Last updated: May 25, 2021

CONTENTS

GETTING STARTED

CHAPTER 1 Introducing SOAP API

In this chapter ...

Salesforce provides programmatic access to your org's information using simple, powerful, and secure application programming interfaces. To use this document, you should have a basic familiarity with software development, web services, and the Salesforce user interface.

Any functionality described in this guide is available if your org has the API feature enabled. This feature is enabled by default for Performance, Unlimited, Enterprise, and Developer Editions. Some Professional Edition orgs have the API enabled. If you can't access the features you see in this guide, contact Salesforce.

Note: Salesforce Education Services offers a suite of training courses to enable developers to design, create, integrate, and extend applications built on the Lightning platform. Be sure to visit http://www.salesforce.com/training to learn more.

When to Use the SOAP API

The Salesforce prebuilt applications provide powerful CRM functionality. In addition, Salesforce provides the ability to customize the prebuilt applications to fit your organization. However, your organization may have complex business processes that are unsupported by the existing functionality. In this case, Lightning Platform provides various ways for advanced administrators and developers to build custom functionality. These include SOAP API, Apex, and Visualforce.

SOAP API

Use SOAP API to create, retrieve, update or delete records, such as accounts, leads, and custom objects. With more than 20 different calls, SOAP API also allows you to maintain passwords, perform searches, and much more. Use SOAP API in any language that supports web services.

REST API

REST API provides a powerful, convenient, and simple REST-based web services interface for interacting with Salesforce. Its advantages include ease of integration and development, and it's an excellent choice of technology for use with mobile applications and web projects. For certain projects, you may want to use REST API with other Salesforce REST APIs. To build UI for creating, reading, updating, and deleting records, including building UI for list views, actions, and dependent picklists, use User Interface API. To build UI for B2B Commerce on Lightning, CMS managed content, Experience Cloud sites, or Chatter, use Connect REST API. If you have many records to process, consider using Bulk API, which is based on REST principles and optimized for large sets of data.

Bulk API

Bulk API is based on REST principles and is optimized for loading or deleting large sets of data. You can use it to query, queryAll, insert, update, upsert, or delete many records asynchronously by submitting batches. Salesforce processes batches in the background.

SOAP API, in contrast, is optimized for real-time client applications that update a few records at a time. You can use SOAP API for processing many records, but when the data sets contain hundreds of thousands of records, SOAP API is less practical. Bulk API is designed to make it simple to process data from a few thousand to millions of records.

Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your org. The most common use is to migrate changes from a sandbox or testing org to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

The easiest way to access the functionality in Metadata API is to use the Salesforce Extensions for Visual Studio Code or the Ant Migration Tool. Both tools are built on top of Metadata API and use the standard tools to simplify working with Metadata API.

- The Salesforce Extensions for Visual Studio Code includes tools for developing on the Salesforce platform in the lightweight, extensible VS Code editor. These tools provide features for working with development orgs (scratch orgs, sandboxes, and DE orgs), Apex, Aura components, and Visualforce.
- The Ant Migration Tool is ideal if you use a script or the command line for moving metadata between a local directory and a Salesforce org.

Apex

Use Apex if you want to:

- Create Web services.
- Create email services.
- Perform complex validation over multiple objects.
- Create complex business processes that are not supported by workflow.
- Create custom transactional logic (logic that occurs over the entire transaction, not just with a single record or object).
- Attach custom logic to another operation, such as saving a record, so that it occurs whenever the operation is executed, regardless of whether it originates in the user interface, a Visualforce page, or from SOAP API.

For more information, see the *Apex Developer Guide*.

Visualforce

Visualforce consists of a tag-based markup language that gives developers a more powerful way of building applications and customizing the Salesforce user interface. With Visualforce you can:

- Build wizards and other multistep processes.
- Create your own custom flow control through an application.
- Define navigation patterns and data-specific rules for optimal, efficient application interaction.

For more information, see the *Visualforce Developer's Guide*.

Customize, Integrate, and Extend Your Salesforce Solutions

The Lightning Platform allows you to customize, integrate, and extend your Salesforce organization using the language and platform of your choice:

- **Customize Salesforce** with custom fields, links, objects, page layouts, buttons, record types, s-controls, and tabs to meet specific business requirements.
- **Integrate Salesforce** with your org's ERP and finance systems. Deliver real-time sales and support information to company portals and populate critical business systems with customer information.
- **Extend Salesforce** in presentation, business logic, and data services with new functionality that reflects the business requirements of your org.

For more information about Lightning Platform solutionsand developer resources, go to Salesforce Developers.

Supported Salesforce Editions

To use SOAP API, your org must use Enterprise Edition, Performance Edition, Unlimited Edition, or Developer Edition. If you're an existing Salesforce customer and want to upgrade to Enterprise, Unlimited, or Performance Edition, contact your account representative.

It is recommended that you use Developer Sandbox to develop Web service client applications. Developer Sandbox is an exact replica of your Salesforce deployment, including all customization and data. For more information, see Deploy Enhancements from Sandboxes.

Developer Edition provides access to all features available with Enterprise Edition. Developer Edition is constrained only by the number of users and the amount of storage space. Developer Edition provides a development context that allows you to build and test your solutions without affecting your org's live data. Developer Edition accounts are available for free at `developer.salesforce.com/gettingstarted`.

Standards Compliance

SOAP API is implemented to comply with the following specifications:

Standard Name	Website
Simple Object Access Protocol (SOAP) 1.1	https://www.w3.org/TR/2000/NOTE-SOAP-20000508/
Web Service Description Language (WSDL) 1.1	http://www.w3.org/TR/2001/NOTE-wsdl-20010315
WS-I Basic Profile 1.1	http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html

Development Platforms

SOAP API works with current SOAP development environments, including, but not limited to, Visual Studio .NET 2005. In this document, we provide examples in Java and C# (.NET). The Java examples are based on WSC 20.0 (WSC) and JDK 6 (Java Platform Standard Edition Development Kit 6). Other versions of WSC are available at `https://github.com/forcedotcom/wsc` and `http://mvnrepository.com/artifact/com.force.api/force-wsc`. To see a complete list of compatible development platforms and more sample code, go to `developer.salesforce.com`.

Note: Development platforms vary in their SOAP implementations. Implementation differences in certain development platforms might prevent access to some or all features of the API. If you are using Visual Studio for .NET development, we recommend that you use Visual Studio 2003 or higher.

SOAP API Support Policy

Salesforce recommends that your new client applications use the most recent version of the Lightning Platform WSDL file to fully exploit the benefits of richer features and greater efficiency. You can navigate to the most recent WSDL for your organization from Setup by entering *API* in the Quick Find box, then selecting **API**. When a new version is released, use the following steps in Quick Start to update your WSDL:

- Regenerate the WSDL file (see Step 2: Generate or Obtain the Web Service WSDL)
- Import it into your environment (see Step 3: Import the WSDL File Into Your Development Platform)

Backward Compatibility

Salesforce strives to make backward compatibility easy when using the Lightning platform.

Each new Salesforce release consists of two components:

- A new release of platform software that resides on Salesforce systems
- A new version of SOAP API

For example, the Winter '07 release included SOAP API version 9.0 and the Summer '07 release included SOAP API version 10.0.

We maintain support for each SOAP API version across releases of the platform software. SOAP API is backward compatible in that an application created to work with a given SOAP API version will continue to work with that same SOAP API version in future platform software releases.

Salesforce does not guarantee that an application written against one SOAP API version will work with future SOAP API versions: Changes in method signatures and data representations are often required as we continue to enhance SOAP API. However, we strive to keep SOAP API consistent from version to version with minimal, if any, changes required to port applications to newer SOAP API versions.

For example, an application written using SOAP API version 9.0 which shipped with the Winter '07 release will continue to work with SOAP API version 9.0 on the Summer '07 release and on future releases beyond that. However, that same application may not work with SOAP API version 10 without modifications to the application.

API End-of-Life

Salesforce is committed to supporting each API version for a minimum of three years from the date of first release. In order to mature and improve the quality and performance of the API, versions that are more than three years old might cease to be supported.

When an API version is to be deprecated, advance notice is given at least one year before support ends. Salesforce will directly notify customers using API versions planned for deprecation.

Note: Versions 7.0 through 20.0 of SOAP API will be retired in the Summer '21 release. For more information, see Knowledge Article: Lightning Platform API legacy versions retirement.

Choosing a WSDL

There are two Lightning Platform Web services for which you can obtain WSDL files for API access:

- **Lightning Platform Enterprise WSDL**—This API is for most enterprise users who are developing client applications for their org. The enterprise WSDL file is a strongly typed representation of your org's data. It provides information about your schema, data types, and fields to your development environment, allowing for a tighter integration between it and the Lightning Platform Web service. This WSDL changes if custom fields or custom objects are added to, renamed, or removed from, your org's Salesforce configuration. If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL.

  Note the following when generating the enterprise WSDL:

  - If new custom fields or objects are added to, renamed, or removed from your org's information, you must regenerate the WSDL file to access them.
  - The generated WSDL contains the objects and fields in your org, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.

- **Lightning Platform Partner WSDL**—This API is for Salesforce partners who are developing client applications for multiple orgs. As a loosely-typed representation of the Salesforce object model, the partner WSDL can be used to access data within any org.

Related Resources

The Salesforce developer website provides a full suite of developer toolkits, sample code, sample SOAP messages, community-based support, and other resources to help you with your development projects. Be sure to visit `developer.salesforce.com/gettingstarted` for more information, or visit `developer.salesforce.com/signup` to sign up for a free Developer Edition account.

You can visit these websites to find out more about Salesforce applications:

- Salesforce for information about the Salesforce application.

- Salesforce AppExchange for access to apps created for Salesforce.
- Trailblazer Community for services to ensure Salesforce customer success.

Quick Start

Use this quick start to create a sample application in your development environment.

Note: Before you begin building an integration or other client application:

- Install your development platform according to its product documentation.
- Read through all the steps before beginning this quick start. You may also wish to review the rest of this document to familiarize yourself with terms and concepts.

Step 1: Obtain a Salesforce Developer Edition Organization

If you are not already a member of the Lightning Platform developer community, go to `developer.salesforce.com/signup` and follow the instructions for signing up for a Developer Edition organization. Even if you already have Enterprise Edition, Unlimited Edition, or Performance Edition, use Developer Edition for developing, staging, and testing your solutions against sample data to protect your organization's live data. This is especially true for applications that insert, update, or delete data (as opposed to simply reading data).

If you already have a Developer Edition organization, verify that you have the API Enabled permission. This permission is enabled by default, but may have been changed by an administrator. For more information, see the help in the Salesforce user interface.

Step 2: Generate or Obtain the Web Service WSDL

To access the Lightning Platform Web service, you need a Web Service Description Language (WSDL) file. The WSDL file defines the Web service that is available to you. Your development platform uses this WSDL to generate an API to access the Lightning Platform Web service it defines. You can either obtain the WSDL file from your organization's Salesforce administrator or you can generate it yourself if you have access to the WSDL download page in the Salesforce user interface. You can navigate to the most recent WSDL for your organization from Setup by entering *`API`* in the Quick Find box, then selecting **API**.

For more information about WSDL, see `http://www.w3.org/TR/wsdl`.

Generating the WSDL File for Your Organization

Any user with the Modify All Data permission can download the Web Services Description Language (WSDL) file to integrate and extend Salesforce using the API. (The System Administrator profile has this permission.)

The WSDL file is dynamically generated based on which type of WSDL file (enterprise or partner) you download. The generated WSDL defines all of the API calls, objects (including standard and custom objects), and fields that are available for API access for your organization.

To generate the WSDL file for your organization:

1. Log in to your Enterprise, Unlimited, Performance, or Developer Edition Salesforce account. You must log in as an administrator or as a user who has the "Modify All Data" permission. Logins are checked to ensure they are from a known IP address. For more information, see "Restrict Where and When Users Can Log In to Salesforce" in the Salesforce online help.
2. From Setup, enter *`API`* in the Quick Find box, then select **API** to display the WSDL download page.
3. Download the appropriate WSDL:
   - If you're downloading an enterprise WSDL and you have managed packages installed in your org, click **Generate Enterprise WSDL**. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.

- Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As**.

Step 3: Import the WSDL File Into Your Development Platform

Once you have the WSDL file, you need to import it into your development platform so that your development environment can generate the necessary objects for use in building client Web service applications in that environment. This section provides sample instructions for WSC and Microsoft Visual Studio. For instructions about other development platforms, see your platform's product documentation.

Note: The process for importing WSDL files is identical for the enterprise and partner WSDL files.

Instructions for Java Environments (WSC)

Java environments access the API through Java objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Each SOAP client has its own tool for this process. For WSC, use the `wsdlc` utility.

Note: Before you run `wsdlc`, you must have the WSC JAR file installed on your system and referenced in your classpath.

The basic syntax for `wsdlc` is:

```
java -classpath pathToJAR/wsc-22.jar com.sforce.ws.tools.wsdlc pathToWsdl/WsdlFilename
pathToOutputJar/OutputJarFilename
```

This command generates an output jar file based on the specified WSDL file. After the output jar file is created, reference it along with the wsc jar file (for example, wsc-22.jar) in your Java program to create a client application.

Instructions for Microsoft Visual Studio

Visual Studio languages access the API through objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization's WSDL file.

Once you have the proxy classes for the server-side objects, you need to ensure that you specify whether you have set any values on non-string fields. For more information, see Implementation Considerations.

Visual Studio provides two approaches for importing your WSDL file and generating an XML Web service client: an IDE-based approach and a command line approach. This walkthrough describes how to import your WSDL file through the IDE.

Note: Before you begin, the first step is to create a new application or open an existing application in Visual Studio. In addition, you need to have generated the WSDL file, as described in Generating the WSDL File for Your Organization.

An XML Web service client is any component or application that references and uses an XML Web service. This does not necessarily need to be a client-based application. In fact, in many cases, your XML Web service clients might be other Web applications, such as Web Forms or even other XML Web services. When accessing XML Web services in managed code, a proxy class and the .NET Framework handle all of the infrastructure coding.

To access an XML Web service from managed code:

1. Name your project `Walkthrough` or change the `using` directive in the following sample to *`your_project_name.web_reference_name`*. Then, add a Web reference to your project for the XML Web service that you want to access. The Web reference creates a proxy class with methods that serve as proxies for each exposed method of the XML Web service.
2. Add the namespace for the Web reference.

3. Create an instance of the proxy class and then access the methods of that class as you would the methods of any other class.

You can add either a .NET 2.0 style Web reference, or a .NET 3.0 style Service reference, depending on your version of Visual Studio and preferred developer environment. A .NET 3.0 style reference uses services like SoapClient instead of SforceService.

To add a Web reference:

Note: These steps may be different depending on the version of Visual Studio that you're using. For more information, see "Adding and Removing Web References" in the Visual Studio documentation.

1. If you are using Visual Studio 2010 or earlier, on the Project menu, choose **Add Web Reference.** For later versions of Visual Studio, on the Project menu, choose **Add Service Reference**, select **Advanced** and then select **Add Web Reference**.
2. In the URL box of the Add Web Reference dialog box, type the URL to obtain the service description of the XML Web service you want to access, such as:

   `c:\WSDLFiles\enterprise.wsdl`

3. Click **Go** to retrieve information about the XML Web service.
4. In the Web reference name box, rename the Web reference to `sforce`, which is the name you will use for this Web reference.
5. Click **Add Reference** to add a Web reference for the target XML Web service.
6. Visual Studio retrieves the service description and generates a proxy class to interface between your application and the XML Web service.

Note: If you are using Visual Basic .Net 1.1 and the enterprise WSDL, you will need to modify the generated Web service client to overcome a bug in Visual Studio's client generation utility. The API exposes two objects (Case and Event) whose names conflict with Visual Basic keywords. When the classes that represent these objects are created, Visual Studio wraps the class names with brackets (`[Case]` and `[Event]`). This is the method by which you can reuse keywords.

Unfortunately, in the definition of the `sObject` class, Visual Studio does not wrap Case and Event to class references in the `System.Xml.Serialization.XmlIncludeAttribute` that are part of the `sObject` definition. To work around this problem in Visual Studio, you need to edit the `XmlIncludeAttribute` settings for Case and Event as shown below. This does not apply to C# and only applies when using the enterprise version of the WSDL.

```
    System.Xml.Serialization.XmlIncludeAttribute(GetType([Event])), _

    System.Xml.Serialization.XmlIncludeAttribute(GetType([Case])), _
```

Step 4: Walk Through the Sample Code

Once you have imported your WSDL file, you can begin building client applications that use the API. Use the following samples to create a basic client application. Comments embedded in the sample explain each section of code.

Java Sample Code

This section walks through a sample Java client application that uses the WSC SOAP client. The purpose of this sample application is to show the required steps for logging into the login server and to demonstrate the invocation and subsequent handling of several API calls.

To run this sample, you must pass the authentication endpoint URL as an argument for your program. You can obtain this URL from the WSDL file. This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.

2. Calls `login()` to log in to the single login server and, if the login succeeds, retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines the objects that are available to the logged in user. This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The DescribeGlobalResult is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string `("SELECT FirstName, LastName FROM Contact")`, and iterating through the returned QueryResult.
6. Calls `logout()` to the log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

```
package com.example.samples;

import java.io.BufferedReader;
import java.io.FileNotFoundException;
import java.io.InputStreamReader;
import java.io.IOException;
import com.sforce.soap.enterprise.DeleteResult;
import com.sforce.soap.enterprise.DescribeGlobalResult;
import com.sforce.soap.enterprise.DescribeGlobalSObjectResult;
import com.sforce.soap.enterprise.DescribeSObjectResult;
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.soap.enterprise.Error;
import com.sforce.soap.enterprise.Field;
import com.sforce.soap.enterprise.FieldType;
import com.sforce.soap.enterprise.GetUserInfoResult;
import com.sforce.soap.enterprise.LoginResult;
import com.sforce.soap.enterprise.PicklistEntry;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.sobject.Account;
import com.sforce.soap.enterprise.sobject.Contact;
import com.sforce.soap.enterprise.sobject.SObject;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;

public class QuickstartApiSample {

   private static BufferedReader reader = new BufferedReader(
         new InputStreamReader(System.in));

   EnterpriseConnection connection;
   String authEndPoint = "";

   public static void main(String[] args) {
      if (args.length < 1) {
         System.out.println("Usage: com.example.samples."
```

```
                + "QuickstartApiSamples <AuthEndPoint>");

            System.exit(-1);
        }

        QuickstartApiSample sample = new QuickstartApiSample(args[0]);
        sample.run();
    }

    public void run() {
        // Make a login call
        if (login()) {
            // Do a describe global
            describeGlobalSample();

            // Describe an object
            describeSObjectsSample();

            // Retrieve some data using a query
            querySample();

            // Log out
            logout();
        }
    }

    // Constructor
    public QuickstartApiSample(String authEndPoint) {
        this.authEndPoint = authEndPoint;
    }

    private String getUserInput(String prompt) {
        String result = "";
        try {
            System.out.print(prompt);
            result = reader.readLine();
        } catch (IOException ioe) {
            ioe.printStackTrace();
        }

        return result;
    }

    private boolean login() {
        boolean success = false;
        String username = getUserInput("Enter username: ");
        String password = getUserInput("Enter password: ");

        try {
            ConnectorConfig config = new ConnectorConfig();
            config.setUsername(username);
            config.setPassword(password);

            System.out.println("AuthEndPoint: " + authEndPoint);
```

```
      config.setAuthEndpoint(authEndPoint);

      connection = new EnterpriseConnection(config);
      printUserInfo(config);

      success = true;
    } catch (ConnectionException ce) {
      ce.printStackTrace();
    }

    return success;
  }

  private void printUserInfo(ConnectorConfig config) {
    try {
      GetUserInfoResult userInfo = connection.getUserInfo();

      System.out.println("\nLogging in ...\n");
      System.out.println("UserID: " + userInfo.getUserId());
      System.out.println("User Full Name: " + userInfo.getUserFullName());
      System.out.println("User Email: " + userInfo.getUserEmail());
      System.out.println();
      System.out.println("SessionID: " + config.getSessionId());
      System.out.println("Auth End Point: " + config.getAuthEndpoint());
      System.out
            .println("Service End Point: " + config.getServiceEndpoint());
      System.out.println();
    } catch (ConnectionException ce) {
      ce.printStackTrace();
    }
  }

  private void logout() {
    try {
      connection.logout();
      System.out.println("Logged out.");
    } catch (ConnectionException ce) {
      ce.printStackTrace();
    }
  }

  /**
   * To determine the objects that are available to the logged-in user, the
   * sample client application executes a describeGlobal call, which returns
   * all of the objects that are visible to the logged-in user. This call
   * should not be made more than once per session, as the data returned from
   * the call likely does not change frequently. The DescribeGlobalResult is
   * simply echoed to the console.
   */
  private void describeGlobalSample() {
    try {
      // describeGlobal() returns an array of object results that
      // includes the object names that are available to the logged-in user.
      DescribeGlobalResult dgr = connection.describeGlobal();
```

```
        System.out.println("\nDescribe Global Results:\n");
        // Loop through the array echoing the object names to the console
        for (int i = 0; i < dgr.getSobjects().length; i++) {
           System.out.println(dgr.getSobjects()[i].getName());
        }
     } catch (ConnectionException ce) {
        ce.printStackTrace();
     }
  }

  /**
   * The following method illustrates the type of metadata information that can
   * be obtained for each object available to the user. The sample client
   * application executes a describeSObject call on a given object and then
   * echoes the returned metadata information to the console. Object metadata
   * information includes permissions, field types and length and available
   * values for picklist fields and types for referenceTo fields.
   */
  private void describeSObjectsSample() {
     String objectToDescribe = getUserInput("\nType the name of the object to "
           + "describe (try Account): ");

     try {
        // Call describeSObjects() passing in an array with one object type
        // name
        DescribeSObjectResult[] dsrArray = connection
              .describeSObjects(new String[] { objectToDescribe });

        // Since we described only one sObject, we should have only
        // one element in the DescribeSObjectResult array.
        DescribeSObjectResult dsr = dsrArray[0];

        // First, get some object properties
        System.out.println("\n\nObject Name: " + dsr.getName());

        if (dsr.getCustom())
           System.out.println("Custom Object");
        if (dsr.getLabel() != null)
           System.out.println("Label: " + dsr.getLabel());

        // Get the permissions on the object

        if (dsr.getCreateable())
           System.out.println("Createable");
        if (dsr.getDeletable())
           System.out.println("Deleteable");
        if (dsr.getQueryable())
           System.out.println("Queryable");
        if (dsr.getReplicateable())
           System.out.println("Replicateable");
        if (dsr.getRetrieveable())
           System.out.println("Retrieveable");
        if (dsr.getSearchable())
```

```
            System.out.println("Searchable");
        if (dsr.getUndeletable())
            System.out.println("Undeleteable");
        if (dsr.getUpdateable())
            System.out.println("Updateable");

        System.out.println("Number of fields: " + dsr.getFields().length);

        // Now, retrieve metadata for each field
        for (int i = 0; i < dsr.getFields().length; i++) {
            // Get the field

```

C# Sample Code

This section walks through a sample C# client application. The purpose of this sample application is to show the required steps for logging in and to demonstrate the invocation and subsequent handling of several API calls.

This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds:
   - Sets the returned `sessionId` into the session header, which is required for session authentication on subsequent API calls.
   - Resets the Lightning Platform endpoint to the returned `serverUrl`, which is the target of subsequent API calls.

     All client applications that access the API must complete the tasks in this step before attempting any subsequent API calls.
   - Retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines the objects that are available to the logged in user. This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The DescribeGlobalResult is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string `("SELECT FirstName, LastName FROM Contact")`, and iterating through the returned QueryResult.
6. Calls `logout()` to the log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

The following code begins the sample C# client application.

```
using System;

```

CHAPTER 2 Object Basics

In this chapter ...

Generally speaking, API objects represent database tables that contain your organization's information. For example, the central object in the Salesforce data model represents accounts—companies and organizations involved with your business, such as customers, partners, and competitors.

The term "record" describes a particular occurrence of an object (such as a specific account like "IBM" or "United Airlines" that is represented by an Account object). A record is analogous to a row in a database table.

Objects already created for you by Salesforce are called standard objects. Objects you create in your organization are called custom objects. Objects you create that map to data stored outside your organization are called external objects.

While this document describes all of the objects available in the API, your applications work with only the objects that you are authorized to access. Programmatic access to objects is determined by the objects defined in your organization, your organization configuration, your user permissions and access settings (which are configured by your organization's system administrator), your data sharing model, and other factors related specifically to the object.

Most of the objects accessible through the API are read-write objects. However, there are a few objects that are read-only. This fact is noted in the description for the object.

For details about the data types and size restrictions for each object's fields, see the *Salesforce Field Reference Guide*.

Primitive Data Types

The API uses the following primitive data types:

Value	Details
base64	Base 64-encoded binary data. Fields of this type are used for storing binary files in Attachment records, Document records, and Scontrol records. In these objects, the `Body` or `Binary` field contains the (base64 encoded) data, while the `BodyLength` field defines the length of the data in the `Body` or `Binary` field. In the Document object, you can specify a URL to the document instead of storing the document directly in the record.
boolean	Boolean fields have one of these values: `true` (or 1), or `false` (or 0).
byte	A set of bits.
date	Date data. Fields of this type contain date values, such as `ActivityDate` in the Event object. Unlike dateTime fields, date fields contain no time value—the time portion of a date field is not relevant and is always set to midnight in the Coordinated Universal Time (UTC) time zone. If you specify a date value in a query, you can filter on date fields only.
dateTime	Date/time values (timestamps). Fields of this type handle date/time values (timestamps), such as `ActivityDateTime` in the Event object or the `CreatedDate`, `LastModifiedDate`, or `SystemModstamp` in many objects. Regular dateTime fields are full timestamps with a precision of one second. They are always transferred in the Coordinated Universal Time (UTC) time zone. In your client application, you might need to translate the timestamp to or from a local time zone. If you specify a dateTime value in a query, you can filter on dateTime fields only. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation. Note: The Event object has a `DurationInMinutes` field that specifies the number of minutes for an event. Even though this is a temporal value, it is an integer type—not a dateTime type.
double	Double values. Fields of this type can contain fractional portions (digits to the right of the decimal place), such as `ConversionRate` in CurrencyType. In the API, all non-integer values (such as Currency Field Type and Percent Field Type) contain values of type double. Some restrictions may be applied to double values: • `scale`: Maximum number of digits to the right of the decimal place. • `precision`: Total number of digits, including those to the left and the right of the decimal place The maximum number of digits to the left of the decimal place is equal to `precision` minus `scale`. In the online application, precision is defined differently—it is the maximum number of digits allowed to the left of the decimal place. Values can be stored in scientific notation if the number is large enough (or, for negative numbers, small enough), as indicated by the W3C XML Schema Part 2: Datatypes Second Edition specification. Warning: When the user sets the precision in custom fields in the Salesforce application, it displays the precision set by the user, even if the user enters a more precise value than defined for those

Value	Details
	fields. However, when you set the precision in custom fields using the API, no rounding occurs when the user retrieves the number field.
int	Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the `NumberOfEmployees` in an Account. For integer fields, `digits` specifies the maximum number of digits that an int can have.
long	Large integers. They are similar to the int type but can hold a wider range of numbers. The smallest possible value for long is -9223372036854775808 and the largest possible value is 9223372036854775807. For long fields, `digits` specifies the maximum number of digits that the number can have.
string	Character strings. Fields that are of data type `string` contain text and some have length restrictions depending on the data being stored. For example, in the Contact object, the `FirstName` field is 40 characters, the `LastName` field is 80 characters, the `MailingStreet` is 255 characters. Note: For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. AllowFieldTruncationHeader allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: anyType, email, encryptedstring, multipicklist, phone, picklist, string, and textarea.
time	Time values. Fields of this type handle time values, such as `FridayEndTime` in the BusinessHours object, with a precision of one millisecond. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.

These data types are used in the SOAP messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these SOAP data types.

The primitive data types are:

- specified in the World Wide Web Consortium's publication *XML Schema Part 2: Data Types* at the following URL: `http://www.w3.org/TR/xmlschema-2/`.
- enumerated in the `SOAPType` field of the Field type, which is described in the `fields` property of the DescribeSObjectResult.

Primitive types are used as a standardized way to define, send, receive, and interpret basic data types in the SOAP messages exchanged between client applications and the API. In addition, primitive data types are interpreted in a Salesforce-specific way, which is useful for display formatting and for numeric conversion (adding values of different currencies).

For example, Salesforce chooses to interpret a double value passed via SOAP as a `double` in a number of possible ways, depending on the field definition. If the field type for that data is currency, Salesforce handles the display of the data by prepending it with a currency symbol and inserting a decimal for precision. Similarly, if the field type is percent, Salesforce handles the display of the data by appending a percent sign (%). Regardless of the field type, however, the value is sent in the SOAP message as a double.

The API uses data types called field types that are defined in the WSDLs. For more information, see Field Types.

Field Types

In addition to the primitive data types, the API defines the following data types for fields:

Note: For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. AllowFieldTruncationHeader allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: anyType, email, encryptedstring, multipicklist, phone, picklist, string, and textarea.

Field Type	What the Field Contains
address	A compound data type that contains address field data. See Address Compound Fields.
anyType	Polymorphic data type that returns string, picklist, reference, Boolean, currency, int, double, percent, ID, date, datetime, url, or email data depending on the kind of field involved. See AnyType Field Type.
calculated	Fields that are defined by a formula. See Calculated Field Type.
combobox	A combobox, which includes a set of enumerated values and allows the user to specify a value not in the list. See ComboBox Field Type.
currency	Currency values. See Currency Field Type.
DataCategoryGroupReference	Reference to a data category group or a category unique name. See DataCategoryGroupReference Field Type.
email	Email addresses. See Email Field Type.
encryptedstring	Encrypted text fields contain any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Available in API versions 11.0 and later.
ID	Primary key field for the object. See ID Field Type. Note: Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your Web services toolkit documentation for more information.
JunctionIdList	A string array of referenced ID values that represent the many-to-many relationship of an underlying junction entity. Query and manipulate the string array to query and manipulate the underlying junction entities in a single API call. See: JunctionIdList Field Type Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
location	A compound data type that contains latitude and longitude values for geolocation fields. See Geolocation Compound Field.
masterrecord	When records are merged, the ID of the record that is saved (the other records are deleted).

Field Type	What the Field Contains
multipicklist	Multi-select picklists, which include a set of enumerated values from which multiple values can be selected. See Multi-Select Picklist Field Type.
percent	Percentage values. See Percent Field Type.
phone	Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting. See Phone Field Type.
picklist	Picklists, which include a set of enumerated values from which one value can be selected. See Picklist Field Type.
reference	Cross-references to a different object. Analogous to a foreign key field in SQL. See Reference Field Type.
textarea	String that is displayed as a multiline text field. See Textarea Field Type.
url	URL values. Client applications commonly display URLs as hyperlinks. See URL Field Type.

These field types extend primitive data types. Many of these field types follow common data typing conventions that are made explicit in their metadata. However, certain field types have unique characteristics that you must understand before using them in your client application.

These field types apply to both standard and custom fields. They are enumerated in the `type` field of the Field type, which is described in the `fields` property of the DescribeSObjectResult.

Note: Some numeric fields have precision and scale limits. In addition, certain text fields have length restrictions. These restrictions are enforced when you `create()` or `update()` objects. However, the API can return data that does not meet these restrictions.

AnyType Field Type

The `anyType` field type is dynamic and returns `string`, `date`, `number`, or `boolean` data depending on the kind of field involved. For example, the element in a SOAP message has an `xsi:type="xsd:string"` attribute if the field is of type `string`. This field type is used in history objects for the `NewValue` and `OldValue` fields. It is also a valid field type for `fieldType` and `soapType`.

Note: Most SOAP toolkits automatically deserialize this element into the correct native type.

Calculated Field Type

Calculated fields are read-only fields in the API. These fields are defined by a formula, which is an algorithm that derives its value from other fields, expressions, or values. You can filter on these fields in SOQL, but you don't replicate these fields. The length of text calculated fields is 3900 characters or less—anything longer is truncated.

Calculated fields are called formula fields in the Salesforce user interface.

ComboBox Field Type

A combobox is a picklist that also allows users to type a value that is not already specified in the list. A combobox is defined as a string value.

Currency Field Type

Currency fields contain currency values, such as the `ExpectedRevenue` field in a Campaign, and are defined as type double.

For organizations that have the multicurrency option enabled, the `CurrencyIsoCode` field is defined for any object that can have currency fields. The `CurrencyIsoCode` field and currency fields are linked in a special way. On any specific record, the `CurrencyIsoCode` field defines the currency of that record. Therefore, the values of all currency fields on that record are expressed in that currency.

For most cases, clients do not need to consider the linking of the `CurrencyIsoCode` field and the currency fields on an object. However, consider the following:

- The `CurrencyIsoCode` field exists only for those organizations that have enabled multicurrency support.
- When displaying the currency values in a user interface, it is preferred to prepend each currency value with its `CurrencyIsoCode` value and a space separator.
- The `CurrencyIsoCode` field is a restricted picklist field. The set of allowable values, defined in the CurrencyType object, can vary from organization to organization. Attempting to set it to a value that is not defined for an organization causes the operation to be rejected.
- If you update the `CurrencyIsoCode` field on an object, it implicitly converts all currency values on that object to the new currency code The field uses the conversion rates that are defined for that organization in the Salesforce user interface. If you specify currency values in that same `update()` call, the new currency values you specify are interpreted in the new `CurrencyIsoCode` field value, without conversion.
- The picklist values in a `CurrencyIsoCode` field do not exactly match the labels displayed in Salesforce.

To perform currency conversions, client applications can look up the `CurrencyIsoCode` in the CurrencyType object.

DataCategoryGroupReference Field Type

A data category group has categories that classify articles in Salesforce Knowledge and questions in the Answers feature. Every article and question object has two fields of type DataCategoryGroupReference which contain the category group and category unique name. You can use the `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` calls to retrieve the category groups and categories associated to these objects.

Email Field Type

Email fields contain email addresses. Client applications are responsible for specifying valid and properly formatted email addresses in `create()` and `update()` calls.

ID Field Type

With rare exceptions, all objects in the API have a field of type ID. The field is named `Id` and contains a unique identifier for each record in the object. It is analogous to a primary key in relational databases. When you `create()` a new record, the Web service generates an ID value for the record, ensuring that it is unique within your organization's data. You cannot use the `update()` call on ID fields. Because the ID value stays constant over the lifetime of the record, you can refer to the record by its ID value in subsequent API calls. Also, the ID value contains a three-character code that identifies the object type, which client applications can retrieve via the `describeSObjects()` call.

In addition, certain objects, including custom objects, have one or more fields of type `reference` that contain the ID value for a related record. These fields have names that end in the suffix "Id", for example, `OwnerId` in the account object. `OwnerId` contains the ID of the user who owns that object. Unlike the field named `Id`, `reference` fields are analogous to foreign keys and can be changed via the `update()` call. For more information, see Reference Field Type.

Some API calls, such as `retrieve()` and `delete()`, accept an array of IDs as parameters—each array element uniquely identifies the row to retrieve or delete. Similarly, the `update()` call accepts an array of sObject records—each sObject contains an `Id` field that uniquely identifies the sObject.

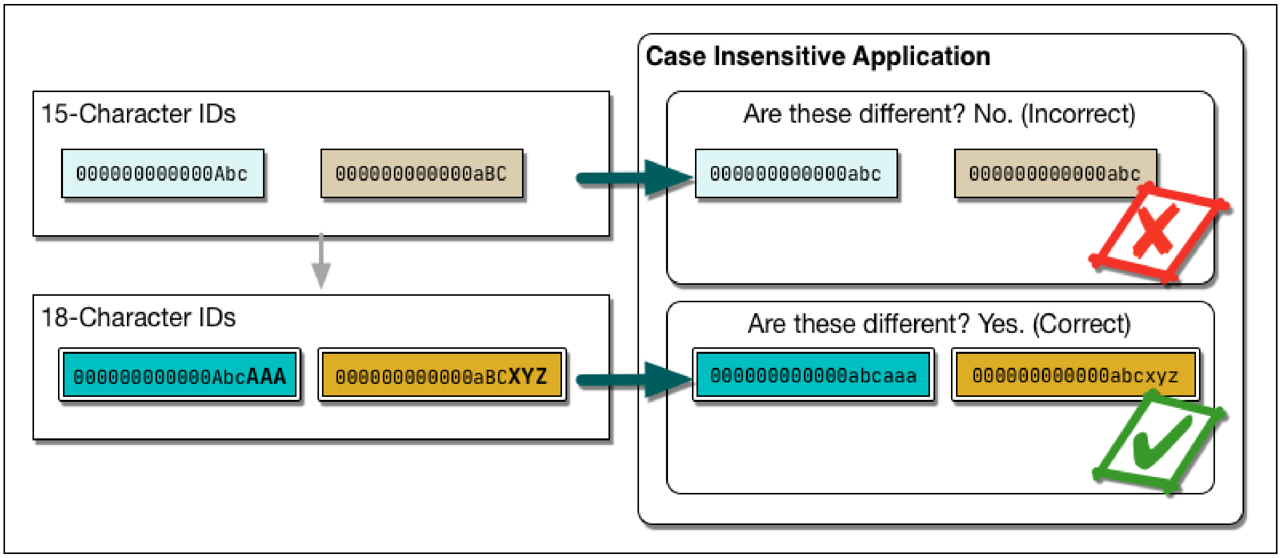
Note: Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your web services toolkit documentation for more information.

15-Character and 18-Character IDs, and Case Sensitivity

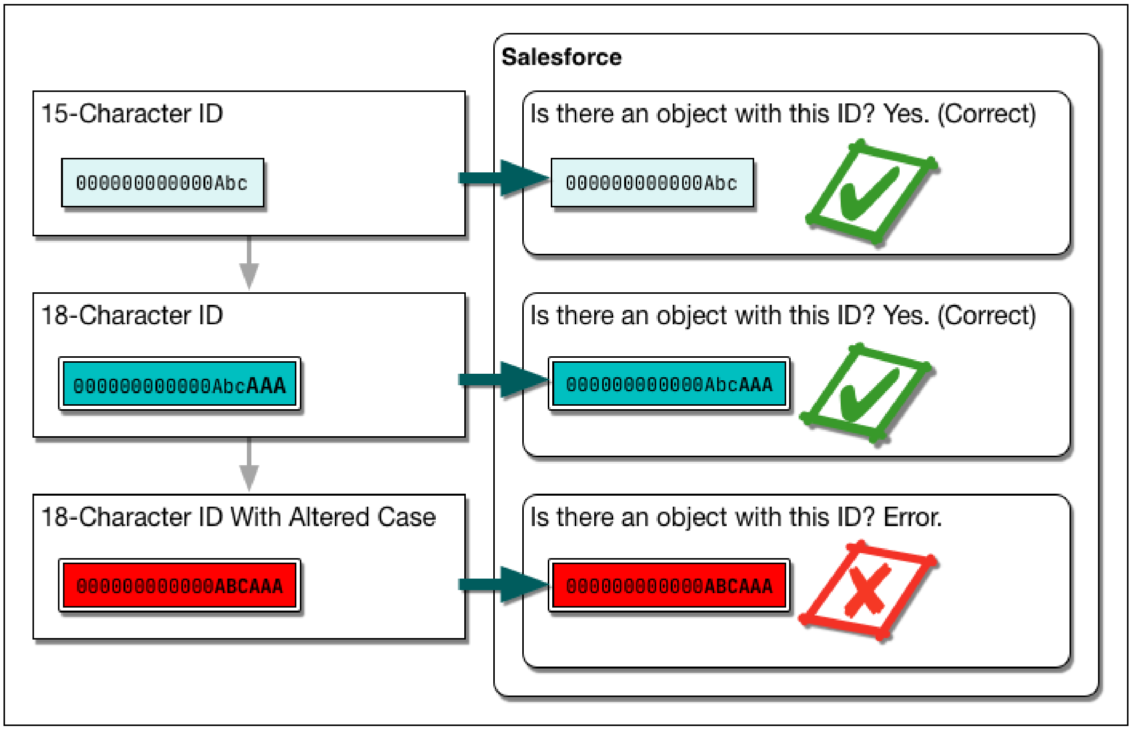
Salesforce IDs are often represented by 15-character, base-62, strings. Each of the 15 characters can be a numeric digit (0-9), a lowercase letter (a-z), or an uppercase letter (A-Z). These 15-character IDs are *case-sensitive*. To Salesforce, `000000000000Abc` is not the same as `000000000000aBC`.

Don't use 15-character IDs in case-insensitive applications like Microsoft Access™. These applications incorrectly consider `000000000000Abc` to be the same as `000000000000aBC`.

To avoid these issues, all API calls return 18-character IDs that are *case-safe*, meaning that they will be compared correctly by case-insensitive applications. The extra 3 characters at the end of the ID encode the case of the preceding 15 characters. Use 18-character IDs in all API calls when creating, editing, or deleting data.



Note: 18-character IDs are *case-safe*, but not *case-insensitive*. In other words, if you manually change the case of an 18-character ID, Salesforce detects that the three extra characters do not match the case of the preceding characters and returns an error.



To convert the 18-character ID to a 15-character version, you may truncate the last three characters. However, Salesforce recommends that you use the 18-character ID.

JunctionIdList Field Type

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID.

Query JunctionIdList fields just like any other field. Here's an example of a SOQL query that includes the `TaskWhoIds` JunctionIdList field.

```
SELECT Id, Subject, TaskWhoIds
FROM Task
WHERE LastModifiedDate > LAST_WEEK
```

Note: The total number of records you can query for in a single SOQL query, when one of the fields being queried on is of type JunctionIdList, can't exceed 500. If the number of records returned exceeds 500, EXCEPTION: System.UnexpectedException: Truncated appears.

The restriction is <total number of entity records> * <total number of records in the entity's JunctionIdList field> <= 500.

For example, you query on the EventWhoIds JunctionIdList field for a list of events. There are 101 events and for each event, there are 5 records in the EventWhoIds JunctionIdList. Therefore, the SOQL query would be querying for 505 records in total, which is over the 500 limit, and you get an exception.

Multi-Select Picklist Field Type

Multi-select picklist fields contain a list of one or more items from which a user can choose multiple items. One of the items can be configured as the default item. Selections are maintained as a string containing a series of attributes delimited by semicolons. For example, a query can return the values of a multivalue picklist as "first value; second value; third value". For information on querying multi-select picklists, see Querying Multi-Select Picklists in the *Salesforce SOQL and SOSL Reference Guide*.

Percent Field Type

Percent fields contain percent values. Percent fields are defined as type double.

Phone Field Type

Phone fields contain phone numbers, which can include alphabetic characters. Client applications are responsible for phone number formatting.

Picklist Field Type

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as dropdown lists in the Salesforce user interface. One of the items can be configured as the default item.

In the Field object associated with the DescribeSObjectResult, the `restrictedPicklist` field defines whether the field is a restricted picklist or not. The API does not enforce the list of values for advisory (unrestricted) picklist fields on `create()` or `update()`. When inserting an unrestricted picklist field that does not have a PicklistEntry, the system creates an "inactive" picklist value. This value can be promoted to an "active" picklist value by adding the picklist value in the Salesforce user interface.

When creating new, inactive picklists, the API checks to see if there is a match. This check is case-insensitive.

In theField object associated with the DescribeSObjectResult, the `picklistValues` field contains an array of items (PicklistEntry objects). Each PicklistEntry defines the item's label, value, and whether it is the default item in the picklist (a picklist has no more than one default value).

Enumerated fields support localization of the labels to the language of the user. For example, for the `Industry` field on an Account, the value "Agriculture" can be translated to various languages. The enumerated field values are fixed and do not change with a user's language. However, each value may have a specified "label" field that provides the localized label for that value. Always use the value when inserting or updating a field. The `query()` call always returns the value, not the label. Use the corresponding label for a value in the describeSObjectResult when displaying the value to the user in any user interface.

The API supports the retrieval of the certain picklists in the following objects: CaseStatus, ContractStatus, LeadStatus, OpportunityStage, PartnerRole, SolutionStatus, TaskPriority, and TaskStatus. Each object represents a value in the respective picklist. These picklist entries always specify some other piece of information, such as whether the status is converted. Your client application can invoke the `query()` call on any of these objects (such as CaseStatus) to retrieve the set of values in the picklist. The application can then use that information while processing other objects (such as Case objects) to find more information about those objects (such as a given case). These objects are read-only via the API. To modify items in picklists, you must use the Salesforce user interface.

Reference Field Type

A reference field contains an `Id` value that points to a unique record (usually the parent record) on another object. A reference field is analogous to the concept of a foreign key in relational databases. The name of a reference field ends, by convention, with the letters `Id` (such as `CaseId` or `OpportunityId`). For example, in the OpportunityCompetitor object, the `OpportunityId` field is a reference field that points to the Opportunity object. It contains an ID value that uniquely identifies an Opportunity record.

Sometimes, an object can refer to another object of its same type. For example, an Account can have a parent link that points to another Account.

The Event and Task objects both have `WhoId` and `WhatId` cross-reference ID fields. Each of these cross-reference fields can point to one of several other objects. The `WhoId` field can point to a Contact or Lead, and the `WhatId` field can point to an Account, Opportunity, Campaign, or Case. In addition, if the `WhoId` field refers to a Lead, then the `WhatId` field must be empty.

You can describe and query each cross-referenced object. When you query a cross-reference ID field, it returns an object ID of the appropriate type. You can then query that ID to get additional information about the object, using the ID in the `id` field for that query.

The cross-reference ID field value is either:

- a valid record in your organization, or
- an empty value, which indicates an empty reference

The cross-reference ID field value, if non-`null`, is guaranteed to be an object in your organization. However, it is not guaranteed that you can query that object. Users with the "View All Data" permission can always query that object. Other users can be restricted from viewing or editing the referenced object.

When specifying a value for a cross-reference ID field in a `create()` or `update()` call, the value must be a valid value of type ID, and the user must have appropriate access to that object. The exact requirements vary from field to field.

Textarea Field Type

Textarea fields contain text that can be longer than 4000 bytes. Unlike string fields, textarea fields cannot be specified in the WHERE clause of a queryString of a `query()` call. To filter records on this field, you must do so while processing records in the QueryResult. For fields with this restriction, its `filterable` field in the Field type (described in the `fields` property of the DescribeSObjectResult) is `false`.

URL Field Type

URL fields contain URLs. Client applications are responsible for specifying valid and properly formatted URLs in `create()` and `update()` calls.

Compound Fields

Compound fields group together multiple elements of primitive data types, such as numbers or strings, to represent complex data types, such as a location or an address. Compound fields are an abstraction that can simplify application code that handles the values, leading to more concise, understandable code.

Address compound fields are available in the SOAP and REST APIs in API version 30.0 and later. Geolocation fields are available in the SOAP and REST APIs in API version 26.0 and later, with some limitations on SOAP for API versions below 30.0.

Compound fields are accessible as a single, structured field, or as individual component fields. The values contained within the compound field and the values in individual fields both map to the same underlying data stored in Salesforce; they always have identical values. Code that references individual component fields is unaffected by the new compound fields.

Compound fields are read-only. Changes are performed by writing to the individual component fields. This maintains a single, consistent method for performing updates, and avoids the possibility of conflicts. For example, if both the `BillingAddress` compound field and `BillingCity` individual component field were updated in the same API call, it would be unclear which value should be saved.

Compound fields are available only through the SOAP and REST APIs. Compound fields are described in both the Enterprise and Partner WSDLs. Update your WSDL to at least API 30.0 to access the new compound data types.

Address Compound Fields

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an `Address`, a structured compound data type, as well as individual address elements.

The `Address` type extends the `Location` type, the data type used for compound geolocation fields. Using API 30.0 and later, standard addresses are available in the SOAP and REST APIs as a compound field of type `Address`, a structured data type that combines the following fields.

Field	Type	Description
`Accuracy`	picklist	Accuracy level of the geocode for the address. For example, this field is known as `MailingGeocodeAccuracy` on Contact.
`City`	string	The city detail for the address. For example, this field is known as `MailingCity` on Contact.
`Country`	string	The country detail for the address. For example, this field is known as `MailingCountry` on Contact.
`CountryCode`	picklist	The ISO country code for the address. For example, this field is known as `MailingCountryCode` on Contact. `CountryCode` is always available on compound address fields, whether or not state and country picklists are enabled in your organization.
`Latitude`	double	Used with `Longitude` to specify the precise geolocation of the address. For example, this field is known as `MailingLatitude` on Contact.
`Longitude`	double	Used with `Latitude` to specify the precise geolocation of the address. For example, this field is known as `MailingLongitude` on Contact.
`PostalCode`	string	The postal code for the address. For example, this field is known as `MailingPostalCode` on Contact.
`State`	string	The state detail for the address. For example, this field is known as `MailingState` on Contact.
`StateCode`	picklist	The ISO state code for the address. For example, this field is known as `MailingStateCode` on Contact. `StateCode` is always available on compound address fields, whether or not state and country picklists are enabled in your organization.
`Street`	textarea	The street detail for the address. For example, this field is known as `MailingStreet` on Contact.

Address fields are provided on many standard objects, such as Account, Contact, Quote, and User. Some objects provide fields for multiple addresses. For example, Account provides for four different addresses. In this case, address field names are prefixed with the type of address, for example, `BillingAddress`, `ShippingAddress`, and so on.

Note: Standard address compound fields are read-only, and are only accessible using the SOAP and REST APIs. See Compound Field Considerations and Limitations on page 43 for additional details of the restrictions this imposes.

When an address is geocoded, its latitude and longitude fields are populated with coordinates. A related geolocation field is also populated. Typically, geocoding service providers geocode addresses, and rate the accuracy of the geocodes.

The accuracy subfield `GeocodeAccuracy` stores the accuracy data for a geocoded location. External geolocation apps can get the accuracy level of a geocoded address via the API. When you retrieve an address via the API, any accuracy data is included. You can also retrieve the accuracy information by itself, if needed.

Like its parent, the compound `Address` field, the `GeocodeAccuracy` field is only available for standard address fields on standard objects.

Retrieving Compound Address Fields

Using compound fields can simplify code that works with addresses, especially for SOQL queries. SOQL `SELECT` clauses can reference addresses directly, instead of all of the individual component fields.

```
SELECT Name, BillingAddress
FROM Account
```

To write code that's compatible with API versions before 30.0, as well as API 30.0 and above, use the individual fields:

```
SELECT Name, BillingStreet, BillingCity, BillingState, BillingPostalCode,
       BillingCountry, BillingLatitude, BillingLongitude
FROM Account
```

Compound address field values are returned as a structured data type, `Address`. Code that works with compound address fields needs to reference the individual components of the returned value. See the code sample below.

Example: **Retrieve a Standard Address Compound Field with the SOAP API**

The following Java method uses the Salesforce SOAP API to retrieve and display the Mailing Address for a list of contacts.

```
// Modified version of code in the SOAP API QuickStart
private void querySample() {
    String soqlQuery = "SELECT FirstName, LastName, MailingAddress FROM Contact";
    try {
        QueryResult qr = connection.query(soqlQuery);
        boolean done = false;

        if (qr.getSize() > 0) {
            System.out.println("\nLogged-in user can see "
              + qr.getRecords().length + " contact records.");

            while (!done) {
                System.out.println("");
                SObject[] records = qr.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName();
                    String lName = con.getLastName();

                    // Access the compound address field MailingAddress
                    Address addr = (Address) con.getMailingAddress();
                    String streetAddr = "";
                    if (null != addr) streetAddr = addr.getStreet();

                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName +
                            " -- " + streetAddr);
                    } else {
```

```
                    System.out.println("Contact " + (i + 1) + ": " + fName +
                        " " + lName +
                        " -- " + streetAddr);
                }
            }

            if (qr.isDone()) {
                done = true;
            } else {
                qr = connection.queryMore(qr.getQueryLocator());
            }
        }
    } else {
        System.out.println("No records found.");
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
```

Using Compound Address Fields as Locations

Compound address fields include latitude and longitude fields. Address fields can be used as locations in SOQL `WHERE` and `ORDER BY` clauses. For example, here's a SOQL query that uses the `GEOLOCATION` function to retrieve the 10 accounts closest to San Francisco.

```
SELECT Id, Name, BillingAddress
FROM Account
WHERE DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi') < 20
ORDER BY DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi')
LIMIT 10
```

Note: In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

Geolocation Compound Field

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

In API versions 26.0 and later, geolocation fields are available in the SOAP and REST APIs as a compound field of type `Location`. This structured data type contains the following fields.

- `latitude`
- `longitude`

Note: SOAP calls that use API versions earlier than 30.0 return geolocation compound values as strings. See "Returned Geolocation Data Types" later in this topic.

Geolocation fields are provided on many standard objects, such as Account, Contact, Quote, and User, as part of their address field or fields. Geolocation fields can also be added as custom fields to standard or custom objects.

Note:

- A geolocation compound field is read-only, although its `latitude` and `longitude` subfields are editable. You can only access compound fields using the SOAP or REST API. For more information about working with compound fields and their subfields, see Compound Field Considerations and Limitations on page 43.
- Although geolocation fields appear as a single field in the user interface, custom geolocation fields count as *three* custom fields towards your organization's limits: one for latitude, one for longitude, and one for internal use.

Retrieving Compound Geolocation Fields

Using compound fields can simplify code that works with geolocations, especially for SOQL queries. SOQL `SELECT` clauses can reference geolocations directly, instead of the individual component fields.

```
SELECT location__c
FROM Warehouse__c
```

To write code that's compatible with API versions earlier than 26.0 and with API versions 26.0 and later, use the individual latitude and longitude fields.

```
SELECT location__latitude__s, location__longitude__s
FROM Warehouse__c
```

Returned Geolocation Data Types

A compound geolocation field value is returned as the structured data type `Location`. Code that works with compound geolocation fields must reference the individual components of the returned value. See the sample code in Address Compound Fields on page 41.

In API versions earlier than 30.0, SOAP calls return compound geolocation field values as strings, instead of as a structured data type, for backward compatibility. If you plan to display your latitude and longitude values or pass them to a service that expects strings, use the values that are returned. If you plan to use the values in mathematical calculations or pass them to a map service that expects numbers, cast the results to numbers.

The string value format is:

```
API location: [latitudeValue longitudeValue]
```

An example of a regular expression to parse out the latitude and longitude values is:

```
API location: \[([-+]?\d{1,2}([.]\d+)?) ([-+]?\d{1,3}([.]\d+)?)]
```

The first capture is the latitude, and the third is the longitude.

Compound Field Considerations and Limitations

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

Both address and geolocation compound fields have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP and REST APIs. The compound versions of fields aren't accessible anywhere in the Salesforce user interface.

- Although compound fields can be queried with the `Location` and `Address` Apex classes, they're editable only as components of the actual field. Read and set geolocation field components by appending "__latitude__s" or "__longitude__s" to the field name, instead of the usual "__c." For example:

  ```
  Double theLatitude = myObject__c.aLocation__latitude__s;
  myObject__c.aLocation__longitude__s = theLongitude;
  ```

  You can't access or set the compound value.
- You can't use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Custom geolocation and location fields on standard addresses aren't supported with email templates.
- You can't use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are `ISBLANK`, `ISCHANGED`, and `ISNULL`. You can't use `BLANKVALUE`, `CASE`, `NULLVALUE`, `PRIORVALUE`, or the equality and comparison operators with compound fields. The equality and comparison operators include `=` and `==` (equal), `<>` and `!=` (not equal), `<` (less than), `>` (greater than), `<=` (less than or equal), `>=` (greater than or equal), `&&` (AND), and `||` (OR).

Address compound fields have the following limitations.

- Compound address fields are available only for address fields that exist as part of the standard objects included in Salesforce. You can't create custom compound address fields.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.
- The accuracy subfield of address fields is populated only when an address is geocoded. Typically, geocoding service providers provide accuracy data for an address's latitude and longitude coordinates.
- Address fields can't be used in `WHERE` statements in SOQL. Address fields aren't filterable, but the `isFilterable()` method of the `DescribeFieldResult` Apex class erroneously returns `true` for address fields.

Geolocation compound fields have the following limitations.

- Geolocation fields aren't supported in custom settings.
- Geolocation fields aren't available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can't be used in filter-based workflow updates and approvals.
- `DISTANCE` formulas are supported in:
  - Entry criteria for workflow rules and approval processes
  - Field update actions in workflow rules and approval processes
  - Custom validation rules
  - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration

rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

- Geolocation fields are supported in SOQL with the following limitations.
  - `DISTANCE` and `GEOLOCATION` are supported in `WHERE` and `ORDER BY` clauses in SOQL, but not in `GROUP BY`. `DISTANCE` is supported in `SELECT` clauses.
  - `DISTANCE` supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
  - When using the `GEOLOCATION` function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')` works but `DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km')` doesn't work.
  - Apex bind variables aren't supported for the units parameter in the `DISTANCE` function. This query doesn't work.

```
String units = 'mi';
List<Account> accountList =
    [SELECT ID, Name, BillingLatitude, BillingLongitude
     FROM Account
     WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the *SOQL and SOSL Reference*.

API Data Types and Salesforce Field Types

Generally, API data types and field types in the user interface have the same names. For example, a date field is represented by a date data type in the API. However, some field types are represented differently depending on whether you are inspecting an object via the API or the user interface. The following table contains the mapping for field types and data types that are different:

API Data Type	Corresponding Field Types in the User Interface
ID	Lookup relationship, master-detail relationship
string	Auto number, email, phone, picklist, multi-select picklist, text, text area, long text area, rich text area, data category group reference and URL. Different maximum lengths are specified in the WSDL for text, text area, and long text area.
boolean	Checkbox
double	Currency, formula, number, percent, and roll-up summary
Varies by type	When formula fields are created in the user interface, a type must be specified. This type corresponds to the API data type of the same name: currency, date, date/time, number, percent, or text.

All other fields that you can create in the user interface fall into one of the following categories:

- The field is not available in both the user interface and the API. For example, the BusinessHours object has fields of API data type time, but you cannot create a custom field of this type.
- Field types are the same as their corresponding API data type. For example, if you create a date field in the user interface, that field is the date data type in the API.

For more information about API data types, see Primitive Data Types and Field Types.

Core Data Types Used in API Calls

Many calls in the API use the following data types:

- sObject
- ID (String). See ID Field Type.

The API also uses several error handling objects. If an error occurs during a SOAP request, the API returns a SOAP fault message. The message contains different content, depending on the type of error:

- If an error affects the entire request, an API Fault Element, is returned, containing an ExceptionCode and the associated error message text.
- If the error affects some records and not others, an Error is returned, containing a StatusCode. These errors typically occur during bulk operations, such as creating, updating, or deleting multiple records with a single call.

sObject

An sObject represents an object, such as an Account or Campaign. For a list of standard objects, see Standard Objects.

An sObject has the following properties:

Name	Type	Description
`fieldsToNull`	string[]	Array of one or more field names whose value you want to explicitly set to `null`. When used with `update()` or `upsert()`, you can specify only those fields that you can update and that have the `nillable` property. When used with `create()`, you can specify only those fields that you can create and that have the `nillable` or the `default on create` property. For example, if specifying an ID field or required field results in a runtime error, you can specify that field name in `fieldsToNull`. Similarly, if a picklist field has a default value and you want to set the value to `null` instead, specify the field in `fieldsToNull`.
`ID`	ID	Unique ID for this individual object. For the `create()` call, this value is null. For all other API calls, this value must be specified.

API Fault Element

An `ApiFault` element contains information about a fault that occurs when processing a service request. The `ApiFault` element has the following properties.

Name	Type	Description
`exceptionCode`	ExceptionCode	A code that characterizes the exception. The full list of exception codes is available in the WSDL file for your org. See Generating the WSDL File for Your Organization.
`exceptionMessage`	string	Exception message text.
`extendedErrorDetails`	ExtendedErrorDetails	More details about the exception, including an extended error code and extra error properties, when available. Reserved for future use.

The following table lists the API fault elements that represent all the API faults that can occur.

Fault	Description
ApiQueryFault	The row and column numbers where the problem occurred.
LoginFault	An error occurred during the login() call.
InvalidSObjectFault	An invalid sObject in a describeSObject(), describeSObjects(), describeLayout(), describeDataCategoryGroups(), describeDataCategoryGroupStructures(), create(), update(), retrieve(), or query() call.
InvalidFieldFault	An invalid field in a retrieve() or query() call.
InvalidOrNullForRestrictedPicklist	An invalid appMenuType in a describeAppMenu() call.
MalformedQueryFault	A problem in the queryString passed in a query() call.
InvalidQueryLocatorFault	A problem in the queryLocator passed in a queryMore() call.
MalformedSearchFault	A problem in the search passed in a search() call.
InvalidIdFault	A specified ID was invalid in a setPassword() or resetPassword() call.
UnexpectedErrorFault	An unexpected error occurred. The error is not associated with any other API fault.

ExceptionCode

The following list of ExceptionCode values is defined in your WSDL file. Some codes don't appear in your WSDL, depending on the features you have enabled.

API_CURRENTLY_DISABLED
Because of a system problem, API functionality is temporarily unavailable.

API_DISABLED_FOR_ORG
API access has not been enabled for the org. Contact Salesforce to enable API access.

CANT_ADD_STANDARD_PORTAL_USER_TO_TERRITORY
A user with a standard portal license can't be added to a territory.

CIRCULAR_OBJECT_GRAPH
The request failed because it contained a circular object reference.

CLIENT_NOT_ACCESSIBLE_FOR_USER
The current user does not have permission to access the specified client.

CLIENT_REQUIRE_UPDATE_FOR_USER
The current user is required to use a newer version of the specified client and doesn't have access until the client is updated.

CLONE_NOT_SUPPORTED
This entity does not support the clone operation.

CLONE_FIELD_INTEGRITY_EXCEPTION
A field integrity exception occurred during the clone operation.

DELETE_REQUIRED_ON_CASCADE
The delete operation triggers a cascade delete on a record, but the logged-in user does not have delete permission on that related object.

DUPLICATE_COMM_NICKNAME
You can't create a user with the same nickname as another user.

DUPLICATE_VALUE
You can’t supply a duplicate value for a field that must be unique. For example, you can’t submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_BATCH_SIZE_LIMIT_EXCEEDED
A method tried to process more email records than the maximum batch size.

EMAIL_TO_CASE_INVALID_ROUTING
An email to case record has been submitted for processing but the feature is not enabled.

EMAIL_TO_CASE_LIMIT_EXCEEDED
The daily converted email limit for the Email-to-Case feature has been exceeded.

EMAIL_TO_CASE_NOT_ENABLED
The Email-to-Case feature has not been enabled.

EXCEEDED_ID_LIMIT
Too many IDs were specified in a call. For example, more than 2000 IDs were requested in a `retrieve()` call, or more than 200 session IDs were specified in a `logout()` call.

EXCEEDED_LEAD_CONVERT_LIMIT
Too many IDs were sent to a `convertLead()` call.

EXCEEDED_MAX_SIZE_REQUEST
The size of the message sent to the API exceeded 50 MB.

EXCEEDED_MAX_TYPES_LIMIT
The number of object types to describe is too large.

EXCEEDED_QUOTA
The size limit for org data storage was exceeded during a `create()` call.

FUNCTIONALITY_NOT_ENABLED
Functionality has been temporarily disabled. Other calls continue to work.

INACTIVE_OWNER_OR_USER
The user or record owner is not active.

INACTIVE_PORTAL
The referenced portal is inactive.

INSUFFICIENT_ACCESS
The user does not have sufficient access to perform the operation.

INVALID_ASSIGNMENT_RULE
An invalid AssignmentRuleHeader value was specified.

INVALID_BATCH_SIZE
The query options have an invalid batch size value.

INVALID_CLIENT
The client is invalid.

INVALID_CROSS_REFERENCE_KEY
An invalid foreign key can’t be set on a field. For example, an object share, such as AccountShare, can’t be deleted because the share row is a result of a sharing rule.

`INVALID_FIELD`
The specified field name is invalid.

`INVALID_FILTER_LANGUAGE`
The specified language can't be used as a filter.

`INVALID_FILTER_VALUE`
A SOQL query with `LIKE` specified an invalid character, for example, an incorrectly placed asterisk (*). Correct the query and resubmit.

`INVALID_ID_FIELD`
The specified ID is correctly formatted but isn't valid. For example, the ID is of the wrong type, or the object it identifies no longer exists.

`INVALID_GOOGLE_DOCS_URL`
An invalid Salesforce record URL was used when trying to associate a Google Doc to that record. Correct the URL before trying the operation again.

`INVALID_LOCATOR`
The locator is invalid.

`INVALID_LOGIN`
The `login()` credentials are not valid, or the maximum number of logins have been exceeded. Contact your administrator for more information.

`INVALID_NEW_PASSWORD`
The new password does not conform with the password policies of the org.

`INVALID_OPERATION`
The client application tried to modify a record that is locked by an approval process.

`INVALID_OPERATION_WITH_EXPIRED_PASSWORD`
Due to password expiration, a valid password must be set using `setPassword()` before the call can be invoked.

`INVALID_QUERY_FILTER_OPERATOR`
An invalid operator was used in the `query()` filter clause, at least for that field.

`INVALID_QUERY_LOCATOR`
An invalid `queryLocator` parameter was specified in a `queryMore()` call. It's also possible that you've exceed the maximum number of calls, which is 10 per user for the API, and 5 for Apex and Visualforce.

`INVALID_QUERY_SCOPE`
The specified search scope is invalid.

`INVALID_REPLICATION_DATE`
The date for replication is out of the allowed range, such as before the org was created.

`INVALID_SETUP_OWNER`
The setup owner must be an Organization, Profile, or User.

`INVALID_SEARCH`
The `search()` call has invalid syntax or grammar. For more information, see the *Salesforce SOQL and SOSL Reference Guide*.

`INVALID_SEARCH_SCOPE`
The specified search scope is invalid.

`INVALID_SESSION_ID`
The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_SOAP_HEADER
There is an error in the SOAP header. If you are migrating from an earlier version of the API, be advised that the SaveOptions header can't be used with API version 6.0 or later. Use AssignmentRuleHeader instead.

INVALID_SSO_GATEWAY_URL
The URL provided to configure the Single Sign-On gateway was not a valid URL.

INVALID_TYPE
The specified sObject type is invalid.

INVALID_TYPE_FOR_OPERATION
The specified sObject type is invalid for the specified operation.

LIMIT_EXCEEDED
An array is too long. For example, there are too many BCC addresses, targets, or email messages.

LOGIN_DURING_RESTRICTED_DOMAIN
The user is not allowed to log in from this IP address.

LOGIN_DURING_RESTRICTED_TIME
The user is not allowed to log in during this time period.

MALFORMED_ID
An invalid ID string was specified. For information about IDs, see ID Field Type.

MALFORMED_QUERY
An invalid query string was specified. For example, the query string was longer than 100,000 characters.

MALFORMED_SEARCH
An invalid search string was specified. For example, the search string was longer than 100,000 characters.

MISSING_ARGUMENT
A required argument is missing.

MIXED_DML_OPERATION
There are limits on what kinds of DML operations can be performed in the same transaction. For more information, see the *Lightning Platform Apex Code Developer's Guide*.

NOT_MODIFIED
The describe call response has not changed since the specified date.

NO_SOFTPHONE_LAYOUT
If an org has the CTI feature enabled, but no softphone layout has been defined, this exception is returned if a describe call is issued. This exception is most often caused because no call center has been defined. A default softphone layout is created during call center definition.

If an org doesn't have the CTI feature enabled, `FUNCTIONALITY_NOT_ENABLED` is returned instead.

NUMBER_OUTSIDE_VALID_RANGE
The number specified is outside the valid range for the field.

OPERATION_TOO_LARGE
The query has returned too many results. If certain queries are run by a user without the "View All Data" permission and many records are returned, the queries require sharing rule checking. For example, consider queries that are run on objects, such as Task, that use a polymorphic foreign key. These queries return this exception because the operation requires too many resources. To correct, add filters to the query to narrow the scope, or use filters such as date ranges to break the query up into a series of smaller queries.

ORG_LOCKED
The org has been locked. Contact Salesforce to unlock the org.

ORG_NOT_OWNED_BY_INSTANCE
: The user tried to log in to the wrong server instance. Choose another server instance or log in at `https://login.salesforce.com`. You can use `http` instead of `https`.

PASSWORD_LOCKOUT
: The user has exceeded the allowed number of login attempts. The user must contact an administrator to regain login access.

PORTAL_NO_ACCESS
: Access to the specified portal is not available.

QUERY_TIMEOUT
: The query has timed out. For more information, see the *Salesforce SOQL and SOSL Reference Guide*.

QUERY_TOO_COMPLICATED
: SOQL query is either selecting too many fields or there are too many filter conditions. Try reducing the number of formula fields referenced in the query.

REQUEST_LIMIT_EXCEEDED
: Exceeded either the concurrent request limit or the request rate limit for your org. For details on API request limits, see API Usage Metering.

REQUEST_RUNNING_TOO_LONG
: A request has taken too long to be processed.

SERVER_UNAVAILABLE
: A server that is necessary for this call is unavailable. Other types of requests could still work.

SSO_SERVICE_DOWN
: The service was unavailable, and an authentication call to the org's specified Single Sign-On server failed.

TOO_MANY_APEX_REQUESTS
: Too many Apex requests have been issued. If this exception persists, contact Salesforce Customer Support.

TRIAL_EXPIRED
: The trial period for the org has expired. A representative from the company must contact Salesforce to re-enable the org.

UNSUPPORTED_API_VERSION
: A method call was made that doesn't exist in the accessed API version, for example, trying to use `upsert()` (new in 8.0) against version 5.0.

UNSUPPORTED_CLIENT
: This version of the client is no longer supported.

Error

An `Error` contains information about an error that occurred during a `create()`, `merge()`, `process()`, `update()`, `upsert()`, `delete()`, or `undelete()` call. For more information, see Error Handling. An `Error` has the following properties:

Name	Type	Description
`statusCode`	StatusCode	A code that characterizes the error. The full list of status codes is available in the WSDL file for your org (see Generating the WSDL File for Your Organization).
`message`	string	Error message text.
`fields`	string[]	Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

Name	Type	Description
extendedErrorDetails	ExtendedErrorDetails	More details about the error, including an extended error code and extra error properties, when available. Reserved for future use.

Note: If your org has active duplicate rules and a duplicate is detected, the SaveResult includes an error with a data type of DuplicateError.

StatusCode

The following table lists API status codes that are returned with an error. Some codes don't appear in your WSDL, depending on the features you have enabled.

ALL_OR_NONE_OPERATION_ROLLED_BACK
The bulk operation was rolled back because one of the records wasn't processed successfully. See AllOrNoneHeader.

ALREADY_IN_PROCESS
You can't submit a record that is already in an approval process. Wait for the previous approval process to complete before resubmitting a request with this record.

ASSIGNEE_TYPE_REQUIRED
Designate an assignee for the approval request (ProcessInstanceStep or ProcessInstanceWorkitem).

BAD_CUSTOM_ENTITY_PARENT_DOMAIN
The changes you are trying to make can't be completed because changes to the associated master-detail relationship can't be made.

BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED
Your client application blind carbon-copied an email address even though the org's Compliance BCC Email option is enabled. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the Quick Find box, then select **Compliance BCC Email**.

BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED
Your client application blind carbon-copied the logged-in user's email address even though the org's BCC COMPLIANCE option is set to true. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can't BCC any other email address. To disable the option, log in to the user interface and from Setup, enter *Compliance BCC Email* in the Quick Find box, then select **Compliance BCC Email**.

CANNOT_CASCADE_PRODUCT_ACTIVE
An update to a product caused by a cascade can't be done because the associated product is active.

CANNOT_CHANGE_FIELD_TYPE_OF_APEX_REFERENCED_FIELD
You can't change the type of a field that is referenced in an Apex script.

CANNOT_CREATE_ANOTHER_MANAGED_PACKAGE
You can create only one managed package in an org.

CANNOT_DEACTIVATE_DIVISION
You can't deactivate Divisions if an assignment rule references divisions or if the DefaultDivision field on a user record isn't set to null.

CANNOT_DELETE_LAST_DATED_CONVERSION_RATE
If dated conversions are enabled, you must have at least one DatedConversionRate record.

CANNOT_DELETE_MANAGED_OBJECT
You can't modify components that are included in a managed package.

CANNOT_DISABLE_LAST_ADMIN
You must have at least one active administrator user.

CANNOT_ENABLE_IP_RESTRICT_REQUESTS
If you exceed the limit of five IP ranges specified in a profile, you can't enable restriction of login by IP addresses. Reduce the number of specified ranges in the profile and try the request again.

CANNOT_INSERT_UPDATE_ACTIVATE_ENTITY
You do not have permission to create, update, or activate the specified record.

CANNOT_MODIFY_MANAGED_OBJECT
You can't modify components that are included in a managed package.

CANNOT_RENAME_APEX_REFERENCED_FIELD
You can't rename a field that is referenced in an Apex script.

CANNOT_RENAME_APEX_REFERENCED_OBJECT
You can't rename an object that is referenced in an Apex script.

CANNOT_REPARENT_RECORD
You can't define a new parent record for the specified record.

CANNOT_RESOLVE_NAME
A `sendEmail()` call could not resolve an object name.

CANNOT_UPDATE_CONVERTED_LEAD
A converted lead could not be updated.

CANT_DISABLE_CORP_CURRENCY
You can't disable the corporate currency for an org. To disable a currency that is set as the corporate currency, first use the user interface to change the corporate currency to a different currency. Then disable the original currency.

CANT_UNSET_CORP_CURRENCY
You can't change the corporate currency for an org from the API. Use the user interface to change the corporate currency.

CHILD_SHARE_FAILS_PARENT
If you don't have appropriate permissions on a parent record, you can't change the owner of or define sharing rules for a child record. For example, you can't change the owner of a contact record if you can't edit its parent account record.

CIRCULAR_DEPENDENCY
You can't create a circular dependency between metadata objects in your org. For example, public group A can't include public group B, if public group B already includes public group A.

COMMUNITY_NOT_ACCESSIBLE
You do not have permission to access the Experience Cloud site that this entity belongs to. You must be given permission to access the site before you can access this entity.

CUSTOM_CLOB_FIELD_LIMIT_EXCEEDED
You can't exceed the maximum size for a CLOB field.

CUSTOM_ENTITY_OR_FIELD_LIMIT
You have reached the maximum number of custom objects or custom fields for your org.

CUSTOM_FIELD_INDEX_LIMIT_EXCEEDED
You have reached the maximum number of indexes on a field for your org.

CUSTOM_INDEX_EXISTS
You can create only one custom index per field.

CUSTOM_LINK_LIMIT_EXCEEDED
You have reached the maximum number of custom links for your org.

CUSTOM_METADATA_LIMIT_EXCEEDED
Your org has reached its custom metadata maximum limit.

CUSTOM_SETTINGS_LIMIT_EXCEEDED
Your org has reached its custom settings maximum limit.

CUSTOM_TAB_LIMIT_EXCEEDED
You have reached the maximum number of custom tabs for your org.

DELETE_FAILED
You can't delete a record because it is in use by another object.

DEPENDENCY_EXISTS
You can't perform the requested operation because of an existing dependency on the specified object or field.

DUPLICATE_CASE_SOLUTION
You can't create a relationship between the specified case and solution because it already exists.

DUPLICATE_CUSTOM_ENTITY_DEFINITION
Custom object or custom field IDs must be unique.

DUPLICATE_CUSTOM_TAB_MOTIF
You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_DEVELOPER_NAME
You can't create a custom object or custom field with a duplicate developer name.

DUPLICATES_DETECTED
Duplicate records have been detected. Used for an Error object with a data type of DuplicateError.

DUPLICATE_EXTERNAL_ID
A user-specified external ID matches more than one record during an upsert.

DUPLICATE_MASTER_LABEL
You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_SENDER_DISPLAY_NAME
A `sendEmail()` call could not choose between OrgWideEmailAddress.`DisplayName` or `senderDisplayName`. Define only one of the two fields.

DUPLICATE_USERNAME
A create, update, or upsert failed because of a duplicate user name.

DUPLICATE_VALUE
You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a `invalidateSessions()` call.

EMAIL_ADDRESS_BOUNCED
Emails to one or more recipients have bounced. Check the email addresses to make sure that they are valid.

EMAIL_NOT_PROCESSED_DUE_TO_PRIOR_ERROR
Because of an error earlier in the call, the current email was not processed.

EMAIL_OPTED_OUT
A single email message was sent with the `REJECT` setting in the `optOutPolicy` field to recipients that have opted out from receiving email. To avoid this error, set the `optOutPolicy` field to another value.

EMAIL_TEMPLATE_FORMULA_ERROR
The email template is invalid and can't be rendered. Check the template for incorrectly specified merge fields.

`EMAIL_TEMPLATE_MERGEFIELD_ACCESS_ERROR`
You don’t have access to one or more merge fields in this template. To request access, contact your Salesforce administrator.

`EMAIL_TEMPLATE_MERGEFIELD_ERROR`
One or more merge fields don’t exist. Check the spelling of field names.

`EMAIL_TEMPLATE_MERGEFIELD_VALUE_ERROR`
One or more merge fields have no value. To provide values, update the records before sending the email.

`EMAIL_TEMPLATE_PROCESSING_ERROR`
The merge fields in this email template can’t be processed. Ensure that your template body is valid.

`EMPTY_SCONTROL_FILE_NAME`
The Scontrol file name was empty, but the binary was not empty.

`ENTITY_FAILED_IFLASTMODIFIED_ON_UPDATE`
If the value in a record’s `LastModifiedDate` field is later than the current date, you can’t update the record .

`ENTITY_IS_ARCHIVED`
If a record has been archived, you can’t access it.

`ENTITY_IS_DELETED`
You can’t reference an object that has been deleted. This status code occurs only in API version 10.0 and later. Previous releases of the API use `INVALID_ID_FIELD` for this error.

`ENTITY_IS_LOCKED`
You can’t edit a record that is locked by an approval process.

`ENVIRONMENT_HUB_MEMBERSHIP_CONFLICT`
You can’t add an org to more than one Environment Hub.

`ERROR_IN_MAILER`
An email address is invalid, or another error occurred during an email-related transaction.

`FAILED_ACTIVATION`
The activation of a Contract failed.

`FIELD_CUSTOM_VALIDATION_EXCEPTION`
You can't define a custom validation formula that violates a field integrity rule.

`FIELD_FILTER_VALIDATION_EXCEPTION`
You can't violate field integrity rules.

`FILTERED_LOOKUP_LIMIT_EXCEEDED`
The creation of the lookup filter failed because it exceeds the maximum number of lookup filters allowed per object.

`HTML_FILE_UPLOAD_NOT_ALLOWED`
Your attempt to upload an HTML file failed. HTML attachments and documents, including HTML attachments to a Solution, can't be uploaded if the `Disallow HTML documents and attachments` checkbox is selected on the HTML Documents and Attachments Settings page.

`IMAGE_TOO_LARGE`
The image exceeds the maximum width, height, and file size.

`INACTIVE_OWNER_OR_USER`
The owner of the specified item is an inactive user. To reference this item, either reactivate the owner or reassign ownership to another active user.

INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE
Starting with version 32.0, you can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see `trust.salesforce.com`. Before version 32.0, the code is `INVALID_READ_ONLY_USER_DML`.

INSUFFICIENT_ACCESS_ON_CROSS_REFERENCE_ENTITY
An operation affects an object that is cross-referenced by the specified object, but the logged-in user doesn't have sufficient permissions on the cross-referenced object. For example, a logged-in user attempts to modify an account record, and the update creates a ProcessInstanceWorkitem. If the user doesn't have permission to approve, reject, or reassign the ProcessInstanceWorkitem, this exception occurs.

INSUFFICIENT_ACCESS_OR_READONLY
You can't perform the specified action because you don't have sufficient permissions.

INVALID_ACCESS_LEVEL
You can't define a new sharing rule that provides less access than the specified org-wide default.

INVALID_ARGUMENT_TYPE
You supplied an argument that is of the wrong type for the operation being attempted.

INVALID_ASSIGNEE_TYPE
You specified an assignee type that is not a valid integer between one and six.

INVALID_ASSIGNMENT_RULE
You specified an assignment rule that is invalid or that isn't defined in the org.

INVALID_BATCH_OPERATION
The specified batch operation is invalid.

INVALID_CONTENT_TYPE
The outgoing email has anEmailFileAttachment with an invalid`contentType` property. See RFC2045 - Internet Message Format.

INVALID_CREDIT_CARD_INFO
The specified credit card information is not valid.

INVALID_CROSS_REFERENCE_KEY
The specified value in a relationship field is not valid, or data is not of the expected type.

INVALID_CROSS_REFERENCE_TYPE_FOR_FIELD
The specified cross-reference type is not valid for the specified field.

INVALID_CURRENCY_CONV_RATE
Specify a positive, non-zero value for the currency conversion rate.

INVALID_CURRENCY_CORP_RATE
You can't modify the corporate currency conversion rate.

INVALID_CURRENCY_ISO
The specified currency ISO code is not valid.

INVALID_EMAIL_ADDRESS
A specified email address is invalid.

INVALID_EMPTY_KEY_OWNER
You can't set the value for `owner` to null.

INVALID_EVENT_SUBSCRIPTION
Invalid parameters were specified when subscribing to an event.

INVALID_FIELD
You specified an invalid field name when trying to update or upsert a record.

INVALID_FIELD_FOR_INSERT_UPDATE
You can't combine a person account record type change with any other field update.

INVALID_FIELD_WHEN_USING_TEMPLATE
You can't use an email template with an invalid field name.

INVALID_FILTER_ACTION
The specified filter action can't be used with the specified object. For example, an alert is not a valid filter action for a Task.

INVALID_ID_FIELD
The specified ID field (`ID`, `ownerId`), or cross-reference field is invalid.

INVALID_INET_ADDRESS
A specified Inet address is not valid.

INVALID_LINEITEM_CLONE_STATE
You can't clone a Pricebook2 or PricebookEntry record that isn't active.

INVALID_MASTER_OR_TRANSLATED_SOLUTION
The solution is invalid. For example, this exception occurs if you try to associate a translated solution with a master solution that's associated with another translated solution.

INVALID_MESSAGE_ID_REFERENCE
The outgoing email's References or In-Reply-To fields are invalid. These fields must contain valid Message-IDs. See RFC2822 - Internet Message Format.

INVALID_OPERATION
There is no applicable approval process for the specified object.

INVALID_OPERATOR
The specified operator is not applicable for the field type when used as a workflow filter.

INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST
You specified an invalid or null value for a restricted picklist.

INVALID_PARTNER_NETWORK_STATUS
The specified partner network status is invalid for the specified template field.

INVALID_PERSON_ACCOUNT_OPERATION
You can't delete a person account.

INVALID_READ_ONLY_USER_DML
Version 31.0 and earlier: You can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see `trust.salesforce.com`. After version 31.0, the code is `INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE`.

INVALID_SAVE_AS_ACTIVITY_FLAG
Specify `true` or `false` for the `saveAsActivity` flag.

INVALID_SESSION_ID
The specified `sessionId` is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_STATUS
The specified org status change is not valid.

INVALID_TYPE
The specified type is not valid for the specified object.

INVALID_TYPE_FOR_OPERATION
The specified type is not valid for the specified operation.

INVALID_TYPE_ON_FIELD_IN_RECORD
The specified value is not valid for the specified field's type.

IP_RANGE_LIMIT_EXCEEDED
The specified IP address is outside the IP range specified for the org.

JIGSAW_IMPORT_LIMIT_EXCEEDED
The number of records you attempted to purchase from Data.com exceeds your available record addition limit.

LICENSE_LIMIT_EXCEEDED
You have exceeded the number of licenses assigned to your org.

LIGHT_PORTAL_USER_EXCEPTION
You attempted an action with a customer portal that's not allowed. For example, trying to add the user to a case team.

LIMIT_EXCEEDED
You have exceeded a limit on a field size or value, license, platform event publishing, or other component.

LOGIN_CHALLENGE_ISSUED
An email containing a security token was sent to the user's email address because the user logged in from an untrusted IP address. The user can't log in until tthe security token is added to the end of the password.

LOGIN_CHALLENGE_PENDING
The user logged in from an untrusted IP address, but a security token has not yet been issued.

LOGIN_MUST_USE_SECURITY_TOKEN
The user must add a security token to the end of the password to log in.

MALFORMED_ID
An ID must be either 15 characters, or 18 characters with a valid case-insensitive extension. There is also an exception code of the same name.

MANAGER_NOT_DEFINED
A manager has not been defined for the specified approval process.

MASSMAIL_RETRY_LIMIT_EXCEEDED
A mass mail retry failed because your org has exceeded its mass mail retry limit.

MASS_MAIL_LIMIT_EXCEEDED
The org has exceeded its daily limit for mass email. Mass email messages can't be sent again until the next day.

MAXIMUM_CCEMAILS_EXCEEDED
You have exceeded the maximum number of specified CC addresses in a workflow email alert.

MAXIMUM_DASHBOARD_COMPONENTS_EXCEEDED
You have exceeded the document size limit for a dashboard.

MAXIMUM_HIERARCHY_LEVELS_REACHED
You have reached the maximum number of levels in a hierarchy.

MAXIMUM_SIZE_OF_ATTACHMENT
You have exceeded the maximum size of an attachment.

MAXIMUM_SIZE_OF_DOCUMENT
You have exceeded the maximum size of a document.

MAX_ACTIONS_PER_RULE_EXCEEDED
You have exceeded the maximum number of actions per rule.

MAX_ACTIVE_RULES_EXCEEDED
You have exceeded the maximum number of active rules.

MAX_APPROVAL_STEPS_EXCEEDED
You have exceeded the maximum number of approval steps for an approval process.

MAX_FORMULAS_PER_RULE_EXCEEDED
You have exceeded the maximum number of formulas per rule.

MAX_RULES_EXCEEDED
You have exceeded the maximum number of rules for an object.

MAX_RULE_ENTRIES_EXCEEDED
You have exceeded the maximum number of entries for a rule.

MAX_TASK_DESCRIPTION_EXCEEDED
The task description is too long.

MAX_TM_RULES_EXCEEDED
You have exceeded the maximum number of rules per Territory.

MAX_TM_RULE_ITEMS_EXCEEDED
You have exceeded the maximum number of rule criteria per rule for a Territory.

MERGE_FAILED
A merge operation failed.

MISSING_ARGUMENT
You did not specify a required argument.

NONUNIQUE_SHIPPING_ADDRESS
You can't insert a reduction order item if the original order shipping address is different from the shipping address of other items in the reduction order.

NO_APPLICABLE_PROCESS
A `process()` request failed because the record submitted does not satisfy the entry criteria of any active approval processes for which the user has permission.

NO_ATTACHMENT_PERMISSION
Your org does not permit email attachments.

NO_INACTIVE_DIVISION_MEMBERS
You can't add members to an inactive Division.

NO_MASS_MAIL_PERMISSION
You don't have permission to send the email. You must have "Mass Email" to send mass mail or "Send Email" to send individual email.

NUMBER_OUTSIDE_VALID_RANGE
The number specified is outside the valid range of values.

NUM_HISTORY_FIELDS_BY_SOBJECT_EXCEEDED
The number of history fields specified for the sObject exceeds the allowed limit.

OP_WITH_INVALID_USER_TYPE_EXCEPTION
The operation you attempted can't be performed for one or more users. For example, you can't add high-volume portal users to a group.

OPTED_OUT_OF_MASS_MAIL
An email can't be sent because the specified User has opted out of mass mail.

PACKAGE_LICENSE_REQUIRED
The logged-in user can't access an object that is in a licensed package without a license for the package.

PLATFORM_EVENT_ENCRYPTION_ERROR
The platform event messages could not be published due to a problem with encryption. A misconfiguration in your Salesforce org or a general encryption service error can cause this problem.

PLATFORM_EVENT_PUBLISHING_UNAVAILABLE
Publishing platform event messages failed due to a service being temporarily unavailable. Try again later.

PLATFORM_EVENT_PUBLISH_FAILED
The platform event message could not be published after one or more attempts because of a system error. Try again later.

PORTAL_USER_ALREADY_EXISTS_FOR_CONTACT
A create User operation failed because you can't create a second portal user under a Contact.

PRIVATE_CONTACT_ON_ASSET
You can't have a private contact on an asset.

RECORD_IN_USE_BY_WORKFLOW
You can't access a record that's in use by a workflow or approval process.

REQUEST_RUNNING_TOO_LONG
A request that has been running too long is canceled.

REQUIRED_FIELD_MISSING
A call requires a field that was not specified.

SELF_REFERENCE_FROM_TRIGGER
You can't recursively update or delete the same object from an Apex trigger. This error often occurs when:

- You try to update or delete an object from within its before trigger.
- You try to delete an object from within its after trigger.

This error occurs with both direct and indirect operations. The following is an example of an indirect operation:

1. A request is submitted to update Object A.
2. A `before update` trigger on object A creates an object B.
3. Object A is updated.
4. An `after insert` trigger on object B queries object A and updates it. This update is an indirect update of object A because of the before trigger of object A, so an error is generated.

SHARE_NEEDED_FOR_CHILD_OWNER
If a parent record has a child record that needs a sharing rule, you can't delete the sharing rule for the parent record.

SINGLE_EMAIL_LIMIT_EXCEEDED
(API version 18.0 and later) The org has exceeded its daily limit for individual emails. Individual email messages can't be sent again until the next day.

STANDARD_PRICE_NOT_DEFINED
Custom prices can't be defined without corresponding standard prices.

STORAGE_LIMIT_EXCEEDED
You have exceeded your org's storage limit.

STRING_TOO_LONG
The specified string exceeds the maximum allowed length.

TABSET_LIMIT_EXCEEDED
You have exceeded the number of tabs allowed for a tabset.

TEMPLATE_NOT_ACTIVE
The template specified is unavailable. Specify another template or make the template available for use.

TERRITORY_REALIGN_IN_PROGRESS
An operation can't be performed because a territory realignment is in progress.

TEXT_DATA_OUTSIDE_SUPPORTED_CHARSET
The specified text uses a character set that is not supported.

TOO_MANY_APEX_REQUESTS
Too many Apex requests have been sent. This error is transient. Resend your request after a short wait.

TOO_MANY_ENUM_VALUE
A request failed because too many values were passed in for a multi-select picklist. You can select a maximum of 100 values for a multi-select picklist.

TRANSFER_REQUIRES_READ
You can't assign the record to the specified User because the user does not have read permission.

UNABLE_TO_LOCK_ROW
A deadlock or timeout condition has been detected.

- A deadlock involves at least two transactions that are attempting to update overlapping sets of objects. If the transaction involves a summary field, the parent objects are locked, making these transactions especially prone to deadlocks. To debug, check your code for deadlocks and correct. Deadlocks are generally not the result of an issue with Salesforce operations.
- A timeout occurs when a transaction takes too long to complete, for example, when replacing a value in a picklist or changing a custom field definition. The timeout state is temporary. No corrective action is needed.

If an object in a batch can't be locked, the entire batch fails with this error. Errors with this status code contain the IDs of the records that couldn't be locked, when available, in the error message.

UNAVAILABLE_RECORDTYPE_EXCEPTION
The appropriate default record type could not be found.

UNDELETE_FAILED
An object could not be undeleted because it does not exist or has not been deleted.

UNKNOWN_EXCEPTION
The system encountered an internal error. Report this problem to Salesforce.

Note: Do not report this exception code to Salesforce if it results from a `sendEmail()` call. The `sendEmail()` call returns this exception code when it is used to send an email to one or more recipients who have the **Email Opt Out** option selected.

UNSPECIFIED_EMAIL_ADDRESS
The specified user does not have an email address.

UNSUPPORTED_APEX_TRIGGER_OPERATION
You can't save recurring events with an Apex trigger.

UNVERIFIED_SENDER_ADDRESS
A `sendEmail()` call attempted to use an unverified email address defined in the OrgWideEmailAddress object.

WEBLINK_SIZE_LIMIT_EXCEEDED
The size of a WebLink URL or JavaScript code exceeds the limit.

`WEBLINK_URL_INVALID`
The WebLink URL has failed the URL string validation check.

`WRONG_CONTROLLER_TYPE`
The controller type for your Visualforce email template does not match the object type being used.

If you receive a status code not listed in the previous table, contact Customer Support.

ExtendedErrorDetails

Reserved for future use. An `ExtendedErrorDetails` element contains extra detailed information about an error. The `ExtendedErrorDetails` element has the following properties.

Name	Type	Description
`extendedErrorCode`	ExtendedErrorCode	A code that characterizes the extended error details.
`extended error property`	Varies	An extended error property that contains more information about the error. The property name and value vary based on the extended error code.

Duplicate Management Data Types

DuplicateError

Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

Fields

Field	Details
`duplicateResult`	**Type** DuplicateResult **Description** The details of a duplicate rule and duplicate records found by the duplicate rule.
`fields`	**Type** string[] **Description** Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.
`message`	**Type** string **Description** Error message text.

Field	Details
statusCode	**Type** StatusCode **Description** A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization (see Generating the WSDL File for Your Organization).

Usage

DuplicateError and its constituent objects are available to organizations that use duplicate rules.

DuplicateError is a data type of Error.

To process duplicates, loop through all the Error objects in the `errors` field on SaveResult. An Error object with a data type of DuplicateError contains information about an error that occurred when an attempt was made to save a duplicate record. To access information about the duplicates, use the `duplicateResult` field.

Java Sample

Here is a sample that shows how to see if there are any errors on the saveResult with a data type of DuplicateError. If so, duplicates were detected. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
if (!saveResult.isSuccess()) {
    for (Error e : saveResult.getErrors()) {
        if (e instanceof DuplicateError) {
            System.out.println("Duplicate(s) Detected for lead with ID: " +
leads[i].getId());
            System.out.println("ERROR MESSAGE: " + e.getMessage());
            System.out.println("STATUS CODE: " + e.getStatusCode());
            DuplicateResult dupeResult = ((DuplicateError)e).getDuplicateResult();
            System.out.println("Found the following duplicates...");
            for (MatchResult m : dupeResult.getMatchResults()) {
                if (m.isSuccess()) {
                    System.out.println("The match rule that was triggered was " +
m.getRule());
                    for (MatchRecord mr : m.getMatchRecords()) {
                       System.out.println("Your record matched " + mr.getRecord().getId()
 + " of type "
                            + mr.getRecord().getType());
                        System.out.println("The match confidence is " +
mr.getMatchConfidence());
                    }
                }
            }
        }
    }
}
```

DuplicateResult

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

Fields

Field	Details
`allowSave`	**Type** boolean **Description** `true` if duplicates are allowed to be saved. `false` if duplicates are not allowed to be saved.
`duplicateRule`	**Type** string **Description** The name of the duplicate rule that detected duplicate records.
`duplicateRuleEntityType`	**Type** string **Description** The name of the duplicate rule that detected duplicate records.
`errorMessage`	**Type** string **Description** The error message configured by the administrator to warn users they are potentially creating duplicate records. This message is associated with a duplicate rule.
`matchResults`	**Type** MatchResult **Description** The duplicate records and related match information.

Usage

DuplicateResult and its constituent objects are available to organizations that use duplicate rules.

Java Sample

Here is a sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
package com.doc.example;

import java.io.FileNotFoundException;
```

```
import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.sobject.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class SaveResultsWithDupeHeader {

    private PartnerConnection partnerConnection = null;
    static SaveResultsWithDupeHeader tester;

    public static void main(String[] args) {
        tester = new SaveResultsWithDupeHeader();
        try {
            tester.demoDuplicateRuleHeader();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }

    /*
     * Make sure that you have an active lead duplicate rule linked to an active matching
 rule. This method tries to save
     * an array of leads and inspects whether any duplicates were detected
     */
   public void demoDuplicateRuleHeader() throws FileNotFoundException, ConnectionException
 {
        // Create the configuration for the partner connection
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername("user@domain.com");
        config.setPassword("secret");
        config.setAuthEndpoint("authEndPoint");
        config.setTraceFile("traceLogs.txt");
        config.setTraceMessage(true);
        config.setPrettyPrintXml(true);

        // Initialize the connection
        partnerConnection = new PartnerConnection(config);

        // Get the leads that have to be saved
        SObject[] leads = getLeadsForInsertOrUpdate();

        /* Set a duplicate rule header to return a result if duplicates are detected
         * This sets the allowSave, includeRecordDetails, and runAsCurrentUser flags to
true
         */
        partnerConnection.setDuplicateRuleHeader(true, true, true);

        // Save the leads
        SaveResult[] saveResults = partnerConnection.create(leads);

        // Check the results to see if duplicates were detected
        for (int i = 0; i < leads.length; i++) {
```

```
            SaveResult saveResult = saveResults[i];
            if (!saveResult.isSuccess()) {
                for (Error e : saveResult.getErrors()) {
                    // See if there are any errors on the saveResult with a data type of
DuplicateError
                    if (e instanceof DuplicateError) {
                        System.out.println("Duplicate(s) Detected for lead with ID: " +
leads[i].getId());
                        System.out.println("ERROR MESSAGE: " + e.getMessage());
                        System.out.println("STATUS CODE: " + e.getStatusCode());
                        DuplicateResult dupeResult =
((DuplicateError)e).getDuplicateResult();
                        System.out.println("Found the following duplicates...");
                        for (MatchResult m : dupeResult.getMatchResults()) {
                            if (m.isSuccess()) {
                                System.out.println("The match rule that was triggered was
 " + m.getRule());
                                for (MatchRecord mr : m.getMatchRecords()) {
                                    System.out.println("Your record matched " +
mr.getRecord().getId() + " of type "
                                            + mr.getRecord().getType());
                                    System.out.println("The match confidence is " +
mr.getMatchConfidence());
                                    for (FieldDiff f : mr.getFieldDiffs()) {
                                        System.out.println("For field " + f.getName() + "
 field difference is "
                                                + f.getDifference().name());
                                    }
                                }
                            }
                        }
                    }
                }
            }
        }

        // Clear the duplicate rule header
        partnerConnection.clearDuplicateRuleHeader();
    }

    /**
     * The assumption here is that this method is retrieving leads from either UI, a data
 source, etc
     */
    private SObject[] getLeadsForInsertOrUpdate() {
        return new SObject[0];
    }

}
```

MatchResult

Represents the duplicate results for a matching rule.

Fields

Field	Details
`errors`	**Type** Error[] **Description** Errors that occurred during matching for the matching rule.
`entityType`	**Type** string **Description** The entity type of the matching rule.
`matchEngine`	**Type** string **Description** The match engine for the matching rule.
`matchRecords`	**Type** MatchRecord[] **Description** Information about the duplicates detected by the matching rule.
`rule`	**Type** string **Description** The developer name of the matching rule that detected duplicates.
`size`	**Type** int **Description** The number of duplicates detected by the matching rule.
`success`	**Type** boolean **Description** `true` if the matching rule successfully ran. `false` if there's an error with the matching rule.

Usage

MatchResult and its constituent objects are available to organizations that use duplicate rules.

There is 1 MatchResult for each saved record that has duplicates. The MatchResult contains all duplicates for that saved record.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when leads are saved. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchResult m : dupeResult.getMatchResults()) {
    if (m.isSuccess()) {
        System.out.println("The match rule that was triggered was " + m.getRule());
        for (MatchRecord mr : m.getMatchRecords()) {
            System.out.println("Your record matched " + mr.getRecord().getId() + " of type
 "
                 + mr.getRecord().getType());
            System.out.println("The match confidence is " + mr.getMatchConfidence());
        }
    }
}
```

MatchRecord

Represents a duplicate record detected by a matching rule.

Fields

Field	Details
`additionalInformation`	**Type** AdditionalInformationMap **Description** Other information about matched records.
`fieldDiffs`	**Type** FieldDiff[] **Description** Matching rule fields and how each field value compares for the duplicate and its matching record.
`matchConfidence`	**Type** double **Description** The ranking of how similar a matched record's data is to the data in your request. Must be equal to or greater than the value of the `minMatchConfidence` specified in your request. Returns `-1` if unused.
`record`	**Type** sObject **Description** The fields and field values for the duplicate record.

Usage

MatchRecord and its constituent objects are available to organizations that use duplicate rules.

Each MatchRecord represents a duplicate detected when a record is saved. There can be multiple MatchRecord objects for a saved record if multiple duplicates are detected.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when a lead is saved. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (MatchRecord mr : m.getMatchRecords()) {
    System.out.println("Your record matched " + mr.getRecord().getId() + " of type "
        + mr.getRecord().getType());
    System.out.println("The match confidence is " + mr.getMatchConfidence());
}
```

FieldDiff

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Fields

Field	Details
`difference`	**Type** differenceType **Description** How the values of the matching rule field compare for the duplicate and its matching record. Possible values include: • `Same`: Indicates the field values match exactly. • `Different`: Indicates that the field values do not match. • `Null`: Indicates that the field values are a match because both values are blank.
`name`	**Type** string **Description** The name of a field on a matching rule that detected duplicates.

Java Sample

Here is a sample that shows how to display the matching rule field differences when a duplicate is detected. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```
for (FieldDiff f : mr.getFieldDiffs()) {
    System.out.println("For field " + f.getName() + " field difference is "
```

```
        + f.getDifference().name());
}
```

AdditionalInformationMap

Represents other information, if any, about matched records.

Fields

Field	Details
`name`	**Type** string **Description** The name of the element.
`value`	**Type** string **Description** The value of the element.

System Fields

The following fields are read-only fields found on most objects. These fields are automatically updated during API operations. For example, the ID field is automatically generated during a create operation and the LastModifiedDate is automatically updated when a user modifies a record.

Field	Field Type	Description
`Id`	ID	Globally unique string that identifies a record. For information on IDs, see ID Field Type. Because this field exists in every object, it is not listed in the field table for each object. `Id` fields have Defaulted on create and Filter access.
`IsDeleted`	boolean	Indicates whether the record has been moved to the Recycle Bin (`true`) or not (`false`). Because this field does not appear in all objects, it is listed in the field table for each object.
		Audit Fields
`CreatedById`	reference	ID of the User who created this record. `CreatedById` fields have Defaulted on create and Filter access.
`CreatedDate`	dateTime	Date and time when this record was created. `CreatedDate` fields have Defaulted on create and Filter access.
`LastModifiedById`	reference	ID of the User who last updated this record. `LastModifiedById` fields have Defaulted on create and Filter access.

Field	Field Type	Description
`LastModifiedDate`	dateTime	Date and time when a user last modified this record. `LastModifiedDate` fields have Defaulted on create and Filter access.
`SystemModstamp`	dateTime	Date and time when a user or automated process (such as a trigger) last modified this record. In this context, "trigger" refers to Salesforce code that runs to implement standard functionality, and not an Apex trigger. `SystemModstamp` fields have Defaulted on create and Filter access.

Note: Audit Fields with the dateTime field type have a certain range of valid dates. Unlike other dateTime fields, the earliest valid date is 1970-01-01T00:00:00Z GMT, or just after midnight on January 1, 1970. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1969-12-31T16:00:00, or 4:00 PM on December 31, 1969.

If you import data into Salesforce and want to retain the audit field values of the source system, you can set the values for audit fields on the following objects: Account, ArticleVersion, Attachment, CampaignMember, Case, CaseComment, Contact, ContentVersion, Contract, Event, Idea, IdeaComment, Lead, Opportunity, Question, Task, Vote, and custom objects. The only audit field you cannot set a value for is `systemModstamp`.

1. From Setup, enter *`User Interface`* in the `Quick Find` box, then select **User Interface** under Customize.
2. Under Setup, select **Enable "Set Audit Fields upon Record Creation" and "Update Records with Inactive Owners" User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Not all standard objects have all audit fields. Check the Enterprise WSDL to verify which audit fields are available for a given object.

Parent Reference Fields

If an object has a relationship to a parent object, two fields are added.

- *`Parent_Name`* contains the object name of the parent. For example, Case has a `Contact` field that contains a reference to the contact parent of the case.
- *`Parent_NameId`* contains the ID of the parent. For example, Case has a `ContactId` field that refers to the contact parent of the case. This field is used in SOQL relationship queries such as the following:

```
SELECT Case.ContactId, Case.Contact.Name FROM Case
```

Even if the object can parent itself, these fields occur. For example, the Campaign object has a `Campaign` and `CampaignId` field for referencing the parent Campaign.

Required Fields

Required fields must have a non-`null` value. This rule affects the create and update calls:

- In a create call, the system automatically populates the data for certain required fields (such as system fields and the object ID fields). Similarly, if a required field has a default value (its `defaultedOnCreate attribute` is set to `true`, as described in Field in a describe result, then the system implicitly assigns a value for this field when the object is created, even if a value for this field is not explicitly passed in on the create call. For all other required fields, such as ID fields that are analogous to foreign keys in SQL, a client application must explicitly assign a value when the object is created (it cannot be `null`).

- In updates, a required field cannot be set to `null`, and many required fields can't be changed.

Any field not specified as required in the object description is optional, that is, it can be `null` when updated or created.

Some required fields for some objects require special handling.

Frequently-Occurring Fields

In addition to system fields, these fields are found on many objects.

- `OwnerId`
- `RecordTypeId`
- `CurrencyIsoCode`

`OwnerId`

Objects have an `ownerId` field that is an reference to the user who owns that object. Ownership is an important concept that affects the security model and has other implications throughout the system. Any user can query the owner field for any record they can access. However, setting the `ownerId` field has the following limitations:

- For most users and most objects, this field can't be set directly upon insert. It is implicitly set to the current user when inserting an object.
- When creating or updating a Case or Lead, a client application (that is logged in with sufficient permissions to transfer a record) can set this field to any valid User in the organization or to any valid queue of the appropriate type in the organization.
- Updating this field via the API changes only the owner of that record. The change of ownership does not cascade to associated records as it does when you transfer record ownership in the Salesforce user interface.
- Updating this field on an account deletes the existing sharing information and reapplies the organization-wide sharing defaults and sharing rules.
- To update the `ownerId` field, the user must have the "Transfer Record" permission and Read access to the new owner.

In API version 12.0 and later, if your organization has set up opportunity teams, `OwnerId` fields behave the same for Account and Opportunity objects as for other objects. That is, if you update the `OwnerId` field in either object, any AccountShare or OpportunityShare records with `RowCause` set to Sales Team are kept. In API version 11.0 and earlier, the sharing records are deleted.

`RecordTypeId`

Record types are used to offer different business processes and subsets of picklist values to different User records based on their Profile settings. (In addition, person accounts use record types to manage a number of additional elements.

Record types are configured in the user interface or by creating, editing, or deleting the RecordType object in the API. Retrieve the list of valid record type IDs (String) for an object by querying the RecordType object.

The `RecordTypeId` field in an object contains the ID of the RecordType record that is associated with a standard or custom object. You can create or update this field.

Note: You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

When specified in a create or update call, the record type ID (String) must refer to a valid record type for that object.

Note: The `RecordTypeId` field is in your organization's WSDL only if at least one record type is configured for your organization in the Salesforce user interface.

`CurrencyIsoCode`

For organizations that have multicurrency enabled, the `CurrencyIsoCode` field contains the string representation of the currency ISO code associated with currency values in the object. Note that the User object also has a `DefaultCurrencyIsoCode` field, which is the default currency for that user. For example, a user in France could have a `DefaultCurrencyIsoCode` set to Euros, and that would be their default currency in the application. However, the User object could have currency custom fields stored in a different currency, that will correspond to the organization currency at the time the user record is created.

API Field Properties

Fields on objects represent the details of each object and are analogous to columns in a database table. Each field on each object has one or more of the following properties:

Property	Description
Aggregatable	Can be used by one of the SOQL aggregate functions.
Autonumber	The API creates an autonumber.
Create	Value for the field can be specified during create using the API.
Defaulted on create	If no other value is specified when created, a default value is supplied.
Delete	Value for the field can be deleted using the API.
Filter	Can be used as filter criteria in a SOQL query FROM or WHERE clause.
Group	Can be included in the GROUP BY clause of a SOQL query (`true`) or not (`false`). Available in API version 18.0 and later.
idLookup	Can be used to specify a record in an upsert call. The `Id` field of each object has this property and some `Name` fields. There are exceptions, so check for the property in any object you wish to upsert.
Namepointing	Indicates whether the field's value is the Name of the parent of this object (true) or not (false). Used for objects whose parents can be more than one type of object. For example, a task can have an account or a contact as a parent.
Nillable	The field can contain a null value.
Query	The field can be queried with SOQL using the API.
Restricted picklist	A picklist whose values are restricted to those values defined by a Salesforce admin. Users can't load unapproved values through the API.
Retrieve	Value of the field can be retrieved using the API.
Sort	Indicates whether a query can sort on this field (`true`) or not (`false`).
Update	Can be updated using the API.

Relationships Among Objects

Relationships associate objects with other objects. For example, a relationship can link a custom object to standard object in a related list, such as linking a custom object called Bugs to cases to track product defects associated with customer cases. To view the parent and child relationships among standard objects, see the ERD diagrams in Data Model.

Note:

- You can use parent-child relationships in SOQL queries. For more information, see Relationship Queries in the *Salesforce SOQL and SOSL Reference Guide*.
- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported. See "External Object Relationships" in the Salesforce Help.

You can define different types of relationships by creating custom relationship fields on an object. The differences between relationship types include how they handle data deletion, record ownership, security, and required fields in page layouts:

- **Master-Detail (1:n)** — A parent-child relationship in which the master object controls certain behaviors of the detail object:
  - When a record of the master object is deleted, its related detail records are also deleted.
  - The `Owner` field on the detail object is not available and is automatically set to the owner of its associated master record. Custom objects on the detail side of a master-detail relationship cannot have sharing rules, manual sharing, or queues, as these require the `Owner` field.
  - The detail record inherits the sharing and security settings of its master record.
  - The master-detail relationship field is required on the page layout of the detail record.
  - By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

  You can define master-detail relationships between custom objects or between a custom object and a standard object. However, the standard object cannot be on the detail side of a relationship with a custom object. In addition, you cannot create a master-detail relationship in which the User or Lead objects are the master.

  When you define a master-detail relationship, the custom object on which you are working is the detail side. Its data can appear as a custom related list on page layouts for the other object.

- **Many-to-many** — You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you create a custom object called Bug that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. To create a many-to-many relationship, simply create a custom junction object with two master-detail relationship fields, each linking to the objects you want to relate. See the Salesforce online help for details.

  Custom objects with two master-detail relationships are supported in API version 11 and later.

  Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID. `JunctionIdList` is implemented in the `Task` and `Event` objects.

- **Lookup (1:n)** — This type of relationship links two objects together, but has no effect on deletion or security. Unlike master-detail fields, lookup fields are not automatically required. When you define a lookup relationship, data from one object can appear as a custom related list on page layouts for the other object. See the Salesforce online help for details.

To create relationships, use the user interface or Salesforce Metadata API.

Relabeling Fields and Tabs and the API

The user interface allows you to change the labels on some fields and tabs. Although you cannot relabel fields or tabs using the API, you can retrieve the current values. To do so, issue a `describeSObjects()` call and inspect the label field of the returned DescribeSObjectResult.

Tooling API Objects in the Enterprise WSDL

Some objects used by the Tooling API are included in the Enterprise and Partner WSDL. Use the objects from these WSDLs instead of the Tooling WSDL if you need field-level security.

The following Tooling API objects are exposed in the Enterprise and Partner WSDL.

- BriefcaseDefinition
- DataType
- EntityDefinition
- EntityParticle
- FieldDefinition
- PicklistValueInfo
- Publisher
- SearchLayout
- Service
- ServiceDataType (Reserved for future use.)
- ServiceFieldDataType (Unavailable in version 35.0 and later. Do not use.)
- RelationshipDomain
- RelationshipInfo
- UserEntityAccess
- UserFieldAccess
- WsdlDataType (Reserved for future use.)
- XmlSchema (Reserved for future use.)

For more information, use the *Tooling API Developer's Guide*.

Salesforce AppExchange Object Prefixes and the API

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix__name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the *ISVforce Guide*.

Custom Object Behavior

In the user interface, you can extend your org's data by defining custom objects. Custom objects are custom database tables that allow you to store information unique to your organization. For custom objects, the `custom` flag—a Boolean field in the describe results—is `true`.

Client applications with sufficient permissions can invoke API calls on existing custom objects. You can create custom objects with the user interface, or by using the metadata WSDL with a client application or using the Salesforce Extensions for Visual Studio Code. For more information about using the metadata WSDL to create custom objects, see the *Lightning Platform Metadata API Developer's Guide*. For more information about Visual Studio Code, see *Salesforce Extensions for Visual Studio Code.*

Use the following topics to understand how the API interacts with custom objects and fields:

- Naming Conventions for Custom Objects
- Relationships Among Custom Objects
- Audit Fields for Custom Objects
- Sharing and Custom Objects
- Tags and Custom Objects
- Standard Fields for Custom Objects
- Required Fields in Custom Objects
- Managed Packages and API Names

Naming Conventions for Custom Objects

Your Salesforce administrator defines an associated name field for each custom object during setup. Custom objects must have unique names within your organization.

In the API, the names of custom objects include a suffix of two underscores followed by a lowercase "c". For example, a custom object labeled "Issue" in the Salesforce user interface is `Issue__c` in that organization's WSDL.

Relationships change the naming convention. See Relationships Among Custom Objects for more information.

For a custom object record to appear in the Salesforce user interface, its name field must be populated. If you use the API to create a custom object record that doesn't have a name, the record's ID is used as its name.

Relationships Among Custom Objects

Custom objects behave and relate to other objects just like standard objects do, as described in Relationships Among Objects. For example, cascading deletes are supported in custom objects in a Master-Detail relationship.

Custom objects can also have many-to-many relationships with other custom objects or standard objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For more information, see Relationships Among Objects.

Custom objects require special treatment so that they can participate in Relationship Queries. For the relationship field name of a custom object, `__r` is appended to the name to create the ID. Also, `__c` is appended to the name to create the parent object pointer. For example, if the relationship field name is MyRel, the name of the ID becomes `MyRelId__r`, the parent object pointer becomes `MyRel__c`, and the relationship name is `MyRel__r`. For more information, see Understanding Relationship Names, Custom Objects, and Custom Fields in the *Salesforce SOQL and SOSL Reference Guide*.

This table summarizes whether a standard object can be:

- The master in a master-detail relationship with a custom object. Master-detail relationships involve cascading deletes and sharing rules that the parent controls.
- The lookup in a lookup relationship on a custom object. In other words, whether a custom object can have a lookup to the standard object.
- Extended with custom fields.

Standard Object	Master-Detail	Lookup	Custom Fields
Account	Yes	Yes	Yes
Campaign	Yes	Yes	Yes
Case	Yes	Yes	Yes
Contact	Yes	Yes	Yes
Contract	Yes	Yes	Yes
Event	No	No	Yes
Lead	No	No	Yes
Opportunity	Yes	Yes	Yes
Product2	No	Yes	Yes
Solution	Yes	Yes	Yes
Task	No	No	Yes
User	No	Yes	Yes

Audit Fields for Custom Objects

Custom objects can have the same audit fields as standard objects. When you create a custom object, the four audit fields, `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate`, are created and populated for the object. These fields are read only. If you import data into Salesforce custom objects and want to retain the audit field values from the source system, you can set the values when you create the custom objects. The only audit field you cannot set a value for is `SystemModstamp`. Your organization must be API enabled, and you must have the “Modify All Data” permission.

1. From Setup, enter *`User Interface`* in the `Quick Find` box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Note these restrictions:

- `CreatedDate` can't be greater than the `LastModifiedDate`.
- You can't set any date field to be greater than the current time.

For more information about audit fields, see System Fields.

Sharing and Custom Objects

A sharing rule object is created for each custom object that does not have a master-detail relationship to another object. They are similar to standard object sharing rules, for example AccountOwnerSharingRule. If the user creating the custom object has the "Manage Sharing" permission, a sharing rule object is automatically created for it.

Apex sharing reasons can be retrieved describing the custom object's sharing object, and examining the information in the `rowCause` field. The name of a sharing object for each custom object is of the form: *`MyObjectName`*__Share, similar to AccountShare and other standard object sharing objects.

Tags and Custom Objects

When a custom object is created, a Tag object related to it is also created. These object names are of the form: *`MyObjectName`*__Tag, similar to AccountTag and other standard object tag objects.

Standard Fields for Custom Objects

When a custom object is created, Salesforce assigns some standard fields to the object or entity. For details, see Custom Objects.

Required Fields in Custom Objects

In the user interface, you can mark a custom field as required, and this rule is also enforced in the API. Each custom field has a `nillable` attribute, with a data type boolean. The default value is `false`. If set to `true`, each request supplies a value (or leaves the current value) to this field. Otherwise, the request fails. When the value is set to `true`, the next time the field is edited or created, the validation applies. If no value is supplied or default value specified, the request fails.

To edit the `nillable` attribute, you must log in as a user with the "Customize Application" permission.

If you change a custom object field to be required in an existing client application or integration, be sure that a value is supplied for that field. For example, if the custom picklist field `Education Level` on the contact object is required, supply a default value for that custom field. If a required field does not have a specified or default value, an error with the status code `REQUIRED_FIELD_MISSING` is returned.

Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: *`name`*`__c` becomes *`prefix`*`__`*`name`*`__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the *ISVforce Guide*.

SEE ALSO:

Custom Objects

External Objects

External objects are supported in API version 32.0 and later. External objects are similar to custom objects, but external object record data is stored outside your Salesforce organization. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

External objects are available with Salesforce Connect and Files Connect. Each external object is associated with an external data source definition in your Salesforce organization.

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Lightning Platform use to interact with the external data and content.

By accessing record data on demand, external objects always reflect the current state of the external data. You don't have to manage a copy of that data in Salesforce, so you're not wasting storage and resources keeping data in sync.

External objects are best used when you have a large amount of data that you can't or don't want to store in your Salesforce organization, and you need to use only a small amount of data at any one time.

See "Define External Objects" in the Salesforce Help for how to create and modify external objects.

Naming Conventions for External Objects

Object names must be unique across all standard, custom, and external objects in the org.

In the API, the names of external objects are identified by a suffix of two underscores immediately followed by a lowercase "x" character. For example, an external object named "ExtraLogInfo" in the Salesforce user interface is seen as `ExtraLogInfo__x` in that organization's WSDL.

We recommend that you make object labels unique across all standard, custom, and external objects in the org.

External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that's stored outside your Salesforce org often doesn't contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups. See "External Object Relationships" in the Salesforce Help for details.

Feature Support for External Objects

Most of the Salesforce features that support custom objects also support external objects. However, there are exceptions, and some features have special limitations and considerations for external objects. See the following topics in the Salesforce Help.

- Salesforce Compatibility Considerations for Salesforce Connect—All Adapters
- Considerations for Salesforce Connect—All Adapters

Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. This table describes the available adapters.

Salesforce Connect Adapter	Description	Where to Find Callout Limits
Cross-org	Uses the Lightning Platform REST API to access data that's stored in other Salesforce orgs.	No callout limits. However, each callout counts toward the API usage limits of the provider org. *Salesforce Help*: API Usage Considerations for Salesforce Connect—Cross-Org Adapter *Salesforce Limits Quick Reference Guide*: API Request Limits and Allocations
OData 2.0 OData 4.0	Uses Open Data Protocol to access data that's stored outside Salesforce. The external data must be exposed via OData producers.	*Salesforce Help*: General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters
Custom adapter created via Apex	You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren't suitable for your needs. A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically.	*Apex Developer Guide*: Callout Limits and Limitations *Apex Developer Guide*: Execution Governors and Limits

Files Connect Adapters

Several Files Connect adapters are also available:

- Google Drive
- Box
- SharePoint Online
- OneDrive for Business

For more information about setting up Files Connect adapters see, The Files Connect Process.

For more information about Salesforce Connect, see "Salesforce Connect" in the Salesforce Help.

For details on using the Apex Connector Framework, see "Salesforce Connect" and "DataSource Namespace" in the *Apex Code Developer's Guide*.

CHAPTER 3 API Call Basics

In this chapter ...

API calls represent specific operations that your client applications can invoke at runtime to perform tasks, for example:

- Query data in your organization.
- Add, update, and delete data.
- Obtain metadata about your data.
- Run utilities to perform administration tasks.

Using your development environment, you can construct Web service client applications that use standard Web service protocols to programmatically:

- Log in to the login server (`login()`) and receive authentication information to be used for subsequent calls
- Query your organization's information (`query()`, `queryAll()`, `queryMore()`, and `retrieve()` calls)
- Perform text searches across your organization's information (`search()` call)
- Create, update, and delete data (`create()`, `merge()`, `update()`, `upsert()`, `delete()`, and `undelete()` calls)
- Perform administrative tasks, such as retrieving user information (`getUserInfo()` call), changing passwords (`setPassword()` and `resetPassword()` calls), and getting the system time (`getServerTimestamp()` call)
- Replicate data locally (`getDeleted()` and `getUpdated()` calls)
- Obtain and navigate metadata about your organization's data (`describeGlobal()`, `describeSObject()`, `describeSObjects()`, `describeLayout()`, and `describeTabs()` calls)
- Work with approval processes (`process()`)
- Return category groups and categories from your organization (`describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()`).

See Core Calls, Describe Calls, and Utility Calls for complete details about each call.

Characteristics of API Calls

All API calls are:

- **Service Requests and Responses**—Your client application prepares and submits a service request to the Lightning Platform Web Service via the API, the Lightning Platform Web Service processes the request and returns a response, and the client application handles the response.
- **Synchronous**—Once the API call is invoked, your client application waits until it receives a response from the service. Asynchronous calls are not supported.
- **Committed Automatically Versus Rollback on Error**—By default, every operation that writes to a Salesforce object is committed automatically. This is analogous to the AUTOCOMMMIT setting in SQL. For `create()`, `update()`, and `delete()` calls that attempt to write to multiple records for an object, the write operation for each record is treated as a separate transaction. For example, if a client application attempts to create two new accounts, they're created using mutually exclusive insert operations that succeed or fail individually, not as a group.

  For API version 20.0 and later, there is an AllOrNoneHeader header that allows a call to roll back all changes unless all records are processed successfully. This header is supported by the `create()`, `delete()`, `undelete()`, `update()`, and `upsert()` calls.

Note: The default behavior means that client applications may need to handle some failures: for example, if you create an opportunity that has shipments (a custom object), and the opportunity line item gets created but the shipment creation fails, if your business rules required all opportunities be created with shipment, your client application would need to roll back the opportunity creation. The easiest way to do this is to use AllOrNoneHeader.

Factors that Affect Data Access

When using the API, the following factors affect access to your organization's data:

Access

Your organization must be enabled for API access.

Objects may not be available until you contact Salesforce and request access. For example, Territory2 is visible only if Enterprise Territory Management has been enabled in the application. Such requirements are in the "Usage" section for each object.

Sometimes a feature must be used once before objects related to it can be accessed with the API. For example, the `recordTypeIds` is available only after at least one record type has been created for your organization in the user interface.

To investigate data access issues, you can start by inspecting the WSDL:

- **Enterprise WSDL**: The generated enterprise WSDL file contains all of the objects that are available to your organization. By using the API, a client application can access objects that are defined in your enterprise WSDL file.
- **Partner WSDL**: When using the generated partner WSDL file, a client application can access objects that are returned in the `describeGlobal()` call.

Object-Level and Field-Level Security

The API respects object-level and field-level security configured in the user interface. You can access objects and fields only if the logged-in user's permissions and access settings allow such access. For example, fields that are not visible to a given user are not returned in a `query()` or `describeSObjects()` call. Similarly, read-only fields can't be updated.

User Permissions

A user attempting to access the API must have the permission "API Enabled" selected. It's selected by default.

Your client application logs in as a user called a *logged-in* user. The logged-in user's permissions grant or deny access to specific objects and fields in your organization:

- **Read**—Users can only view objects of this type.
- **Create**—Users can read and create objects of this type.
- **Edit**—Users can read and update objects of this type.
- **Delete**—Users can read, edit, and delete objects of this type.

User permissions do not affect field-level security. If field-level security specifies that a field is hidden, users with "Read" on that object can view only those fields that are not hidden on the record. In addition, users with "Read" on an object can view only those records that sharing settings allow. The one exception is the "Edit Read Only Fields" permission, which gives users the ability to edit fields marked as read only via field-level security.

Sharing

For most API calls, data that is outside of the logged-in user's sharing model is not returned. Users are granted the most permissive access that is available to them, either through organization-wide defaults or manual record sharing, just as in the application.

User Permissions that Override Sharing

- **View All**—Users can view all records associated with this object, regardless of sharing settings.
- **Modify All**—Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.
- **Modify All Data**—users can read, edit, delete, transfer, and approve all records regardless of sharing settings. This permission is not an object-level permission, unlike "View All" and "Modify All."

To protect the security of your data, give the logged-in user only the permissions needed to successfully execute all the calls made by the application. For large integration applications, "Modify All Data" may speed up call response times. If you are loading a large number of records, use the Bulk API instead.

Related Objects

Some objects depend on other objects for permission. For example, AccountTeamMember follows sharing on the associated permission-assigned object such as the Account record. Similarly, a Partner depends on the permissions in the associated .

Ownership changes to a record do not automatically cascade to related records. For example, if ownership changes for a given Account, ownership does not then automatically change for any Contract associated with that Account—each ownership change must be made separately and explicitly by the client application.

Object Properties

To create an object with the `create()` call, the object's `createable` attribute must be set to `true`. To determine what operations are allowed on a given object, your client application can invoke the `describeSObjects()` call on the object and inspect the properties in the DescribeSObjectResult.

Note: `replicatable` allows `getUpdated()` and `getDeleted()` calls.

Page Layouts and Record Types

Requirements defined in the Salesforce user interface for page layouts and record types are not enforced by the API:

- Page layouts can specify whether a given field is required, but the API does not enforce such layout-specific field restrictions or validations in `create()` and `update()` calls. It's up to the client application to enforce any such constraints, if applicable.
- Record types can control which picklist values can be chosen in a given record and which page layouts users with different profiles can see. However, such rules that are configured and enforced in the user interface are not enforced in the API. For example, the API does not validate whether the value in a picklist field is allowed per any record type restrictions associated with the profile of the logged-in user. Similarly, the API does not prevent a client application from adding data to a particular field simply because that field does not appear in a layout associated with the profile of the logged-in user.

Referential Integrity

To ensure referential integrity, the API forces or prevents certain behaviors:

- ID values in reference fields are validated in `create()` and `update()` calls.

- If a client application deletes a record, then its children are automatically deleted as part of the call if the `cascadeDelete` property on ChildRelationship for that child has a value of `true`. For example, if a client application deletes an Opportunity, then any associated OpportunityLineItem records are also deleted. However, if an OpportunityLineItem is not deletable or is currently being used, then deletion of the parent Opportunity fails. For example, if a client application deletes an Invoice_Statement, then any associated Line_Item records are also deleted. However, if a Line_Item is not deletable or is currently being used, then deletion of the parent Invoice_Statement fails. Use DescribeSObjectResult to view the ChildRelationship value if you want to be sure what will be deleted.

  There are certain exceptions that prevent the execution of a `cascadeDelete`. For example, you can't delete an account if it has associated cases, if it has related opportunities that are owned by other users, or if associated contacts are enabled for the Customer Portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you or has active contracts, then the delete request for that record will fail.

Package Version Settings

When your API client is referencing components in managed packages, you can specify the version of each installed package that you want to reference for your integration. This allows your API client to continue to function with specific, known behavior even when you install subsequent versions of a package. You can use the PackageVersionHeader SOAP header to set different package versions for different calls, if necessary.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *`majorNumber.minorNumber.patchNumber`* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *`patchNumber`* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. The SOAP endpoint contains a URL with a format of *`serverName`*`/services/Soap/c/`*`api_version`*`/`*`ID`* where *`api_version`* is the version of the API, such as , and *`ID`* encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, enter `API` in the `Quick Find` box, then select **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

Note: Installing a new version of a package in your organization does not affect the current default settings.

CHAPTER 4 Error Handling

In this chapter ...

The API calls return error data that your client application can use to identify and resolve runtime errors. If an error occurs during the invocation of most API calls, then the API provides the following types of error handling:

- For errors resulting from badly formed messages, failed authentication, or similar problems, the API returns a SOAP fault message with an associated ExceptionCode.
- For most calls, if the error occurs because of a problem specific to the query, the API returns an Error. For example, if a `create()` request contains more than 200 objects.

Error Handling for Session Expiration

When you sign on via the `login()` call, a new client session begins and a corresponding unique session ID is generated. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking **Security Controls**. The default is 120 minutes (two hours). If you make an API call, the inactivity timer is reset to zero.

When your session expires, the exception code INVALID_SESSION_ID is returned. If this happens, you must invoke the `login()` call again.

More About Error Handling

For more information about errors, see the following topics:

- API Fault Element
- ExceptionCode
- Error

CHAPTER 5 Security and the API

In this chapter ...

Client apps that access your Salesforce data are subject to the same security protections that are used in the Salesforce user interface. Additional protection is available for orgs that install AppExchange managed packages if those packages contain components that access Salesforce via the API.

User Authentication

Client apps must log in using valid credentials. After validating, the server provides the client app with a:

- `sessionId` that is set into the session header so that all subsequent calls to the Web service are authenticated
- URL address (`serverUrl`) for the client app's web service requests

Salesforce supports only the Transport Layer Security (TLS) protocol and frontdoor.jsp. Ciphers must have a key length of at least 128 bits.

User Profile and Permission Sets Configuration

As an org's Salesforce admin, you control which features and views are available to users by configuring profiles and permission sets and assigning users to them. To access the API to issue calls and receive the call results, a user must have the API Enabled permission. Client apps can query or update only those objects and fields to which they have access via the permissions of the logged-in user.

To create, edit, or delete a profile, from Setup, enter *`Profiles`* in the Quick Find box, then select **Profiles**. To create, edit, or delete a permission set, from Setup, enter *`Permission Sets`* in the Quick Find box, then select **Permission Sets**.

Note: The web services WSDL files return all available objects and fields for an org.

Security Token

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce authorizes the login as follows.

1. Salesforce checks whether the user's profile has login-hour restrictions. If the user's profile specifies login-hour restrictions, login attempts outside the specified hours are denied.
2. If the user has the Multi-Factor Authentication for User Interface Logins permission, the Salesforce login process prompts the user for an identity verification method in addition to their username and password. If the user's account isn't already connected to a verification method, such as the Salesforce Authenticator mobile app, Salesforce prompts the user to register a method.
3. If the user has the Multi-Factor Authentication for API Logins permission and connected an authenticator app to the account, the user must enter a verification code (TOTP) generated by the authenticator app. If the user uses the standard security token, Salesforce returns an error.
4. Salesforce then checks whether the user's profile defines IP address range restrictions. If so, logins from outside the IP address range are denied. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client apps.
5. If profile-based IP address restrictions aren't set, Salesforce checks whether the user is logging in from a device that was previously used to access Salesforce.
   - If the user is logging in from a device and browser that Salesforce recognizes, the login is allowed.
   - If the user is logging in from an IP address on your org's trusted IP address list, the login is allowed.
   - If the user isn't logging in from a trusted IP address, device, or browser that Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce verifies the user's identity.

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later) or enter a verification code.

Note: Users aren't asked for a verification code the first time they log in to Salesforce.

- For access via the API or client app, if the Multi-Factor Authentication on API Logins permission is set on the user profile, users enter a TOTP verification code generated by an authenticator app.

  If the permission isn't set, users must add their security token to the end of their password to log in. A security token is a generated key from Salesforce. For example, if a user's password is *mypassword* and the security token is *XXXXXXXXXX*, the user enters *mypasswordXXXXXXXXXX* to log in. Some client apps have a separate field for the security token.

  Users can get their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

  Tip: Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

For more information about tokens, see Reset Your Security Token in Salesforce Help.

When a user's password is changed, the user's security token is automatically reset. To log in after the reset, the user adds the generated security token to the end of the password. Or the user enters the new password after you add the user's IP address to the org's list of trusted IP addresses.

If single sign-on (SSO) is enabled, users who access the API or a desktop client can't log in unless their IP address is included on your org's list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. The delegated authentication authority usually handles login lockout policies for users with the Uses Single Sign-On permission. However, if the security token is enabled, your login lockout settings determine how many times a user can try to log in with an invalid security token before getting locked out. For more information, see Setting Login Restrictions and Setting Password Policies in Salesforce Help.

Sharing

Sharing refers to the act of granting read or write access to a user or group so that they can view or edit a record owned by other users, if the default access levels don't permit such access. All API calls respect the sharing model.

The following table describes the types of access levels.

API Value	Salesforce User Interface Label	API Picklist Label	Description
`None`	`Private`	`Private`	Only the record owner and Users above that role in the hierarchy can view and edit the record.
`Read`	`Read Only`	`Read Only`	All Users and Groups can view the record but not edit it. Only the owner and users above that role in the hierarchy can edit the record.
`Edit`	`Read/Write`	`Read/Write`	All Users and Groups can view and edit the record.
`ReadEditTransfer`	`Read/Write/Transfer`	`Read/Write/Transfer`	All Users and Groups can view, edit, delete, and transfer the record. (Only available for cases and leads as an org-wide default setting.)
`All`	`Full Access`	`Owner`	All Users and Groups can view, edit, transfer, delete, and share the record. (Only available for campaigns as an org-wide default setting.)

API Value	Salesforce User Interface Label	API Picklist Label	Description
ControlledByParent	Controlled by Parent	Controlled By Parent	(Contacts only.) All Users and Groups can perform an action (such as view, edit, or delete) on the contact based on whether he or she can perform that same action on the record associated with it.

Not all access levels are available for every object. See the Fields table for each object to learn which access levels are available, as well as other sharing details specific to that object.

For more information about sharing in general, see Salesforce Help.

Note: In the API, you can create and update objects such as AccountShare and OpportunityShare that define sharing entries for records.

Implicit Restrictions for Objects and Fields

Certain objects can be created or deleted only in the Salesforce user interface. Other objects are read-only—client apps cannot create(), delete(), or update() such objects. Similarly, certain fields within some objects can be specified on create() but not on update(). Other fields are read-only—client apps cannot specify field values in create() or update() calls. For more information, see the respective object descriptions in Object Basics.

API Access in Salesforce AppExchange Packages

The API allows access to objects and calls based on the permissions of the user who logs into the API. To prevent security issues from arising when installed packages have components that access data via the API, Salesforce provides additional security:

- When a developer creates an AppExchange package with components that access the API, the developer can restrict the API access for those components.
- When an administrator installs an AppExchange package, the administrator can accept or reject the access. Rejecting the access cancels the installation.
- After an administrator installs a package, the administrator can restrict the API access of components in the package that access the API.

Editing API access for a package is done in the Salesforce user interface. For more information, see *Manage API and Dynamic Apex Access in Packages* in Salesforce Help.

API access for a package affects the API requests originating from components within the package; it determines the objects that the API requests can access. If the API access for a package is not defined, then the objects that the API requests have access to are determined by the user's permissions.

The API access for a package never allows users to do more than the permissions granted to the user. API access in a package only reduces what the user's permissions allow.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
  - Author Apex
  - Customize Application

  - Edit HTML Templates
  - Edit Read Only Fields
  - Manage Billing
  - Manage Call Centers
  - Manage Categories
  - Manage Custom Report Types
  - Manage Dashboards
  - Manage Letterheads
  - Manage Package Licenses
  - Manage Public Documents
  - Manage Public List Views
  - Manage Public Reports
  - Manage Public Templates
  - Manage Users
  - Transfer Record
  - Use Team Reassignment Wizards
  - View Setup and Configuration
  - Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.
- A package with `Restricted` API access can't create new users.
- Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.
- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user's full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
  - For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
  - For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.

- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

To manage API access to packages, see “Manage API and Dynamic Apex Access in Packages” in Salesforce Help.

Note: XML-RPC requests that originate from restricted packages are denied access.

Outbound Port Restrictions

For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

The port restriction applies to any feature where a port is specified, for example outbound messages, AJAX proxy, or single-sign on.

CHAPTER 6 Using the Partner WSDL

In this chapter ...

The API provides two WSDLs to choose from:

- **Enterprise Web Services WSDL**—Used by enterprise developers to build client applications for a single Salesforce organization. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it when changes are made to the custom objects or fields in their org or when they want to use a different version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter *API* in the `Quick Find` box. Then, on the API page, select **Generate Enterprise WSDL**.
- **Partner Web Services WSDL**—Used for client applications that are metadata-driven and dynamic in nature. It is particularly—but not exclusively—useful to Salesforce partners who are building client applications for multiple organizations. As a loosely typed representation of the Salesforce data model that works with name-value pairs of field names and values instead of specific data types, it can be used to access data within any organization. This WSDL is most appropriate for developers of clients that can issue a query call to get information about an object before the client acts on the object. The partner WSDL document needs to be downloaded and consumed only once per version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter *API* in the `Quick Find` box. Then, on the API page, select **Generate Partner WSDL**.

In general, the enterprise WSDL is more straightforward to use, while the partner WSDL is more flexible and dynamically adaptable to different organizations, allowing you to write a single application that can be used for multiple users and multiple organizations.

High Precision Versions

If you require higher precision than the regular WSDLs provide, ask your account team about the "High Precision API" feature. When this feature is enabled, the WSDLs that you download (both Enterprise and Partner) use higher precision data types. For example, this feature is useful if your organization uses complex numerical formulas that are prone to rounding errors.

Note: This feature is a limited pilot and is not currently a generally available feature.

If you have been using the regular version of the WSDL and change to the high precision version, perform the following checks:

1. Download the new WSDL.
2. Regenerate the stub code. (See Setting Up Your Java Developer Environment.)
3. Verify that the type of variables used to store numeric values in your code can accommodate the new types.

Obtaining the Partner WSDL File

To use the partner WSDL, download a copy of the file using either of the following methods:

- Obtain it from your organization's Salesforce administrator, or
- Generate from Setup in Salesforce (enter `API` in the `Quick Find` box, then select **API**) according to the instructions in Step 2: Generate or Obtain the Web Service WSDL.

While the enterprise WSDL file needs to be regenerated whenever custom fields or custom objects are added to an organization's Salesforce information, the partner WSDL file remains the same regardless of underlying changes in the organization's Salesforce data.

Calls and the Partner WSDL

The partner WSDL file defines exactly the same API calls found in the enterprise WSDL file. A client application using the partner WSDL will likely use the following API calls to determine an organization's metadata:

Task / Call	Description
`describeGlobal()`	Retrieves a list of available objects for your organization's data.
`describeLayout()`	Retrieves metadata about page layouts for the specified object type.
`describeSObject()`	`describeSObject()` has been superseded by `describeSObjects()`.
`describeSObjects()`	Use to obtain metadata for a given object. You can first call to retrieve a list of all objects for your organization, then iterate through the list and use to obtain metadata about individual objects.
`describeTabs()`	In the user interface, users have access to standard apps (and may also have access to custom apps) as listed in the Lightning Platform app menu at the top of the page. Selecting a standard app or custom app in the user interface allows the user to switch between the listed apps at any time.

To explore an organization's metadata, a client application can:

1. Call `describeGlobal()` to obtain a list of available objects.
2. In the returned DescribeGlobalResult object, retrieve an array of DescribeGlobalSObjectResult objects by calling `sobjects`.
3. Get the sObject type name for each returned sObject by calling `name` on the DescribeGlobalSObjectResult objects.
4. The DescribeGlobalSObjectResult object provides some metadata about the sObject, such as whether the sObject is createable or updateable. If you want to get more information about particular sObjects, like their fields and child relationships, call `describeSObjects()` by passing it an array of the sObject type names that you're interested in obtaining more information about.

sObject Reference Reuse

An sObject reference can't be reused within a single operation.

Use a different reference. For example, the following code snippet creates an account and contact with a custom field and an event using two different references:

```
SObject account = new com.sforce.soap.partner.sobject.wsc.SObject();
    account.setType("Account");
```

```
account.setField("Name","myAccount");
account.setField("XID1__c", "1");
SObject refAcc1 = new com.sforce.soap.partner.sobject.wsc.SObject();
refAcc1.setType("Account");
refAcc1.setField("XID1__c", "1");
SObject refAcc2 = new com.sforce.soap.partner.sobject.wsc.SObject();
refAcc2.setType("Account");
refAcc2.setField("XID1__c", "1");

SObject contact = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Contact");
contact.setField("LastName", "LName");
contact.setField( "XID2__c", "2");
contact.setField( "Account", refAcc1);
SObject refCon = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Contact");
contact.setField( "XID2__c", "2");

SObject event = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Event");
contact.setField("Subject", "myEvent");
contact.setField( "ActivityDateTime", Calendar.getInstance());
contact.setField("DurationInMinutes", 60);
contact.setField("Who", refCon);
contact.setField("What", refAcc2);

client.create(new SObject[] { account, contact, event}); // exception thrown here
```

Any call that takes a parameter of the form `sObject[] sObjects` is subject to this limitation.

Objects, Fields, and Field Data and the Partner WSDL

The enterprise WSDL file defines all the specific objects (such as Account and Contact) in a Salesforce org. In contrast, the partner WSDL file defines a single, generic object (sObject) that represents all the objects. For a particular object, its type is defined in the `name` field in the returned DescribeSObjectResult.

With the partner WSDL, your client application code handles fields as arrays of name-value pairs that represent the field data. When referring to the name of an individual field, use the value in its `name` field of the Field type in the DescribeSObjectResult.

Languages vary in the way they handle name-value pairs and map typed values to the primitive XML data types defined in SOAP messages. With the enterprise WSDL, the mapping is handled implicitly. With the partner WSDL, however, you manually manage values and data types when building client applications. Specify the object type before you assign field values. When specifying the value of a particular field, use a value that is valid for the field (range, format, and data type). Make sure that you understand the mapping between data types in your programming language and XML primitive data types. See SOAPType for more information.

Queries and the Partner WSDL

When using the `query()` call with the partner WSDL, consider the following guidelines:

- The queryString parameter is case-insensitive. The API will accept field names in the *fieldList* using any combination of uppercase and lowercase letters. However, in the QueryResult, the case of field names (both predefined and custom fields) will match exactly the value in the `name` field of the Field type in the DescribeSObjectResult. It is recommended that you use the proper case when specifying fields in the *fieldList*.

- For the partner WSDL, the ordering of fields in the QueryResult is determined by the field order in the *fieldList*, not the field order in the WSDL file.
- The *fieldList* cannot contain duplicate field names. For example:
  - Invalid (returns an error): `"SELECT Firstname, Lastname, Firstname FROM User"`
  - Valid: `"SELECT Firstname, Lastname FROM User"`
- The QueryResult always contains all of the fields specified in the *fieldList*, even if some of the fields contain no data (`null`). Although SOAP allows you to omit fields that contain no values in the result set, the API always returns an array containing all fields.
- If you use the partner WSDL, a query that includes ID will return the ID field twice in the SOAP XML response data. Similarly, a query that does not include ID will return a single null ID field in the SOAP XML response data. For example, a query for `SELECT ID, FirstName, LastName FROM Contact` might return a SOAP XML response with records like:

```
<records xsi:type="sf:sObject" xmlns="urn:partner.soap.sforce.com">
    <sf:type>Contact</sf:type>
    <sf:Id>0038000000FrjoBQRW</sf:Id>
    <sf:Id>0038000000FrjoBQRW</sf:Id>
    <sf:FirstName>John</sf:FirstName>
    <sf:LastName>Smith</sf:LastName>
</records>
```

  This is expected behavior and something to be aware of if you are accessing the full SOAP XML response data and not using WSC to access the web service response.

Namespaces in the Partner WSDL

In XML, every tag has a defined namespace. In the `enterprise.wsdl`, namespaces are handled implicitly. When using API calls with the partner WSDL, however, you need to explicitly specify the correct namespaces for API calls, objects, and fields, and faults. This rule applies to predefined and custom objects and fields.

For	Namespace
API Calls	`urn:partner.soap.sforce.com`
sObjects	`urn:sobject.partner.soap.sforce.com`
Fields	`urn:sobject.partner.soap.sforce.com`
Faults	`urn:fault.partner.soap.sforce.com`

Package Versions and the Partner WSDL

The partner WSDL is loosely typed. This makes it more flexible for partners who want to integrate with multiple organizations. Default package versions for API calls provide fallback settings if package versions are not provided by an API call.

The behavior of a package in partner API calls is defined by the latest installed package version if the default value (`Not Specified`) is selected for the installed package. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

An API client developer should communicate with the administrator of the default partner package version settings if these are two different roles in your organization and the developer recommends changing the settings. Alternatively, an API client developer can set the package versions in the PackageVersionHeader SOAP header for the client.

A partner that is developing a package that references another package should always supply version information for the base package in their partner API calls. This ensures that the extension package is not affected by a component being deprecated in the base package.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls with the partner WSDL, see Package Version Settings.

User Interface Themes

EDITIONS

Available in: Salesforce Classic and earlier

Back in the Winter '06 release, Salesforce started supporting multiple user interface themes, allowing you to use different sets of icons and colors for the user interface. But these user interface themes do not apply when your org is using Lightning Experience.

Two user interface themes match the earlier iterations of Salesforce.

- Theme3—The "Salesforce Classic 2010 user interface theme." This interface was previously referred to as "Salesforce" or "new user interface theme." You might also be familiar with it as the Salesforce *Aloha* interface.
- Theme2—The "Salesforce Classic 2005 user interface theme." This interface was previously referred to as "Salesforce Classic" or the "classic user interface theme."

The `getUserInfo()` call returns a `getUserInfoResult` object, which includes the `userUiSkin` property. This property informs you of the user's current user interface theme.

Use the `describeQuickActions()`, `describeTabs()`, and `describeTheme()` calls and their return types to get information on theme icons and colors.

Style sheets are available to mimic the look and feel of the older user interfaces. For more information, see Styling Visualforce Pages in the *Visualforce Developer's Guide*. But if you're planning to switch to Lightning Experience, consider the Lightning Component framework, our new UI framework. See the "Lightning Components" module in the Develop for Lightning Experience Trailhead trail to learn more.

Examples Using the Partner WSDL

This section includes examples in Java and C# for making API calls using the partner WSDL. Before running these samples, perform the following steps in the quick start tutorial to get the partner WSDL file and generate the proxy client code for your development environment.

- Step 2: Generate or Obtain the Web Service WSDL
- Step 3: Import the WSDL File Into Your Development Platform

After you generate the proxy client code and set up your development environment, you can start writing your client application. First, your application needs to log into the Salesforce service using the partner authentication endpoint. After a successful login, you can execute the sample methods.

For your convenience, template classes are provided, one in Java and one in C#, that make a login call. You can use them to execute the sample methods provided later in this section.

