasts.

 **Note:** This information only applies to Collaborative Forecasts.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`,
`retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AdjustedAmount	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The revenue amount of an individual forecast item, after an adjustment.</p>
AdjustedQuantity	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The quantity amount of an individual forecast item, after an adjustment. This field is available in API version 28 and later.</p>
AdjustmentNote	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A text note providing information about the adjustment. The maximum length is 140 characters. This field does not appear in reports.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The currency code of the adjustment. If omitted, the default is the importing user's personal currency.</p>
ForecastCategoryName	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The category within the sales cycle that an opportunity is assigned to based on its opportunity stage. The standard forecast categories are Pipeline, Best Case,</p>

Field Name	Details
	<p>Commit, Omitted, and Closed. You can customize forecast category names. The forecast categories display information for that specific category; for example, Best Case only reflects amounts in the Best Case category.</p>
ForecastingItemCategory	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description This field indicates which type of forecast rollup the manager adjustment belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the <code>ForecastingItemCategory</code> field.</p> <p>Individual forecast category rollups:</p> <ul style="list-style-type: none"> • PipelineOnly - Rollup from Pipeline opportunities only. • BestCaseOnly - Rollup from Best Case opportunities only. Adjustable. • CommitOnly - Rollup from Commit opportunities only. Adjustable. <p>Cumulative forecast rollups:</p> <ul style="list-style-type: none"> • OpenPipeline - Rollup from Pipeline + Best Case + Commit opportunities. • BestCaseForecast - Rollup from Best Case + Commit + Closed opportunities. Adjustable. • CommitForecast - Rollup from Commit + Closed opportunities. Adjustable. <p>Either cumulative or individual forecast category rollups:</p> <ul style="list-style-type: none"> • ClosedOnly - Rollup from Closed opportunities only. <p>The <code>ForecastingItemCategory</code> field differs from the <code>ForecastCategoryName</code> field.</p> <ul style="list-style-type: none"> • The <code>ForecastCategoryName</code> field represents the forecast category of the <i>underlying opportunities</i> rolling up to forecast amounts. In organizations using cumulative forecast rollups, the <code>ForecastCategoryName</code> field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories. • The new <code>ForecastingItemCategory</code> field represents the <i>type of rollup</i> a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories. <p>When inserting manager adjustments, the values you insert for <code>ForecastCategoryName</code> and <code>ForecastingItemCategory</code> must be compatible with each other. In organizations using cumulative forecast rollups, the <code>ForecastCategoryName</code> is nillable. These are the valid pairs.</p>

Field Name

Details

Individual forecast category rollups:

- ForecastCategoryName: BestCase, ForecastingItemCategory: BestCaseOnly
- ForecastCategoryName: Commit, ForecastingItemCategory: CommitOnly

Cumulative forecast category rollups:

- ForecastCategoryName:null, ForecastingItemCategory: BestCaseForecast
- ForecastCategoryName:null, ForecastingItemCategory: CommitForecast

ForecastingTypeId

Type

reference

Properties

Create, Filter, Group, Sort

Description

The ID of the related ForecastingType.

ForecastingItemId

Type

reference

Properties

Filter, Group, Sort

Description

The ID of the related ForecastingItem.

IsAmount

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

True indicates that the adjustment is made in a revenue amount. If false, then `IsQuantity` must be true. This field is available in API version 28 and later.

IsQuantity

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

True indicates that the adjustment is made in a quantity amount. If false, then `IsAmount` must be true. This field is available in API version 28 and later.

Field Name	Details
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description The ID of the forecast owner.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Period ID for the adjustment. Read only.</p>
ProductFamily	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The Product Family for the adjustment. Read only. This field is available in API version 29 and later.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The start of the adjustment, expressed as month and year. The date can include any day in a given month. Stored using the first date of the month.</p>

Usage

Use this object to obtain a manager's adjustment detail for a specified ForecastingItem. The ForecastingAdjustment object itself is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write ForecastingAdjustment records.

Note: Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The ForecastingQuota, ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingItem, and ForecastingFact objects can all have records with different ForecastingTypeId values. Use the ForecastingType

object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

SEE ALSO:

[ForecastingFact](#)

[ForecastingItem](#)

[ForecastingQuota](#)

ForecastingDisplayedFamily

Represents the table in Forecasts Settings where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>DisplayPosition</code>	<p>Type int</p> <p>Properties Filter, Group, idLookup, Nillable, Sort</p> <p>Description The order in which product families are displayed on the forecasts page. Each value is unique to a product family.</p>
<code>ProductFamily</code>	<p>Type picklist</p> <p>Properties Filter, Group, Sort</p> <p>Description The product family available to forecast on. Each product family is unique.</p>

ForecastingFact

This is a read-only object linking a `ForecastingItem` with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

 **Note:** This information only applies to Collaborative Forecasts.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ForecastCategoryName	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A forecast category is the category within the sales cycle to which an opportunity is assigned based on its opportunity stage. The standard forecast categories are Pipeline, Best Case, Commit, Omitted, and Closed. You can customize the forecast category names.</p>
ForecastedObjectId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Contains the Split ID of the forecasted OpportunitySplit object if the forecast data source is opportunity splits or the OpportunityLineItem ID of the forecasted opportunity if the data source is product families. If the data source is product families and the opportunity has no line item, this field is Null. If the forecast data source is opportunities, this field is Null. This field is available in API version 29 and later. Read only.</p>
ForecastingItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the ForecastingItem.</p>
ForecastingTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the related ForecastingType.</p>

Field Name	Details
OpportunityId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The opportunity ID.</p>
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the opportunity owner.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Period ID for the forecast.</p>

Usage

Use this object to get information about opportunities linked to forecasting items.

Note: Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

[ForecastingAdjustment](#)

[ForecastingItem](#)

[ForecastingQuota](#)

ForecastingItem

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

Additionally, note that users:

- with the “View All Forecasts” permission have access to all ForecastingItem fields.
- without the “View All Forecasts” permission have access to all fields for their own subordinates.

Other users can see the ForecastingItem object, but not its records.

 **Note:** This information only applies to Collaborative Forecasts.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>AmountWithoutAdjustments</code>	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The sum of a person’s owned revenue opportunities and the person’s subordinates’ opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. This amount is visible only on reports.</p>
<code>AmountWithoutManagerAdjustment</code>	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The forecast number as seen by the forecast owner. This is the sum of the owner’s revenue opportunities and the owner’s subordinates’ opportunities, including adjustments made by the forecast owner on the owner’s or subordinates’ forecasts. It doesn’t include adjustments made by forecast managers above the owner in the forecast hierarchy.</p>

Field Name	Details
AmountWithoutOwnerAdjustment	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The forecast amount as seen by the forecast owner without the owner's adjustment. This is the sum of the subordinate's opportunities, including adjustments made by their manager or by the subordinate themselves, plus the rollup of the owner's own opportunities. <i>It doesn't include adjustments made by the forecast owner.</i></p>
ForecastAmount	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.</p>
ForecastCategoryName	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description A forecast category is the category within the sales cycle to which an opportunity is assigned based on its opportunity stage. The standard forecast categories are Pipeline, Best Case, Commit, Omitted, and Closed. You can customize the forecast category names.</p>
ForecastQuantity	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments. This field is available in API version 28 and later.</p>
ForecastingItemCategory	<p>Type picklist</p>

Field Name

Details

Properties

Filter, Group, Sort

Description

This field indicates which type of forecast rollup the forecasting item belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the `ForecastingItemCategory` field.

Individual forecast category rollups:

- PipelineOnly - Rollup from Pipeline opportunities only.
- BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.
- CommitOnly - Rollup from Commit opportunities only. Adjustable.

Cumulative forecast rollups:

- OpenPipeline - Rollup from Pipeline + Best Case + Commit opportunities.
- BestCaseForecast - Rollup from Best Case + Commit + Closed opportunities. Adjustable.
- CommitForecast - Rollup from Commit + Closed opportunities. Adjustable.

Either cumulative or individual forecast category rollups:

- ClosedOnly - Rollup from Closed opportunities only.

The `ForecastingItemCategory` field differs from the `ForecastCategoryName` field.

- The `ForecastCategoryName` field represents the forecast category of the *underlying opportunities* rolling up to forecast amounts. In organizations using cumulative forecast rollups, the `ForecastCategoryName` field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.
- The new `ForecastingItemCategory` field represents the *type of rollup* a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.

ForecastingTypeId

Type

reference

Properties

Filter, Group, Sort

Description

The ID of the related ForecastingType.

HasAdjustment

Type

boolean

Field Name	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description A flag that indicates if the forecasting item includes a <i>manager</i> adjustment. This flag is true only when the item includes an adjustment and the user performing the query has read access to the adjustment.</p>
HasOwnerAdjustment	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description A flag that indicates if the forecasting item includes an <i>owner</i> adjustment. This flag is true only when the item includes an adjustment and the user performing the query has read access to the adjustment. Available in API versions 33 and greater.</p>
IsAmount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description True indicates that the adjustment is made in a revenue amount. If false, then <code>IsQuantity</code> must be true. This field is available in API version 28 and later.</p>
IsQuantity	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description True indicates that the adjustment is made in a quantity amount. If false, then <code>IsAmount</code> must be true. This field is available in API version 28 and later.</p>
IsUpToDate	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description A flag indicating whether or not a specific forecasting item reflects current information. For example, if users are making adjustments which are in process, the item won't be up-to-date.</p>

Field Name	Details
OwnerId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the forecast owner.</p>

OwnerOnlyQuantity	<p>Type double</p> <p>Properties Filter, Sort, Nillable</p> <p>Description The sum of a person's quantity opportunities, without adjustments. This field is available in API version 28 and later.</p>
ParentForecastingItemId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the ForecastingItem that the current item rolls up to.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Period ID for the forecast.</p>
ProductFamily	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The product family of the forecast item. This field is available in API version 29 and later. Read only.</p>
QuantityWithoutAdjustments	<p>Type</p> <p>double</p> <p>Properties</p> <p>Filter, Sort, Nillable</p> <p>Description</p> <p>The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. This field is available in API version 28 and later.</p>
QuantityWithoutManagerAdjustment	<p>Type</p> <p>double</p> <p>Properties</p> <p>Filter, Sort, Nillable</p> <p>Description</p> <p>The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and subordinates' opportunities, including adjustments made on the subordinates' forecasts. It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy. This field is available in API version 28 and later.</p>
QuantityWithoutOwnerAdjustment	<p>Type</p> <p>double</p> <p>Properties</p> <p>Filter, Sort, Nillable</p> <p>Description</p> <p>The forecast quantity as seen by the forecast owner without the owner's adjustment. This is the sum of the subordinate's opportunities, including adjustments made by their manager or by the subordinate themselves, plus the rollup of the owner's own opportunities. <i>It doesn't include adjustments made by the forecast owner.</i> This field is available in API version 38.0 and later.</p>

Usage

Use this object to obtain individual forecast amounts, either with or without adjustments, based on a user's perspective and forecast role. The ForecastingItem object is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write ForecastingAdjustment records.

 **Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

[ForecastingFact](#)

[ForecastingQuota](#)

ForecastingOwnerAdjustment

This object represents an individual forecast user's adjustment of their *own* forecast via a `ForecastingItem`. Available in API versions 33 and greater. This object is separate from the `ForecastingAdjustment` object, which represents managers' adjustments of *subordinates'* forecasts.

 **Note:** This information only applies to Collaborative Forecasts.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>CurrencyIsoCode</code>	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The currency code of the adjustment. If omitted, the default is the importing user's personal currency.</p>
<code>ForecastCategoryName</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The category within the sales cycle that an opportunity is assigned to based on its opportunity stage. The standard forecast categories are Pipeline, Best Case,</p>

Field Name**Details**

Commit, Omitted, and Closed. You can customize forecast category names. The forecast categories display information for that specific category; for example, Best Case only reflects amounts in the Best Case category.

ForecastingItemCategory

Type

picklist

Properties

Create, Filter, Group, Sort

Description

This field indicates which type of forecast rollup the owner adjustment belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the `ForecastingItemCategory` field.

Individual forecast category rollups:

- PipelineOnly - Rollup from Pipeline opportunities only.
- BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.
- CommitOnly - Rollup from Commit opportunities only. Adjustable.

Cumulative forecast rollups:

- OpenPipeline - Rollup from Pipeline + Best Case + Commit opportunities.
- BestCaseForecast - Rollup from Best Case + Commit + Closed opportunities. Adjustable.
- CommitForecast - Rollup from Commit + Closed opportunities. Adjustable.

Either cumulative or individual forecast category rollups:

- ClosedOnly - Rollup from Closed opportunities only.

The `ForecastingItemCategory` field differs from the `ForecastCategoryName` field.

- The `ForecastCategoryName` field represents the forecast category of the *underlying opportunities* rolling up to forecast amounts. In organizations using cumulative forecast rollups, the `ForecastCategoryName` field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.
- The new `ForecastingItemCategory` field represents the *type of rollup* a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.

When inserting owner adjustments, the values you insert for `ForecastCategoryName` and `ForecastingItemCategory` must be compatible with each other. In organizations using cumulative forecast rollups, the `ForecastCategoryName` is nillable. These are the valid pairs.

Field Name

Details

Individual forecast category rollups:

- ForecastCategoryName: BestCase, ForecastingItemCategory: BestCaseOnly
- ForecastCategoryName: Commit, ForecastingItemCategory: CommitOnly

Cumulative forecast category rollups:

- ForecastCategoryName:null, ForecastingItemCategory: BestCaseForecast
- ForecastCategoryName:null, ForecastingItemCategory: CommitForecast

ForecastingItemId

Type

reference

Properties

Filter, Group, Sort

Description

The ID of the related ForecastingItem.

ForecastingTypeId

Type

reference

Properties

Create, Filter, Group, Nillable, Sort

Description

The ID of the related ForecastingType.

ForecastOwnerId

Type

reference

Properties

Create, Filter, Group, Nillable, Sort

Description

The ID of the forecast owner.

IsAmount

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

True indicates that the adjustment is made in a revenue amount. If false, then IsQuantity must be true.

Field Name	Details
IsQuantity	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description True indicates that the adjustment is made in a quantity amount. If false, then IsAmount must be true.</p>
OwnerAdjustedAmount	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The revenue amount of an individual forecast item, after an adjustment.</p>
OwnerAdjustedQuantity	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The quantity amount of an individual forecast item, after an adjustment.</p>
OwnerAdjustmentNote	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A text note providing information about the adjustment. The maximum length is 140 characters. This field does not appear in reports.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Period ID for the adjustment. Read only.</p>
ProductFamily	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The Product Family for the adjustment. Read only.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The start of the adjustment, expressed as month and year. The date can include any day in a given month. Stored using the first date of the month.</p>

Usage

Use this object to obtain a user's adjustment detail for a specified `ForecastingItem` in their own forecast.

Note: Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

ForecastingQuota

This object represents an individual user's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast role hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates who report to them in the forecast hierarchy.

Note: This information only applies to Collaborative Forecasts.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The currency code of the quota. If omitted, the default is the importing user's personal currency.</p>
ForecastingTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the related ForecastingType.</p>
IsAmount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description True indicates that the adjustment is made in a revenue amount. If false, then <code>IsQuantity</code> must be true. This field is available in API version 28 and later.</p>
IsQuantity	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description True indicates that the adjustment is made in a quantity amount. If false, then <code>IsAmount</code> must be true. This field is available in API version 28 and later.</p>
PeriodId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Period ID for the quota. Read only.</p>

Field Name	Details
ProductFamily	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The product family for the quota. This field is available in API version 29 and later.</p>
QuotaAmount	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The revenue quota amount for an individual user and for a specific period.</p>
QuotaOwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID that identifies the quota owner.</p>
QuotaQuantity	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The quantity quota amount for an individual user and for a specific period. This field is available in API version 28 and later.</p>
StartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The start of the quota, expressed as month and year. The date can include any day in a given month. Stored using the first date of the month.</p>

Usage

Use this object to get an individual user's quota for a specified time period.