Sample template class for Java: This sample prompts the user to enter the username, password, and authentication endpoint. Next, it logs the user in. For the authentication endpoint URL, pass in the endpoint found in the partner WSDL file.

```
import com.sforce.soap.partner.PartnerConnection;
import com.sforce.soap.partner.sobject.*;
import com.sforce.soap.partner.*;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;
import com.sforce.soap.partner.Error;
import java.io.FileNotFoundException;
import java.io.IOException;
import java.io.InputStreamReader;
import java.io.BufferedReader;
import java.util.*;

public class PartnerSamples {
    PartnerConnection partnerConnection = null;
    private static BufferedReader reader =
        new BufferedReader(new InputStreamReader(System.in));

    public static void main(String[] args) {
        PartnerSamples samples = new PartnerSamples();
        if (samples.login()) {
            // Add calls to the methods in this class.
            // For example:
            // samples.querySample();
        }
    }

    private String getUserInput(String prompt) {
        String result = "";
        try {
          System.out.print(prompt);
          result = reader.readLine();
        } catch (IOException ioe) {
          ioe.printStackTrace();
        }
        return result;
    }

    private boolean login() {
        boolean success = false;
        String username = getUserInput("Enter username: ");
        String password = getUserInput("Enter password: ");
        String authEndPoint = getUserInput("Enter auth end point: ");

        try {
          ConnectorConfig config = new ConnectorConfig();
          config.setUsername(username);
          config.setPassword(password);

          config.setAuthEndpoint(authEndPoint);
```

```
          config.setTraceFile("traceLogs.txt");
          config.setTraceMessage(true);
          config.setPrettyPrintXml(true);

          partnerConnection = new PartnerConnection(config);

          success = true;
        } catch (ConnectionException ce) {
          ce.printStackTrace();
        } catch (FileNotFoundException fnfe) {
          fnfe.printStackTrace();
        }

        return success;
      }

    //
    // Add your methods here.
    //
}
```

Sample template class for C#: This sample prompts the user to enter the username and password. Next, it logs the user in. The project name for this sample is assumed to be *TemplatePartner* and the Web reference name *sforce*. If these values are different for your project, make sure to change the using directive to appropriate values for your project: `using your_project_name.web_reference_name;`.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Web.Services.Protocols;
using System.Collections;
using TemplatePartner.sforce;

namespace TemplatePartner
{
    class PartnerSamples
    {
        private SforceService binding;

        static void Main(string[] args)
        {
            PartnerSamples samples = new PartnerSamples();
            if (samples.login())
            {
            // Add calls to the methods in this class.
            // For example:
            // samples.querySample();
            }
        }

        private bool login()
        {
            Console.Write("Enter username: ");
```

```
string username = Console.ReadLine();
Console.Write("Enter password: ");
string password = Console.ReadLine();

// Create a service object
binding = new SforceService();

// Timeout after a minute
binding.Timeout = 60000;

// Try logging in
LoginResult lr;
try
{

    Console.WriteLine("\nLogging in...\n");
    lr = binding.login(username, password);
}

// ApiFault is a proxy stub generated from the WSDL contract when
// the web service was imported
catch (SoapException e)
{
    // Write the fault code to the console
    Console.WriteLine(e.Code);

    // Write the fault message to the console
    Console.WriteLine("An unexpected error has occurred: " + e.Message);

    // Write the stack trace to the console
    Console.WriteLine(e.StackTrace);

    // Return False to indicate that the login was not successful
    return false;
}

// Check if the password has expired
if (lr.passwordExpired)
{
    Console.WriteLine("An error has occurred. Your password has expired.");
    return false;
}

// Set the returned service endpoint URL
binding.Url = lr.serverUrl;

// Set the SOAP header with the session ID returned by
// the login result. This will be included in all
// API calls.
binding.SessionHeaderValue = new SessionHeader();
binding.SessionHeaderValue.sessionId = lr.sessionId;

// Return true to indicate that we are logged in, pointed
// at the right URL and have our security token in place.
```

```
            return true;
        }

    //
    // Add your methods here.
    //
}
```

This partner WSDL samples are:

- Sample query and queryMore Calls
- Sample search Call
- Sample create Call
- Sample update Call

Sample query and queryMore Calls

The following Java and C# examples show usage of the `query()` and `queryMore()` calls for the partner WSDL. Each example sets the batch size of the query to 250 items returned. It then performs a query call to get the first name and last name of all contacts and iterates through the contact records returned. For each contact, it writes the contact's first name and last name to the output, or only the last name if the first name is null. Finally, if there are more items to be returned by the query, as indicated by a `QueryResult.done` property value of `false`, it calls `queryMore()` to get the next batch of items, and repeats the process until no more records are returned.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```
public void querySample() {
    try {
        // Set query batch size
        partnerConnection.setQueryOptions(250);

        // SOQL query to use
        String soqlQuery = "SELECT FirstName, LastName FROM Contact";
        // Make the query call and get the query results
        QueryResult qr = partnerConnection.query(soqlQuery);

        boolean done = false;
        int loopCount = 0;
        // Loop through the batches of returned results
        while (!done) {
            System.out.println("Records in results set " + loopCount++
                    + " - ");
            SObject[] records = qr.getRecords();
            // Process the query results
            for (int i = 0; i < records.length; i++) {
                SObject contact = records[i];
                Object firstName = contact.getField("FirstName");
                Object lastName = contact.getField("LastName");
                if (firstName == null) {
                    System.out.println("Contact " + (i + 1) +
```

```
                            ": " + lastName
                    );
                } else {
                    System.out.println("Contact " + (i + 1) + ": " +
                            firstName + " " + lastName);
                }
            }

                done = true;
            } else {
                qr = partnerConnection.queryMore(qr.getQueryLocator());
            }
        }
    } catch(ConnectionException ce) {
        ce.printStackTrace();
    }
    System.out.println("\nQuery execution completed.");
}
```

C# Example

```
public void querySample()
{
    try
    {
        QueryResult qr = null;
        binding.QueryOptionsValue = new sforce.QueryOptions();
        binding.QueryOptionsValue.batchSize = 250;
        binding.QueryOptionsValue.batchSizeSpecified = true;

        qr = binding.query("SELECT FirstName, LastName FROM Contact");

        bool done = false;
        int loopCount = 0;
        while (!done)
        {
            Console.WriteLine("\nRecords in results set " +
                Convert.ToString(loopCount++)
                    + " - ");
            // Process the query results
            for (int i = 0; i < qr.records.Length; i++)
            {
                sforce.sObject con = qr.records[i];
                string fName = con.Any[0].InnerText;
                string lName = con.Any[1].InnerText;
                if (fName == null)
                    Console.WriteLine("Contact " + (i + 1) + ": " + lName);
                else
                    Console.WriteLine("Contact " + (i + 1) + ": " + fName
                        + " " + lName);
            }

            if (qr.done)
```

```
                done = true;
            else
                qr = binding.queryMore(qr.queryLocator);
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " + e.Message +
            " Stack trace: " + e.StackTrace);
    }
    Console.WriteLine("\nQuery execution completed.");
}
```

Sample search Call

The following Java and C# examples show how to use the `search()` call for the partner WSDL. Each example accepts a phone number string value that is used in the SOQL query. The search call looks for phone fields that match the passed in phone value in all contacts, leads, and accounts. Next, the example iterates through the returned search results that contain the matching records, adds them to arrays, and writes their field values to the console. The record fields returned correspond to the fields specified in the SOQL query for each record type.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```
public void searchSample(String phoneNumber) {
    try {
        // Example of phoneNumber format: 4155551212
        String soslQuery =
            "FIND {" + phoneNumber + "} IN Phone FIELDS " +
            "RETURNING " +
            "Contact(Id, Phone, FirstName, LastName), " +
            "Lead(Id, Phone, FirstName, LastName)," +
            "Account(Id, Phone, Name)";
        // Perform SOSL query
        SearchResult sResult = partnerConnection.search(soslQuery);
        // Get the records returned by the search result
        SearchRecord[] records = sResult.getSearchRecords();
        // Create lists of objects to hold search result records
        List<SObject> contacts = new ArrayList<SObject>();
        List<SObject> leads = new ArrayList<SObject>();
        List<SObject> accounts = new ArrayList<SObject>();

        // Iterate through the search result records
        // and store the records in their corresponding lists
        // based on record type.
        if (records != null && records.length > 0) {
          for (int i = 0; i < records.length; i++){
            SObject record = records[i].getRecord();
            if (record.getType().toLowerCase().equals("contact")) {
              contacts.add(record);
            } else if (record.getType().toLowerCase().equals("lead")){
```

```
            leads.add(record);
          } else if (record.getType().toLowerCase().equals("account")) {
            accounts.add(record);
          }
        }
        // Display the contacts that the search returned
        if (contacts.size() > 0) {
          System.out.println("Found " + contacts.size() +
              " contact(s):");
          for (SObject contact : contacts) {
            System.out.println(contact.getId() + " - " +
                contact.getField("FirstName") + " " +
                contact.getField("LastName") + " - " +
                contact.getField("Phone")
            );
          }
        }
        // Display the leads that the search returned
        if (leads.size() > 0) {
          System.out.println("Found " + leads.size() +
              " lead(s):");
          for (SObject lead : leads) {
            System.out.println(lead.getId() + " - " +
                lead.getField("FirstName") + " " +
                lead.getField("LastName") + " - " +
                lead.getField("Phone")
            );
          }
        }
        // Display the accounts that the search returned
        if (accounts.size() > 0) {
          System.out.println("Found " +
              accounts.size() + " account(s):");
          for (SObject account : accounts) {
            System.out.println(account.getId() + " - " +
                account.getField("Name") + " - " +
                account.getField("Phone")
            );
          }
        }
      } else {
        // The search returned no records
        System.out.println("No records were found for the search.");
      }
    } catch (ConnectionException ce) {
      ce.printStackTrace();
    }
}
```

C# Example

```
public void searchSample(String phoneNumber)
{
```

```
try
{
    // Example of phoneNumber format: 4155551212
    String soslQuery =
        "FIND {" + phoneNumber + "} IN Phone FIELDS " +
        "RETURNING " +
        "Contact(Id, Phone, FirstName, LastName), " +
        "Lead(Id, Phone, FirstName, LastName)," +
        "Account(Id, Phone, Name)";
    // Perform SOSL query
    SearchResult sResult = binding.search(soslQuery);
    // Get the records returned by the search result
    SearchRecord[] records = sResult.searchRecords;
    // Create lists of objects to hold search result records
    ArrayList contacts = new System.Collections.ArrayList();
    ArrayList leads = new System.Collections.ArrayList();
    ArrayList accounts = new System.Collections.ArrayList();

    // Iterate through the search result records
    // and store the records in their corresponding lists
    // based on record type.
    if ((records != null) && (records.Length > 0))
    {

        Console.WriteLine("An unexpected error has occurred: " + e.Message +
            " Stack trace: " + e.StackTrace);
    }
}
```

Sample create Call

The following Java and C# examples show how to use the `create()` call for the partner WSDL. Each example creates a contact record with several fields. It iterates through the results of the create call and checks whether the operation was successful or not. If the create operation was successful, it writes the ID of the contact created to the console. Otherwise, it iterates through the errors and writes details of each error to the console. In this case, the output of the example is the ID of the new contact.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```
public String createSample() {
    String result = null;
    try {
        // Create a new sObject of type Contact
           // and fill out its fields.
        SObject contact = new SObject();
```

```
            contact.setType("Contact");
            contact.setField("FirstName", "Otto");
            contact.setField("LastName", "Jespersen");
            contact.setField("Salutation", "Professor");
            contact.setField("Phone", "(999) 555-1234");
            contact.setField("Title", "Philologist");

            // Add this sObject to an array
            SObject[] contacts = new SObject[1];
            contacts[0] = contact;
            // Make a create call and pass it the array of sObjects
            SaveResult[] results = partnerConnection.create(contacts);

            // Iterate through the results list
            // and write the ID of the new sObject
            // or the errors if the object creation failed.
            // In this case, we only have one result
            // since we created one contact.
            for (int j = 0; j < results.length; j++) {
                if (results[j].isSuccess()) {
                    result = results[j].getId();
                    System.out.println(
                        "\nA contact was created with an ID of: " + result
                    );
                 } else {
                    // There were errors during the create call,
                    // go through the errors array and write
                    // them to the console
                    for (int i = 0; i < results[j].getErrors().length; i++) {
                        Error err = results[j].getErrors()[i];
                        System.out.println("Errors were found on item " + j);
                        System.out.println("Error code: " +
                            err.getStatusCode().toString());
                        System.out.println("Error message: " + err.getMessage());
                    }
                 }
            }
        } catch (ConnectionException ce) {
            ce.printStackTrace();
        }
        return result;
}
```

C# Example

```
public void createSample()
{
    try
    {
        // Create a new sObject of type Contact
        // and fill out its fields.
        sObject contact = new sforce.sObject();
        System.Xml.XmlElement[] contactFields = new System.Xml.XmlElement[6];
```

```
        // Create the contact's fields
        System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
        contactFields[0] = doc.CreateElement("FirstName");
        contactFields[0].InnerText = "Otto";
        contactFields[1] = doc.CreateElement("LastName");
        contactFields[1].InnerText = "Jespersen";
        contactFields[2] = doc.CreateElement("Salutation");
        contactFields[2].InnerText = "Professor";
        contactFields[3] = doc.CreateElement("Phone");
        contactFields[3].InnerText = "(999) 555-1234";
        contactFields[4] = doc.CreateElement("Title");
        contactFields[4].InnerText = "Philologist";

        contact.type = "Contact";
        contact.Any = contactFields;

        // Add this sObject to an array
        sObject[] contactList = new sObject[1];
        contactList[0] = contact;

        // Make a create call and pass it the array of sObjects
        SaveResult[] results = binding.create(contactList);
        // Iterate through the results list
        // and write the ID of the new sObject
        // or the errors if the object creation failed.
        // In this case, we only have one result
        // since we created one contact.
        for (int j = 0; j < results.Length; j++)
        {
            if (results[j].success)
            {
                Console.Write("\nA contact was created with an ID of: "
                                + results[j].id);
            }
            else
            {
                // There were errors during the create call,
                // go through the errors array and write
                // them to the console
                for (int i = 0; i < results[j].errors.Length; i++)
                {
                    Error err = results[j].errors[i];
                    Console.WriteLine("Errors were found on item " + j.ToString());
                    Console.WriteLine("Error code is: " + err.statusCode.ToString());
                    Console.WriteLine("Error message: " + err.message);
                }
            }
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " + e.Message +
            " Stack trace: " + e.StackTrace);
```

```
    }
}
```

Sample update Call

The following Java and C# examples show how to use the `update()` call for the Partner WSDL. Each example takes the ID of the contact to update as an argument. It creates two sObject records of type Contact—one to hold the valid passed in ID and the other has an invalid ID. Next, it sets a new phone number for the valid contact and `null` for the last name of the invalid contact. It then makes the update call and iterates through the results. For a successful update operation, it writes the ID of the contact that got updated. For a failed update operation, it writes the details of all returned errors to the console. In this case, the output is the ID of the contact that was successfully updated and an error for the invalid contact update.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```
public void updateSample(String id) {
  try {
      // Create an sObject of type contact
      SObject updateContact = new SObject();
      updateContact.setType("Contact");

      // Set the ID of the contact to update
      updateContact.setId(id);
      // Set the Phone field with a new value
      updateContact.setField("Phone", "(415) 555-1212");

      // Create another contact that will cause an error
      // because it has an invalid ID.
      SObject errorContact = new SObject();
      errorContact.setType("Contact");
      // Set an invalid ID on purpose
      errorContact.setId("SLFKJLFKJ");
      // Set the value of LastName to null
      errorContact.setFieldsToNull(new String[] {"LastName"});

      // Make the update call by passing an array containing
      // the two objects.
      SaveResult[] saveResults = partnerConnection.update(
         new SObject[] {updateContact, errorContact}
      );
      // Iterate through the results and write the ID of
      // the updated contacts to the console, in this case one contact.
      // If the result is not successful, write the errors
      // to the console. In this case, one item failed to update.
      for (int j = 0; j < saveResults.length; j++) {
          System.out.println("\nItem: " + j);
          if (saveResults[j].isSuccess()) {
              System.out.println("Contact with an ID of " +
                      saveResults[j].getId() + " was updated.");
          }
          else {
```

```
            // There were errors during the update call,
            // go through the errors array and write
            // them to the console.
            for (int i = 0; i < saveResults[j].getErrors().length; i++) {
              Error err = saveResults[j].getErrors()[i];
              System.out.println("Errors were found on item " + j);
              System.out.println("Error code: " +
                  err.getStatusCode().toString());
              System.out.println("Error message: " + err.getMessage());
            }
          }
      }
  } catch (ConnectionException ce) {
      ce.printStackTrace();
  }
}
```

For more information about `setFieldsToNull` (or its equivalent in client tools other than WSC), see `fieldsToNull` and Resetting Values to null.

C# Example

```
public void updateSample(String id) {
     try
     {
         // Create an sObject of type contact
         sObject updateContact = new sObject();
         updateContact.type = "Contact";

         // Set the ID of the contact to update
         updateContact.Id = id;
         // Set the Phone field to a new value.
         // The Phone field needs to be created as an XML element.
         System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
         System.Xml.XmlElement phoneField = doc.CreateElement("Phone");
         phoneField.InnerText = "(415) 555-1212";

         // Add the Phone field to the contact
         updateContact.Any = new System.Xml.XmlElement[] {phoneField};

         // Create another contact that will cause an error
         // because it has an invalid ID.
         sObject errorContact = new sObject();
         errorContact.type = "Contact";
         // Set an invalid ID on purpose
         errorContact.Id = "SLFKJLFKJ";
         // Set the value of LastName to null
         errorContact.fieldsToNull = new String[] { "LastName" };

         // Make the update call by passing an array containing
         // the two objects.
         SaveResult[] saveResults = binding.update(
             new sObject[] {updateContact, errorContact});
         // Iterate through the results and write the ID of
```

```
        // the updated contacts to the console, in this case one contact.
        // If the result is not successful, write the errors
        // to the console. In this case, one item failed to update.
        for (int j = 0; j < saveResults.Length; j++) {
            Console.WriteLine("\nItem: " + j);
            if (saveResults[j].success)
            {
                Console.WriteLine("Contact with an ID of " +
                saveResults[j].id + " was updated.");
            }
            else
            {
                // There were errors during the update call,
                // go through the errors array and write
                // them to the console.
                for (int i = 0; i < saveResults[j].errors.Length; i++) {
                    Error err = saveResults[j].errors[i];
                    Console.WriteLine("Errors were found on item " + j.ToString());
                    Console.WriteLine("Error code: " +
                        err.statusCode.ToString());
                    Console.WriteLine("Error message: " + err.message);
                }
            }
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " + e.Message +
            " Stack trace: " + e.StackTrace);
    }
}
```

REFERENCE

CHAPTER 7 Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. Salesforce ERDs use crow's foot notation. The following ERDs are available.

- Sales Objects—includes accounts, contacts, opportunities, leads, campaigns, and other related objects
- Task and Event Objects—includes tasks and events and their related objects
- Support Objects—includes cases and solutions and their related objects
- Salesforce Knowledge Objects—includes view and vote statistics, article versions, and other related objects
- Document, Note, and Attachment Objects—includes documents, notes, and attachments and their related objects
- User, Sharing, and Permission Objects—includes users, profiles, and roles
- User Email Objects
- Profile and Permission Objects—includes users, profiles, permission sets, and related permission objects
- Record Type Objects—includes record types and business processes and their related objects
- Product and Schedule Objects—includes opportunities, products, and schedules
- Sharing and Team Selling Objects—includes account teams, opportunity teams, and sharing objects
- Forecasts Objects—includes objects for Collaborative Forecasts.
- Territory Management 2.0 Objects—includes territories and related objects associated with Territory Management 2.0
- Territory Management—includes territories and related objects
- Process Objects—includes approval processes and related objects
- Content Objects—includes content and libraries and their related objects
- Chatter Feed Objects—includes objects related to feeds
- Consent Management Objects—includes consent, authorization form, and communication subscription objects
- WDC Badge and Reward Objects—includes badge and reward objects
- WDC Feedback and Performance Cycle Objects—includes feedback and performance cycle objects

Each ERD includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

Territory Management

Note: The original territory management feature is scheduled for retirement for all customers as of Summer '21. After the feature is retired, users can't access the original territory management feature and its underlying data. We encourage you to migrate to Enterprise Territory Management. We also strongly recommend that you keep a comprehensive backup of your territory data while you're still using the original territory management feature. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Chatter Objects

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that's being followed, an updated post, or a user status change.
- All feed items have a `ParentId`, which is either:
  - a record
  - a user
  - a group

CHAPTER 8 Standard Objects

This section provides a list of standard objects and their standard fields.

Some fields may not be listed for some objects. To see the system fields for each object, see System Fields.

To verify the complete list of fields for an object, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

AcceptedEventRelation

Represents event participants (invitees or attendees) with the status `Accepted` for a given event.

Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

AccountBrand

Represents the brand details of a Partner Account. This object is available in API version 43.0 and later.

AccountContactRelation

Represents a relationship between a contact and one or more accounts.

AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

AccountContactRole

Represents the role that a Contact plays on an Account.

AccountInsight

Represents an individual insight (a key business development) related to an account record.

AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

AccountPartner

This object represents a partner relationship between two Account records. An AccountPartner record is created automatically when a Partner record is created for a partner relationship between two accounts.

AccountRelationship

Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.

AccountRelationshipShareRule

Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

AccountShare

Represents a sharing entry on an Account.

AccountTag

Associates a word or short phrase with an Account.

AccountTeamMember

Represents a User who is a member of an Account team.

AccountTerritoryAssignmentRule

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

AccountTerritoryAssignmentRuleItem

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

AccountTerritorySharingRule

Represents the rules for sharing an Account within a Territory.

AccountUserTerritory2View

Represents the view of the Users in Assigned Territories related list in Lightning Experience. Available in API version 42.0 and later.

ActionCadence

Represents the definition of a sales cadence. This object is available in API version 45.0 and later.

ActionCadenceRule

Represents the logic that a branch step uses to make decisions in your sales cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

ActionCadenceRuleCondition

Represents the logic for a branch step. This object is available in API version 48.0 and later.

ActionCadenceStep

Represents a step in a sales cadence. Use ActionCadenceStep to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

ActionCadenceStepTracker

Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

ActionCadenceTracker

Represents an active sales cadence target. This object is available in API version 45.0 and later.

ActionLinkGroupTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

ActionPlan

Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

ActionPlanItem

Represents the instance of an action plan item. This object is used by more than one cloud in Industries.

ActionPlanTemplate

Represents the instance of an action plan template. This object is used by more than one cloud in Industries.

ActionPlanTemplateItem

Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

ActionPlanTemplateItemValue

Represents the value associated with an action plan template item. This object is used by more than one cloud in Industries.

ActionPlanTemplateVersion

Represents the version of an action plan template. This object is used by more than one cloud in Industries.

ActiveScratchOrg

Represents an active scratch org. This object is available in API version 41.0 and later.

ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

ActivityMetric

Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

AdditionalNumber

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Address

Represents a mailing, billing, or home address.

AgentWork

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

AgentWorkSkill

Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

AIApplication

Represents an AI application such as Einstein Prediction Builder. This object is available in API version 50.0 and later.

AIApplicationConfig

Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

AIInsightAction

Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

AIInsightFeedback

Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

AIInsightReason

Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

AIInsightValue

Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

AIRecordInsight

Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

AlternativePaymentMethod

Represents a payment method that doesn't have a defined Commerce Orders entity such as CardPaymentMethod on page 577 or DigitalWallet on page 1008. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. `AlternativePaymentMethod` functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.

Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

ApexClass

Represents an Apex class.

ApexComponent

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

ApexLog

Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

ApexPage

Represents a single Visualforce page.

ApexPageInfo

Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

ApexTestQueueItem

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

ApexTrigger

Represents an Apex trigger.

AppAnalyticsQueryRequest

Represents a request for AppExchange App Analytics data.

AppDefinition

Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

AppExtension

Represents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

AppMenuItem

Represents the organization's default settings for items in the app menu or App Launcher.

AppointmentSchedulingPolicy

Represents a set of rules for scheduling appointments using Lightning Scheduler. This object is available in API version 45.0 and later.

Approval

Represents an approval request for a Contract.

AppTabMember

Represents the list of tabs for each of the available apps. This object is available in API version 43.0 and later.

Article Type__DataCategorySelection

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

AssetRelationship

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

AssetTag

Associates a word or short phrase with an Asset.

AssetTokenEvent

The documentation has moved to AssetTokenEvent in the *Platform Events Developer Guide*.

AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

AssignedResource

Represents a service resource who is assigned to a service appointment in Field Service and Lightning Scheduler. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

AssignmentRule

Represents an assignment rule associated with a Case or Lead.

AssociatedLocation

Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

AsyncApexJob

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`. Use this object to query Apex batch jobs in your organization.

AsyncOperationLog

Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

AttachedContentDocument

This read-only object contains all `ContentDocument` objects associated with an object.

AttachedContentNote

This read-only object contains all ContentNote objects associated with an object. This object is available in API version 35.0 and later.

Attachment

Represents a file that a User has uploaded and attached to a parent object.

Audience

Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

AuraDefinition

Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

AuraDefinitionBundle

Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

AuraDefinitionBundleInfo

For internal use only.

AuraDefinitionInfo

For internal use only.

AuthConfig

Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

AuthConfigProviders

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

AuthorizationForm

Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

AuthorizationFormConsent

Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

AuthorizationFormDataUse

Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

AuthorizationFormText

Represents an authorization form's text and language settings. This object is available in API version 46.0 and later.

AuthProvider

Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.

AuthSession

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

BatchApexErrorEvent

The documentation has moved to BatchApexErrorEvent in the *Platform Events Developer Guide*.

Bookmark

Represents a link between opportunities that share common information.

BrandTemplate

Letterhead for HTML EmailTemplate.

BriefcaseAssignment

Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

BriefcaseDefinition

Represents a briefcase definition. A briefcase makes selected records available for users to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.

BriefcaseRule

Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

BriefcaseRuleFilter

Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

BusinessProcess

Represents a business process.

BusinessProcessDefinition

Setup object that stores information about stages in a customer lifecycle map. The stages are associated with surveys and questions created using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

BusinessProcessFeedback

Setup object that stores information about the survey and the question associated with each stage in a customer lifecycle map. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

BusinessProcessGroup

Setup object that stores information about customer lifecycle maps. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

BuyerGroupPricebook

Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

Calendar

Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.

CalendarView

These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.

CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

CallCoachConfigModifyEvent

Represents a Conversation Insights configuration change. This object is available in API version 49.0 and later.

CallCoachingMediaProvider

Represents the media provider for call recordings. This object is available in API version 49.0 and later.

CallDisposition

Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

CallDispositionCategory

Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

CallTemplate

Represents a call script for users to read when making calls.

Campaign

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

CampaignInfluence

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

CampaignInfluenceModel

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

CampaignMember

Represents the association between a campaign and either a lead or a contact.

CampaignMemberStatus

One or more member status values defined for a campaign.

CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

CampaignShare

Represents a sharing entry on a Campaign.

CampaignTag

Associates a word or short phrase with a Campaign.

CardPaymentMethod

References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.

CartCheckoutSession

Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later.

CartDeliveryGroup

Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

CartDeliveryGroupMethod

Represents the selected delivery method for a cart delivery group used in Lightning B2B Commerce checkout. This object is available in API version 49.0 and later.

CartItem

Represents an item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type `Product` or `Charge`. This object is available in API version 49.0 and later.

CartTax

Represents taxes for a line item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

CartValidationOutput

Associate errors to cart entities, such as cart line items, delivery groups, and the like, in a store built with B2B Commerce on Lightning Experience. An example error is "Out of stock." Available in API version 49.0 and later.

Case

Represents a case, which is a customer issue or problem.

CaseArticle

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

CaseComment

Represents a comment that provides additional information about the associated Case.

CaseContactRole

Represents the role that a given Contact plays on a Case.

CaseHistory

Represents historical information about changes that have been made to the associated Case.

CaseMilestone

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

CaseShare

Represents a sharing entry on a Case.

CaseSolution

Represents the association between a Case and a Solution.

CaseStatus

Represents the status of a Case, such as New, On Hold, or In Process.

CaseSubjectParticle

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts. This object is available in API version 41.0 and later.

CaseTag

Associates a word or short phrase with a Case

CaseTeamMember

Represents a case team member, who works with a team of other users to help resolve a case.

CaseTeamRole

Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

CaseTeamTemplate

Represents a predefined case team, which is a group of users that helps resolve a case.

CaseTeamTemplateMember

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

CategoryData

Represents a logical grouping of Solution records.

CategoryNode

Represents a tree of Solution categories.

CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

ChannelObjectLinkingRule

Represents a rule for linking a channel interaction with an object (such as Lead or Contact). This object is available in API version 47.0 and later.

ChannelProgram

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

ChannelProgramLevel

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

ChannelProgramMember

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

ChatterAnswersActivity

Represents the reputation of a User in Chatter Answers zones.This object is available in API version 25.0 and later.

ChatterAnswersReputationLevel

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

ChatterConversation

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

ChatterConversationMember

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

ChatterExtension

Represents a Rich Publisher App that's integrated with the Chatter publisher. This object is available in API version 41.0 and later.

ChatterExtensionConfig

Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

ChatterMessage

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

CollaborationGroup

Represents a Chatter group. This object is available in API version 19.0 and later.

CollaborationGroupMember

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

CollaborationGroupMemberRequest

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

CollaborationGroupRecord

Represents the records associated with Chatter groups.

CollaborationInvitation

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

CollabUserEngagementMetric

Represents the user engagement metrics for a Quip thread in a Quip template or document. This object is available in API version 50.0 and later.

CollabUserEngmtRecordLink

Represents an association between a CollabUserEngagementMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

ColorDefinition

Represents the color-related metadata for a custom tab. This object is available in API version 43.0 and later.

CombinedAttachment

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

CommerceEntitlementBuyerGroup

Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

CommerceEntitlementPolicy

Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

CommerceEntitlementPolicyShare

Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

CommerceEntitlementProduct

Represents the entitlement policy for a product. This object is available in API version 49.0 and later.

CommSubscription

Represents a customer’s subscription preferences for a specific communication. This object is available in API version 48.0 and later.

CommSubscriptionChannelType

Represents the engagement channel through which you can reach a customer for a communication subscription. This object is available in API version 48.0 and later.

CommSubscriptionConsent

Represents a customer’s consent to a communication subscription. This object is available in API version 48.0 and later.

CommSubscriptionTiming

Represents a customer's timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

Community (Zone)

Represents a zone that contains Idea or Question objects.

ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Consumption Rate

Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.

Consumption Schedule

A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

Contact

Represents a contact, which is a person associated with an account.

ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record’s clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

ContactPointAddress

Represents a contact’s billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

ContactPointConsent

Represents a customer's consent to be contacted via a specific contact point, such as an email address or phone number. This object is available in API version 48.0 and later.

ContactPointEmail

Represents a contact’s email, which is associated with an individual or person account. This object is available in API version 48.0 and later.

ContactPointPhone

Represents a contact’s phone number, which is associated with an individual or person account. This object is available in API version 48.0 and later.

ContactPointTypeConsent

Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

ContactOwnerSharingRule

Represents the rules for sharing a contact with a User other than the owner.

ContactRequest

Represents a customer's request for support to get back to them about an issue. This object is available in API version 45.0 and later.

ContactRequestShare

Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is Owner.

ContactSuggestionInsight

Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

ContactTag

Associates a word or short phrase with a Contact.

ContentAsset

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

ContentBody

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

ContentDistribution

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

ContentDocument

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

ContentDocumentHistory

Represents the history of a document. This object is available in versions 17.0 and later.

ContentDocumentLink

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

ContentDocumentListViewMapping

Represents an association between a ListView and a Quip ContentDocument. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

ContentDocumentSubscription

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

ContentFolder

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

ContentFolderItem

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

ContentFolderLink

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

ContentHubItem

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

ContentNote

Represents a note created with the enhanced note taking tool, released in Winter '16. This object is available in API version 32.0 and later.

ContentNotification

Represents a notification for a file. This object is available in API version 42.0 and later.

ContentTagSubscription

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

ContentUserSubscription

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

ContentVersionComment

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

ContentVersionRating

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

ContentWorkspace

Represents a content library. This object is available in versions 17.0 and later.

ContentWorkspaceDoc

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

ContentWorkspaceMember

Represents a member of a content library. This object is available in API version 40.0 and later.

ContentWorkspacePermission

Represents a library permission. This object is available in API version 40.0 and later.

ContentWorkspaceSubscription

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

Contract

Represents a contract (a business agreement) associated with an Account.

ContractContactRole

Represents the role that a given Contact plays on a Contract.

ContractLineItem

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

ContractTag

Associates a word or short phrase with a Contract.

Conversation

Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

ConversationContextEntry

Represents the context of a message or an event in the chat history between an agent and a messaging user. This object is available in API version 47.0 and later.

ConversationEntry

Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.

ConversationParticipant

Represents an active participant in a conversation. A new ConversationParticipant record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

CorsWhitelistEntry

Cross-Origin Resource Sharing (CORS) enables web browsers to request resources from origins other than their own. For example, using CORS, JavaScript code at `https://www.example.com` could request a resource from `https://www.salesforce.com`. To access supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the origin serving the code to a Salesforce CORS allowlist.

CreditMemo

Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

CreditMemoLine

Represents a partial or full application of a credit memo's balance against an invoice or invoice line. This object is available in API version 48.0 and later.

Crisis

Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

CronJobDetail

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

CronTrigger

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

CspTrustedSite

Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

CustomHelpMenuItem

Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

CustomHelpMenuSection

Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

CustomHttpHeader

Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

CustomNotificationType

Stores information about custom notification types. This object is available in API version 47.0 and later.

CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

CustomPermissionDependency

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

DandBCompany

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

Dashboard

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

DashboardComponent

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

DashboardTag

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

DataAssessmentFieldMetric

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com.This object is available in API version 37.0 and later.

DataAssessmentMetric

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records.This object is available in API version 37.0 and later.

DataAssessmentValueMetric

Summarizes the number of fields matched for your account records with Data.com account records.This object is available in API version 37.0 and later.

DatacloudCompany

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

DatacloudContact

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

DatacloudDandBCompany

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

DatacloudOwnedEntity

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

DatacloudPurchaseUsage

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

DataIntegrationRecordPurchasePermission

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

DatasetExport

Represents a dataset exported from Einstein Analytics. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

DatasetExportPart

Represents a dataset exported from Einstein Analytics. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExportPart contains parts of the .csv file.

DataUseLegalBasis

Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

DataUsePurpose

Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

DatedConversionRate

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

DeclinedEventRelation

Represents event participants (invitees or attendees) with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

DelegatedAccount

Represents the external managed account. This object is available in API version 49.0 and later.

DeleteEvent

Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0.

DigitalSignature

Represents a signature captured on a service report in field service.

DigitalWallet

The digital wallet entity represents a customer's digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

DirectMessage

Represents a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

Division

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

Document

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

DocumentTag

Associates a word or short phrase with a Document.

Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

DsarPolicy

Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer's request. This object is available in API version 50.0 and later.

DsarPolicyLog

Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

DuplicateJob

Represents an instance of a job that identifies duplicates among existing records in the system.

DuplicateJobDefinition

Setup object defining a job that identifies duplicate record items globally.

DuplicateJobMatchingRule

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

DuplicateJobMatchingRuleDefinition

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

DuplicateRecordSet

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

DuplicateRule

Represents a duplicate rule for detecting duplicate records.

ElectronicMediaGroup

Represents the type of media that you can associate with a product or category.This object is available in API version 49.0 and later.

ElectronicMediaUse

Represents the usage of media. This object is available in API version 49.0 and later.

EmailContent

Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.

EmailDomainFilter

Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

EmailDomainKey

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

EmailMessage

Represents an email in Salesforce.

EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

EmailRelay

Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company's email servers. This object is available in API version 43.0 and later.

EmailServicesAddress

An email service address.

EmailServicesFunction

An email service.

EmailStatus

Represents the status of email sent.

EmailTemplate

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

EmbeddedServiceDetail

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

Employee

Represents an employee within a company or organization. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

EmployeeCrisisAssessment

Represents a crisis assessment of an Employee. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

EngagementChannelType

Represents a channel through which a customer can be reached for communication. This object is available in API version 48.0 and later.

EmbeddedServiceLabel

Represents a customized label in Embedded Chat or embedded Appointment Management.This object is available in API version 44.0 and later.

EnhancedLetterhead

Represents an enhanced letterhead that can be associated with a Lightning email template that doesn't use the Salesforce Merge Language (SML). This object is available in API version 46.0 and later.

Entitlement

Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

EntitlementContact

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

EntitlementTemplate

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

EntityHistory

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific Historyobjects instead.

EntityMilestone

Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

EntitySubscription

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

EnvironmentHubMember

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

Event

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

EventLogFile

Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org's operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The `Interval` and `Sequence` fields are available only in API version 37.0 and later.

EventRelation

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

EventBusSubscriber

Represents a trigger, process, or flow that's subscribed to a platform event or a change data capture event. Doesn't include CometD subscribers.

EventTag

Associates a word or short phrase with an Event.

EventWhoRelation

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the EventRelation on page 1386 object; that is, IsParent is *`true`* and IsWhat is *`false`*. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

Expense

Represents an expense linked to a work order. Service resource technicians can log expenses, such as tools or travel costs. This object is available in API version 49.0 and later.

ExpenseReport

Represents a report that summarizes expenses. This object is available in API version 50.0 and later.

ExpenseReportEntry

Represents an entry in an expense report. This object is available in API version 50.0 and later.

ExpressionFilter

Represents a logical expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

ExpressionFilterCriteria

Represents a condition in an expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

ExternalAccountHierarchy

Represents the external account hierarchy, which works like a role-based hierarchy. Use ExternalAccountHierarchy to allow partner and customer users to share data with other external accounts in their hierarchy.This object is available in API version 49.0 and later.

ExternalAccountHierarchyHistory

Represents the history of changes to values in the fields of an external account hierarchy. This object is available in API version 50.0 and later.

ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

ExternalDataUserAuth

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

ExternalSocialAccount

Represents a managed social media account on a social network such as Facebook or Twitter. This object is available in API version 29.0 and later.

FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

FeedItem

FeedItem represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces FeedPost.

FeedLike

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

FeedPollVote

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

FeedPost

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

FeedRevision

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

feedSignal

Attach feed signals, like `UpDownVote`, `UserVerified`, and `Verified`, to a feed post or comment. This object is available in API version 41.0 and later.

FeedTrackedChange

Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later.

FieldHistoryArchive

Represents field history values for all objects that retain field history. `FieldHistoryArchive` is a big object, available only to users with the "Retain Field History" permission. This object is available in API version 29.0 and later.

FieldPermissions

Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

FieldSecurityClassification

Represents a field's data sensitivity value selected from the SecurityClassification picklist. This object is available in API version 46.0 and later.

FieldServiceMobileSettings

Represents a configuration of settings that control the Field Service iOS and Android mobile app experience. This object is available in API version 38.0 and later.

FiscalYearSettings

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

FlexQueueItem

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the AsyncApexJob. This object is available in API version 36.0 and later.

FlowDefinitionView

Represents the description of a flow definition. This object is available in API version 46.0 and later.

FlowInterview

Represents a flow interview. A *flow interview* is a running instance of a flow.

FlowInterviewOwnerSharingRule

Represents the rules for sharing a FlowInterview with users other than the owner. This object is available in API version 33.0 and later.

FlowInterviewShare

Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

FlowRecordRelation

Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the $Flow.CurrentRecord global variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

FlowStageRelation

Represents a relationship between a paused flow interview and its stages. When a flow interview is paused, Salesforce creates a FlowStageRelation record for each stage that's set to the `$Flow.CurrentStage` or `$Flow.ActiveStages` global variable. Available in API version 43.0 and later.

FlowVariableView

Represents a variable within the flow version. This object is available in API version 46.0 and later.

FlowVersionView

Represents the version of a flow definition. This object is available in API version 46.0 and later.

Folder

Represents a repository for a Dashboard, Document, EmailTemplate, Macro, QuickText, or Report. Only one type of item can be contained in a folder.

FolderedContentDocument

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

ForecastingAdjustment

This object represents an individual forecast manager's adjustment for a subordinate's or child territory's forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users' adjustments of their *own* forecasts, including territory forecasts they own.

ForecastingDisplayedFamily

Represents the table in Forecasts Settings where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

ForecastingFact

This is a read-only object linking a ForecastingItem with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

ForecastingItem

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

ForecastingOwnerAdjustment

This object represents an individual forecast user's adjustment of their *own* forecast, including territory forecasts they own, via a ForecastingItem. Available in API versions 33 and greater. This object is separate from the ForecastingAdjustment object, which represents managers' adjustments of *subordinates'* and child territories' forecasts.

ForecastingQuota

This object represents an individual user's or territory's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' or child territories' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates and territories below them in the forecast hierarchy.

ForecastingShare

Represents forecasts shared between a forecast manager and a user. Available in API version 44.0 and later.

ForecastingType

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

ForecastingUserPreference

Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

FormulaFunction

Represents a function used when building a formula, including examples and uses. This object is available in API version 47.0 and later.

FormulaFunctionAllowedType

Represents the functions that are supported in the given formula context. This object is available in API version 48.0 and later.

FormulaFunctionCategory

Represents the category to which a formula belongs when building a formula. This object is available in API version 47.0 and later.

FulfillmentOrder

Represents a group of products and delivery charges on a single order that share the same fulfillment location, delivery method, and recipient. The FulfillmentOrderLineItems belonging to a FulfillmentOrder are associated with OrderItemSummary objects belonging to a single OrderSummary. This object is available in API version 48.0 and later.

FulfillmentOrderItemAdjustment

Represents a price adjustment on a FulfillmentOrderLineItem. Corresponds to an OrderItemAdjustmentLineSummary associated with the corresponding OrderItemSummary. This object is available in API version 48.0 and later.

FulfillmentOrderItemTax

Represents the tax on a FulfillmentOrderLineItem or FulfillmentOrderItemAdjustment. Corresponds to an OrderItemTaxLineItemSummary. This object is available in API version 48.0 and later.

FulfillmentOrderLineItem

Represents a product or delivery charge belonging to a FulfillmentOrder. Corresponds to an OrderItemSummary. This object is available in API version 48.0 and later.

FunctionInvocationRequest (Beta)

Represents invocation information for a Salesforce Function. This object is available in API version 51.0 and later.

GtwyProvPaymentMethodType

The gateway provider payment method type allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 50.0 and later.

Goal

The Goal object represents the components of a goal such as its name, description, and status.

GoalLink

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

GoogleDoc

Represents a link to a Google Document. This object is available in API version 14.0 and later.

Group

A set of User records.

GroupMember

Represents a User or Group that is a member of a public group.

GuestBuyerProfile

Represents a store's guest buyer profile, which allows unauthenticated buyers to browse the store. This object is available in API version 51.0 and later.

HashtagDefinition

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

HealthCareDiagnosis

Represents information related to industry-standard healthcare diagnosis codes.

HealthCareProcedure

Represents information related to industry-standard healthcare procedure codes.

Holiday

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

IconDefinition

Represents the icon-related metadata for a custom tab. This object is available in API version 43.0 and later.

Idea

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

IdeaComment

Represents a comment that a user has submitted in response to an idea.

IdeaReputation

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

IdeaReputationLevel

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

IdeaTheme

Represents an invitation to zone members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

IdpEventLog

Represents the Identity Provider Event Log. This log records both problems and successes with inbound SAML or OpenID Connect authentication requests from another app provider. It also records outbound SAML responses when Salesforce is acting as an identity provider. This object is available in API version 39.0 and later.

IframeWhiteListUrl

Represents a list of trusted external domains that you allow to frame your Embedded Service, Surveys, and Visualforce pages. This object is available in API version 45.0 and later.

Image

Represents the details of an image. This object is available in API version 47.0 and later.

Individual

Represents a customer's data privacy and protection preferences. Data privacy records based on the Individual object store your customers' preferences. Data privacy records are associated with related leads, contacts, person accounts, and users. This object is available in API version 42.0 and later.

IndividualHistory

Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

IndividualShare

Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access to a record because you own it, the `IndividualAccessLevel` is `All` and `RowCause` is Owner. This object is available in API version 42.0 and later.

InternalOrganizationUnit

Represents an organization that an Employee belongs to. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Invoice

Represents a financial document describing the total amount a buyer must pay for goods or services provided. This object is available in API version 48.0 and later.

InvoiceLine

Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 48.0 and later.

JobProfile

Represents a job profile used for shift scheduling. This object is available in API versions 47.0 and later.

Knowledge__Feed

Represents the feed for a knowledge article. This object is available in API version 39.0 and later.

Knowledge__ka

Provides access to the concrete object that represents a Knowledge article, the parent object for article versions. This object is available in API version 39.0 and later.

Knowledge__kav

Provides access to the concrete object that represents a Knowledge article version. This object is available in API version 39.0 and later.

Knowledge__DataCategorySelection

Represents a data category that classifies an article. This object is available in API version 39.0 and later.

KnowledgeableUser

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

KnowledgeArticle

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

KnowledgeArticleVersion

Provides a global view of standard article fields across all types of articles depending on their version. This object is available in API version 18.0 and later.

KnowledgeArticleVersionHistory

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

KnowledgeArticleViewStat

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20.0 and later.

KnowledgeArticleVoteStat

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20.0 and later.

LandingPage

Represents a Pardot landing page that has been synced to Salesforce. A landing page is a web page that a visitor reaches after clicking a link or advertisement. This object is available in API version 42.0 and later.

Lead

Represents a prospect or lead.

LeadCleanInfo

Stores the metadata Data.com Clean uses to determine a lead record’s clean status. Helps you automate the cleaning or related processing of lead records.

LeadOwnerSharingRule

Represents the rules for sharing a lead with users other than the owner.

LeadShare

Represents a sharing entry on a Lead.

LeadStatus

Represents the status of a Lead, such as Open, Qualified, or Converted.

LeadTag

Associates a word or short phrase with a Lead.

LegalEntity

Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 48.0 and later.

LightningExperienceTheme

Represents information for a theme in Lightning Experience. This object is available in API Version 42.0 and later.

LightningOnboardingConfig

Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. Available in API version 47.0 and later.

LightningToggleMetrics

Represents users who switched from Lightning Experience back to Salesforce Classic. This object is available in API version 43.0 and later.

LightningUsageByAppTypeMetrics

Represents number of users on Lightning Experience and Salesforce Mobile. This object is available in API version 43.0 and later.

LightningUsageByBrowserMetrics

Represents Lightning Experience usage grouped by user's browser. This object is available in API version 43.0 and later.

LightningUsageByPageMetrics

Represents standard pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

LightningUsageByFlexiPageMetrics

Represents custom pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

LightningExitByPageMetrics

.Represents standard pages users switched from Lightning Experience to Salesforce most frequently. This object is available in API version 44.0 and later.

LinkedArticle

Represents a knowledge article that is attached to a work order, work order line item, or work type. This object is available in API version 37.0 and later.

LinkedArticleFeed

Represents the comment feed on a linked article. This object is available in API version 39.0 and later.

LinkedArticleHistory

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

ListEmail

Represents a list email sent from Salesforce, or sent from Pardot and synced to Salesforce. When the list email is sent, the recipients are generated by combining recipients in ListEmailIndividualRecipients and ListEmailRecipientSource. Duplicate and other invalid recipients are removed. The result is the recipients who are actually sent any given list email. Has a one-to-many relationship with ListEmailRecipientSource and ListEmailIndividualRecipient. This object is available in API version 41.0 and later.

ListEmailIndividualRecipient

For a list email in Salesforce, represents a recipient. Each record represents a link from a list email to exactly one recipient for that list email. Recipients can be contacts, leads, or campaign members. Has a one-to-many relationship with ListEmail.This object is available in API version 44.0 and later.

ListEmailRecipientSource

For a list email in Salesforce, represents the dynamically defined sources of recipient email addresses. Each record represents a link to a single list view or campaign that is examined when the list email is sent. Has a one-to-many relationship with ListEmail. This object is available in API version 41.0 and later.

ListView

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

ListViewChart

Represents a graphical chart that's displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later.

ListViewChartInstance

Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

LiveAgentSession

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

LiveAgentSessionHistory

This object is automatically created for each Chat session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

LiveAgentSessionShare

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

LiveChatBlockingRule

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

LiveChatButton

Represents a button that allows visitors to request chats with Chat users. This object is available in API version 24.0 and later.

LiveChatButtonDeployment

Associates an automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

LiveChatButtonSkill

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

LiveChatDeployment

Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

LiveChatSensitiveDataRule

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

LiveChatTranscript

This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

LiveChatTranscriptEvent

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

LiveChatTranscriptShare

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

LiveChatTranscriptSkill

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

LiveChatUserConfig

Represents a setting that controls the console settings for Chat users. This object is available in API version 24.0 and later.

LiveChatUserConfigProfile

Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

LiveChatUserConfigUser

Represents a join between Live Chat User Config and User. This object is available in API version 24.0 and later.

LiveChatVisitor

Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

Location

Represents a warehouse, service vehicle, work site, or other element of the region where your team performs field service work. In API version 49.0 and later, you can associate activities with specific locations. Activities, such as the tasks and events related to a location, appear in the activities timeline when you view the location detail page. Also in API version 49.0 and later, Work.com users can view Employees as a related list on Location records.

LocationGroup

Represents a group of Omnichannel Inventory locations, providing an aggregate view of inventory availability across those locations. Omnichannel Inventory can create an inventory reservation for an order at the location group level, then assign the reservation to one or more locations in the group as needed. This object is available in API version 51.0 and later.

LocationGroupAssignment

Represents the assignment of a location to a location group. This object is available in API version 51.0 and later.

LocationTrustMeasure

Represents the COVID safety protocols that your business follows. For example, enforcement of masks, social distancing, cleanliness, and capacity limits. This object is available in API version 50.0 and later.

LocWaitlistMsgTemplate

Represents a junction object connecting LocationWaitlist to MessagingTemplate. This object is available in API version 50.0 and later.

LocationWaitlist

Represents a queue created for a specific location. Multiple queues can be created for a single location. For example, you can have a queue for each sales agent or a standard queue and a queue for vulnerable groups. The specific party of people in a queue is represented by LocationWaitlistedParty. This object is available in API version 50.0 and later.

LocationWaitlistedParty

Represents a specific party of people waiting in a queue. This object is available in API version 50.0 and later.

LoginEvent

The documentation has moved to LoginEvent in the *Platform Events Developer Guide*.

LoginGeo

Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

LoginHistory

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

LoginIp

Represents a validated IP address. This object is available in version 28.0 and later.

LogoutEventStream

The documentation has moved to LogoutEventStream in the *Platform Events Developer Guide*.

LookedUpFromActivity

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

Macro

Represents a macro, which is a set of instructions that tells the system to perform one or more tasks. This object is available in API version 32.0 and later.

MacroInstruction

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro's actions.

MacroUsage

Represents macro usage on a record, including which macro was used, who used it, and how they used it. This object is available in API version 47.0 and later.

MailmergeTemplate

Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

MaintenanceAsset

Represents an asset covered by a maintenance plan in field service. Assets can be associated with multiple maintenance plans.

MaintenancePlan

Represents a preventive maintenance schedule for one or more assets in field service.

MaintenanceWorkRule

Represents the recurrence pattern for a maintenance record. This object is available in API version 49.0 and later.

ManagedContentInfo

Allows the creation of relationship to Product using ProductMedia. This object is available in API version 49.0 and later.

MarketingForm

Represents a Pardot marketing form that has been synched to Salesforce. Use forms on your website and landing pages to collect information about visitors and turn anonymous visitors into identified prospects. This object is available in API version 42.0 and later.

MarketingLink

Represents a Pardot marketing link record, either a custom redirect or a file, that has been synced to Salesforce. This object is available in API version 42.0 and later.

MatchingRule

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

MatchingRuleItem

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

MessagingChannel

Represents a communication channel that an end user can use to send a message to an agent. A communication channel can be an SMS number, a Facebook page, or another supported messaging channel. This object is available in API version 45.0 and later.

MessagingChannelSkill

Junction object that represents an association between MessagingChannel and Skill. This object is available in API version 45.0 and later.

MessagingConfiguration

Represents the details for a Messaging configuration. This object is available in API version 47.0 and later.

MessagingDeliveryError

Represents a log of triggered outbound failures to verify when a triggered outbound has failed. This object is available in API version 44.0 and later.

MessagingEndUser

Represents a single address—such as a phone number or Facebook page—communicating with a single Messaging channel. This object is available in API version 45.0 and later

MessagingLink

Represents the link between a Messaging Channel and where it's shared. This object is available in API version 47.0 and later.

MessagingSession

Represents a session on a Messaging channel. This object is available in API version 47.0 and later.

MessagingTemplate

Represents a Messaging template used to send pre-formatted messages. This object is available in API version 47.0 and later.

MetadataPackage

Represents a package that has been developed in the org you're logged in to. Applies to unlocked, unmanaged, first-generation, and second-generation managed packages.

MetadataPackageVersion

Represents a package version (managed or unmanaged) that has been uploaded from the org you're logged in to.

Metric

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

MetricDataLink

The link between the metric and the data source, such as a report.

MetricsDataFile

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

MilestoneType

Represents a milestone (required step in a customer support process). This object is available in API version 18.0 and later.

MLField

Represents a single field in a data definition. This object is available in API version 50.0 and later.

MlIntentUtteranceSuggestion

Represents a customer input, used for training purposes in the feedback loop process of a conversation. Admins can add these inputs to the intent training model. This object is available in API version 51.0 and later.

MLPredictionDefinition

Represents a prediction definition that specifies details about the prediction. This object is available in API version 50.0 and later.

MLRecommendationDefinition

For internal use only.

MobileSettingsAssignment

Represents the assignment of a particular field service mobile settings configuration to a user profile. This object is available in API version 41.0 and later.

MsgChannelLanguageKeyword

Represents the consent configuration for a Messaging channel. This object is available in API version 48.0 and later.

MyDomainDiscoverableLogin

Represents configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This object is available in API version 45.0 and later.

MutingPermissionSet

Represents a set of disabled permissions and is used in conjunction with PermissionSetGroup . This object is available in API version 46.0 and later.

Name

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

NamedCredential

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

NamespaceRegistry

Represents a namespace that you can link to scratch orgs that were created from your org's Dev Hub. You use the namespace when developing, packaging, and releasing an app. You can't create this object with the API. Use the **Link Namespace** action in the Dev Hub graphical interface to insert a `NamespaceRegistry` record. This object is available in API version 41.0 and later.

NavigationLinkSet

Represents the navigation menu in an Experience Cloud site. A navigation menu consists of items that users can click to go to other parts of the site. This object is available in API version 35.0 and later.

NavigationMenuItem

Represents a single menu item in a NavigationLinkSet. Use this object to create, delete, or update menu items in your Experience Cloud site's navigation menu. This object is available in API version 35.0 and later.

NavigationMenuItemLocalization

Represents the translated value of a navigation menu item in an Experience Cloud site. This object is available in API version 36.0 and later.

Network

Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they're communities, sites, or portals, to meet your business needs, then transition seamlessly between them. Experience Cloud sites let you share information, records, and files with coworkers and stakeholders all in one place. This object is available in API version 26.0 and later.

NetworkActivityAudit

Represents an audit trail of moderation actions in Experience Cloud sites. This object is available in API version 30.0 and later.

NetworkAffinity

Represents a junction object that associates a user profile with a Network object, that is, with an Experience Cloud site. Use NetworkAffinity to assign a default Experience Cloud site to a user profile. This object is available in API version 41.0 and later.

NetworkDiscoverableLogin

Represents the Login Discoverable page from where customers and partners log in to an Experience Cloud site. Customers and partners are users with an External Identity license or any communities license for Experience Cloud.This object is available in API version 44.0 and later

NetworkFeedResponseMetric

Represents an object that stores the date and time values of question posts. It captures information for question creation, answer creation, and when an answer is marked as best answer This object is available in API version 51.0 and later.

NetworkMember

Represents a member of an Experience Cloud site. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

NetworkMemberGroup

Represents a group of members in an Experience Cloud site. Members can be either users in your internal org or external users assigned portal profiles. An administrator adds members to an Experience Cloud site by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the site. This object is available in API version 26.0 and later.

NetworkModeration

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

NetworkPageOverride

Represents information about custom pages used to override the default pages in Experience Cloud sites. You can create Experience Builder or Visualforce pages and override the default pages in a site. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

NetworkSelfRegistration

Represents the account that self-registering Experience Cloud users are associated with by default. Self-registering users in an Experience Cloud site are required to be associated with an account, which the administrator must specify while setting up self-registration for the site. If an account isn't specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

NetworkUserHistoryRecent

Represents an Experience Cloud site user's history of accessed records. This object is available in API version 42.0 and later.

Note

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

NoteAndAttachment

This read-only object contains all notes and attachments associated with an object.

NoteTag

Associates a word or short phrase with a Note.

OauthCustomScope

Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider.

OauthCustomScopeApp

Represents the name of the connected app to which the custom scope is assigned. This object is available in API version 49.0 and later.

OauthToken

Represents an OAuth access token for connected app authentication. Use this object to create a user interface for token management. This object is available in API version 32.0 and later.

ObjectPermissions

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

ObjectTerritory2AssignmentRule

Represents a territory assignment rule that's associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is `null`. Available only if Enterprise Territory Management has been enabled for your organization.

ObjectTerritory2AssignmentRuleItem

A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the `BooleanFilter` field on its corresponding ObjectTerritory2AssignmentRule object is a `null` value. Available only if Enterprise Territory Management has been enabled for your organization.

ObjectTerritory2Association

Represents an association (by assignment) between a territory and an object record, such as an account. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

OmniDataTransform

For internal use only.

OmniDataTransformItem

For internal use only.

OmniInteractionConfig

For internal use only.

OmniProcess

For internal use only.

OmniProcessCompilation

For internal use only.

OmniProcessElement

For internal use only.

OmniScriptSavedSession

For internal use only.

OmniUiCard

For internal use only.

OpenActivity

This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. OpenActivity fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

OperatingHours

Represents the hours in which a service territory, service resource, or account is available for field service work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

OperatingHoursHistory

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

Opportunity

Represents an opportunity, which is a sale or pending deal.

OpportunityCompetitor

Represents a competitor on an Opportunity.

OpportunityContactRole

Represents the role that a Contact plays on an Opportunity.

OpportunityContactRoleSuggestionInsight

Represents a suggestion for a new opportunity contact role. Available in API versions 45.0 and later.

OpportunityFieldHistory

Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

OpportunityHistory

Represents the stage history of an Opportunity.

OpportunityInsight

Represents an individual insight (deal prediction, follow-up reminder, or key moment) related to an opportunity record.

OpportunityLineItem

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

OpportunityLineItemSchedule

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

OpportunityOwnerSharingRule

Represents a rule for sharing an opportunity with users other than the owner.

OpportunityPartner

This object represents a partner relationship between an Account and an Opportunity. An OpportunityPartner record is created automatically when a Partner record is created for a partner relationship between an account and an opportunity.

OpportunityShare

Represents a sharing entry on an Opportunity.

OpportunitySplit

OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

OpportunitySplitType

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

OpportunityStage

Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

OpportunityTag

Associates a word or short phrase with an Opportunity.

OpportunityTeamMember

Represents a User on the opportunity team of an Opportunity.

Order

Represents an order associated with a contract or an account.

OrderAdjustmentGroup

Group containing a set of adjustments applied to an order. This object is available in API version 48.0 and later.

OrderAdjustmentGroupSummary

Represents the current properties and state of a group of related price adjustments. Associated with a set of OrderItemAdjustmentLineSummaries that apply to OrderItemSummaries belonging to one OrderSummary. Corresponds to one or more order adjustment group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderDeliveryGroup

A group of order items that share a delivery method and address. The delivery method and address are used during the fulfillment process, such as shipping as a gift, downloading, picking up in store, or shipping to a standard address This object is available in API version 48.0 and later.

OrderDeliveryGroupSummary

Represents the current properties and state of a group of OrderItemSummaries, belonging to one OrderSummary, to be fulfilled using the same delivery method and delivered to the same address. A single shipment can include them all, but that is not guaranteed. Corresponds to one or more order delivery group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderDeliveryMethod

Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

OrderHistory

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

OrderItem

Represents an order product that your organization sells.

OrderItemAdjustmentLineItem

An adjustment that has been made to an order item. This object is available in API version 48.0 and later.

OrderItemAdjustmentLineSummary

Represents the current properties and state of price adjustments on an OrderItemSummary. Corresponds to one or more order item adjustment line item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemSummary

Represents the current properties and state of a product or charge on an OrderSummary. Corresponds to one or more order item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemSummaryChange

Represents a change to an OrderItemSummary, usually a reduction in quantity due to a cancel or return. Corresponds to a change order item. This object is available in API version 48.0 and later.

OrderItemTaxLineItem

The tax amount that has been applied to an order item. This object is available in API version 48.0 and later.

OrderItemTaxLineItemSummary

Represents the current tax on an OrderItemSummary or OrderItemAdjustmentLineSummary. Corresponds to one or more order item tax line items, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemType

Shows whether the order product is a product line or charge line. This object is available in API version 48.0 and later.

OrderOwnerSharingRule

Represents a rule which determines order sharing access for the order’s owners.

OrderPaymentSummary

Represents the current properties and state of payments using a single payment method that are applied to one OrderSummary. This object is available in API version 48.0 and later.

OrderShare

Represents a sharing entry on an Order. This object is available in API version 48.0 and later.

OrderStatus

Represents the status of the order entity. This object is available in API version 48.0 and later.

OrderSummary

Represents the current properties and state of an order. Corresponds to one or more order objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderSummaryRoutingSchedule

Represents an attempt to route an order summary to one or more inventory locations for fulfillment. You can use it to schedule future attempts and to record completed attempts. This object is available in API version 51.0 and later.

Organization

Represents key configuration information for an organization.

OrgDeleteRequest

Represents a request to delete a developer edition (DE) org. This object is available in API version 42.0 and later. It is available only in Developer and Database.com editions.

OrgWideEmailAddress

Represents an organization-wide email address for user profiles.

OutOfOffice

Represents a user-set value on a profile that shows when the user intends to be out of the office. This object is available in API version 41.0 and later.

OutgoingEmail

For internal use only.

OutgoingEmailRelation

For internal use only.

OwnedContentDocument

Represents a file owned by a user. This object is available in version 30.0 and later.

OwnerChangeOptionInfo

Represents default and optional actions that can be performed when a record's owner is changed. Available in API version 35.0 and later, but to query for change owner metadata, use the OwnerChangeOptionInfo object in Tooling API instead. For more information, see OwnerChangeOptionInfo in the Tooling API.

PackageLicense

Represents a license for an installed managed package. This object is available in API version 31.0 and later.

PackagePushError

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

PackagePushJob

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

PackagePushRequest

Represents the push request for upgrading a package in one or many orgs from one version to another version.

PackageSubscriber

Represents an installation of a package in an org. This object contains installation information for managed or unlocked packages developed in the org you're logged in to.

Partner

Represents a partner relationship between two Account records or between an Opportunity record and an Account record.

PartnerFundAllocation

Represents allocated funds from a partner marketing budget for channel partners. This object is available in API version 41.0 and later.

PartnerFundClaim

Represents a claim of funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

PartnerFundRequest

Represents a request for funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

PartnerMarketingBudget

Represents a budget that provides funds to channel partners for selling and marketing products and services. This object is available in API version 41.0 and later.

PartnerNetworkConnection

Represents a Salesforce to Salesforce connection between Salesforce organizations.

PartnerNetworkRecordConnection

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

PartnerNetworkSyncLog

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log's twenty most recent entries, and provides a link to the log.

PartnerRole

Represents a role for an account Partner, such as consultant, supplier, and so on.

PartyConsent

Represents consent preferences for an individual. This object is available in API version 48.0 and later.

Payment

Represents a single event where the customer creates a payment. For credit cards, this is a payment capture or payment sale, which won't show up in the end user's credit card statement. This object is available in API version 48.0 and later.

PaymentAuthAdjustment

Shows information about an adjustment made to an authorized transaction. This object is available in API version 51.0 and later.

PaymentAuthorization

Represents a single payment authorization event where users can capture or reverse a payment against a reserve of funds. This object is available in API version 48.0 and later.

PaymentGateway

Platform entity that represents the connection to the external payment gateway. This object is available in API version 48.0 and later.

PaymentGatewayLog

Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities. This object is available in API version 48.0 and later.

PaymentGatewayProvider

Setup entity for payment gateways. Defines the connection to a payment gateway Apex adapter. This object is available in API version 48.0 and later.

PaymentGroup

Top-level object that groups of all the payment transactions that have been processed an order or contract. PaymentGroup is a standalone object, so it isn't required for users to execute payment transactions (authorizations, captures, refunds, and sales). This object is available in API version 48.0 and later.

PaymentLineInvoice

Represents a payment allocated to or unallocated from an invoice. This object is available in API version 48.0 and later.

PaymentMethod

The method that a buyer uses to compensate the seller of a good or service. Common payment methods include cash, checks, credit or debit cards, money orders, bank transfers, and online payment services. This object is available in API version 48.0 and later.

PendingServiceRouting

Represents a work assignment that's waiting to be routed. This object is available in API version 40.0 and later.

Period

Represents a fiscal period defined in FiscalYearSettings.

PermissionSet

Represents a set of permissions that's used to grant more access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

PermissionSetAssignment

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

PermissionSetGroup

Represents a group of permission sets and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed. This object is available in API version 45.0 and later.

PermissionSetGroupComponent

A junction object that relates the PermissionSetGroup and PermissionSet objects via their respective IDs; enables permission set group recalculation to determine the aggregated permissions for the group. This object is available in API version 45.0 and later.

PermissionSetLicense

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

PermissionSetLicenseAssign

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

PermissionSetTabSetting

Represents a permission set tab setting. Requires the View Setup permission. Use this object to query all tab settings of the permission set. This object is available in API version 45.0 and later.

PersonalizationTargetInfo

Represents a target for an audience. This object is available in API version 47.0 and later.

PlatformAction

PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

PlatformEventUsageMetric

Contains usage data for event publishing and CometD-client delivery. Usage data is available for the last 24 hours, ending at the last hour, and for historical daily usage. PlatformEventUsageMetric contains separate usage metrics for platform events and change data capture events. This object is available in API version 50.0 and later.

PlatformStatusAlertEvent

The documentation has moved to PlatformStatusAlertEvent in the *Platform Events Developer Guide*.

PortalDelegablePermissionSet

PortalDelegablePermissionSet is a base platform object used to store permission sets that can be assigned by a delegated portal/external user admin (DPUA) to portal users. This object is available in API version 47.0 and later.

PresenceConfigDeclineReason

Represents the settings for a decline reason that a presence user provides when declining work. This object is available in API version 37.0 and later.

PresenceDeclineReason

Represents an Omni-Channel decline reason that agents can select when declining work requests. This object is available in API version 37.0 and later.

PresenceUserConfig

Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

PresenceUserConfigProfile

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

PresenceUserConfigUser

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

PriceAdjustmentSchedule

Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 47.0 and later.

PriceAdjustmentTier

Represents a discount tier in a price adjustment schedule. This object is available in API version 47.0 and later.

Pricebook2

Represents a price book that contains the list of products that your org sells.

Pricebook2History

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 51.0 and later.

PricebookEntry

Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

PricebookEntryAdjustment

Read-only junction object created when you associate a price adjustment schedule with a price book entry. This object is available in API version 47.0 and later.

ProcessDefinition

Represents the definition of a single approval process.

ProcessException

Represents a processing failure on an order summary. A separate process is required to resolve the failure that caused the process exception before order summary processing can continue. This object is available in API version 50.0 and later.

ProcessInstance

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

ProcessInstanceHistory

This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

ProcessInstanceStep

Represents one work item in an approval process (ProcessInstance).

ProcessInstanceNode

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

ProcessInstanceWorkitem

Represents a user's pending approval request.

ProcessNode

Describes a step in a process definition. Compare to ProcessInstanceNode, which describes the step in a running process.

Product2

Represents a product that your org sells.

ProductAttribute

Represents the attributes that can be associated with a product. This object is available in API version 50.0 and later.

ProductAttributeSet

Represents a group of attributes that can be associated with a product. This object is available in API version 50.0 and later.

ProductAttributeSetItem

Represents a set of attributes that can be associated with a product. This object is available in API version 50.0 and later.

ProductAttributeSetProduct

Represents the product associated with a set of attributes. This object is available in API version 50.0 and later.

Product2DataTranslation

Represents the translated values of the data stored within a Product2 record's fields. This object is available in API version 45.0 and later.

ProductCategory

Represents the category that products are organized in.This object is available in API version 49.0 and later.

ProductCategoryDataTranslation

Represents the translated values for the data stored within a ProductCategory record's fields. This object is available in API version 46.0 and later.

ProductConsumed

Represents an item from your inventory that was used to complete a work order or work order line item in field service.

ProductEntitlementTemplate

Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

ProductItem

Represents the stock of a particular product at a particular location in field service, such as all bolts stored in your main warehouse.

ProductItemTransaction

Represents an action taken on a product item in field service. Product item transactions are auto-generated records that help you track when a product item is replenished, consumed, or adjusted.

ProductMedia

Represents the rich media, including images and attachments, that can be added to products.This object is available in API version 49.0 and later.

ProductRequest

Represents an order for a part or parts in field service.

ProductRequestLineItem

Represents a request for a part in field service. Product request line items are components of product requests.

ProductRequired

Represents a product that is needed to complete a work order or work order line item in field service.

ProductServiceCampaign

Represents a set of activities to be performed on a product service campaign asset, such as a product recall for safety issues or product defects. This object is available in API version 51.0 and later.

ProductServiceCampaignItem

Represents a product service campaign's asset. This object is available in API version 51.0 and later.

ProductServiceCampaignItemStatus

Represents a status for a product service campaign item in field service. This object is available in API version 51.0 and later.

ProductServiceCampaignStatus

Represents a status for a product service campaign in field service. This object is available in API version 51.0 and later.

ProductTransfer

Represents the transfer of inventory between locations in field service.

ProductWarrantyTerm

Defines the relationship between a product or product family and warranty term. This object is available in API version 50.0 and later.

Profile

Represents a profile, which defines a set of permissions to perform different operations. Operations can include querying, adding, updating, or deleting information, and so forth.

ProfileSkill

Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

ProfileSkillEndorsement

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

ProfileSkillShare

Represents a sharing entry on a ProfileSkill.

ProfileSkillUser

Represents a detail relationship of User. The object connects profile skills with users.

Prompt

Represents record details about an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

PromptAction

Represents how the user interacted with the in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

PromptActionOwnerSharingRule

Represents a rule which determines `PromptAction` sharing access for the owners. Available in API version 46.0 and later.

PromptActionShare

Represents a sharing entry on a prompt action record. Available in API version 46.0 and later.

PromptLocalization

Represents the translated value of a label for record details about in-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

PromptVersion

Represents an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

PromptVersionLocalization

Represents the translated value of a label for-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

PushTopic

Represents a query that is the basis for notifying Streaming API clients of changes to records in an org. This object is available in API version 21.0 and later.

QueueRoutingConfig

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

Question

Represents a question in a zone that users can view and reply to.

QuestionDataCategorySelection

A data category selection represents a data category that classifies a question.

QuestionReportAbuse

Represents a user-reported abuse on a Question in a Chatter Answers zone. This object is available in API version 24.0 and later.

QuestionSubscription

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

QueueSobject

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

QuickText

This object stores a snippet of text that allows users to send a quick response to a customer. Use quick text to create greetings, answers to common questions, short notes, and more. This object is available in API version 24.0 and later.

QuickTextUsage

Represents the usage of quick text on a record, including which quick text was used, who used it, and how they used it. This object is available in API version 47.0 and later.

Quote

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

QuoteDocument

Represents a quote in document format. Available in API version 18.0 and later.

QuoteLineItem

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

RecentlyViewed

Represents records or list views that the current user has recently viewed or referenced (by viewing a related record). List views are available in API version 29.0 and later.

Recommendation

Represents the recommendations surfaced as offers and actions for Einstein Next Best Action. This object is available in API version 45.0 and later.

RecordAction

Represents a relationship between a record and an action, such as a flow. Create a RecordAction for every action that you want to associate with a particular record. Available in API version 42.0 and later.

RecordActionHistory

Represents the lifecycle of a RecordAction as it goes through different states. Available in API version 44.0 and later.

RecordsetFilterCriteria

Represents a set of filters on service appointment fields to associate with shifts. Only service appointments that satisfy the filter criteria are assigned to those shifts. This object is available in API version 50.0 and later.

RecordsetFilterCriteriaRule

Represents a rule on a service appointment filter for shifts. This is associated with the RecordsetFilterCriteria object. This object is available in API version 50.0 and later.

RecordType

Represents a record type.

RecordTypeLocalization

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

RecordVisibility (Pilot)

Represents the visibility attributes that determine a record's read access. This object is read only and is available in API version 46.0 and later.

RedirectWhitelistUrl

Represents a trusted URL that users can navigate to without being shown a warning message. This object is available in API version 48.0 and later.

Refund

Represents a refund made against a payment. This object is available in API version 48.0 and later.

RefundLinePayment

A refund line that has been applied to a payment. This object is available in API version 48.0 and later.

RegisteredExternalService

Represents a registered external service used for checkout integrations by data integrators. This object is available in API version 49.0 and later.

RemoteKeyCalloutEvent

The documentation has moved to RemoteKeyCalloutEvent in the *Platform Events Developer Guide*.

Reply

Represents a reply that a user has submitted to a question in an answers zone.

ReplyReportAbuse

Represents a user-reported abuse on a Reply in a Chatter Answers zone. This object is available in API version 24.0 and later.

ReplyText

A text reply generated by Einstein Reply Recommendations that is based on closed chat transcripts. Admins review replies and publish them to quick text, editing them as needed. Einstein recommends relevant published replies to support agents in the Lightning Service Console, and agents can insert replies into chats or messaging sessions. This object is available in API version 49.0 and later.

Report

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

ReportTag

Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

ReputationLevel

Represents a reputation level defined for an Experience Cloud site. This object is available in API version 32.0 and later.

ReputationLevelLocalization

Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in Experience Cloud sites. This object is available in API version 35.0 and later.

ReputationPointsRule

Represents the reputation point rules for an Experience Cloud site. Each rule specifies an action that members can earn points from and the points associated with those actions in a particular site. This object is available in API version 32.0 and later.

ResourceAbsence

Represents a time period in which a service resource is unavailable to work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ResourcePreference

Represents an account’s preference for a specified service resource on field service work.

ReturnOrder

Represents the return or repair of inventory or products in Field Service, or the return of order products in Order Management. This object is available in API version 42.0 and later.

ReturnOrderItemAdjustment

Represents a price adjustment on a return order line item. This object is available in API version 50.0 and later.

ReturnOrderItemTax

Represents the tax on a return order line item or return order item adjustment. This object is available in API version 50.0 and later.

ReturnOrderLineItem

Represents a specific product that is returned or repaired as part of a return order in Field service, or a specific order item that is returned as part of a return order in Order Management. This object is available in API version 42.0 and later.

ReturnOrderOwnerSharingRule

Represents the rules for sharing a return order with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 42.0 and later.

RuleTerritory2Association

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

SalesAIScoreCycle

Represents the cycle type and ID used to score records. This object is available in API version 47.0 and later.

SalesAIScoreModelFactor

Represents the factors that Sales Cloud Einstein uses to build a scoring model. Scoring models are used by features, such as Opportunity Scoring, to score individual records. This object is available in API version 47.0 and later.

SalesChannel

Represents the origin of an order. For example, a web storefront, physical store, marketplace, or mobile app. Usually you will set up a SalesChannel for each Site in your B2C Commerce implementation. This object is available in API version 48.0 and later.

SalesStoreCatalog

Represents the catalog associated with a store. This object is available in API version 49.0 and later.

SalesWorkQueueSettings

Represents settings used to customize work queue options for third-party scoring. Third-party scoring enables custom number fields on person accounts, contacts, and leads. You must be a High Velocity Sales customer to update this object. Previously, you could only use the Einstein Intelligence Score for third-party scoring. Available starting in Version 47.0.

SamlSsoConfig

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

Scontrol

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

ScontrolLocalization

The translated value of the field label for an s-control.

ScratchOrgInfo

Represents a scratch org and its audit log. Use this object to create a scratch org and keep a log of its creation and deletion. This object is available in API version 41.0 and later.

SearchPromotionRule

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user's search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

SecureAgent

Represents a Secure Agent that connects Salesforce to on-premises external data sources like SharePoint 2010 and 2013. This object is available in API version 32.0 and later.

SecureAgentsCluster

Represents a cluster consisting of several Secure Agents on different servers. Clusters provide failover protection if an agent on a particular server becomes inaccessible. This object is available in API version 35.0 and later.

SecurityCustomBaseline

Provides the ability to read, create, and delete user-defined custom security baselines, which define an org's security standards. This object is available in API version 39.0 and later.

SelfServiceUser

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

ServiceAppointment

Represents an appointment to complete work for a customer in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceAppointmentStatus

Represents a possible status of a service appointment in field service.

ServiceChannel

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

ServiceChannelFieldPriority

Represents a secondary routing priority field-value mapping. This object is available in API version 47.0 and later.

ServiceChannelStatus

Represents the status that's associated with a specific service channel. This object is available in API version 32.0 and later.

ServiceChannelStatusField

Represents the values that you use to indicate completed and in-progress work item status for the status field in the Status-Based Capacity routing model. This object is available in API version 49.0 and later.

ServiceContract

Represents a customer support contract (business agreement). This object is available in API version 18.0 and later.

ServiceContractOwnerSharingRule

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

ServiceCrew

Represents a group of service resources who can be assigned to service appointments as a unit.

ServiceCrewMember

Represents a technician service resource that belongs to a service crew.

ServiceCrewOwnerSharingRule

Represents the rules for sharing a service crew with user records other than the owner or anyone above the owner in the role hierarchy.

ServicePresenceStatus

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

ServiceReport

Represents a report that summarizes a work order, work order line item, or service appointment.

ServiceReportLayout

Represents a service report template in field service.

ServiceResource

Represents a service technician or service crew in field service in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceResourceCapacity

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

ServiceResourceCapacityHistory

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

ServiceResourceOwnerSharingRule

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

ServiceResourceSkill

Represents a skill that a service resource possesses in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceTerritory

Represents a geographic or functional region in which field service work can be performed in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceTerritoryLocation

Represents a location associated with a particular service territory in field service.

ServiceTerritoryMember

Represents a service resource who can be assigned to service appointments in a service territory in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceTerritoryWorkType

Represents the relationship between a ServiceTerritory object and a WorkType object for Lightning Scheduler appointments. This object is available in API version 45.0 and later.

SessionPermSetActivation

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later.

SetupAuditTrail

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

SetupEntityAccess

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

ShapeRepresentation

Contains information about the shape of an org. The shape of an org includes features, settings, licenses, and limits information. You can easily create scratch orgs based on a source org's shape. This object is available in API version 50.0 and later.

SharingRecordCollection

Represents a collection of records. This object is available in API version 51.0 and later.

SharingRecordCollectionItem

Represents a single record in a collection of records. This object is available in API version 51.0 and later.

SharingRecordCollectionMember

Represents a user with access to a collection of records. This object is available in API version 51.0 and later.

Shift

Represents a shift for service resource scheduling. Available in API versions 46.0 and later.

ShiftHistory

Represents the history of changes made to tracked fields on a time sheet. Available in API versions 46.0 and later.

ShiftOwnerSharingRule

Represents the rules for sharing a shift with user records other than the owner or anyone above the owner in the role hierarchy. Available in API versions 46.0 and later.

ShiftShare

Represents a sharing entry on a field service shift. Available in API versions 46.0 and later.

ShiftStatus

Represents a shift, such as Tentative, Published, or Confirmed. Available in API versions 46.0 and later.

Shipment

Represents the transport of inventory in field service or a shipment of order items in Order Management.

ShipmentItem

Represents an order item included in a shipment. This object is available in API version 51.0 and later.

SignupRequest

Represents a request for a new signup. This object is available in API version 27.0 and later.

Site

Represents a public website that is integrated with an org. This object is available in API version 16.0 and later.

SiteDetail

Represents the details of a Salesforce site or Experience Cloud site. Available in API Version 38.0 and later.

SiteDomain

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the Domain and DomainSite objects instead.

SiteHistory

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

SiteIframeWhitelistUrl

Represents a list of external domains that you allow to frame your Salesforce site or Experience Cloud site pages. This object is available in API version 44.0 and later.

Skill

Represents a category or group that Chat users or field service resources can be assigned to. This object is available in API version 24.0 and later.

SkillProfile

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

SkillRequirement

Represents a skill that is required to complete a particular task in Field Service and Lightning Scheduler. Skill requirements can be added to work types, work orders, and work order line items in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later. You also can add skill requirements to work items in Omni-Channel skills-based routing using API version 42.0 and later.

SkillUser

Represents a join between Skill and User. This object is available in API version 24.0 and later.

SlaProcess

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

Snippet

Represents a snippet, which is a container for rich text that can be reused across Pardot emails and email templates. This object is available in API version 47.0 and later.

SnippetAssignment

Represents a relationship between a snippet and a campaign. Assignments are required to use snippet content in Pardot emails and email templates. A snippet can be assigned to more than one campaign. This object is available in API version 47.0 and later.

SocialPersona

Represents a snapshot of a contact's profile on a social network such as Facebook or Twitter. This object is available in API version 22.0 and later.

SocialPost

Represents a snapshot of a post on a social network such as a Facebook or Twitter. This object is available in API version 23.0 and later.

Solution

Represents a detailed description of a customer issue and the resolution of that issue.

SolutionStatus

Represents the status of a Solution, such as Draft, Reviewed, and so on.

SolutionTag

Associates a word or short phrase with a Solution.

SOSDeployment

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

SOSSession

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

SOSSessionActivity

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

Stamp

Represents a User Specialty. This object is available in API version 39.0 and later.

StampAssignment

Represents assignment of a User Specialty to a user. This object is available in API version 39.0 and later.

StaticResource

Represents a static resource that can be used in Visualforce markup.

StoreIntegratedService

Represents an association between an integration and a store. This object is available in API version 49.0 and later.

StreamingChannel

Represents a channel that is the basis for notifying listeners of generic Streaming API events. This object is available in API version 29.0 and later.

Salesforce Surveys Object Model

Learn about how Salesforce Surveys objects relate to one another in Salesforce.

Survey

Represents a survey.

SurveyEmailBranding

Represents the configuration settings for invitation emails sent to survey participants for a particular survey.

SurveyEngagementContext

Represents the context based on which a survey invitation was sent or a survey response was received. This object is available in API version 49.0 and later.

SurveyInvitation

Represents the invitation sent to a participant to complete the survey.

SurveyPage

Represents a page, such as the title page or a question page, in a survey.

SurveyQuestion

Represents a question in a survey.

SurveyQuestionChoice

Represents an answer choice that a participant can select for a survey question.

SurveyQuestionResponse

Represents a participant's answer to a specific question.

SurveyQuestionScore

Represents the aggregate of responses for the following question types: date, multiple choice, picklist, radio, ranking, rating, scoring, slider, and Net Promoter Score® (NPS®).

SurveyResponse

Represents information about a participant's response to a survey, such as the status of the response, the participant's location, and when the survey was completed.

SurveySubject

Represents a relationship between a survey and another object, such as an account or a case.

SurveyVersion

Represents a version of a survey.

SurveyVersionAddlInfo

Represents additional information about a survey version. This information defines the default settings of a survey version. This object is available in API version 49.0 and later.

TabDefinition

Represents a custom tab. Returns only the tabs that the current user has access to. This object is available in API version 43.0 and later.

TagDefinition

Defines the attributes of child Tag objects.

Task

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

TaskPriority

Represents the importance or urgency of a Task, such as High, Normal, or Low.

TaskRelation

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

TaskStatus

Represents the status of a Task, such as Not Started, Completed, or Closed.

TaskTag

Associates a word or short phrase with a Task.

TaskWhoRelation

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

TenantSecret

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

Territory

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

Territory2

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

Territory2Model

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

Territory2ModelHistory

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

Territory2Type

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

TestSuiteMembership

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

ThirdPartyAccountLink

Represents the list of external users who authenticated using an Auth. Provider. This object is available in API version 32.0 and later.

ThreatDetectionFeedback

Represents feedback provided by a user about a Threat Detection event that occurred in your org. The feedback specifies whether the event was malicious, suspicious, not a threat, or unknown. Each ThreatDetectionFeedback object is associated with one of these Threat Detection storage events: CredentialStuffingEventStore, ReportAnomalyEventStore, or SessionHijackingEventStore. This object is available in API version 49.0 and later.

TimeSheet

Represents a schedule of a service resource's time in field service. This object is available in API v47.0 and later.

TimeSheetEntry

Represents a span of time that a service resource spends on a field service task. This object is available in API version 47.0 and later.

TimeSlot

Represents a period of time on a specified day of the week during which field service work can be performed in Field Service and Lightning Scheduler. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

TimeSlotHistory

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

Topic

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

TopicAssignment

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

TopicLocalization

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in Experience Cloud sites. This object is available in API version 33.0 and later.

TopicUserEvent

Represents an action (such as comment, post, like, or share) made by a user on a topic. This object is available in API version 42.0 and later.

TransactionSecurityPolicy

Represents a transaction security policy definition.

Translation

The Translation object represents the languages enabled for translation in your Salesforce org. This object is available in API version 47.0 and later.

TwoFactorInfo

Stores a user's secret for multi-factor operations. Use this object when customizing multi-factor authentication in your organization. (Note that multi-factor authentication was formerly called two-factor authentication.) This object is available in API version 32.0 and later.

TwoFactorMethodsInfo

Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

TwoFactorTempCode

Stores information about a user's temporary verification code for confirming their identity when logging in. This object is available in API version 37.0 and later.

UiFormulaCriterion

Represents a filter that helps define component visibility on a Lightning page. This object is available in API version 47.0 and later.

UiFormulaRule

Represents a set of one or more filters that define the conditions under which a component displays on a Lightning page. This object is available in API version 47.0 and later.

UndecidedEventRelation

Represents event participants (invitees or attendees) with the status `Not Responded` for a given event. This object is available in API versions 29.0 and later.

User

Represents a user in your organization.

UserAccountTeamMember

Represents a User on the default account team of another User.

UserAppInfo

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

UserAppMenuCustomization

Represents an individual user's settings for items in the app menu or App Launcher. This object is available in API version 35.0 and later.

UserAppMenuItem

Represents the organization-wide settings for items in the app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

UserAuthCertificate

Represents a user authentication certificate in your org. A user certificate is a unique PEM-encoded X.509 digital certificate to authenticate individual users to your org. This object is available in API version 45.0 and later.

UserConfigTransferButton

Represents the association between a Chat configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

UserConfigTransferSkill

Represents the association between a Chat configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

UserCustomBadge

Represents a custom badge for a user. This object is available in API version 38.0 and later.

UserCustomBadgeLocalization

Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

UserDevice

Represents information unique to a device. Available in API version 43.0 and later.

UserDeviceApplication

Represents information on applications installed on a device that is accessing Salesforce. Available in API version 43.0 and later.

UserDeviceHistory

Represents tracking information on the UserDevice sObject. This object is available in API version 50.0 and later.

UserEmailCalendarSync

Represents the user assignments of an Einstein Activity Capture configuration. This object is available in API version 49.0 and later.

UserEmailPreferredPerson

Represents a mapping for a user's preferred record for an email address when multiple records match an email field.This object is available in API version 44.0 and later.

UserEmailPreferredPersonShare

Represents a sharing entry on a UserEmailPreferredPerson object. Sharing is not customizable for UserEmailPreferredPerson records.This object is available in API version 44.0 and later.

UserLicense

Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

UserListView

Represents the customizations a user made to a list view. This object is available in API version 32.0 and later.

UserListViewCriterion

Represents the criterion for a user's customized list view. The criterion consists of the filters or sort order a user added to a list view for the Salesforce Mobile app. This object is available in API version 32.0 and later.

UserLogin

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

UserMembershipSharingRule

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

UserPackageLicense

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

UserPermissionAccess

Represents the permissions accessibility for a current user. Available in API version 41.0 and later.

UserPreference

Represents a functional preference for a specific user in your organization.

UserProfile

Represents a Chatter user profile.

UserProvAccount

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

UserProvAccountStaging

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

UserProvMockTarget

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

UserProvisioningConfig

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

UserProvisioningLog

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

UserProvisioningRequest

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

UserRecordAccess

Represents a user's access to a set of records. This object is read only and is available in API version 24.0 and later.

UserRole

Represents a user role in your organization.

UserServicePresence

Represents a presence user's real-time presence status. This object is available in API version 32.0 and later.

UserShare

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

UserTeamMember

Represents a single User on the default opportunity team of another User.

UserTerritory

Represents a User who has been assigned to a Territory.

UserTerritory2Association

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

UserWorkList

Represents a list of work items in the My Feed tab for High Velocity Sales users.

UserWorkListItem

Represents an individual work item in the My Feed tab for High Velocity Sales users.

VerificationHistory

Represents the past six months of your org users' attempts to verify their identity. This object is available in API version 36.0 and later.

VisualforceAccessMetrics

Represents summary statistics for Visualforce pages.

VideoCall

Represents a video call.

VideoCallParticipant

Represents a participant in a video call.

VideoCallRecording

Represents a recording from a video call, such as a video recording, a voice recording, or a transcript.

VoiceCall

Represents a call in Service Cloud Voice and Sales Dialer.

VoiceCallList

Represents a prioritized list of numbers to call.

VoiceCallListItem

Represents a single phone number in a prioritized call list.

VoiceCallQualityFeedback

Represents feedback given by a Sales Dialer user about the quality of a VoiceCall.

VoiceCallRecording

Represents a call recording in Service Cloud Voice and Sales Dialer. Call recordings are saved as files in Salesforce.

VoiceCoaching

Represents a call that is using call monitoring.

VoiceLocalPresenceNumber

Represents a phone number with the same area code as the person who's being called.

VoiceMailContent

Represents a voicemail message left by a caller to the context user.

VoiceMailGreeting

Represents a custom greeting message that plays upon reaching a user's voicemail. This object is available in API version 41.0 and later.

VoiceMailMessage

Represents a prerecorded voicemail message.

VoiceUserLine

Represents a user's forwarding phone number.

VoiceUserPreferences

Represents the number the user displays when making outbound calls. This object is available in API version 41.0 and later.

VoiceVendorInfo

Represents information about the Service Cloud Voice or Sales Dialer provider's vendor.

VoiceVendorLine

Represents a user's phone number reserved with the vendor.

Vote

Represents a vote that a user has made on an Idea or a Reply.

WarrantyTerm

Represents warranty terms defining the labor, parts, and expenses covered, along with any exchange options, provided to rectify issues with products. This object is available in API version 50.0 and later.

WaveAutoInstallRequest

Provides access the concrete object that represents an Analytics auto install request. The auto install request tracks the progress of Analytics applications created from Analytics templates by the automated process user. This object is available in API version 38.0 and later.

WebCart

Represents an online shopping cart in a store built with B2B Commerce on Lightning, with total amounts for products, shipping and handling, and taxes. This object is available in API version 49.0 and later.

WebCartHistory

WebCartHistory represents the history of changes to the values in the fields of the `WebCart` object.

WebLink

Represents a custom link to a URL or Scontrol.

WebLinkLocalization

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

WebStore

Represents a B2B Commerce store.This object is available in API version 49.0 and later.

WebStoreCatalog

Represents the collection of products associated with a store.This object is available in API version 49.0 and later.

WebStorePricebook

Represents a store price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

Wishlist

Represents a buyer-created list of `WishlistItem`s in a store that's built with B2B Commerce on Lightning. Available in API version 49.0 and later.

WishlistItem

Represents an item on a `Wishlist` in a store built with B2B Commerce for Lightning. Available in API version 49.0 and later.

WorkAccess

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

WorkAccessShare

Used to control Givers of WorkBadgeDefinition records.

WorkBadge

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

WorkBadgeDefinition

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

WorkCoaching

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

WorkFeedback

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

WorkFeedbackQuestion

Represents a free-form text type or multiple choice question within a set of questions.

WorkFeedbackQuestionSet

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

WorkFeedbackRequest

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

WorkGoal

Represents the components of a goal, such as its description and associated metrics. This object has been deprecated as of API version 35.0. Use the Goal object to query information about WDC goals.

WorkGoalCollaborator

Represents collaborators on a WorkGoal object. This doesn't include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the Goal object to query information about WDC goals.

WorkGoalCollaboratorHistory

Represents the history of changes to the values in the fields in a WorkGoalCollaborator object. Access is read-only.

WorkGoalHistory

Represents the history of changes to the values in the fields of a WorkGoal. Access is read-only. This object has been deprecated as of API version 35.0. Use the GoalHistory object to query historical information for WDC goals.

WorkGoalLink

Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the GoalLink object to query information about the relationship between two WDC goals.

WorkGoalShare

Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the GoalShare object to query information about sharing for WDC goals.

WorkOrder

Represents field service work to be performed for a customer. This object is available in API version 36.0 and later.

WorkOrderHistory

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

WorkOrderLineItem

Represents a subtask on a work order in field service. This object is available in API version 36.0 and later.

WorkOrderLineItemHistory

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

WorkOrderLineItemStatus

Represents a possible status of a work order line item in field service.

WorkOrderShare

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

WorkOrderStatus

Represents a possible status of a work order in field service.

WorkPerformanceCycle

Represents feedback that is gathered to assess the performance of a specific set of employees.

WorkReward

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

WorkRewardFund

Represents a Reward Fund and describes the Reward Fund attributes.

WorkRewardFundType

Represents the type of WorkRewardFund object.

WorkThanks

Represents the source and message of a thanks post.

WorkType

Represents a type of work to be performed in Field Service and Lightning Scheduler. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

WorkTypeGroup

Represents a grouping of work types used to categorize types of appointments available in Lightning Scheduler, or to define scheduling limits in Field Service. This object is available in API version 45.0 and later.

WorkTypeGroupMember

Represents the relationship between a work type and the work type group it belongs to. This object is available in API version 45.0 and later.

AcceptedEventRelation

Represents event participants (invitees or attendees) with the status `Accepted` for a given event.

This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`EventId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** Indicates the ID of the event.
RelationId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the invitee.
RespondedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates the most recent date and time when the invitee accepted an invitation to the event.
Response	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates the content of the response field. Label is `Comment`.
Type	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates whether the invitee is a user, lead or contact, or resource.

Usage

Query invitees who have accepted an invitation to an event

```
SELECT eventId, type, response FROM AcceptedEventRelation WHERE eventid='00UTD000000ZH5LA'
```

SEE ALSO:

DeclinedEventRelation

UndecidedEventRelation

Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access their own accounts and any account shared with them.

Fields

Field Name	Details
`AccountNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Account number assigned to this account (not the unique, system-generated ID assigned during creation). Maximum size is 40 characters.
`AccountSource`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The source of the account record. For example, *`Advertisement`*, *`Data.com`*, or *`Trade Show`*. The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.

Field Name	Details
AnnualRevenue	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Estimated annual revenue of the account.
BillingAddress	**Type** address **Properties** Filter, Nillable **Description** The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.
BillingCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 40 characters.
BillingCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 80 characters.
BillingCountryCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO country code for the account’s billing address.
BillingGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field Name	Details
	Description Accuracy level of the geocode for the billing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.
BillingLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `BillingLongitude` to specify the precise geolocation of a billing address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
BillingLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `BillingLatitude` to specify the precise geolocation of a billing address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
BillingPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 20 characters.
BillingState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 80 characters.
BillingStateCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO state code for the account's billing address.

Field Name	Details
`BillingStreet`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Street address for the billing address of this account.
`ChannelProgramName`	**Type** string **Properties** Group, Nillable **Description** Read only. Name of the channel program the account has enrolled. Note: If this account has enrolled more than one channel program, the oldest channel program name will be displayed. .
`ChannelProgramLevelName`	**Type** string **Properties** Group, Nillable **Description** Read only. Name of the channel program level the account has enrolled. Note: If this account has enrolled more than one channel program level, the oldest channel program name will be displayed.
`CleanStatus`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the record's clean status as compared with Data.com. Values are: `Matched`, `Different`, `Acknowledged`, `NotFound`, `Inactive`, `Pending`, `SelectMatch`, or `Skipped`. Several values for `CleanStatus` display with different labels on the account record detail page. • `Matched` displays as `In Sync` • `Acknowledged` displays as `Reviewed` • `Pending` displays as `Not Compared`

Field Name	Details
`ConnectionReceivedId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
`ConnectionSentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Text description of the account. Limited to 32,000 KB.
`DunsNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. Maximum size is 9 characters. This field is available on business accounts, not person accounts. Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.
`Fax`	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description Fax number for the account.
HasOptedOutOfEmail	**Type** boolean **Properties** Create, Defaulted on create, Filter, Update **Description** Indicates whether the contact doesn’t want to receive email from Salesforce (`true`) or does (`false`). Label is **Email Opt Out**.
Industry	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An industry associated with this account. Maximum size is 40 characters.
IsCustomerPortal	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the account has at least one contact enabled to use the org's Customer Portal (`true`) or not (`false`). This field is available if Customer Portal is enabled OR digital experiences is enabled and you have Customer Portal licenses. If you change this field's value from `true` to `false`, you can disable up to 100 Customer Portal users associated with the account and permanently delete all of the account's Customer Portal roles and groups. You can't restore deleted Customer Portal roles and groups. This field can be updated in API version 16.0 and later. Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.

Field Name	Details
`IsPartner`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the account has at least one contact enabled to use the org's partner portal (`true`) or not (`false`). This field is available if partner relationship management (partner portal) is enabled ORdigitial experiences is enabled and you have partner portal licenses. If you change this field's value from `true` to `false`, you can disable up to 15 partner portal users associated with the account and permanently delete all of the account's partner portal roles and groups. You can't restore deleted partner portal roles and groups. Disabling a partner portal user in the Salesforce user interface or the API does not change this field's value from `true` to `false`. Even if this field's value is `false`, you can enable a contact on an account as a partner portal user via the API. This field can be updated in API version 16.0 and later. Tip: We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.
`IsPersonAccount`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read only. Label is **Is Person Account**. Indicates whether this account has a record type of Person Account (`true`) or not (`false`).
`Jigsaw`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** References the ID of a company in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is `null`, the account was not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is **Data.com Key**. This field is available on business accounts, not person accounts. Important: The `Jigsaw` field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify the value in the `Jigsaw` field.

Field Name	Details
LastActivityDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Value is one of the following, whichever is the most recent: • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
LastReferencedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
LastViewedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.
MasterRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If this object was deleted as the result of a merge, this field contains the ID of the record that was kept. If this object was deleted for any other reason, or has not been deleted, the value is null.
NaicsCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries,

Field Name	Details
	according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. Maximum size is 8 characters. This field is available on business accounts, not person accounts. Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.
`NaicsDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an org's line of business, based on its NAICS code. Maximum size is 120 characters. This field is available on business accounts, not person accounts. Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Label is **Account Name**. Name of the account. Maximum size is 255 characters. If the account has a record type of Person Account: • This value is the concatenation of the `FirstName`, `MiddleName`, `LastName`, and `Suffix` of the associated person contact. • You can't modify this value.
`NumberOfEmployees`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Label is **Employees**. Number of employees working at the company represented by this account. Maximum size is eight digits.
`OperatingHoursId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The operating hours associated with the account. Available only if Field Service is enabled.

Field Name	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who currently owns this account. Default value is the user logged in to the API to perform the create. If you have set up account teams in your org, updating this field has different consequences depending on your version of the API: • For API version 12.0 and later, sharing records are kept, as they are for all objects. • For API version before 12.0, sharing records are deleted. • For API version 16.0 and later, users must have the "Transfer Record" permission in order to update (transfer) account ownership using this field.
Ownership	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Ownership type for the account, for example Private, Public, or Subsidiary.
ParentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the parent object, if any.
PersonIndividualId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the data privacy record associated with this person's account. This field is available if you enabled Data Protection and Privacy in Setup. Available in API version 42.0 and later.
Phone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description Phone number for this account. Maximum size is 40 characters.
`PhotoUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** Path to be combined with the URL of a Salesforce instance (for example, https://*yourInstance*.salesforce.com/) to generate a URL to request the social network profile image associated with the account. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the account. Blank if Social Accounts and Contacts isn't enabled for the org or if Social Accounts and Contacts is disabled for the requesting user.
`Rating`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account's prospect rating, for example Hot, Warm, or Cold.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the record type assigned to this object.
`Salutation`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Honorific added to the name for use in letters, etc.
`ShippingAddress`	**Type** address **Properties** Filter, Nillable

Field Name	Details
	Description The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.
ShippingCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address for this account. City maximum size is 40 characters
ShippingCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address for this account. Country maximum size is 80 characters.
ShippingCountryCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO country code for the account's shipping address.
ShippingGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Accuracy level of the geocode for the shipping address. See Compound Field Considerations and Limitations for details on geolocation compound fields.
ShippingLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `ShippingLongitude` to specify the precise geolocation of a shipping address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.

Field Name	Details
ShippingLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with ShippingLatitude to specify the precise geolocation of an address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
ShippingPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address for this account. Postal code maximum size is 20 characters.
ShippingState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address for this account. State maximum size is 80 characters.
ShippingStateCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO state code for the account's shipping address.
ShippingStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street address of the shipping address for this account. Maximum of 255 characters.
Sic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description Standard Industrial Classification code of the company's main business categorization, for example, 57340 for Electronics. Maximum of 20 characters. This field is available on business accounts, not person accounts.
`SicDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an org's line of business, based on its SIC code. Maximum length is 80 characters. This field is available on business accounts, not person accounts.
`Site`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name of the account's location, for example `Headquarters` or `London`. Label is **Account Site**. Maximum of 80 characters.
`TickerSymbol`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The stock market symbol for this account. Maximum of 20 characters. This field is available on business accounts, not person accounts.
`Tradestyle`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A name, different from its legal name, that an org may use for conducting business. Similar to "Doing business as" or "DBA". Maximum length is 255 characters. This field is available on business accounts, not person accounts. Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.
`Type`	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Type of account, for example, Customer, Competitor, or Partner.
`Website`	**Type** url **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The website of this account. Maximum of 255 characters.
`YearStarted`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when an org was legally established. Maximum length is 4 characters. This field is available on business accounts, not person accounts. Note: This field is only available to organizations that use Data.com Prospector or Data.com Clean.

IsPersonAccount Fields

These fields are the subset of person account fields that are contained in the child person contact record of each person account. If the `IsPersonAccount` field has the value `false`, the following fields have a null value and can't be modified. If `true`, the fields can be modified.

Person accounts are not enabled by default.

Field Name	Details
`FirstName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** First name of the person for a person account. Maximum size is 40 characters.
`LastName`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Last name of the person for a person account. Required if the record type is a person account record type. Maximum size is 80 characters.
`MiddleName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Middle name of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.
`PersonAssistantName`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The person account's assistant name. Label is **Assistant**. Maximum size is 40 characters.
`PersonAssistantPhone`	**Type** phone **Properties** Create, Filter, Nillable, Update **Description** The person account's assistant phone. Label is **Asst. Phone**. Maximum size is 40 characters.

`PersonBirthDate`	**Type**
	date
	Properties
	Create, Filter, Nillable, Update
	Description
	The assistant name. Label is **Birthdate**.
	Note: The year portion of the `PersonBirthDate` field is ignored in filter criteria, including report filters, list view filters, and SOQL queries. For example, the following SOQL query returns person accounts with birthdays later in the year than today:
	`SELECT FirstName, LastName, PersonBirthDate`
	`FROM Account`
	`WHERE Birthdate > TODAY`

Field Name	Details
PersonContactId	**Type** reference **Properties** Filter, Nillable, Update **Description** The ID for the contact associated with this person account. Label is **Contact ID**.
PersonDepartment	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The department. Label is **Department**. Maximum size is 80 characters.
PersonEmail	**Type** email **Properties** Create, Filter, Nillable, Update **Description** Email address for this person account. Label is **Email**.
PersonEmailBouncedDate	**Type** dateTime **Properties** Create, Filter, Nillable, Update **Description** If bounce management is activated and an email sent to the person account bounces, the date and time the bounce occurred.
PersonEmailBouncedReason	**Type** string **Properties** Create, Filter, Nillable, Update **Description** If bounce management is activated and an email sent to the person account bounces, the reason the bounce occurred
PersonHasOptedOutOfEmail	**Type** boolean **Properties** Create, Filter, Nillable, Update

Field Name	Details
	Description Indicates whether the person account has opted out of email (`true`) or not (`false`). Label is **Email Opt Out**.
`PersonHomePhone`	**Type** phone **Properties** Create, Filter, Nillable, Update **Description** The home phone number for this person account. Label is **Home Phone**.
`PersonLeadSource`	**Type** picklist **Properties** Create, Filter, Nillable, Update **Description** The person account's lead source. Label is **Lead Source**.
`PersonMailingAddress`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the person account mailing address. Read-only. See Address Compound Fields for details on compound address fields.
`PersonMailingCity`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** Details about the person account's mailing city. Labels are **Mailing City**, **Mailing Country**, **Postal Code**, and **State**. Maximum size for city and country is 40 characters. Maximum size for postal code and state is 20 characters.
`PersonMailingGeocodeAccuracy`	**Type** picklist **Properties** Retrieve, Query, Restricted picklist, Nillable **Description** Accuracy level of the geocode for the person's mailing address. See Compound Field Considerations and Limitations for details on geolocation compound fields.

Field Name	Details
`PersonMailingLatitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `PersonMailingLongitude` to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
`PersonMailingLongitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `PersonMailingLatitude` to specify the precise geolocation of a person account's mailing address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations on page 43 for details on geolocation compound fields.
`PersonMailingStreet`	**Type** textarea **Properties** Create, Filter, Nillable, Update **Description** The mailing street address for this person account. Label is **Mailing Street**. Maximum size is 255 characters.
`PersonMobilePhone`	**Type** phone **Properties** Create, Filter, Nillable, Update **Description** The mobile phone number for this person account. Label is **Mobile**.
• `PersonOtherCity` • `PersonOtherCountry` • `PersonOtherPostalCode` • `PersonOtherState`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** Details about the alternate address for this person account. Labels are **Other City**, **Other Country**, **Other Zip/Postal Code**, and **Other State**.

Field Name	Details
• PersonOtherCountryCode • PersonOtherStateCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO country or state code for the alternate address of the person account.
PersonOtherLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with PersonOtherLongitude to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
PersonOtherLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with PersonOtherLatitude to specify the precise geolocation of a person account's alternate address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places. See Compound Field Considerations and Limitations for details on geolocation compound fields.
PersonOtherPhone	**Type** phone **Properties** Create, Filter, Nillable, Update **Description** The alternate phone number for this person account. Label is **Other Phone**.
PersonOtherStreet	**Type** textarea **Properties** Create, Filter, Nillable, Update **Description** The person account's alternate street address. Label is **Other Street**.

Field Name	Details
`PersonTitle`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The person account's title. Label is **Title**. Maximum size is 80 characters.
`Suffix`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name suffix of the person for a person account. Maximum size is 40 characters. Contact Salesforce Customer Support to enable this field.

Note: If you are importing Account data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use this object to query and manage accounts in your org. Client applications can create, update, delete, or query Attachment records associated with an account via the API.

Client applications can also create or update account objects by converting a Lead via the `convertLead()` call.

If the values in the IsPersonAccount Fields are not null, you can't change `IsPersonAccount` to `false`, or an error occurs.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AccountFeed (API version 18.0)
Feed tracking is available for the object.

AccountHistory (API version 11.0)
History is available for tracked fields of the object.

AccountOwnerSharingRule
Sharing rules are available for the object.

AccountShare

Sharing is available for the object.

SEE ALSO:

AccountShare

AccountTeamMember

Person Account Record Types

AccountBrand

Represents the brand details of a Partner Account. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()` `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if digital experiences is enabled in your org and it has a Partner Community or Customer Community Plus license.

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the Account. This number is unique within your organization.
`Address`	**Type** address **Properties** Filter, Nillable **Description** The street address.
`City`	**Type** string

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The city.
CompanyName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the company associated with the account brand.
Country	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The country where the account is physically located.
Email	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Email address associated with the account.
GeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist Sort, Update **Description** Stores data for accurate geocoded location.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Most recent date referenced.
LastViewedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** Most recent date viewed.
`Latitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used along with `Longitude` to specify the precise geolocation of an address.
`LogoId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the logo.
`LogoUrl`	**Type** url **Properties** Nillable, **Description** URL of the logo. This field is available in API version 44.0 and later.
`Longitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `Latitude` to specify the precise geolocation of an address.
`Name`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Required. Name of the account.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create Filter, Group, Sort, Update **Description** Required. ID of the Owner.
Phone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Phone number.
PostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code where the user's IP address is physically located.
State	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address state.
Street	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address street.
Website	**Type** url **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Website for the Account Brand.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AccountBrandOwnerSharingRule
Sharing rules are available for the object.

AccountBrandShare
Sharing is available for the object.

AccountContactRelation

Represents a relationship between a contact and one or more accounts.

This object is available in API version 37.0. The AccountContactRelation object supports person accounts. That means that a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
`AccountContactRelationshipCurrency`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the account that is related to the contact. Field can't be modified when updating existing account-contact relationship records.
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field Name	Details
	Description ID of the contact that is related to the account. Field can't be modified when updating existing account-contact relationship records.
`EndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date a relationship between a contact and account ended. Use with the `Start Date` to keep a history of the relationship.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether relationship is active (`true`) or not (`false`).
`IsDirect`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the account associated with the contact is the contact's primary account (`true`) or not (`false`).
`Roles`	**Type** multipicklist **Properties** Create, Filter, Nillable, Update **Description** The contact's participating role in the account. Values are `Business User`, `Decision Maker`, `Economic Buyer`, `Economic Decision Maker`, `Evaluator`, `Executive Sponsor`, `Influencer`, `Technical Buyer`, and `Other`.
`StartDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description The date a relationship between a contact and account began. Use with the `End Date` to keep a history of the relationship.

Usage

Use this object to associate a single contact record to multiple account records so you can easily track the relationships between the people and businesses they work with.

When you insert a non-private contact in your org that associates a contact to multiple accounts, an AccountContactRelation is created and its validation rules, database insertion, and triggers are executed immediately after the contact is saved to the database. When you change a contact's primary account, an AccountContactRelation may be created or edited, and the AccountContactRelation validation rules, database changes, and triggers are executed immediately after the contact is saved to the database. See Order of Execution.

AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentState` field. If the `IsDifferentState` field's value is `False`, that means the `State` field value is *the same* on the Salesforce account record and its matched Data.com record.

AccountCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the account record.
- `IsDifferent` indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the account record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Their individual bits are defined here.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
AccountId	**Type** reference **Properties** Filter, Group, Sort **Description** The unique, system-generated ID assigned when the account record was created.
AccountSite	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Information about the account's location, such as single location, headquarters, or branch.
Address	**Type** address **Properties** Filter, Nillable **Description** The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.
AnnualRevenue	**Type** currency **Properties** Filter, Nillable, Sort **Description** Estimated annual revenue of the account.
City	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the account.
CleanedByJob	**Type** boolean

Field Name	Details
	Properties Filter **Description** Indicates whether the account record was cleaned by a Data.com Clean job (`true`) or not (`false`).
`CleanedByUser`	**Type** boolean **Properties** Filter **Description** Indicates whether the account record was cleaned by a Salesforce user (`true`) or not (`false`).
`CompanyName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the company.
`CompanyStatusDataDotCom`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The status of the company per Data.com. Values are: `Company is In Business per Data.com` or `Company is Out of Business per Data.com.`
`Country`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the account.
`DandBCompanyDunsNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The D-U-N-S Number on the D&B Company record (if any) that is linked to the account.
`DataDotComId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID Data.com maintains for the company.
`Description`	**Type** textarea **Properties** Nillable **Description** A description of the account.
`DunsNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.
`DunsRightMatchConfidence`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The account's DUNSRight confidence code.
`DunsRightMatchGrade`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The account's DUNSRight match grade.

Field Name	Details
`Fax`	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** The account's fax number.
`Industry`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The industry the account belongs to.
`IsDifferentAccountSite`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `AccountSite` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentAnnualRevenue`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `AnnualRevenue` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentCity`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `City` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentCompanyName`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the account's `AccountName` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentCountry`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Country` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentCountryCode`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Country Code` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentDandBCompanyDunsNumber`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `DandBCompanyID` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentDescription`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Description` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentDunsNumber`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the account's `DunsNumber` field value is different from the D-U-N-S Number on its matched Data.com record (`true`) or not (`false`).
`IsDifferentFax`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Fax` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentIndustry`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Industry` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentNaicsCode`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `NaicsCode` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentNaicsDescription`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `NaicsDescription` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentNumberOfEmployees`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the account's `NumberOf Employees` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentOwnership`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Ownership` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentPhone`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Phone` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentPostalCode`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `PostalCode` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentSic`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Sic` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentSicDescription`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the account's `SicDescription` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentState`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `State` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentStateCode`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `State Code` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentStreet`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `State` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentTickerSymbol`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `TickerSymbol` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentTradestyle`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the account's `Tradestyle` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentWebsite`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `Website` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentYearStarted`	**Type** boolean **Properties** Filter **Description** Indicates whether the account's `YearStarted` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsFlaggedWrongAccountSite`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `AccountSite` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongAddress`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Address` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongAnnualRevenue`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `AnnualRevenue` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongCompanyName`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `CompanyName` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongDescription`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Description` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongDunsNumber`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `DunsNumber` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongFax`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Fax` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongIndustry`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Industry` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongNaicsCode`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NaicsCode` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongNaicsDescription`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NaicsDescription` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongNumberOfEmployees`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NumberOfEmployees` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongOwnership`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Ownership` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongPhone`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Phone` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongSic`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Sic` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongSicDescription`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `SicDescription` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongTickerSymbol`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `TickerSymbol` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongTradestyle`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Tradestyle` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongWebsite`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Website` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongYearStarted`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `YearStarted` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsInactive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the account has been reported to Data.com as *`Inactive`* (`true`) or not (`false`).
`IsReviewedAccountSite`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `AccountSite` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedAddress`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Address` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedAnnualRevenue`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `AnnualRevenue` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedCompanyName`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `CompanyName` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedDandBCompanyDunsNumber`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `DandBCompanyID` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedDescription`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Description` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedDunsNumber`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `DunsNumber` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedFax`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Fax` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedIndustry	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Industry` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedNaicsCode	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NaicsCode` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedNaicsDescription	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NaicsDescription` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedNumberOfEmployees	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `NumberOfEmployees` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedOwnership	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Ownership` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedPhone`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Phone` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedSic`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Sic` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedSicDescription`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `SicDescription` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedTickerSymbol`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `TickerSymbol` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedTradestyle`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the account's `Tradestyle` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedWebsite`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `Website` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedYearStarted`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the account's `YearStarted` field value is in a `Reviewed` state (`true`) or not (`false`).
`LastMatchedDate`	**Type** dateTime **Properties** Filter, Sort **Description** The date the account record was last matched and linked to a Data.com record.
`LastStatusChangedById`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of who or what last changed the record's `Clean Status` field value: a Salesforce user or a Clean job.
`LastStatusChangedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date on which the record's `Clean Status` field value was last changed.

Field Name	Details
`Latitude`	**Type** double **Properties** Filter, Nillable, Sort **Description** Used with `Longitude` to specify the precise geolocation of a billing address. Data not currently provided.
`Longitude`	**Type** double **Properties** Filter, Nillable, Sort **Description** Used with `Latitude` to specify the precise geolocation of a billing address. Data not currently provided.
`NaicsCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy.
`NaicsDescription`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A brief description of an organization’s line of business, based on its NAICS code.
`Name`	**Type** string **Properties** Filter, Group, Sort, Update **Description** Field label is **Account Clean Info Name**. The name of the account. Maximum size is 255 characters.

Field Name	Details
NumberOfEmployees	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of employees working at the account.
Ownership	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** Ownership type for the account, for example Private, Public, or Subsidiary.
Phone	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** The phone number for the account.
PostalCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the account.
Sic	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Standard Industrial Classification code of the company’s main business categorization, for example, 57340 for Electronics.
SicDescription	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description A brief description of an organization's line of business, based on its SIC code.
`State`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the account.
`Street`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the account.
`TickerSymbol`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The stock market symbol for the account.
`Tradestyle`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A name, different from its legal name, that an organization can use for conducting business. Similar to "Doing business as" (DBA).
`Website`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The website of the account.
`YearStarted`	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The year the company was established or the year when current ownership or management assumed control of the company.

Usage

Administrators can modify a limited set of AccountCleanInfo fields from the Account Clean Info page.

Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the `Clean Status` field on the Account object. If an account record's `Clean Status` field value is `Different` but the record has no `Billing Street` value, the trigger could update the record's status to `Not Compared`.

Create triggers that read AccountCleanInfo fields to help automate the cleaning or related processing of account records. For example:

- Keep account records' status `InSync` if the only difference from matched records is the `Phone` format (for example, *`(415) 353-8000`* on the account record versus *`415 353 8000`* on the matched Data.com record).

```
trigger AccountPhoneTrigger on Account (before update) {

   for (Account account: Trigger.new) {
       Account oldAccount = Trigger.oldMap.get(account.ID);
       if (account.CleanStatus == 'Different') {
           List <AccountCleanInfo> cleanInfo = [Select Id, IsDifferentPhone,
IsReviewedPhone, Phone from AccountCleanInfo where AccountId = :account.Id];
           if (cleanInfo.size() > 0 && cleanInfo[0].IsDifferentPhone &&
cleanInfo[0].Phone.StartsWith('+')) {
               // if Data.com phone number is marked Different but starts with '+',
ignore this
               // and set the status to "Reviewed"
               AccountCleanInfo cleanInfoToUpdate = new AccountCleanInfo();
               cleanInfoToUpdate.Id = cleanInfo[0].Id;
               cleanInfoToUpdate.IsReviewedPhone = true;
               update cleanInfoToUpdate;
               account.CleanStatus = 'Reviewed';
           }
       }
   }
}
```

- Create a customized set of `Industry` field values for accounts. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.
- Read the `CleanStatus` field value on the Account object. If that value is `Different`, but a Salesforce record has no street address value, update the record's status to `Not Compared`.

AccountContactRole

Represents the role that a Contact plays on an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Account.
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. ID of the Contact associated with this account.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`IsPrimary`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Specifies whether the Contact plays the primary role on the Account (`true`) or not (`false`). Note that each account has only one primary contact role. Label is **Primary**. Default value is `false`.
`Role`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name of the role played by the Contact on this Account, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the `AccountId`, `ContactId`, and `Role` values are identical. Different contacts can play the same role on the same account. A contact can play different roles on the same account.

Usage

Use this object to define the role that a Contact plays on a given Account within the context of a specific Opportunity.

SEE ALSO:

Account

Contact

AccountInsight

Represents an individual insight (a key business development) related to an account record.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

To see an insight related to a specific account, users need a Sales Cloud Einstein license and access to the account record. As of the Spring '20 release, Pardot and High Velocity Sales users no longer have access to this object.

Fields

Field Name	Details
AccountId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the related account record.
ActualHeardWithinDays	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Reserved for future use.
CompetitorName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field has been deprecated as of API version 45.0.
ContactName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field is not in use as of API version 46.0.
ContactTitle	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field is not in use as of API version 46.0.
CurrencyIsoCode	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort

Field Name	Details
	Description Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The division of the related record.
`ExpectedHeardWithinDays`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Reserved for future use.
`LastHeard`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Reserved for future use.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.

Field Name	Details
NumberOfNewsArticles	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of news articles related to insights of type `M&A activity detected`, `Company is expanding`, and `Leadership changes`.
Rationale	**Type** string **Properties** Filter, Group, Nillable **Description** The explanation for an insight, providing more background information and details that are specific to the org.
Title	**Type** string **Properties** Filter, Group, Nillable **Description** The title of the insight.
TrendType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The trend type of the insight. Possible values include: • Negative • Positive • Informational
Type	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of insight. Possible values include: • M&A activity detected • Company is expanding

Field Name	Details
	• Leadership changes

Usage

This object is read-only and isn't supported with workflows, triggers, or process builder.

AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
AccountAccessLevel	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Update **Description** A value that represents the type of sharing being allowed. The possible values are: • Read • Edit • All (This value isn't valid for creating or updating.)
CaseAccessLevel	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description A value that represents the type of access granted to the target Group for all child cases. The possible values are: • `None` • `Read` • `Edit`
`ContactAccessLevel`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** A value that represents the type of access granted to the target Group, UserRole, or User for any associated contacts. The possible values are: • `None` • `Read` • `Edit` Note: When `DefaultContactAccess` is set to `Controlled by Parent`, you can't create or update this field.
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. This field is available in API version 24.0 and later.

Field	Details
	Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the source group. An Account owned by a User in the source Group triggers the rule to give access.
`OpportunityAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target Group for any associated Opportunity. The possible values are: • `None` • `Read` • `Edit`
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the User or Group being granted access.

Usage

Use this object to manage the sharing rules for accounts. General sharing and territory management-related sharing use this object. For example, the following code creates an account owner sharing rule between two public groups, which can also contain portal users.

```
AccountOwnerSharingRule rule = new AccountOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx00000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx00000000001"); // Set the group of users to share records to
rule.setAccountAccessLevel("Edit");
rule.setOpportunityAccessLevel("Read");
rule.setCaseAccessLevel("None");
connection.create(rule);
```

Note: The original territory management feature is scheduled for retirement for all customers as of Summer '21. After the feature is retired, users can't access the original territory management feature and its underlying data. We encourage you to migrate to Enterprise Territory Management. We also strongly recommend that you keep a comprehensive backup of your territory data while you're still using the original territory management feature. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

AccountPartner

This object represents a partner relationship between two Account records. An AccountPartner record is created automatically when a Partner record is created for a partner relationship between two accounts.

Note: This object is completely distinct from and independent of Account records that have been enabled for the partner portal.

Supported Calls

`create()`, `delete()`, `describeLayout()` `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`AccountFromId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the main Account in the partner relationship.
`AccountToId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the partner Account in the partner relationship.
`IsPrimary`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether the AccountPartner is the main account's primary partner (`true`) or not (`false`).
`OpportunityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the opportunity in a partner relationship.
`ReversePartnerId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the account in a partner relationship.
`Role`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description The UserRole that the partner Account has on the main Account. For example, `Consultant` or `Distributor`.

Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner record and specify the `AccountFromId`), the API automatically creates two AccountPartner records, one for the forward relationship and one for the reverse. For example, if you create a Partner relationship with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`, the API automatically creates two AccountPartner records:

- The forward relationship AccountPartner with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`.
- The reverse relationship AccountPartner with “Acme Consulting” as the `AccountFromId` and “Acme, Inc.” as the `AccountToId`.
- The value of the `Role` field in the reverse relationship AccountPartner is set to the PartnerRole record `ReverseRole` value associated with the value of the `Role` field in the forward relationship AccountPartner.

This mapping allows the API to manage the records and their relationships efficiently.

SEE ALSO:

Partner

OpportunityPartner

AccountRelationship

Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

In Digital Experience Settings, turn on the Enable Account Relationships org preference, which is off by default.

Fields

Field	Details
`AccountFromID`	**Type** reference **Properties** Create, Filter, Group, Sort,

Field	Details
	Description ID of the account that will gain access to data from `AccountTo`.
`AccountToId`	**Type** **reference** **Properties** Create, Filter, Group, Sort **Description** ID of the account sharing data with `AccountFrom`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the account relationship.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the account relationship.

Field	Details
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The relationship type. All account relationship sharing rules of that type will be applied to this account relationship. Standard values are: • System Integrator • Agency • Advertiser • Reseller • Distributor • Developer • Broker • Lender • Institution • Contractor • Dealer • Consultant • Client • Vendor • Agent • Retailer • SubContractor • Supplier Picklist items can be updated with your own values.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AccountRelationshipFeed
Feed tracking is available for the object.

AccountRelationshipHistory
History is available for tracked fields of the object.

AccountRelationshipOwnerSharingRule
Sharing rules are available for the object.

AccountRelationshipShare
Sharing is available for the object.

AccountRelationshipShareRule

Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`. `describeSObjects()`, `query()`, `retrieve()`, `update()`. `upsert()`

Fields

Field	Details
`AccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Type of access granted by the share rule. Valid values are: • `Read` (Read Only) • `Edit` (Read/Write)
`AccountToCriteriaField`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Criteria that must be met for the data to be shared. Possible values are: • `Account.OwnerId` • `Account.ParentId` • `Campaign.OwnerId` • `Case.AccountId` • `Case.OwnerId` • `Contact.AccountId` • `Contact.OwnerId` • `Lead.ConvertedAccountId` • `Lead.OwnerId` • `Lead.PartnerAccountId` • `Opportunity.AccountId` • `Opportunity.OwnerId`

Field	Details
	• `Opportunity.PartnerAccountId` • `Order.AccountId` • `Order.ActivatedById` • `Order.CompanyAuthorizedById` • `Order.OwnerId` • `PartnerFundAllocation.CreatedById` • `PartnerFundAllocation.ChannelPartnerId` • `PartnerFundAllocation.OwnerId` • `PartnerFundClaim.CreatedById` • `PartnerFundClaim.OwnerId` • `PartnerFundRequest.ChannelPartnerId` • `PartnerFundRequest.CreatedById` • `PartnerFundRequest.OwnerId` • `PartnerMarketingBudget.CreatedById` • `PartnerMarketingBudget.ChannelPartnerId` • `PartnerMarketingBudget.OwnerId`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A meaningful explanation of the sharing rule.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`EntityType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of data shared by this rule. Values are: • `Account` • `Campaign` • `Case` • `Contact` • `Lead` • `Opportunity` • `Order` • `PartnerFundAllocation` • `PartnerFundClaim` • `PartnerFundRequest` • `PartnerMarketingBudget`
`Language`	**Type** picklist **Properties** Create, Defaulted on create. Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the account relationship share rule.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label assigned to the sharing rule to identify it.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values.

Field	Details
	• In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`StaticFormulaCriteria`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** A way to further filter what data gets shared. This must be a deterministic formula and spanning is not allowed.
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Must match the type of an account relationship for data to be shared according to the `AccountToCriteriaField` and the `StaticForumulaCriteria`.

AccountShare

Represents a sharing entry on an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Account object can access this object.

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
`AccountAccessLevel`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to the Account. The possible values are: • `Read` • `Edit` • `All` (This value isn't valid for create or update calls.) This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, either this field, the `OpportunityAccessLevel` field, or the `CaseAccessLevel` field must be set higher than the organization's default access level.
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Account associated with this sharing entry. This field can't be updated.
`CaseAccessLevel`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to cases associated with the account. The possible values are: • `None` • `Read` • `Edit` This field must be set to an access level that is at least equal to the organization's default `CaseAccessLevel`. This field can't be updated via the API if the `AccountAccessLevel` field is set to `All`. You can't update this field for the associated account owner via the API. You must update the account owner's `CaseAccessLevel` via the Salesforce user interface.

Field	Details
ContactAccessLevel	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Level of access that the User or Group has to contacts associated with the account. The possible values are: • None • Read • Edit This field must be set to an access level that is at least equal to the organization's default ContactAccessLevel. This field can't be updated via the API if the ContactAccessLevel field is set to "Controlled by Parent." You can't update this field for the associated account owner using the API. You must update the account owner's ContactAccessLevel via the Salesforce user interface.
OpportunityAccessLevel	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to opportunities associated with the Account. The possible values are: • None • Read • Edit This field must be set to an access level that is at least equal to the organization's default opportunity access level. This field can't be updated via the API if the AccountAccessLevel field is set to All. You can't use the API to update this field for the associated Account owner. You must update the Account owner's opportunityAccessLevel via the Salesforce user interface.
RowCause	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include:

Field	Details
	• `Manual`—The User or Group has access because a User with "All" access manually shared the Account with the user or group. • `Owner`—The User is the owner of the Account • `Team`—The User or Group has team access (is an AccountTeamMember). • `Rule`—The User or Group has access via an Account sharing rule. • `GuestRule`—The user or group has access via an Account guest user sharing rule. • `ImplicitParent`—The User or Group has access because they're the owner of or have sharing access to records related to the account, such as opportunities, cases, contacts, contracts, or orders. • `GuestParentImplicit`—The guest user has access because they have access to records related to the Account, such as opportunities, cases, contacts, contracts, or orders. • `LpuParentImplicit`—The User has access because they have access to records related to the Account, which are owned by high-volume Experience Cloud site users and shared via a share group. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group. • `PortalImplicit`—The Account is associated with the portal user. • `ARImplicit`—The User, who belongs to a partner or customer account, has access to the Account via an account relationship data sharing rule. • `Territory2AssociationManual`—With Enterprise Territory Management in API version 44.0 and earlier, the `TerritoryManual` reason code was written to `AccountShare` records when you manually assigned an account to a territory. In API version 45.0 and later, `Territory2AssociationManual` replaces all instances of `TerritoryManual`, and the `Territory2AssociationManual` reason code is written to `AccountShare` records when you manually assign an account to a territory. • `Territory`—The territory has access via a territory assignment rule. • `TerritoryManual`—Deprecated starting in API version 45.0 and replaced by the `Territory2AssociationManual` value.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Account. This field can't be updated.

Usage

This object allows you to determine which users and groups can view or edit Account records owned by other users.

If you attempt to create an AccountShare record that matches an existing record, the request updates any modified fields and returns the existing record.

For example, the following code finds all accounts owned by a user and manually shares them to a portal user.

```
QueryResult result = conn.query("SELECT Id FROM Account WHERE OwnerId = '005D0000001LPFB'");
// Create a new AccountShare object
List<AccountShare> shares = new ArrayList<AccountShare>();
for (SObject rec : result.getRecords()) {
      AccountShare share = new AccountShare();
     share.setAccountId(rec.getId());
     //Set the portal user Id to share the accounts with
     share.setUserOrGroupId("003D000000QA8Tl");
     share.setAccountAccessLevel("Edit");
     share.setOpportunityAccessLevel("Read");
     share.setCaseAccessLevel("Edit");
     shares.add(share);
}
conn.create(shares.toArray(new AccountShare[shares.size()]));
```

This code shares the accounts that the user owns at the time, but not those accounts that are owned later. For these types of shares, use an owner-based sharing rule, such as AccountOwnerSharingRule.

If an account is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an account for one or more of the following RowCause values, the records in the AccountShare object are compressed into one record with the highest level of access.

- `ImplicitParent`
- `Manual`
- `Owner`

SEE ALSO:

Account
CaseShare
LeadShare
OpportunityShare

AccountTag

Associates a word or short phrase with an Account.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference

Field Name	Details
	Properties Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

AccountTag stores the relationship between its parent TagDefinition and the Account being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AccountTeamMember

Represents a User who is a member of an Account team.

See also UserAccountTeamMember, which represents a User who is on the default account team of another user.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- This object is available only for Enterprise, Unlimited, and Performance Edition users who have enabled the account team functionality.
- Customer Portal users can't access this object.

Fields

Field Name	Details
`AccountAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Level of access that the User has to the Account. The possible values are: • `Read` • `Edit` • `All` This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, the users's `AccountAccessLevel`, `ContactAccessLevel`, `OpportunityAccessLevel`, or `CaseAccessLevel` field must be set higher than the organization's default access level.
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Account to which this user is a team member. Must be a valid account ID.
`CaseAccessLevel`	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Level of access that the User has to cases associated with the account. The possible values are: • `None` • `Read` • `Edit` This field must be set to an access level that is at least equal to the organization's default case access level. In addition, the users's `AccountAccessLevel`, `ContactAccessLevel`, `OpportunityAccessLevel`, or `CaseAccessLevel` field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.
`ContactAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Level of access that the User has to contacts associated with the account. The possible values are: • `None` • `Read` • `Edit` This field must be set to an access level that is at least equal to the organization's default contact access level. In addition, the users's `AccountAccessLevel`, `ContactAccessLevel`, `OpportunityAccessLevel`, or `CaseAccessLevel` field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.
`CurrencyIsoCode`	**Type** picklist **Properties** Filter, Restricted picklist **Description** Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the org.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter

Field Name	Details
	Description Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**. Note: An AccountTeamMember record that is deleted is not moved to the Recycle Bin. A deleted AccountTeamMember record can't be undeleted unless the record was cascade-deleted when deleting a related Account. For directly deleted AccountTeamMember records, don't use the isDeleted field to detect deleted records in SOQL queries or `queryAll()` calls. Instead, use `getDeleted()`.
`OpportunityAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Level of access that the User has to opportunities associated with the account. The possible values are: • `None` • `Read` • `Edit` This field must be set to an access level that is at least equal to the organization's default opportunity access level. In addition, the users's `AccountAccessLevel`, `ContactAccessLevel`, `OpportunityAccessLevel`, or `CaseAccessLevel` field must be set higher than the organization's default access level. This field is available in API version 37.0 and later.
`PhotoURL`	**Type** URL **Properties** Filter, Nillable, Sort, Group **Description** Read only. Retrieves the users Chatter photo URL. This field is available in API version 37.0 and later.
`TeamMemberRole`	**Type** picklist **Properties** Create, Filter, Nillable, Update **Description** Role associated with this team member. One of the valid team member roles defined for your organization. Label is **Team Role**.

Field Name	Details
`Title`	**Type** string **Properties** Filter, Nillable, Sort, Group **Description** Read only. Retrieves the user's title. This field is available in API version 37.0 and later.
`UserId`	**Type** reference **Properties** Create, Filter **Description** Required. ID of the User who is a member of this account team. Must be a valid User ID.

Usage

Use this object to manage the team members of a particular Account and to specify team member roles for those users on that account.

Behavior differs when an account owner adds a team member whose access is based on group sharing. If the account owner is changed, the team member with group-based access is removed from the team, even if the **Keep account team** option is selected.

Account

AccountTerritoryAssignmentRule

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

Note: The original territory management feature is scheduled for retirement for all customers as of Summer '21. After the feature is retired, users can't access the original territory management feature and its underlying data. We encourage you to migrate to Enterprise Territory Management. We also strongly recommend that you keep a comprehensive backup of your territory data while you're still using the original territory management feature. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring ’20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

Fields

Field	Details
`BooleanFilter`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** Advanced filter conditions that were specified for the rule in the online application. For example, “(1 AND 2) OR 3.”
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Update **Description** Indicates whether the rule is active (`true`) or inactive (`false`). Via the API, active rules run automatically when new accounts are created and existing accounts are edited. The exception is when the `IsExcludedFromRealign` field on an account is `true`, which prevents account assignment rules from evaluating that account.
`IsInherited`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Update **Description** Indicates whether the rule is an inherited rule (`true`) or a local rule (`false`). An inherited rule also acts upon territories below it in the territory hierarchy. A local rule is created at the immediate territory and only impacts the immediate territory.
`Name`	**Type** string **Properties** Create, Filter, Update **Description** A name for the rule. Limit is 80 characters.

Field	Details
`TerritoryId`	**Type** reference **Properties** Create, Filter, Update **Description** ID of the territory where accounts that satisfy this rule are assigned.

Usage

A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:
AccountTerritoryAssignmentRuleItem
Territory
UserTerritory

AccountTerritoryAssignmentRuleItem

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

Note: The original territory management feature is scheduled for retirement for all customers as of Summer '21. After the feature is retired, users can't access the original territory management feature and its underlying data. We encourage you to migrate to Enterprise Territory Management. We also strongly recommend that you keep a comprehensive backup of your territory data while you're still using the original territory management feature. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

AccountTerritoryAssignmentRuleItem can be created or deleted if the `BooleanFilter` field on its corresponding AccountTerritoryAssignmentRule object is a null value.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

Fields

Field	Details
`Field`	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** The standard or custom account field to use as a criteria.
`Operation`	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** The criteria to apply, such as “equals” or “starts with.”
`RuleID`	**Type** reference **Properties** Create, Filter, Update **Description** ID of the associated AccountTerritoryAssignmentRule.
`SortOrder`	**Type** int **Properties** Create, Filter, Update **Description** The order in which this row is evaluated compared to other AccountTerritoryAssignmentRuleItem objects for the given AccountTerritoryAssignmentRule.
`Value`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The field value(s) to evaluate, such as `94105` if the `Field` is `Billing Zip/Postal Code`.

Usage

- Both standard and custom account fields can be used as criteria for account assignment rules.
- A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:

AccountTerritoryAssignmentRule

Territory

UserTerritory

AccountTerritorySharingRule

Represents the rules for sharing an Account within a Territory.

Note: The original territory management feature is scheduled for retirement for all customers as of Summer '21. After the feature is retired, users can't access the original territory management feature and its underlying data. We encourage you to migrate to Enterprise Territory Management. We also strongly recommend that you keep a comprehensive backup of your territory data while you're still using the original territory management feature. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`AccountAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of sharing being allowed. The possible values are: • `Read` • `Edit` • `All`

Field	Details
CaseAccessLevel	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target group for all child cases of the account. The possible values are: • `None` • `Read` • `Edit`
ContactAccessLevel	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** A value that represents the type of access granted to the target group for all related contacts on the account. The possible values are: • `None` • `Read` • `Edit` Note: This field is read only.
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.
DeveloperName	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With

Field	Details
	this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. This field is available in API version 24.0 and later. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the source group. Accounts owned by users in the source territory trigger the rule to give access.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
`OpportunityAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target group for all opportunities associated with the account. The possible values are: • `None` • `Read` • `Edit`
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the user or group being given access, or, if a territory ID, the users assigned to that territory.

Usage

Use this object to manage the sharing rules for a particular object. General sharing and Territory-related sharing use this object.

SEE ALSO:

- Account
- AccountShare

AccountUserTerritory2View

Represents the view of the Users in Assigned Territories related list in Lightning Experience. Available in API version 42.0 and later.

Note: This information applies to Enterprise Territory Management and not to the original territory management feature.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only standard and partner users can access this object.

Fields

Field Name	Details
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Unique identifier for the account associated with the Users in Assigned Territories related list.
`RoleInTerritory2`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The role of each user in the Users in Assigned Territories related list.
`Territory2Id`	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** Unique identifier for each territory in the Users in Assigned Territories related list.
`UserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Unique identifier for each user in the Users in Assigned Territories related list.

Usage

Use this object to show the users who are assigned to the territories assigned to an account.

A filter criterion with one `AccountId` is required when you execute a SOQL query on this object.

ActionCadence

Represents the definition of a sales cadence. This object is available in API version 45.0 and later.

Use ActionCadence and its related objects to learn about a sales cadence, including:

- The current state of the sales cadence.
- The steps that the sales cadence contains.
- Which leads, contacts, or person accounts are assigned to the sales cadence.

The ActionCadence, ActionCadenceStep, ActionCadenceRule, and ActionCadenceRuleCondition objects define a sales cadence and the steps that it contains. ActionCadenceTracker and ActionCadenceStepTracker track a prospect's movement through an active sales cadence.

By learning when the sales cadence objects are created and deleted, you can make the most of the sales cadence API.

- An ActionCadence record is created when you use the High Velocity Sales app to create a sales cadence.
- An ActionCadenceStep record is created to represent a step. If the step is a branch step, then corresponding ActionCadenceRule and ActionCadenceRuleCondition records are also created.
- An ActionCadenceTracker record is created when you assign a prospect to a sales cadence.
- An ActionCadenceStepTracker record is created each time the prospect moves to a new step.

All of these sales cadence records exist until you use the High Velocity Sales app to delete a sales cadence. If many prospects have been assigned to the sales cadence, there can be many associated ActionCadenceTracker and ActionCadenceStepTracker records. In this case, deleting the sales cadence can take some time. While the sales cadence is being deleted, the ActionCadence record is in the Deleting state.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`,

Fields

Field	Details
`ActivatedDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date that the user activated the sales cadence. ActionCadence objects are created in a draft state and must be manually activated before they are used.
`Description`	**Type** textarea **Properties** Nillable, Update **Description** The description of this sales cadence.
`ErrorMessage`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** If there was an error when activating the sales cadence, this field contains the error message.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date this object was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date this sales cadence was last viewed in the High Velocity Sales app.

Field	Details
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort, Update **Description** The name of this sales cadence. Every sales cadence in an org must have a unique name.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** The ID of the owner of the sales cadence (typically the user who created it). Note: To change the owner of a sales cadence, the new owner must have read access to sales cadences enabled in their user profile.
`State`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** This entity's state. Possible values are: • `Active` The user finished modifying the sales cadence and has activated it. At this point, you can't make any more changes to the steps in the sales cadence. • `Deleting` All records associated with this sales cadence, including the ActionCadence record and all its related records, are being deleted. While in this state, the ActionCadence cannot be attached to a prospect. • `Draft` ActionCadence objects are in the draft state when they are created. In this state, the ActionCadence cannot be assigned to any prospect. • `Error` An error occurred while trying to activate the sales cadence. • `Inactive` The user deactivated the sales cadence. New targets can’t be added to the sales cadence. Existing targets continue in the sales cadence until completion.

Usage

Use ActionCadence to learn how many sales cadences are currently active:

```
select COUNT() from ActionCadence where State="Active"
```

Retrieve all ActionCadence records that have "West Coast" in their name:

```
SELECT ActionCadenceId FROM ActionCadence WHERE NAME LIKE '[West Coast Cadence]%'
```

Retrieve all ActionCadence records owned by a specific user:

```
SELECT ActionCadenceId  FROM ActionCadence WHERE OwnerId = '<owner id>'
```

SEE ALSO:

ActionCadenceRule

ActionCadenceRuleCondition

ActionCadenceStep

ActionCadenceStepTracker

ActionCadenceRule

Represents the logic that a branch step uses to make decisions in your sales cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`ActionCadenceStepId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ActionCadenceStep that this rule is associated with.
`ConditionLogic`	**Type** string **Properties** Filter, Group, Sort **Description** The logical operator used to evaluate the rule conditions. Possible values are:

Field	Details
	• `AND` If this rule has several conditions, all of them must be `true` for this step to be `true`.
`GlobalEventType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** If the action cadence rule contains a global exit condition, this field contains the type of event that the rule represents. Possible values are: • `EmailReply` • `EmailHardBounce` • `EmailSoftBounce` • `CallMeaningfulConnect` • `CallNotInterested` • `CallUnqualified` • `CallLeftVoicemail` • `CallCallBackLater` This field is available in API version 49.0 and later.
`OutcomeNextStepName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The next step in the sales cadence if this rule evaluates as `true`. If this rule evaluates as `false`, the next step is `ActionCadenceStep.BranchDefaultStepName`.
`ParentRuleName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The value of the `RuleName` field of the previous rule in the sales cadence. Must contain a valid rule name value unless this rule is the root rule. `null` if this rule is a root rule. This field is available in API version 49.0 and later.

Field	Details
`RuleName`	**Type** string **Properties** Filter, Group, Sort **Description** The name given to the rule. Every rule in a sales cadence must have a unique name.
`RuleType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of step that this rule applies to. Possible values are: • `BranchStep` — The rule evaluates the condition of a branch step. A branch step is an ActionCadenceStep record with the field `type` equal to `Branch`. • `RootStep`— The rule evaluates a global exit condition. This field is available in API version 49.0 and later.

Usage

Use ActionCadenceRule to see all the rules associated with a branch step:

```
select RuleName from ActionCadenceRule  where ActionCadenceStep.ActionCadence.Name = "High
 Priority CFO"
```

SEE ALSO:
ActionCadence
ActionCadenceRuleCondition
ActionCadenceStep
ActionCadenceStepTracker

ActionCadenceRuleCondition

Represents the logic for a branch step. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`ActionCadenceRuleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the ActionCadenceRule that this condition is associated with.
`Operator`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The conditional operator for this rule. Possible values are: • `Equal`
`Resource`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The field to evaluate. Possible values are: • `CallDispositionCategory` Use by branch steps. • `EmailEngagement` Used by ListenerBranch steps.
`RuleConditionName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of the rule condition. Every rule condition in a sales cadence must have a unique name.
`Value`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The event that your sales cadence rule condition listens for to decide when the event is complete. Possible values for emails are: • `EmailOpen` • `EmailLinkClick` Possible values for calls are: • `CallMeaningfulConnect` • `CallUnqualified` • `CallLeftVoicemail` • `CallNotInterested` • `CallCallBackLater`

Usage

Use ActionCadenceRuleContion to see all the rule conditions associated with a branch step:

```
select RuleConditionName from ActionCadenceRuleCondition where ActionCadenceStepId= <ID
of a branch step>
```

SEE ALSO:

ActionCadence

ActionCadenceRule

ActionCadenceStep

ActionCadenceStepTracker

ActionCadenceStep

Represents a step in a sales cadence. Use ActionCadenceStep to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

An ActionCadenceStep record is created to represent a step. If the step is a branch step, then corresponding ActionCadenceRule and ActionCadenceRuleCondition records are also created.

Note: An ActionCadenceStep with `IsOrphan` equal to `true` can be part of a sales cadence but is never executed. To retrieve the steps that can be executed by the sales cadence, query for ActionCadenceStep records with `IsOrphan` equal to `false`. ActionCadenceStep records with `IsOrphan` equal to `true` will be deleted.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`ActionCadenceId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the ActionCadence that this step belongs to.
`AllCallsCallBackLater`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls having the call outcome **Call Back Later**.
`AllCallsLeftVoicemail`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls having the call outcome **Left Voicemail**.
`AllCallsMeaningfulConnect`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls having the call outcome **Meaningful Connect**.
`AllCallsNotInterested`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls having the call outcome **Not Interested**.
`AllCallsUncategorized`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The number of calls where the call outcome is not categorized.
`AllCallsUnqualified`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls having the call outcome **Unqualified**.
`AllEmailsBouncedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that were not delivered successfully.
`AllEmailsDeliveredCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails delivered.
`AllEmailsHardBouncedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails returned for a permanent reason — for example, the email address does not exist. This field is available in API version 50.0 and later.
`AllEmailsLinkClickedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of links inside an email that the sales rep clicked during this step. Multiple clicks on the same link count towards this total. This field is available in API version 50.0 and later.
`AllEmailsOpenedCount`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of emails that the sales rep opened while working on this step. Multiple opens of the same email count towards this total.
AllEmailsOutOfOfficeCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that were returned because the recipient set an out-of-office responder. Multiple replies count towards this total. This field is available in API version 50.0 and later.
AllEmailsRepliedCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that the sales reps replied to as part of this step. Multiple replies to the same email count towards this total, This field is available in API version 50.0 and later.
AllEmailsSentCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of sent emails.
AllEmailsSoftBouncedCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that were returned for temporary reasons — for example, the email is too large. This field is available in API version 50.0 and later.
AllManuallyCompletedCount	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The number of steps manually completed.
AllOnTimeCompletedCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of steps completed on time.
AllOverdueCompletedCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of overdue steps that were completed.
AllSkippedCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of steps skipped.
AllTotalCallsCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of calls that the sales rep made during this step.
BranchDefaultStepName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the default step.
ChainedCadenceId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the ActionCadence for the linked sales cadence. Available only if the step type is `DaisyChain` (meaning that another sales cadence is connected to this sales cadence).
`IsImmediateWakeUp`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description**
`IsOrphan`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If `true`, this step is not executed by the sales cadence and will be deleted. Steps with `IsOrphan` equal to `true` have `ParentStepName` equal to `null`. Note: To retrieve the active steps in a sales cadence, include `IsOrphan=false` in your query. The default value is false. This field is available in API version 49.0 and later.
`IsThreaded`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** This field is valid for email steps. Email steps have ActionCadence.StepType equal to `SendAnEmail`. If `true`, the email for this email step is sent as a reply to the email conversation from the previous email step. By sending the email as a reply to a previous email, customers see a "conversation" view of the emails. Only emails from the same sales cadence are grouped as conversations. This field cannot be true for the first email step in a sales cadence, because the first email from a sales cadence must start a new conversation with the prospect. The default value is false. This field is available in API version 49.0 and later.
`ParentStepName`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The step name (`ActionCadenceStep.StepName`) of the previous step in the sales cadence. Must contain a valid step name value unless this step is the root step. `null` if this step is a parent step.
`RootStepId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the root step for this sales cadence. Every sales cadence has exactly one root step (so that the Salesforce api can find all the steps for this cadence).
`StepComments`	**Type** textarea **Properties** Nillable **Description** A comment that provides additional information about this step.
`StepName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Unique identifier for this step. Generated by Salesforce.
`StepTitle`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The title given to the step when it was created.
`TemplateId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If a template was added to this step, this field contains the template's ID. For example, if this step is a call step it can contain a template for a call script. Or, if this step is an email step, it can contain a template for an email.

Field	Details
Type	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of step. Possible values are: • AutoSendAnEmail — Salesforce automatically sends the specified email. • Branch — A branch step in the sales cadence. • CreateTask — Used for custom steps. • DaisyChain — A daisy chain step. A daisy chain step connects this sales cadence to another sales cadence. It must be the last step in the path. • ListenerBranch — A branch step for emails. • MakeACall — The sales rep must call the prospect at this step. • Root — This step is the root step for the sales cadence. • SendAnEmail — The sales rep must send the prospect an email at this step. • Wait — A wait step tells the sales rep not to do anything at this point in the sales cadence.
UniqueEmailsLinkClickedCount	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The number of links inside an email that the sales rep clicks during this step. Multiple clicks on the same link are not counted. This field is available in API version 50.0 and later.
UniqueEmailsOpenedCount	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that the sales rep opens as part of this step. Multiple openings of the same email are not counted. This field is available in API version 50.0 and later.
UniqueEmailsRepliedCount	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The number of emails that the sales rep replies to as part of this step. Multiple replies to the same email are not counted. This field is available in API version 50.0 and later.

Field	Details
`WaitTimeInSeconds`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Required if the step type is `Wait`. The time in seconds for this step to wait.

Usage

Use ActionCadenceStep to see what steps your sales cadence has:

```
select StepTitle from ActionCadenceStep where ActionCadence.ID= <the id of an action
cadence> and IsOrphan=false
```

SEE ALSO:

ActionCadence

ActionCadenceRule

ActionCadenceRuleCondition

ActionCadenceStepTracker

ActionCadenceStepTracker

Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

An ActionCadenceStepTracker record is created when a target moves to a new step in a sales cadence. Use ActionCadenceStepTracker to find information such as the step's current state, the reason it completed, and its type.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`ActionCadenceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the ActionCadence that is related to the ActionCadenceStep.

Field	Details
ActionCadenceName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the related ActionCadence object.
ActionCadenceStepId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ActionCadenceStepTracker is the runtime version of an ActionCadenceStep. This field contains the ID of the related ActionCadenceStep.
ActionCadenceTrackerId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the related ActionCadenceTracker.
ActionTakenDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that the action described in this step was taken.
CompletedById	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The user ID of the sales rep who completed this step. A step can be assigned to several users before it’s completed. This field is available in API version 50.0 and later.
CompletionDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date this step completed. A step is completed either when the action is taken, or the step is skipped.
`CompletionReason`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The reason that this step completed: Possible values are: • `AutomaticallyCompleted` — the sales rep successfully completed this step and moved to the next one. Salesforce automatically marks this step as completed. • `AutomaticallyExited` — the step exited because a global exit condition occurred. This value is available in API version 49.0 and later. • `ManuallyCompleted` — the sales rep manually marked this step as completed. • `ManuallySkipped` — the sales rep skipped this step.
`DueDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Some steps have a due date to indicate when they must be completed. If this step has been assigned a due date, this field contains the date and time it is due.
`IsActionTaken`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** `true` if the sales rep completed an action during this step, such as making a phone call, otherwise `false`.
`SecondsOverdue`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** If this step has a due date that has passed, this field contains the number of seconds that has elapsed since the due date.

Field	Details
`State`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The current state of this step. Possible values are: Possible values are: • `Active` — the current step that the sales rep is performing. There can only be one active step for a given target. • `Cancelled` — the sales rep canceled the step. Salesforce doesn't run any canceled steps. • `Completed` — this step is finished. Either the work in the step completed, or the step was skipped. • `Error` — an error occurred while executing this step. • `InProgress` — the sales rep has started the step, but it isn't yet completed. • `Paused` — the sales rep paused the step. • `Scheduled` — used for email steps. An email can be scheduled to be sent later. • `Queued` — used for automated email steps. The email step has started but the email is waiting in the queue to be sent.
`StepTitle`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the related step.
`StepType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of step to execute. Possible values are: • `AutoSendAnEmail` • `Branch` • `CreateTask` • `DaisyChain` • `ListenerBranch` • `MakeACall` • `Root`

Field	Details
	• `SendAnEmail` • `Wait`
`TargetId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the prospect that is assigned to this sales cadence.
`WasEverPaused`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the sales rep had ever paused this step `(true)`, or not `(false)`. This field is available in API version 50.0 and later.

Usage

List all the steps that this prospect has completed in a given sales cadence:

```
select StepTitle from ActionCadenceStepTracker where TargetID = <target ID> and
ActionCadenceId=<action cadence id> and StepType="Completed"
```

SEE ALSO:

ActionCadence

ActionCadenceRule

ActionCadenceStep

ActionCadenceRuleCondition

ActionCadenceTracker

Represents an active sales cadence target. This object is available in API version 45.0 and later.

An ActionCadenceTracker record is created when you add a target to a sales cadence. Use ActionCadenceTracker to learn about a running sales cadence target, including its state, current step, assigned prospect, and reason for completion.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
ActionCadenceId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the related ActionCadence.
CompletionDisposition	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The target's disposition when it exited the sales cadence. This field contains a value if the target's state is `Completed`. Sales reps can set this value when removing a target from a sales cadence. This field is available in API version 51.0 and later. Possible values are: • `Bad Data` — some of the target's data is incorrect or invalid. • `Contact Later` — the target asked to be contacted at a later date. • `Customer Connected` — the sales rep contacted the target. • `Customer Engaged` — the target engaged with an email. • `Disqualified`— a sales rep determined that the target is not qualified. • `Duplicate` — the target has a duplicate lead, contact, or person account record. • `No Response` — the target did not reply to any outreach. • `Not Interested` — the target stated a lack of interest. • `Success` — the sales cadence outreach was successful.
CompletionReason	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The reason that the target completed the sales cadence. This field contains a value if the target's state is `Completed`. Possible values are: • `AutomaticallyExited` — the target completed because a global exit condition occurred. This value is available in API version 49.0 and later. • `DaisyChained` — the target completed because it's connected to another sales cadence. • `LeadConverted` — the target completed because the lead converted. • `ManuallyRemoved` — the target completed because the sales rep removed it from the sales cadence.

Field	Details
	• `ManuallyRemovedNoAccess`— reserved for future use. • `NoMoreSteps` — the target completed the sales cadence because all the sales cadence steps were completed.
`CurrentStepId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the current ActionCadenceStepTracker.
`ErrorMessage`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** If an error occurs while this target is being completed, this field contains the error message.
`ExitGlobalRuleId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If a global exit condition occurs, a target completes. One example of a global exit condition is an email returned because of an invalid address. If the target completed because a global exit condition occurred, this field contains the ID of the ActionCadenceRule record that evaluated as `true`. This field is available in API version 49 and later.
`IsTrackerActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the action cadence target is active `(true)` or not `(false)`. An action cadence target is active if the state is `Running`, `Paused`, `Processing`, or `Initializing`. Only active targets count against the org limit of 150,000 trackers. This field is available in API version 50 and later.
`LastCompletedStepId`	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The ID of the last completed ActionCadenceStepTracker.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user who is assigned to complete the sales cadence steps for the target.
`State`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The state of the current step. Possible values are: • `Complete` • `Error` • `Initializing` • `Paused` • `Processing`—Salesforce is working on changing the state of this step. We recommend that you filter out steps that have this state from your dashboards. • `Running`
`TargetId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the target that is assigned to this sales cadence.

Usage

Use ActionCadenceTracker to see what targets are currently assigned to an active sales cadence.