 **Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

[ForecastingItem](#)

ForecastingType

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

 **Note:** This information only applies to Collaborative Forecasts.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>DeveloperName</code>	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The name of the forecasting type. Allowed values include:</p> <ul style="list-style-type: none"> • <code>OpportunityRevenue</code> : Opportunities - Revenue • <code>OpportunityQuantity</code> : Opportunities - Quantity • <code>OpportunitySplitRevenue</code> : Opportunity Revenue Splits - Revenue • <code>OpportunityOverlayRevenue</code> : Opportunity Overlay Splits - Revenue • <code>OpportunityLineItemRevenue</code> : Product Families - Revenue • <code>OpportunityLineItemQuantity</code> : Product Families - Quantity • The name of a custom opportunity split type that has been enabled as a forecast type. Custom split types are based on currency fields, which can contain revenue amounts only.

Field Name	Details
	The DeveloperName is called name in the Metadata API and Forecasting Type in custom reports.
HasProductFamily	<p>Type boolean</p> <p>Properties Defaulted on create, Group</p> <p>Description Indicates whether a forecasts view includes product families. Available in API version 40.0 and later.</p>
IsActive	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the forecasting type is enabled.</p>
IsAmount	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the forecasting type is based on the revenue measurement.</p>
IsQuantity	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the forecasting type is based on the quantity measurement.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language of the forecasting type.</p>
MasterLabel	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description Master label for this Forecasting Type value. This display value is the internal label that does not get translated.</p>
OpportunitySplitTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the forecasting type has a split type, and if so, the name the split type. Available in API version 41.0 and later.</p>
RoleType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Indicates whether the role type has a forecasting type, and if so, which forecasting type. Possible values are \mathbb{R} (user role-based forecasting type), \mathbb{T} (Territory1-based forecasting type; not used), and \mathbb{Y} (Territory2-based forecasting type). Available in API version 41.0 and later.</p>
Territory2ModelId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Indicates whether the forecasting type has a Territory2 model, and if so, the name of the Territory2 model. Available in API version 41.0 and later.</p>

Usage

Use this object to identify the forecast type of `ForecastingAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects.

ForecastingUserPreference

Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

 **Note:** This information applies to Collaborative Forecasts and not to Customizable Forecasts.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>ExternalId</code>	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description A unique system-generated numerical identifier for the user.</p>
<code>ForecastingDisplayedTypeId</code>	<p>Type reference</p> <p>Properties Create, Group, Sort, Update</p> <p>Description An identifier for the forecasting type that's displayed.</p>
<code>ForecastingPeriodDuration</code>	<p>Type int</p> <p>Properties Create, Group, Nillable, Sort, Update</p> <p>Description How long the forecasting period lasts.</p>
<code>ForecastingPeriodType</code>	<p>Type picklist</p> <p>Properties Create, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The forecasting period's type. Valid values include: Month, Quarter, Week, or Year</p>
<code>ForecastingStartPeriod</code>	<p>Type int</p> <p>Properties Create, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The date when the forecasting period begins.</p>
ForecastingViewCurrency	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The currency shown on the forecasts page.</p>
IsForecastingHideZeroRows	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Group, Sort, Update</p> <p>Description</p> <p>Whether the forecasts page shows zero-value rows.</p>
IsForecastingShowQuantity	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Group, Sort, Update</p> <p>Description</p> <p>Whether the forecasts page shows forecast quantity.</p>
IsHideForecastingGuidedTour	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Group, Sort, Update</p> <p>Description</p> <p>Whether the forecasts page shows the guided tour.</p>
IsHideForecastingQuotaColumn	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Group, Sort, Update</p> <p>Description</p> <p>Whether the forecasts page shows a quota column.</p>
IsShowForecastingQuotaAttainment	<p>Type</p> <p>boolean</p>

Field Name	Details
	<p>Properties Create, Defaulted on create, Group, Sort, Update</p> <p>Description Whether the forecasts page shows quota attainment information (Salesforce Classic only).</p>

ForecastShare

Represents the sharing of a customizable forecast at a given role and territory.

Note: This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
<code>AccessLevel</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description A value (<code>Read</code>, <code>Edit</code>, or <code>All</code>) that represents the type of sharing being allowed.</p>
<code>CanSubmit</code>	<p>Type boolean</p> <p>Properties Filter, Group, Sort</p> <p>Description Indicates whether the user or group can submit forecasts (<code>True</code>) or not (<code>False</code>).</p>

Field	Details
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a User has manually shared the forecast with them. • <code>Owner</code>—The User is the owner of the forecast.
UserOrGroupId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID representing the User or Group being granted access.</p>
UserRoleId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the UserRole associated with this object.</p>

Usage

This object allows you to determine which users and groups can view or submit forecasts owned by other users.

Goal

The Goal object represents the components of a goal such as its name, description, and status.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
CompletionDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The completion date of the goal.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The description of the goal. The maximum length is 65,535 characters.</p>
DueDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date the goal is due.</p>
ImageUrl	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL for the goal image. The image must be stored in Documents and set as externally available. Applicable only to Goal objects of <code>Type: Goal</code>.</p>
IsKeyCompanyGoal	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the goal is a key company goal.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p>

Field Name	Details
	Description The timestamp that indicates when a user last viewed a record that is related to this goal.
LastViewedDate	Type dateTime Properties Filter, Nillable, Sort Description The timestamp that indicates when a user last viewed this goal. If this value is null, this record might have been only referenced (<code>LastReferencedDate</code>) and not viewed.
Name	Type string Properties Create, Filter, Group, Sort, Update Description The name of the goal. The maximum length is 255 characters.
OwnerId	Type reference Properties Create, Defaulted on create, Filter, Group, Sort, Update Description ID of the user who owns the goal.
Progress	Type percent Properties Filter, Nillable, Sort Description The progress of the goal measured as a percentage.
StartDate	Type date Properties Create, Filter, Group, Nillable, Sort, Update Description The start date of the goal.

Field Name	Details
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The status of the goal. Possible values:</p> <ul style="list-style-type: none"> • Draft • Published • Completed • Canceled • Not Completed

GoalFeed

Represents a single feed item in the feed displayed for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the FeedItem. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p>

Field Name	Details
	<p>Description The numbers of FeedComments associated with this feed item.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The file uploaded to the feed. Required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Available in API version 36.0 and earlier only. Group, Nillable, Sort</p> <p>Description Read only. Automatically determined during insert. The size of the file (in bytes) uploaded to the feed.</p>
ContentType	<p>Type string</p> <p>Properties Available in API version 36.0 and earlier only. Group, Nillable, Sort</p>

Field Name	Details
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a LinkPost.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the goal record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost. For example, set this field to an existing ContentVersion and post it to a feed as a FeedItem object of TypeContentPost.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the FeedItem. When the <code>Type</code> is LinkPost, the LinkUrl is the URL and this field is the link name.</p>
Type	<p>Type picklist</p>

Field Name

Details

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

The type of feed item. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create feed item types directly from the API.

- `ActivityEvent`—indirectly generated event when a user or the API adds a `Task` associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a `Task` or `Event` associated with a case record (excluding email and call logging).

For a recurring `Task` with `CaseFeed` disabled, one event is generated for the series only. For a recurring `Task` with `CaseFeed` enabled, events are generated for the series and each occurrence.

- `AdvancedTextPost`—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

Field Name	Details
	<p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to CaseFeed:</p> <ul style="list-style-type: none"> <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case. <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object. <code>ChangeStatusPost</code>—generated event when a user changes the status of a case. <code>ChatTranscriptPost</code>—generated event when Live Agent transcript is saved to a case. <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received. <code>FacebookPost</code>—generated when a Facebook post is created from a case. Deprecated. <code>MilestoneEvent</code>—generated when a case milestone is completed or reaches violation status. <code>SocialPost</code>—generated when a social post is created from a case.

GoalHistory

This read-only object contains historical information about changes that have been made to the Goal object.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
<code>Field</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
<code>GoalId</code>	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description ID of the goal.</p>
newValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
oldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

GoalLink

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description The auto-generated name of the goal link.</p>

Field Name	Details
ParentGoalId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the parent goal.</p>
SubgoalId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The ID of the subgoal.</p>

GoalShare

Represents a sharing entry on a Goal object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field Name	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The user's or group's level of access to the goal. The possible values are:</p> <ul style="list-style-type: none"> • Read Only • Read/Write • Owner <p>This field must be set to an access level that is higher than the organization's default access level for goals.</p>

Field Name	Details
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the goal that is associated with this sharing entry.</p>
RowCause	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Valid values include:</p> <ul style="list-style-type: none"> • Owner: User is the owner of the Goal or is in a user role above the Goal owner in the role hierarchy. • Manual: User or group has access because a user with "All" access manually shared the Goal with the user or group. • Rule: User or group has access via a Goal sharing rule.
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group that was given access to the Goal. This field can't be updated.</p>

GoogleDoc

Represents a link to a Google Document. This object is available in API version 14.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available in **All** Editions except **Database.com** for Google Apps Premier Edition accounts. See the Salesforce online help for more information.

Fields

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the Google document.</p>
Owner	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Nillable, Update</p> <p>Description The ID of the user who currently owns this Google Document. Default value is the user logged in to the API to perform the create.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description Required. ID of the attachment's parent object. The following objects are supported as parents of Google documents: Account, Asset, Campaign, Case, Contact, Contract, Custom Objects, Lead, Opportunity, Product2, and Solution.</p>
Url	<p>Type string</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description The URL of the Google document.</p>

Group

A set of User records.

Groups are sets of users. They can contain individual users, other groups, the users in a particular role or territory, or the users in a particular role or territory plus all the users below that role or territory in the hierarchy.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `search()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
<code>DefaultDivision</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description This record's default division. Only applicable if divisions are enabled for your organization.</p>
<code>DeveloperName</code>	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Group Name in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
<code>DoesIncludeBosses</code>	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>Indicates whether the managers have access (<code>true</code>) or do not have access (<code>false</code>) to records shared with members of the group. This field is only available for public groups. This field is available in API version 18.0 and later.</p>
DoesSendEmailToMembers	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Indicates whether the email is sent (<code>true</code>) or not sent (<code>false</code>) to the group members. The email is sent to queue members as well.</p>
Email	<p>Type</p> <p>email</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Email address for a group of type Case. Applies only for a case queue.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Required. Name of the group. Corresponds to Label on the user interface.</p>
OwnerId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>ID of the user who owns the group.</p>
QueueRoutingConfig	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Delete, Query, Retrieve, Update</p> <p>Description</p> <p>The ID of the queue routing configuration associated with the queue.</p>

Field	Details
RelatedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Represents the ID of the associated groups. For groups of type "Role," the ID of the associated UserRole. The RelatedId field is polymorphic.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description Required. Type of the group. One of the following values:</p> <ul style="list-style-type: none"> • Regular—Standard public group. When you create () a group, its type must be Regular, unless a partner portal is enabled for the organization, in which case the type can be Regular or PRMOrganization. • Role—Public group that includes all the User records in a particular UserRole. • RoleAndSubordinates—Public group that includes all the User records in a particular UserRole and all the User records in any subordinate UserRole. • Organization—Public group that includes all the User records in the organization. This group is read-only. • Case—Public group of users, members of a queue that can own a Case. • Lead—Public group of users, members of a queue that can own a Lead. • Manager—Public group that includes a user's direct and indirect managers. This group is read-only. • ManagerAndSubordinatesInternal—Public group that includes a user and the user's direct and indirect reports. This group is read-only. • PRMOrganization—Public group that includes all the partners in an organization that has the partner portal feature enabled. • Queue—Public group that includes all the User records that are members of a queue. • Territory—Public group that includes all the User records in an organization that has the territory feature enabled. • TerritoryAndSubordinates—Public group that includes all the User records in a particular UserRole and all the User records in any subordinateUserRole in an organization that has the territory feature enabled. • ChannelProgramGroup—Public group for partners in a channel program. • CollaborationGroup—Chatter group. <p>Only Regular, Case, and Lead can be used when creating a group. The other values are reserved.</p>

Usage

Unlike users, this object can be deleted. Any User can access this object—no special permissions are needed.

Only public groups are accessible via the API. Personal groups are not available.

In API version 34.0 and later, you can query a group using `Related.Name` to retrieve the group's name. `Related.Name` is supported for public groups, user roles, territories, manager groups, and user names.

In API version 13.0 and later, if you delete a public group, it is deleted even if it has been used in sharing, consistent with the behavior for `UserRole`. In versions before 13.0, such sharing prevents the record from being deleted.

[GroupMember](#)

[Object Basics](#)

GroupMember

Represents a User or Group that is a member of a public group.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users cannot access this object.

Fields

Field	Details
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the Group.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description Required. ID of the User or Group that is a direct member of the group.</p>

Usage

A record exists for every User or Group who is a direct member of a public group whose `Type` field is set to Regular. User records that are indirect members of Regular public groups are not listed as group members. A User can be an indirect member of a group if he or she is in a UserRole above the direct group member in the hierarchy, or if he or she is a member of a group that is included as a subgroup in that group.

If you attempt to create a record that matches an existing record, system simply returns the existing record.

SEE ALSO:

[Object Basics](#)

HashtagDefinition

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

 **Important:** Starting in Spring '16, API access to HashtagDefinition is disabled across all API versions. Any integrations relying on API queries to this object stop working. You can continue to use hashtags in posts and comments, and the hashtags continue to create corresponding topics. We recommend that you redirect all API queries and reports using the HashtagDefinition object to use the Topic object instead. For more information, see [Retiring the Legacy HashtagDefinition Object—FAQs](#).

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
HashtagCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of times a hashtag topic is used.</p>
Name	<p>Type string</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The string of characters following the hashtag (#) in a hashtag topic.</p>
NameNorm	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The string of characters following the hashtag (#) in a hashtag topic, normalized to remove capitalization and punctuation.</p>
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Identifier of the community to which the HashtagDefinition belongs. This field is available only if Salesforce Communities is enabled in your organization.</p>

Usage

Use this object to identify public hashtag topics and see how often they're used.

SEE ALSO:

[Topic](#)

Holiday

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

All users, even those without the "View Setup and Configuration" user permission, can view holidays via the API.

Fields

Field	Details
ActivityDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description If the Holiday <code>IsAllDay</code> flag is set to <code>true</code> (indicating that it is an all-day holiday), then the holiday due date information is contained in the <code>ActivityDate</code> field. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. The timestamp is not relevant, and you should not attempt to alter it to account for any time zone differences.</p>
Description	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Text description of the holiday.</p>
EndTimeInMinutes	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The end time of the holiday in minutes.</p>
IsAllDay	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the duration of the holiday is all day (<code>true</code>) or not (<code>false</code>).</p>
IsRecurrence	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the holiday is scheduled to repeat itself (<code>true</code>) or only occurs once (<code>false</code>). This is a read only field on update, but not on create. If this field value is <code>true</code>, then any recurrence fields associated with the given recurrence type must be populated.</p>

Field	Details
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the holiday.</p>
RecurrenceDayOfMonth	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The day of the month on which the holiday repeats.</p>
RecurrenceDayOfWeekMask	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The day or days of the week on which the holiday repeats. This field contains a bitmask. For each day of the week, the values are as follows:</p> <ul style="list-style-type: none"> • Sunday = 1 • Monday = 2 • Tuesday = 4 • Wednesday = 8 • Thursday = 16 • Friday = 32 • Saturday = 64 <p>Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.</p>
RecurrenceEndDateOnly	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The last date on which the holiday repeats. For multiday recurring events, this is the day on which the last occurrence starts.</p>
RecurrenceInstance	<p>Type picklist</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The frequency of the recurring holiday. For example, 2nd or 3rd.</p>
RecurrenceInterval	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The interval between recurring holidays.</p>
RecurrenceMonthOfYear	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The month of the year on which the event repeats.</p>
RecurrenceStartDate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The date when the recurring holiday begins. Must be a date and time before <code>RecurrenceEndDateOnly</code>.</p>
RecurrenceType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates how often the holiday repeats. For example, daily, weekly, or every Nth month (where "Nth" is defined in <code>RecurrenceInstance</code>).</p>
StartTimeInMinutes	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The start time of the holiday in minutes.</p>

Usage

Use this object to view and update holidays, which specify dates and times at which associated business hours and escalation rules are suspended.

Idea

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

 **Note:** For other standard objects, the `describeLayout()` call returns the `recordTypeMappings` section that contains the layout ID and picklist values for each record type. However, the `recordTypeMappings` section and the fields it includes are not available for the Idea object.

When performing a SOSL search on Idea objects, IdeaComment objects are also searched.

Fields

Field	Details
<code>AttachmentBody</code>	<p>Type base64</p> <p>Properties Create, Nillable, Update</p> <p>Description File data for the attachment. This field is available in API version 28.0 and later.</p>
<code>AttachmentContentType</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Type of the attachment. This field is available in API version 28.0 and later.</p>
<code>AttachmentLength</code>	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description</p> <p>Size of the attachment in bytes. This field is available in API version 28.0 and later.</p>
AttachmentName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>Name of the attachment. This field is available in API version 28.0 and later.</p>
Body	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Nillable, Update</p> <p>Description</p> <p>Description of the Idea.</p>
Categories	<p>Type</p> <p>multipicklist</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>Customizable multi-select picklist used to organize Ideas into logical groupings.</p> <p> Note: This field is only available if your organization has the <code>Categories</code> field enabled. This field is enabled by default in organizations created after API version 14 was released. If the <code>Categories</code> field is enabled, API versions 13 and earlier do not have access to either the <code>Categories</code> or <code>Category</code> fields.</p>
Category	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Nillable, Update</p> <p>Description</p> <p>Customizable picklist of values used to organize Ideas into logical groupings.</p> <p> Note: This field is not available if your organization has the multi-select <code>Categories</code> field enabled.</p>
CommunityId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p>

Field	Details
	<p>Description</p> <p>The zone ID associated with the idea. Once you create an idea, you can't change the zone ID associated with that idea.</p> <p> Note: API version 12 does not support zone ID. If you create an idea in version 12, your idea is automatically posted to the oldest zone that you have permission to access.</p>
CreatorFullPhotoUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the user's profile photo. This field is available in API version 28.0 and later.</p>
CreatorName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Name of the user who posted the idea or commented on the idea.</p> <p>This field is available in API version 28.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>URL of the user's thumbnail photo. This field is available in API version 28.0 and later.</p>
CurrencyIsoCode	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
IdeaThemeID	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description Identifies the idea theme associated with the idea.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsHtml	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read-only. If this value is <code>true</code>, your organization has the Ideas HTML editor enabled, and the Idea <code>Body</code> may contain HTML. If this value is <code>false</code>, the HTML editor is disabled and the Idea <code>Body</code> only contains regular text.</p>
IsMerged	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read only. Indicates whether the idea has been merged with a parent idea (<code>true</code>) or not (<code>false</code>). You can't vote for or add comments to a merged idea.</p> <p> Note: In API version 27, <code>IsMerged</code> replaces <code>IsLocked</code>. Existing formula fields that use <code>IsLocked</code> must be edited to use <code>IsMerged</code>.</p>
LastCommentDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date and time the last comment (child <code>IdeaComment</code> object) was added.</p>
LastCommentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description Read only. The ID of the last comment (child IdeaComment object).</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
NumComments	<p>Type int</p> <p>Properties Defaulted on create, Filter, Group, Nillable, Sort</p> <p>Description The number of comments (child IdeaComment objects) that users have submitted for the given idea.</p>
ParentIdeaId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID associated with this idea's parent idea. When multiple ideas are merged together, one idea becomes the parent (master) of the other ideas. The ParentIdeaId is automatically set when you merge ideas.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the record type assigned to this object.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customizable picklist of values used to specify the status of an idea.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The descriptive title of the idea.</p>
VoteScore	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The internal score of the Idea, used to sort Ideas on the Popular tab in the application user interface. The internal algorithm that determines the score gives older votes less weight than newer votes, simulating exponential decay. The score itself does not display in the application user interface.</p> <p> Note: Unlike other fields of type double, you can't use a SOQL aggregate function with this field.</p>
VoteTotal	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description An Idea's total number of points. Each vote a user makes is worth ten points, therefore the value of this field is ten times the number of votes an idea has received.</p> <p> Note: Unlike other fields of type double, you can't use a SOQL aggregate function with this field.</p>

 **Note:** If you are importing Idea data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Use this object to track ideas, which are written suggestions on which users can vote and comment.

SEE ALSO:

[IdeaComment](#)

[Vote](#)

IdeaComment

Represents a comment that a user has submitted in response to an idea.

Supported Calls

`create()`, `delete()`, `describeSOBJECTS()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

 **Note:** When performing a SOSL search on IdeaComment objects, Idea objects are also searched.

Fields

Field	Field Type
CommentBody	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Body of the submitted comment.</p>
CommunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The zone ID associated with the idea. Once you create an idea, you can't change the zone ID associated with that idea.</p> <p> Note: API version 12 does not support zone ID. If you create an idea in version 12, your idea is automatically posted to the oldest zone that you have permission to access.</p>
CreatorFullPhotoUrl	<p>Type string</p>

Field	Field Type
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's profile photo. This field is available in API version 28.0 and later.</p>
CreatorName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Name of the user who posted the idea or commented on the idea. This field is available in API version 28.0 and later.</p>
CreatorSmallPhotoUrl	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description URL of the user's thumbnail photo. This field is available in API version 28.0 and later.</p>
IdeaId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the idea on which this comment was made.</p>
IsHtml	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Read-only. If this value is <code>true</code>, your organization has the Ideas HTML editor enabled, and the <code>CommentBody</code> field may contain HTML. If this value is <code>false</code>, the HTML editor is disabled and the <code>CommentBody</code> field only contains regular text.</p>
UpVotes	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Field Type
	Description Total number of up votes for the question.

 **Note:** If you import these records, and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use this object to track comments on ideas, which are users' text responses to ideas.

SEE ALSO:

[Idea](#)

[Vote](#)

IdeaReputation

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

Supported Calls

`query()`, `retrieve()`,

Fields

Field	Details
<code>CommentCount</code>	Type int Properties Filter, Group, Nillable, Sort Description The number of comments a user has created in a zone or the internal organization. This number excludes comments the user creates on his or her own idea.
<code>CommentsReceivedCount</code>	Type int Properties Filter, Group, Nillable, Sort

Field	Details
	<p>Description The number of comments a user has received in a zone or the internal organization.</p>
ContextId	<p>Type reference</p> <p>Properties Filter, Group, Namepointing, Nillable, Sort</p> <p>Description The ID of the zone or internal organization.</p>
DownVotesGivenCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes a user has given in a zone or the internal organization.</p>
DownVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of down votes a user has received in a zone or the internal organization.</p>
IdeaCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of ideas a user has created in a zone or the internal organization.</p>
ReputationLevel	<p>Type string</p> <p>Properties Nillable</p> <p>Description The reputation level that a user has achieved based on their score in a zone or within an organization.</p>
Score	<p>Type double</p>

Field	Details
	<p>Properties Filter, Nillable, Sort</p> <p>Description The total score of a user's activity within a zone or within an organization.</p>
UpVotesGivenCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes a user has given in a zone or the internal organization. This number doesn't include the default vote the system applies when the user creates the idea.</p>
UpVotesReceivedCount	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of up votes a user has received in a zone or the internal organization.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The user ID associated with the reputation.</p>

Usage

Use to query a user's reputation within a zone.

IdeaReputationLevel

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ContextId	<p>Type reference</p> <p>Properties Create, Filter, Group, Namepointing, Sort, Update</p> <p>Description The ID of the zone or internal organization.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Name of the reputation level. The name must be unique within the zone or internal organization. Maximum size is 50 characters.</p>
Threshold	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Minimum number of points for this level. The threshold must be unique within the zone or internal organization and must be greater than or equal to zero.</p>

Usage

Use to create or edit reputation levels for an Ideas zone or internal organization.

IdeaTheme

Represents an invitation to community members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`,

Fields

Field Name	Details
Categories	<p>Type multipicklist</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description Customizable multi-select picklist used to organize ideas and idea themes into logical groupings.</p>
CommunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort,</p> <p>Description The zone ID associated with the idea theme.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description Description of the idea theme.</p>
EndDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date marking the end of the idea theme.</p>
LastReferencedDate	<p>Type date</p>

Field Name	Details
	<p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
StartDate	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Date that the idea theme begins.</p>
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Sort, Update</p> <p>Description Customizable picklist of values used to specify the status of the idea theme.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Namefield, Sort, Update</p> <p>Description Title of the idea theme.</p>

Usage

Use the object to track ideas that are submitted to an idea theme.

Individual

Represents a customer's data privacy and protection preferences. Data privacy records based on the Individual object store your customers' preferences. Data privacy records are associated with related leads and contacts. This object is available in API version 42.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- This object is available if Data Protection and Privacy is enabled.
- The Individual object isn't available for Customer Community, Partner Community, and Customer Portal users.

Fields

Field Name	Details
Birthdate	<p>Type date</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The customer's birthdate.</p>
CanStorePiiElsewhere	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indication that you can store the customer's personally identifiable information (PII) outside of their legislation area. For example, you could store an EU citizen's PII data in the US.</p>
FirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The customer's first name. Maximum size is 40 characters.</p>
HasOptedOutGeoTracking	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Preference to not track geolocation on mobile devices.</p>
HasOptedOutProcessing	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field Name	Details
	Description Preference to not process personal data, which can include collecting, storing, and sharing personal data.
HasOptedOutProfiling	Type boolean Properties Create, Defaulted on create, Filter, Group, Sort, Update Description Preference to not process data for predicting personal attributes, such as interests, behavior, and location.
HasOptedOutSolicit	Type boolean Properties Create, Defaulted on create, Filter, Group, Sort, Update Description Preference to not solicit products and services.
HasOptedOutTracking	Type boolean Properties Create, Defaulted on create, Filter, Group, Sort, Update Description Preference to not track web activity.
IndividualsAge	Type picklist Properties Create, Filter, Group, Nillable, Sort, Update Description Indicates whether the customer is considered to be a minor.
LastName	Type string Properties Create, Filter, Group, Sort, Update Description Required. The customer's last name. Maximum size is 80 characters.
Name	Type string

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description Concatenation of <code>FirstName</code> and <code>LastName</code>. Maximum size is 121 characters.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the owner of the account associated with this customer.</p>
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The title for addressing the customer, such as Dr. or Mrs.</p>
SendIndividualData	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Preference to export personal data for delivery to the customer.</p>
ShouldForget	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Preference to delete records and personal data related to this customer.</p>

IndividualHistory

Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

- This object is available if Data Protection and Privacy is enabled.
- The Individual object isn't available to Customer Community, Partner Community, and Customer Portal users.

Fields

Field Name	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the changed field.</p>
IndividualId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the data privacy record. Label is Individual ID.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The updated value of the changed field.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The previous value of the changed field.</p>

Usage

Use this object to identify changes to data privacy records.

This object respects field-level security on the parent object.

IndividualShare

Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access to a record because you own it, the `IndividualAccessLevel` is `All` and `RowCause` is `Owner`. This object is available in API version 42.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- This object is available if Data Protection and Privacy is enabled.
- The Individual object isn't available to Customer Community, Partner Community, and Customer Portal users.

Fields

Field Name	Details
<code>IndividualAccessLevel</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the user or group has to the data privacy record. The possible values include:</p> <ul style="list-style-type: none"> • Read • Edit • All (Except for create or update.) <p>Set this field to an access level that's higher than your default access level for individuals.</p>
<code>IndividualId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>ID of the Individual associated with this sharing entry. This field isn't available for updates.</p>
RowCause	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Reason that this sharing entry exists. Write to this field when its value is omitted or set to <code>Manual</code> (default). We give you some of the many possible values, including:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The user or group has access because a user with "All" access manually shared the data privacy record with them. • <code>Owner</code>—The user is the owner of the data privacy record. • <code>Rule</code>—The user or group has access to the data privacy record via an Individual sharing rule.
UserOrGroupId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>ID of the User or Group that has been given access to the data privacy record. This field isn't available for updates.</p>

Usage

This object lets you determine which users and groups can view or edit Individual records owned by other users.

KnowledgeableUser

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
NetworkId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the community the topic exists in. This field is available only if Salesforce Communities is enabled for your organization.</p>
RawRank	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Rank of this user's knowledge on the topic relative to other users.</p>
TopicId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Unique ID for the topic in Salesforce.</p>
UserId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description Unique ID for the user in Salesforce.</p>

KnowledgeArticle

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

Unlike KnowledgeArticleVersion, the ID of a KnowledgeArticle record is identical irrespective of the article's version (status). For more information on articles and article types, see "Work with Articles and Translations" and "Knowledge Article Types" in the Salesforce online help.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

A user must have the “View Articles” permission enabled. Salesforce Knowledge users, unlike Customer Portal and partner portal users, must also be granted the `Knowledge User` feature license.

Fields

Field Name	Details
ArchivedById	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the user who archived the article.</p>
ArchivedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the article was archived.</p>
ArticleNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, Sort</p> <p>Description The unique number automatically assigned to the article when it's created. You can't change the format or value for this field.</p>
CaseAssociationCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of cases attached to the article.</p>
FirstPublishedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the article was first published.</p>

Field Name	Details
LastPublishedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The date when the article was last published.</p>
LastReferencedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
MasterLanguage	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The article's original language. Only accessible if your knowledge base supports multiple languages.</p>

Usage

Use this object to query or retrieve articles. KnowledgeArticle can be used in a SOQL clause, but doesn't provide access to the fields from the article. Provides read-only access to an article and the ability to delete the master article.

SEE ALSO:

[Articles](#)

[Data Categories](#)

[KnowledgeArticleVersion](#)

KnowledgeArticleVersion

Provides a global view of standard article fields across all article types depending on their version. This object is available in API version 18.0 and later.

Use this object to:

- Query or search generically across multiple article types.
- Filter on a specific version.
- Update standard fields, those fields that are updateable, in draft versions.

When you query on the archived article, the results include both the article and the article's archived versions.

 **Note:** You can't update draft translations with the API.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, and `update()`.

 **Note:**

- You can only update draft versions.
- To create, update, or delete a Knowledge article version, use the call on `ArticleType_kav`, where `ArticleType` is the name of the article's type. For example, to delete, use `ArticleType_kav.delete()`.

Special Access Rules

A user must have the "View Articles" permission enabled. Salesforce Knowledge users, unlike Customer Portal and partner portal users, must also be granted the `Knowledge User` feature license to view and edit article versions.