```
select TargetId from ActionCadenceTracker where ActionCadenceId=<Id of the sales cadence>
 and State= "Running"
```

ActionLinkGroupTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the "Customize Application" permission can modify or delete this object.

Fields

Field Name	Details
`Category`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The location of the action link group within the feed element. Values are: • `Primary`—The action link group is displayed in the body of the feed element. • `Overflow`—The action link group is displayed in the overflow menu of the feed element.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of the action link group template to use in code.
`ExecutionsAllowed`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The number of times an action link can be executed. Values are:

Field Name	Details
	• `Once`—An action link can be executed only once across all users. • `OncePerUser`—An action link can be executed only once for each user. • `Unlimited`—An action link can be executed an unlimited number of times by each user. If the action link's `actionType` is `Api` or `ApiAsync`, you can't use this value.
`HoursUntilExpiration`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of hours from when the action link group is created until it's removed from associated feed elements and can no longer be executed. The maximum value is 8,760.
`IsPublished`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, the action link group template is published. Action link group templates shouldn't be published until at least one ActionLinkTemplate is associated with it. Once set to `true`, this can't be set back to `false`.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the `MasterLabel`.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of the action link group template.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Define action link templates in Setup and use `ConnectApi` in Apex or Connect REST API to instantiate action links from the templates and to post feed elements with the action links.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with the "Customize Application" permission can modify or delete this object.

Fields

Field Name	Details
`ActionLinkGroupTemplateId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the ActionLinkGroupTemplate with which this action link template is associated.
`ActionUrl`	**Type** textarea **Properties** Create, Update **Description** The action link URL. For example, a `Ui` action link URL is a Web page. A `Download` action link URL is a link to the file to download. `Ui` and `Download` action link URLs are provided to clients. An `Api` or `ApiAsync` action link URL is a REST resource. `Api` and `ApiAsync` action link URLs aren't provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with `https://`. Links to resources hosted on Salesforce servers can be relative, starting with a `/`. All other links must be absolute and start with `https://`. This field can contain context variables and binding variables in the form `{!Bindings.`***`key`***`}`, for example, `https://www.example.com/{!Bindings.itemId}`. Set the binding variable's value when you instantiate the action link group from the template.
`Headers`	**Type** textarea **Properties** Create, Nillable, Update **Description** Template for the HTTP headers sent when corresponding action links are invoked. This field can be used only for `Api` and `ApiAsync` action links. This field can contain context variables and binding variables in the form `{!Bindings.`***`key`***`}`.
`IsConfirmationRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field Name	Details
	Description If `true`, a confirmation dialog appears before the action is executed.
`IsGroupDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, action links derived from this template are the default or primary action in their action groups. There can be only one default action per action group.
`Label`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A custom label to display on the action link button. If none of the `LabelKey` values make sense for an action link, use a custom label. Set the `LabelKey` field to `None` and enter a label name in the `Label` field. Action links have four states: new, pending, success, and failed. These strings are appended to the label for each state: • *Label* • *Label* Pending • *Label* Success • *Label* Failed For example, if the value of `Label` is “Call Home,” the values of the four action link states are: Call Home, Call Home Pending, Call Home Success, and Call Home Failed. If `LabelKey` has any value other than `None`, the `Label` field is empty.
`LabelKey`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Key for the set of labels to display for these action link states: new, pending, success, failed. For example, the Approve set contains these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Links Labels in the *Connect REST API Developer Guide* or the *Apex Developer Guide*. If none of the label key values make sense for an action link, set this field to `None` and enter a custom label name in the `Label` field.

Field Name	Details
`LinkType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of action link. One of these values: • `Api`—The action link calls a synchronous API at the action URL. Salesforce sets the status to `SuccessfulStatus` or `FailedStatus` based on the HTTP status code returned by your server. • `ApiAsync`—The action link calls an asynchronous API at the action URL. The action remains in a `PendingStatus` state until a third party makes a request to `/connect/action-links/`***`actionLinkId`*** to set the status to `SuccessfulStatus` or `FailedStatus` when the asynchronous operation is complete. • `Download`—The action link downloads a file from the action URL. • `Ui`—The action link takes the user to a web page at the action URL.
`Method`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** HTTP method for the action URL. One of these values: • `HttpDelete`—Returns HTTP 204 on success. Response body or output class is empty. • `HttpGet`—Returns HTTP 200 on success. • `HttpHead`—Returns HTTP 200 on success. Response body or output class is empty. • `HttpPatch`—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty. • `HttpPost`—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success. • `HttpPut`—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty. `Ui` and `Download` action links must use `HttpGet`.
`Position`	**Type** int **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description An integer specifying the position of the action link template relative to other action links in the group. 0 is the first position.
`RequestBody`	**Type** textarea **Properties** Create, Nillable, Update **Description** Template for the HTTP request body sent when corresponding action links are invoked. This field can be used only for `Api` and `ApiAsync` action links. This field can contain context variables and binding variables in the form `{!Bindings.`***`key`***`}`.
`UserAlias`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** If you selected `CustomUser` or `CustomExcludedUser` for `UserVisibility`, this field is the alias for the custom user. Use the alias in a template binding to specify the custom user when an action link group is created using the template.
`UserVisibility`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Who can see the action link. This value is set per action link, not per action link group. One of these values: • `Creator`—Only the creator of the action link can see the action link. • `Everyone`—Everyone can see the action link. • `EveryoneButCreator`—Everyone but the creator of the action link can see the action link. • `Manager`—Only the manager of the creator of the action link can see the action link. • `CustomUser`—Only the custom user can see the action link. • `CustomExcludedUser`—Everyone but the custom user can see the action link.

Usage

Create action link templates in Setup. Use Apex classes in the `ConnectApi` namespace or Connect REST API to instantiate action links from templates and to post feed elements with the action links.

For information about action links, see “Working with Action Links” in the *Apex Developer Guide* or the *Connect REST API Developer Guide*.

ActionPlan

Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ActionPlanState`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The status of work being done for the action plan.. Possible values are: • `Not Started` • `In Progress` • `Canceled` • `Complete`
`ActionPlanTemplateVersionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the version of the action plan template used to create this action plan. At creation, the referenced action plan template must be in the published state.
`ActionPlanType`	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Restricted picklist, Sort **Description** The action plan's type. Possible values are: • `Industries` • `Visit Execution`
`IsUsingHolidayHours`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates that task completion dates have been calculated by incrementing the task offset for each non-work day, excluding recurring holidays.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Name of the action plan.
`OwnerId`	**Type** reference

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns this record.
StartDate	**Type** date **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** The start date of this action plan.
TargetId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the parent object record that relates to this action plan. For API version 48 and later, supported parent objects are Account, AssetsAndLiabilities, BusinessMilestone, Campaign, Card, Case, Claim, Contact, Contract, Financial Account, Financial Goal, Financial Holding, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, ResidentialLoanApplication, and Visit as well as custom objects with activities enabled. For API version 47 and later, supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit as well as custom objects with activities enabled. For API version 46 and later, supported parent objects are Account, Campaign, Case, Contact, Contract, Lead, and Opportunity as well as custom objects with activities enabled. For API version 45 and earlier: the only supported parent object is Account.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ActionPlanOwnerSharingRule
Sharing rules are available for the object.

ActionPlanShare
Sharing is available for the object.

ActionPlanItem

Represents the instance of an action plan item. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ActionPlanId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the action plan that this item belongs to.
`ActionPlanTemplateItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the action plan template item this item was created from.
`DisplayOrder`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** Order in which tasks are displayed.
`IsRequired`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this action plan item is required.
`ItemId`	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The ID of the task created by this action plan item.
`ItemState`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The action plan item’s work state. Possible values are: • `Pending` • `In Progress` • `Completed` • `Canceled` • `Deleted`
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Name of this action plan item.

ActionPlanTemplate

Represents the instance of an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ActionPlanType`	**Type** picklist

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The action plan template's type. Possible values are: • Industries • Visit Execution
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of this action plan template.
`IsAdHocItemCreationEnabled`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether users can add tasks or other items to generated action plans.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description The name of this action plan template.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns this action plan template.
`TargetEntityType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The parent object this action plan template relates to. For API Version 48 and higher, possible values are: • `Account` • `Business Milestone` • `Campaign` • `Case` • `Claim` • `Contact` • `Contract` • `Assets and Liabilities` • `Card` • `Financial Account` • `Financial Goal` • `Financial Holding` • `Insurance Policy` • `Insurance Policy Coverage` • `Lead` • `Opportunity` • `Person Life Event` • `Residential Loan Application` • `Visit` For API version 47 and later, supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy,

Field Name	Details
	InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit as well as custom objects with activities enabled. For API version 46 and later, supported parent objects are Account, Campaign, Case, Contact, Contract, Lead, and Opportunity as well as custom objects with activities enabled. For API version 45 and earlier: the only supported parent object is Account.
`UniqueName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name for this action plan template. This field is unique within your organization.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ActionPlanTemplateOwnerSharingRule
Sharing rules are available for the object.

ActionPlanTemplateShare
Sharing is available for the object.

ActionPlanTemplateItem

Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ActionPlanTemplateVersionId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field Name	Details
	Description The version of the action plan template this item is for.
`DisplayOrder`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The order in which this item is displayed within the action plan template version.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the task created from this template item is active.
`IsRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the task created from this template item is required.
`ItemEntityType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of action plan template item entity. Always set to Task. Possible values are: • Assessment Task • RecordAction • Signature Task • Task
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field Name	Details
	Description The most recent date on which a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique identifier for this action plan template item record.
UniqueName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name for this action plan template item. This field is unique within your organization.

ActionPlanTemplateItemValue

Represents the value associated with an action plan template item. This object is used by more than one cloud in Industries.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Fields

Field Name	Details
ActionPlanTemplateItemId	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Sort **Description** The ID of the action plan template item that this value relates to.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the task created from this template item is active.
ItemEntityFieldName	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The name of the field on the action plan template item that this value is for. Available fields include: • AssessmentTask.AssessmentTaskDefinitionId • AssessmentTask.Description • AssessmentTask.EndTime • AssessmentTask.IsRequired • AssessmentTask.Name • AssessmentTask.OwnerId • AssessmentTask.ParentId (Visit ID) • AssessmentTask.SequenceNumber • AssessmentTask.StartTime • AssessmentTask.Status • AssessmentTask.TaskDefinitionId • AssessmentTask.TaskType • DocumentChecklistItem.DocumentTypeId • DocumentChecklistItem.Instruction • DocumentChecklistItem.IsAccepted • DocumentChecklistItem.IsFrozen • DocumentChecklistItem.IsRequired • DocumentChecklistItem.Name • DocumentChecklistItem.OwnerId • DocumentChecklistItem.ParentRecordId

Field Name	Details
	• `DocumentChecklistItem.Status` • `DocumentChecklistItem.WhoId` • `RecordAction.ActionDefinition` • `RecordAction.ActionType` • `RecordAction.FlowDefinition` (Interaction Definition ID) • `RecordAction.FlowInterviewId` • `RecordAction.IsMandatory` • `RecordAction.IsUiRemoveHidden` (Hide Remove Action in UI) • `RecordAction.Order` • `RecordAction.Pinned` • `RecordAction.RecordId`(Parent Record ID) • `RecordAction.Status` • `Task.ActivityDate` (Due Date Only) • `Task.CallDisposition` • `Task.CallDurationInSeconds` • `Task.CallObject` • `Task.CallType` • `Task.Description` • `Task.IsRecurrence` • `Task.IsReminderSet` • `Task.OwnerId` (Assigned To ID) • `Task.Priority` • `Task.RecurrenceDayOfMonth` • `Task.RecurrenceDayOfWeekMask` • `Task.RecurrenceEndDateOnly` • `Task.RecurrenceInstance` • `Task.RecurrenceInterval` • `Task.RecurrenceMonthOfYear` • `Task.RecurrenceRegeneratedType` • `Task.RecurrenceStartDateOnly` • `Task.RecurrenceTimeZoneSidKey` • `Task.RecurrenceType` • `Task.ReminderDateTime` • `Task.Status` • `Task.Subject` • `Task.TaskSubtype` • `Task.WhatId` (Related To ID) • `Task.WhoId`

Field Name	Details
`ItemEntityType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of action plan template item. Possible values are: • `Assessment Task` • `Document Checklist Item` • `RecordAction` • `SignatureTask` • `Task`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique identifier for this record.
`ValueFormula`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description A formula used to calculate the value for this action plan template item.
`ValueLiteral`	**Type** textarea **Properties** Create, Nillable, Update **Description** The value for this action plan template item.

ActionPlanTemplateVersion

Represents the version of an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ActionPlanTemplateId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the action plan template this version represents.
`ActivationDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time at which this version became active.
`InactivationDateTime`	**Type** dateTime

Field Name	Details
	Properties Create, Filter, Nillable, Sort **Description** The date and time at which this version became inactive.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of this version item.
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The action plan template version’s state Default values are: Draft, Obsolete, and Published.
Version	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** The index number of this action plan template version.

ActiveScratchOrg

Represents an active scratch org. This object is available in API version 41.0 and later.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Fields

Field Name	Details
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A description of this scratch org.
`Edition`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The org edition of this scratch org. Possible values are `Group`, `Developer`, `Enterprise`, and `Professional`. This field is read-only.
`ExpirationDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Date when the scratch org expires. This field is read-only.
`Features`	**Type** textarea **Properties** Nillable **Description** The features enabled in this scratch org, such as `MultiCurrency`. See the *Salesforce DX Developer Guide* for the full list of valid features. This field is read-only.

Field Name	Details
HasSampleData	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Specifies whether the scratch org contains sample data. If set to `true`, the sample data is similar to the data in a Salesforce free trial org.
LastLoginDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date of the last user login to the scratch org. This field is read-only.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date this scratch org was last referenced. This field is read-only.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date this scratch org was last viewed. This field is read-only.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, Sort **Description** The auto-generated ID of this scratch org. This field is read-only.
Namespace	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The namespace associated with this scratch org. This field is read-only.
`OrgName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the scratch org. This field is read-only.
`OwnerId`	**Type** reference **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns this scratch org. This field is read-only.
`ScratchOrg`	**Type** string **Properties** Filter, Group, Sort **Description** The org ID of the scratch org. This field is read-only.
`ScratchOrgInfoId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The id of the associated `ScratchOrgInfo` object. This field is read-only.
`SignupEmail`	**Type** email **Properties** Filter, Group, Nillable, Sort **Description** The email address of the Administration user. This field is read-only.
`SignupInstance`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The Salesforce instance on which this scratch org resides. This field is read-only.
`SignupTrialDays`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of days between the scratch org's creation and expiration. This field is read-only.
`SignupUsername`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The username of the Administration user of the scratch org. This field is read-only.
`Template`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The template used to create this scratch org. This field is read-only.

Usage

Salesforce automatically creates an instance of this object after a `ScratchOrgInfo` record moves to the Active state. The new `ActiveScratchOrg` gets many of its field values from the `ScratchOrgInfo` object with which it is associated.

When you delete an `ActiveScratchOrg` record, its associated scratch org is deleted and its associated `ScratchOrgInfo` record is moved to the Deleted state.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ActiveScratchOrgFeed
Feed tracking is available for the object.

ActiveScratchOrgHistory
History is available for tracked fields of the object.

ActiveScratchOrgOwnerSharingRule
Sharing rules are available for the object.

ActiveScratchOrgShare

Sharing is available for the object.

SEE ALSO:

ScratchOrgInfo

NamespaceRegistry

Salesforce DX Developer Guide

ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

Supported Calls

`describeSObjects()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the related account, which is determined as follows: • The account associated with the `WhatId`, if it exists; or • The account associated with the `WhoId`, if it exists; otherwise • `null` For information on IDs, see ID Field Type.
`ActivityDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Indicates one of the following: • The due date of a task • The due date of an event if `IsAllDayEvent` is set to `true`

Field	Details
	This field has a time stamp that is always set to midnight in the Universal Time Coordinated (UTC) time zone. The time stamp doesn't represent the time of the activity; don't attempt to alter it to accommodate time zone differences. Label is `Date`.
`ActivityDateTime`	**Type** dateTime **Properties** Aggregate, Filter, Nillable, Sort **Description** Contains the event's due date if the `IsAllDayEvent` flag is set to `false`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is **Due Date Time**. The value for this field and `StartDateTime` must match, or one of them must be `null`.
`ActivitySubtype`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Provides standard subtypes to facilitate creating and searching for specific activity subtypes. This field isn't updateable. `ActivitySubtype` values: • Task • Email • Call • Event • List Email
`ActivityType`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** Represents one of the following values: `Call`, `Email`, `Meeting`, or `Other`. Label is `Type`. These are default values, and can be changed. `ActivityType` is the union of `TaskType` and `EventType`. If the same activity appears in both dynamic picklists, duplicate activities appear. `TaskType` and `EventType` can each have a `Call` type. Internally, they are distinct from each other.

Field	Details
AlternateDetailId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of a record the activity is related to which contains more details about the activity. For example, an activity can be related to an EmailMessage record.
CallDisposition	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Represents the result of a given call, for example, “we'll call back,” or “call unsuccessful.” Limit is 255 characters.
CallDurationInSeconds	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Duration of the call in seconds.
CallObject	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of a call center. Limit is 255 characters.
CallType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of call being answered: Inbound, Internal, or Outbound.
ConnectionReceivedId	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Indicates the ID of the PartnerNetworkConnection that shared this record with your organization. This field is available only if your organization has enabled Salesforce to Salesforce and only in API versions 28.0 and later.
`ConnectionSentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the PartnerNetworkConnection that your organization shared this record with. This field is available only if your organization has enabled Salesforce to Salesforce, and only in API versions 28.0 and later. The value is always `null`. You can use the PartnerNetworkRecordConnection object to forward records to connections.
`Description`	**Type** textarea **Properties** Nillable **Description** Contains a description of the event or task. Limit is 32 KB.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as “North America,” “Healthcare,” or “Consulting.” Available only if the organization has the Division permission enabled.
`DurationInMinutes`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Indicates the duration of the event or task.

Field	Details
EndDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates the end date and time of the event or task. Available in versions 27.0 and later. This field is optional, depending on the following: • If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day. • If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time.
IsAllDayEvent	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the value of this field is set to `true`, then the activity is an event spanning a full day, and the `ActivityDate` defines the date of the event. If the value of this field is set to `false`, then the activity may be an event spanning less than a full day, or it may be a task. Label is `All-Day Event`.
IsClosed	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a task is closed; value is always `true`. This field is set indirectly by setting the `Status` field on the task—each picklist value has a corresponding `IsClosed` value. Label is `Closed`.
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the activity has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.

Field	Details
IsHighPriority	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates a high-priority task. This field is derived from the `Priority` field.
IsOnlineMeeting	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the activity represents an online meeting (`true`) or not (`false`). Note: This field is not available in API version 16.0 or later.
IsReminderSet	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a reminder is set for an activity (`true`) or not (`false`).
IsTask	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the value of this field is set to `true`, then the activity is a task. If the value is set to `false`, then the activity is an event. Label is `Task`.
IsVisibleInSelfService	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the value of this field is set to `true`, then the activity can be viewed in the self-service portal. Label is `Visible in Self-Service`.
Location	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** If the activity is an event, then this field contains the location of the event. If the activity is a task, then the value is `null`.
`OwnerId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the user or group who owns the activity.
`PrimaryAccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Contains the `AccountId` value from the activity record. Available in API versions 30.0 and later to organizations that use Shared Activities.
`PrimaryWhoId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Contains the `WhoId` value from the activity record. Available in API versions 30.0 and later to organizations that have enabled Shared Activities.
`Priority`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Indicates the priority of a task, such as high, normal, or low.
`ReminderDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description Represents the time when the reminder is scheduled to fire, if `IsReminderSet` is set to `true`. If `IsReminderSet` is set to `false`, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.
`StartDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates the start date and time of the event. Available in versions 29.0 and later. If the event's `IsAllDayEvent` flag is set to true (indicating an all-day event), then the time stamp in `StartDateTime` is always set to midnight in the Coordinated Universal Time (UTC) time zone. Note: Don't attempt to alter the time stamp to account for any time zone differences. If the event's `IsAllDayEvent` flag is set to false, then you must translate the time portion of the time stamp in `StartDateTime` to or from a local time zone for the user or the application, as appropriate. The translation must be in the Coordinated Universal Time (UTC) time zone. If this field has a value, then `ActivityDate` and `ActivityDateTime` either must be null or must match the value of this field. If the activity is a task, `StartDateTime` is null
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Indicates the current status of a task, such as in progress or complete. Each predefined status field sets a value for `IsClosed`. To obtain picklist values, query TaskStatus.
`Subject`	**Type** combobox **Properties** Filter, Nillable, Sort **Description** Contains the subject of the task or event.

Field	Details
`WhatId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The `WhatId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. `WhatId`s are polymorphic. Polymorphic means a `WhatId` is equivalent to the ID of a related object. The label is `Related To ID`.
`WhoId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is `Name ID`. If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is `Name ID`. If your organization uses Shared Activities, when you query activities in API version 30.0 or later, the returned value of the `WhoId` field matches the value in the queried object, not necessarily in the activity record itself. If Shared Activities is enabled, the value of this field is not populated and the field `PrimaryWhoId` should be queried instead.

Usage

Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity history; for example:

```
SELECT
   (SELECT ActivityDate, Description
    FROM ActivityHistories)
FROM Account
WHERE Name Like 'XYZ%'
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following constraints on users who don't have the "View All Data" permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with "A." Instead, you must reference a single account record.

```
SELECT
   (SELECT ActivityDate, Description
    FROM ActivityHistories
    ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC
    LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can't use `WHERE`.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- In the inner clause of the query, you must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

SEE ALSO:

Task

ActivityMetric

Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

This object is available in API version 45.0.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Unless otherwise noted, Einstein Activity Capture and Activity Metrics must be enabled.

Fields

Field	Details
`BaseId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, idLookup, Sort **Description** The ID of the record that the activities apply to.

Field	Details
BaseType	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The entity that corresponds to the BaseId
FirstCallDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date when the first call was made. This field is available only to High Velocity Sales users. Einstein Activity Capture and Activity Metrics aren't required.
FirstEmailDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date when the first email was sent. This field is available only to High Velocity Sales users. Einstein Activity Capture and Activity Metrics aren't required.
InactiveDays	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Indicates the number of days since the most recent activity was completed. This field is derived from the Last Activity Date field.
LastActivityDateLastModDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the LastActivityDateTime field was last modified.
LastActivityDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description Indicates the date when the most recent activity was completed.
LastCallDateLastModDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the LastCallDateTime field was last modified.
LastCallDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date when the most recent call was made through Sales Dialer or Inbox.
LastEmailDateLastModDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the LastEmailDateTime field was last modified.
LastEmailDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date when the most recent email was sent or received.
LastEventDateLastModDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the LastEventDateTime field was last modified.
LastEventDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description Indicates the date when the most recent event was completed.
`LastTaskDateLastModDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the LastTaskDateTime field was last modified.
`LastTaskDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date when the last task was completed.
`NextActivityDateLastModDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the NextActivityDateTime field was last modified.
`NextActivityDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date of the next scheduled task or event. Only open tasks in the future are included.

Usage

Use this object to see data about sales activities that were added to Salesforce manually and by Einstein Activity Capture. Activity Metric fields are derived from your activity data. For example, the Inactive Days field indicates the number of days since the most recent activity was completed. Create a trigger that notifies a user when there isn't any activity on an account for a certain amount of time.

AdditionalNumber

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`CallCenterId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** System field that contains the ID of the user who created the call center associated with this additional number. If value is null, this additional number is displayed in every call center's phone directory.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of the additional number, such as Conference Room B. Limit: 255 characters.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the additional number. Limit: 80 characters.
`Phone`	**Type** phone **Properties** Create, Filter, Nillable, Group, Sort, Update **Description** The phone number that corresponds to this additional number.

Usage

Create an additional number for a call center directory. Use this object if the number is not easily categorized as a User, Contact, Lead, Account, or the other object. Examples include phone queues or conference rooms.

Address

Represents a mailing, billing, or home address.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
`Address`	**Type** address **Properties** Filter, Nillable **Description** The full address.
`AddressType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** Picklist of address types. The values are: • Mailing • Shipping • Billing • Home
`City`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The address city.
`Country`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address country.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of the address.
`DrivingDirections`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Directions to the address.
`GeocodeAccuracy`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates.
`Latitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field Name	Details
	Description Used with `Longitude` to specify the precise geolocation of the address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places.
`LocationType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Filter, Group, Sort, Update **Description** Picklist of location types. The available values are: • Warehouse (default) • Site • Van • Plant
`Longitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `Latitude` to specify the precise geolocation of the address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the address.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** A lookup field to the parent location.
`PostalCode`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The address postal code.
`State`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address state.
`Street`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address street.
`TimeZone`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Picklist of available time zones.

Usage

Important: "Address" in Salesforce can also refer to the Address compound field found on many standard objects. When referencing the Address object in your Apex code, always use `Schema.Address` instead of `Address` to prevent confusion with the standard Address compound field. If referencing both the address object and the Address field in the same snippet, you can differentiate between the two by using `System.Address` for the field and `Schema.Address` for the object.

AgentWork

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, Omni-Channel must be enabled.

Fields

Field	Details
AcceptDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the work item was accepted.
ActiveTime	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The amount of time an agent actively worked on the work item. Tracks when the item is open and in focus in the agent’s console. Note: ActiveTime is tracked only for work that is routed using the tab-based capacity model.
AgentCapacityWhenDeclined	**Type** double **Properties** Filter, Nillable, Sort **Description** The agent’s capacity when declining work, either explicitly or through push timeout.
AssignedDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the work item was assigned to an agent,
CancelDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description Indicates when the work item was canceled.
`CapacityModel`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the capacity model used to determine agent capacity. Valid values are StatusBased and TabBased. This field is available in API version 50.0 and later. Note: A work item consumes agent capacity only if it was first assigned to the agent by Omni-Channel using queues or skills.
`CapacityPercentage`	**Type** percent **Properties** Create, Filter, Nillable, Sort **Description** The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel. When an agent's combined work items reach 100%, the agent won't receive new work items until there is enough open capacity for more work. For example, if you give phone calls a capacity percentage of *100*, an agent on a call doesn't receive new work items until the call ends.
`CapacityWeight`	**Type** double **Properties** Create, Filter, Nillable, Sort **Description** The amount of an agent's capacity for work items that's consumed by a work item from this service channel. For example, if cases are assigned a capacity weight of *2*, an agent with a capacity of *6* can accept up to 3 cases before the agent is at capacity and can't receive new work items.
`CloseDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the work item was closed.

Field	Details
`DeclineDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the agent declined this record.
`DeclineReason`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The provided reason for why an agent declined the work request.
`HandleTime`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The amount of time an agent had the work item open. Calculated by `Close Time – Accepted Time`.
`IsOwnerChangeInitiated`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a work item owner change triggered the direct assignment of the work item to the agent. The default value is false. Status-Based Capacity Model has to be turned on to use this field. This field is available in API version 50.0 and later.
`IsPreferredUserRequired`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a work item should stay with the preferred user even when the user is not available. The default value is false. This field is available in API version 50.0 and later.
`IsStatusChangeInitiated`	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Indicates whether a work item status change triggered the direct assignment of the work item to the agent. The default value is false. Status-Based Capacity Model has to be turned on to use this field. This field is available in API version 50.0 and later.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An automatically generated ID number that identifies the record.
`OriginalGroupId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the queue that the work assignment was originally routed to.
`OriginalQueueId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the queue that the work assignment was originally routed to. Due to API changes, OriginalQueueId is no longer recommended. Use OriginalGroupId instead.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the `AgentWork`. This field is available in API version 50.0 and later.
`PendingServiceRoutingId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description ID of the PendingServiceRouting from which the AgentWork was created. This field is available in API version 50.0 and later.
`PreferredUserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the preferred user to handle the work. This field is available in API v46.0 and later.
`PushTimeout`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of seconds set for push timeout. `0` is returned when push timeout isn't enabled. Available in API version 36.0 and later.
`PushTimeoutDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the push timeout event occurred. Available in API version 36.0 and later.
`RequestDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the work was requested.
`RoutingModel`	For internal use only.
`RoutingPriority`	For internal use only.
`RoutingType`	For internal use only.
`SecondaryRoutingPriority`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description Indicates the secondary routing priority.
ServiceChannelId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the service channel that's associated with the work assignment.
ShouldSkipCapacityCheck	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether to skip checking an agent's available capacity (`true`) or not (`false`) when an externally routed work item is created. This field is used when agents can simultaneously handle work from both Omni-Channel queues and queues using external routing. When `true`, the receiving agent can exceed their set capacity to accept the item, but they don't receive more Omni-Channel routed work. When `false`, the receiving agent can't exceed their set capacity and must have enough open capacity to accept the item.
SpeedToAnswer	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The amount of time between when the work was requested and when an agent accepted it.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The working status of the work item. Valid values are: • Assigned – The item is assigned to the agent but hasn't been opened. • Opened – The agent opened the item. • Unavailable – The item was assigned to the agent but the agent became unavailable (went offline or lost connection). • Declined – The item was assigned to the agent but the agent explicitly declined it.

Field	Details
	• DeclinedOnPushTimeout – The item was declined because push time-out is enabled and the item request timed out with the agent. • Closed – The item is closed. • Canceled – The item no longer needs to be routed. For example: a chat visitor cancels their Omni-Channel routed chat request before it reaches an agent. • Transferred–The item was transferred from an agent to another agent, queue, or skill.
`UserId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the user that the work item was assigned to.
`WorkItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the object that's routed to the agent through Omni-Channel.

Usage

`AgentWork` records can only be deleted if they have the status Closed, Declined, or Unavailable. They can't be deleted if their status is Assigned or Opened because they're active in Omni-Channel.

`AgentWork` records have the status Assigned when they're created. Once created, the record is automatically pushed to the assigned agent.

While the metadata for `AgentWork` indicates support for `upsert()` and `update()`, these calls aren't used with `AgentWork` because none of its fields can be updated.

Apex triggers are supported with `AgentWork`.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AgentWorkOwnerSharingRule
Sharing rules are available for the object.

AgentWorkShare
Sharing is available for the object.

AgentWorkSkill

Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

To access this object, Omni-Channel must be enabled.

Fields

Field	Details
`AgentWorkId`	**Type** reference **Properties** Filter, Group, Sort **Description** The AgentWork object associated with this skill.
`IsAdditionalSkill`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** After a designated timeout period, a skill marked as additional is dropped from Omni-Channel routing. The case is then routed to the best-matched agent, even if the agent doesn't have all the skills. The default value is false. Available in API version 48.0 and later.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An automatically generated ID number that identifies the record.
`SkillId`	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description The skill that is required or additional.
`SkillLevel`	**Type** double **Properties** Filter, Sort **Description** The level of the required or additional skill. Skill levels can range from 1 to 10. Depending on your business needs, you might want the skill level to reflect years of experience, certification levels, or license classes.
`SkillPriority`	**Type** int **Properties** Aggregatable, Filter, Group, Nillable, Sort **Description** For additional skills, specifies the order in which skills are dropped if after the specified timeout no agent with that skill is available. Higher priority-value skills are dropped first. Lower priority-value skills, for example 0, are dropped last. Skills with the same priority value are dropped as a group. You can set skill priority using attribute setup for skills-based routing or Apex code.
`WasDropped`	**Type** boolean **Properties** Filter, Group, Sort **Description** For skills marked as additional, indicates if the skill was dropped from Omni-Channel routing because an agent with this skill was not available. The default value is false. Available in API version 48.0 and later.

AIApplication

Represents an AI application such as Einstein Prediction Builder. This object is available in API version 50.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
DeveloperName	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
Language	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the application. Possible values are: • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)

Field	Details
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** Label that identifies the AI application throughout the Salesforce user interface.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Specifies the namespace of the application, if installed with a managed package.
Status	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Status of the AI application. Possible values are: • Disabled • Enabled • Migrated
Type	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of application. Possible values are: • PredictionBuilder

AIApplicationConfig

Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
DeveloperName	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
Language	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the application. Possible values are: • da—Danish • de—German • en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)

Field	Details
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** Label that identifies the AI application throughout the Salesforce user interface.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Specifies the namespace of the application config, if installed with a managed package.

AIInsightAction

Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Case Classification, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIInsightAction is a one-to-many child of AIRecordInsight. AIInsightAction contains information about predicted actions for this particular insight. AIInsightAction has one or more AIInsightValue children which contain predicted values for the action. For example, an AIInsightAction could represent a quick action, and have a child AIInsightValue with the recommended value used by the quick action.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
ActionId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The unique ID of the associated action, such as the ID of a Macro.
`ActionName`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The ID of the action. For example, a value of "Case.SendEmail" indicates a send email quick action on Case.
`AiRecordInsightId`	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the associated AIRecordInsight.
`Confidence`	**Type** double **Properties** Filter, Nillable, Sort **Description** Relative confidence strength of the generated prediction insight. Higher values (near 1.0) indicate stronger confidence.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the AIInsightAction.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of action. Possible values are: • `InvocableAction`—Invocable Action • `Macro`—Macro

Field	Details
	• `QuickAction`—Quick action. • `StandardAction`—Standard Action. An example standard action would be to update a record.

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AIInsightFeedback

Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Case Classification, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIInsightFeedback is a one-to-many child of AIRecordInsight. AIInsightFeedback contains information about explicit and implicit feedback collected from users for a particular insight.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
`ActualValue`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The raw feedback value. This field is null when no recommendation is selected.
`AiFeedback`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The feedback user sentiment. Possible values are: • `Negative`—Negative feedback • `Neutral`—Neutral feedback • `Positive`—Positive feedback
`AiInsightFeedbackType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The nature of the feedback. Possible values are: • `Explicit`—Explicit feedback. For example, a user applies and saves an Einstein recommendation on a case. • `Implicit`—Implicit feedback. For example, a user edits or updates a case field without viewing or applying field recommendations from Einstein.
`AiRecordInsightId`	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the associated AIRecordInsight.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The name of the AIInsightFeedback.
`Rank`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The feedback score.
`ValueId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unique ID of the associated AIInsightValue.

Usage

Salesforce creates AIInsightFeedback records based on user responses to predictions after the prediction has been created. User feedback, such as a thumbs up/down response or accepting a recommended value, results in the creation of a feedback record in which the feedback type is explicit. An implicit feedback record is created when Einstein makes a recommendation but the field is updated in another way, for example, by a process. Once the AIInsightFeedback record has been created, it's immutable.

Custom fields can't be added to Einstein insight objects.

AIInsightReason

Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Case Classification, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIInsightReason is a one-to-many child of AIInsightValue. AIInsightReason contains details about how Einstein predicted an insight value.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
AiInsightValueId	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the associated AIInsightValue.
Contribution	**Type** double **Properties** Filter, Nillable, Sort **Description** The contribution weight for this insight reason.
FeatureType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of the feature, such as BOOL.
FeatureValue	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The value of the feature, such as TRUE or FALSE.
FieldName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the field the insight uses for its evaluation.
FieldValue	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The value for the field the insight uses for its evaluation.
`Intensity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The intensity weight for this insight reason.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the AIInsightReason.
`Operator`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The logical operator the insight uses to compare the field value with the expression value. For example, if the prediction evaluates whether the fieldValue for the field `bonus__c` is greater than $5,000, the logical operator is `greater than`.
`Variance`	**Type** double **Properties** Filter, Nillable, Sort **Description** The variance weight for this insight reason.

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AIInsightValue

Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Case Classification, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIInsightValue is a one-to-many child of AIRecordInsight. AIInsightValue represents a predicted value of a predicted insight.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
`AiInsightActionId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unique ID of the associated AIInsightAction.
`AiRecordInsightId`	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the associated AIRecordInsight.

Field	Details
Confidence	**Type** double **Properties** Filter, Nillable, Sort **Description** Relative confidence strength of the generated prediction insight. Higher values (near 1.0) indicate stronger confidence.
Field	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The name of the target field Einstein is making predictions for, such as “AnnualRevenue”.
FieldValueLowerBound	**Type** textarea **Properties** Nillable **Description** The lower bound value.
FieldValueUpperBound	**Type** textarea **Properties** Nillable **Description** The upper bound value.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the AIInsightValue.
SobjectLookupValueId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The unique ID of the value object, if this insight value references an object.
`SobjectType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of the value object, such as Account or Case, if this insight value references an object.
`Value`	**Type** textarea **Properties** Nillable **Description** The prediction result insight value.
`ValueType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The data type of the prediction result insight value. Possible values are: • `Boolean`—Boolean • `Currency`—Currency • `DateTime`—DateTime • `Enum`—Enum • `Lookup`—Lookup • `Number`—Number • `String`—String

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

AIRecordInsight

Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Case Classification, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIRecordInsight contains information on the Einstein prediction, the AI prediction field where results were written to, and other details such as the type of prediction.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

Fields

Field	Details
`AiApplicationId`	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the AiApplication that generated this prediction.
`Confidence`	**Type** double **Properties** Filter, Nillable, Sort **Description** Relative confidence strength of the generated prediction insight, from 0.0 to 1.0. Higher values (near 1.0) indicate stronger confidence.

Field	Details
MlPredictionDefinitionId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unique ID of the associated MLPredictionDefinition.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the AIRecordInsight.
PredictionField	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The label of the field that Einstein is making predictions for, such as “Case.IsEscalated”.
RunGuid	**Type** string **Properties** Filter, Group, Sort **Description** A unique identifier for the Einstein process that made the prediction.
RunStartTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time the Einstein prediction process was started.
Status	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of this insight. Possible values are:

Field	Details
	• `Defunct`—The insight has been consumed by the Einstein feature that owns the prediction. For example, Case Classification marks an insight as defunct if a predicted recommendation was presented to a user and the user either accepted or ignored the recommendation. This behavior ensures that the same recommendation isn't presented multiple times to the user. • `New`—The insight hasn't been consumed by the Einstein feature.
`TargetField`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The field to which prediction results are written. Case Classification doesn't use this field.
`TargetId`	**Type** reference **Properties** Filter, Group, Sort **Description** The unique ID of the record Einstein is making predictions for.
`TargetSobjectType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of the target object, such as Account or Case.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of insight. Possible values are: • `Action`—An insight that indicates a suggested action, such as sending an email. • `Lookup`—An insight that indicates a related value not directly related to the target object and field. • `MultiValue`—An insight with multiple values, such as a multi-class classification. • `SimilarRecord`—An insight that indicates similar or duplicate records. • `SingleValue`—A single value insight, such as a regression number or a score.

Field	Details
`ValidUntil`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The day and time this insight is valid until. After this day and time, the insight might no longer be valid due to new prediction results from new or changed data. If this field is `null`, this insight never expires.

Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren't run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can't be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

Considerations for Case Classification

To generate reports about how well Einstein Case Classification predictions are working, use the root AIRecordInsight object and its child objects, AIInsightFeedback and AIInsightValue. For example, you can determine how many cases received predictions or how often agents accepted or rejected them.

- To determine how many cases received recommendations, the AIRecordInsight table identifies the case and contains a row for each field and each recommendation. In AIRecordInsight, the TargetId field contains the case ID. The PredictionField indicates which case field is being predicted. Each field value recommendation is contained in a separate AIInsightValue object with AIRecordInsight as the parent. For a picklist field, Einstein creates AIInsightValue objects with up to 10 field value recommendations. However, just the top three predictions appear to agents in the Einstein Field Recommendations component.
- To learn whether agents acted on any of the top three predictions, use the AIInsightFeedback object. When an agent updates fields after viewing Einstein's recommendations, or when Einstein applies a recommendation automatically, the object's AiInsightFeedbackType field contains Explicit. If the agent updates fields without viewing the predictions, such as on the case details tab, AiInsightFeedbackType is set to Implicit. When the agent applies the recommended value, the object's AiFeedback field is set to Positive; if the agent applies a different value, AiFeedback is Negative.

AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the "Manage Internal Users" user permission to use this object.

Note: If you don't see this object, contact your Salesforce representative to enable it.

Fields

Field	Details
`Domain`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** An allowed email domain for users.

AlternativePaymentMethod

Represents a payment method that doesn't have a defined Commerce Orders entity such as CardPaymentMethod on page 577 or DigitalWallet on page 1008. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. `AlternativePaymentMethod` functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account for the alternative payment method.
AlternativePaymentMethodNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Salesforce ID number for the alternative payment method.
AuditEmail	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description**
Comments	**Type** textarea **Properties** Create, Nillable, Update **Description** Users can add comments to provide additional details about a record. Maximum of 1000 characters.
CompanyName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Company name for this payment method. Part of the payment method's address.
Email	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Email address of the payment method holder.
GatewayToken	**Type** encryptedstring **Properties** Create, Nillable, Update **Description** Tokenized form of the alternative payment method, returned by the gateway. Stored as encrypted text.
GatewayTokenDetails	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Unique tokenized ID generated by the payment gateway when this payment method first interacts with the gateway. Used to identify the payment method during future transactions.
IpAddress	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** IP address for the payment method owner.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

Field	Details
MacAddress	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Mac Address of the payment method holder.
NickName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** User-defined nickname for this pamyent method.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The user who owns the alternative payment method.
PaymentGatewayId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the payment gateway entity used to handle transactions from this payment method.
PaymentMethodAddress	**Type** address **Properties** Filter, Nillable **Description** User address column type. First name and last name are listed as separate fields.
PaymentMethodCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for this payment method.

Field	Details
PaymentMethodCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for this payment method.
PaymentMethodGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Part of the address for this payment method.
PaymentMethodLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Part of the address for this payment method.
PaymentMethodLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Part of the address for this payment method.
PaymentMethodPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for this payment method.
PaymentMethodState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for this payment method.

Field	Details
PaymentMethodStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for this payment method.
Phone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Phone number of the payment method's owner.
ProcessingMode	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Shows whether the payment method was created in Salesforce or externally. Required. Possible values are: • `External`: Select this value if you create the alternative payment method record through any method other than Commerce Payments Connect API. • `Salesforce`: Select this value if you use Commerce Payments Connect API to create the alternative payment method record.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The state of the payment method. Required. Possible values are: • `Active`: The Payments Platform can use the alternative payment method to make payments. Active alternative payment methods can't be deleted. • `Canceled`: The Payments Platform can no longer use the payment method to make payments. A value of `Canceled` can't be changed back to `Active` or `Inactive` • `InActive`: The Payment Platform currently can't use the payment method to make payments. Admins can change this value to `Active` or `Canceled` when needed.

Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`ExpirationDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Required. The date on which the announcement expires. Announcements display on the group UI until 11:59 p.m. local time on the selected date.
`FeedItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the FeedItem that contains the content of the announcement. Announcements are stored as text posts.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the parent CollaborationGroup that the announcement belongs to. An announcement can belong only to a single Chatter group.
`SendEmails`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field Name	Details
	Description Set to `true` to email all group members when an announcement is posted to the group. The default is `false`. This requires the user to have the "Send announcement on email" permission. This field is available in API version 36.0 and later. Note: This field is currently available to select customers through a pilot program. To be nominated to join this pilot program, contact Salesforce. Additional terms and conditions may apply to participate in the pilot program. Please note that pilot programs are subject to change, and as such, we cannot guarantee acceptance into this pilot program or a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

Usage

Group owners, managers, and users with the "Modify All Data" permission can use the Announcement object to create, edit, and delete group announcements. Creating a group announcement is a three-step process.

1. Use the FeedItem object to create a text post with the announcement's content. Use the CollaborationGroup record you want to post the announcement to as the parent of this feed item.
2. Next, use the feed item ID and an expiration date to create the announcement record.
3. Finally, update the `AnnouncementId` field in the CollaborationGroup record with the ID of the announcement you created.

To delete the group announcement, simply delete the `AnnouncementId` value in the CollaborationGroup record. To restore a group announcement, update the `AnnouncementId` field for a group with the announcement's ID. The expiration date for the announcement should be in the future and the feed item used to create the announcement should be parented by the same group.

ApexClass

Represents an Apex class.

Note: Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()update()`, `upsert()`

Fields

Field	Details
ApiVersion	**Type** double **Properties** Create, Filter, Sort, Update **Description** The API version for this class. Every class has an API version specified at creation.
Body	**Type** textarea **Properties** Create, Nillable, Update **Description** The Apex class definition. Limit: 1 million characters.
BodyCrc	**Type** double **Properties** Create, Defaulted on create, Filter, Nillable, Sort, Update **Description** The CRC (cyclic redundancy check) of the class or trigger file.
IsValid	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether any dependent metadata has changed since the class was last compiled (`true`) or not (`false`). The default value is `false`.
LengthWithoutComments	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Length of the class without comments.
Name	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Name of the class. Limit: 255 characters
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The current status of the Apex class. The following string values are valid: • `Active`—The class is active. • `Deleted`—The class is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated. • `Inactive`—This option is unused and is only supported for ApexTrigger. For more information, see the Metadata API Developer Guide.

Developer Guide: Apex Developer Guide

ApexComponent

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`. For information, see the *Visualforce Developers Guide*.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`ApiVersion`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The API version for this custom component. Every custom component has an API version specified at creation. If the API version is less than 15.0 and `ApiVersion` is not specified, `ApiVersion` defaults to 15.0.
`ControllerKey`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifier for the controller associated with this custom component: • If the `ControllerType` parameter is set to `Standard` or `StandardSet`, this value is the name of the sObject that defines the controller. • If the `ControllerType` parameter is set to `Custom`, this value is the name of the Apex class that defines the controller.
`ControllerType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of controller associated with this Visualforce custom component. Possible values include:

Field	Details
	• `Not Specified`, for custom components defined without a value for the `controller` attribute on the `<apex:component>` tag • `Standard`, a value that can't be used with custom components or errors may occur • `StandardSet`, a value that can't be used with custom components or errors may occur • `Custom`, for components that have a value for the `controller` attribute on the `<apex:component>` tag
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the Visualforce custom component.
`Markup`	**Type** textarea **Properties** Create, Update **Description** The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the custom component.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The text used to identify the Visualforce custom component in the Setup area of Salesforce. The Label for this field is **Label**.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of this Visualforce custom component.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use custom components to encapsulate a common design pattern and then reuse that pattern several times in one or more Visualforce pages. All users who can view Visualforce pages can view custom components, but the "Customize Application" permission is required to create or update custom components.

StaticResource

Developer Guide: Visualforce Developer Guide

ApexLog

Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`Application`	**Type** string

Field	Details
	Properties Filter, Group, Sort **Description** This value depends on the client type that triggered the log. • For API clients, this value is the client ID. • For browser clients, this value is `Browser`.
`DurationMilliseconds`	**Type** int **Properties** Filter, Group, Sort **Description** Duration of the transaction in milliseconds.
`Location`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the location of the origin of the log. Values are: • `Monitoring`—Log is generated as part of debug log monitoring. These types of logs are maintained for seven days or until a user deletes them. • `SystemLog`—Log is generated from the Developer Console. These types of logs are maintained for 24 hours or until the user clears them.
`LogLength`	**Type** int **Properties** Filter, Group, Sort **Description** Length of the log in bytes.
`LogUserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the user whose actions triggered the debug log.
`Operation`	**Type** string

Field	Details
	Properties Filter, Group, Sort **Description** Name of the operation that triggered the debug log, such as `APEXSOAP`, `Apex Sharing Recalculation`, and so on.
`Request`	**Type** string **Properties** Filter, Group, Sort **Description** Request type. Values are: • `API`—Request came from the API • `Application`—Request came from the Salesforce user interface
`RequestIdentifier`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The unique identifier of the request that triggered the debug log. Use this request identifier to correlate multiple debug logs triggered by the same request.
`StartTime`	**Type** dateTime **Properties** Filter, Sort **Description** Start time of the transaction.
`Status`	**Type** string **Properties** Filter, Group, Sort **Description** Status of the transaction. This value is either `Success`, or the text of an unhandled Apex exception.

Usage

You can read information about this object, as well as delete it, but you can't update or insert it.

SEE ALSO:

ApexClass

ApexTrigger

Developer Guide: Apex Developer Guide

ApexPage

Represents a single Visualforce page.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`ApiVersion`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The API version for this page. Every page has an API version specified at creation. If the API version is less than 15.0 and `ApiVersion` is not specified, `ApiVersion` defaults to 15.0.
`ControllerKey`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifier for the controller associated with this page: • If the `ControllerType` parameter is set to `Standard` or `StandardSet`, this value is the name of the sObject that defines the controller. • If the `ControllerType` parameter is set to `Custom`, this value is the name of the Apex class that defines the controller.

Field	Details
ControllerType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of controller associated with this Visualforce page. Possible values include: • `Not Specified`, for pages defined with neither a `standardController` nor a `controller` attribute on the `<apex:page>` tag • `Standard`, for pages defined with the `standardController` attribute on the `<apex:page>` tag • `StandardSet`, for pages defined using the `standardController` and `recordSetVar` attribute on the `<apex:page>` tag • `Custom`, for pages defined with the `controller` attribute on the `<apex:page>` tag
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the Visualforce page.
IsAvailableInTouch	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce mobile app (`true`) or not (`false`). (Use of this field for Salesforce Touch is deprecated.) This field is available in API version 27.0 and later. Standard object tabs that are overridden with a Visualforce page aren’t supported in the Salesforce mobile app, even if you set this field for the page. The default Salesforce app page for the object is displayed instead of the Visualforce page.
IsConfirmationTokenRequired	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether `GET` requests for the page require a CSRF confirmation token (`true`) or not (`false`). This field is available in API version 28.0 and later.

Field	Details
	If you change this field's value from `false` to `true`, links to the page require a CSRF token to be added to them, or the page will be inaccessible.
`Markup`	**Type** textarea **Properties** Create, Update **Description** The Visualforce markup, HTML, Javascript, and any other Web-enabled code that defines the content of the page.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The text used to identify the Visualforce page in the Setup area of Salesforce. The Label is **Label**.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of this Visualforce page.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	• In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use Visualforce pages to add custom content that extends the base Salesforce application functionality. All users in Visualforce-enabled organizations can view Visualforce pages, but the "Customize Application" permission is required to create or update them.

SEE ALSO:

ApexComponent

StaticResource

Developer Guide: Visualforce Developer Guide

ApexPageInfo

Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

As of Summer '20 and later, this object can only be accessed by users who can view a particular Visualforce page, and users with the View Setup and Configuration permission.

Fields

Field	Details
`ApexPageId`	**Type** string **Properties** Filter, Group, Sort **Description** ID for the Visualforce page.
`ApiVersion`	**Type** double

Field	Details
	Properties Filter, Sort **Description** The API version for the page. Every page has an API version specified at creation. If the API version is less than `15.0` and `ApiVersion` is not specified, `ApiVersion` defaults to `15.0`.
`Description`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Description of the Visualforce page.
`DurableId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** For internal use only.
`IsAvailableInTouch`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates if Visualforce tabs associated with the Visualforce page can be used in the Salesforce app (`true`) or not (`false`). The default value is `false`.
`IsShowHeader`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The `showHeader` value for the Visualforce page. This will be "unknown" if the Visualforce page uses an expression to compute `showHeader`. The default value is `true`.
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The text used to identify the Visualforce page in the Setup area of Salesforce.
`Name`	**Type** string **Properties** Filter, Group, Sort **Description** Developer name of the Visualforce page.
`NameSpacePrefix`	**Type** string **Properties** Filter, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, the namespace prefix is set to the namespace prefix of the org for all objects that support it. Note: If an object is in an installed managed package, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In non-Developer Edition orgs, `NamespacePrefix` is only set for objects that are part of an installed managed package. Objects outside of an installed managed package do not have a namespace prefix.

Usage

Use `ApexPageInfo` to query limited metadata about Visualforce pages. Some of this metadata corresponds to settings for a Visualforce page available in Visualforce Pages. To access Visualforce Pages, from *Setup*, in the *Quick Find* box, enter *Custom Code*. Then, select Visualforce Pages. Other values are only available via API. Use `ApexPageInfo` in Visualforce pages to add custom content that extends the base Salesforce application functionality.

Users can only query `ApexPageInfo` records if they can display the associated Visualforce page, or if they have the View Setup & Configuration permission. Allow users to view Visualforce pages by modifying their user profile or assigning permission sets.

ApexTestQueueItem

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

This object is available in API version 23.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to access Apex test data". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Description
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The Apex class whose tests are to be executed.
`ExtendedStatus`	**Type** string **Properties** Filter, Nillable, Sort **Description** The pass rate of the test run. For example: "(4/6)". This means that four out of a total of six tests passed. If the class fails to execute, this field contains the cause of the failure.
`ParentJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Points to the AsyncApexJob that represents the entire test run. If you insert multiple Apex test queue items in a single bulk operation, the queue items share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

Field Name	Description
ShouldSkipCodeCoverage	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to opt out of collecting code coverage information during Apex test runs. Available in API version 43.0 and later.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update **Description** The status of the job. Valid values are: • Holding[1] • Queued • Preparing • Processing • Aborted • Completed • Failed [1] This status applies to batch jobs in the Apex flex queue.
TestRunResultId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the associated ApexTestRunResult object.

Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the ApexTestQueueItem object and set its `Status` field to *`Aborted`*.

If you insert multiple Apex test queue items in a single bulk operation, the queue items share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to access Apex test data". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The Apex class whose test methods were executed.
`ApexLogId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Points to the ApexLog for this test method execution if debug logging is enabled; otherwise, `null`.
`ApexTestRunResultId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the ApexTestRunResult that represents the entire test run.
`AsyncApexJobId`	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Points to the AsyncApexJob that represents the entire test run. This field points to the same object as `ApexTestQueueItem.ParentJobId`.
`Message`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The exception error message if a test failure occurs; otherwise, `null`.
`MethodName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The test method name.
`Outcome`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The result of the test method execution. Can be one of these values: • Pass • Fail • CompileFail • Skip
`QueueItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Points to the ApexTestQueueItem which is the class that this test method is part of.

Field Name	Details
`RunTime`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The time it took the test method to run, in milliseconds.
`StackTrace`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The Apex stack trace if the test failed; otherwise, `null`.
`TestTimestamp`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start time of the test method.

Usage

You can query the fields of the `ApexTestResult` record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single `ApexTestResult` record. For example, if an Apex test class contains six test methods, six `ApexTestResult` records are created. These records are in addition to the `ApexTestQueueItem` record that represents the Apex class.

Each ApexTestResult record has an associated ApexTestResultLimits on page 399 record, which captures the Apex limits used during execution of the test method.

ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to access Apex test data". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
`ApexTestResultId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated ApexTestResult object.
`AsyncCalls`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of asynchronous calls made during the test run.
`Callouts`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of callouts made during the test run.
`Cpu`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The amount of CPU used during the test run, in milliseconds.
`Dml`	**Type** int **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description The number of DML statements made during the test run.
`DmlRows`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of rows accessed by DML statements during the test run.
`Email`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of email invocations made during the test run.
`LimitContext`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates whether the test run was synchronous or asynchronous.
`LimitExceptions`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates whether your org has any limits that differ from the default limits.
`MobilePush`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of mobile push calls made during the test run.
`QueryRows`	**Type** int

Field Name	Details
	Properties Create, Filter, Group, Sort, Update **Description** The number of rows queried during the test run.
`Soql`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of SOQL queries made during the test run.
`Sosl`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number of SOSL queries made during the test run.

Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren't called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to access Apex test data". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
`AsyncApexJobId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The parent Apex job ID for the result.
`ClassesCompleted`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of classes executed during the test run.
`ClassesEnqueued`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The total number of classes enqueued during the test run.
`EndTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time at which the test run ended.
`IsAllTests`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field Name	Details
	Description Indicates whether all Apex test classes were run.
JobName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Reserved for future use.
MethodsCompleted	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods completed during the test run. This value is updated after each class is run.
MethodsEnqueued	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods enqueued for the test run. This value is initialized before the test runs.
MethodsFailed	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of methods that failed during this test run. This value is updated after each class is run.
Source	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The source of the test run, such as the Developer Console.

Field Name	Details
`StartTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time at which the test run started.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the test run. Values include: • Queued • Processing • Aborted • Completed • Failed
`TestTime`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The time it took the test to run, in seconds.
`UserId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user who ran the test run.

ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to access Apex test data". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Description
`TestSuiteName`	**Type** string **Properties** Create, Filter, Group, Sort, Unique, Update **Description** The name of the Apex test suite. This label appears in the user interface. This value is case-sensitive and must be unique.

Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
    AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

SEE ALSO:

TestSuiteMembership

ApexTrigger

Represents an Apex trigger.

Note: Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`ApiVersion`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The API version for this trigger. Every trigger has an API version specified at creation.
`Body`	**Type** textarea **Properties** Create, Nillable, Update **Description** The Apex trigger definition. Limit: 1 million characters.
BodyCrc	**Type** double **Properties** Create, Defaulted on create, Filter, Nillable, Sort, Update **Description** The CRC (cyclic redundancy check) of the class or trigger file.
`IsValid`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether any dependent metadata has changed since the trigger was last compiled (`true`) or not (`false`).
`LengthWithoutComments`	**Type** int **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description Length of the trigger without comments
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the trigger. Limit: 255 characters
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The current status of the Apex trigger. The following string values are valid: • `Active`—The trigger is active. • `Inactive`—The trigger is inactive, but not deleted. • `Deleted`—The trigger is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated.

Field	Details
	Note: `Inactive` is not valid for ApexClass. For more information, see the *Metadata API Developer Guide*.
`TableEnumOrId`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the object associated with the trigger, such as Account or Contact.
`UsageAfterDelete`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is an `after delete` trigger (`true`) or not (`false`).
`UsageAfterInsert`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is an `after insert` trigger (`true`) or not (`false`).
`UsageAfterUndelete`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is an `after undelete` trigger (`true`) or not (`false`).
`UsageAfterUpdate`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is an `after update` trigger (`true`) or not (`false`).
`UsageBeforeDelete`	**Type** boolean **Properties** Create, Filter, Update

Field	Details
	Description Specifies whether the trigger is a `before delete` trigger (`true`) or not (`false`).
`UsageBeforeInsert`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is a `before insert` trigger (`true`) or not (`false`).
`UsageBeforeUpdate`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is a `before update` trigger (`true`) or not (`false`).
`UsageIsBulk`	**Type** boolean **Properties** Create, Filter, Update **Description** Specifies whether the trigger is defined as a bulk trigger (`true`) or not (`false`). Note: This field is not used for Apex triggers saved using Salesforce API version 10.0 or higher: all triggers starting with that version are automatically considered bulk, and this field will always return `true`.

ApexClass

Developer Guide: Apex Developer Guide

AppAnalyticsQueryRequest

Represents a request for AppExchange App Analytics data.

AppExchange App Analytics is available for packages that passed security review and are registered to a License Management App (LMA). Usage data is provided as log files, as month-based usage summaries, or as point-in-time subscriber snapshots. Log files, monthly summaries, and subscriber snapshots are downloadable comma-separated value (.csv) files.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

See Request AppExchange App Analytics in the *ISVforce Guide*.

Fields

Field Name	Details
`DataType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of usage data being requested. Valid values include: • `PackageUsageLog` • `PackageUsageSummary` • `SubscriberSnapshot` Note: In Summer '20, we changed the enum names from `CustomObjectUsageSummary` and `CustomObjectUsageLog` to `PackageUsageSummary` and `PackageUsageLog`. If you wrote integrations using `CustomObjectUsageSummary` or `CustomObjectUsageLog`, they continue to work only with v47 and earlier. After you upgrade to v48, you must update the `DataType` to `PackageUsageSummary` and `PackageUsageLog`.
`DownloadExpirationTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The time when the download URL is no longer valid. The expiration time is 60 minutes after the query is completed.
`DownloadSize`	**Type** long **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The size of the AppExchange App Analytics results file available for download, in bytes.
DownloadUrl	**Type** textarea **Properties** Nillable **Description** URL that the user can download data from. Populated after the request is completed. This URL expires and is removed after the expiration time is reached.
EndTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** Enter end time in format yyyy-MM-ddTHH:mm:ss. Example: 2019-04-15T12:00:00
ErrorMessage	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Stores error message text that results from this query.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field Name	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated name of the App Analytics query request.
`OrganizationIds`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** Optional. Enter up to 16 comma-separated org IDs without spaces between IDs. Or enter up to 15 comma-separated org IDs with spaces between the IDs. To request data for all the orgs the package is installed in, leave the field blank.
`PackageIds`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** Optional. Enter up to 16 comma-separated package IDs without spaces between IDs. Or enter up to 15 comma-separated package IDs with spaces between the IDs. Use the subscriber package ID that begins with `033`. To retrieve a list of your second-generation managed package IDs, run `sfdx force:package:list --verbose` in Salesforce CLI. To request data on all packages registered to this License Management App, leave the field blank.
`RequestState`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Status of the query request. Valid values are:

Field Name	Details
	• `New` • `Pending` • `Complete` • `Expired` • `Failed` • `NoData`
`StartTime`	**Type** dateTime **Properties** Create, Filter, Sort **Description** Required. Enter start time in format yyyy-MM-ddTHH:mm:ss. Example: 2019-04-14T12:00:00

Usage

To request usage data, log into the License Management Org (LMO) that your package is registered to, and initiate the API request from the LMO. In a 24-hour period, you can download a maximum 20 GB of AppExchange App Analytics data.

See Download Package Log Files, Usage Summaries, and Subscriber Snapshots in the *ISVforce Guide*.

If requests to view package data are inactive for 90 days, we stop collecting the log file data. To resume data collection for package log files, Request AppExchange App Analytics in the Partner Community.

AppDefinition

Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`Description`	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The optional description of the application.
`DeveloperName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The developer name of the application.
`DurableId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A unique virtual Salesforce ID for the application.
`HeaderColor`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The header color in the application. Specify the color with a hexadecimal code, such as #0000FF for blue.
`Id`	**Type** ID **Properties** Defaulted on create, Filter, Group, idLookup, Sort **Description** A default Salesforce ID.
`IsLargeFormFactorSupported`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the Large form factor is set in the `CustomApplication` metadata.

Field Name	Details
`IsMediumFormFactorSupported`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the Medium form factor is set in the `CustomApplication` metadata.
`IsNavAutoTempTabsDisabled`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the navigation automatically creates temporary tabs settings.
`IsNavPersonalizationDisabled`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether navigation personalization is disabled.
`IsOverrideOrgTheme`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether to override the global theme for the org. When `true`, the color scheme and logo that the user has set are used. When `false`, the global theme for the org is used, even if the user has set a color scheme and logo.
`IsSmallFormFactorSupported`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the Small form factor is set in the `CustomApplication` metadata.
`Label`	**Type** string

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The localized label value corresponding to the MasterLabel field.
`LogoUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The logo URL of the application as selected by the admin.
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The non-translated label entered when the application was created.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace of the application.
`NavType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of navigation for the application. The value `Standard` is for Lightning Experience. The value `Console` is for Salesforce console. A null value is for Salesforce Classic.
`UiType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the type of custom application. The value `Aloha` is for Salesforce Classic, and `Lightning` is for Lightning Experience.

Field Name	Details
`UtilityBar`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the utility bar associated with this application.

AppExtension

Represents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
`AppExtensionLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label in the UI for the app extension.
`AppExtensionName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The API name of the app extension.
`FieldServiceMobileSettingsId`	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Sort **Description** The ID of a set of field service mobile settings.
`InstallationUrl`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The URL that takes the user to the app install location, such as the App Store or Google Play.
`LaunchValue`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** A value directing the Field Service app to the appropriate app extension. The Launch Value can be a static URL or a dynamic value that you can represent with certain tokens. These tokens pass field information from the record that the user is currently viewing. The basic format for these tokens is based on the field names; for example: **{!$Name}**.
`ScopedToObjectTypes`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the types of records from which the app extension can be activated. Scoping an app extension to an object lets users activate the app extension from records of the specified type. For example, to scope to both work orders and service appointments you would use the value `WorkOrder,ServiceAppointment`.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A picklist of types of app extensions: iOS, Android, Flow, and Lightning Apps

AppMenuItem

Represents the organization's default settings for items in the app menu or App Launcher.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
`ApplicationId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The 15-character ID for the menu item.
`CanvasAccessMethod`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The access method for the canvas app. Values can be: • `Get`—OAuth Webflow • `Post`—Signed Request
`CanvasEnabled`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates if the app menu item is a canvas app (`true`) or not (`false`). The default setting is `false`.
`CanvasOptions`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Represents the options enabled for a canvas connected app. The options are:

Field	Details
	• `PersonalEnabled`—The app is enabled as a canvas personal app. • `HideHeader`—The publisher header, which contains the "What are you working on?" text, is hidden. • `HideShare`—The publisher **Share** button is hidden. This field is available in API version 34.0 and later.
`CanvasReferenceId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The canvas app unique identifier.
`CanvasSelectedLocations`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The selected locations for the canvas app which define where the canvas app can appear in the user interface. For example: `Chatter,ChatterFeed,Publisher,ServiceDesk`
`CanvasUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The URL of the canvas app.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A description of this menu item.
`IconUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The icon for the menu item’s application.
InfoUrl	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The URL for more information about the application.
IsAccessible	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If `true`, the current user is authorized to use the app. The default setting is `false`.
IsRegisteredDeviceOnly	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If `true`, indicates that the app is available to registered devices only. The default setting is `false`. Available in API version 49.0 and later.
IsUsingAdminAuthorization	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If `true`, the app is pre-authorized for certain users by the administrator. The default setting is `false`.
IsVisible	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, the app is visible to users of the organization. The default setting is `false`.

Field	Details
Label	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The app's name.
LogoUrl	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The logo for the menu item's application. The default is the initials of the `Label` value.
MobileAppBinaryId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The URL for the Mobile App Binary file.
MobileAppInstallUrl	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** The location mobile users are directed to install the app. Available in API version 49.0 and later.
MobileAppInstalledDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that a user installed a mobile app. Available in API version 49.0 and later.
MobileAppInstalledVersion	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The version of the user's installed mobile app. Available in API version 49.0 and later.
MobileAppVer	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The version number of the mobile app. Available in API version 49.0 and later.
MobileDeviceType	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The supported device form factors for the mobile app. Available in API version 49.0 and later.
MobileMinOsVer	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The minimum version required for the app. Available in API version 49.0 and later.
MobilePlatform	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The mobile platform for the app. Possible values include: • `android - Android` • `ios - iOS` Available in API version 49.0 and later.
MobileStartUrl	**Type** url **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The location mobile users are directed to after they've authenticated. This field is used with connected apps and Experience Builder sites. For sites only, this location is a fully qualified domain name. For other apps, it's a relative URL.
`Name`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The API name of the item.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values: • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`SortOrder`	**Type** int **Properties** Filter, Group, Sort **Description** The index value that controls where this item appears in the menu. For example, a menu item with a sort order of 5 appears between items with sort order values of 3 and 9.
`StartUrl`	**Type** url

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** For a connected app, the location users are directed to after they've authenticated. Otherwise, the application's default start page.
`Type`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of application represented by this item. The types are: • `ConnectedApplication` • `Network` • `ServiceProvider` • `TabSet`
`UserSortOrder`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 appears between items with sort order values of 3 and 9. This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use: `SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST`

Usage

Use this read-only object to view an entry in the Lightning Platform app menu or the App Launcher. You can create a SOQL query to retrieve all items, even items the user does not see from the user interface.

There are many ways you can use AppMenuItem. Here are some examples:

- Build your own App Launcher or app menu in Salesforce. Create a custom page showing all the apps you have access to and that lets you run them using single sign-on.
- Build your own App Launcher or app menu on a tablet or mobile app. You can have your own app for launching applications on various mobile devices.

- Build an app launcher into your company's intranet. There's no need to have it run on Salesforce because Salesforce APIs let you integrate with Salesforce programmatically and build an app launcher.

Tip: To get metadata information about apps and their tabs, use the Apex `Schema.describeTabs()` method, REST API `/vXX.X/tabs/` resource, or SOAP API `describeTabs()` call.

AppointmentSchedulingPolicy

Represents a set of rules for scheduling appointments using Lightning Scheduler. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`AppointmentStartTimeInterval`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The proposed time interval in minutes between appointment start times. For example, set the interval to 15. Appointments can then begin at the top of the hour and at 15-minute intervals thereafter (10:00 AM, 10:15 AM, 10:30 AM, and so on). Possible values are: • `5` • `10` • `15` • `20` • `30` • `45` • `60` • `90` • `120` • `150` • `180` • `240` • `300` • `360` • `420` • `480`

Field	Details
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The API name of the AppointmentSchedulingPolicy object.
ExtCalEventHandlerId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The API name of the custom Apex class that checks service resources' external calendar events and returns the time slots where service resources are already booked. Available in API version 50.0 and later.
IsOrgDefault	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this scheduling policy is the default appointment scheduling policy for Lightning Scheduler appointments in this org.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the appointment scheduling policy. Possible values are: • `Possible` values are: • `da` (Danish) • `de` (German) • `en_US` (English) • `es` (Spanish) • `es_MX` (Spanish - Mexican) • `fi` (Finnish) • `fr` (French) • `it` (Italian)

Field	Details
	• ja (Japanese) • ko (Korean) • nl_NL (Dutch) • no (Norwegian) • pt_BR (Portuguese - Brazilian) • ru (Russian) • sv (Swedish) • th (Thai) • zh_CN (Chinese - Simplified) • zh_TW (Chinese - Traditional)
MasterLabel	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label for the appointment scheduling policy.
ShouldEnforceExcludedResource	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy prevents excluded service resources from being assigned to appointments.
ShouldEnforceRequiredResource	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy allows only required service resources to be assigned to appointments.
ShouldMatchSkill	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy allows only required service resources who have certain skills to be assigned to appointments.

Field	Details
ShouldMatchSkillLevel	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy allows only required service resources who have certain skills and skill levels to be assigned to appointments.
ShouldRespectVisitingHours	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy prevents users from scheduling appointments outside of an account's visiting hours.
ShouldUsePrimaryMembers	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy allows only service resources who are primary members of a service territory to be assigned to appointments.
ShouldUseSecondaryMembers	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this appointment scheduling policy allows service resources who are secondary members of a service territory to be assigned to appointments.

Approval

Represents an approval request for a Contract.

Note: This object is read-only and is specific to approvals on the Contract object. It isn't equal to or involved in the approval processes represented by the ProcessInstance, which is more powerful.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`ApproveComment`	**Type** string **Properties** Filter, Nillable, Sort **Description** Text entered by the user when they approved or rejected this approval request. Required. Limit: 4,000 characters.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. ID of the User being asked to approve or reject the approval request. Must be a valid User ID. Required.
`ParentId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. ID of the Contract associated with this approval request. Must be a valid contract ID.
`RequestComment`	**Type** string **Properties** Filter, Nillable, Sort

Field	Details
	Description Text entered by the User who created the approval request. Optional. This field can't be updated after the Approval has been created. Limit: 4,000 characters.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. Status of this approval request. One of the following picklist values: • `Pending`—Specified only when the Approval request is created (`create()` call) • `Approved`—Specified only when the Approval request is approved (`update()` call) • `Rejected`—Specified when the Approval request is rejected (`update()` call) or when it is created (`create()` call) and immediately rejected for archival/historical purposes.

Usage

This object allows client applications to programmatically handle approval requests for a Contract. Initially, to request a Contract approval, a client application might create a new Approval request record, specifying the `ParentId`, `OwnerId` (user approving or rejecting the request), `Status` (Pending), and (optionally) `RequestComment` fields. Note that when a client application creates the first approval request, if the value of the Contract `Status` field is Draft, then the Approval `Status` for this record is automatically changed to In Approval Process (see ContractStatus for more information).

A client application might subsequently update an existing Approval request, specifying the `Status` (Approved or `Rejected`) and an `ApproveComment` (required); the `RequestComment` field can't be updated. Updating an Approval record (either to approve or reject) requires the client application to be logged in with "Approve Contract" permission. To update an Approval request, its `Status` must be Pending—a client application can't update an Approval that has already been Approved or Rejected. To re-submit an approval request for a given Contract, a client application must create a new, separate Approval record and repeat the approval process.

Once a Contract has been approved (not rejected), the Contract `LastApprovedDate` field is automatically updated, however the Contract `Status` field isn't updated, it keeps the value InApproval.

An approved Contract must be activated explicitly. Client applications can activate a Contract by setting the value in its `Status` field to Activated, or a User can activate a Contract via the Salesforce user interface.

A Contract can have multiple approval requests in various states (Pending, Approved, and Rejected). In addition, one User can have multiple approval requests associated with the same Contract.

Client applications can't explicitly deleteApproval records. Approval records are deleted automatically if the parent Contract is deleted.

SEE ALSO:

Object Basics

AppTabMember

Represents the list of tabs for each of the available apps. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
AppDefinitionId	**Type** string **Properties** Filter, Nillable, Sort **Description** The ID of the `AppDefinition` object.
DurableId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A unique virtual Salesforce ID for the color.
SortOrder	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number used to sort this tab in the application.
TabDefinitionId	**Type** string **Properties** Filter, Nillable, Sort **Description** The ID of the `TabDefinition` object.
WorkspaceDriverField	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** Refers to the workspace mapping in the `CustomApplication` Metadata API object.

*`Article Type`*__DataCategorySelection

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

This object can be used to associate an article with data categories from a data category group or to query the category selections for an article.

The object name is variable and has a syntax of *`Article Type`*__DataCategorySelection, where *`Article Type`* is the `Object Name` for the article type associated with the article. For example, `Offer__DataCategorySelection` represents the association between the `Offer` article type and its data categories. Every article is associated with an article type.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `getDeleted()`, `retrieve()`

Special Access Rules

Knowledge must be enabled in your org. Not available in Lightning Knowledge. Users can only access, create or delete data category selection visible to their role, permission set, or profile. If a user has partial visibility on an article's categorization, only the visible categories are returned.

Fields

Field Name	Details
`DataCategoryGroupName`	**Type** DataCategoryGroupReference **Properties** Create **Description** Unique name of the data category group which has categories associated with the article.
`DataCategoryName`	**Type** DataCategoryGroupReference **Properties** Create

Field Name	Details
	Description Unique name of the data category associated with the article.
`ParentId`	**Type** reference **Properties** Create, Filter **Description** ID of the article associated with the data category selection.

Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use the *`Article Type`*__DataCategorySelection object to query and manage article categorization in your org. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

Note: When using *`Article Type`*__DataCategorySelection to classify an article, you can't select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

Answers zones use QuestionDataCategorySelection to classify questions.

SOQL Sample

The following SOQL query returns the data category selections used to classify the article whose ID is `ka0D000000005ApIAI`.