Fields

Field Name	Details
ArchivedById	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description The ID of the user who archived the article.</p>
ArchivedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p>

Field Name	Details
	<p>Description The date when the article was archived.</p>
ArticleNumber	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter</p> <p>Description The unique number automatically assigned to the article when it's created. You can't change the format or value for this field.</p>
ArticleType	<p>Type string</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates the API Name of the article type. The <code>ArticleType</code> is assigned to the article when it's created. You can't change the value of this field. This field is available in API version 26.0 and later.</p>
FirstPublishedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description The date when the article was first published.</p>
IsLatestVersion	<p>Type boolean</p> <p>Properties Defaulted on create, Group, Filter, Sort</p> <p>Description Indicates whether the article is the most current version. (<code>true</code>) or not (<code>false</code>). This field can be <code>true</code> on the online or published version, a draft version in the master language, a draft version in a translation, and the latest archived version. However, you can't filter by (<code>PublishState='Online'</code>) and (<code>IsLatestVersion=false</code>) because the online version is also the latest version. This field is available in API version 24.0 and later.</p>
IsMasterLanguage	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the article has one or more translations associated with it (<code>true</code>) or not (<code>false</code>). Only accessible if your knowledge base supports multiple languages.</p>
IsOutOfDate	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the source article has been updated since this translated version was created (<code>true</code>) or not (<code>false</code>). Only accessible if your knowledge base supports multiple languages.</p>
IsVisibleInApp	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Required. Indicates whether the article is visible in the Articles tab (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInCsp	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Required. Indicates whether the article is visible in the Customer Portal (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInPkb	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Required. Indicates whether the article is visible in the public knowledge base (<code>true</code>) or not (<code>false</code>).</p>
IsVisibleInPrm	<p>Type boolean</p>

Field Name	Details
	<p>Properties Defaulted on create, Filter</p> <p>Description Required. Indicates whether the article is visible in the partner portal (<code>true</code>) or not (<code>false</code>).</p>
KnowledgeArticleId	<p>Type reference</p> <p>Properties Filter</p> <p>Description The ID of the article independent from its version. The value for this field is retrieved from the <code>Id</code> field of the KnowledgeArticle object.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The language that the article is written in, such as <code>French</code> or <code>Chinese (Traditional)</code>. Querying or searching articles in SOQL or SOSL requires that you specify the <code>Language</code> field in the WHERE clause. The language must be the same for all article types.</p>
LastPublishedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description The date when the article was last published.</p>
MasterVersionId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the source article, if the article is the translation of a source article. Only accessible if your knowledge base supports multiple languages.</p>
OwnerId	<p>Type reference</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description The ID of the article's owner.</p>
PublishStatus	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Restricted picklist</p> <p>Description The publication status for the article:</p> <ul style="list-style-type: none"> • Draft: any draft articles. • Online: articles published in Salesforce Knowledge. • Archived: archived articles. <p>A user must have the “Manage Articles” permission enabled to use Online.</p> <p>Querying or searching articles in SOQL or SOSL requires that you specify either the PublishStatus or the Id field in the WHERE clause. You can search for only one publication status per article type in a single SOSL query. When searching for articles with a PublishStatus of Archived, also check that IsLatestVersion equals false in your WHERE clause.</p>
SourceId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the source from which the article was created (Case or Reply).</p>
Summary	<p>Type textarea</p> <p>Properties Filter, Nillable</p> <p>Description Summary of the article. Maximum size is 1000 characters.</p>
Title	<p>Type string</p> <p>Properties Defaulted on create, Filter, idLookup</p> <p>Description Required. Article's title. Maximum size is 255 characters.</p>

Field Name	Details
TranslationCompletedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description Date and time when the article was last translated. Only accessible if your knowledge base supports multiple languages.</p>
TranslationExportedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description Date and time when the article was last exported for translation. Only accessible if your knowledge base supports multiple languages.</p>
TranslationImportedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable</p> <p>Description Date and time when the article was last imported for translation. Only accessible if your knowledge base supports multiple languages.</p>
UrlName	<p>Type string</p> <p>Properties Filter</p> <p>Description Required. Represents the article's URL. Can contain alphanumeric characters and hyphens but can't begin or end with a hyphen. <code>UrlName</code> is case-sensitive and its maximum size is 255 characters.</p>
ValidationStatus	<p>Type picklist</p> <p>Properties Filter, Group</p> <p>Description Shows whether the content of the article has been validated. Default values are <code>Validated</code> and <code>Not Validated</code>. This field is available in API version 24.0 or later.</p>

Field Name	Details
VersionNumber	<p>Type int</p> <p>Properties None</p> <p>Description The number assigned to a version of an article. This field is available in API version 24.0 and later.</p>

Usage

Use this object to query, retrieve, or search for articles across all article types depending on their version. You can update draft master articles. Additionally, you can delete articles that are not drafts. Client applications can use KnowledgeArticleVersion with `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` to return the category groups and the category structure associated with Salesforce Knowledge.

Alternatively, client applications can use the article type `API Name` followed by `__kav` to query, retrieve, or search for articles for a specific article type.

To access an article independent of its version, use the KnowledgeArticle object.

SOQL Samples

The following SOQL clause uses KnowledgeArticleVersion to query all published articles from **all article types** complying with the classification specified in the WITH DATA CATEGORY clause:

```
SELECT Title, Summary
FROM KnowledgeArticleVersion
WHERE PublishStatus='Online'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c ABOVE_OR_BELOW europe__c AND Product__c BELOW All__c
```

The following SOQL clause uses the article type `API Name` to limit the query to all draft articles from the `Offer__kav` article type:

```
SELECT Id, Title
FROM Offer__kav
WHERE PublishStatus='Draft'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c AT (france__c,usa__c) AND Product__c ABOVE dsl__c
```

The following SOQL clause uses KnowledgeArticleVersion to query the Ids of all archived versions of a particular article:

```
SELECT Id
FROM KnowledgeArticleVersion
WHERE PublishStatus='Archived'
AND IsLatestVersion=false
AND KnowledgeArticleId='kA1D00000001PQ6KAM'
```

SOQL and SOSL with KnowledgeArticleVersion

- Always filter on a single value of `PublishStatus` unless the query filters on one or more primary key IDs. To support security, only users with the “Manage Articles” permission see articles whose `PublishStatus` value is `Draft`.
- Archived article versions are stored in the `articletype_kav` object. To query archived article versions, specify the article `Id` and set `IsLatestVersion='0'`.
- Always filter on a single value of `Language`. However, in SOQL, you can filter on more than one `Language` if there is a filter on `Id` or `KnowledgeArticleId`.

[KnowledgeArticle](#)

[KnowledgeArticleViewStat](#)

[KnowledgeArticleVoteStat](#)

KnowledgeArticleVersionHistory

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object respects field, entity, and record-level security. You must have at least “Read” permission on the article type or the field to access its history. For data category security, Salesforce determines access based on the categorization of the online version of an article. If there is no online version, then security is applied based on the archived version, followed by the security of the draft version.

Fields

Field Name	Details
<code>EventType</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of event that is tracked in the history table.</p>
<code>FieldName</code>	<p>Type picklist</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description Name of the tracked field.</p>
Language	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The language that the article is written in, such as <code>French</code> or <code>Chinese (Traditional)</code>. Querying or searching articles in SOQL or SOSL requires that you specify the <code>Language</code> field in the WHERE clause. The language must be the same for all article types.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The most recent value of the field before it was changed.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the article.</p>
ParentObjectType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p>

Field Name	Details
	<p>Description</p> <p>The type of object that contains the field.</p>
VersionId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID assigned to a version of the article.</p>
VersionNumber	<p>Type</p> <p>int</p> <p>Properties</p> <p>Filter, Group, Sort</p> <p>Description</p> <p>The number assigned to a version of an article. This field is available in API version 24.0 and later.</p>

Usage

Use this object to query events in the history of an article. For example, you can retrieve the number of edits a particular user has made to an article, how many times the article has been published, and so on.

KnowledgeArticleViewStat

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Users must have access to the published version of an article to retrieve its views. For more information on published article version, see the `PublishStatus` field in `KnowledgeArticleVersion`.

Fields

Field Name	Details
Channel	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The channel where the article is viewed:</p> <ul style="list-style-type: none"> • AllChannels for article views across all channels. • App for the internal Salesforce Knowledge application. • Pkb for article views in public knowledge base. • Csp for Customer Portal. • Prm for article view in partner portal.
NormalizedScore	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description Article's weighted views in the selected channel. The article with most views has a score of 100. Other article views are then calculated relative to this highest view score. For example, if the best read article has 2000 views and another has 1000. The first one gets a score of 100 while the second gets 50.</p>
ParentId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the viewed article. This corresponds to a KnowledgeArticle record.</p>
ViewCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of unique views an article has received in the selected channel. An article with a high number of views may not always have a high normalized score. The normalized score for an article is calculated based on views over time, with more recent views earning a higher score. This field is available in API version 27.0 and later.</p>

Usage

Use this object to query or retrieve statistics for article views.

Alternatively, client applications can use the article type `API Name` followed by `__ViewStat` to query or retrieve most viewed articles from a specific article type.

SOQL Samples

The following SOQL clause uses `KnowledgeArticleViewStat` to query all the article views in Salesforce Knowledge and return the related articles:

```
SELECT Id, NormalizedScore, Parent.Id
      FROM KnowledgeArticleViewStat where Channel = 'App'
      ORDER BY NormalizedScore
```

Use the following clause to restrict your query to `Offer` articles for the `Offer` article type:

```
SELECT Id, NormalizedScore, Parent.Id
      FROM Offer__ViewStat where Channel = 'App'
      ORDER BY NormalizedScore
```

[KnowledgeArticleVersion](#)

[KnowledgeArticleVoteStat](#)

KnowledgeArticleVoteStat

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Users must have access to the published version of an article to retrieve its votes. For more information on published article version, see the `PublishStatus` field in `KnowledgeArticleVersion`.

Fields

Field Name	Details
Channel	<p>Type picklist</p> <p>Properties Filter, Restricted picklist</p> <p>Description The channel where the article is rated:</p> <ul style="list-style-type: none"> • AllChannels for article views across all channels. • App for the internal Salesforce Knowledge application. • Pkb for article views in public knowledge base. • Csp for Customer Portal. • Prm for article view in partner portal.
NormalizedScore	<p>Type double</p> <p>Properties Filter, Nillable</p> <p>Description Article's weighted score on a scale of 1 to 5. A higher score means more votes. Articles without recent votes trend towards an average rating of three stars.</p>
ParentId	<p>Type reference</p> <p>Properties Filter</p> <p>Description The rated article. This corresponds to a KnowledgeArticle record.</p>

Usage

Use this object to query or retrieve the rating for an article.

Alternatively, client applications can use the article type `API Name` followed by `__VoteStat` to query or retrieve the rating for an article for a specific article type.

SOQL Samples

See KnowledgeArticleViewStat.

Lead

Represents a prospect or lead.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. For details on compound address fields, see Address Compound Fields.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Annual revenue for the lead's company.</p>
City	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field	Details
	<p>Description City for the lead's address.</p>
CleanStatus	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Indicates the record's clean status compared with Data.com. Values include: <i>Matched</i>, <i>Different</i>, <i>Acknowledged</i>, <i>NotFound</i>, <i>Inactive</i>, <i>Pending</i>, <i>SelectMatch</i>, or <i>Skipped</i>.</p> <p>Several values for <i>CleanStatus</i> appear with different labels on the lead record.</p> <ul style="list-style-type: none"> • <i>Matched</i> appears as <i>In Sync</i> • <i>Acknowledged</i> appears as <i>Reviewed</i> • <i>Pending</i> appears as <i>Not Compared</i>
Company	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Required. The lead's company.</p> <p> Note: If person account record types have been enabled, and if the value of <i>Company</i> is null, the lead converts to a person account.</p>
CompanyDunsNumber	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The Data Universal Numbering System (D-U-N-S) number, which is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. Industries and companies use D-U-N-S numbers as a global standard for business identification and tracking. Maximum size is 9 characters.</p> <p> Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.</p>
ConnectionReceivedId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field	Details
	<p>Description ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</p>
ConnectionSentId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.</p>
ConvertedAccountId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Object reference ID that points to the account into which the lead converted.</p>
ConvertedContactId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Object reference ID that points to the contact into which the lead converted.</p>
ConvertedDate	<p>Type date</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Date on which this lead was converted.</p>
ConvertedOpportunityId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Object reference ID that points to the opportunity into which the lead has been converted.</p>

Field	Details
Country	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's country.</p>
CountryCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO country code for the lead's address.</p>
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The lead's description.</p>
Division	<p>Type picklist</p> <p>Properties Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p>Description A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>
Email	<p>Type email</p>

Field	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's email address.</p>
EmailBouncedDate	<p>Type dateTime</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the lead bounced, the date and time of the bounce.</p>
EmailBouncedReason	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort, Update</p> <p>Description If bounce management is activated and an email sent to the lead bounced, the reason for the bounce.</p>
Fax	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's fax number.</p>
FirstName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's first name up to 40 characters.</p>
HasOptedOutOfEmail	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Update</p> <p>Description Indicates whether the lead opted out of email (<code>true</code>) or not (<code>false</code>). Label is Email Opt Out.</p>

Field	Details
GeocodeAccuracy	<p>Type picklist</p> <p>Properties Retrieve, Query, Restricted picklist, Nillable</p> <p>Description Accuracy level of the geocode for the address. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
IndividualId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the data privacy record associated with this lead. This field is available if you enabled Data Protection and Privacy in Setup.</p>
Industry	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Industry in which the lead works.</p>
IsConverted	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the lead has been converted (<code>true</code>) or not (<code>false</code>). Label is Converted.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
IsUnreadByOwner	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p>

Field	Details
	<p>Description</p> <p>If true, lead has been assigned, but not yet viewed. See Unread Leads for more information. Label is Unread By Owner.</p>
Jigsaw	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>References the ID of a contact in Data.com. If a lead has a value in this field, it means that a contact was imported as a lead from Data.com. If the contact (converted to a lead) was not imported from Data.com, the field value is null. Maximum size is 20 characters. Available in API version 22.0 and later. Label is Data.com Key.</p> <p> Important: The <code>Jigsaw</code> field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify the value in the <code>Jigsaw</code> field.</p>
LastActivityDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Value is the most recent of either:</p> <ul style="list-style-type: none"> • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Required. Last name of the lead up to 80 characters.</p>
LastReferencedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>

Field	Details
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
Latitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
Longitude	<p>Type double</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of an address. Acceptable values are numbers between -180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.</p>
LeadSource	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's source.</p>
MasterRecordId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description If this record was deleted as the result of a merge, this field contains the ID of the record that was kept. If this record was deleted for any other reason, or has not been deleted, the value is <code>null</code>.</p>

Field	Details
	<p> Note: When using Apex triggers to determine which record was deleted in a merge event, this field's value is the ID of the record that remains in <code>Trigger.old</code>. In <code>Trigger.new</code>, the value is <code>null</code>.</p>
MiddleName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's middle name up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>
MobilePhone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's mobile phone number.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description Concatenation of <code>FirstName</code>, <code>MiddleName</code>, <code>LastName</code>, and <code>Suffix</code> up to 121 characters.</p>
NumberOfEmployees	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Number of employees at the lead's company. Label is Employees.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the lead's owner.</p>

Field	Details
PartnerAccountId	<p>Type reference</p> <p>Properties Filter, Nillable</p> <p>Description ID of the partner account for the partner user that owns this lead. Available if Partner Relationship Management is enabled or if Communities is enabled and you have partner portal licenses.</p> <p> Note: If you are uploading leads using API version 15.0 or earlier, and one of the leads in the batch has a partner user as the owner, the <code>Partner Account</code> field on all leads in the batch is set to that partner user's account regardless of whether the partner user is the owner. In version 16.0, the <code>Partner Account</code> field is set to the appropriate account for the partner user that owns the lead. If the owner of the lead is not a partner user, this field remains empty.</p>
Phone	<p>Type phone</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's phone number.</p>
PhotoUrl	<p>Type url</p> <p>Properties Filter, Group, Sort</p> <p>Description Path to be combined with the URL of a Salesforce instance (<i>Example:</i> <code>https://yourInstance.salesforce.com/</code>) to generate a URL to request the social network profile image associated with the lead. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the lead.</p> <p>Empty if Social Accounts and Contacts isn't enabled or if Social Accounts and Contacts has been disabled for the requesting user.</p>
PostalCode	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Postal code for the address of the lead. Label is Zip/Postal Code.</p>

Field	Details
Rating	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Rating of the lead.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Nillable, Update</p> <p>Description ID of the record type assigned to this object.</p>
Salutation	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Salutation for the lead.</p>
ScoreIntelligenceId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID of the intelligent field record that contains lead score.</p>
State	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description State for the address of the lead.</p>
StateCode	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ISO state code for the lead's address.</p>

Field	Details
Status	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Status code for this converted lead. Status codes are defined in <code>Status</code> and represented in the API by the <code>LeadStatus</code> object.</p>
Street	<p>Type textarea</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Street number and name for the address of the lead.</p>
Suffix	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The lead's name suffix up to 40 characters. To enable this field, ask Salesforce Customer Support for help.</p>
Title	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Title for the lead, such as CFO or CEO.</p>
Website	<p>Type url</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Website for the lead.</p>

Note: If you import lead data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Converted Leads

Leads have a special state to indicate that they have been converted into an account, a contact, and an opportunity. Your client application can convert leads via the `convertLead()` call. Users can also convert leads in Salesforce. After a lead has been converted, it is read-only. However, you can query converted lead records.

Leads have several fields that indicate their converted status. These special fields are set when converting the lead in the user interface.

- `ConvertedAccountId`
- `ConvertedContactId`
- `ConvertedDate`
- `ConvertedOpportunityId`
- `IsConverted`
- `Status`

 **Note:** If person account record types have been enabled, and if the value of `Company` is null, the lead converts to a person account.

Unread Leads

Leads have a special state to indicate that they have not been viewed or edited by the lead owner. In Salesforce, this is helpful for users to know which leads have been assigned to them but which they have not touched yet. `IsUnreadByOwner` is `true` if the lead owner has not yet viewed or edited the lead, and `false` if the lead owner has viewed or edited the lead at least once.

Lead Status Picklist

Each `Status` value corresponds to either a converted or unconverted status in the lead status picklist, as defined in the user interface. To obtain the lead status values in the picklist, a client application can query `LeadStatus`.

You can't convert a lead via the API by changing `Status` to one of the converted lead status values. When you convert qualified leads into an account, contact, and opportunity, you can select one of the converted status types for the lead. Leads with a converted status type are no longer available in the Leads tab, although you can include them in reports.

Usage

To update a lead or to convert one with `convertLead()`, log in to your client application with the "Edit" permission on leads.

When you create, update, or upsert a lead, your client application can have the lead assigned to multiple user records based on assignment rules that have been configured in Salesforce.

To use this feature, your client application needs to set either of the following options (but not both) in the `AssignmentRuleHeader` used in create or update:

Field	Field Type	Details
<code>assignmentRuleId</code>	reference	<p>ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is <code>true</code>, then the default assignment rule is used.</p> <p>To find the ID for a given assignment rule, query the <code>AssignmentRule</code> object (specifying <code>RuleType="leadAssignment"</code>), iterate through the returned <code>AssignmentRule</code> records, find the one you want to use, retrieve its ID, and then specify its ID in this field in the <code>AssignmentRuleHeader</code>.</p>

Field	Field Type	Details
useDefaultRule	boolean	Specifies whether to use the default rule for rule-based assignment (<code>true</code>) or not (<code>false</code>). Default rules are assigned in the user interface.

Java Sample

The following Java sample shows how to automatically assign a newly created lead.

```
package wsc;

import com.sforce.soap.enterprise.Connector;
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;
import com.sforce.soap.enterprise.subject.Lead;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.subject.SObject;

public class LeadAssignment {

    static final String USERNAME = "REPLACE USER NAME";
    static final String PASSWORD = "REPLACE PASSWORD";
    static EnterpriseConnection connection;

    static LeadAssignment _leadAssignment;

    // Main
    public static void main(String[] args)
    {
        // Establish connection and login
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(USERNAME);
        config.setPassword(PASSWORD);
        try {
            connection = Connector.newConnection(config);
            System.out.println("Logged in, endpoint: " + config.getAuthEndpoint());
        } catch (ConnectionException e1) {
            e1.printStackTrace();
        }
    }

    // Create lead
    _leadAssignment = new LeadAssignment();
    try {
        _leadAssignment.CreateLead();
    } catch (Exception e) {
        e.printStackTrace();
    }
}

// Logout
try {
    connection.logout();
}
```

```

        System.out.println("Logged out");
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}

public void CreateLead() throws ConnectionException
{
    // Create a new Lead and assign various properties
    Lead lead = new Lead();

    lead.setFirstName("Joe");
    lead.setLastName("Smith");
    lead.setCompany("ABC Corporation");
    lead.setLeadSource("API");
    // The lead assignment rule will assign any new leads that
    // have "API" as the LeadSource to a particular user

    // In this sample we will look for a particular rule and if found
    // use the id for the lead assignment. If it is not found we will
    // instruct the call to use the current default rule. You can't use
    // both of these values together.
    QueryResult qr = connection.query("SELECT Id FROM AssignmentRule WHERE Name = " +
                                     "'Mass Mail Campaign' AND SubjectType = 'Lead'");
    if (qr.getSize() == 0) {
        connection.setAssignmentRuleHeader(null, true);
    } else {
        connection.setAssignmentRuleHeader(qr.getRecords()[0].getId(), false);
    }

    // Every operation that results in a new or updated lead will
    // use the specified rule until the header is removed from the
    // connection.
    SaveResult[] sr = connection.create(new SObject[] {lead});
    for (int i=0;i<sr.length;i++) {
        if (sr[i].isSuccess()) {
            System.out.println("Successfully created lead with id of: " +
                               sr[i].getId() + ".");
        } else {
            System.out.println("Error creating lead: " +
                               sr[i].getErrors()[0].getMessage());
        }
    }

    // This call effectively removes the header, the next lead will
    // be assigned to the default lead owner.
    connection.clearAssignmentRuleHeader();
}
}

```

C# Sample

The following C# sample shows how to automatically assign a newly created lead.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.ServiceModel;
using LeadSample.sforce;

namespace LeadSample
{
    class LeadAssignment
    {
        private static SoapClient client;
        private static SoapClient apiClient;
        private static SessionHeader header;
        private static LoginResult loginResult;
        private static readonly string Username = "REPLACE USERNAME";
        private static readonly string Password = "REPLACE PASSWORD AND SECURITY TOKEN";

        // Create the proxy binding and login
        private LeadAssignment()
        {
            client = new SoapClient();

            try
            {
                loginResult = client.login(null, Username, Password);
            }
            catch (Exception e)
            {
                Console.WriteLine("Unexpected login error: " + e.Message);
                Console.WriteLine(e.StackTrace);
                return;
            }
            // Access API endpoint and create new client
            header = new SessionHeader();
            header.sessionId = loginResult.sessionId;
            apiClient = new SoapClient("Soap", loginResult.serverUrl);
        }

        [STAThread]
        static void Main(string[] args)
        {
            LeadAssignment leadAssignment = new LeadAssignment();
            try
            {
                leadAssignment.CreateLead();
            }
            catch (Exception e)
            {
                Console.WriteLine(e.Message);
            }
        }
    }
}
```

```
        Console.WriteLine(e.StackTrace);
        Console.WriteLine(e.InnerException);
    }
    // logout
    client.logout(header);
}

public void CreateLead()
{
    // Create a new Lead and assign various properties
    Lead lead = new Lead();

    lead.FirstName = "John";
    lead.LastName = "Brown";
    lead.Company = "ABC Corporation";
    lead.LeadSource = "Advertisement";
    // Setting the lead source for a pre-existing lead assignment rule. This
    // rule was created outside of this sample and will assign any new leads
    // that have "Advertisement" as the LeadSource to a particular user.

    // Create the assignment rule header and add it to the proxy binding
    AssignmentRuleHeader arh = new AssignmentRuleHeader();