```
SELECT Id,DataCategoryName, ParentId
        FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

This clause only returns category unique names. To retrieve category labels use the following clause:

```
SELECT Id,toLabel(DataCategoryName), ParentId
        FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

Tip: You can also use relationship queries to retrieve categorizations from an article type.

QuestionDataCategorySelection

Knowledge

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** (Required) ID of the Account associated with this asset. Must be a valid account ID. Required if `ContactId` isn't specified.
`AssetLevel`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The asset's position in an asset hierarchy. If the asset has no parent or child assets, its level is 1. Assets that belong to a hierarchy have a level of 1 for the root asset, 2 for the child assets of the root asset, 3 for their children, and so forth. Note: On assets created before the introduction of this field, the asset level defaults to –1. After the asset record is updated, the asset level is calculated and automatically updated.
`AssetProvidedById`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account that provided the asset, typically a manufacturer.
`AssetServicedById`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account in charge of servicing the asset.

Field	Details
Availability	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of expected uptime where the asset was available for use.
AverageUptimePerDay	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The average number of hours per day the asset is expected to be available for use.
ContactId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required if `AccountId` isn't specified. ID of the Contact associated with this asset. Must be a valid contact ID that has an account parent (but doesn't need to match the asset's `AccountId`).
Description	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the asset.
DigitalAssetStatus	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Status of digital tracking of the asset. The default picklist includes the following values: • `On` • `Off` • `Warning` • `Error`

Field	Details
ExternalIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the matching record in an external system. This field is available from API version 49.0 and later.
InstallDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date when the asset was installed.
IsCompetitorProduct	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this Asset represents a product sold by a competitor (`true`) or not (`false`). Default value is `false`. Its UI label is Competitor Asset.
IsInternal	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates that the asset is produced or used internally (`true`) or not (`false`). Default value is `false`. Its UI label is Internal Asset.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that the asset was last modified. Its UI label is Last Modified Date.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date and time that the asset was last viewed.
`LocationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset's location. Typically, this location is the place where the asset is stored, such as a warehouse or van.
`ManufactureDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the asset was manufactured. This field is available from API version 49.0 and later.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** (Required) Name of the asset. Label is Asset Name.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The asset's owner. By default, the asset owner is the user who created the asset record. Its UI label is Asset Owner.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset's parent asset. Its UI label is Parent Asset.

Field	Details
Price	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Price paid for this asset.
Product2Id	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** (Optional) ID of the Product2 associated with this asset. Must be a valid Product2 ID. Its UI label is Product.
ProductCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The product code of the related product.
ProductDescription	**Type** string **Properties** Filter, Sort, Nillable **Description** The product description of the related product.
ProductFamily	**Type** picklist **Properties** Filter, Group, Sort, Nillable **Description** The product family of the related product.
PurchaseDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Date on which this asset was purchased.
Quantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Quantity purchased or installed.
Reliability	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of expected uptime where the asset wasn't subject to unplanned downtime.
RootAssetId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** (Read only) The top-level asset in an asset hierarchy. Depending on where an asset lies in the hierarchy, its root could be the same as its parent. Its UI label is Root Asset.
SerialNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Serial number for this asset.
Status	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Customizable picklist of values. The default picklist includes the following values: • Purchased • Shipped • Installed

Field	Details
	• `Registered` • `Obsolete`
`StatusReason`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The explanation of the device status. This field is available from API version 49.0 and later. Possible values are: • `Not Ready` • `Off` • `Offline` • `Online` • `Paused` • `Standby`
`StockKeepingUnit`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The SKU assigned to the related product.
`SumDowntime`	**Type** double **Properties** Filter, Nillable, Sort **Description** Accumulated downtime (planned and unplanned), determined as follows: • When only `UptimeRecordStart` is set, the sum of all downtime from `UptimeRecordStart`. • When `UptimeRecordStart` and `UptimeRecordEnd` are set, the sum of all downtime from `UptimeRecordStart` to `UptimeRecordEnd`. Otherwise, downtime isn't accumulated.
`SumUnplannedDowntime`	**Type** double **Properties** Filter, Nillable, Sort

Field	Details
	Description Accumulated unplanned downtime, determined as follows: • When only `UptimeRecordStart` is set, the sum of all unplanned downtime from `UptimeRecordStart`. • When `UptimeRecordStart` and `UptimeRecordEnd` are set, the sum of all unplanned downtime from `UptimeRecordStart` to `UptimeRecordEnd`. Otherwise, unplanned downtime is not accumulated.
`TotalLifecycleAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of revenue for the asset, including revenue from each stage in the asset lifecycle.
`UptimeRecordEnd`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date that `SumDowntime` and `SumUnplannedDowntime` are accumulated until.
`UptimeRecordStart`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date from which `SumDowntime` and `SumUnplannedDowntime` are accumulated.
`UsageEndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date when usage for this asset ends or expires.
`Uuid`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The unique ID for the asset. This field is available from API version 49.0 and later.

Usage

Use this object to track products sold to customers. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of up to 10,000 assets.

For example, your organization might want to renew and up-sell opportunities on products sold in the past. Similarly, your organization might want to track competitive products that exist in a customer environment that could potentially be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the `PurchaseDate` or `SerialNumber` could indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the `UsageEndDate` might indicate when the asset was removed from service or when a license or warranty expires.

If an application creates an Asset record, it must specify a `Name` and either an `AccountId`, `ContactId`, or both.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AssetFeed
Feed tracking is available for the object.

AssetHistory
History is available for tracked fields of the object.

AssetOwnerSharingRule
Sharing rules are available for the object.

AssetShare
Sharing is available for the object.

SEE ALSO:

Object Basics

AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssetDowntimePeriodNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The unique number of this asset downtime period record.
AssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset this asset downtime period record is for.
Description	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of this asset downtime period.
DowntimeType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of this asset downtime period. Possible values are: • Planned • Unplanned
EndTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time this asset downtime period ended.
IsExcluded	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Whether this asset downtime period is excluded from the calculation of accumulated downtime and accumulated unplanned downtime, and therefore not included in availability and reliability calculations.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`StartTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time this asset downtime period started.

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can’t access this object.

Fields

Field	Details
`AssetAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of sharing being allowed. The possible values are: • `Read` • `Edit`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Rule Name** in the user interface. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.
Name	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
UserOrGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the target user or group. Target users or groups are given access.

Usage

Use this object to manage the sharing rules for assets. General sharing uses this object.

SEE ALSO:

Metadata API Developer Guide: SharingRules

AssetRelationship

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

Asset relationships appear in the Primary Assets and Related Assets related lists on asset records in the UI.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
AssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The replacement asset.
AssetRelationshipNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the asset relationship.
FromDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The day the replacement asset is installed.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the asset relationship was last modified. Its label in the user interface is `Last Modified Date`.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the asset relationship was last viewed.
RelatedAssetId	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description The asset being replaced.
`RelationshipType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The type of relationship between the assets. This field comes with three values—Replacement, Upgrade, and Crossgrade—but you can create more in Setup.
`ToDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The day the replacement asset is uninstalled.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AssetRelationshipFeed
Feed tracking is available for the object.

AssetRelationshipHistory
History is available for tracked fields of the object.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
AssetAccessLevel	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Level of access that the User or Group has to the Asset. The possible values are: • Read • Edit • All This value is not valid for creating or deleting records. This field must be set to an access level that is higher than the organization's default access level for cases.
AssetId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the Asset associated with this sharing entry. This field can't be updated.
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is **Deleted**.
RowCause	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include:

Field	Details
	• `Manual`—The User or Group has access because a user with "All" access manually shared the Asset with them. • `Owner`—The User is the owner of the Asset. • `Rule`—The User or Group has access via an Asset sharing rule. • `GuestRule`—The User or Group has access via an Asset guest user sharing rule. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group.
`UserOrGroupId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Asset. This field can't be updated.

Usage

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.

Field Name	Details
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AssetTokenEvent

The documentation has moved to AssetTokenEvent in the *Platform Events Developer Guide*.

AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset this warranty term applies to.
`AssetWarrantyNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The identifier of the asset warranty record.
`EndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which this warranty term expires.
`ExchangeType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The type of exchange offered by this warranty term.

Field	Details
Exclusions	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of any exclusions.
ExpensesCovered	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of expenses covered.
ExpensesCoveredEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for expenses ends.
IsTransferable	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Defines whether the warranty term can be transferred to a new owner.
LaborCovered	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of labor covered.
LaborCoveredEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for labor ends.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the asset warranty term was last modified. Its label in the user interface is `Last Modified Date`.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the asset warranty term was last viewed.
PartsCovered	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of parts covered.
PartsCoveredEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for parts ends.
Pricebook2Id	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the price book item associated with this asset warranty term.
StartDate	**Type** date **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The date on which cover under this warranty term starts.
WarrantyTermId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the warranty term this asset warranty term extends.
WarrantyType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The type of the warranty.

AssignedResource

Represents a service resource who is assigned to a service appointment in Field Service and Lightning Scheduler. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
ActualTravelTime	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The number of minutes that the service resource needed to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places.

Field Name	Details
AssignedResourceNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the resource assignment.
EstimatedTravelTime	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The estimated number of minutes needed for the service resource to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places.
IsPrimaryResource	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the service resource is a primary resource or not. The default value is false. Available in API version 47.0 and later.
ServiceAppointmentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The service appointment that the resource is assigned to.
ServiceCrewId	**Type** reference **Properties** Create, Update, Filter, Group, Sort, Nillable **Description** The service crew that the resource is assigned to. Note: Since service resources can represent crews or individuals, appointment are typically assigned to crews in the following way: 1. Create a service resource of the Crew type that represent the crew.

Field Name	Details
	2. Create an assigned resource on the service appointment and select the crew resource in the `ServiceResourceId` field. As an alternative, you can assign appointments to crew members separately. This lets you track each member's travel time and see a list of the crew members in the Assigned Resources related list. To take this approach, create an assigned resource for each crew member. List the crew member in the `ServiceResourceId` field and the crew they belong to in the `ServiceCrewId` field.
`ServiceResourceId`	**Type** reference **Properties** Create, Update, Filter, Group, Sort **Description** The resource who is assigned to the service appointment.

Usage

You can assign multiple service resources to a service appointment. Service resources who are assigned to service appointments cannot be deactivated until they are removed from the appointments.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AssignedResourceFeed
Feed tracking is available for the object.

AssignmentRule

Represents an assignment rule associated with a Case or Lead.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Special Access Rules

- This object is read only. Assignment rules are created, configured, and deleted in the user interface.
- Customer Portal users can't access this object.

Fields

Field	Details
`Active`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this assignment rule is active (`true`) or not (`false`).
`Name`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of this assignment rule.
`SobjectType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Type of assignment rule—Case or Lead.

Usage

Before creating or updating a new Case or Lead, a client application can query (by name) the AssignmentRule to obtain the ID of the assignment rule to use, and then assign that ID to the `assignmentRuleId` field of the AssignmentRuleHeader. The AssignmentRuleHeader can be set using either SOAP API or REST API.

Assignment rules can also be specified when creating or upserting Case or Lead objects via the Bulk API or the Bulk 2.0 API.

SEE ALSO:

Object Basics

AssociatedLocation

Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
`ActiveFrom`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time the associated location is active.
`ActiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time the associated location stops being active.
`AssociatedLocationNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated number identifying the associated location.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the associated location was last modified.
`LastViewedDate`	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The date the associated location was last viewed.
`LocationId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The location associated with the address.
`ParentRecordId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The account associated with the location.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Picklist of address types. The values are: • Bill To • Ship To

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AssociatedLocationHistory
History is available for tracked fields of the object.

AsyncApexJob

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`. Use this object to query Apex batch jobs in your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

The `enableAsyncRequiresViewSetup` field on the ApexSettings metadata type controls the activation of the critical update "Require View Setup permission to enqueue async Apex Jobs". In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

Field Name	Details
`ApexClassId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the Apex class executing the job. Label is `Class ID`.
`CompletedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the job was completed.
`ExtendedStatus`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** If one or more errors occurred during the batch processing, this contains a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the last user who modified the batch class. This field is available in API version 19.0 and later.
`JobItemsProcessed`	**Type** int **Properties** Filter, Group, Sort **Description** Number of job items processed. Label is `Batches Processed`.

Field Name	Details
`JobType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of job being processed. Valid values are: • `Future` • `SharingRecalculation` • `ScheduledApex` • `BatchApex` • `BatchApexWorker` • `TestRequest` • `TestWorker` • `ApexToken` • `Queueable`
`MethodName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the Apex method being executed. Label is `Apex Method`.
`NumberOfErrors`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Total number of batches with a failure. A batch is considered transactional, so any unhandled exceptions constitute an entire failure of the batch. Label is `Failures`.
`ParentJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** For batch Apex jobs that run using chunking implementation, multiple child jobs of type `BatchApexWorker` are created. Each of these child job records contain the job Id of the parent Apex job that started their execution. For batch Apex jobs that run using a non-chunking implementation, child jobs are not created.

Field Name	Details
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The status of the job. Valid values are: • Holding[1] • Queued • Preparing • Processing • Aborted • Completed • Failed [1] This status applies to batch jobs in the Apex flex queue.
TotalJobItems	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Total number of batches processed. Each batch contains a set of records. Label is Total Batches.

Usage

Use this object to query Apex batch jobs in your organization.

AsyncOperationLog

Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

Supported Calls

delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete()

Special Access Rules

This object is only available in Omnichannel Inventory orgs.

Fields

Field	Details
AsyncOperationNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated number assigned to the operation.
Description	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Description of the operation.
Error	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The error message for the operation. Applies only if the operation has an error.
ExternalReference	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The unique external reference ID per type.
FinishedAt	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time the operation finished.
LastStatusUpdateAt	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date and time the status of the operation was last updated.
`Request`	**Type** textarea **Properties** Nillable **Description** The request sent to the external service.
`Response`	**Type** textarea **Properties** Nillable **Description** The full response from the external service.
`StartedAt`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time the operation started.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The status of the operation. Possible values are: • `Completed` • `Error` • `In Progress` • `New`
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description The type of operation that is being tracked. Possible values are: • `Location Management`

AttachedContentDocument

This read-only object contains all `ContentDocument` objects associated with an object.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the attached `ContentDocument`.
`ContentSize`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Size of the document in bytes.
`ContentUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the `FileType`. This field is available in API version 31.0 and later.

Field Name	Details
ExternalDataSourceName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of the external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 32.0 and later.
ExternalDataSourceType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Type of external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in APIAPI version 35.0 and later.
FileExtension	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the attached `ContentDocument`. This field is available in API version 31.0 and later.
FileType	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of document, determined by the file extension.
LinkedEntityId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the record the `ContentDocument` is attached to.

Field Name	Details
SharingOption	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Allowed`, which means that new shares are allowed. When set to `Restricted`, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.
Title	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Title of the attached `ContentDocument`.

Usage

Use this object to list all `ContentDocument` objects attached to an object via a feed post.

To retrieve `ContentDocument` objects, issue a describe call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

AttachedContentNote

This read-only object contains all ContentNote objects associated with an object. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

- Notes must be enabled.
- Chatter must be enabled.

Fields

Field Name	Details
ContentDocumentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the attached ContentNote
ContentSize	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Size of the note in bytes.
FileExtension	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the attached ContentNote.
FileType	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of file for the note. All notes have a file type of SNOTE.
LinkedEntityId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the record the ContentNote is attached to.
TextPreview	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** A preview of the note, up to 255 characters.
`Title`	**Type** string **Properties** Filter, Group, Sort **Description** Title of the note.

Usage

Use this object to list all `ContentNote` objects attached to an object.

To retrieve `ContentNote` objects, issue a describe call on an object, which returns a query result for each note created or attached. You can't directly query this object.

Attachment

Represents a file that a User has uploaded and attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Body`	**Type** base64 **Properties** Create, Update **Description** Required. Encoded file data.
`BodyLength`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Size of the file (in bytes).
`ConnectionReceivedId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
`ConnectionSentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
`ContentType`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The content type of the attachment. If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`. When you insert a document or attachment through the API, make sure that this field is set to the appropriate MIME type.
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description Description of the attachment. Maximum size is 500 characters. This field is available in API version 18.0 and later.
`IsEncrypted`	This information is about Shield Platform Encryption and not Classic Encryption. **Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the attachment is encrypted using Shield Platform Encryption (`true`) or not (`false`). This field is available in API version 34.0 and later.
`IsPartnerShared`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this record is shared with a connection using Salesforce to Salesforce. Label is `Is Shared With Partner`.
`IsPrivate`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this record is viewable only by the owner and administrators (`true`) or viewable by all otherwise-allowed users (`false`). During a create or update call, it is possible to mark an Attachment record as private even if you are not the owner. This can result in a situation in which you can no longer access the record that you just inserted or updated. Label is **Private**. Attachments on tasks or events can't be marked private.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of the attached file. Maximum size is 255 characters. Label is **File Name**.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the User who owns the attachment. This field was required previous to release 9.0. Beginning with release 9.0, it can be null on create. The owner of an attachment on a task or event must be the same as the owner of the task or event.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the parent object of the attachment. The following objects are supported as parents of attachments: • Account • Asset • Campaign • Case • Contact • Contract • Custom objects • EmailMessage • EmailTemplate • Event • Lead • Opportunity • Product2 • Solution • Task

Note: If you are importing Attachment data and want to set the value for an audit field, such as `CreatedDate`, contact Salesforce. For example, for compliance reasons, you may prefer to set the `CreatedDate` to the date the record was originally created in your system, rather than the date it was imported into Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

The API sends and receives the binary file attachment data encoded as a base64Binary data type. Before creating a record, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

The create call restricts these files to a maximum size of 25 MB. For a file attached to a Solution, the limit is 1.5 MB. The maximum email attachment size is 3 MB.

The API supports attachments on email in create, delete, or update calls. The query call does not return attachments parented by email, unless the user performing the query has the “Modify All Data” permission.

Note:

- Attachment records are not searched during text searches.
- When issued by an administrator, the query results include Attachment records from the Recycle Bin.
- When issued by a non-administrator, the `queryAll()` call results do not include Attachment records from the Recycle Bin.

Access to fields depends on the method being used:

- All of the fields are accessible using the `describeSObjects()` and `query()` calls. With the `create()` call, you can insert the `Name`, `ParentId`, `Body`, `IsPrivate`, and `OwnerId` fields.
- To modify existing records, the `update()` call gives you access to change the `Name`, `Body`, `IsPrivate`, and `OwnerId` fields.
- You can access all of the fields using a `query()` call. However, you can't receive the `Body` field for multiple records in a single `query()` call. If your query returns the `Body` field, your client application must ensure that only one row with one Attachment is returned; otherwise, an error occurs. A more effective approach is to return IDs (but not Attachment records in the `Body` field) from a `query()` call and then pass them into `retrieve()` calls that return the `Body` field.
- For information about accessing the attachments of archived activities, see Archived Activities.

SEE ALSO:

Note

Audience

Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
`AudienceName`	**Type** string

Field	Details
	Properties Filter, Group, Sort, Update **Description** Name of the audience.
`ContainerId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the site or org that contains the audience. ContainerId is nillable in API versions 47.0 and earlier.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Description of the audience.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort, Update **Description** The unique name of the audience in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`FormulaFilterType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Formula filter for the criteria used to define the audience. Valid values are: • `AllCriteriaMatch`—Matching all the conditions (AND). • `AnyCriterionMatches`—Matching at least one condition (OR).

Field	Details
	• `CustomLogicMatches`—Matching condition logic (AND and OR) and numbered criteria groups. This value is available in API version 45.0 and later.
`Language`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Language of the audience. Valid values are: • Chinese (Simplified): `zh_CN` • Chinese (Traditional): `zh_TW` • Danish: `da` • Dutch: `nl_NL` • English: `en_US` • Finnish: `fi` • French: `fr` • German: `de` • Italian: `it` • Japanese: `ja` • Korean: `ko` • Norwegian: `no` • Portuguese (Brazil): `pt_BR` • Russian: `ru` • Spanish: `es` • Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: `sv` • Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort, Update **Description** Master label for the audience. This internal name doesn’t get translated.

AuraDefinition

Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field Name	Details
`AuraDefinitionBundleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the bundle containing the definition. A bundle contains a Lightning definition and all its related resources.
`DefType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The definition type. Valid values are: • `APPLICATION` — Lightning Aura Components app • `CONTROLLER` — client-side controller • `COMPONENT` — component markup • `EVENT` — event definition • `HELPER` — client-side helper • `INTERFACE` — interface definition • `RENDERER` — client-side renderer • `STYLE` — style (CSS) resource • `PROVIDER` — reserved for future use • `MODEL` — deprecated, do not use • `TESTSUITE` — reserved for future use

Field Name	Details
	• `DOCUMENTATION` — documentation markup • `TOKENS` — tokens collection • `DESIGN` — design definition • `SVG` — SVG graphic resource • `MODULE` — reserved for future use
`Format`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The format of the definition. Valid values are: • `XML` for component markup • `JS` for JavaScript code • `CSS` for styles • `TEMPLATE_CSS` reserved for future use • `SVG` for an SVG graphic
`Source`	**Type** textarea **Properties** Create, Update **Description** The contents of the definition. This is all the markup or code for the definition.

Usage

For more information, see the Lightning Aura Components Developer Guide.

AuraDefinitionBundle

Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
ApiVersion	**Type** double **Properties** Create, Filter, Sort, Update **Description** The API version for this bundle. Every bundle has an API version specified at creation.
Description	**Type** textarea **Properties** Create, Filter, Group, Sort, Update **Description** The text description of the bundle. Maximum size of 255 characters.
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the `MasterLabel`.
MasterLabel	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Sort, Update **Description** Master label for the Lightning bundle. This internal label doesn't get translated.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

For more information, see the Lightning Aura Components Developer Guide.

AuraDefinitionBundleInfo

For internal use only.

AuraDefinitionInfo

For internal use only.

AuthConfig

Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

The fields for this object control the options that display on the login page of an org configured with a My Domain, an Experience Cloud site, or custom domain.

- Logging in with a username and password
- Using SAML for single sign-on
- Authentication provider logins from a third-party service, such as Facebook or Twitter

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have “View Setup and Configuration” permission to view the settings.

Fields

Field Name	Details
`AuthOptionsAuthProvider`	**Type** boolean **Properties** Filter **Description** If `true`, at least one Auth. Provider is selected to show up on the login page, and this object has child AuthConfigProvider objects for each provider.
`AuthOptionsCertificate`	**Type** boolean **Properties** Filter **Description** If `true`, certificate-based login displays on the My Domain login page.
`AuthOptionsSaml`	**Type** boolean **Properties** Filter **Description** If `true`, at least one SAML configuration is selected to show up on the login page. If the organization has only one SAML configuration, this value indicates whether that configuration is selected to show up on the login page. If the organization has multiple SAML configurations, see the child AuthConfigProvider objects for each configuration.

Field Name	Details
AuthOptionsUsernamePassword	**Type** boolean **Properties** Filter **Description** If `true`, the login option for a username and password appears on the login page.
DeveloperName	**Type** string **Properties** Filter, Group, Sort **Description** The name of the domain created using My Domain or, for an Experience Cloud site, a concatenated string of *`site name_site prefix`*.
IsActive	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Whether this configuration is in use.
Language	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language for the organization.
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** The text that’s used to identify the Visualforce page in Setup.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The organization type for this object. • `Org` (includes custom domains) • `Community` • `Site` • Portal
`Url`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The login URL of the organization for this AuthConfig object. Each URL has only one associated AuthConfig object.

AuthConfigProviders

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

This object links the authentication configuration for an organization to the Auth. Provider through the `AuthOptionsAuthProvider` field of the AuthConfig object. The login page of a Community or My Domain can allow multiple SAML configurations and multiple authentication providers. These configurations can be set to show up as buttons on the login page. Each configuration has an AuthConfigProvider object.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

Fields

Field Name	Details
`AuthConfigId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID for this configuration.
`AuthProviderId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the Auth. Provider or SAML configuration.

AuthorizationForm

Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
DefaultAuthFormTextId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The ID of the default authorization form text to use if text isn't available for a specific language.
EffectiveFromDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the authorization form takes effect.
EffectiveToDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the authorization form is no longer in effect.
IsSignatureRequired	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the authorization form requires a signature.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the authorization form.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this customer.
`RevisionNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The revision number of the authorization form. For example, "rev1.21."

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AuthorizationFormHistory
History is available for tracked fields of the object.

AuthorizationFormOwnerSharingRule
Sharing rules are available for the object.

AuthorizationFormShare
Sharing is available for the object.

AuthorizationFormConsent

Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
`AuthorizationFormTextId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The authorization form text that the Individual consented to.
`ConsentCapturedDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Required. The date and time that consent was given.
`ConsentCapturedSource`	**Type** string **Properties** Create, Filter, Group, Nillable Sort, Update **Description** Required. The source through which consent was captured. For example, user@example.com, www.example.com.
`ConsentCapturedSourceType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. The source type through which consent was captured. For example, phone, email, or website.

Field Name	Details
ConsentGiverId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the person consenting to the authorization form.
DocumentVersionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the document version for which consent is given.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it’s possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the authorization form consent.
OwnerId	**Type** reference

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the owner of the account associated with this customer.
`RelatedRecordId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of a record showing consent of an authorization form.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the authorization form. Possible values are: • `Seen` • `Signed`
`PartyId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** This field was removed in API version 47.0. Use`ConsentGiverId` instead.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AuthorizationFormConsentHistory
History is available for tracked fields of the object.

AuthorizationFormConsentOwnerSharingRule
Sharing rules are available for the object.

AuthorizationFormConsentShare
Sharing is available for the object.

AuthorizationFormDataUse

Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
`AuthorizationFormId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the associated authorization form record.
`DataUsePurposeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. Identifies the data use purpose record associated with the authorization form.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field Name	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the authorization form data use.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AuthorizationFormDataUseHistory
History is available for tracked fields of the object.

AuthorizationFormDataUseOwnerSharingRule
Sharing rules are available for the object.

AuthorizationFormDataUseShare
Sharing is available for the object.

AuthorizationFormText

Represents an authorization form's text and language settings. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
AuthorizationFormId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the associated authorization form record.
ContentDocumentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the ContentDocument that provides the authorization form's text.
FullAuthorizationFormUrl	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The URL where the full text of the authorization form is located.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Locale	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The combined language and locale ISO code that control the language of the authorization form text. `Locale` and `LocaleSelection` have the same function. Note: `Locale` can contain custom values not included in the picklist if added before version 47.0.
`LocaleSelection`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The combined language and locale ISO code that control the language of the authorization form text. `Locale` and `LocaleSelection` have the same function.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the authorization form text.
`SummaryAuthFormText`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A shortened version of the authorization form that is displayed to the user.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AuthorizationFormTextHistory

History is available for tracked fields of the object.

AuthProvider

Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Only users with Customize Application and Manage AuthProviders permissions can access this object.

Fields

Field Name	Details
`AppleTeam`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required when using Apple as a third-party authentication provider. A 10-character team ID, obtained from an Apple developer account. Available in API version 48.0 and later.
`AuthorizeUrl`	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** Required when creating an OpenID Connect authentication provider. The OAuth authorization endpoint URL. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.
`ConsumerKey`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The app's key that is registered at the third-party (external) authentication provider. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.

Field Name	Details
ConsumerSecret	**Type** string **Properties** Create, Nillable **Description** The consumer secret of the authentication provider that is registered at the third-party SSO provider. It's used by the consumer for identification to Salesforce. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. You can create your own consumer secret on `create()`. However, after you set it, you can't change the value.
CustomMetadataTypeRecord	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required when creating a custom authentication provider plug-in. The API name of the custom authentication provider. Available in API version 36.0 and later.
DefaultScopes	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** For OpenID Connect authentication providers, the scopes to send with the authorization request, if not specified when a flow starts. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Used when referring to the authentication provider from a program.
EcKey	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description Required when using Apple as a third-party authentication provider. Available in API version 48.0 and later.
ErrorUrl	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** A custom error URL for the authentication provider to use to report errors.
ExecutionUserId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required when specifying a registration handler class. The username of the Salesforce admin or system user who runs the Apex handler, which provides the context in which the Apex handler runs. For example, if the Apex handler creates a contact, the creation can be easily traced back to the registration process. In production, use a system user. The user must have the Manage Users permission. Available in API version 27.0 and later.
FriendlyName	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. A user-friendly name for the authentication provider.
IconUrl	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** The path to an icon to use as a button on the login page. Users click the button to log in with the associated authentication provider, such as Twitter or Facebook. Available in API version 32.0 and later.
IdTokenIssuer	**Type** string

Field Name	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Available when configuring an OpenID Connect authentication provider, the source of the authentication token in https: URI format. If provided, Salesforce validates the returned `id_token` value. OpenID Connect requires returning an `id_token` value with the `access_token` value. Available in API version 30.0 and later.
`LinkKickoffUrl`	**Type** url **Properties** Nillable **Description** The URL for linking existing Salesforce users to a third-party account. This field is read-only. Available in API version 43.0 and later.
`LogoutUrl`	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** The destination for users after they log out if they authenticated using single sign-on. The URL must be fully qualified with an http or https prefix, such as `https://acme.my.salesforce.com`. Available in API version 33.0 and later.
`OauthKickoffUrl`	**Type** url **Properties** Nillable **Description** The URL for obtaining OAuth access tokens for a third party. This field is read-only. Available in API version 43.0 and later.
`OptionsIncludeOrgIdInId`	**Type** boolean **Properties** Create, Filter, Update **Description** Used to differentiate between users with the same user ID from two sources (such as two sandboxes). If enabled (`true`), Salesforce stores the org ID of the

Field Name	Details
	third-party identity in addition to the user ID. After you enable this setting, you can't disable it. Applies only to a Salesforce-managed auth provider. Available in API version 32.0 and later.
`OptionsSendAccessTokenInHeader`	**Type** boolean **Properties** Create, Filter, Update **Description** If enabled (`true`), the access token is sent to the `UserInfoUrl` in a header instead of a query string. Available in API version 30.0 and later.
`OptionsSendClientCredentialsInHeader`	**Type** boolean **Properties** Create, Filter, Update **Description** Required when creating an OpenID Connect authentication provider. If enabled (`true`), the client credentials are sent in a header to the `tokenUrl` instead of a query string. The credentials are in the standard OpenID Connect Basic Credentials header format, which is `Basic <token>`, where `<token>` is the base64-encoded string `"clientkey:clientsecret"`. Available in API version 30.0 and later.
`OptionsSendSecretInApis`	**Type** boolean **Properties** Create, Filter, Update **Description** Determines whether the encrypted consumer secret appears in API responses. If enabled (default), the secret appears in the response. If disabled (`false`), responses don't include the consumer secret. For security, you can disable the setting. However, keep in mind that: • By disabling this setting, the consumer secret is excluded from API responses in all API versions. • Change sets and other metadata deployments break because both the consumer key and secret are expected. To fix this problem, insert the consumer key manually during deployment. Available in API version 47.0 and later.
`PluginId`	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** An existing Apex class that extends the `Auth.AuthProviderPluginClass` abstract class. Available in API version 39.0 and later.
`ProviderType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The third-party authentication provider to use. Valid values include: • `Apple`. Available in API version 48.0 and later. • `Facebook`. • `Salesforce`. • `Janrain`. • `LinkedIn`. Available in API version 32.0 and later. • `Twitter`. Available in API version 32.0 and later. • `OpenIdConnect`. Available in API version 29.0 and later. • `MicrosoftACS`—Microsoft Access Control Service provides authentication for a Microsoft Office 365 service, like SharePoint Online. Available in API version 31.0 and later. • `GitHub`—Provides authentication for a `GitHub` provider. Used to log in users of your Lightning Platform app to GitHub using OAuth. When logged in to GitHub, your app can make calls to GitHub APIs. The `GitHub` provider isn't available as an SSO provider, so users can't log in to your Salesforce org using their GitHub login credentials. Available in API version 35.0 and later. • `Custom`—A provider configured with a custom authentication provider plug-in. Available in API version 36.0 and later.
`RegistrationHandlerId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An existing Apex class that implements the `Auth.RegistrationHandler` interface.
`SsoKickoffUrl`	**Type** url

Field Name	Details
	Properties Nillable **Description** The URL for performing SSO into Salesforce from a third party by using its third-party credentials. This field is read-only. Available in API version 43.0 and later.
`TokenUrl`	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** The OAuth token endpoint URL of an OpenID Connect authentication provider. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.
`UserInfoUrl`	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** The OpenID Connect endpoint URL of the OpenID Connect authentication provider. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value.

AuthSession

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`CreatedDate`	**Type** dateTime

Field Name	Details
	Properties Defaulted on create, Filter, Sort **Description** The date and time this session was created. This field is a standard system field.
`Id`	**Type** id **Properties** Defaulted on create, Filter, Group, ID Lookup, Sort **Description** The current session's ID.
`IsCurrent`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If `true`, the session is a member of the user's current session family. This field is available in API version 37.0 and later.
`LastModifiedDate`	**Type** dateTime **Properties** Defaulted on create, Filter, Sort **Description** The date and time this session was last updated. A session expires when the current date and time equals `LastModifiedDate` + `NumSecondsValid`. This field is a standard system field.
`LoginGeoId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The 18-character ID for the record of the geographic location of the user for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary. This field is available in API version 34.0 and later.
`LoginHistoryId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The 18-character ID for a successful login event. When a session is reused, Salesforce updates the `LoginHistoryId` with the value from the most recent login. This field is available in API version 33.0 and later.
`LoginType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of login used to access the session. Possible values are: • `AJAX Toolkit` • `Apex Office Toolkit` • `AppExchange` • `Application` • `AppStore` • `Certificate-based login` • `Chatter Communities Eternal User Third Party SSO` • `Chatter Communities External User` • `Community` • `Customer Service Portal Third-Party SSO` • `Customer Service Portal` • `DataJunction` • `DB Replication` • `Employee Login to Community` • `Excel Integration` • `Help and Training` • `HOTP YubiKey` • `Lightning Login` • `Networks Portal API Only` • `Offline Client` • `Order Center` • `Other Apex API` • `Outlook Integration` • `Partner Portal Third-Party SSO` • `Partner Portal` • `Partner Product`

Field Name	Details
	• `Passwordless Login` • `Remote Access 2.0` • `Remote Access Client` • `Sales Anywhere` • `Salesforce Outlook Integration` • `Salesforce.com Website` • `SAML Chatter Communities External User SSO` • `SAML Customer Service Portal SSO` • `SAML Idp Initiated SSO` • `SAML Partner Portal SSO` • `SAML Sfdc Initiated SSO` • `SAML Site SSO` • `Self-Service` • `Signup` • `Sync` • `SysAdmin Switch` • `Third Party SSO` • `Validate`
`LogoutUrl`	**Type** string **Properties** Filter, Nillable, Sort **Description** The page or view to display after users log out of an Experience Cloud site, or an org if they authenticated using SAML. This field is available in API version 32.0 and later.
`NumSecondsValid`	**Type** int **Properties** Filter, Group, Sort **Description** The number of seconds before the session expires, starting from the last update time.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The 18-character ID for the parent session, if one exists (for example, if the current session is for a canvas app). If the current session doesn't have a parent, this value is the current session's own ID.
`SessionSecurityLevel`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Standard or High, depending upon the authentication method used.
`SessionType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of session. Common ones are UI, Content, API, and Visualforce.
`SourceIp`	**Type** string **Properties** Filter, Group, Sort **Description** IP address of the end user's device from which the session started. This address can be an IPv4 or IPv6 address.
`UserType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The kind of user for this session. Types include Standard, Partner, Customer Portal Manager, High Volume Portal, and CSN Only.
`UsersId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The user's Salesforce user ID.

Usage

The AuthSession object exposes session data and enables read and delete operations on that data. For example, use this object to create a report showing who is signed in to your organization. Or you can use this object to create a tool to delete a session, ending that user's session. For a user, only their own sessions are available, while administrators can see all sessions.

You can't change user sessions with this object. You can only read and delete them.

BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
`Error`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The error message for the operation. Applies only if the operation has an error status.
`ExecutionGroup`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the execution group.
`ExpiresAt`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** After this time, the operation is removed from the asynchronous job queue. Applies only if the operation has a status of complete, canceled, error, or merged.

Field Name	Details
`FinishedAt`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** When the operation reached the status of completed or error.
`GroupLeaderId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Identifies the operation that's selected as the leader of the execution group.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Identifies the background operation.
`NumFollowers`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Number of other operations that are in the execution group.
`ParentKey`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** Tag that identifies related sets of operations, if any.
`ProcessAfter`	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The operation is scheduled to be processed after this time.
`RetryBackoff`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Applies only if the operation has an error status. The first retry is attempted immediately. Each subsequent retry is increasingly delayed according to an exponential expression that's multiplied by the `RetryBackoff`, in milliseconds. Specifically, the delay time is $(2^{n}-1)\times R$, where `n` is the `RetryCount`, and `R` is the `RetryBackoff`. The default value for `RetryBackoff` depends on the type of operation. For example, the `RetryBackoff` default for write operations on external objects is 1,000 milliseconds. For write operations, retries are attempted immediately, after 3 seconds, after 7 seconds, after 15 seconds, and so on.
`RetryCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Number of attempted retries. Applies only if the operation has an error status.
`RetryLimit`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Maximum number of retries to attempt. Applies only if the operation has an error status.
`SequenceGroup`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description Identifies the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.
SequenceNumber	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Order position within the sequence group. Applies only if the operation is merged with other operations into an execution group to be processed in bulk. Within an execution group, operations can be placed into a sequence group to be executed in a specific order.
StartedAt	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** When the operation started running.
Status	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Status of the background operation. The options are: • New • Scheduled • Canceled • Merged • Waiting • Running • Error • Complete
SubmittedAt	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** When the operation was added to the job queue.
`Timeout`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Maximum time in milliseconds to wait for results after the operation started running.
`WorkerUri`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** URI of the worker that performed the operation. Example for a Salesforce Connect OData operation: `services/data/v35.0/xds/upsert`

Usage

The BackgroundOperation object lets you:

- Monitor the job status of asynchronous operations.
- View errors that are related to the asynchronous operations.
- Extract statistics for the asynchronous job queue.

BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

Each instance of `BackgroundOperationResult` represents one error. The `Message` field stores the text of the error message. The `ParentID` field stores the:

- job ID of the query, in case of Async SOQL
- batch ID for the data import, in case of Bulk API

Bulk API validates data at the time of import, and generates an error message for the first occurrence of invalid data in any row of the data file. The validation performed depends on the type of data being imported.

- **Text**—The length of the input string must be less than or equal to the length of the corresponding text field in the target object.
- **Number**—The input data must be a number, whose scale and precision are compatible with the corresponding number field in the target object.
- **ID—**The input data must be a valid 15- or 18-character ID.
- **DateTime**—The input data must be a valid dateTime value, in the approved format.
- **Lookup**—The lookup value must be a valid 15- or 18-character ID.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`CreatedById`	**Type** ID **Properties** Nillable **Description** The user ID of the user initiating the Bulk API or Async SOQL request.
`CreatedDate`	**Type** dateTime **Properties** Defaulted on create **Description** The date and time at which the Bulk API or Async SOQL request was made.
`Data`	**Type** string **Properties** Nillable **Description** The data that generated the error message. The total length is limited to 2,000 characters, and each column can occupy a maximum of 50 characters. Any data exceeding those limits is truncated.
`Id`	**Type** ID **Properties** Defaulted on create, idLookup

Field Name	Details
	Description The ID of the error message.
`Message`	**Type** string **Properties** Nillable **Description** The text of the error message.
`MessageType`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The type of error message. The possible values are: ERROR, WARNING, or INFO.
`ParentId`	**Type** reference **Properties** Filter, Sort **Description** The batch ID, in case of Bulk API, or the job ID, in case of Async SOQL.

Usage

You can check for errors by querying the `BackgroundOperationResult` object. For example, this query returns details of all errors in a data file imported using Bulk API, whose batch ID is `751xx000000006OAAQ`.

```
SELECT CreatedbyId, CreatedDate, Id, Message, MessageType, ParentId FROM
BackgroundOperationResult WHERE ParentId = “751xx000000006OAAQ”
```

Note: You can only view errors resulting from Async SOQL or Bulk API requests that you initiated, unless you have the global permission to view all data.

BatchApexErrorEvent

The documentation has moved to BatchApexErrorEvent in the *Platform Events Developer Guide*.

Bookmark

Represents a link between opportunities that share common information.

This object is available to organizations with the Similar Opportunities feature enabled.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`ID`	**Type** ID **Properties** Defaulted on create, Filter **Description** ID of the bookmark. Label is **Bookmark ID**.
`FromId`	**Type** ID **Properties** Filter **Description** The originating opportunity. Label is **Bookmarked From ID**
`ToId`	**Type** ID **Properties** Filter **Description** The opportunity to which the originating opportunity is linked. Label is **Bookmarked To ID**.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.

Usage

The Bookmark object works with the Opportunity object only.

Use this read-only object to query the bookmarks between opportunities in your organization. In the online application, users can search for opportunities that share attributes with their opportunity. The user can then bookmark the appropriate opportunities for future reference.

BrandTemplate

Letterhead for HTML EmailTemplate.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`Description`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the letterhead. Limited to 1000 characters.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Letterhead Unique Name**. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

Field	Details
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the letterhead is available for use (`true`) or not (`false`). Label is **Active**.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Label of the template as it appears in the user interface. Limited to 255 characters. Label is **Brand Template Name**.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Value`	**Type** textarea **Properties** Create, Update **Description** The contents of the letterhead, in HTML, including any logos.

Usage

Use this object to brand EmailTemplate records with your letterhead. You can also set a brand template to active or inactive. For example, if you have five different marketing brands, you can maintain each different brand in one template, and assign to the appropriate EmailTemplate.

SEE ALSO:

EmailTemplate

BriefcaseAssignment

Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

Use this object to assign selected records for users and groups to view offline. Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`BriefcaseId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the briefcase definition. Label is **Briefcase Definition ID**.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the user or group requiring access to the briefcase. Label is **User or Group ID**.

BriefcaseDefinition

Represents a briefcase definition. A briefcase makes selected records available for users to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.

Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Packaging Considerations

An org can have up to 5 briefcases. Installed briefcases are counted against this limit. You can't install a package that includes a briefcase if your org already has 5 briefcases. When a managed package includes a briefcase, the only changes allowed for the briefcase are activating or deactivating and assigning users or groups to the briefcase.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Description of the briefcase definition. Limited to 1024 characters.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Limited to 80 characters. Label is **Name**.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the briefcase is available for use (`true`) or not (`false`). Label is **Active**.
`Language`	**Type** picklist

Field	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** The language for the briefcase. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned. Possible values are: • Chinese (Simplified): `zh_CN` • Chinese (Traditional): `zh_TW` • Danish: `da` • Dutch: `nl_NL` • English: `en_US` • Finnish: `fi` • French: `fr` • German: `de` • Italian: `it` • Japanese: `ja` • Korean: `ko` • Norwegian: `no` • Portuguese (Brazil): `pt_BR` • Russian: `ru` • Spanish: `es` • Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: `sv` • Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** The master label for the briefcase. This internal label doesn’t get translated. Limited to 80 characters.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use this object to query a briefcase or a list of briefcases with selected records and user assignments. For example:

```
SELECT Id, Description FROM BriefcaseDefinition
WHERE Id in (SELECT BriefcaseId FROM BriefcaseRule
WHERE TargetEntity='Account')
AND Id in (SELECT BriefcaseId FROM BriefcaseAssignment where
UserOrGroupId='00GR0000000VtwUMAS')
```

BriefcaseRule

Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`BriefcaseId`	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description Required. ID of the briefcase definition. Label is **Briefcase Definition ID**.
`FilterLogic`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The filter logic for record selection, for example, `1 AND 2` where 1 and 2 correspond to filter 1 and filter 2. Filter logic operators include `AND` and `OR`. Limited to 255 characters. Label is **Filter Logic**.
`IsAscendingOrder`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether the records should be sorted in ascending order. Label is **Ascending**.
`OrderBy`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The field to order the records by, which determines how the records can be sorted. For example, `AccountName` or `CreatedBy`. Label is **Order By**.
`QueryScope`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. A group of records to restrict the scope of this rule. Possible values are: • `assignedToMe` • `everything` The default value is `everything` (All Records). The value `assignedToMe` is available only for the `ServiceAppointment` object.
`RecordLimit`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The record limit for the object. The recommended number for record limit is up to 500 records per object for optimal performance. The maximum number is 2000. Label is **Limit**.
`TargetEntity`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The standard or custom object that the briefcase rule evaluates. Label is **Target Object**.

BriefcaseRuleFilter

Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`BriefcaseRuleId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. ID of the briefcase rule.
`FilterOperator`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The comparison operator for this rule filter. Possible values are: • `d`—Ends with

Field	Details
	• `e`— Equals • `g`—Greater than • `h`—Greater than or equal • `i`—Like • `l`—Less than • `m`—Less than or equal • `s`—Starts with
`FilterSeqNumber`	**Type** int **Properties** Filter, Group, Sort **Description** Required. The filter number. When you apply multiple filters, the filters are numbered sequentially, 1, 2, 3, and so on.
`FilterValue`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The value for the field and criteria. For example, `true` or `false` for a boolean field whose criteria or filter operator is Equals. Capitalization matters with date filter operators. Be sure to specify date literals in uppercase. Some valid date literals include TODAY, YESTERDAY and TOMORROW.
`TargetEntityField`	**Type** picklist **Properties** Restricted picklist **Description** Required. The field to filter by. Compound fields and encrypted fields aren't supported. Label is **Field**.

BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

If business hours are associated with any Holiday records, then business hours and escalation rules associated with business hours are suspended during the dates and times specified as holidays.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view business hours via the API.

Fields

Field	Details
`BusinessHoursId`	**Type** reference **Properties** Filter, Group, Nillable,Sort **Description** ID of the BusinessHours associated with the SlaProcess.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the business hours is active (`true`) or not active (`false`).
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the business hours.
`IsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the business hours are set as the default business hours (`true`) or not (`false`).
`LastViewedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date when the business hours were last viewed.
`FridayEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
`FridayStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
`MondayEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
`MondayStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
`SaturdayEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
`SaturdayStartTime`	**Type** time

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
`SundayEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
`SundayStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
`ThursdayEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
`ThursdayStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
`TimeZoneSidKey`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The time zone of the business hours.
`TuesdayEndTime`	**Type** time

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
TuesdayStartTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.
WednesdayEndTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business closes.
WednesdayStartTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Time that business opens.

Usage

Use this object to specify the business hours at which your support team operates. Escalation rules only run during the business hours with which they are associated. To set business hours to 24-hours a day, set the times from midnight to midnight (00:00:00 ~ 00:00:00) on each day.

By default, business hours are set from 12:00 AM to 12:00 AM in the default time zone specified in your organization's profile.

SEE ALSO:

Object Basics

BusinessProcess

Represents a business process.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of this business process. Limit: 255 characters.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this business process can be presented to users in the Salesforce user interface (`true`) or not (`false`) when creating a new record type or changing the business process of an existing record type.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of this business process. Limit: 80 characters.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation.

Field	Details
	The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`TableEnumOrId`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Required. One of the following values: Case, Opportunity, or Solution. Label is **Entity Enumeration Or ID**.

Usage

Use the BusinessProcess object to offer different subsets of picklist values to different users for the LeadStatus, CaseStatus, and OpportunityStage fields. Similar to a RecordType, a BusinessProcess identifies the type of a row in a Case, Lead, or Opportunity and implies a subset of picklist values for these three fields. The values for the remaining picklist fields are driven by RecordType.

SEE ALSO:

Object Basics

BusinessProcessDefinition

Setup object that stores information about stages in a customer lifecycle map. The stages are associated with surveys and questions created using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`BusinessProcessGroupId`	**Type** reference

Field	Details
	Properties Filter, Group, Sort **Description** Unique identifier of the customer lifecycle map associated with the stage.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** Developer name of the stage.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the MasterLabel. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string

Field	Details
	Properties Filter, Group, Sort **Description** Label of the stage.
`ProcessDescription`	**Type** textarea **Properties** Nillable **Description** Description of the stage.
`SequenceNumber`	**Type** int **Properties** Filter, Group, Sort **Description** The position of the stage in the associated customer lifecycle map.

BusinessProcessFeedback

Setup object that stores information about the survey and the question associated with each stage in a customer lifecycle map. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`ActionName`	**Type** string **Properties** Filter, Group, Sort **Description** Name of the survey used to gather feedback.

Field	Details
ActionParam	**Type** string **Properties** Filter, Group, Sort **Description** Name of the question used to gather feedback.
ActionType	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Method of collecting feedback. Possible value is: • SURVEY—Survey
BusinessProcessDefinitionId	**Type** reference **Properties** Filter, Group, Sort **Description** Unique identifier of the stage associated with the survey and question.

BusinessProcessGroup

Setup object that stores information about customer lifecycle maps. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

Field	Details
CustomerSatisfactionMetric	**Type** picklist

Field	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** Represents the question type that measures the customers' Net Promote Score or satisfaction score across their lifecycle. Possible values are: • `NPS` • `Rating`
`Description`	**Type** textarea **Properties** Nillable **Description** Description of the customer lifecycle map.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** Developer name the customer lifecycle map.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the MasterLabel. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean

Field	Details
	• nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** Label of the customer lifecycle map.

BuyerGroupPricebook

Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

The BuyerGroupPricebook object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BuyerGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the buyer group that the price book record is assigned to.

Field	Details
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Determines whether the BuyerGroupPricebook is active (`true`) or not (`false`). Default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the Buyer Group Price Book record.
Pricebook2Id	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the price book assigned to the buyer group.
Priority	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The sequential priority used to determine the price of a product. This field is only available for web stores that use the **Priority** pricing strategy.

Usage

Use the BuyerGroupPricebook object to assign a price book to a set of buyer users. Assigning a price book to a buyer group allows buyers within that buyer group to retrieve product prices from the price book. When a buyer has multiple price book assignments, including multiple prices for the same product, the store Pricing Strategy determines the price.

Limits

The are organization limits on Buyer Group Price Book records, price books that you can associate to a given buyer group, and buyer groups that you can associate to a given price book.

- Maximum **total** number of Buyer Group Price Book records: 5,000
- Maximum number of price books associated to a given buyer group: 50
- Maximum number of buyer groups associated to a given price book: 100

Calendar

Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.

Newly created users are assigned a default calendar automatically. Similarly, holiday calendars are created automatically for each organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

Special Access Rules

Users with "View Setup and Configuration" user permissions can create, edit, and delete public and resource calendars in the user interface. All users, even those without the “View Setup and Configuration” user permission, can view calendars via the API.

Fields

All fields are readable only.

Field	Details
`IsActive`	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** This field indicates whether a user can save events to the calendar.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** A user provided name that identifies the calendar. It is text-indexed for searchability. Note that this is not an enumerated field; it can be any string to a maximum length of 80 characters.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of the calendar. Possible values are: • `Holiday` (Holiday Calendar) • `Public` (Public Calendar) • `Resource` (Resource Calendar) • `User` (User Calendar)
`UserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the user that owns that calendar record. If Type=User, there's a UserID associated (foreign key reference to the user). Otherwise, the user field is null.

CalendarView

These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

All fields and entities referenced by field values must be accessible by the CalendarView creator even if the creator isn't the CalendarView owner.

Fields

Field	Details
`Color`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** Represents the color used in the background for records displayed in a user's calendar view within the user interface.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`DateHandlingType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Determined by the data type of the `StartField`. Valid values include: • `Date` • `Datetime`
`DisplayField`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description Represents the `SobjectType` field used as the subject for records displayed in a user's calendar view within the user interface.
`EndField`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An optional field that represents the sObjectType field used as the end time for records displayed in a user's calendar view within the user interface. Must be a date or dateTime field that matches the type in `StartField`.
`FillPattern`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the pattern displayed as the background for records displayed in a user's calendar view within the user interface. Valid values include: • `verticalStripes` • `ascDiagonalStripes` • `descDiagonalStripes`
`IsDisplayed`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Defines whether users can see a calendar's records in their calendar view in the user interface. When `true`, records are visible in the user's calendar view. When `false`, records are hidden from the user's calendar view. The default is `true`.
`ListViewFilterId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** References the ListView used to filter records represented by the CalendarView. ListView must have the same sObjectType. If no `ListViewFilterId` is defined, the calendar displays only records with the same owner as the CalendarView.

Field	Details
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** A user-provided name that identifies the calendar. This isn't an enumerated field; it can be any string to a maximum length of 80 characters.
OwnerId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Represents the owner of the CalendarView.
PublisherId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Represents the user, user list, public, or resource calendar from where event data is populated.
SobjectType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of standard or custom Salesforce object that is used to create records for the CalendarView. Use the API name of the desired `SobjectType`.
StartField	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Represents the `SobjectType` field used as the start time for records displayed in a user's calendar view within the user interface. Must be a date or dateTime field type.

Usage

To distribute a CalendarView to multiple users, IDs can be pulled from a group, user list, or profile. For this example, a CalendarView based on opportunity close dates is being distributed to a sales team in a public group, Sales Group:

```
Group userGroup = [SELECT Id FROM Group WHERE Name = 'Sales Group' LIMIT 1];
List<Id> groupId = new List<Id>();
groupId.add(userGroup.id);
List<GroupMember> groupMembers = [SELECT UserOrGroupId FROM GroupMember
   WHERE GroupId IN: groupId];

List<CalendarView> calendarViews = new List<CalendarView>();
for (GroupMember groupMember : groupMembers) {
   CalendarView calendarView = new CalendarView(name = 'Opportunity Close
    Dates', SobjectType = 'Opportunity', StartField = 'CloseDate', DisplayField =
    'Name', OwnerId = groupMember.UserOrGroupId);
   calendarViews.add(calendarView);
}
insert calendarViews;
```

CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`AdapterUrl`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** An optional field that specifies the location of where the CTI adapter is hosted. For example, `http://localhost:11000`. This field is available in API version 23.0 or later.

Field	Details
CustomSettings	**Type** string **Properties** Create, Filter, Nillable, Sort **Description** Specifies settings in the call center definition file, such as whether the call center uses the Open CTI, and SoftPhone properties, such as height in pixels. This field is available for Open CTI and in API version 25.0 or later.
Id	**Type** ID **Properties** Defaulted on create, Filter **Description** System field that uniquely identifies this call center. Label is **Call Center ID**. This ID is created automatically when the call center is created.
InternalName	**Type** string **Properties** Create, Filter, Group, Sort **Description** The internal name of the call center. Limit is 80 characters.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort **Description** The name of the call center. Limit is 80 characters.
Version	**Type** double **Properties** Create, Filter, Nillable, Sort **Description** The version of the CTI Toolkit used to create the call center (for versions 2.0 and later). This field is available in API version 18.0 and later.

Usage

Create a call center or query an existing call center.

CallCoachConfigModifyEvent

Represents a Conversation Insights configuration change. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `describeSObjects()`

Fields

Field	Details
`ChangeType`	**Type** picklist **Properties** Create, Restricted picklist **Description** The type of configuration change made. Possible values are: • `FEATURE` • `OTHER` • `PROVIDER` • `USER`
`OrganizationId`	**Type** string **Properties** Create **Description** The ID of the Salesforce org with the related change.
`ProviderIdChange`	**Type** string **Properties** Create, Nillable **Description** The ID of the provider related to the change.

Field	Details
`ReplayId`	**Type** string **Properties** Nillable **Description** The ID of the related event as it is positioned in the event stream.

CallCoachingMediaProvider

Represents the media provider for call recordings. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Whether the connection with the provider is active or not.
`ProviderDescription`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the media provider.
`ProviderName`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort **Description** The name of the media provider.

CallDisposition

Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field	Details
`Disposition`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The result of a phone call, such as whether a call was connected or the rep left a voicemail.
`DispositionCategoryId`	**Type** reference **Properties** Filter, Group, Sort **Description** The related call outcome that is used in reports and branching criteria for sales cadences.

CallDispositionCategory

Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field	Details
`Category`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The name of the call outcome.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the call category. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian

Field	Details
	• `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** The static name of the call outcome.

CallTemplate

Represents a call script for users to read when making calls.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The description of the call script.
`HtmlBody`	**Type** textarea **Properties** Nillable **Description** The body content of the call script.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The time stamp that indicates when the current user last viewed a record that is related to this CallTemplate.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The time stamp that indicates when the current user last viewed this CallTemplate. If this value is null, this record might have been only referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The name of the call script.
OwnerId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user who owns the call script.
TemplateType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of call template. Possible values are: • Text

Field	Details
TotalCalls	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of calls that use the CallTemplate.
TotalCallsCallBackLater	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total Call Back Later call results that use the CallTemplate.
TotalCallsLeftVoicemail	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total Left Voicemail call results that use the CallTemplate.
TotalCallsMeaningfulConnect	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total Meaningful Connect call results that use the CallTemplate.
TotalCallsNotInterested	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total Not Interested call results that use the CallTemplate.
TotalCallsUncategorized	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total uncategorized call results that use the CallTemplate.

Field	Details
`TotalCallsUnqualified`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total Unqualified call results that use the CallTemplate.

Campaign

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`ActualCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Amount of money spent to run the campaign.
`AmountAllOpportunities`	**Type** currency **Properties** Filter, Sort **Description** Amount of money in all opportunities associated with the campaign, including closed/won opportunities. Label is **Value Opportunities in Campaign**.
`AmountWonOpportunities`	**Type** currency

Field	Details
	Properties Filter, Sort **Description** Amount of money in closed or won opportunities associated with the campaign. Label is **Value Won Opportunities in Campaign**.
`BudgetedCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Amount of money budgeted for the campaign.
`CampaignImageId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the campaign image. Available in API version 42.0 and later.
`CampaignMemberRecordTypeId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The record type ID for CampaignMember records associated with the campaign.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`Description`	**Type** textarea **Properties** Nillable **Description** Description of the campaign. Limit: 32 KB. Only the first 255 characters display in reports.

Field	Details
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Ending date for the campaign. Responses received after this date are still counted.
`ExpectedResponse`	**Type** percent **Properties** Filter, Nillable, Sort **Description** Percentage of responses you expect to receive for the campaign.
`ExpectedRevenue`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Amount of money you expect to generate from the campaign.
`HierarchyActualCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Calculated field for the total amount of money spent to run the campaigns in a campaign hierarchy. Label is **Total Actual Cost in Hierarchy**.
`HierarchyBudgetedCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Calculated field for the total amount of money budgeted for the campaigns in a campaign hierarchy. Label is**Total Budgeted Cost in Hierarchy**.
`HierarchyExpectedRevenue`	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description Calculated field for the total amount of money you expect to generate from the campaigns in a campaign hierarchy. Label is **Total Expected Revenue in Hierarchy**.
`HierarchyNumberSent`	**Type** double **Properties** Filter, Nillable, Sort **Description** Calculated field for the total number of individuals targeted by the campaigns in a campaign hierarchy. For example, the number of email messagess sent. Label is **Total Num Sent in Hierarchy**.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this campaign is active (`true`) or not (`false`). Default value is `false`. Label is **Active**.
`LastActivityDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Value is one of the following, whichever is the most recent: • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
`LastReferencedDate`	**Type** datetime **Properties** Filter, Nillable, Sort, **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** datetime **Properties** Filter, Nillable, Sort,

Field	Details
	Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Required. Name of the campaign. Limit: is 80 characters.
`NumberOfContacts`	**Type** int **Properties** Filter, Group, Sort **Description** Number of contacts associated with the campaign. Label is **Total Contacts**.
`NumberOfConvertedLeads`	**Type** int **Properties** Filter, Group, Sort **Description** Number of leads that were converted to an account and contact due to the marketing efforts in the campaign. Label is **Converted Leads**.
`NumberOfLeads`	**Type** int **Properties** Filter, Group, Sort **Description** Number of leads associated with the campaign. Label is **Leads in Campaign**.
`NumberOfOpportunities`	**Type** int **Properties** Filter, Group, Sort **Description** Number of opportunities associated with the campaign. Label is **Opportunities in Campaign**.

Field	Details
NumberOfResponses	**Type** int **Properties** Filter, Group, Sort **Description** Number of contacts and unconverted leads with a Member Status equivalent to “Responded” for the campaign. Label is **Responses in Campaign**.
NumberOfWonOpportunities	**Type** int **Properties** Filter, Group, Sort **Description** Number of closed or won opportunities associated with the campaign. Label is **Won Opportunities in Campaign**.
NumberSent	**Type** double **Properties** Filter, Nillable, Sort **Description** Number of individuals targeted by the campaign. For example, the number of emails sent. Label is **Num Sent**.
OwnerId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who owns this campaign. Default value is the user logging in to the API to perform the create.
ParentCampaign	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** The campaign above the selected campaign in the campaign hierarchy.
ParentId	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** ID of the parent Campaign record, if any.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object.
`StartDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Starting date for the campaign.
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Status of the campaign, for example, Planned, In Progress. Limit: 40 characters.
`TenantId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the associated Pardot business unit. Read-only. Available in API verson 51.0 and later.
`TotalAmountAllOpportunities`	**Type** currency **Properties** Filter **Description** Calculated field for total amount of all opportunities associated with the campaign hierarchy, including closed/won opportunities. Label is **Total Value Opportunities in Hierarchy**.

Field	Details
TotalAmountAllWonOpportunities	**Type** currency **Properties** Filter **Description** Calculated field for amount of all closed/won opportunities associated with the campaign hierarchy. Label is **Total Value Won Opportunities in Hierarchy**.
TotalNumberofContacts	**Type** int **Properties** Filter **Description** Calculated field for number of contacts associated with the campaign hierarchy. Label is **Total Contacts in Hierarchy**.
TotalNumberofConvertedLeads	**Type** int **Properties** Filter **Description** Calculated field for the total number of leads associated with the campaign hierarchy that were converted into accounts, contacts, and opportunities. Label is **Total Converted Leads in Hierarchy**.
TotalNumberofLeads	**Type** int **Properties** Filter **Description** Calculated field for total number of leads associated with the campaign hierarchy. This number also includes converted leads. Label is **Total Leads in Hierarchy**.
TotalNumberofOpportunities	**Type** int **Properties** Filter **Description** Calculated field for the total number of opportunities associated with the campaign hierarchy. Label is **Total Opportunities in Hierarchy**.

Field	Details
`TotalNumberofResponses`	**Type** int **Properties** Filter **Description** Calculated field for number of contacts and unconverted leads that have a `Member Status` equivalent to "Responded" for the campaign hierarchy. Label is **Total Responses in Hierarchy**.
`TotalNumberofWonOpportunities`	**Type** int **Properties** Filter **Description** Calculated field for the total number of won opportunities associated with the campaign hierarchy. Label is **Total Won Opportunities in Hierarchy**.
`Type`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Type of campaign, for example, Direct Mail or Referral Program. Limit: 40 characters.

Usage

Client applications can create, update, delete, and query Attachment records associated with a campaign via the API.

The Campaign object is defined only for those organizations that have the marketing feature enabled and valid marketing licenses. In addition, it is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the Campaign object.

Note: The main constituent of a campaign is a CampaignMember. You will commonly need to update campaigns with CampaignMember.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CampaignFeed (API version 18.0)
Feed tracking is available for the object.

CampaignHistory (API version 40.0)
History is available for tracked fields of the object.

CampaignOwnerSharingRule

Sharing rules are available for the object.

CampaignShare

Sharing is available for the object.

SEE ALSO:

Object Basics

CampaignInfluence

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

Note: This information applies only to Customizable Campaign Influence and not to Campaign Influence 1.0.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
`CampaignId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated campaign.
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the contact on the associated opportunity.

Field Name	Details
`Influence`	**Type** percent **Properties** Create, Defaulted on create, Filter, Nillable, Sort, Update **Description** The percentage of the associated opportunity's Amount field attributed to the associated campaign.
`ModelId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the campaign influence model associated with the record.
`OpportunityId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated opportunity.
`RevenueShare`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of revenue from the associated opportunity attributed to the associated campaign.

Usage

Use this object to create campaign influence records for your custom campaign influence models. Do not create campaign influence records for the Primary Campaign Source model. Records added to the Primary Campaign Source model via the API are deleted when the model is recalculated.

CampaignInfluenceModel

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

Note: This information applies only to Customizable Campaign Influence and not to Campaign Influence 1.0.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

Field Name	Details
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The API name of the influence model. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the model is active. Active models can generate campaign influence records. Deactivating a model deletes its campaign influence records. Custom models are always active and this field is ignored.
`IsDefaultModel`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the model is the default model (`true`) or not (`false`). `CampaignInfluence` records associated with the default model appear in 3 locations.

Field Name	Details
	• The Campaign Influence related list on opportunities • The Influenced Opportunities related list on campaigns • The Campaign Statistics section on campaigns The value of `IsDefaultModel` can only be true for 1 model at a time.
`IsModelLocked`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the model is locked (`true`) or not (`false`). Records for locked models can only be added, updated, or deleted via the API.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the influence model.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** The label for the influence model.
`ModelDescription`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The description of the influence model.
`ModelType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates whether the model is the Primary Campaign Source influence model, or a custom model. These values are the allowed.

Field Name	Details
	• 1: Primary Campaign Source Model • 2: Custom Model • 3: First Touch Model • 4: Last Touch Model • 5: Even Distribution Model • 6: Data-Driven Model
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`RecordPreference`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The value of this field determines when to create campaign influence records. • AllRecords: Creates records regardless of the revenue attribution percentage. • RecordsWithAttribution: Creates records only when the revenue attribution is greater than 0%.

CampaignMember

Represents the association between a campaign and either a lead or a contact.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`CampaignId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Campaign to which this Lead or Contact is associated.
`City`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The city for the address of the lead or contact.
`CompanyOrAccount`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The company or account of the lead or contact.
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** Required. ID of the Contact who is associated with a Campaign.
`CurrencyIsoCode`	**Type** picklist

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`Country`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The country for the address of the lead or contact.
`Description`	**Type** textarea **Properties** Nillable **Description** The description of the associated lead or contact.
`DoNotCall`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates that the contact does not wish to be called.
`Email`	**Type** email **Properties** Filter, Group, Nillable, Sort **Description** Email address for the contact or lead.
`Fax`	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** Fax number for the contact or lead.

Field	Details
FirstName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The first name of the contact or lead.
FirstRespondedDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Indicates the date on which the campaign member was first given a responded status.
HasOptedOutOfEmail	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the contact or lead would prefer not to receive email from Salesforce (`true`) or not (`false`).
HasOptedOutOfFax	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates that the contact or lead does not wish to receive faxes.
HasResponded	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the campaign member has responded to the campaign (`true`) or not (`false`). Label is **Responded**.
LastName	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The last name of the contact or lead. Limit is 80 characters.
LeadId	**Type** reference **Properties** Create, Filter, Group, Nillable,Sort **Description** Required. ID of the Lead who is associated with a Campaign.
LeadOrContactId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the associated lead or contact.
LeadOrContactOwnerId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the owner of the associated lead or contact.
LeadSource	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The source from which the lead was obtained.
MobilePhone	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** The mobile phone number of the lead or contact.
Name	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** First and last name of the contact or lead with which the campaign member is associated.
`Phone`	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** The phone number of the lead or contact.
`PostalCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The postal code of the lead or contact.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object. To change the record type, modify the `CampaignMemberRecordTypeId` field on the associated Campaign.
`Salutation`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** Salutation for the lead or contact.
`State`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The state for the address of the lead or contact. Limit is 80 characters.

Field	Details
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Controls the `HasResponded` flag on this object. You can't directly set the `HasResponded` flag, as it is read-only. You can set it indirectly by setting this field in a create or update call. Each predefined value implies a `HasResponded` flag value. Each time you update this field, you implicitly update the `HasResponded` flag. In the Salesforce user interface, Marketing users can define valid status values for the `Status` picklist. They can choose one status as the default status. For each `Status` field value, they can also select which values to count as "Responded," meaning that the `HasResponded` flag is set to `true` for those values. 40 character limit. Note: When creating or updating campaign members, use the text value for `Status` instead of the ID from the CampaignMemberStatus object.
`Street`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The street for the address of the lead or contact.
`Title`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Title for the lead or contact.
`Type`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates whether the campaign member is a lead or a contact.

Note: If you are importing CampaignMember data into Salesforce and want to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Each record has a unique ID, and must contain either a `ContactId` or a `LeadId`, but can't contain both. Any attempt to create a single record with both results in a successful insert but only the `ContactId` is inserted. However, you can create two separate records on a Campaign—one for the Lead and one for the Contact.

Standard fields from a Contact or Lead are associated with the CampaignMember object but you can't query them directly. To include a lead's `Phone` in your query, for example, query the field from the Lead object.