    // In this sample we will look for a particular rule and if found
    // use the id for the lead assignment. If it is not found we will
    // instruct the call to use the current default rule. Both these
    // values can't be used together.
    QueryResult qr = null;
    string query = "SELECT Id FROM AssignmentRule WHERE Name = " +
        "'Mass Mail Campaign' AND SubjectType = 'Lead'";
    try
    {
        LimitInfo[] limitArray = apiClient.query(
            header, // sessionheader
            null, // queryoptions
            null, // mruheader
            null, // packageversionheader
            query, // SOQL query
            out qr);
    }
    catch (Exception e)
    {
        Console.WriteLine("Unexpected query error: " + e.Message);
        Console.WriteLine(e.StackTrace);
    }
    if (qr.size == 0)
    {
        arh.useDefaultRule = true;
    }
    else
    {
        arh.assignmentRuleId = qr.records[0].Id;
    }
}
```

field. If the `IsDifferentTitle` field's value is `False`, that means the `Title` field value is *the same* on the Salesforce lead record and its matched Data.com record.

LeadCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the lead record.
- `IsDifferent` indicates whether or not a field on the lead record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the lead record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the lead record is in a `Reviewed` state, which means that the value was reviewed but not accepted..

Their individual bits are defined here

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
Address	<p>Type address</p> <p>Properties Filter, Nillable</p> <p>Description The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.</p>
AnnualRevenue	<p>Type currency</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Estimated annual revenue of the lead.</p>
City	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the lead.</p>
CleanedByJob	<p>Type boolean</p>

Field Name	Details
	<p>Properties Filter</p> <p>Description Indicates whether the lead record was cleaned by a Data.com Clean job (<code>true</code>) or not (<code>false</code>).</p>
CleanedByUser	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the lead record was cleaned by a Salesforce user (<code>true</code>) or not (<code>false</code>).</p>
CompanyDunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.</p>
CompanyName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The name of the company.</p>
ContactStatusDataDotCom	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The status of the contact associated with the lead per Data.com. Values are: Contact is Active per Data.com, Phone is Wrong per Data.com , Email is Wrong per Data.com, Phone and Email are Wrong per Data.com, Contact Not at Company per Data.com, Contact is Inactive per Data.com, Company this contact belongs to is out of business</p>

Field Name	Details
	per Data.com, Company this contact belongs to never existed per Data.com or Email address is invalid per Data.com.
Country	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the lead.</p>
DandBCompanyDunsNumber	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The D-U-N-S Number on the D&B Company record (if any) that is linked to the lead.</p>
DataDotComCompanyId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the company associated with the lead.</p>
DataDotComId	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The ID Data.com maintains for the contact associated with the lead.</p>
Email	<p>Type email</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The lead's email address.</p>
FirstName	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description The lead's first name.</p>
Industry	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The industry the lead belongs to.</p>
IsDifferentAnnualRevenue	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the lead's <code>AnnualRevenue</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCity	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the lead's <code>City</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCompanyDunsNumber	<p>Type boolean</p> <p>Properties Filter</p> <p>Description Indicates whether the lead's <code>Company D-U-N-S Number</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
IsDifferentCompanyName	<p>Type boolean</p> <p>Properties Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>Company Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Country</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentCountryCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>Country Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentDandBCompanyDunsNumber</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>D&B Company D-U-N-S Number</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentEmail</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Email</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentFirstName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>First Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentIndustry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Industry</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentLastName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Last Name</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentNumberOfEmployees</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>No. of Employees</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Phone</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentPostalCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>Postal Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentState</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>State</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStateCode</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the account's <code>State Code</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentStreet</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Street</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsDifferentTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter</p> <p>Description</p> <p>Indicates whether the lead's <code>Title</code> field value is different from the corresponding value on its matched Data.com record (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAddress</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description Indicates whether the lead's <code>Address</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongAnnualRevenue</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Annual Revenue</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongCompanyDunsNumber</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Company D-U-N-S Number</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongCompanyName</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Company Name</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongEmail</code>	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Email</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongIndustry</code>	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>Industry</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Name</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongNumberOfEmployees</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>No. of Employees</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Phone</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsFlaggedWrongTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Title</code> field value is flagged as wrong to Data.com (<code>true</code>) or not (<code>false</code>).</p>
<code>IsInactive</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Defaulted on create, Filter, Group, Sort</p>

Field Name	Details
	<p>Description Indicates whether the lead has been reported to Data.com as <i>Inactive</i> (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedAddress	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Address</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedAnnualRevenue	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Annual Revenue</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedCompanyDunsNumber	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Company D-U-N-S Number</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedCompanyName	<p>Type boolean</p> <p>Properties Filter, Update</p> <p>Description Indicates whether the lead's <code>Company Name</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
IsReviewedDandBCompanyDunsNumber	<p>Type boolean</p> <p>Properties Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>D&B Company D-U-N-S Number</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedEmail</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Email</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedIndustry</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Industry</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedName</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Name</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedNumberOfEmployees</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>No. of Employees</code> field value is in a Reviewed state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedPhone</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates whether the lead's <code>Phone</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>IsReviewedTitle</code>	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Filter, Update</p> <p>Description</p> <p>Indicates whether the lead's <code>Title</code> field value is in a <code>Reviewed</code> state (<code>true</code>) or not (<code>false</code>).</p>
<code>LastMatchedDate</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Sort</p> <p>Description</p> <p>The date the lead record was last matched and linked to a Data.com record.</p>
<code>LastName</code>	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The lead's last name.</p>
<code>LastStatusChangedById</code>	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of who or what last changed the record's <code>Clean Status</code> field value: a Salesforce user or a Clean job.</p>
<code>LastStatusChangedDate</code>	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Filter, Nillable, Sort</p> <p>Description</p> <p>The date on which the record's <code>Clean Status</code> field value was last changed.</p>

Field Name	Details
Latitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Longitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
LeadId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The unique, system-generated ID assigned when the lead record was created.</p>
Longitude	<p>Type double</p> <p>Properties Filter, Nillable, Sort</p> <p>Description Used with <code>Latitude</code> to specify the precise geolocation of a billing address. Data not currently provided.</p>
Name	<p>Type string</p> <p>Properties Filter, Group, Sort, Update</p> <p>Description Field label is Lead Clean Info Name. The name of the lead. Maximum size is 255 characters.</p>
NumberOfEmployees	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The number of employees working at the lead.</p>
Phone	<p>Type phone</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description The phone number for the lead.</p>
PostalCode	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the lead.</p>
State	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the lead.</p>
Street	<p>Type textarea</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Details for the billing address of the lead.</p>
Title	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The lead's title.</p>

Usage

Developers can create triggers that read the Lead Clean Info fields to help automate the cleaning or related processing of lead records.

LeadFeed

Represents a single feed item in the feed displayed on the detail page for a lead record. This object is available in API version 18.0 and later.

A lead feed shows recent changes to a lead record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to leads in Salesforce.

Supported Calls

`delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Lead object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

Fields

Field	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of LeadFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedComments associated with this feed item.</p> <p> Tip: In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p>
ConnectionId	<p>Type reference</p>

Field	Details
	<p>Properties Filter, Group, Nillable, Sort</p> <p>Description When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>
ContentData	<p>Type base64</p> <p>Properties Nillable</p> <p>Description Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentDescription	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>
ContentFileName	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>
ContentSize	<p>Type int</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>

Field	Details
ContentType	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>
CreatedDate	<p>Type dateTime</p> <p>Properties Defaulted on create, Filter, Sort</p> <p>Description Date and time when this record was created. This field is a standard system field. Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>
FeedPostId	<p>Type reference</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in an FeedItem: changes to tracked fields, text posts, link posts, and content posts.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Standard system field. Indicates whether the record has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>).</p>

Field	Details
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of FeedLikes associated with this feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether this feed item is available in the default community, a specific community, or all communities. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>NetworkScope</code> can have the following values:</p> <ul style="list-style-type: none"> • <code>NetworkId</code>—The ID of the community in which the <code>FeedItem</code> is available. If left empty, the feed item is only available in the default community. • <code>AllNetworks</code>—The feed item is available in all communities. <p>Note the following exceptions for <code>NetworkScope</code>:</p> <ul style="list-style-type: none"> • Only feed items with a Group or User parent can set a <code>NetworkId</code> or a null value for <code>NetworkScope</code>. • For feed items with a record parent, users can set <code>NetworkScope</code> only to <code>AllNetworks</code>. • You can't filter a <code>FeedItem</code> on the <code>NetworkScope</code> field.
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the lead record that is tracked in the feed. The feed is displayed on the detail page for this record.</p>

Field	Details
RelatedRecordId	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost.</p>
Title	<p>Type string</p> <p>Properties Group, Nillable, Sort</p> <p>Description The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name.</p>
Type	<p>Type picklist</p> <p>Properties Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description The type of feed item:</p> <ul style="list-style-type: none"> • ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • AnnouncementPost—Not used. • ApprovalPost—generated when a user submits an approval. • BasicTemplateFeedItem—Not used. • CanvasPost—a post made by a canvas app posted on a feed. • CollaborationGroupCreated—generated when a user creates a public group. • CollaborationGroupUnarchived—Not used. • ContentPost—a post with an attached file. • CreatedRecordEvent—generated when a user creates a record from the publisher. • DashboardComponentAlert—generated when a dashboard metric or gauge exceeds a user-defined threshold.

Field	Details
	<ul style="list-style-type: none"> • <code>DashboardComponentSnapshot</code>—created when a user posts a dashboard snapshot on a feed. • <code>LinkPost</code>—a post with an attached URL. • <code>PollPost</code>—a poll posted on a feed. • <code>ProfileSkillPost</code>—generated when a skill is added to a user’s Chatter profile. • <code>QuestionPost</code>—generated when a user posts a question. • <code>ReplyPost</code>—generated when Chatter Answers posts a reply. • <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com. • <code>TextPost</code>—a direct text entry on a feed. • <code>TrackedChange</code>—a change or group of changes to a tracked field. • <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated. <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> • <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object • <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received • <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • <code>ChangeStatusPost</code>—generated event when a user changes the status of a case • <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case <p> Note: If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p>

Visibility

Type

picklist

Properties

Filter, Group, Nillable, Restricted picklist, Sort

Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

`Visibility` can have the following values:

- `AllUsers`—The feed item is available to all users who have permission to see the feed item.
- `InternalUsers`—The feed item is available to internal users only.

Note the following exceptions for `Visibility`:

- For record posts, `Visibility` is set to `InternalUsers` for all internal users by default.
- External users can set `Visibility` only to `AllUsers`.

Field	Details
	<ul style="list-style-type: none"> On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.

Usage

Use this object to track changes for a lead record. If a lead record is converted, use this object to query and retrieve the associated lead feed items.

[UserProfileFeed](#)

LeadHistory

Represents the history of changes to the values in the fields of a lead.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort,</p> <p>Description The name of the field that was changed.</p>
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>

Field	Details
LeadId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Lead. Label is Lead ID.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The latest value of the field before it was changed.</p>

Usage

Use this object to identify changes to a lead.

This object respects field level security on the parent object.

LeadOwnerSharingRule

Represents the rules for sharing a lead with users other than the owner.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Leads owned by users in the source group trigger the rule to give access.</p>
LeadAccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"> • Read

Field	Details
	<ul style="list-style-type: none"> Edit
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. The target user or group is being given access.</p>

Usage

Use these objects to manage the sharing rules for leads. General sharing and Territory-related sharing use this object.

[Metadata API Developer Guide: SharingRules](#)

LeadShare

Represents a sharing entry on a Lead.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
LeadAccessLevel	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Level of access that the User or Group has to the Lead. The possible values are:</p> <ul style="list-style-type: none"> • <code>Read</code> • <code>Edit</code> • <code>All</code> This value is not valid when creating or updating these records. <p>This field must be set to an access level that is higher than the organization's default access level for leads.</p>
LeadId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the Lead associated with this sharing entry. This field can't be updated.</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can only write a value in this field when its value is either omitted or set to <code>Manual</code> (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.</p> <p>Values include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a user with "All" access manually shared the Lead with them. • <code>Owner</code>—The User is the owner of the Lead. • <code>Rule</code>—The User or Group has access via a Lead sharing rule.

Field	Details
UserOrGroupId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the Lead. This field can't be updated.</p>

Usage

This object allows you to determine which users and groups can view or edit leads owned by other users.

If you attempt to create a record that matches an existing record, the existing record is returned.

LeadStatus

Represents the status of a Lead, such as Open, Qualified, or Converted.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
ApiName	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Uniquely identifies a picklist value so it can be retrieved without using an id or master label.</p>
IsConverted	<p>Type boolean</p>

Field	Details
	<p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this lead status value represents a converted lead (<code>true</code>) or not (<code>false</code>). Multiple lead status values can represent a converted lead.</p>
IsDefault	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether this is the default lead status value (<code>true</code>) or not (<code>false</code>) in the picklist.</p>
MasterLabel	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Master label for this lead status value. This display value is the internal label that does not get translated.</p>
SortOrder	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description Number used to sort this value in the lead status picklist. These numbers are not guaranteed to be sequential, as some previous lead status values might have been deleted.</p>

Usage

This object represents a value in the lead status picklist (see Lead Status Picklist). The lead status picklist provides additional information about the status of a Lead, such as whether a given status value represents a converted Lead. Query this object to retrieve the set of values in the lead status picklist, and then use that information while processing Lead objects to determine more information about a given lead. For example, the application could test whether a given lead is converted based on its `STATUS` value and the value of the `IsConverted` property in the associated LeadStatus record.

[LeadOwnerSharingRule](#)

[LeadShare](#)

LeadTag

Associates a word or short phrase with a Lead.

Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ItemId	<p>Type reference</p> <p>Properties Create, Filter</p> <p>Description ID of the tagged item.</p>
Name	<p>Type string</p> <p>Properties Create, Filter</p> <p>Description Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>
TagDefinitionId	<p>Type reference</p> <p>Properties Filter</p> <p>Description ID of the parent TagDefinition object that owns the tag.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Restricted picklist</p> <p>Description Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"> Public—The tag can be viewed and manipulated by all users in an organization.

Field Name	Details
	<ul style="list-style-type: none"> <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.

Usage

LeadTag stores the relationship between its parent TagDefinition and the Lead being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

LimitAllocationPerApp

Represents a connected app quota for an API limit. This object is available in API version 30.0 and later.

Note: LimitAllocationPerApp is currently available through a pilot program. For information on enabling LimitAllocationPerApp for your organization, contact Salesforce.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ConnectedAppName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the connected app.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p>

Field Name	Details
	<p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the <code>MasterLabel</code>.</p>
LimitType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of API limit for which you're setting a quota. The available values are:</p> <ul style="list-style-type: none"> • <code>TotalRequests</code>—Total API requests per 24-hour period • <code>ApiBatchItems</code>—Number of Bulk API batches per 24-hour period • <code>StreamEventsPerDay</code>—Number of Streaming API events per 24-hour period • <code>GenStreamingEventsPerDay</code>—Number of generic streaming events per 24-hour period <p> Note: Generic streaming is currently available through a pilot program. For information on enabling generic streaming for your organization, contact Salesforce.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Master label for the API limit quota. This is the internal label that does not get translated.</p>
Percentage	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The percentage of the API limit reserved for the connected app. The app can't consume more than this percentage of the API limit.</p>

Field Name**Details**

You can find the available percentage for each limit type through the user interface or by using the `query()` call.

Usage

App quotas for API limits enable you to reserve API capacity for mission-critical connected apps or set a ceiling for API usage of non-critical connected apps.

LineitemOverride

A forecast override of a line item on an Opportunity. This read-only object for customizable forecasting has a child-parent relationship with OpportunityOverride.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is only accessible if your organization has enabled the customizable forecasting feature, which can be done in the user interface. Requires the "View All Data" permission.

Fields

Field**Details**

AmountInherited

Type

boolean

Properties

Create, Defaulted on create, Filter, Group, Sort, Update

Description

Indicates whether the overridden amount rolls up through the forecast hierarchy (`true`), or was overridden by the owner of this record (`false`).

ForecastCategoryInherited

Type

boolean

Properties

Create, Defaulted on create, Filter, Group, Sort, Update

Description

Indicates whether the overridden forecast category rolls up through the forecast hierarchy (`true`), or was overridden by the owner of this record (`false`).

Field	Details
IsDeleted	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is Deleted.</p>
OpportunityId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the associated Opportunity.</p>
OpportunityLineItemId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the associated OpportunityLineItem.</p>
OverrideAmount	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The total monetary amount of the line item, which may be overridden.</p>
OverrideForecastCategory	<p>Type picklist</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The forecast category of the line item. Can be overridden.</p>
OverrideQuantity	<p>Type double</p> <p>Properties Create, Filter, Sort, Update</p>

Field	Details
	<p>Description The quantity of the line item, which may be overridden.</p>
OverrideUnitPrice	<p>Type currency</p> <p>Properties Create, Filter, Sort, Update</p> <p>Description The monetary amount of the unit price. Can be overridden.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort</p> <p>Description ID of the owner of this record.</p>
QuantityInherited	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Indicates whether the overridden quantity rolls up through the forecast hierarchy (<code>true</code>), or is overridden by the owner of this record (<code>false</code>).</p>
UnitPriceInherited	<p>Type boolean</p> <p>Properties Defaulted on create, Filter</p> <p>Description Indicates whether the overridden unit price rolls up through the forecast hierarchy (<code>true</code>), or was overridden by the owner of this record (<code>false</code>).</p>

[OpportunityOverride](#)

LinkedArticle

Represents a Knowledge article that is attached to a work order or work order line item. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Knowledge must be set up in your org, and Field Service Lightning must be enabled.

Fields

Field Name	Details
CurrencyIsoCode	<p>Type picklist</p> <p>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.</p>
KnowledgeArticleId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the Knowledge article attached to the record. The label in the user interface is Knowledge Article ID.</p>
KnowledgeArticleVersionId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The version of the Knowledge article attached to the record. This field lists the title of the attached version and links to the version. The label in the user interface is Article Version. When you attach an article to a work order, that version of the article stays associated with the work order, even if later versions are published. If needed, you can detach and reattach an article to a work order to link the latest version.</p>
LinkedEntityId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The ID of the record that the Knowledge article is attached to. The label in the user interface is Linked Record ID.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The title of the article. The label in the user interface is Article Title.</p>
RecordTypeId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the article's record type, if used.</p>
Type	<p>Type string</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description (Read only) The type of record that the Knowledge article is attached to. For example, work order. The label in the user interface is Linked Object Type.</p>

Usage

Admins can customize linked articles' page layouts, fields, validation rules, and more in Setup.

LinkedArticleFeed

Represents a single feed item on a linked Knowledge article attached to a work order. This object is available in API version 37.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Knowledge must be set up in your org.

Fields

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Nillable, Sort</p> <p>Description The content of the feed item. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>.</p>
CommentCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of comments associated with the feed item.</p>
InsertedById	<p>Type reference</p> <p>Properties Group, Nillable, Sort</p> <p>Description ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>
IsRichText	<p>Type boolean</p> <p>Properties Defaulted on create, Filter, Group, Sort</p> <p>Description Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via the SOAP API. Otherwise, the post is rendered as plain text.</p> <p>Rich text supports the following HTML tags.</p> <ul style="list-style-type: none"> • <code><p></code>

Field Name	Details
	<p> Tip: Although the <code>
</code> tag isn't supported, you can use <code><p>&nbsp;&nbsp;&nbsp;</p></code> to create lines.</p> <ul style="list-style-type: none"> • <code></code> • <code><i></code> • <code><u></code> • <code><s></code> • <code></code> • <code></code> • <code></code> • <code></code> <p>The <code></code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code></code></p>
LikeCount	<p>Type int</p> <p>Properties Filter, Group, Sort</p> <p>Description The number of Likes associated with the feed item.</p>
LinkUrl	<p>Type url</p> <p>Properties Nillable, Sort</p> <p>Description The URL of a <code>LinkPost</code>.</p>
NetworkScope	<p>Type picklist</p> <p>Properties Group, Nillable, Restricted picklist, Sort</p> <p>Description Specifies whether the feed item is available in the default community, a specific community, or all communities.</p>
ParentId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p>

Field Name	Details
	<p>Description</p> <p>The ID of the object type to which the feed item is related. For example, set this field to a <code>UserId</code> to post to someone's profile feed. Or set it to an <code>AccountId</code> to post to a specific account.</p>
RelatedRecordId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the <code>ContentVersion</code> object associated with a content post. This field is null for all posts, except <code>ContentPost</code>.</p>
Title	<p>Type</p> <p>string</p> <p>Properties</p> <p>Group, Nillable, Sort</p> <p>Description</p> <p>The title of the feed item. When the <code>Type</code> is <code>LinkPost</code>, the <code>LinkUrl</code> is the URL, and this field is the link name.</p>
Type	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>The type of feed item.</p>
Visibility	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Filter, Group, Nillable, Restricted picklist, Sort</p> <p>Description</p> <p>Specifies whether this feed item is available to all users or only internal users.</p>

LinkedArticleHistory

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Knowledge must be set up in your org.

Fields

Field Name	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed.</p>
LinkedArticleId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the tracked linked article. The history is displayed on the detail page for this record.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The value of the field before it was changed.</p>

ListEmail

Represents a list email in Salesforce. Available in API version 41.0 and later. Has a one-to-many relationship with ListEmailRecipientSource.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
FromAddress	<p>Type string</p> <p>Properties Create Filter Update</p> <p>Description Read-only except when list email is in draft state. Validated against user's addresses.</p>
FromName	<p>Type string</p> <p>Properties Create Filter Nillable Update</p> <p>Description Read-only except when list email is in draft state. Validated against user's addresses.</p>
HasAttachment	<p>Type boolean</p> <p>Properties Defaulted on create Filter Group Sort</p> <p>Description Read-only. Defaulted on create and update. Value is <code>true</code> if the list email has an attachment.</p>

Field	Details
HtmlBody	<p>Type string</p> <p>Properties Create Nillable Update</p> <p>Description The body of the list email.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter Nillable Sort</p> <p>Description The timestamp that indicates when the current user last viewed a record that is related to this list email.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter Nillable Sort</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</p>
Name	<p>Type string</p> <p>Properties Create Filter Group idLookup Sort Update</p> <p>Description Read-only except when list email is in draft state.</p>

Field	Details
OwnerId	<p>Type reference</p> <p>Properties Create Defaulted on create Filter Group Sort Update</p> <p>Description References Group and User.</p>
ScheduledDate	<p>Type dateTime</p> <p>Properties Filter Nillable Sort</p> <p>Description Read-only. If null and <code>Status</code> is set to Scheduled, defaults to created time.</p>
Status	<p>Type picklist</p> <p>Properties Create Filter Group Restricted picklist Sort Update</p> <p>Description Read-only except when list email is in draft state. Changing the status to Scheduled causes the list email to be sent. Valid values:</p> <ul style="list-style-type: none"> • Draft • Scheduled • Sent • Limit Error

Field	Details
	<ul style="list-style-type: none"> • Canceled
Subject	<p>Type string</p> <p>Properties Create Filter Nillable Update</p> <p>Description Read-only except when list email is in draft state.</p>
TextBody	<p>Type string</p> <p>Properties Create Nillable Update</p> <p>Description Read-only except when list email is in draft state.</p>
TotalSent	<p>Type int</p> <p>Properties Filter Group Nillable Sort</p> <p>Description Read-only. The total number of list emails sent, including bounced, opted-out, and invalid To: addresses.</p>

ListEmailRecipientSource

For a list email in Salesforce, represents the source of a recipient's email. Available in API version 41.0 and later.

The visibility and accessibility of this object is inherited from the related list email.

Supported Calls

`create()`, `delete()`, `query()`, `getDeleted()`, `getUpdated()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ListEmailId	<p>Type reference</p> <p>Properties Create Filter Group Sort</p> <p>Description The related list email record. Required on record creation; read-only otherwise.</p>
Name	<p>Type string</p> <p>Properties Autonumber Defaulted on create Filter idLookup Sort</p> <p>Description The auto-generated name of the list email recipient source.</p>
SourceListId	<p>Type reference</p> <p>Properties Create Filter Group Sort Update</p> <p>Description Required. The id of a list view to send the list email to. Read-only except when list email is in draft state.</p>

Field	Details
SourceType	<p>Type reference</p> <p>Properties Create Filter Group Restricted picklist Sort Update</p> <p>Description Required. Read-only except when list email is in draft state. Valid values:</p> <ul style="list-style-type: none"> • Include

ListView

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Name	Details
CreatedBy	<p>Type User</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description The name of the user who created the list view.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Query, Retrieve, Sort</p>

Name	Details
	<p>Description The fully qualified developer name of the list view.</p>
IsSoqlCompatible	<p>Type boolean</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description Whether the list view can be used with SOQL..</p>
LastModifiedBy	<p>Type User</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description The name of the user who last modified the list view.</p>
LastModifiedById	<p>Type ID</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description The ID of the user who last modified the list view.</p>
LastModifiedDate	<p>Type dateTime</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description The date and time of the last modification of the list view, with a precision of one second.</p>
LastReferencedDate	<p>Type dateTime</p> <p>Properties Filter, Query, Retrieve, Sort</p> <p>Description The date and time when the list view was last referenced, with a precision of one second.</p>
LastViewedDate	<p>Type dateTime</p> <p>Properties Filter, Query, Retrieve, Sort</p>

Name	Details
	<p>Description</p> <p>The date and time when the list view was last viewed, with a precision of one second.</p>
Name	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Query, Retrieve, Sort</p> <p>Description</p> <p>The name of the list view.</p>
NamespacePrefix	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Query, Retrieve, Sort</p> <p>Description</p> <p>The namespace of the list view.</p>
SubjectType	<p>Type</p> <p>string</p> <p>Properties</p> <p>Filter, Query, Retrieve, Sort</p> <p>Description</p> <p>The API name of the sObject for the list view.</p>

ListViewChart

Represents a graphical chart that's displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Name	Description
AggregateField	<p>Type</p> <p>string</p>

Name	Description
AggregateType	<p>Properties Create, Filter, Query, Restricted picklist, Retrieve, Sort, Update</p> <p>Description The field that's used for calculating data on each group. <code>AggregateField</code> can't be the same as <code>GroupingField</code>.</p>
ChartType	<p>Type picklist</p> <p>Properties Create, Filter, Query, Retrieve, Sort, Update</p> <p>Description The type of chart to create. The supported chart types are horizontal bar chart, vertical bar chart, and donut chart.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Query, Retrieve, Sort, Update</p> <p>Description The fully qualified developer name of the chart.</p>
GroupingField	<p>Type string</p> <p>Properties Create, Filter, Query, Retrieve, Sort, Update</p> <p>Description The field that's used to divide the data into collections. The field has to be supported by SQL <code>GROUP BY</code> functionality. <code>GroupingField</code> can't be the same as <code>AggregateField</code>.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p>

Name	Description
	<p>Description The language of the <code>MasterLabel</code>.</p>
<code>MasterLabel</code>	<p>Type string</p> <p>Properties Create, Filter, Query, Retrieve, Sort, Update</p> <p>Description The label for the chart.</p>
<code>OwnerId</code>	<p>Type ID</p> <p>Properties Defaulted on create, Filter, Query, Retrieve, Sort</p> <p>Description The ID of the user who owns the chart.</p>
<code>SubjectType</code>	<p>Type string</p> <p>Properties Create, Filter, Query, Retrieve, Sort</p> <p>Description The API name of the <code>sObject</code> for the chart.</p>

ListViewChartInstance

Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
<code>AggregateField</code>	<p>Type string</p>

Field Name	Details
	<p>Properties Filter, Group, Sort</p> <p>Description The field that's used for calculating data on each group. <code>AggregateField</code> can't be the same as <code>GroupingField</code>.</p>
AggregateType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of calculations to run on each group. The supported <code>AggregateType</code> values are <code>Count</code>, <code>Sum</code>, and <code>Avg</code>.</p>
ChartType	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The type of chart to create. The supported chart types are horizontal bar chart, vertical bar chart, and donut chart.</p>
DataQuery	<p>Type textarea</p> <p>Properties Filter, Nillable, Sort</p> <p>Description The SOQL query that can be executed to fetch the data for drawing a chart.</p>
DeveloperName	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description API name of the chart. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>

Field Name

Details

Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

ExternalId

Type

string

Properties

Filter, Group, Nillable, Sort

Description

Reserved for future use.

GroupingField

Type

string

Properties

Filter, Group, Sort

Description

The field that's used to divide the data into collections. The field has to be supported by SOQL `GROUP BY` functionality. `GroupingField` can't be the same as `AggregateField`.

IsDeletable

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

Indicates if the chart can be deleted.

IsEditable

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

Indicates if the chart can be edited. Standard charts are not editable.

IsLastViewed

Type

boolean

Properties

Defaulted on create, Filter, Group, Sort

Description

Indicates if a chart is the last viewed by a user.

Field Name	Details
Label	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description The display name of the chart.</p>
ListViewChartId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the chart created by a user. For standard charts, this is null.</p>
ListViewContextId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the list view in context of which the chart is generated. Required to query <code>ListViewChartInstance</code>.</p>
SourceEntity	<p>Type string</p> <p>Properties Filter, Group, Sort</p> <p>Description API name of the entity to which the chart is related. Required to query <code>ListViewChartInstance</code>.</p>

Usage

Example 1. Retrieve all custom and standard charts for Account entity for All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
and ListViewContextId='00BR0000000U8Hr'
```

Example 2. Retrieve metadata for a specific custom chart by ID for Account entity and All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
```

```
ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
and ListViewContextID='00BR0000000U8Hr' and ListViewChartId='0DdR00000004CBxKAM'
```

Example 3. Retrieve metadata for a specific standard chart by its developer name for Account entity and All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
and ListViewContextID='00BR0000000U8Hr' and DeveloperName='AccountsByIndustry'
```

LiveAgentSession

This object is automatically created for each Life Agent session and stores information about the session. This object is available in API versions 28.0 and later.

Note: Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

Fields

Field Name	Details
AgentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description ID of the agent associated with the session.</p>
ChatReqAssigned	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of chat requests that were assigned to an agent during a session.</p>
ChatReqDeclined	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	Description The number of chat requests that were declined by an agent during a session.
ChatReqEngaged	Type int Properties Create, Filter, Group, Nillable, Sort, Update Description The number of chats in which an agent was engaged during a session.
ChatReqTimedOut	Type int Properties Create, Filter, Group, Nillable, Sort, Update Description The number of chat requests that timed out in an agent's queue during a session.
LastReferencedDate	Type dateTime Properties Filter, Nillable, Sort Description The date and time that the session record was last referenced.
LastViewedDate	Type dateTime Properties Filter, Nillable, Sort Description The date and time that the session record was last viewed.
LoginTime	Type dateTime Properties Create, Filter, Sort, Update Description The date and time an agent logged in during the session.
LogoutTime	Type dateTime Properties Create, Filter, Sort, Update

Field Name	Details
	<p>Description The date and time an agent logged out during a session.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookupSort</p> <p>Description The name of the session.</p>
NumFlagLoweredAgent	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of assistance flags lowered by the agent.</p>
NumFlagLoweredSupervisor	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of assistance flags lowered by the supervisor.</p>
NumFlagRaised	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of assistance flags raised by the agent.</p>
OwnerId	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description ID of the owner of the session record.</p>
TimeAtCapacity	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>The amount of time an agent spent with the maximum number of chats in his or her queue.</p>
TimeIdle	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The amount of time an agent spent idle during the session.</p>
TimeInAwayStatus	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The amount of time an agent spent with a status of "Away" during a session.</p>
TimeInChats	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The amount of time an agent spent engaged in chats during a session.</p>
TimeInOnlineStatus	<p>Type</p> <p>int</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The amount of time an agent spent with a status of "Online" during a session.</p>

Usage

Use this object to query and manage live chat session records.

LiveAgentSessionHistory

This object is automatically created for each Life Agent session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

 **Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed in a session record.</p>
LiveAgentSessionId	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description ID of the session record that was changed.</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed.</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The original value of the field that was changed.</p>

Usage

Use this object to identify changes to live chat session records.

LiveAgentSessionOwnerSharingRule

Represents the rules for sharing a Life Agent session record with users other than the record owner. This object is available in API version 28.0 and later.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, restrictedPicklist, Sort, Update</p> <p>Description Determines the level of access users have to session records. Specifies whether or not users can read, edit, or transfer session records. Corresponds to the Default Access column in the UI.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the UI.</p>

Field	Details
	<p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Session records owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label in the UI.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. The target user or group is being given access.</p>

Usage

Use this object to manage the sharing rules for Life Agent session records.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

LiveAgentSessionShare

This object is automatically created for each Life Agent session and stores information about the session. This object is available in API versions 28.0 and later.

 **Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field Name	Details
<code>AccessLevel</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to the LiveAgentSession. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value is not valid for <code>create()</code> or <code>update()</code> calls.) <p>This value must be set to an access level that is higher than the organization's default access level for live chat transcripts.</p>
<code>ParentId</code>	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent object, if any.</p>
<code>RowCause</code>	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Values can include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The user or group has access because a user with "All" access manually shared the LiveAgentSession with them. • <code>Owner</code>—The user is the owner of the LiveAgentSession or is in a role above the QuickText owner in the role hierarchy.

Field Name	Details
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the user or group that has been given access to the LiveAgentSession.</p>

Usage

This object lets you determine which users and groups can view and edit LiveAgentSession records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

LiveChatBlockingRule

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
Description	<p>Type string</p> <p>Properties Create, Nillable, Update</p> <p>Description The description of the blocking rule—for example, the reason why the given IP address or range of addresses is being banned from starting new chats.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with</p>

Field Name	Details
	<p>a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
FromIpAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The IP address of the user that you want to block, or the beginning of the range of IP addresses you want to block. If you want to block a range of IP addresses, indicate the end of the range in the <code>ToIpAddress</code> field. If you don't indicate an IP address in the <code>ToIpAddress</code> field, the only IP address that will be blocked is the IP address in the <code>FromIpAddress</code> field.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the blocking rule.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label for the blocking rule.</p>
ToIpAddress	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description (Optional) The end of the range of IP addresses that you want to block. The range begins with and includes the IP address in the <code>FromIpAddress</code> field, and it ends with and includes the IP address in the <code>ToIpAddress</code> field.</p>

Usage

Use this object to query and manage rules for blocking customers from starting new chats with agents.

LiveChatButton

Represents a button that allows visitors to request chats with Life Agent users. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
<code>Animation</code>	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The type of animation used when an automated chat invitation appears on-screen. For automated chat invitations only. Available in API version 29.0 and later.</p>
<code>AutoGreeting</code>	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The text that is automatically sent from an agent to a visitor when a chat session starts.</p> <p> Note: A greeting message in the <code>AutoGreeting</code> field of the <code>LiveChatButton</code> object overrides individual users' greeting messages in the <code>AutoGreeting</code> field in the <code>LiveChatUserConfig</code> object.</p>
<code>ChasitorIdleTimeout</code>	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The amount of time a customer has to respond to an agent message before the chat times out.</p>

Field Name	Details
ChasitorIdleTimeoutWarning	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The amount of time a customer has to respond to an agent message before a warning appears and a timer begins a countdown. This value must be shorter than the <code>ChasitorIdleTimeout</code> value (we recommend at least 30 seconds shorter).</p>
ChatPageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the custom Visualforce page that contains the custom chat window code.</p>
CustomAgentName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The custom name of the agent associated with the button. Available in API version 29.0 and later.</p> <p> Note: A custom agent name in the <code>CustomAgentName</code> field of the <code>LiveChatButton</code> object overrides individual users' custom agent name in the <code>CustomAgentName</code> field in the <code>LiveChatUserConfig</code> object.</p>
CustomRoutingClassId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the Apex class you customize to create your custom routing rules if <code>RoutingType</code> equals <code>Custom</code>. Available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p>

Field Name

Details

Description

The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.

Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

HasQueue

Type

boolean

Properties

Create, Defaulted on create, Filter, Group, Sort, Update

Description

Determines whether to allow incoming chat requests to queue until an agent is available.

InviteEndPosition

Type

picklist

Properties

Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Description

The position on-screen where an automated chat invitation's animation ends.

Note: You don't need to select an end position for your automated chat invitation if you use a custom animation.

For automated chat invitations only. Available in API version 29.0 and later.

InviteImageId

Type

reference

Properties

Create, Filter, Group, Nillable, Sort, Update

Description

The record ID of the static image resource displayed on your automated chat invitation. For automated chat invitations only. Available in API version 29.0 and later.

InviteStartPosition

Type

picklist

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The position on-screen where an automated chat invitation's animation begins.</p> <p> Note: You don't need to select a start position for your automated chat invitation if you use a custom animation.</p> <p>For automated chat invitations only. Available in API version 29.0 and later.</p>
IsActive	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description For automated chat invitations, specifies whether an automated chat invitation is active and able to be sent to customers (<code>true</code>) or not (<code>false</code>). For chat buttons, this is set to <code>true</code> by default.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the chat.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label for the live chat button.</p>
NumberOfReroutingAttempts	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Specifies the number of times a chat request can be rerouted to available agents if all agents reject the chat request.</p>
OfflineImageId	<p>Type reference</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the static image resource that is displayed when the button is offline (inactive).</p>
OnlineImageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the static image resource that is displayed when the button is online (active).</p>
OptionsHasChasitorIdleTimeout	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether Customer Time-Out is enabled.</p>
OptionsHasInviteAfterAccept	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether an automated chat invitation can be sent to a customer after that customer has accepted a prior automated chat invitation (<code>true</code>) or not (<code>false</code>). For automated chat invitations only. Available in API version 29.0 and later.</p>
OptionsHasInviteAfterReject	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether an automated chat invitation can be sent to a customer after that customer has rejected a prior automated chat invitation (<code>true</code>) or not (<code>false</code>). For automated chat invitations only. Available in API version 29.0 and later.</p>

Field Name	Details
OptionsHasRerouteDeclinedRequest	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether a chat request that has been rejected by all available agents should be rerouted to available agents again (<code>true</code>) or not (<code>false</code>).</p>
OptionsIsAutoAccept	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether a chat request should be automatically accepted by the agent it's assigned to (<code>true</code>) or not (<code>false</code>). For chat buttons and automated chat invitations with <code>RoutingType</code> set to <code>Most Available</code> or <code>Least Active</code>. Available in API version 30.0 and later.</p>
OptionsIsInviteAutoRemove	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether an automated chat invitation should be automatically removed from the screen after a certain amount of time (<code>true</code>) or not (<code>false</code>). For automated chat invitations only. Available in API version 29.0 and later.</p>
OverallQueueLength	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The maximum number of chat requests allowed to queue.</p>
PerAgentQueueLength	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The maximum number of chat requests allowed to queue for each agent with the required skill.</p>

Field Name	Details
PostchatPageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the custom Visualforce page displayed when the chat ends.</p>
PostchatUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL the user is directed to after the chat ends.</p>
PrechatFormPageId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the custom Visualforce page displayed before the chat begins.</p>
PrechatFormUrl	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The URL the user is directed to before the chat begins.</p>
PushTimeout	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of seconds an agent has to answer a chat request before it's routed to the next available agent.</p>
RoutingType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>How chat requests are routed to agents. The values are:</p> <ul style="list-style-type: none"> • Choice—Incoming chat requests are added to the queue in Life Agent in the Salesforce console and are available to any agent with the required skill. • Least Active—Incoming chats are routed to the agent with the required skill who has the fewest active chats. • Most Available—Incoming chats are routed to the agent with the required skill and the greatest difference between chat capacity and active chat sessions. For example, if Agent A and Agent B each have a chat capacity of five, and Agent A has three active chat sessions while Agent B has one, incoming chats will be routed to Agent B. • Omni—Incoming chats are routed using Omni-Channel queues.
SiteId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the site used for loading static resources and custom Visualforce pages.</p>
SkillId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the skill used to route incoming chat requests. To associate multiple skills with a live chat button, reference one skill in the <code>SkillId</code> field and use LiveChatButtonSkill junction objects for the remaining skills.</p>
TimeToRemoveInvite	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of seconds an automated invitation stays on-screen before it is automatically removed. For automated chat invitations only. Available in API version 29.0 and later.</p>
Type	<p>Type picklist</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description The type of element to display to customers (either a chat button or an automated invitation).</p>
WindowLanguage	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language used for standard chat windows. Custom chat windows use the language of the user's browser.</p>

Usage

Use this object to query and manage live chat buttons and automated chat invitations.