```
SELECT Id, (SELECT Phone FROM Lead)
FROM CampaignMember
```

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the CampaignMember object.

In API version 16.0 and later, a `create()` call only creates record; in earlier versions, a `create()` call creates and updates records. The API determines whether a record exists with the specified `CampaignId` and either `ContactId` or `LeadId`.

Note: Only use a `ContactId` or `LeadId`, but not both, unless you want to track lead-based campaign members you convert to contacts.

When using the API, the `create()` call only requires read access to campaigns.

If the record does not exist for the given `ContactId` or `LeadId`, then a new record is created. If the record exists, an error is returned and no update is made. To update an existing record, specify the ID of the CampaignMember record to update.

In API versions 15.0 and earlier, if you submit multiple records using a single create request, and if more than one record matches an existing record, only the first record submitted updates the existing record. If any of the submitted records match each other but do not match existing records, only the last record submitted is created.

To delete a record, specify the ID of the CampaignMember record to delete.

When creating or updating records, the `Status` field value specified in the call is verified as a valid status for the given Campaign:

- If the specified `Status` value is a valid status, the value is updated, and the `HasResponded` field is updated to either `true` or `false`, depending on the `Status` value association with `HasResponded`.
- If the specified `Status` value is not a valid status, the API assigns the default status to the `Status` field and updates the `HasResponded` field with the associated value. However, if the given Campaign does not have a default status, the API assigns the value specified in the call to the `Status` field, and the `HasResponded` field is set to `false`.

SEE ALSO:

Campaign

CampaignMemberStatus

CampaignMemberStatus

One or more member status values defined for a campaign.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

You can't delete a CampaignMemberStatus if that status is designated as the default status or if the status is currently used in a Campaign.

Fields

Field	Details
`CampaignId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the campaign associated with this member status.
`HasResponded`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this status is equivalent to “Responded” (`true`) or not (`false`). Beginning with API version 39.0, at least one `CampaignMemberStatus` on each campaign must have a `hasResponded` value of `true`.
`IsDefault`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this status is the default status (`true`) or not (`false`). Beginning with API version 39.0, there must be a default CampaignMemberStatus defined for every campaign.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`Label`	**Type** string

Field	Details
	Properties Filter, Sort **Description** Label for the status in the picklist. Limited to 765 characters.
`SortOrder`	**Type** int **Properties** Filter, Group, Sort, Update **Description** Unique number order where this campaign member status appears in the picklist.

Usage

Use this object to create picklist items for the member status in a campaign.

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in a `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the CampaignMember object.

SEE ALSO:

Campaign

CampaignMember

CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`CampaignAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target Group, or UserRole. The possible values are: • `Read` • `Edit` • `All`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. This field is available in API version 24.0 and later. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description The ID representing the source group. ACampaign owned by a User in the source Group triggers the rule to give access.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the User or Group being granted access.

Usage

Use this object to manage the sharing rules for campaigns.

SEE ALSO:

Metadata API Developer Guide: SharingRules

CampaignShare

Represents a sharing entry on a Campaign.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Campaign object can access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
`CampaignId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Campaign associated with this sharing entry. This field can't be updated.
`CampaignAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to the Campaign. The possible values are: • `Read` • `Edit` • `All` (This value is not valid for creating or updating records.) This field must be set to an access level that is higher than the organization's default access level for Campaign.
`RowCause`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to `Manual` (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values: • `Rule`—The User or Group has access via a Campaign sharing rule. • `GuestRule`—The User or Group has access via a Campaign guest user sharing rule. • `Manual`—The User or Group has access because a User with "`All`" access manually shared the Campaign with them. • `Owner`—The User is the owner of the Campaign. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group. • `ARImplicit`—The User, who belongs to a partner or customer account, has access to the Campaign via an account relationship data sharing rule.

Field	Details
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Campaign. This field can't be updated.

Usage

This object allows you to determine which users and groups can view or edit Campaign records owned by other users.

CampaignTag

Associates a word or short phrase with a Campaign.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.

Field Name	Details
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

CampaignTag stores the relationship between its parent TagDefinition and the Campaign being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CardPaymentMethod

References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Customer account for the payment method.
AuditEmail	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Email of the payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.
AutoCardType	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** Card network type, derived from the card number. This is a system field.
CardBin	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** First six digits of the card number.
CardCategory	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Defines whether the card is a credit card or debit card. Possible values are: • `CreditCard`—Credit Card

Field	Details
	• `DebitCard`—Debit Card
`CardHolderFirstName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** First name of the cardholder.
`CardHolderLastName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Last name of the cardholder.
`CardHolderName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Full name of the cardholder.
`CardLastFour`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** Last four digits of the credit card or debit card.
`CardPaymentMethodNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** System-defined unique ID for the card payment method.
`CardType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description Defines the credit card bank. Possible values are: • `AmericanExpress` • `DinersClub` • `JCB` • `Maestro` • `MasterCard` • `Visa`
`CardTypeCategory`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Defines the credit card bank. Used for internal reference. Possible values are: • `AmericanExpress` • `DinersClub` • `JCB` • `Maestro` • `Master` • `Visa`
`Comments`	**Type** textarea **Properties** Create, Nillable, Update **Description** Users can add comments to provide additional details about a record. Maximum of 1000 characters.
`CompanyName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Company of the cardholder.

Field	Details
DisplayCardNumber	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Masked digits for the full credit card number except the last four digits.
Email	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Email address of the card payment method holder.
ExpiryMonth	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The card's expiration month.
ExpiryYear	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The card's expiration year.
GatewayDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date that the card payment method interacted with the payment gateway.
GatewayResultCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The result of the card payment method's interaction with the payment gateway during a transaction request.
`GatewayResultCodeDescription`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional information about the gateway result code. Descriptions will vary between payment gateway providers.
`GatewayTokenDetails`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional information about the gateway token.
`GatewayToken`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Unique ID generated by the payment gateway for the card for future transactions.
`IpAddress`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** IP address of the card payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.
`InputCardNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description Input field for the card number. This field doesn't store the card number directly, but instead populates CardBin, LastFour, and DisplayCardNumber based on the value entered in InputCardNumber.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
MacAddress	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** MAC address of the card payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.
NickName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** User-defined nickname for the card payment method.
PaymentGatewayId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description The payment gateway used to create a gateway token. For transactions with a saved payment method in Salesforce, this field stores the payment gateway record used in the transaction.
PaymentMethodAddress	**Type** address **Properties** Filter, Nillable **Description** Full address related to the card payment method. Also known as the billing address.
PaymentMethodCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Part of the address for the payment method. Possible values are: • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State

Field	Details
	• `Street` • `Unknown` • `Zip`
`PaymentMethodLatitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Part of the address for the payment method.
`PaymentMethodLongitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Part of the address for the payment method.
`PaymentMethodPostalCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
`PaymentMethodState`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
`PaymentMethodStreet`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
`Phone`	**Type** phone

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Phone number of the card payment method holder. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own.
ProcessingMode	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Defines whether the card payment method is used for transactions made inside or outside the payment platform. Possible values are: • `External:` Transactions happened outside of the Salesforce payments platform. • `Salesforce:` Salesforce made and recorded an external call to the payment platform. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the CardPaymentMethod page layout on their own. Important: `ProcessingMode` is required to create a CardPaymentMethod entity.
SfResultCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Shows the results of the card payment method's interaction with the payment gateway. Possible values are: • `Decline` • `Indeterminate` • `PermanentFail` • `RequiresReview` • `Success` • `SystemError` • `ValidationError`
StartMonth	**Type** int

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Start month of the card.
StartYear	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Start year of the card.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Possible values are: • Active • Canceled • InActive

CartCheckoutSession

Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later.

A checkout session is tied to a single web cart, but there can be multiple checkout sessions for a single cart.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BackgroundOperationId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the in progress background operation.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The currency used for the checkout session. Default value is USD. Possible values are: • USD—U.S. Dollar
IsArchived	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether checkout processing is archived (true) or not (false). Once a session is archived, it can't be unarchived. Default value is false.
IsError	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the session is in error state (true) or not (false). Default value is false.
IsProcessing	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Determines whether checkout processing is in progress (true) or not (false). Default value is false.

Field	Details
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the checkout session.
`NextState`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The next state of the checkout session.
`OrderId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of a created order once the checkout session has gone from cart to order.
`State`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The current state of the checkout session.
`WebCartId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the cart that is used to create the checkout session.

CartDeliveryGroup

Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartDeliveryGroup object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`CartId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID the `WebCart on page 3079` that's associated with this delivery group.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ISO code for the currency that's specified on the buyer's account. Default value is `USD`. Possible values are: • `USD`—U.S. Dollar
`DeliverToAddress`	**Type** address **Properties** Filter, Nillable **Description** The address to which a buyer order is delivered.
`DeliverToCity`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The city to which a buyer order is delivered.

Field	Details
DeliverToCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The country to which a buyer order is delivered.
DeliverToGeocodeAccuracy	**Type** picklist **Properties** Aggregate, Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The geocode location to which a buyer order is delivered. Possible values are: • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State • Street • Unknown • Zip
DeliverToLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The latitude of a buyer delivery location.
DeliverToLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The longitude of a buyer delivery location.

Field	Details
DeliverToName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the person to which to deliver a buyer order.
DeliverToPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code to which to deliver a buyer order.
DeliverToState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The state to which to deliver a buyer order.
DeliverToStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street to which to deliver a buyer order.
DeliveryMethodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID for the delivery method to use to deliver a buyer order.
DesiredDeliveryDate	**Type** datetime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date that a buyer requests to have an order delivered.

Field	Details
GrandTotalAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of all cart items' `TotalAmount`, or `CartDeliveryGroup TotalAmount` plus `CartDeliveryGroup TotalTaxAmount`.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Name field, Sort, Update **Description** The name of this `CartDeliveryGroup` record. `Name` can be up to 255 characters.
ShippingInstructions	**Type** textarea **Properties** Create, Nillable, Update **Description** Instructions for delivering an order.
TotalAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of all cart items `TotalPrice`, or `TotalProductAmount` plus `TotalChargeAmount`.
TotalChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** Cart items can be of type Product or Charge. This field contains the sum of all the cart items `TotalPrice` for all cart items of the `CHARGE` type.
TotalChargeTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description Cart items can be of type Product or Charge. This field contains the Sum of all the cart items `TotalTaxAmount` for all cart items of the `CHARGE` type.
`TotalProductAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Cart items can be of type Product or Charge. This field contains the sum of all the cart items `TotalPrice` for all cart items of the `PRODUCT` type.
`TotalProductTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Cart items can be of type Product or Charge. Sum of all the cart items `TotalTaxAmount` for all cart items of the `PRODUCT` type.
`TotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of all cart items `TotalTaxAmount`, or `TotalProductTaxAmount` plus `TotalChargeTaxAmount`.

CartDeliveryGroupMethod

Represents the selected delivery method for a cart delivery group used in Lightning B2B Commerce checkout. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
CartCheckoutSessionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique ID used to identify your cart checkout session.
CartDeliveryGroupId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the cart delivery group associated with the checkout session.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The currency used for your shipping fee. Default value is `USD`. Possible values are: • `USD`—U.S. Dollar
DeliveryMethodId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the selected order delivery method.
ExternalProvider	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the external shipping method provider. Optional field.
Name	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Name of the delivery method.
`ShippingFee`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Shipping fee associated with the delivery method. Required field.
`WebCartId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the WebCart associated with the cart delivery group method. Required field.

Usage

Use the CartDeliveryGroupMethod object to give commerce buyers the ability to choose a delivery method for a cart delivery group. Shipping integrations populate the delivery options that are available for a cart delivery group.

CartItem

Represents an item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type `Product` or `Charge`. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartItem object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`AdjustmentAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Non-itemized adjustments for this cart item
`AdjustmentTaxAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The tax that's calculated on the `AdjustmentAmount`.
`CartDeliveryGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the `CartDeliveryGroup` that's associated with a cart item.
`CartId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the `WebCart` that's associated with a cart item.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ISO code for the currency that's specified on the buyer's account. Default value is `USD`. Possible values are: • `EUR`—Euro • `USD`—U.S. Dollar

Field	Details
ListPrice	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The original price of the cart item. Typically shown with a line through it. List price is shown only when it’s higher than the negotiated price. If the list price is the same or lower, it isn’t shown to the buyer.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of this `CartItem` record. `Name` can be up to 255 characters.
Product2Id	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of a product type cart item. Cart items can be of type `PRODUCT` or `CHARGE`.
Quantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The number of a given cart item in a cart.
SalesPrice	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The discounted price of a cart item.
Sku	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The Shelf-Keeping Unit ID of a cart item.
`TotalAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total cost of this cart item, including taxes and adjustments.
`TotalLineAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Total amount for this cart item, based on sales price and quantity.
`TotalLineTaxAmount`	**Type** currency **Properties** Defaulted on create, Filter, Nillable, Sort **Description** Total tax amount for `TotalLineAmount`.
`TotalListPrice`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Total amount for this cart item, based on `ListPrice`. We provide this value for comparison. It's not the price that the buyer is paying
`TotalPrice`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Total amount for this cart item, including adjustments but excluding taxes.
`TotalTaxAmount`	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** Total tax amount for this cart item. This value includes taxes for both `TotalLineAmount` and `AdjustmentAmount`.
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The `CartItem` type. Possible values are: • `Product` • `Charge`
`UnitAdjustedPrice`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Price per quantity unit after a discount or surcharge is applied. This field is available in API version 50.0 and later.
`UnitAdjustmentAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Discount or surcharge to apply to a quantity unit. This amount is added to the `SalesPrice` to get the `UnitAdjustedPrice`. This field is available in API version 50.0 and later.

WebCart

CartTax

Represents taxes for a line item in a `WebCart` that's active in a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartTax object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`Amount`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Calculated tax amount.
`CartId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the `WebCart` being taxed.
`CartItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of a cart item being taxed.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ISO code for the currency that’s specified on the buyer’s account. Default value is `USD`. Valid values include: • `USD`—U.S. Dollar

Field	Details
Description	**Type** textarea **Properties** Create, Nillable, Update **Description** A description of the tax. Enter up to 2000 characters.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of this `CartTax` record. `Name` can be up to 255 characters.
TaxCalculationDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date this tax was calculated.
TaxRate	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The applied tax rate for this line of tax.
TaxType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of tax for this line of tax. Possible values are: • `Actual` • `Estimated`

WebCart

CartValidationOutput

Associate errors to cart entities, such as cart line items, delivery groups, and the like, in a store built with B2B Commerce on Lightning Experience. An example error is "Out of stock." Available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CartValidationOutput object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`BackgroundOperationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the background operation that ran the validation.
`CartId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the related `WebCart`.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ISO code for the currency that's specified on the buyer's account. Default value is `USD`.Possible values are: • `EUR`—Euro • `USD`—U.S. Dollar

Field	Details
IsDismissed	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the validation process is finished. Default value is `false`.
Level	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Describes the type of output resulting from the validation process. Possible values are: • 0 (`Info`) • 1 (`Error`) • 2 (`Warning`)
Message	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Defines the message to show in the log when validation is complete. Message can be up to 255 characters.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of this `CartValidationOutput` record. `Name` can be up to 255 characters.
RelatedEntityId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Foreign key to `WebCart`, `CartItem`, and `CartDeliveryGroup`.
RelatedEntityPrefix	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Three-character prefix for the related entity.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The `CartValidationOutput` type. Possible values are: • 0 (`Inventory`) • 1 (`Taxes`) • 2 (`Pricing`) • 3 (`Shipping`) • 4 (`Entitlement`) • 5 (`System Error`) • 6 (`Other`)

CartItem

CartDeliveryGroup

Case

Represents a case, which is a customer issue or problem.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** ID of the account associated with this case.
`BusinessHoursId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the business hours associated with this case.
`Comments`	**Type** textarea **Properties** Create, Delete, Layout, Nillable, Query, Retrieve, Search, Sort, Undelete, Update **Description** Used to insert a new CaseComment. Email textarea has a length of 4000 chars.
`CaseNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Assigned automatically when each case is inserted. It can't be set directly, and it can't be modified after the case is created.
`ClosedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the case was closed.
`CommunityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the zone associated with this case. This field is available in API version 24.0 and later.

Field	Details
ConnectionReceivedId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
ConnectionSentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
ContactEmail	**Type** email **Properties** Filter, Group, Nillable, Sort **Description** Email address for the contact. The Case.ContactEmail field displays the Email field on the contact on page 725 that is referenced by Case.ContactId. Label is `Contact Email`. This field is available in API version 38.0 and later.
ContactFax	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** Fax number for the contact. Label is `Contact Fax`. This field is available in API version 38.0 and later.
ContactId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the associated contact.

Field	Details
ContactMobile	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** Mobile telephone number for the contact. Label is `Contact Mobile`. This field is available in API version 38.0 and later.
ContactPhone	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** Telephone number for the contact. Label is `Contact Phone`. This field is available in API version 38.0 and later.
CreatorFullPhotoUrl	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the user’s profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.
CreatorName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.
CreatorSmallPhotoUrl	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the user’s thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.

Field	Details
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A text description of the case. Limit: 32 KB.
`FeedItemId`	**Type** reference **Properties** Create, Group, Nillable, Sort **Description** ID of the question in Chatter associated with the case. This field is available in API version 33.0 and later, and is only accessible in organizations where Question-to-Case is enabled.
`HasCommentsUnreadByOwner`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a case contains comments that the case owner hasn't read (`true`) or not (`false`).
`HasSelfServiceComments`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a case has comments added by a Self-Service user (`true`) or not (`false`). Only visible when Customer Portal is enabled.
`IsClosed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the case is closed (`true`) or open (`false`). This field is controlled by the `Status` field; it can't be set directly. Label is `Closed`.
`IsClosedOnCreate`	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Indicates whether the case was closed at the same time that it was created (`true`) or not (`false`). This flag is read-only and is automatically set when a record is created. It can't be set to `true` unless the `IsClosed` flag is also `true`.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.
`IsEscalated`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the case has been escalated (`true`) or not. A case's escalated state does not affect how you can use a case, or whether you can query, delete, or update it. You can set this flag via the API. Label is `Escalated`.
`IsSelfServiceClosed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the case is closed for Self-Service users (`true`) or not (`false`).
`IsStopped`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether an entitlement process on a case is stopped (`true`) or not (`false`).
`IsVisibleInSelfService`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field	Details
	Description Indicates whether the case can be viewed in the Customer Service Portal, Partner Service Portal, and Self-Service Portal (`true`) or not (`false`). This field is applied for case visibility in the Partner Relationship Management, Customer Service Portal, and the earlier version of Self Service Portal. The field does not alter sharing and will not prevent usage of a direct URL to a case if a portal user has read or write access.
`Language`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the case. The Language field is available when you enable Einstein Case Classification in Enterprise, Performance, and Unlimited edition orgs with Service Cloud. By default, only Einstein Case Classification uses this field.
`LastReferencedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`MasterRecordId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If this object was deleted as the result of a merge, this field contains the ID of the record that was kept. If this object was deleted for any other reason, or has not been deleted, the value is `null`.

Field	Details
`Origin`	**Type** picklist **Properties** Create, Filter, Group, Nillable,Sort, Update **Description** The source of the case, such as `Email`, `Phone`, or `Web`. Label is `Case Origin`.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the contact who owns the case.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the parent case in the hierarchy. The label is `Parent Case`.
`Priority`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The importance or urgency of the case, such as `High`, `Medium`, or `Low`.
`QuestionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The question in the answers zone that is associated with the case. This field does not appear if you don't have an answers zone enabled.
`Reason`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The reason why the case was created, such as `Instructions not clear`, or `User didn't attend training`.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object.
`SlaStartDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Shows the time that the case entered an entitlement process. If you have the Edit permission on cases, you can update or reset the time. This field is available in API version 18.0 and later.
`SourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the social post source.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The status of the case, such as New, Closed, or Escalated. This field directly controls the `IsClosed` flag. Each predefined `Status` value implies an `IsClosed` flag value. For more information, see CaseStatus.
`StopStartDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time an entitlement process was stopped on the case.

Field	Details
	This field is available in API version 18.0 and later.
`Subject`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The subject of the case. Limit: 255 characters.
`SuppliedCompany`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The company name that was entered when the case was created. Label is `Company`.
`SuppliedEmail`	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The email address that was entered when the case was created. Label is `Email`. If your organization has an active auto-response rule, `SuppliedEmail` is required when creating a case via the API. Auto-response rules use the email in the contact specified by `ContactId`. If no email address is in the contact record, the email specified here is used.
`SuppliedName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name that was entered when the case was created. Label is `Name`.
`SuppliedPhone`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The phone number that was entered when the case was created. Label is `Phone`.
`Type`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The type of case, such as `Feature Request` or `Question`.

Note: If you are importing Case data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

Use the Case object to manage cases for your organization. Client applications can query, update, and delete Attachment records associated with a case via the API.

Assignment Rules

When you query or update a case, your client application can have the case automatically assigned to one or more User records based on assignment rules that have been configured in the user interface. To use this feature, your client application must set either of the following options (but not both) in the AssignmentRuleHeader used in the create or update:

Field	Field Type	Details
`assignmentRuleId`	reference	ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and `useDefaultRule` is `true`, then the default assignment rule is used. To find the ID for a given assignment rule, query the AssignmentRule object (specifying `RuleType="caseAssignment"`), iterate through the returned AssignmentRule objects, find the one you want to use, retrieve its ID, and then specify its ID in this field in the AssignmentRuleHeader.
`useDefaultRule`	boolean	Specifies whether to use the default rule for rule-based assignment (`true`) or not (`false`). The default rule is assigned by users in the Salesforce user interface.

For a code example that shows setting the AssignmentRuleHeader for a Lead (which is similar to setting the AssignmentRuleHeader for a Case), see Lead.

Separating Accounts from Contacts in Cases

In releases before 8.0, the `AccountId` could not be specified, it was derived from the contact's account. This behavior will continue to be supported in future releases, but you can also now specify an `AccountId`. If you do not specify the `AccountId` during the creation of a case, the value will default to the contact's `AccountId`.

Note: When a record is updated, if the `ContactId` has not changed, then the `AccountId` is not regenerated. This prevents the API from overwriting a value previously changed in the Salesforce user interface. However, if an API call changes the `ContactId` and the `AccountId` field is empty, then the `AccountId` is generated using the contact's account.

Using `_case` with Java

Depending on the development tool you use, you might need to write your application using `_case` instead of `Case`, because `case` is a reserved word in Java.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CaseFeed (API version 18.0)
Feed tracking is available for the object.

CaseHistory
History is available for tracked fields of the object.

CaseOwnerSharingRule
Sharing rules are available for the object.

CaseShare
Sharing is available for the object.

SEE ALSO:

Account

CaseMilestone

CaseArticle

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Access to this object is controlled by the parent Case and KnowledgeArticle. However, when querying, access is only controlled by the parent Case.

Customer Portal users can't access this object.

Fields

Field	Details
ArticleLanguage	**Type** picklist **Properties** Filter, Restricted picklist **Description** The language of the article associated with the case.
ArticleVersionNumber	**Type** int **Properties** Create, Group, Nillable **Description** The number assigned to a version of an article. This field is available in API version 24.0 and later.
CaseId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Case associated with the KnowledgeArticle.
IsSharedByEmail	**Type** int **Properties** Create, Group, Nillable **Description** Indicates that the article has been shared with the customer through an email.
KnowledgeArticleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the KnowledgeArticle associated with the Case.

Usage

This object represents the association of a knowledge article with a Case. An article is associated with a case when it's relevant to a specific issue, when it helps an agent solve the case, or when the agent sends the article to a customer.

You can use this object to include case-article associations in Apex and Visualforce.

You can't update this object via the API. If you attempt to create a record that matches an existing record, the create request simply returns the existing record.

SEE ALSO:

Case

KnowledgeArticle

CaseComment

Represents a comment that provides additional information about the associated Case.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CommentBody`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Text of the CaseComment. The maximum size of the comment body is 4,000 bytes. Label is **Body**.
`ConnectionReceivedId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
`ConnectionSentId`	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
`CreatorFullPhotoUrl`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the user's profile photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.
`CreatorName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of the user who posted the question or reply. Only the first name of internal users (agents) appears to portal users in the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.
`CreatorSmallPhotoUrl`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the user's thumbnail photo from the feed. Chatter Answers must be enabled to view this field. This field is available in API version 26.0 and later.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.

Field	Details
`IsNotificationSelected`	**Type** boolean **Properties** Create, Defaulted on create, Update **Description** Indicates whether an email notification is sent to the case contact when a CaseComment is created or updated. When this field is queried, it always returns null. This field is available only when the `Enable Case Comment Notification to Contacts` setting is enabled on the Support Settings page in Setup. To send email notifications for CaseComment, you must use the `EmailHeader triggerUserEmail`. Available in API version 43.0 and later.
`IsPublished`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the CaseComment is visible to customers in the Self-Service portal (`true`) or not (`false`). Label is **Published**. This is the only CaseComment field that can be updated via the API.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort, **Description** Required. ID of the parent Case of the CaseComment.

Note: If you're importing CaseComment data and must set the value for an audit field, such as `CreatedDate`, contact Salesforce. Record id's can't delete CaseComments entities when calling the Database.delete() Apex method or its analogous SOAP API. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

Usage

In the Salesforce user interface, comments are entered by a User working on a Case. All users have access to create and view CaseComment in the Salesforce user interface and when using the API. In the API, CaseComment records can't be modified after insertion unless the user has the "Modify All" object-level permission for Cases or the "Modify All Data" permission. If not, users can only update the `IsPublished` field, and can't delete CaseComment.

SEE ALSO:

Object Basics

CaseContactRole

Represents the role that a given Contact plays on a Case.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`CasesId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the cases associated with this contact.
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. ID of the contact.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`Role`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name of the role played by the contact on this case, such as Technical Contact, Business Contact, Decision Maker, and so on. Must be unique—there can't be multiple records in which the **CaseId**, `ContactId` , and `Role` values are identical. Different contacts can play the same role on the same case. A contact can play different roles on the same case.

Usage

Use this object to define the role that a given Case plays on a given Contact. For example, you can use this object to be able to see all contacts who are associated to a case, or, given a contact, be able to query all cases that they are associated with, even if they are not the primary contact on the case.

CaseHistory

Represents historical information about changes that have been made to the associated Case.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

This object is always read-only.

Fields

Field	Details
`CaseId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the Case associated with this record.
`DataType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Data type of the field that was changed.
`Field`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Name of the case field that was modified, or a special value to indicate some other modification to the case. The possible values, in addition to the case field names, are:

Field	Details
	• **ownerAssignment**—The owner of the case was changed. • **ownerAccepted**—A user took ownership of a case from a queue. • **ownerEscalated**—The owner of the case was changed due to case escalation. • **external**—A user made the case visible to customers in the Customer Self-Service Portal.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`NewValue`	**Type** anyType **Properties** Nillable, Sort **Description** New value of the modified case field. Maximum of 255 characters.
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** Previous value of the modified case field. Maximum of 255 characters.

Usage

Case history entries are indirectly created each time a case is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, `Jane Doe` is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

SEE ALSO:

Object Basics

CaseMilestone

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
`BusinessHoursId`	**Type** reference **Properties** Filter, Group, Nillable,Sort **Description** ID of the BusinessHours associated with the CaseMilestone.
`CaseId`	**Type** reference **Properties** Filter **Description** ID of the case.
`CompletionDate`	**Type** dateTime **Properties** Filter, Nillable, Update **Description** The date and time the milestone was completed.
`ElapsedTimeInDays`	**Type** double **Properties** Filter, Nillable **Description** The time required to complete a milestone in days.
`ElapsedTimeInHrs`	**Type** double

Field	Details
	Properties Filter, Nillable **Description** The time required to complete a milestone in hours.
`ElapsedTimeInMins`	**Type** int **Properties** Filter, Nillable **Description** The time required to complete a milestone in minutes.
`IsCompleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the milestone is completed (`true`) or not (`false`).
`IsViolated`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the milestone is violated (`true`) or not (`false`).
`MilestoneTypeId`	**Type** reference **Properties** Filter, Nillable **Description** The ID of the milestone on the case.
`StartDate`	**Type** dateTime **Properties** Filter, Nillable, Update **Description** The date and time the milestone started on the case.
`TargetDate`	**Type** dateTime

Field	Details
	Properties Filter **Description** The date and time the milestone must be completed.
`TargetResponseInDays`	**Type** double **Properties** Filter, Nillable, Sort **Description** The time to complete the milestone in days.
`TargetResponseInHrs`	**Type** double **Properties** Filter, Nillable, Sort **Description** The time to complete the milestone in hours.
`TargetResponseInMins`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The time to complete the milestone in minutes.
`TimeRemainingInDays`	**Type** double **Properties** Group, Nillable, Sort **Description** Time remaining to reach the milestone target, measured in days.
`TimeRemainingInHrs`	**Type** text **Properties** Nillable **Description** Time remaining to reach the milestone target, measured in hours.
`TimeRemainingInMins`	**Type** text

Field	Details
	Properties Group, Nillable, Sort **Description** Time remaining to reach the milestone target. The format is minutes and seconds.
`TimeSinceTargetInDays`	**Type** double **Properties** Nillable, Sort **Description** The time elapsed since the milestone target, measured in days.
`TimeSinceTargetInHrs`	**Type** string **Properties** Group, Nillable, Sort **Description** The time elapsed since the milestone target, measured in hours.
`TimeSinceTargetInMins`	**Type** string **Properties** Group, Nillable, Sort **Description** The time elapsed since the milestone target. The format is minutes and seconds.

Usage

This object lets you view a milestone on a case. It also lets you view if the milestone was completed and when it must be completed.

Case

MilestoneType

SlaProcess

CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`CaseAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of sharing being allowed. The possible values are: • `Read` • `Edit`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name

Field	Details
	in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. This field is available in API version 24.0 and later. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the target user or group. Target users or groups are given access.

Usage

Use this object to manage the sharing rules for cases. General sharing and territory management-related sharing use this object.

SEE ALSO:

Case

CaseShare

Metadata API Developer Guide: SharingRules

CaseShare

Represents a sharing entry on a Case.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only users with access to the Case object can access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
`CaseAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to the Case. The possible values are: • `Read` • `Edit` • `All` This value is not valid for creating or deleting records. This field must be set to an access level that is higher than the organization's default access level for cases.
`CaseId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Case associated with this sharing entry. This field can't be updated.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter

Field	Details
	Description Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`RowCause`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to `Manual` (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include: • `Manual`—The User or Group has access because a user with "All" access manually shared the Case with them. • `Owner`—The User is the owner of the Case. • `ImplicitChild`—The User or Group has access to the Case on the Account associated with this Case. • `RelatedPortalUser`—The portal user is the contact on the Case. • `Rule`—The User or Group has access via a Case sharing rule. • `GuestRule`—The User or Group has access via a Case guest user sharing rule. • `Team`—The User or Group has team access. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group. • `ARImplicit`—The User, who belongs to a partner or customer account, has access to the Case via an account relationship data sharing rule.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Case. This field can't be updated.

Usage

This object allows you to determine which users and groups can view and edit Case records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

SEE ALSO:

- AccountShare
- LeadShare
- OpportunityShare

CaseSolution

Represents the association between a Case and a Solution.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`CaseId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Case associated with the Solution.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`SolutionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Solution associated with the case.

Usage

You can't update this object via the API. If you attempt to create a record that matches an existing record, the request simply returns the existing record.

SEE ALSO:

CaseShare

SolutionStatus

CaseStatus

Represents the status of a Case, such as New, On Hold, or In Process.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`ApiName`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Uniquely identifies a picklist value so it can be retrieved without using an id or master label.
`IsClosed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this case status value represents a closed Case (`true`) or not (`false`). Multiple case status values can represent a closed Case.
`IsDefault`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this is the default case status value (`true`) or not (`false`) in the picklist.

Field	Details
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Master label for this case status value. This display value is the internal label that does not get translated.
`SortOrder`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Number used to sort this value in the case status picklist. These numbers are not guaranteed to be sequential, as some previous case status values might have been deleted.

Usage

This object represents a value in the case status picklist. The case status picklist provides additional information about the status of a Case, such as whether a given `Status` value represents an open or closed case. Query the CaseStatus object to retrieve the set of values in the case status picklist, and then use that information while processing Case records to determine more information about a given case. For example, the application could test whether a given case is open or closed based on its `Status` value and the value of the `IsClosed` property in the associated CaseStatus object.

SEE ALSO:

Object Basics

CaseSubjectParticle

Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name for the CaseSubjectParticle object. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`Index`	**Type** int **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The order in which the custom **Case Subject** is generated, meaning if the social network is 0 and the social message is 1, then the subject generates as `Twitter | Tweet`.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the case subject field. Possible values are: • `ar`—Arabic • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French

Field	Details
	• `it`—Italian • `iw`—Hebrew • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label for the case subject field.
`TextField`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies inbound social content added to **Case Subject** in case records.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies the custom **Case Subject** format from which inbound social content appears in case records. Possible values are: • `ColonSeparator` • `Content`—Message • `HyphenSeparator` • `MessageType` • `PipeSeparator`

Field	Details
	• `ProvidedString` • `RealName` • `Sentiment` • `SocialHandle` • `SocialNetwork` • `Source`

Usage

In the Salesforce UI, case subjects are brief descriptions of cases. They are what agents see on cases first. Social Business Rules specify the brief descriptions of cases created from social posts. Using CaseSubjectParticle objects you can build your own case subject format, where each object represents a social post's component. For example, combining CaseSubjectParticle objects with components for types `MessageType`, `RealName`, and `SocialNetwork` results in "Tweet Customer123 Twitter".

CaseTag

Associates a word or short phrase with a Case

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.

Field Name	Details
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

CaseTag stores the relationship between its parent TagDefinition and the Case being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

CaseTeamMember

Represents a case team member, who works with a team of other users to help resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
`MemberId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the user or contact who is a member on a case team.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the case with which the case team member is associated.
`TeamRoleId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the case team role with which the case team member is associated.
`TeamTemplateId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the predefined team with which the case team member is associated.
`TeamTemplateMemberId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the team member included in a predefined case team.

CaseTeamRole

Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
`AccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target Group for cases. The possible values are: • `None` • `Read` • `Edit`
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the case team role.
`PreferencesVisibleInCSP`	**Type** boolean **Properties** Create, Filter, Update **Description** Indicates whether or not the case team role is visible to Customer Portal users.

CaseTeamTemplate

Represents a predefined case team, which is a group of users that helps resolve a case.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A text description of the predefined case team.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the predefined case team.

CaseTeamTemplateMember

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
`MemberId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the user or contact who is a team member on a predefined case team.
`TeamRoleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the predefined case team member's case team role.
`TeamTemplateId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the predefined case team's template.

CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

Field	Details
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the case with which the case team template record is associated.
`TeamTemplateId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the predefined case team with which the case team template record is associated.

CategoryData

Represents a logical grouping of Solution records.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`CategoryNodeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the CategoryNode associated with the solution.

Field	Details
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`RelatedSobjectId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the solution related to the category.

Usage

This object allows you to assign one or more categories to a Solution. It is an intermediate data table with two foreign keys that defines the relationship between a CategoryNode and a Solution record.

CategoryData has two foreign keys:

- The first foreign key, `CategoryNodeId`, refers to the ID of a CategoryNode.
- The other foreign key, `RelatedSobjectId`, refers to a Solution ID.

This is a many-to-many relationship, so there can be multiple rows returned with a `CategoryNodeId`. A Solution can be associated with multiple categories.

SEE ALSO:

Object Basics

CategoryNode

Represents a tree of Solution categories.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer Portal users can't access this object.

- Attempting to delete a CategoryNode that has children (referred by CategoryNode.Parent), or is referred to elsewhere, causes a failure.

Fields

Field	Details
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label for the category node.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the parent of this node, if any.
`SortOrder`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the sort order of child CategoryNode objects.
`SortStyle`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates whether the sort order is alphabetical or custom.

Usage

A CategoryNode defines a category of solutions. In the user interface, you can edit category definitions from Setup by entering *`Solution Categories`* in the `Quick Find` box, then selecting **Solution Categories**.

Solution

CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the "View Setup and Configuration" permission.

Fields

Field	Details
`CategoryNodeId`	**Type** reference **Properties** Create, Filter, Nillable **Description** The ID of the solution CategoryNode that is being translated.
`LanguageLocaleKey`	**Type** picklist **Properties** Create, Filter, Nillable, Restricted picklist **Description** This field is available in API version 16.0 and earlier. It is the same as the `Language` field.
`Language`	**Type** picklist **Properties** Create, Filter, Nillable, Restricted picklist **Description** This field is available in API version 17.0 and later. The combined language and locale ISO code, which controls the language for labels displayed in an application. This picklist contains the following fully-supported languages:

Field	Details
	• Chinese (Simplified): `zh_CN` • Chinese (Traditional): `zh_TW` • Danish: `da` • Dutch: `nl_NL` • English: `en_US` • Finnish: `fi` • French: `fr` • German: `de` • Italian: `it` • Japanese: `ja` • Korean: `ko` • Norwegian: `no` • Portuguese (Brazil): `pt_BR` • Russian: `ru` • Spanish: `es` • Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: `sv` • Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English. The following end-user only languages are available. • Arabic: `ar` • Bulgarian: `bg` • Croatian: `hr` • Czech: `cs` • English (UK): `en_GB` • Greek: `el` • Hebrew: `iw` • Hungarian: `hu` • Indonesian: `in` • Polish: `pl` • Portuguese (European): `pt_PT` • Romanian: `ro` • Slovak: `sk` • Slovenian: `sl` • Turkish: `tr` • Ukrainian: `uk` • Vietnamese: `vi`

Field	Details
	The following platform languages are available for organizations that use Salesforce exclusively as a platform. • Albanian: sq • Afrikaans: af • Amharic: am • Arabic (Algeria): ar_DZ • Arabic (Bahrain): ar_BH • Arabic (Egypt): ar_EG • Arabic (Iraq): ar_IQ • Arabic (Jordan): ar_JO • Arabic (Kuwait): ar_KW • Arabic (Lebanon): ar_LB • Arabic (Libya): ar_LY • Arabic (Morocco): ar_MA • Arabic (Oman): ar_OM • Arabic (Qatar): ar_QA • Arabic (Saudi Arabia): ar_SA • Arabic (Sudan): ar_SD • Arabic (Syria): ar_SY • Arabic (Tunisia): ar_TN • Arabic (United Arab Emirates): ar_AE • Arabic (Yemen): ar_YE • Armenian: hy • Basque: eu • Bosnian: bs • Bengali: bn • Burmese: my • Catalan: ca • Chinese (Hong Kong): zh_HK • Chinese (Singapore): zh_SG • Dutch (Belgium): nl_BE • English (Australia): en_AU • English (Canada): en_CA • English (Hong Kong): en_HK • English (India): en_IN • English (Ireland): en_IE • English (Malaysia): en_MY • English (New Zealand): en_NZ

Field	Details
	• English (Philippines): en_PH • English (Singapore): en_SG • English (South Africa): en_ZA • Estonian: et • Farsi: fa • French (Belgium): fr_BE • French (Canada): fr_CA • French (Luxembourg): fr_LU • French (Switzerland): fr_CH • Georgian: ka • German (Austria): de_AT • German (Belgium): de_BE • German (Luxembourg): de_LU • German (Switzerland): de_CH • Gujarati: gu • Hindi: hi • Icelandic: is • Irish: ga • Italian (Switzerland): it_CH • Kannada: kn • Khmer: km • Latvian: lv • Lithuanian: lt • Luxembourgish: lb • Macedonian: mk • Malay: ms • Malayalam: ml • Maltese: mt • Marathi: mr • Montenegrin: sh_ME • Romanian (Moldova): ro_MD • Romansh: rm • Serbian (Cyrillic): sr • Serbian (Latin): sh • Spanish (Argentina): es_AR • Spanish (Bolivia): es_BO • Spanish (Chile): es_CL • Spanish (Colombia): es_CO

Field	Details
	• Spanish (Costa Rica): `es_CR` • Spanish (Dominican Republic): `es_DO` • Spanish (Ecuador): `es_EC` • Spanish (El Salvador): `es_SV` • Spanish (Guatemala): `es_GT` • Spanish (Honduras): `es_HN` • Spanish (Nicaragua): `es_NI` • Spanish (Panama): `es_PA` • Spanish (Paraguay): `es_PY` • Spanish (Peru): `es_PE` • Spanish (Puerto Rico): `es_PR` • Spanish (United States): `es_US` • Spanish (Uruguay): `es_UY` • Spanish (Venezuela): `es_VE` • Swahili: `sw` • Tagalog: `tl` • Tamil: `ta` • Te reo: `mi` • Telugu: `te` • Urdu: `ur` • Welsh: `cy` • Xhosa: `xh` • Zulu: `zu` The values in this field are not related to the default locale selection.
`NamespacePrefix`	**Type** string **Properties** Filter, Nillable **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	• In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Value`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The actual translated label for the solution category. Label is **Translation**.

Usage

Use this object to translate the labels of your solution categories into a supported language. Users with the Translation Workbench enabled can view category node translations, but either the "Customize Application," "Manage Translation," or "Manage Categories" permission is required to create or update category node translations.

ScontrolLocalization

WebLinkLocalization

ChannelObjectLinkingRule

Represents a rule for linking a channel interaction with an object (such as Lead or Contact). This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`ActionForNoRecordFound`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Action to take when no matching records are found. Possible values are:

Field	Details
	• `CreateNewRecordAndLink`—Create Record and Link (Recommended) • `PromptAgent`—Prompt Agent
`ActionForSingleRecordFound`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Action to take when one matching record is found. Possible values are: • `AutoLink`—Auto-Link Record (Recommended) • `PromptAgent`—Prompt Agent
`ChannelType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of channel used for this rule. Possible values are: • `FacebookMessenger` • `Phone` • `Text` • `WeChat` • `WhatsApp`
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description for this linking rule.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

Field	Details
	In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. **Note:** When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`IsLinkedRecordOpenedAsSubTab`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to open the linked record as a subtab when the link is established.
`IsRuleActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the rule is active.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language for this linking rule. Possible values are: • `ar`—Arabic • `bg`—Bulgarian • `cs`—Czech • `da`—Danish • `de`—German • `el`—Greek • `en_GB`—English (UK) • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French

Field	Details
	• `hr`—Croatian • `hu`—Hungarian • `in`—Indonesian • `it`—Italian • `iw`—Hebrew • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pl`—Polish • `pt_BR`—Portuguese (Brazil) • `pt_PT`—Portuguese (European) • `ro`—Romanian • `ru`—Russian • `sk`—Slovak • `sl`—Slovene • `sv`—Swedish • `th`—Thai • `tr`—Turkish • `uk`—Ukrainian • `vi`—Vietnamese • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique label name for this rule.
`ObjectToLink`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of object to link to the channel interaction. Possible values are: • `Contact`

Field	Details
`RuleName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Name of the rule as it appears in the UI. Maximum length is 80 characters.

ChannelProgram

Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field Name	Details
`Category`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Category of the channel program. Categories group channel programs by type. For example, a reseller category would include all the different regional reseller channel programs.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of the channel program.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field Name	Details
	Description Indicates whether the channel program is active. New channel programs are inactive by default.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Name of the channel program.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the owner of the channel program.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ChannelProgramFeed
Feed tracking is available for the object.

ChannelProgramHistory
History is available for tracked fields of the object.

ChannelProgramOwnerSharingRule
Sharing rules are available for the object.

ChannelProgramShare
Sharing is available for the object.

ChannelProgramLevel

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of the channel program level.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.

Field Name	Details
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the channel program level.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. ID of the user who is the owner of the record.
ProgramId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the channel program.
Rank	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An integer associated with the level. For example, 1 represents the lowest level, 2 the next level up, etc.
RecordTypeId	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ChannelProgramLevelFeed
Feed tracking is available for the object.

ChannelProgramLevelHistory
History is available for tracked fields of the object.

ChannelProgramLevelOwnerSharingRule
Sharing rules are available for the object.

ChannelProgramLevelShare (API version 43.0)
Sharing is available for the object.

ChannelProgramMember

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Most recent date referenced. This field is available in API version 45.0 and later.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Most recent date viewed. This field is available in API version 45.0 and later.
`LevelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the channel program level.
`Name`	**Type** string

Field Name	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the channel program member.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. ID of the user who is the owner of the record.
`PartnerId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the partner.
`ProgramId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the channel program.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ChannelProgramMemberFeed (API version 46.0)
Feed tracking is available for the object.

ChannelProgramMemberHistory (API version 46.0)
History is available for tracked fields of the object.

ChannelProgramMemberOwnerSharingRule
Sharing rules are available for the object.

ChannelProgramMemberShare (API version 43.0)
Sharing is available for the object.

ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
`CommentCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of FeedComments made by the ParentId.
`CommentReceivedCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of FeedComments received by the ParentId.
`InfluenceRawRank`	**Type** int **Properties** Filter, Group, Sort **Description** Number indicating the ParentId's Chatter influence rank, which is calculated based on the ParentId's ChatterActivity statistics, relative to the other users in the organization. This field is available in API version 26.0 and later.
`LikeReceivedCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of FeedLikes received by the ParentId.

Field Name	Details
`NetworkId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site to which the ChatterActivity belongs. This field is available only if digital experiences is enabled in your org. This field is available in API version 26.0 and later.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the object type to which the ChatterActivity is related. In API version 51.0, the `ParentId` must be a `UserId` or SelfServiceUser ID.
`PostCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of FeedItems made by the ParentId.

Usage

- Use this object to reference the Chatter activity statistics, which include the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user.
- You can directly query for ChatterActivity.

```
SELECT Id, PostCount, LikeReceivedCount
FROM ChatterActivity
WHERE ParentId = UserId
```

  Note: To query ChatterActivity, you must provide the `ParentId`. In API version 51.0, the `ParentId` must be a `UserId` or SelfServiceUser ID.

- A ChatterActivity record is created for users the first time they post or comment. Users who have never posted or commented don't have ChatterActivity records. If users make only one post and then delete it, they do have ChatterActivity records. In both cases, the user interface displays zeros for their Chatter activity.

- Use the `InfluenceRawRank` field to reference a user's Chatter influence rank. This field is available in API version 26.0 and later.

ChatterAnswersActivity

Represents the reputation of a User in Chatter Answers zones.This object is available in API version 25.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`BestAnswerReceivedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of best answers the User has received from other users.
`BestAnswerSelectedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of best answers the User has selected.
`QuestionsCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of Question records posted by the User.
`QuestionSubscrCount`	**Type** int

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of Question records the User has selected to follow.
`QuestionSubscrReceivedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of users following Question records posted by the User.
`QuestionUpVotesCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of up votes the User has marked on Question records posted by other users.
`QuestionUpVotesReceivedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of up votes the User has received from other users on the Question records he or she has posted.
`RepliesCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of Reply records posted by the User.
`ReplyDownVotesCount`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The number of down votes the User has marked on Reply records posted by other users.
`ReplyDownVotesReceivedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of down votes the User has received from other users on the Reply records he or she has posted.
`ReplyUpVotesCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of up votes the User has marked on the Reply records posted by other users.
`ReplyUpVotesReceivedCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of up votes the User has received from other users on the Reply records he or she has posted.
`ReportAbuseOnQuestionsCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of abuses that the User has reported on Question records posted by other users.
`ReportAbuseOnRepliesCount`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The number of abuses that the User has reported on Reply records posted by other users.
`ReportAbuseReceivedOnQnCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of abuses reported by other users on the Question records posted by the User.
`ReportAbuseReceivedOnReCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** the number of abuses reported by other users on the Reply records posted by the User.
`UserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The User ID associated with this reputation.
`CommunityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID for the zone associated with this reputation.

Usage

Use this object to view metrics on User activity in Chatter Answers. For example, you can use the ChatterAnswersActivity object to view the number of Question records a user is following in Chatter Answers zones.

User

ChatterAnswersReputationLevel

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

Fields

Field	Details
`CommunityID`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the zone for which you're creating the reputation level.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Name of the reputation level.
`Value`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Minimum number of points for this level.

Usage

Use to create or edit reputation levels for the zone.

ChatterConversation

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`Id`	**Type** ID **Properties** Defaulted on create, Filter, Group, Sort **Description** ID of the conversation.

Usage

Use this object to identify private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

ChatterConversationMember

ChatterMessage

ChatterConversationMember

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
ConversationId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the associated ChatterConversation.
MemberId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the conversation member.

Usage

Use this object to view members of private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

ChatterConversation

ChatterMessage

ChatterExtension

Represents a Rich Publisher App that's integrated with the Chatter publisher. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CompositionComponentEnumOrId	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ID of the composition component for the Rich Publisher App. This field requires a value.
Description	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The description of your custom Rich Publisher App. This field requires a value.
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of the developer who is responsible for the app.
ExtensionName	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of your extension. This field requires a value.
HeaderText	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The text to show in the header of your app composer. Header text is required for Lightning type extensions.
HoverText	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The text to show when a user mouses over your extension's icon. Mouse-over text is required for Lightning type extensions.

Field	Details
`IconId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The icon to show in the Chatter publisher. Use an existing file asset ID from your org. This field requires a value.
`IsProtected`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** An auto-generated value. It currently has no impact.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language used for this instance of the `ChatterExtension`. This field requires a value.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The master label for the `ChatterExtension` object. This field requires a value.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The prefix to use for the extension's namespace.
`RenderComponentEnumOrId`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description The rendering component of the Rich Publisher App that you provide. It's comprised of the `lightning:availableForChatterExtensionRenderer` interface. This field requires a value.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Describes the type of the extension. Currently, the only value supported is *`Lightning`*. Included to allow for other possible types in the future.

ChatterExtensionConfig

Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`CanCreate`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Determines whether the `ChatterExtension` can create an instance that appears by rendering.
`CanRead`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Determines whether the `ChatterExtension` can be viewed.

Field	Details
ChatterExtensionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the ChatterExtension.
NetworkId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the Experience Cloud site where the ChatterExtension is deployed.
Position	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The position of the ChatterExtension icon in the Chatter publisher.

ChatterMessage

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

Supported Calls

delete(), describeSObjects(), query(), retrieve(), update()

Fields

Field Name	Details
Body	**Type** textarea **Properties** Update **Description** Text of the message.

Field Name	Details
ConversationId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the conversation that the message is associated with.
SenderId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the sender.
SenderNetworkId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site from which the message was sent. This field is available only if digital experiences is enabled in your org. This field is available in API version 32.0 and later.
SentDate	**Type** dateTime **Properties** Filter, Sort **Description** Date the message was sent.

Usage

Use this object to view and delete messages sent or received via private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. Users with the Moderate Experiences Chatter Messages permission can access this object in Experience Cloud sites they're a member of, only if the message has been flagged as inappropriate. This object is provided to allow administrators to view and delete users' Chatter messages, for example, for compliance purposes.

Messages are hard deleted. That is, they're removed completely without a trip to the Recycle Bin.

Deleting a message that resulted from sharing a file with someone doesn't also delete the file.

SEE ALSO:

ChatterConversation

ChatterConversationMember

ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`

Fields

Field	Details
`FullUserAgent`	**Type** string **Properties** Filter, Nillable, Sort **Description** Detailed information about the client (browser). For example, `Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9.0.1) Gecko/2008070208 Firefox/3.0.1`
`LastUpdate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Represents the last time the cookie was changed.
`ProxyInfo`	**Type** string **Properties** Filter, Nillable, Sort **Description** The browser's current proxy information.

Field	Details
`UsersId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user associated with this item.

Usage

At every login, the device the login request is from is checked against the known devices using ClientBrowser. A match means a cookie was found on the browser that matches an entry in the ClientBrowser table, so the device is known. No match means that no matching cookie was found, so the device is unknown, and the user is asked to confirm their identity.

CollaborationGroup

Represents a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

The visibility of information in groups depends on the type of group and the user's permissions.

- **Members**: Any user with the Create and Own New Chatter Groups permission can create public, private, and unlisted groups, including in any Experience Cloud sites they belong to.
- **Owners and managers**: Users can modify group details for any group they own or manage. Owners can also delete groups they own.
- **Nonmembers**: These user permissions allow group access regardless of group membership.
  - View All Data—Allows users to view all public and private groups across their org and its Experience Cloud sites. Users with this permission can't view unlisted group information, unless they have the Modify Unlisted Groups permission as well.
  - Modify All Data—Allows users to view, modify, and delete all public and private groups across their org and its Experience Cloud sites. Users with this permission can't view or modify unlisted group information, unless they have the Manage Unlisted Groups permission as well.
  - Create and Set Up Experiences—Allows users to view, modify, and delete all public and private groups in Experience Cloud sites.
  - Manage Unlisted Groups—Allows users to search for, access, and modify any unlisted group in an org and its Experience Cloud sites.
  - Data Export—Allows users to export any data from Salesforce, including private and unlisted group data from an org and its Experience Cloud sites.

- **Apex and Visualforce**: Apex code runs in system mode, which means that the permissions of the current user aren't taken into account.
  - Visualforce pages that display groups might expose unlisted or private group data to users who aren't members.
  - Because system mode disregards the user's permissions, all users who are accessing a Visualforce page that's showing a group can act as an owner of that group.
  - AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren't members.

To limit and manage access to the unlisted and private groups in your org:

- Explicitly filter out unlisted and private group information from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of groups. In Setup, enter *`Group Triggers`* in the `Quick Find` box, then select **Group Triggers** to add triggers.

Fields

Field	Details
`AnnouncementId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the ID of the Announcement last associated with the group. This field is available in API version 30.0 and later.
`BannerPhotoUrl`	**Type** url **Properties** Filter, Nillable, Sort **Description** The URL for the group's banner photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo. This field is available in API version 36.0 and later.
`CanHaveGuests`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If set to `true`, indicates that a group allows customers. Chatter customers are people outside your company's email domains. Customers can see only the groups they're invited to. They

Field	Details
	can interact only with members of those groups. Customers can't see any Salesforce information. This field is available starting in API version 23.0, but groups that allow customers are accessible from earlier API versions. However, when accessed from earlier API versions, groups that allow customers aren't distinguishable from private groups. We strongly recommend that you upgrade to the latest API version. If you must use an earlier version, name groups that allow customers to indicate that they include customers.
`CollaborationType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of Chatter group. Available values are: • `Public`—Anyone can see and post updates. Anyone can join a public group. • `Private`—Only members can see the group feed and post updates. Non-members can only see the group name and a few other details in list views, search, and on the group page. The group's owner or managers must add members who request to join the group. • `Unlisted`—Only members and users with the Manage Unlisted Groups permission can see the group and post updates. Other users can't access the group or see it in lists, search, and feeds.
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the group.
`FullPhotoUrl`	**Type** url **Properties** Filter, Nillable, Sort **Description** The URL for the group's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo. This field is available in API version 20.0 and later.

Field	Details
`GroupEmail`	**Type** email **Properties** Nillable, Sort **Description** The email address for posting to the group. For private groups, only visible to members and users with Modify All Data or View All Data permissions. This field is available in API version 29.0 and later.
`HasPrivateFieldsAccess`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If set to `true`, indicates that a user can see the `InformationBody` and `InformationTitle` fields in a private group. This field is set to `true` for members of a private group and users with Modify All Data or View All Data permissions.
`InformationBody`	**Type** textarea **Properties** Create, Nillable, Update **Description** The text of the Information section. For private groups, only visible to members and users with Modify All Data or View All Data permissions.
`InformationTitle`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The title of the Information section. For private groups, only visible to members and users with Modify All Data or View All Data permissions.
`IsArchived`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the group is archived (`true`) or not (`false`). This field is available in API version 28.0 and later.

Field	Details
IsAutoArchiveDisabled	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether automatic archiving is disabled for the group (`true`) or not (`false`). This field is available in API version 29.0 and later.
IsBroadcast	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the group is a broadcast group (`true`) or not (`false`). This field is available in API version 36.0 and later.
LastFeedModifiedDate	**Type** dateTime **Properties** Filter, Sort **Description** The date of the last post or comment on the group.
LastReferencedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
MediumPhotoUrl	**Type** url

Field	Details
	Properties Filter, Nillable, Sort **Description** The URL for the larger, cropped photo size.
`MemberCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of members in the group.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the group. Group names must be unique across public and private groups. Unlisted groups don't require unique names.
`NetworkId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site that this group is part of. This field is available only if digital experiences is enabled in your org. You can only add a `NetworkId` when creating a group. You can't change or add a `NetworkId` for an existing group. This field is available in API version 26.0 and later.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the owner of the group. Only the current group owner or people with the Modify All Data permission can update the `OwnerId`.
`SmallPhotoUrl`	**Type** url **Properties** Filter, Nillable, Sort

Field	Details
	Description The URL for a thumbnail of the group's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo is not guaranteed to return a photo. Query this field for the URL of the most recent photo. This field is available in API version 20.0 and later.

Usage

Use this object to create, edit, or delete groups in an org or Experience Cloud site. Deleting a group permanently deletes all posts and comments to the group. It also deletes all files and links posted to the group and removes the files from other locations where they were shared.

As a Chatter group member, you can post to the group using the CollaborationGroupFeed object. As a Chatter group owner or manager, you can add or remove group members using the CollaborationGroupMember object, post announcements to the group using the Announcement object, and accept or decline requests to join private groups using the CollaborationGroupMemberRequest object. Additionally, the group owner, manager, or your Salesforce system administrator can invite people to join the group using the CollaborationInvitation object.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CollaborationGroupFeed
Feed tracking is available for the object.

SEE ALSO:

CollaborationGroupMember

CollaborationGroupMemberRequest

CollaborationGroupMember

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
CollaborationGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the associated CollaborationGroup.
CollaborationRole	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The role of a group member. Group owners and managers can change roles for members of their groups. The valid values are: • `Standard`—Indicates that a user is a group member. Members can post and comment in the group. • `Admin`—Indicates that a user is a group manager. Managers can post and comment, change member roles, edit group settings, add and remove members, delete posts and comments, and edit the group information field. Note: To change the group owner, use the `OwnerId` field on the CollaborationGroup object.
LastFeedAccessDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when a group member last accessed the group’s feed. The value is only updated when a member explicitly consumes the group’s feed, not when the member sees group posts in other feeds, like the profile feed.
MemberId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the group member.

Field	Details
`NotificationFrequency`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. The frequency at which Salesforce sends Chatter group email digests to this member. Can only be set by the member or users with the “Modify All Data” permission. The valid values are: • `D`—Daily • `W`—Weekly • `N`—Never • `P`—On every post The default value is specified by the member in their Chatter email settings. In communities, the `Email on every post` option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to `Daily digests`.

Usage

Use this object to view, create, and delete Chatter group members. You must be a group owner or manager to create members for private Chatter groups.

SEE ALSO:

CollaborationGroup

CollaborationGroupMemberRequest

CollaborationGroupMemberRequest

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`CollaborationGroupId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** ID of the private Chatter group.
RequesterId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the user requesting to join the group; must be the ID of the context user.
ResponseMessage	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Optional message to be included in the notification email when Status is Declined.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update **Description** The status of the request. Available values are: • Accepted • Declined • Pending

Usage

This object represents a request to join a private Chatter group, and can be used to accept or decline requests to join private groups you own or manage. On create, an email is sent to the owner and managers of the private group to be accepted or declined. When the Status is Accepted or Declined, an email is sent to notify the requester. When the Status is Declined, a ResponseMessage is optionally included to provide additional details.

Note the following when working with requests:

- Users with the “Modify All Data” or “View All Data” permission can view records for all groups, regardless of membership.
- A user can be a member of 300 groups. Requests to join groups count against this limit.
- Status can't be specified on create.
- You can only update a request when the Status is Pending.

- You can't delete or update a request with a `Status` of `Accepted` or `Declined`.

SEE ALSO:

CollaborationGroup
CollaborationGroupMember

CollaborationGroupRecord

Represents the records associated with Chatter groups.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CollaborationGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Chatter group.
`NetworkId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Optional. The ID of the Experience Cloud site that the group belongs to. Available from API version 34.0.
`RecordId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the record associated with the Chatter group.

CollaborationInvitation

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Invitations are available if "Allow Invitations" is enabled for your organization.

Invitations are limited to your allowed domain(s) unless the invite is sent from a private group that allows customers. Allowed domains are set by the administrator.

Invitations to customers are available if "Allow Customer Invitations" is enabled for your organization. Users must have the "Invite Customers to Chatter" permission to send invitations to people outside their Chatter domain.

Fields

Field	Details
`InvitedUserEmail`	**Type** string **Properties** Create, Filter, Group, Sort **Description** The email address for the user invited to join Chatter. Label is `Invited Email`.
`InvitedUserEmailNormalized`	**Type** email **Properties** Filter, Group, Sort **Description** A normalized version of the `InvitedUserEmail` entered. Label is `Invited Email (Normalized)`.
`InviterId`	**Type** reference **Properties** Filter, Group, Sort **Description** The person that initiated the invitation.

Field	Details
`OptionalMessage`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** An optional message from the person sending the invitation to the person receiving it.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Used when the email address on the invitation is different than the one entered when the invitee accepts the invitation.
`SharedEntityId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the user or group associated with this invitation. • If the invitation is to join Chatter, the `SharedEntityId` is the ID of the User that created the invitation. The invitee will auto-follow the inviter. • If the invitation is to join a group within Chatter, the `SharedEntityId` is the ID of the Chatter CollaborationGroup. • To invite a customer, set `SharedEntityId` to the ID of the private CollaborationGroup with Allow Customers turned on.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The status of the invitation. Possible values are: • `Sent` • `Accepted` • `Canceled`

Usage

Use this object to create or delete (cancel) invitations to join Chatter. You can either invite a user to join Chatter directly or as part of a CollaborationGroup.

Note: To invite someone to join a CollaborationGroup, you must be either the owner or a manager of the group or a Salesforce system administrator.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

When the person accepts your CollaborationGroup invitation, they join the CollaborationGroup and Chatter as well.

Note: You can't send invitations to users of the organization the invite was sent from.

Invited users can view profiles, post on their feed, and join groups, but they can't see your Salesforce data or records.

If your organization allows groups with customers, owners and managers of private groups with the "Allow Customers" setting, as well as system administrators, can use this object to invite customers.

Java Samples

The following example shows how to send an invitation to join Chatter:

```
public void invitePeople(String inviterUserId, String invitedEmail) throws Exception {
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(inviterUserId);//pass the userId of the inviter
    invitation.setInvitedUserEmail(invitedEmail);//email of the invited user
    insert(invitation);
}
```

The following example shows how to send an invitation to a customer user from a group that allows customers:

```
public void inviteToGroup(String GroupName, String invitedEmail) throws Exception {
    QueryResult qr = query("select id from collaborationgroup where name = '" +
        GroupName); //pass the group name
    String groupId = qr.getRecords()[0].getId();
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(groupId);//pass the groupId
    invitation.setInvitedUserEmail(invitedEmail);//email of the invited user
    insert(invitation);
}
```

Apex Samples

```
String emailAddress = 'bob@external.com';
CollaborationGroup chatterGroup = [SELECT Id
      FROM CollaborationGroup
      WHERE Name='All acme.com'
      LIMIT 1];
CollaborationInvitation inv = New CollaborationInvitation();
inv.SharedEntityId = chatterGroup.id;
inv.InvitedUserEmail = emailAddress;

try {
```

```
    Insert inv;
} catch(DMLException e){
    System.debug('There was an error with the invite: '+e);
}
```

CollabUserEngagementMetric

Represents the user engagement metrics for a Quip thread in a Quip template or document. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`CommentCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of comments by the user for the specified `MetricDate`.
`EditCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of edits by the user for the specified `MetricDate`.
`MetricDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date of the gathered metric.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The unique name of the CollabUserEngagementMetric object.
`QuipThread`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The Quip thread ID.
`QuipThreadTitle`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The title of the Quip document, sheet, slide, and so forth.
`QuipThreadType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of Quip thread. The possible values are: • `CHAT` • `DOCUMENT` • `SHEET` • `SLIDE` • `TEMPLATE`
`QuipUser`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The ID of the Quip user.
`SalesforceUserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the Salesforce user.
Site	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the Quip site.
SourceTemplate	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The ID of the source template.
ViewCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of views by the user for the specified MetricDate.

CollabUserEngmtRecordLink

Represents an association between a CollabUserEngagementMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Fields

Field	Details
MetricDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date of the gathered metric.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The unique name of the CollabUserEngmtRecordLink object.
`ObjectType`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The object type of the Salesforce record, such as Account or Contact.
`ParentRecordId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the Salesforce record.
`UserEngagementMetricId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the CollabUserEngagementMetric record.

ColorDefinition

Represents the color-related metadata for a custom tab. This object is available in API version 43.0 and later.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`Color`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The color described in web color RGB format—for example, “00FF00”.
`Context`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The color context, which determines whether the color is the main color (or primary) for the tab.
`DurableId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A unique virtual Salesforce ID for the color.
`TabDefinitionId`	**Type** string **Properties** Filter, Nillable, Sort **Description** The `TabDefinition` ID.
`Theme`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The icon’s theme.

CombinedAttachment

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

Supported Calls

`describeSObjects()`

Fields

Field Name	Details
`ContentSize`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Size of the document in bytes.
`ContentUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** URL for links and Google Docs. This field is set only for links and Google Docs, and is one of the fields that determine the `FileType`. This field is available in API version 31.0 and later.
`ExternalDataSourceName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of the external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 32.0 and later.
`ExternalDataSourceType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field Name	Details
	Description Type of external data source in which the document is stored. This field is set only for external documents that are connected to Salesforce. This field is available in API version 35.0 and later.
`FileExtension`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the document. This field is available in API version 31.0 and later.
`FileType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of document, determined by the file extension.
`ParentId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the parent object.
`RecordType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The parent object type.
`SharingOption`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort

Field Name	Details
	Description Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Allowed`, which means that new shares are allowed. When set to `Restricted`, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.
`Title`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Title of the attached file.

Usage

Use this object to list all notes, attachments, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter for a record, such as a related list on a detail page.

To determine if an object supports the CombinedAttachment object, call `describeSObject()` on the object. For example, `describeSObject('Account')` returns all the child relationships of the Account object, including `CombinedAttachment`. You can then query the CombinedAttachment child relationship.