LiveChatButtonDeployment

Associates a Live Agent automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
ButtonId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the automated invitation associated with the deployment.</p>
DeploymentId	<p>Type reference</p> <p>Properties Create, Filter, Group, NillableSort</p>

Field Name	Details
	<p>Description</p> <p>The ID of the deployment that will feature the automated invitation.</p>

Usage

Use this object to associate automated chat invitations with specific deployments.

LiveChatButtonSkill

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `update()`

Fields

Field Name	Details
ButtonID	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Sort</p> <p>Description</p> <p>The record ID of the button.</p>
SkillID	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The record ID of the skill.</p>

Usage

Use this object to assign a specific skill to a specific button for multi-skill routing. For example:

```
String myButtonId = "button_Id";
String myButtonDevName = "button_DeveloperName";
List<String> skillIds = new List<String>();
```

```
//Get one skill ID from button
for(LiveChatButton lcb : [SELECT SkillId FROM LiveChatButton WHERE DeveloperName =:
myButtonDevName]) {
    skillIds.add(lcb.SkillId);
}
//Get remaining skills from LiveChatButtonSkill join object
for(LiveChatButtonSkill lcbs : [SELECT SkillID FROM LiveChatButtonSkill WHERE ButtonId =:
myButtonId]) {
    skillIds.add(lcbs.SkillId);
}
//Retrieve all skills into a single list
List<Skill> skills = [SELECT Id, DeveloperName FROM Skill WHERE Id IN :SkillIds];
```

LiveChatDeployment

Represents the general settings for deploying Life Agent on a website. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
BrandingId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the static image resource that's displayed in the chat window</p>
ConnectionTimeoutDuration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Indicates the amount of time before the chat times out, in seconds.</p>
ConnectionWarningDuration	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description</p> <p>Indicates the amount of time before a time-out warning is displayed to the agent, in seconds.</p>
DeveloperName	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Sort, Update</p> <p>Description</p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
Domains	<p>Type</p> <p>textarea</p> <p>Properties</p> <p>Create, Filter (unavailable in API version 25.0 and later), Nillable, Sort (unavailable in API version 25.0 and later), Update</p> <p>Description</p> <p>A comma-separated list of domains the deployment is whitelisted for. Leave this blank to allow the deployment to be used on any domain.</p>
HasTranscriptSave	<p>Type</p> <p>boolean</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description</p> <p>Determines whether visitors can download and save transcripts from the chat window</p>
Language	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The language of the deployment</p>

Field Name	Details
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the deployment</p>
MobileBrandingId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the static image resource displayed in the mobile version of the chat window</p>
OptionsHasPrechatApi	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether developers can access the Pre-Chat API</p>
SiteId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the site used for loading static resources</p>
WindowTitle	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The text displayed in the title bar of the browser window used to launch the chat window</p>

Usage

Use this object to query and manage live chat deployments.

LiveChatSensitiveDataRule

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ActionType	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklistSort, Update</p> <p>Description The action to take on the text (remove or replace) when the sensitive data rule is triggered.</p>
Description	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The description of the sensitive data rule—for example, “Block social security numbers.”</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is</p>

Field Name	Details
	specified, performance may slow while Salesforce generates one for each record.
EnforceOn	<p>Type int</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Determines the roles on which the rule is enforced. The value is determined using bitwise OR operation. There are seven possible values:</p> <ol style="list-style-type: none"> 1. Rule enforced on Agent 2. Rule enforced on Visitor 3. Rule enforced on Agent and Visitor 4. Rule enforced on Supervisor 5. Rule enforced on Agent and Supervisor 6. Rule enforced on Visitor and Supervisor 7. Rule enforced on Agent, Visitor, and Supervisor
IsEnabled	<p>Type boolean</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Specifies whether a sensitive data rule is active (<code>true</code>) or not (<code>false</code>). Default value (if none is provided) is <code>false</code>.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the sensitive data rule.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description Label for the sensitive data rule.</p>

Field Name	Details
NamespacePrefix	<p>Type string</p> <p>Properties Filter, Nillable</p> <p>Description The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <i>namespacePrefix__componentName</i> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
Pattern	<p>Type textarea</p> <p>Properties Create, Update</p> <p>Description The pattern of text blocked by the rule. Written as a JavaScript regular expression (regex).</p>
Replacement	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The string of characters that replaces the blocked text (if <code>ActionType Replace</code> is selected).</p>

Usage

Use this object to mask or delete data of specified patterns, such as credit card, social security, phone and account numbers, or even profanity.

LiveChatTranscript

This object is automatically created for each Life Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
Abandoned	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The amount of time in seconds an incoming chat request remained unanswered by an agent before the chat was disconnected by the customer.</p>
AccountId	<p>Type ID</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description ID of the account associated with the chat transcript.</p>
AverageResponseTimeOperator	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The agent's average response time (in seconds) to chat messages from the visitor.</p>
AverageResponseTimeVisitor	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The visitor's average response time (in seconds) to chat messages from the agent.</p>

Field Name	Details
Body	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The contents of the chat.</p>
Browser	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The browser the visitor used for the chat.</p>
BrowserLanguage	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The language of the visitor's browser.</p>
CaseID	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the case associated with the chat transcript.</p>
ChatDuration	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The total duration of the chat in seconds.</p>
ChatKey	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The session ID of the chat before it is persisted. <code>ChatKey</code> can be used with advanced integrations in the Salesforce console. This field is available in API version 25.0 and later.</p>
ContactID	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p>Description</p> <p>The ID of the contact associated with the chat transcript.</p>
EndedBy	<p>Type</p> <p>picklist</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description</p> <p>The way the chat was ended: by the operator, the visitor, or the system.</p>
EndTime	<p>Type</p> <p>dateTime</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The time the chat ended.</p>
IpAddress	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The visitor's IP address.</p>
LastReferencedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p> <p>Description</p> <p>The timestamp for when the current user last viewed a record related to this record.</p>

Field Name	Details
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LeadID	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the lead associated with the chat transcript.</p>
LiveChatButtonID	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The ID of the LiveChatButton the chat session originated from.</p>
LiveChatDeploymentID	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Type The ID of the LiveChatDeployment the chat session originated from.</p>
LiveChatVisitorID	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the visitor associated with the chat transcript.</p>
Location	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The best-guess approximation of the visitor's location.</p>
MaxResponseTimeOperator	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The maximum time in seconds it took an agent to respond to a chat visitor's message.</p>
MaxResponseTimeVisitor	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p> <p>Description The maximum time in seconds it took a customer to respond to an agent's message.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the transcript.</p>
OperatorMessageCount	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of messages sent by agent(s) during the chat.</p>
OwnerID	<p>Type reference</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description The ID of the operator who participated in the chat last; for missed chats, this is a system user.</p>

Field Name	Details
Platform	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The visitor's operating system platform.</p>
ReferrerUri	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Where the chat request originated.</p>
RequestTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description The time the visitor requested the chat.</p>
ScreenResolution	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The visitor's screen resolution.</p>
SkillId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The record ID of the primary Skill associated with the LiveChatButton the chat session originated from. To associate multiple skills with a LiveChatTranscript, use LiveChatTranscriptSkill junction objects.</p>
StartTime	<p>Type dateTime</p> <p>Properties Create, Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The time the chat started.</p>
Status	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The final status of the chat: completed, missed, dropped or blocked.</p>
SupervisorTranscriptBody	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The text body of the supervisor's chat transcript.</p>
UserAgent	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The visitor's user agent string.</p>
VisitorMessageCount	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The number of messages sent by the visitor during the chat.</p>
VisitorNetwork	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The network or service provider the chat visitor used for the chat.</p>
WaitTime	<p>Type int</p> <p>Properties Filter, Group, Nillable, Sort</p>

Field Name	Details
	<p>Description</p> <p>The total amount of time in seconds a chat request was waiting to be accepted by an agent.</p>

Usage

Use this object to query and manage live chat transcripts.

LiveChatTranscriptEvent

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
AgentId	<p>Type</p> <p>reference</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>The ID of the agent associated with the event.</p>
Detail	<p>Type</p> <p>string</p> <p>Properties</p> <p>Create, Filter, Group, Nillable, Sort</p> <p>Description</p> <p>Details associated with the event.</p>
LastReferencedDate	<p>Type</p> <p>date</p> <p>Properties</p> <p>Filter, Nillable, Sort, Update</p>

Field Name	Details
	<p>Description The timestamp for when the current user last viewed a record related to this record.</p>
LastViewedDate	<p>Type date</p> <p>Properties Filter, Nillable, Sort, Update</p> <p>Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (<code>LastReferencedDate</code>) and not viewed.</p>
LiveChatTranscriptId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID of the live chat transcript associated with the event.</p>
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the event.</p>
Time	<p>Type dateTime</p> <p>Properties Create, Filter, Sort</p> <p>Description The time at which the event happened.</p>
Type	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort</p> <p>Description The kind of event that occurred.</p>

Usage

Use this object to query and manage live chat transcript events.

LiveChatTranscriptHistory

Represents changes to field values on a LiveChatTranscript object. This object is available in API version 24.0 and later.

Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
Field	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description The name of the field that was changed</p>
LiveChatTranscriptID	<p>Type reference</p> <p>Properties Filter, Group, Sort</p> <p>Description The ID of the transcript that was changed</p>
NewValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The new value of the field that was changed</p>
OldValue	<p>Type anyType</p> <p>Properties Nillable, Sort</p> <p>Description The old value of the field that was changed</p>

Usage

Use this object to identify changes to a live chat transcript.

LiveChatTranscriptOwnerSharingRule

Represents the rules for sharing a Life Agent chat transcript record with users other than the record owner. This object is available in API version 29.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, restrictedPicklist, Sort, Update</p> <p>Description Determines the level of access users have to chat transcript records. Specifies whether or not users can read, edit, or transfer chat transcript records. Corresponds to the Default Access column in the UI.</p>
Description	<p>Type textarea</p> <p>Properties Create, Filter, Nillable, Sort, Update</p> <p>Description A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>

Field	Details
	<p>In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the UI.</p> <p> Note: When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p>
GroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the source group. Chat transcript records owned by users in the source group trigger the rule to give access.</p>
Name	<p>Type string</p> <p>Properties Create, Filter, Group, idLookup, Sort, Update</p> <p>Description Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label in the UI.</p>
UserOrGroupId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The ID representing the target user or group. The target user or group is being given access.</p>

Usage

Use this object to manage the sharing rules for Life Agent chat transcript records.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

LiveChatTranscriptShare

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field Name	Details
AccessLevel	<p>Type picklist</p> <p>Properties Create, Filter, Group, Restricted picklist, Sort, Update</p> <p>Description Level of access that the User or Group has to the LiveChatTranscript. The possible values are:</p> <ul style="list-style-type: none"> • Read • Edit • All (This value is not valid for <code>create()</code> or <code>update()</code> calls.) <p>This value must be set to an access level that is higher than the organization's default access level for live chat transcripts.</p>
ParentId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the parent object, if any</p>
RowCause	<p>Type picklist</p> <p>Properties Filter, Group, Restricted picklist, Sort</p> <p>Description Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Values may include:</p> <ul style="list-style-type: none"> • <code>Manual</code>—The User or Group has access because a user with "All" access manually shared the LiveChatTranscript with them. • <code>Owner</code>—The User is the owner of the LiveChatTranscript or is in a role above the QuickText owner in the role hierarchy.

Field Name	Details
UserOrGroupID	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description ID of the User or Group that has been given access to the LiveChatTranscript.</p>

Usage

This object lets you determine which users and groups can view and edit LiveChatTranscript records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

LiveChatTranscriptSkill

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Fields

Field Name	Details
Name	<p>Type string</p> <p>Properties Autonumber, Defaulted on create, Filter, idLookup, Sort</p> <p>Description The name of the transcript.</p>
SkillId	<p>Type reference</p> <p>Properties Create, Filter, Group, Nillable, Sort</p> <p>Description The record ID of the skill.</p>

Field Name	Details
TranscriptId	<p>Type reference</p> <p>Properties Create, Filter, Group, Sort</p> <p>Description The record ID of the transcript.</p>

Usage

Use this object to assign a specific skill to a specific transcript for multi-skill routing.

LiveChatUserConfig

Represents a setting that controls the console settings for Life Agent users. This object is available in API version 24.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
AutoGreeting	<p>Type textarea</p> <p>Properties Create, Nillable, Update</p> <p>Description The text that is automatically sent from an agent to a visitor when a chat session starts.</p>
Capacity	<p>Type int</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description Limits the number of active chat session an agent can engage in.</p>
CriticalWaitTime	<p>Type int</p>

Field Name	Details
	<p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The amount of time before a chat flashes to alert an agent to answer it.</p>
CustomAgentName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The custom name of the agent associated with the Life Agent configuration.</p>
DeveloperName	<p>Type string</p> <p>Properties Create, Filter, Group, Nillable, Sort, Update</p> <p>Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p>
HasLogoutSound	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether a sound plays when an agent logs out of the console.</p>
HasNotifications	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether desktop notifications are enabled for the configuration. Available in API version 25.0 and later.</p>

Field Name	Details
HasRequestSound	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether a sound plays when a chat request comes in.</p>
HasSneakPeek	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether an agent sees a real-time preview of the messages a visitor types.</p>
IsAutoAwayOnDecline	<p>Type boolean</p> <p>Properties Create, Defaulted on create, Filter, Group, Sort, Update</p> <p>Description Determines whether agents' status is automatically changed to Away when they decline a chat request. Available in API version 26.0 and later.</p>
Language	<p>Type picklist</p> <p>Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p>Description The language of the configuration.</p>
MasterLabel	<p>Type string</p> <p>Properties Create, Filter, Group, Sort, Update</p> <p>Description The name of the configuration.</p>
OptionsHasAgentFileTransfer	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field Name	Details
	<p>Description Determines whether agents can initiate a file transfer from a chat customer. Available in API version 31.0 and later.</p>
OptionsHasAgentSneakPeek	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether Sneak Peek is enabled for agents. Available in API version 29.0 and later.</p>
OptionsHasAssistanceFlag	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether assistance flags are enabled for agents. Available in API version 29.0 and later.</p>
OptionsHasChatConferencing	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether agents can invite other agents into a customer chat. Available in API version 34.0 and later.</p>
OptionsHasChatMonitoring	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether supervisors can view agents' ongoing chats. Available in API version 29.0 and later.</p>
OptionsHasChatTransferToAgent	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field Name	Details
	<p>Description Specifies whether an agent can transfer a chat directly to another agent. Available in API version 36.0 and later.</p>
OptionsHasChatTransferToButton	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether an agent can transfer a chat to an agent assigned to a particular chat button. Available in API version 36.0 and later.</p>
OptionsHasChatTransferToSkill	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Specifies whether an agent can transfer a chat to agents assigned to a particular skill. Available in API version 36.0 and later.</p>
OptionsHasVisitorBlocking	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether an agent has the ability to block troublesome visitors by IP address. Available in API version 34.0 and later.</p>
OptionsHasWhisperMessage	<p>Type boolean</p> <p>Properties Create, Filter, Update</p> <p>Description Determines whether supervisors can send private messages to agents within an agent's chat with a customer. Available in API version 29.0 and later.</p>
OptionsIsAutoAwayOnPushTimeout	<p>Type boolean</p> <p>Properties Create, Filter, Update</p>

Field Name	Details