```
SELECT Name, (SELECT Title FROM CombinedAttachments)
FROM Account
```

You can't directly query CombinedAttachment.

CommerceEntitlementBuyerGroup

Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

The CommerceEntitlementBuyerGroup object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
BuyerGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID for the buyer group.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The standard code for the currency. Possible values are: • GBP—British Pound • USD—U.S. Dollar
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the entitlement buyer group.
PolicyId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID for the entitlement policy.

CommerceEntitlementPolicy

Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

The CommerceEntitlementPolicy object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`CanViewPrice`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Determines whether a user can view the price of a product (`true`) or not (`false`). Default value is `false`.
`CanViewProduct`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Determines whether a user can view the product (`true`) or not (`false`). Default value is `false`.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The standard code for the currency. Possible values are: • `GBP`—British Pound • `USD`—U.S. Dollar
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The entitlement policy description.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Determines if the entitlement policy is active (`true`) or inactive (`false`). Default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the entitlement policy.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique ID for the entitlement policy owner.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommerceEntitlementPolicyOwnerSharingRule
Sharing rules are available for this object.

CommerceEntitlementPolicyShare

Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

The CommerceEntitlementPolicyShare object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`AccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Possible values are: • `All`—Owner • `Edit`—Read/Write • `Read`—Read Only
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID of the parent entitlement policy.
`RowCause`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Possible values are: • `CompliantCollaboration`—Compliant Data Sharing • `GuestParentImplicit`—Associated guest user sharing • `GuestPersonImplicit`—Associated Guest User Sharing • `GuestRule`—Guest User Sharing Rule • `ImplicitChild`—Account Sharing • `ImplicitParent`—Associated record owner or sharing • `ImplicitPerson`—Person Contact • `Manual`—Manual Sharing • `Owner` • `Rule`—Sharing Rule • `SurveyShare`—Survey Sharing Rule • `Team`—Sales Team • `Territory`—Territory Assignment Rule • `Territory2AssociationManual`—Territory Manual • `Territory2Forecast`—Territory assignment for forecasting and reporting • `TerritoryManual`—Territory Manual • `TerritoryRule`—Territory Sharing Rule
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID of the associated user or buyer group.

CommerceEntitlementProduct

Represents the entitlement policy for a product. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

The CommerceEntitlementProduct object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The standard code for the currency. Possible values are: • `GBP`—British Pound • `USD`—U.S. Dollar
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The product entitlement policy name.
`PolicyId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID for the product entitlement policy.
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique ID for the product referenced in the entitlement policy.

CommSubscription

Represents a customer's subscription preferences for a specific communication. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`DataUsePurposeId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the data use purpose record associated with the communication subscription.
`IsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if this communication subscription is the default (`true`) or not (`false`). This field has a default value of `false`. Only one communication subscription record can be the default.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description Required. Name of the communication subscription record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account owner associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommSubscriptionFeed
Feed tracking is available for the object.

CommSubscriptionHistory
History is available for tracked fields of the object.

CommSubscriptionOwnerSharingRule
Sharing rules are available for the object.

CommSubscriptionShare
Sharing is available for the object.

CommSubscriptionChannelType

Represents the engagement channel through which you can reach a customer for a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CommunicationSubscriptionId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description ID of the associated communication subscription record.
`EngagementChannelTypeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the associated engagement channel type record.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of the communication subscription channel type record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID account owner associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommSubscriptionChannelTypeFeed
Feed tracking is available for the object.

CommSubscriptionChannelTypeHistory
History is available for tracked fields of the object.

CommSubscriptionChannelTypeOwnerSharingRule
Sharing rules are available for the object.

CommSubscriptionChannelTypeShare
Sharing is available for the object.

CommSubscriptionConsent

Represents a customer's consent to a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CommSubscriptionChannelTypeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the associated communication subscription channel type record.
`ConsentCapturedDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Required. Date when the customer's consent was captured.
`ConsentCapturedSource`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Required. Source through which consent was captured. For example, user@example.com or www.example.com.
`ConsentGiverId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the person who gave consent to the communication subscription on behalf of the contact point. Note: If the contact point gave consent, don't use `ConsentGiverId`.
`ContactPointId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the contact point, such as an Individual or person account, associated with the communication subscription consent.
`EffectiveFromDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. Date when consent starts.
`EffectiveToDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date when consent ends.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of the communication subscription consent record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account owner associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommSubscriptionConsentFeed
Feed tracking is available for the object.

CommSubscriptionConsentHistory
History is available for tracked fields of the object.

CommSubscriptionConsentOwnerSharingRule
Sharing rules are available for the object.

CommSubscriptionConsentShare
Sharing is available for the object.

CommSubscriptionTiming

Represents a customer's timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CommSubscriptionConsentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the associated communication subscription consent record.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. Name of the communication subscription timing record.
`Offset`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description The amount of time before or after an event or the specific day of the week to communicate with the contact point. Set the unit of time in the `Unit` field. For example, if you set `Unit` as *`Week`* and `Offset` as *`-4`*, communicate with the contact point four weeks before the event. If you set `Offset` as *`4`*, communicate with the contact point four weeks after the event.
`PreferredTimeEnd`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** End of the preferred time span in which to reach the customer.
`PreferredTimeStart`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** Start of the preferred time span in which to reach the customer.
`PreferredTimeZone`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Time zone of the preferred time span.
`Unit`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit of time that works with the `Offset` field to determine the communication timing. Possible values are: • `Day` • `DayOfWeek` • `Hour` • `Month` • `Week`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CommSubscriptionTimingFeed
Feed tracking is available for the object.

CommSubscriptionTimingHistory
History is available for tracked fields of the object.

Community (Zone)

Represents a zone that contains Idea or Question objects.

Note: Starting with the Summer '13 release, Chatter Answers and Ideas communities were renamed to zones. In API version 28, the API object label has changed to `Zone`, but the API type is still `Community`.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`CanCreateCase`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether users can ask private questions in the zone using Chatter Answers.
`DataCategoryName`	**Type** string **Properties** Filter, Nillable, Group, Sort **Description** The data category associated with the zone.
`Description`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Text description of the zone.

Field	Details
HasChatterService	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether Chatter Answers is available in the zone.
IsActive	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the zone is active or inactive. An idea or question can only be posted to an active zone.
IsPublished	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the zone is available in portals.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The name of the zone.
NetworkId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site that this zone is associated with. This field is available only if digital experiences is enabled in your org. This field is available in API version 51.0 and later.

Usage

Use this object to create a zone in Ideas, Chatter Answers, or Answers. Zones help organize ideas and questions into logical groups and are shared by the Ideas, Answers, and Chatter Answers.

ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Connected apps link client applications, third-party services, other Salesforce organizations, apps, and resources to your organization. The connected app configuration specifies authorization and security settings for these resources. This object exposes the settings for a specified connected app.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`MobileSessionTimeout`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Length of time after which the system logs out inactive mobile users.
`MobileStartUrl`	**Type** url **Properties** Filter, Nillable, Sort **Description** Users are directed to this URL after they've authenticated when the app is accessed from a mobile device.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The unique name for this object.
`OptionsAllowAdminApprovedUsersOnly`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether access is limited to users granted approval to use the connected app by an administrator. Manage profiles for the app by editing each profile's Access list.
`OptionsFullContentPushNotifications`	For internal use only.
`OptionsHasSessionLevelPolicy`	**Type** boolean **Properties** Filter **Description** Specifies whether the connected app requires a High Assurance level session.
`OptionsIsInternal`	For internal use only.
`OptionsRefreshTokenValidityMetric`	**Type** boolean **Properties** Filter **Description** Specifies whether the refresh token validity is based on duration or inactivity. If `true`, the token validity is measured based on the last use of the token; otherwise, it is based on the token duration.
`PinLength`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** For mobile apps, this field is the PIN length requirement for users of the connected app. Valid values are `4`, `5`, `6`, `7`, or `8`.
`RefreshTokenValidityPeriod`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The duration of an authorization token until it expires in hours, months, or days as set in the connected app management page.

Field Name	Details
StartUrl	**Type** url **Properties** Filter, Nillable, Sort **Description** If the app is not accessed from a mobile device, users are directed to this URL after they've authenticated.

Consumption Rate

Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.

The consumption rate sets a quantity-based boundary for usage and defines how much your product costs when its usage falls within that boundary. Consumption rates price usage at a per-unit fee or a flat fee across the entire range of usage.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ConsumptionScheduleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The consumption schedule that contains the consumption rate.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for orgs with the multicurrency feature enabled. Possible values are: • AUD—Australian Dollar • CAD—Canadian Dollar

Field	Details
	• `GBP`—British Pound • `JPY`—Japanese Yen • `USD`—U.S. Dollar
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the consumption rate.
`LowerBound`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The lowest quantity of usage for the consumption rate.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. Default name of this record. Label is **Product Name**.
`Price`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The price for usage that falls within the consumption rate's bounds.
`PricingMethod`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** How Salesforce applies the consumption rate's price to the total quantity of usage within a usage summary. Possible values are: • `FlatFee`—Salesforce applies the rate's price to the entire quantity of usage.

Field	Details
	• `PerUnit`—Salesforce applies the rate's price to each individual quantity of usage within the usage summary.
`ProcessingOrder`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The order for processing the usage rate across multiple rates. Consumption rates are evaluated beginning with the lowest processing order.
`UpperBound`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The highest quantity of usage for the consumption rate.

Consumption Schedule

A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

Salesforce uses consumption schedules to group consumption rates. Your consumption schedule defines the unit of measurement and rating method for the schedule's rates. It also defines the billing frequency that Salesforce Billing uses to invoice a usage product.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`BillingTerm`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The number used with the billing term unit to determine billing frequency.

Field	Details
`BillingTermUnit`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit used with the billing term to determine billing frequency Possible values are: • `Month`— • `Quarter`— • `Year`—
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for orgs with the multicurrency feature enabled. Possible values are: • `AUD`—Australian Dollar • `CAD`—Canadian Dollar • `GBP`—British Pound • `JPY`—Japanese Yen • `USD`—U.S. Dollar
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the consumption schedule.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this record is active (`true`) or not (`false`). Label is **Active**.
`LastReferencedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
MatchingAttribute	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Salesforce Billing matches usage with a consumption schedule if the records share Matching Attribute value.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Default name of this record. Label is **Product Name**.
NumberOfRates	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of consumption rates in this consumption schedule.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The user who owns a consumption schedule record.
RatingMethod	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A specific use case to rate usage against the schedule. This field is the controlling picklist for the Type field. Possible values are: • Tier
SBQQ__Category__c	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** This field is available only with Salesforce CPQ. You can define custom categories to organize consumption schedules in separate tabs on sales rep UI. If you do this, make sure to create a field set for each category. Possible values are: • Rates
Type	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Defines how rate tiers are calculated. Possible values are: • Range—The schedule prices only using the tier that applies to the usage quantity. • Slab—Usage within a given bound receives pricing equal to its tier's value.
UnitOfMeasure	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description A unit of measure defines how you quantify instances of usage for your usage products. For example, if your usage product is a cloud storage subscription, you could provide a value of GB for your unit of measure.
blng__BillingRule__c	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field is available only with Salesforce Billing. Salesforce Billing invoices usage summaries based off their related consumption schedule's billing rule.
blng__RevenueRecognitionRule__c	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field is available only with Salesforce Billing. Salesforce Billing recognizes usage summary revenue based off the summary's related revenue recognition rule.
blng__TaxRule__c	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field is available only with Salesforce Billing. Salesforce Billing taxes usage summary invoice lines based off the summary's related tax rule.

Contact

Represents a contact, which is a person associated with an account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access only portal-enabled contacts.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the account that’s the parent of this contact. We recommend that you update up to 50 contacts simultaneously when changing the accounts on contacts enabled for a Customer Portal or partner portal. We also recommend that you make this update after business hours.
AssistantName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The assistant’s name.
AssistantPhone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The assistant’s telephone number.
Birthdate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact’s birthdate.

Field	Details

	Filter criteria for report filters, list view filters, and SOQL queries ignore the year portion of the `Birthdate` field. For example, this SOQL query returns contacts with birthdays later in the year than today:
	`SELECT Name, Birthdate`
	`FROM Contact`
	`WHERE Birthdate > TODAY`

`CanAllowPortalSelfReg`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this contact can self-register for your Customer Portal (`true`) or not (`false`).
`CleanStatus`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the record's clean status as compared with Data.com. Values include: `Matched`, `Different`, `Acknowledged`, `NotFound`, `Inactive`, `Pending`, `SelectMatch`, or `Skipped`. Several values for `CleanStatus` appear with different labels on the contact record. • `Matched` appears as `In Sync` • `Acknowledged` appears as `Reviewed` • `Pending` appears as `Not Compared`
`ConnectionReceivedId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
`ConnectionSentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
`Department`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact's department.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A description of the contact. Label is **Contact Description** up to 32 KB.
`DoNotCall`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates that the contact does not want to receive calls.
`Email`	**Type** email **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The contact's email address.
`EmailBouncedDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** If bounce management is activated and an email sent to the contact bounces, the date and time of the bounce.

Field	Details
`EmailBouncedReason`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** If bounce management is activated and an email sent to the contact bounces, the reason for the bounce.
`Fax`	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact's fax number. Label is **Business Fax**.
`FirstCallDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time of the first call placed to the contact. This field is available in API version 48.0 and later if you enabled High Velocity Sales.
`FirstEmailDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time of the first email sent to the contact. This field is available in API version 48.0 and later if you enabled High Velocity Sales.
`FirstName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact's first name up to 40 characters.
`HasOptedOutOfEmail`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates whether the contact doesn't want to receive email from Salesforce (`true`) or does (`false`). Label is **Email Opt Out**.
`HasOptedOutOfFax`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the contact prohibits receiving faxes.
`HomePhone`	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact's home telephone number.
`IndividualId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the data privacy record associated with this contact. This field is available if Data Protection and Privacy is enabled.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`IsEmailBounced`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If bounce management is activated and an email is sent to a contact, indicates whether the email bounced (`true`) or not (`false`).

Field	Details
`IsPersonAccount`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read only. Indicates whether this account has a record type of Person Account (`true`) or not (`false`). Label is **Is Person Account**.
`Jigsaw`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** References the company's ID in Data.com. If an account has a value in this field, it means that the account was imported from Data.com. If the field value is `null`, the account was not imported from Data.com. Maximum size is 20 characters. Available in API version 22.0 and later. Label is **Data.com Key**. Important: The `Jigsaw` field is exposed in the API to support troubleshooting for import errors and reimporting of corrected data. Do not modify this value.
`LastActivityDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Value is the most recent of either: • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
`LastName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Last name of the contact up to 80 characters.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`LeadSource`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The lead's source.
`MailingAddress`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the mailing address. Read-only. For details on compound address fields, see Address Compound Fields.
`MailingCity`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Mailing address details.
`MailingState`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Mailing address details.

Field	Details
`MailingCountry`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Mailing address details.
`MailingPostalCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Mailing address details.
`MailingStateCode`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO codes for the mailing address's state and country.
`MailingCountryCode`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO codes for the mailing address's state and country.
`MailingStreet`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Street address for mailing address.
`MailingGeocodeAccuracy`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update, Query, Restricted picklist, Nillable

Field	Details
	Description Accuracy level of the geocode for the mailing address. For details on geolocation compound field, see Compound Field Considerations and Limitations.
MailingLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `MailingLongitude` to specify the precise geolocation of a mailing address. Acceptable values are numbers between –90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.
MailingLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `MailingLatitude` to specify the precise geolocation of a mailing address. Acceptable values are numbers between –180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.
MasterRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If this record was deleted as the result of a merge, this field contains the ID of the record that remains. If this record was deleted for any other reason, or has not been deleted, the value is `null`.
MiddleName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact's middle name up to 40 characters. To enable this field, ask Salesforce Customer Support for help.
MobilePhone	**Type** phone

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Contact's mobile phone number.
`Name`	**Type** string **Properties** Filter, Group, Sort **Description** Concatenation of `FirstName`, `MiddleName`, `LastName`, and `Suffix` up to 203 characters, including whitespaces.
`OtherAddress`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the other address. Read-only. For details on compound address fields, see Address Compound Fields.
`OtherCity`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Alternate address details.
`OtherCountry`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Alternate address details.
`OtherPostalCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Alternate address details.

Field	Details
OtherState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Alternate address details.
OtherCountryCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO codes for the alternate address's state and country.
OtherStateCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO codes for the alternate address's state and country.
OtherGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Accuracy level of the geocode for the other address. For details on geolocation compound fields, see Compound Field Considerations and Limitations.
OtherLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `OtherLongitude` to specify the precise geolocation of an alternate address. Acceptable values are numbers between –90 and 90 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.
OtherLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description Used with `OtherLatitude` to specify the precise geolocation of an alternate address. Acceptable values are numbers between –180 and 180 up to 15 decimal places. For details on geolocation compound fields, see Compound Field Considerations and Limitations.
`OtherPhone`	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Telephone for alternate address.
`OtherStreet`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Street for alternate address.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this contact.
`Phone`	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Telephone number for the contact. Label is **Business Phone**.
`PhotoUrl`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** Path to be combined with the URL of a Salesforce instance (*Example:* https://*`yourInstance`*.salesforce.com/) to generate a URL to request the social network profile image associated with the contact. Generated URL returns an HTTP redirect (code 302) to the social network profile image for the contact.

Field	Details
	Empty if Social Accounts and Contacts isn't enabled or if Social Accounts and Contacts is disabled for the requesting user.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object.
`ReportsToId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field doesn’t appear if `IsPersonAccount` is `true`.
`Salutation`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Honorific abbreviation, word, or phrase to be used in front of name in greetings, such as Dr. or Mrs.
`Suffix`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name suffix of the contact up to 40 characters. To enable this field, ask Salesforce Customer Support for help.
`Title`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Title of the contact, such as CEO or Vice President.

Note: If you are importing contact data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

Usage

Use this object to manage individual people who are associated with an account. You can create, query, delete, or update any attachment associated with a contact.

Create or update contacts by converting a lead with the `convertLead()` call.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContactFeed (API version 18.0)
Feed tracking is available for the object.

ContactHistory (API version 11.0)
History is available for tracked fields of the object.

ContactOwnerSharingRule
Sharing rules are available for the object.

ContactShare
Sharing is available for the object.

SEE ALSO:

Object Basics

ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentEmail` field. If the `IsDifferentEmail` field's value is `False`, that means the `Email` field value is *the same* on the Salesforce contact record and its matched Data.com record.

ContactCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the contact record.

- `IsDifferent` indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the contact record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Fields

Field Name	Details
`Address`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.
`City`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the contact.
`CleanedByJob`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact record was cleaned by a Data.com Clean job (`true`) or not (`false`).
`CleanedByUser`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact record was cleaned by a Salesforce user (`true`) or not (`false`).
`ContactId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Sort **Description** The unique, system-generated ID assigned when the contact record was created.
ContactStatusDataDotCom	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The status of the contact per Data.com. Values are: `Contact is Active per Data.com`, `Phone is Wrong per Data.com` , `Email is Wrong per Data.com`, `Phone and Email are Wrong per Data.com`, `Contact Not at Company per Data.com`, `Contact is Inactive per Data.com`, `Company this contact belongs to is out of business per Data.com`, `Company this contact belongs to never existed per Data.com` or `Email address is invalid per Data.com`.
Country	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the contact.
DataDotComID	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID Data.com maintains for the contact.
Email	**Type** email **Properties** Filter, Group, Nillable, Sort **Description** The email address for the contact.
FirstName	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The contact's first name.
IsDifferentCity	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `City` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
IsDifferentCountry	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Country` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
IsDifferentCountryCode	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Country Code` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
IsDifferentEmail	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Email` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
IsDifferentFirstName	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the contact's `First Name` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentLastName`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Last Name` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentPhone`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Phone` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentPostalCode`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Postal Code` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentState`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `State` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentStateCode`	**Type** boolean **Properties** Filter

Field Name	Details
	Description Indicates whether the contact's `State Code` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentStreet`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Street` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsDifferentTitle`	**Type** boolean **Properties** Filter **Description** Indicates whether the contact's `Title` field value is different from the corresponding value on its matched Data.com record (`true`) or not (`false`).
`IsFlaggedWrongAddress`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Address` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongEmail`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Email` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongName`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the contact's `Name` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongPhone`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Phone` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsFlaggedWrongTitle`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Title` field value is flagged as wrong to Data.com (`true`) or not (`false`).
`IsInactive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the contact has been reported to Data.com as *`Inactive`* (`true`) or not (`false`).
`IsReviewedAddress`	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Address` field value is in a `Reviewed` state (`true`) or not (`false`).
`IsReviewedEmail`	**Type** boolean **Properties** Filter, Update

Field Name	Details
	Description Indicates whether the contact's `Email` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedName	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Name` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedPhone	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Phone` field value is in a `Reviewed` state (`true`) or not (`false`).
IsReviewedTitle	**Type** boolean **Properties** Filter, Update **Description** Indicates whether the contact's `Title` field value is in a `Reviewed` state (`true`) or not (`false`).
LastMatchedDate	**Type** dateTime **Properties** Filter, Sort **Description** The date the contact record was last matched and linked to a Data.com record.
LastName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The contact's last name.

Field Name	Details
LastStatusChangedById	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of who or what last changed the record's `Clean Status` field value: a Salesforce user or a Clean job.
LastStatusChangedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date on which the record's `Clean Status` field value was last changed.
Latitude	**Type** double **Properties** Filter, Nillable, Sort **Description** Used with `Longitude` to specify the precise geolocation of a billing address. Data not currently provided.
Longitude	**Type** double **Properties** Filter, Nillable, Sort **Description** Used with `Latitude` to specify the precise geolocation of a billing address. Data not currently provided.
Name	**Type** string **Properties** Filter, Group, Sort, Update **Description** Field label is **Contact Clean Info Name**. The name of the contact. Maximum size is 255 characters.
Phone	**Type** phone

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The phone number for the contact.
`PostalCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the contact.
`State`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the contact.
`Street`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** Details for the billing address of the contact.
`Title`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The contact's title.

Usage

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.

Create a customized set of `Title` field values. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

ContactPointAddress

Represents a contact's billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ActiveFromDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact's address became active.
`ActiveToDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact's address is no longer active.
`Address`	**Type** address **Properties** Filter, Nillable **Description** The full address.
`AddressType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the type of address. Possible values are: • `Billing`

Field	Details
	• `Shipping`
`BestTimeToContactEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The latest time to contact the individual.
`BestTimeToContactStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The earliest time to contact the individual.
`BestTimeToContactTimezone`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The timezone applied to the best time to contact the individual.
`City`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address city.
`ContactPointPhoneId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the primary phone number associated with this address.
`Country`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The address country.
GeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates. Possible values are: • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State • Street • Unknown • Zip
IsDefault	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's address is the preferred method of communication (true) or not (false). The default value is false.
IsPrimary	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's address is their primary address (true) or not (false). The default value is false.

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last referenced a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Latitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `Longitude` to specify the precise geolocation of the address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places.
`Longitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `Latitude` to specify the precise geolocation of the address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the contact.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The ID of the account's owner associated with this contact.
ParentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the contact's parent record. Only an individual or account can be a contact's parent.
PostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address postal code.
State	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address state.
Street	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The address street.
UsageType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specify the usage type of this address. For instance, whether it's a work address or a home address. Possible values are: • Home • Temp

Field	Details
	• `Work`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

ContactPointPhone
History is available for tracked fields of the object.

ContactPointEmail
Sharing rules are available for the object.

ContactPointPhoneShare
Sharing is available for the object.

ContactPointConsent

Represents a customer's consent to be contacted via a specific contact point, such as an email address or phone number. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CaptureContactPointType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. Indicates how you captured consent. Possible values are: • `Email` • `MailingAddress` • `Phone` • `Social` • `Web`

Field	Details
CaptureDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Required. Date when consent was captured.
CaptureSource	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. Indicates how you captured consent. For example, a website or online form.
ContactPointId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the contact point record through which the customer is consenting to be contacted.
DataUsePurposeId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the data use purpose record that you want to associate this consent with.
DoubleConsentCaptureDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when double opt-in was captured.
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when consents starts.

Field	Details
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when consent ends.
EngagementChannelTypeId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the engagement channel record through which the customer is consenting to be contacted.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the contact point type consent record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description ID of the account owner associated with this customer.
`PrivacyConsentStatus`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Identifies whether the individual or person account associated with this record agrees to this form of contact. Possible values are: • `NotSeen` • `OptIn` • `OptOut` • `Seen`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContactPointConsentHistory
History is available for tracked fields of the object.

ContactPointConsentOwnerSharingRule
Sharing rules are available for the object.

ContactPointConsentShare
Sharing is available for the object.

ContactPointEmail

Represents a contact's email, which is associated with an individual or person account. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ActiveFromDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact’s email became active.
`ActiveToDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact’s email is no longer active.
`BestTimeToContactEndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The latest time to contact the individual.
`BestTimeToContactStartTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The earliest time to contact the individual.
`BestTimeToContactTimezone`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The timezone applied to the best time to contact the individual.
`EmailAddress`	**Type** email **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description Required. The email address of the contact.
`EmailDomain`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The domain of the contact’s email, which is everything after the @ sign.
`EmailLatestBounceDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when an email failed to reach its recipient.
`EmailLatestBounceReasonText`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The reason why the email didn’t reach its recipient.
`EmailMailBox`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A subset of the contact’s email, which is everything before the @ sign.
`IsPrimary`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact’s email is their primary email (`true`) or not (`false`).
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The email of the contact.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account's owner associated with this contact.
ParentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the contact's parent. Only an individual or account can be a contact's parent.
UsageType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specify the usage type of this email. For instance, whether it's a work email or a temporary email. Possible values are: • Home

Field	Details
	• `Temp` • `Work`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

ContactPointEmailHistory
History is available for tracked fields of the object.

ContactPointEmailOwnerSharingRule
Sharing rules are available for the object.

ContactPointEmailShare
Sharing is available for the object.

ContactPointPhone

Represents a contact's phone number, which is associated with an individual or person account. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ActiveFromDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact's phone number became active.
`ActiveToDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the contact's phone number is no longer active.

Field	Details
AreaCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The area code of the phone number's location for the contact.
BestTimeToContactEndTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The latest time to contact the individual.
BestTimeToContactStartTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The earliest time to contact the individual.
BestTimeToContactTimezone	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The timezone applied to the best time to contact the individual.
ExtensionNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The phone number extension for the contact.
FormattedInternationalPhoneNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The internationally recognized format for the contact's phone number.

Field	Details
FormattedNationalPhoneNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The nationally recognized format for the contact's phone number.
IsBusinessPhone	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's phone number is a business number (`true`) or not (`false`).
IsFaxCapable	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's phone number is a fax number (`true`) or not (`false`).
IsPersonalPhone	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's phone number is a personal number (`true`) or not (`false`).
IsPrimary	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a contact's phone number is their primary number (`true`) or not (`false`).
IsSmsCapable	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates whether a contact's phone number can receive text messages (`true`) or not (`false`).
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The phone number for the contact.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account's owner associated with this contact.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the contact's parent. Only an individual or account can be a contact's parent.
`PhoneType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of phone number for the contact. Possible values are: • `Home` • `Mobile`
`PreferenceRank`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specify how this phone numbers ranks in terms of preference among the contact's other phone numbers.
`TelephoneNumber`	**Type** phone **Properties** Create, Filter, Group, Sort, Update **Description** Required. The phone number for the contact.
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specify the usage type of this number. For instance, whether it's a work phone or a home phone. Possible values are: • `Home` • `Temp` • `Work`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

ContactPointPhoneHistory
History is available for tracked fields of the object.

ContactPointPhoneOwnerSharingRule
Sharing rules are available for the object.

ContactPointPhoneShare
Sharing is available for the object.

ContactPointTypeConsent

Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
`CaptureContactPointType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. Indicates how you captured consent. Possible values are: • `Email` • `MailingAddress` • `Phone` • `Social` • `Web`
`CaptureDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Required. Date when consent was captured.
`CaptureSource`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Required. Indicates how you captured consent. For example, a website or online form.
ContactPointType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. Represents the contact method you want to apply consent to. Possible values are: • Email • MailingAddress • Phone • Social • Web
DataUsePurposeId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the record for data use purpose that you want to associate this consent with.
DoubleConsentCaptureDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when double opt-in was captured.
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when consents starts.

Field Name	Details
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date when consent ends.
EngagementChannelType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required if a ContactPointType isn't selected. Represents the contact method you want to apply consent to. Possible values are: • Billboard • Email • MailingAddress • Phone • SMS • Social • Web
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string

Field Name	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Name of the contact point type consent record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this customer.
`PartyId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. Represents the record based on the Individual object you want to associate consent with.
`PrivacyConsentStatus`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Identify whether the individual associated with this record agrees to this form of contact. Possible values are: • `NotSeen` • `Seen` • `OptIn` • `OptOut`

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContactPointTypeConsentHistory
History is available for tracked fields of the object.

ContactPointTypeConsentOwnerSharingRule
Sharing rules are available for the object.

ContactPointTypeConsentShare
Sharing is available for the object.

ContactOwnerSharingRule

Represents the rules for sharing a contact with a User other than the owner.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`ContactAccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of access granted to the target Group, UserRole, or User for Contacts. The possible values are: • `Read` • `Edit`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. This field is available in API version 24.0 and later. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`GroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the source group. A Contact owned by a User in the source Group triggers the rule to give access.
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the User or Group being granted access.

Usage

Use this object to manage the sharing rules for contacts.

Contact

ContactShare

Metadata API Developer Guide: SharingRules

ContactRequest

Represents a customer's request for support to get back to them about an issue. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field Name	Details
	Description The contact request number.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the Salesforce record that owns the request.
PreferredChannel	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The channel the customer selected as their preferred method of communication in the contact request flow. For example: • Phone
PreferredPhone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The phone number the customer provided when requesting help in the contact request flow.
RequestDescription	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the customer's issue that they provided when requesting help in the contact request flow.
RequestReason	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The reason the customer provided when requesting help in the contact request flow. These values are customizable in Object Manager. The default values are:

Field Name	Details
	• Account • Billing • Case • General • Order • Other • Product
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The status of the contact request. For example: • Abandoned • Attempted • Contacted • New
`WhatId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the Salesforce record the contact request is related to, such as an account, case, opportunity, or work order.
`WhoId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the Salesforce contact record the contact request is related to, such as a contact, lead, or user.

Usage

Contact request records are created when a customer fills out an online form. This form is created using a flow that uses the type `ContactRequestFlow`. There's a guided setup experience to create this flow on the Customer Contact Requests page in Setup. You then add the flow to an Experience Cloud site using either the Flows component or the Contact Request Button & Flow component.

Contact Request works in Experience Cloud sites, whether they require authentication or not. Make sure that your users have the Run Flows permission, including your Guest User profile. Without this permission, members won't see the button or the form to submit contact requests.

By default, all Standard User and System Administrator profiles have access to the object. Make sure that your users profiles, like service agents, have at least read access on the contact request object.

You can create queues for contact requests and route them with Omni-Channel.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContactRequestOwnerSharingRule
Sharing rules are available for the object.

ContactRequestShare
Sharing is available for the object.

SEE ALSO:

Salesforce Help: Set Up and Manage Contact Requests

ContactRequestShare

Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
`AccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Level of access that the User or Group has to contact requests. The possible values are: • `Read` • `Edit` • `All` (This value is not valid for `create()` or `update()` calls.) This value must be set to an access level that is higher than the organization's default access level for contact requests.

Field Name	Details
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the parent object, if any.
`RowCause`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Possible values are: • `Manual`—The User or Group has access because a user with “All” access manually shared the ContactRequest with them. • `Owner`—The User is the owner of the ContactRequest. • `Rule`—The User or Group has access via a ContactRequest sharing rule. • `GuestRule`—The User or Group has access via a ContactRequest guest user sharing rule.
`UserOrGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the User or Group that has been given access to the ContactRequest.

Usage

This object lets you determine which users and groups can view and edit ContactRequest records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

SEE ALSO:

Salesforce Help: Set Up and Manage Contact Requests

ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is Owner.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with access to the Contact object can access this object.

Fields

Field	Details
`ContactId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the Contact associated with this sharing entry. This field can't be updated.
`ContactAccessLevel`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Level of access that the User or Group has to cases associated with the account Contact. The possible values are: • `Read` • `Edit` • `All` This value is not valid for create or update. This field must be set to an access level that is higher than the organization's default access level for contacts.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter

Field	Details
	Description Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`RowCause`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to `Manual` (default). There are many possible values, including: • `Rule`—The User or Group has access via a Contact sharing rule. • `GuestRule`—The User or Group has access via a Contact guest user sharing rule. • `ImplicitChild`—The User or Group has access to the Contact via sharing access on the associated Account. • `ImplicitPerson`—The User or Group has access to the business contact of a person account via a Contact sharing rule. • `GuestPersonImplicit`—The guest user has access to the business contact of a person account via a Contact sharing rule. • `PortalImplicit`—The Contact is associated with the portal user. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group. • `ARImplicit`—The User, who belongs to a partner or customer account, has access to the Contact via an account relationship data sharing rule. • `Manual`—The User or Group has access because a User with "All" access manually shared the Contact with them. • `Owner`—The User is the owner of the Contact.
`UserOrGroupId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Contact. This field can't be updated.

Usage

This object allows you to determine which users and groups can view or edit Contact records owned by other users.

SEE ALSO:

AccountShare

ContactSuggestionInsight

Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

To add or decline contact suggestions, users need a Sales Cloud Einstein license and edit access on accounts. As of the Spring '20 release, Pardot and High Velocity Sales users no longer have access to this object.

Fields

Field Name	Details
`AccountId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the related account.
`Address`	**Type** address **Properties** Filter, Nillable **Description** The address of the suggested contact.
`City`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The city of the suggested contact.
`ContactTitle`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The title of the suggested contact.
Country	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The country of the suggested contact.
CreatedRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the created contact record.
CurrencyIsoCode	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
Division	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The division of the suggested contact.
Email	**Type** email **Properties** Filter, Group, Nillable, Sort **Description** The email address of the suggested contact.
FirstName	**Type** string

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The first name of the suggested contact.
`GeocodeAccuracy`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Accuracy level of the geocode for the address. See Compound Field Considerations and Limitations for details on geolocation compound fields. Note: This field is available in the API only.
`LastName`	**Type** string **Properties** Filter, Group, Sort **Description** The last name of the suggested contact.
`LastOperationUserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the user who last performed a related operation.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field Name	Details
	Description The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`Latitude`	**Type** double **Properties** Filter, Nillable, Sort **Description** Used in conjunction with `Longitude` to specify the precise geolocation of an address.
`Longitude`	**Type** double **Properties** Filter, Nillable, Sort **Description** Used in conjunction with `Latitude` to specify the precise geolocation of an address.
`Phone`	**Type** phone **Properties** Filter, Group, Nillable, Sort **Description** The phone number of the suggested contact.
`PostalCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The postal code of the suggested contact.
`RationaleLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The reason why this entry is a suggested contact.

Field Name	Details
`State`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The state of the suggested contact.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The status of the suggested contact. Possible values include: • New • Pending • Added • Declined
`Street`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** The street of the suggested contact.

Usage

This object is read-only and isn't supported in workflows, triggers, or process builder.

ContactTag

Associates a word or short phrase with a Contact.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

ContactTag stores the relationship between its parent TagDefinition and the Contact being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

ContentAsset

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Only admin users can edit or delete ContentAssets.
- Users with file access can create and query ContentAssets.
- It isn't necessary to create asset files for regular, collaborative use of Salesforce Files. "Assetize" files only when they're used in setup and configuration situations.
- Neither the file (ContentDocument) nor the asset settings record (ContentAssets) can be deleted if the asset file is referenced by another component.
- ContentAsset doesn't support search or most recently used (MRU) lists.
- ContentAsset doesn't support Apex triggers.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the document.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the asset file in the API. ContentAsset.DeveloperName: • must be 40 characters or fewer • must begin with a letter • can contain only underscores and alphanumeric characters

Field	Details
	• can't include spaces • can't end with an underscore • can't contain 2 consecutive underscores In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
IsVisibleByExternalUsers	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether unauthenticated users can see the asset file.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language for this document. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as `de_DE` or `en_GB`. For more information on locales, see the `Language` field on the CategoryNodeLocalization object.
MasterLabel	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The master label for the asset file. This internal label doesn't get translated.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation.

ContentBody

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

Cannot be queried, inserted, updated, or deleted directly.

Fields

Field	Details
`Id`	**Type** ID **Properties** , Filter, Group, idLookup, Sort **Description** ID of the file body.

Usage

ContentBody is intended for internal Salesforce use. If you need to access the file content body, please use ContentVersion.

ContentDistribution

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the "View All Data" permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have "Deliver Content" enabled in the library permission definition and be a member of the library. If the file isn't managed by a Content Library, the user must have the "Enable Creation of Content Deliveries for Salesforce Files" permission.

- Users can query the `DistributionPublicUrl` and `Password` fields only if they are the file owner, if the file is shared with them, or if the `RelatedRecordId` specifies a record that the users can access.
- If the shared document is deleted, the delete cascades to any associated ContentDistribution. The ContentDistribution is still queryable by using the `QueryAll` verb.
- If the shared document is archived, the only fields that users can edit are `ExpiryDate` and `PreferencesExpires`.
- Customer Portal users can't access this object.
- Chatter Free users can't access this object.

Fields

Field Name	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the shared document.
`ContentDownloadUrl`	**Type** string **Properties** Sort, Nillable **Description** The link for downloading the file. This field is available in API version 40.0 and later.
`ContentVersionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the shared document version.
`DistributionPublicUrl`	**Type** string **Properties** Nillable, Sort **Description** URL of the link to the shared document.
`ExpiryDate`	**Type** dateTime

Field Name	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Date when the shared document becomes inaccessible.
`FirstViewDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date when the shared document is first viewed.
`LastViewDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date when the shared document was last viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the content delivery.
`OwnerId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the user who owns the shared document.
`PdfDownloadUrl`	**Type** string **Properties** Sort, Nillable **Description** The link for downloading the file as a PDF. This field is available in API version 40.0 and later.

Field Name	Details
Password	**Type** string **Properties** Group, Nillable, Sort **Description** A password that allows access to a shared document.
PreferencesAllowOriginalDownload	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, the shared document can be downloaded as the file type that it was uploaded as. When `false`, download availability depends on whether a preview of the file exists. If a preview exists, the file can't be downloaded. If a preview doesn't exist, the file can still be downloaded. If the shared document is a link, it can't be downloaded.
PreferencesAllowPDFDownload	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, the shared document can be downloaded as a PDF if the original file type is PDF or if a PDF preview has been generated.
PreferencesAllowViewInBrowser	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, a preview of the shared document can be viewed in a Web browser.
PreferencesExpires	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, access to the shared document expires on the date that's specified by `ExpiryDate`.

Field Name	Details
PreferencesLinkLatestVersion	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, users see the most recent version of a shared document. When `false`, users see the version of the document that's shared, even if it isn't the most recent version.
PreferencesNotifyOnVisit	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, the owner of the shared document is emailed the first time that someone views or downloads the shared document.
PreferencesNotifyRndtnComplete	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, the owner of the shared document is emailed when renditions of the shared document that can be previewed in a Web browser are generated.
PreferencesPasswordRequired	**Type** boolean **Properties** Create, Filter, Update **Description** When `true`, a password, specified by `Password`, is required to access the shared document.
RelatedRecordId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the record, such as an Account, Campaign, or Case, that the shared document is related to.

Field Name	Details
`ViewCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of times that the shared document has been viewed.

Usage

Use this object to create, update, delete, or query information about a document shared externally via a link or via Salesforce CRM Content delivery.

The ContentDistribution object supports triggers before and after these operations: insert, update, delete. It supports triggers after undelete.

Example: The VP of Marketing wants file authors to specify whether their files can be shared with external people using content delivery. He also wants some files to have a password. You can add a custom field `DeliveryPolicy` on the ContentVersion object. Make the custom field a picklist with the values, `Allowed`, `Blocked`, and `Password required`. Add the field to the ContentVersion layout so that the user can set the delivery policy per file. Then, add an insert trigger for the ContentDistribution object to enforce the rules based on the delivery policy set in the file.

Note: The `ContentVersionId` for `ContentDistribution` must be unique.

This trigger for the ContentDistribution object enforces the delivery policy rules for each file:

```
trigger deliveryPolicy on ContentDistribution (before insert) {
    for (ContentDistribution cd : trigger.new) {
        String versionId = DeliveryPolicyHelper.getContentVersionId(cd);
        ContentVersion version = [select DeliveryPolicy__c from ContentVersion where
Id = :versionId];
        String policy = version.DeliveryPolicy__c;
        if (policy.equals('Blocked')) {
            cd.addError('This file is not allowed to be delivered.');
        } else if (policy.equals('Password required')){
            if (!DeliveryPolicyHelper.requirePassword(cd)) {
                cd.addError('To deliver this file, set a password.');
            }
        }
    }
}
```

The trigger calls this helper class:

```
public class DeliveryPolicyHelper {
    public static String getContentVersionId(ContentDistribution cd) {
        if (cd.ContentVersionId != null) {
            return cd.ContentVersionId;
        } else {
            String versionId = [select LatestPublishedVersionId from ContentDocument
where Id = :cd.ContentDocumentId].get(0).LatestPublishedVersionId;
```

```
            return versionId;
        }
    }

    public static boolean requirePassword(ContentDistribution cd) {
        return cd.PreferencesPasswordRequired;
    }
}
```

Important: Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the "View All Data" permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have "Deliver Content" enabled in the library permission definition and be a member of the library. If the file isn't managed by a Content Library, the user must have the "Enable Creation of Content Deliveries for Salesforce Files" permission.
- ContentDistributionView can be deleted by an admin.
- If the shared document is deleted, the delete cascades to any associated ContentDistributionView. The ContentDistributionView is still queryable by using the `QueryAll` verb.
- Customer Portal users can't access this object.
- Chatter Free users can't access this object.

Fields

Field Name	Details
`DistributionId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the content delivery that the document is part of.

Field Name	Details
`IsDownload`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** `true` if the shared document is downloaded; `false` if the shared document is viewed.
`IsInternal`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** `true` if the shared document is viewed by a user in the same organization; `false` if viewed by an external user.
`ParentViewId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of this instance of accessing the shared document.

Usage

Use this read-only object to query information about users who are accessing shared documents.

ContentDocument

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

The maximum number of documents that can be published is 30,000,000. Archived files count toward this limit and toward storage usage limits.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period.
- Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Supported Calls

`delete()`, `describeLayout()` `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

Special Access Rules

- By default, users (including users with the "View All Data" permission) can only query files they have access to, including:
  - Salesforce Files in their personal library and in libraries they're a member of, regardless of library permissions (API version 17.0 and later).
  - Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).

  Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.
  - Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
  - Users can't edit, upload new versions, or delete files they don't have access to.
  - View All Data permission is required to enable Query All Files.
- Customer and Partner Portal users must have the "View Content in Portal" permission to query content in libraries where they have access.
- A Salesforce CRM Content document can be deleted if any of the following are true:
  - The document is published into a personal library or is in the user's upload queue.
  - The document is published into a public library, the user is a member of that library with the "Add Content" library privilege enabled, and the user trying to delete the document is the owner.
  - The document is published into a public library that has the "Delete Content" or "Manage Library" permission enabled, and the user trying to delete the document is not the owner.

For API version 25.0 and later, you can change ownership of Salesforce Files and Salesforce CRM Content documents.

- The following must be true to change ownership of a Salesforce CRM Content document:
  - The Salesforce CRM Content app must be enabled.
  - The user who is becoming the owner of the document must have a Salesforce CRM Content feature license.
- A user can change ownership of a Salesforce CRM Content document or Salesforce file if any of the following are true:
  - The user is the current owner, or has either the "Modify All Data" or "Manage Salesforce CRM Content" permission enabled.
  - The user has the "Manage Library" permission enabled for the library containing the document.

  Note: When the owner of a ContentDocument is changed, ContentDocumentLink may be triggered. This action deletes the ContentDocumentLink to the old owner and inserts one to the new owner.

  Note:
  - The user who is becoming the owner of the document must be a visible user who is active, but the original owner can be inactive.
  - A document's owner can be changed to a user who doesn't have access to the library that contains the document. Library administrators must give the new owner membership to the library.

Fields

Field	Details
ArchivedById	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The ID of the user who archived the document. This field is available in API version 24.0 and later.
`ArchivedDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the document was archived. This field is available in API version 24.0 and later.
`ContentAssetId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** If the ContentDocument is an asset file, this field points to the asset. For most entities, the value of this field is `null`. This field is available in API version 38.0 and later.
`ContentModifiedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date the document was modified. `ContentModifiedDate` updates when, for example, the document is renamed or a new document version is uploaded. When you're uploading the first version of a document, `ContentModifiedDate` can be set to the current time or anytime in the past. This field is available in API version 32.0 and later.
`ContentSize`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The size of the document in bytes.

Field	Details
	This field is available in API version 31.0 and later.
`Description`	**Type** textarea **Properties** Filter, Nillable, Sort, Update **Description** A description of the document. This field is available in API version 31.0 and later.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
`FileExtension`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the document. This field is available in API version 31.0 and later.
`FileType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of document, determined by the file extension. This field is available in API version 31.0 and later.
`IsArchived`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates whether the document has been archived (`true`) or not (`false`).
`LastReferencedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`LatestPublishedVersionId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the latest document version (ContentVersion).
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** ID of the owner of this document.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** ID of the library that owns the document. Created automatically when inserting a ContentVersion via the API for the first time. This field is available in API version 24.0 and later when Salesforce CRM Content is enabled.

Field	Details
PublishStatus	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Indicates if and how the document is published. Valid values are: • `P`—The document is published to a public library and is visible to other users. Label is **Public**. • `R`—The document is published to a personal library and is not visible to other users. Label is **Personal Library**. • `U`—The document is not published because publishing was interrupted. Label is **Upload Interrupted**.
SharingOption	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Allowed`, which means that new shares are allowed. When set to `Restricted`, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.
SharingPrivacy	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Visible to Anyone With Record Access`. When set to `Private on Records`, the file is private on records but can be shared selectively with others. This field is available in API versions 41.0 and later.
Title	**Type** string **Properties** Filter, Group, idLookup, Sort, Update **Description** The title of a document.

Usage

- Use this object to retrieve, query, update, and delete the latest version of a document in a library or a Salesforce file. Use the ContentVersion object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file.
- The `query()` call doesn't return archived documents. The `queryAll()` call returns archived documents.
- You can't add new versions of archived documents.
- To query a file that is accessible only through a record share, you must specify the content ID of the file. When SOQL querying the ContentVersion object, either the `ContentVersionId` or the `ContentDocumentId` must be compounded by an AND operator.

  For example,

```
SELECT FileExtension, Title FROM ContentVersion
WHERE (ContentDocumentId = '<ContentDocumentId>' or Id='<ContentVersionId>') and
IsLatest=true
```

```
SELECT Id, VersionData, FileExtension, Title FROM ContentVersion
WHERE ContentDocumentId='<ContentDocumentId>' AND FirstPublishLocationId =
'<FirstPublishLocationId>'
```

- To create a document, create version via the ContentVersion object without setting the `ContentDocumentId`. This process automatically creates a parent document record. When adding a new version of the document, you must specify an existing `ContentDocumentId` which initiates the revision process for the document. When the latest version is published, the title, owner, and publish status fields are updated in the document.
- When you delete a document, all versions of that document are deleted, including ratings, comments, and tags.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- A document record is a container for multiple version records. You create a version to add a document to the system. The new version contains the actual file data which allows the document to have multiple versions. The version stores the body of the uploaded document.
- Assign topics to ContentDocument using `TopicAssignment` in API version 37.0 or later.

Associated Objects

This object has the following associated objects. Unless noted, associated objects are available in the same API version as this object.

ContentDocumentFeed (API version 20.0)
  Feed tracking is available for the object.

ContentDocumentHistory
  History is available for tracked fields of the object.

SEE ALSO:

ContentDocumentHistory

ContentVersion

ContentDocumentHistory

Represents the history of a document. This object is available in versions 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

- Customer and Partner Portal users must have the "View Content in Portal" permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the document.
`DataType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Data type of the field that was changed.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
`Field`	**Type** picklist **Properties** Filter, Group, Sort, Restricted picklist

Field	Details
	Description The name of the field that was changed. Possible values include: • `contentDocPublished`—The document is published into a library. • `contentDocUnpublished`—The document is archived or removed from a library, either directly or when the owning library is changed. • `contentDocRepublished`—The document is removed from the archive. • `contentDocFeatured`—The document is featured. • `contentDocSubscribed`—The document is subscribed to. • `contentDocUnsubscribed`—The document is no longer subscribed to.
`NewValue`	**Type** anyType **Properties** Nillable, Sort **Description** The new value of the field that was changed.
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** The latest value of the field before it was changed.

Usage

Use this read-only object to query the history of a document.

SEE ALSO:

ContentDocument

ContentDocumentLink

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- In API versions 33.0 and later, you can create and delete ContentDocumentLink objects with a `LinkedEntityId` of any record type that can be tracked in the feed, even if feed tracking is disabled for that record type.
- In API versions 25.0 and later, you can create ContentDocumentLink objects with a `LinkEntityId` of type User, CollaborationGroup, or Organization.
- In API versions 21.0 and later, users with explicit Viewer access (the file has been directly shared with the user) to a file can delete ContentDocumentLink objects between the file and other users who have Viewer access. In the same API versions, any user with Viewer access to a file can delete ContentDocumentLink objects between the file and organizations or groups of which they are a member.
- For orgs with digital experiences enabled, a document can only be shared with users and groups that are a part of the Experience Cloud site the file was created in.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the document.
`LinkedEntityId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the linked object. Can include Chatter users, groups, records (any that support Chatter feed tracking including custom objects), and Salesforce CRM Content libraries. Using the API only, you can relate notes to custom settings.
`ShareType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. The permission granted to the user of the shared file in a library. This is determined by the permission the user already has in the library. This field is available in API version 25.0 and later. **V** Viewer permission. The user can explicitly view but not edit the shared file.

Field	Details
	C Collaborator permission. The user can explicitly view and edit the shared file. **I** Inferred permission. The user's permission is determined by the related record. For shares with a library, this is defined by the permissions the user has in that library. Inferred permission on shares with libraries and file owners is available in API versions 21.0 and later. Inferred permission on shares with standard objects is available in API versions 36.0 and later.
`Visibility`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies whether this file is available to all users, internal users, or shared users. This field is available in API version 26.0 and later. `Visibility` can have the following values. • `AllUsers`—The file is available to all users who have permission to see the file. • `InternalUsers`—The file is available only to internal users who have permission to see the file. • `SharedUsers`—The file is available to all users who can see the feed to which the file is posted. SharedUsers is used only for files shared with users, and is available only when an org has private org-wide sharing on by default. The `SharedUsers` value is available in API version 32.0 and later. Note the following exceptions for `Visibility`. • `AllUsers` & `InternalUsers` values apply to files posted on standard and custom object records, but not to users, groups, or content libraries. • For posts to a record feed, `Visibility` is set to `InternalUsers` for all internal users by default. • External users can set `Visibility` only to `AllUsers`. • On user and group posts, only internal users can set `Visibility` to `InternalUsers`. • For posts to a user feed, if the organization-wide default for user sharing is set to private, `Visibility` is set to `SharedUsers`. • Only internal users can update Visibility. • Visibility can be updated on links to files posted on standard and custom object records, but not to users, groups, or content libraries. • Visibility is updatable in API version 43.0 and later. The visibility setting on ContentDocumentLink determines a file's visibility on a record post. When a file has multiple references posted in a feed, the file's visibility is determined by the most visible setting.

Usage

Use this object to query the locations where a file is shared or query which files are linked to a particular location. For example, the following query returns a particular document shared with a Chatter group:

```
SELECT ContentDocument.title FROM ContentDocumentLink WHERE ContentDocumentId =
'069D00000000so2' AND LinkedEntityId = '0D5000000089123'
```

- You can't run a query without filters against ContentDocumentLink.
- You can't filter on ContentDocument fields if you're filtering by `ContentDocumentId`. You can only filter on ContentDocument fields if you're filtering by `LinkedEntityId`.
- You can't filter on the related object fields. For example, you can't filter on the properties of the account to which a file is linked. You can filter on the properties of the file, such as the title field.

A SOQL query must filter on one of `Id`, `ContentDocumentId`, or `LinkedEntityId`.

The ContentDocumentLink object supports triggers before and after these operations: insert, update, delete.

Example: This trigger for the ContentDocumentLink object prevents public XLSX files from being shared.

```
trigger NoShareXLSX on ContentDocumentLink (after insert) {
    for (ContentDocumentLink cdl : trigger.new) {
        if (!CDLHelper.isSharingAllowed(cdl)) {
            cdl.addError('Sorry, you cannot share this file.');
        }
    }
}
```

The trigger calls this helper class.

```
public class CDLHelper {

    /**
     * Gets FileExtension of the inserted content.
     */
    public static String getFileExtension(ContentDocumentLink cdl) {
        String fileExtension;
        String docId = cdl.ContentDocumentId;
       FileExtension = [select FileExtension from ContentVersion where ContentDocumentId
 = :docId].get(0).FileExtension;
        return FileExtension;
    }

    /**
     * Checks the file's PublishStatus and FileExtension to decide whether user can
share the file with others.
     * PublishStatus 'P' means the document is in a public library.
     */
    public static boolean isSharingAllowed(ContentDocumentLink cdl) {
        String docId = cdl.ContentDocumentId;
       ContentVersion version = [select PublishStatus,FileExtension from ContentVersion
 where ContentDocumentId = :docId].get(0);
        if (version.PublishStatus.equals('P') && (version.FileExtension != null &&
version.FileExtension.equals('xlsx'))) {
            return false;
        }
```

```
        return true;
    }

    /**
     * Gets the parent account name if the file is linked to an account.
     */
    public static String getAccountName(ContentDocumentLink cdl) {
        String name;
        String id = cdl.LinkedEntityId;
        if (id.substring(0,3) == '001') {
            name = [select Name from Account where Id = :id].get(0).Name;
        }
        return name;
    }
}
```

Important: Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

SEE ALSO:

ContentDocument

ContentDocumentListViewMapping

Represents an association between a ListView and a Quip ContentDocument. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To use this object, the Files Connect and Quip permissions must be enabled in the org.

To insert and update this object through the API, the QuipMassAction gater permission must also be enabled.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description ID of the document.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this document.
`ListViewId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the list view associated with the document.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the document.

Usage

ContentDocumentListViewMapping is used primarily by the Quip list view integration feature. Only Quip file types (Quip sheets and docs) are supported. The ContentDocumentId field must point to a Quip file.

ContentDocumentSubscription

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the file.
`IsCommentSub`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the user made comments on the file.
`IsDocumentSub`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the user follows the file.
`UserId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user following or commenting on the file.

ContentFolder

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolder.
- All users with a content feature license can modify folders in their personal library.
- To modify a folder, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the folder.
`ParentContentFolderId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the ParentFolder.

ContentFolderItem

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`

Special Access Rules

Fields

Field Name	Details
ContentSize	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The file or folder size of the ContentFolderItem.
FileExtension	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Specifies the file extension if the ContentFolderItem is a file.
FileType	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Specifies the type of file if ContentFolderItem is a file.
IsFolder	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates that the ContentFolderItem is a folder, and not a file.
ParentContentFolderId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the ContentFolder that the ContentFolderItem resides in.

Field Name	Details
`Title`	**Type** string **Properties** Filter, Group, Sort **Description** The name of the file or folder.

Usage

ContentFolderLink

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Salesforce CRM Content must be enabled to access ContentFolderLink.
- ContentFolderLink is read-only in the context of a library.

Fields

Field Name	Details
`ContentFolderId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the folder.
`EnableFolderStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the status of enabling folders for the library. Valid values are:

Field Name	Details
	• `C` — Completed folder enablement • `S` — Started folder enablement • `F` — Failed folder enablement This field is available in API version 39.0 and later.
`ParentEntityId`	**Type** reference **Properties** Filter, Group, Sort **Description** Name of the entity the folder hierarchy is linked to.

ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`, `update()`

Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolderMember.
- All users with a content feature license can modify folders in their personal library.
- To modify ContentFolderMember, the user must be a member of the library and have permission to modify folders.

Fields

Field Name	Details
`ChildRecordId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the file.
`ParentContentFolderId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Sort, Update **Description** ID of the folder the file is in.

ContentHubItem

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Fields

Field Name	Details
`ContentHubRepositoryId`	**Type** reference **Properties** Filter, Group, Nillable **Description** The ID for the related external data source described by the ContentHubRepository object.
`ContentModifiedDate`	**Type** dateTime **Properties** Nillable **Description** Date the file or folder content last changed.
`ContentSize`	**Type** int **Properties** Group, Nillable

Field Name	Details
	Description File or folder size.
Description	**Type** string **Properties** Filter, Group, Nillable **Description** Explanation of item in external data source.
ExternalContentUrl	**Type** url **Properties** Group, Nillable **Description** The URL of the document content in the external data source.
ExternalDocumentUrl	**Type** url **Properties** Group, Nillable **Description** The URL of the detail page in the external data source.
ExternalId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** ID for the file or folder in the external data source.
FileExtension	**Type** string **Properties** Group, Nillable **Description** File format extension, such as .doc or .pdf
FileType	**Type** string **Properties** Group, Nillable

Field Name	Details
	Description Complete file type, such as “Microsoft Word Document.”
`IsFolder`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether item is a folder or file.
`MimeType`	**Type** string **Properties** Filter, Group, Nillable **Description** MIME type of the content.
`Name`	**Type** string **Properties** Filter, Nillable, Sort **Description** Name of the file or folder in the external data source.
`Owner`	**Type** string **Properties** Filter, Group, Nillable **Description** Username of the content owner in the external data source.
`ParentId`	**Type** string **Properties** Filter, Group, Nillable **Description** The ID of the parent folder for the record. This field isn’t returned in queries or searches of the ContentHubItem object. It supports only WHERE clauses, such as the following:

Field Name	Details
	WHERE ContentHubRepositoryId = <ID of external source> and ParentId = <ID of parent folder or record>. Or specify WHERE ParentId = <name of root folder> to return the children of the root folder. **Tip:** The ParentId field supports both Salesforce IDs (in the format "0CHxxx") and external IDs.
Title	**Type** string **Properties** Group, Nillable **Description** The title that appears in the content, which often differs from the Name of the containing file or folder.
UpdatedBy	**Type** string **Properties** Group, Nillable **Description** Username for the person who last updated the file.

Usage

The following SOQL query examples show how to retrieve files and folders from a Files Connect external data source. These examples use placeholders for ID values for the repository ID and folder IDs. Before running these queries, replace the placeholders with valid ID values for your external data source and folders.

Important: You must filter queries and searches on ContentHubItem with the ContentHubRepositoryId field; for example, SELECT Id FROM ContentHubItem WHERE ContentHubRepositoryId = <ID of external data source>.

Example 1: Get the ID and name of the root folder in an external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = NULL
```

Example 2: List all folders and files under the specified root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
```

Example 3: List all external file data sources by querying ContentHubRepository.

```
SELECT DeveloperName
FROM ContentHubRepository
```

Example 4: List all files and folders in a given folder and external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<parent folder ID>'
```

Example 5: To return only folders in the result set, add `IsFolder = true` in the `WHERE` clause to a query that returns files and folders. For example, the following query lists all folders under the root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
      AND IsFolder = true
```

Example 6: Retrieve a link that is used to open the specified document in an external source.

```
SELECT ExternalDocumentUrl
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND Id = '<document ID>'
```

SOSL Example: Retrieve the ID and name of all documents that contain the search string. The result set is limited to the first 10 documents.

```
FIND {<search string>}
RETURNING ContentHubItem(Id, Name
                         WHERE ContentHubRepositoryId = '<repository ID>')
LIMIT 10
```

ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

Special Access Rules

Chatter and Files Connect must be enabled for the organization.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`DeveloperName`	**Type** string

Field Name	Details
	Properties Filter, Group, Sort **Description** The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Master label for the external data source. This display value is the internal label and does not get translated.
`Type`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The data source type. Possible values are: • `contenthubGoogleDrive` • `contenthubOffice365` • `contenthubOneDrive` • `contenthubSharepoint` • `contenthubBox` • `contenthubQuip`

ContentNote

Represents a note created with the enhanced note taking tool, released in Winter ‘16. This object is available in API version 32.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- Notes must be enabled.

Fields

Field	Details
`Content`	**Type** base64 **Properties** Create, Nillable, Update **Description** The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the `Content` field must be escaped. You can escape special characters by calling `content.escapeHtml4()`. If the input contains unsafe HTML characters, we automatically strip them out before saving the content.
`ContentModifiedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date the document was modified. ContentModifiedDate updates when, for example, the document is renamed or a new document version is uploaded. This field is available in API version 48.0 and later.
`ContentSize`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Size of the note in bytes.
`CreatedById`	**Type** reference

Field	Details
	Properties Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on createFilter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission) **Description** ID of the user who created the note.
`CreatedDate`	**Type** dateTime **Properties** Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission) **Description** Date the note was created.
`FileExtension`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the note.
`FileType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of file for the note. All notes have a file type of `SNOTE`.
`Id`	**Type** id **Properties** Defaulted on createFilter, Group, Nillable, Sort **Description** ID of the note.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the note has been deleted.

Field	Details
IsReadOnly	**Type** boolean **Properties** Defaulted on create, Group, Sort **Description** Indicates whether the note is read only.
LastModifiedById	**Type** reference **Properties** Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission) **Description** The ID of the user who last modified the note.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable Sort **Description** Date the note was last viewed. This field is available in API version 35.0 and later.
LatestPublishedVersionId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the ContentVersion for the latest published version of the note.
OwnerId	**Type** reference **Properties** Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission) **Description** ID of the owner of the note.
SharingPrivacy	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Visible to Anyone With Record Access`. When set to `Private on Records`, the file is private on records but can be shared selectively with others. This field is available in API versions 41.0 and later.
`TextPreview`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A preview of the note's content. This field is available in API version 35.0 and later.
`Title`	**Type** string **Properties** Create, Filter, Group, idLookup, Namefield, Sort, Update **Description** Title of the note.

Usage

- Use ContentNote to create, query, retrieve, search, edit, and update notes.
- ContentNote is built on ContentVersion, and so it has many of the same usages.
- Not all fields can be set for notes. Only the `Content` and `Title` fields can be updated.
- The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
- You can convert old Note records to Lightning Experience, so users can view and edit notes from the Notes & Attachments related list in Lightning Experience. Users can edit their converted notes, which are accessible from the Notes related list and Notes tab. Copy old Note records to newly created ContentNote records. Users assigned the Set Audit Fields Upon Creation permission can set the owner, created date, and last modified date on ContentNote records.
- SOQL and SOSL queries on the ContentNote return only the most recent version of the note.
- To relate a note to a record, use `ContentDocumentLink`.

For example, the following Apex code creates a note and escapes any special characters so they are converted to their HTML equivalents.

Note: Apex code doesn't need to be encoded to base64 before it is uploaded and downloaded.

```
ContentNote cn = new ContentNote();
cn.Title = 'test1';
String body = 'Hello World. Before insert/update, escape special characters such as ", ',
```

```
 &, and other standard escape characters.';
cn.Content = Blob.valueOf(body.escapeHTML4());
insert(cn);
```

In this example, the following code creates a note using text that is already formatted as HTML, so it does not need to be escaped.

```
ContentNote cn = new ContentNote();
cn.Title = 'test2';
String body = '<b>Hello World. Because this text is already formatted as HTML, it does not
 need to be escaped.
Special characters such as &quot;, etc. must already use their HTML equivalents.</b>';
cn.Content = body;
insert(cn);
```

ContentNotification

Represents a notification for a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`EntityIdentifierId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the object with the notification.
`EntityType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of object with the notification. One of the following. • `ContentDocument` • `ContentTagName`

Field	Details
	• `ContentVersion` • `ContentWorkspace` • `ContentWorkspacePermission` • `User`
`Nature`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Type of notification.
`Subject`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Subject of the notification.
`Text`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Text of the notification.
`UsersId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who received the notification.

ContentTagSubscription

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`UserId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the user following the tag on the file.

ContentUserSubscription

Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`SubscribedToUserId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who is followed by another user.
`SubscriberUserId`	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description ID of the user who follows another user.

ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

The maximum number of versions that can be published in a 24-hour period is 200,000.

Note: Depending on how files are shared, queries on ContentDocument and ContentVersion without specifying an ID won't return all files a user has access to. For example, if a user only has access to a file because they have access to a record that the file is shared with, the file won't be returned in a query such as "SELECT Id FROM ContentDocument."

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- All users with a content feature license can create versions in their personal library. Customer and Partner Portal users must also supply the `NetworkId` of the Experience Cloud site in the request.
- By default, users (including users with the “View All Data” permission) can only query files they have access to, including:
  - Salesforce Files in their personal library and in libraries they're a member of, regardless of library permissions (API version 17.0 and later).
  - Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).

  Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.
  - Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
  - Users can’t edit, upload new versions, or delete files they don’t have access to.
  - View All Data permission is required to enable Query All Files.
- All users can update versions in their personal library.
- The owner of a version or document can update the document if they are a member of the library, regardless of library permissions.
- To update a Salesforce CRM Content document, the user must be a member of the library with one of these library privileges enabled:
  - Add Content
  - Add Content On Behalf of Others
  - Manage Library
- Customer and Partner Portal users must have the View Content in Portal permission to query content in libraries where they have access.
- Customer and Partner Portal users can only publish, version, or edit documents if they have a Salesforce CRM Content feature license.
- `FileType` is defined by either `ContentUrl` for links or `PathOnClient` for documents, but not both.

- In API version 34.0 and later, any file can be shared with libraries, whether the file originated in Chatter or in Salesforce CRM Content.
- In API version 39.0 and later, custom Apex download handlers can be created that can control access to documents. See the *Apex Developer Guide* for more information.

Fields

Field	Details
`Checksum`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** MD5 checksum for the file.
`ContentBodyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** Allows inserting a file version independently of the file blob being uploaded. This field is available for query and insert only. It can only point to a ContentBody record. This field is available in API version 40.0 and later.
`ContentDocumentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the document.
`ContentLocation`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Origin of the document. Valid values are: • **S**—Document is located within Salesforce. Label is **Salesforce**. • **E**—Document is located outside of Salesforce. Label is **External**. • **L**—Document is located on a social network and accessed via Social Customer Service. Label is **Social Customer Service**.

Field	Details
ContentModifiedById	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the user who modified the document.
ContentModifiedDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** Date the document was modified. ContentModifiedDate updates when, for example, the document is renamed or a new document version is uploaded. When uploading the first version of a document, ContentModifiedDate can be set to the current time or any time in the past.
ContentSize	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Size of the document in bytes. Always zero for links.
ContentUrl	**Type** url **Properties** Create, Filter, Nillable, Sort, Update **Description** URL for links. This is only set for links. One of the fields that determines the FileType. The character limit in API versions 33.0 and later is 1,300. The character limit in API versions 32.0 and earlier was 255.
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the content version.

Field	Details
`Division`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the org has the Division permission enabled.
`ExternalDataSourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the external document referenced in the `ExternalDataSource` object.
`ExternalDocumentInfo1`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Stores the URL of the file in the external content repository. The integration from the external source determines the content for this string. After the reference or copy is created, the URL of the external file is updated when you: • Republish a file reference in Lightning Experience • Open the document • Create a file reference in the Connect REST API with `reuseReference` set to true. When the file is updated, the shared link is updated to the most current version.
`ExternalDocumentInfo2`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Contains the external file ID. Salesforce determines the content for this string, which is private. The content can change without notice, depending on the external system. After the file reference is created, this field isn't updated, even if the file path changes.
`FeaturedContentBoost`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Read only. Designates a document as featured.
`FeaturedContentDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Date the document was featured.
`FileExtension`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** File extension of the document. This field is available in API version 31.0 and later.
`FileType`	**Type** string **Properties** Filter, Group, Sort **Description** Type of content determined by `ContentUrl` for links or `PathOnClient` for documents.
`FirstPublishLocationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the location where the version was first published. If the version is first published into a user's personal library or My Files, the field will contain the ID of the user who owns the personal library or My Files. In Lightning Experience, if the first version is published into a public library, the field will contain the ID of that library. Accepts all record IDs supported by ContentDocumentLink (anything a file can be attached to, like records and groups). Setting `FirstPublishLocationId` allows you to create a file and share it with an initial record/group in a single transaction, and have the option to create more links to share

Field	Details
	the file with other records or groups later. When a file is created, it's automatically linked to the record, and PublishStatus will change to Public from Pending/Personal. This field is only set the first time a version is published via the API. `FirstPublishLocationId` can't be set to another ID when a new content version is inserted. **Note:** Salesforce updates the `FirstPublishLocationId` updates automatically when a new `OwnerId` is added to the `ContentVersion`. For example, when you publish a new version with a different `OwnerId` than the current `OwnerId`, the `FirstPublishLocationId` of all previous versions updates to the previous `OwnerId`. The new published version sets the `FirstPublishLocationId` to the new `OwnerId`.
`IsAssetEnabled`	**Type** boolean **Properties** Create, Group, Defaulted on create **Description** Can be specified on insert of ContentVersion to automatically convert a ContentDocument file into a ContentAsset. This field can be SOQL queried, but it can't be edited. This field is available in API version 38.0 and later.
`IsEncrypted`	**Note:** This information is about Shield Platform Encryption and not Classic Encryption. **Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether files are encrypted using Shield Platform Encryption (`true`) or not (`false`). This field is available in API version 34.0 and later.
`IsLatest`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this is the latest version of the document (`true`) or not (`false`).
`IsMajorVersion`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort

Field	Details
	Description `true` if the document is a major version; `false` if the document is a minor version. Major versions can't be replaced.
`Language`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language for this document. This field defaults to the user's language unless the organization is multi-language enabled. Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as `de_DE` or `en_GB`. For more information on locales, see the `Language` field on the CategoryNodeLocalization object.
`NegativeRatingCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Read only. The number of times different users have given the document a thumbs down. Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-down votes, and Version 2 receives 2 thumbs-down votes, the `NegativeRatingCount` on Version 2 is 12. However, rating counts are not retroactive for prior versions. The `NegativeRatingCount` on Version 1 is 10.
`NetworkId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site that this file originated from. This field is available in API version 26.0 and later, if digital experiences is enabled for your org. You can add a `NetworkId` only when creating a file. You can't change or add a `NetworkId` for an existing file.
`Origin`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The source of the content version. Valid values are:

Field	Details
	• **C**—Content document from the user's personal library. Label is **Content**. The `FirstPublishLocationId` must be the user's ID. If `FirstPublishLocationId` is left blank, it defaults to the user's ID. • **H**—Salesforce file from the user's My Files. Label is **Chatter**. The `FirstPublishLocationId` must be the user's ID. If `FirstPublishLocationId` is left blank, it defaults to the user's ID. Origin can only be set to **H** if Chatter is enabled for your organization. This field defaults to C. Label is **Content Origin**.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the owner of this document.
`PathOnClient`	**Type** string **Properties** Create, Filter, Nillable, Sort **Description** The complete path of the document. One of the fields that determines the `FileType`. Note: Specify a complete path including the path extension in order for the document to be visible in the Preview tab.
`PositiveRatingCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Read only. The number of times different users have given the document a thumbs up. Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-up votes, and Version 2 receives 2 thumbs-up votes, the `PositiveRatingCount` on Version 2 is 12. However, rating counts are not retroactive for prior versions. The `PositiveRatingCount` on Version 1 is 10.
`PublishStatus`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Indicates if and how the document is published. Valid values are:

Field	Details
	• `P`—The document is published to a public library and is visible to other users. Label is **Public**. • `R`—The document is published to a personal library and is not visible to other users. Label is **Personal Library**. • `U`—The document is not published because publishing was interrupted. Label is **Upload Interrupted**.
`RatingCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Read only. Total number of positive and negative ratings.
`ReasonForChange`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The reason why the document was changed. This field can only be set when inserting a new version (revising) a document.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type of the version. Custom fields are restricted in `RecordTypeId`. When an administrator creates a custom field via the API it must be added to at least one page layout: • If the custom field is added to the page layout associated with the General record type, the `RecordTypeId` that corresponds to that record type does not have to be set on the version record. • If the custom field is added to the page layout associated with a custom record type, the `RecordTypeId` that corresponds to that record type must be set on the version record.
`SharingOption`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Allowed`, which means that new shares are allowed. When set to `Restricted`, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.
`SharingPrivacy`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Visible to Anyone With Record Access`. When set to `Private on Records`, the file is private on records but can be shared selectively with others. This field is available in API versions 41.0 and later.
`TagCsv`	**Type** textarea **Properties** Create, Nillable, Sort, Update **Description** Text used to apply tags to a content version via the API.
`TextPreview`	**Type** string **Properties** Nillable, Filter,Group, Sort **Description** A preview of a document. Available in API version 35.0 and later.
`Title`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The title of a document.
`VersionData`	**Type** base64

Field	Details
	Properties Create, Nillable, Update **Description** The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the `Content` field must be escaped. You can escape special characters by calling `content.escapeHtml4()`. This field can't be set for links. The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion. If a custom Apex download handler is active, this field is accessed from the API, and the download is not allowed, Salesforce will return a `CONTENT_CUSTOMIZED_DOWNLOAD_EXCEPTION` error.
`VersionNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The version number. The number increments with each version of the document, for example, 1, 2, 3.

Usage

- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file.
- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a Salesforce file.
- To query a file that is shared only with a record, you must specify the content ID of the file.
- Not all fields can be set for Salesforce Files.
- You can only update a version if it is the latest version and if it is published.
- You can't archive versions.
- Using API version 32.0 and later, you can update record types on versions.
- You can't delete a version via the API.
- The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.

- To download a document via the API, you must export the `VersionData` of the document. This does not increase the download count.
- When you upload a document from your local drive using the Data Loader, you must specify the actual path in both `VersionData` and `PathOnClient`. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
- SOQL queries on the ContentVersion object return all versions of the document. SOSL searches on the ContentVersion object return only the most recent version of the document.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- Documents published into a personal library assume the default record type that is set for the user profile of the person publishing the document (General, if no default is set for the user profile).

  Note: An administrator can rename the default (*Content Version Layout*) page layout.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24–hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24–hour period.
- Custom validation rules can prevent an update of documents published into a personal library via the API.

Applying Tags to ContentVersion Records

Tags can be applied to ContentVersion records using either Enterprise or Partner API.

To apply tags to a ContentVersion record, set a value in the `TagCsv` field. For example, setting this field to `one,two,three` creates and associates three tags to that version.

- The maximum length of the `TagCsv` field is 2,000 characters.
- The maximum length of an individual tag is 100 characters.
- When tags are applied to a version, the content is indexed automatically and the tags are searchable.
- You can't apply tags to a `TagCsv` that is published into a personal library.
- You can't apply tags using the ContentDocument object.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different uppercase and lowercase letters. The case of the original tag is always used.

To delete tags from a ContentVersion record, perform a standard API update, and remove any values from the `TagCsv` field that you want to delete. For example, if the original `TagCsv` is `one,two,three`, perform an API update specifying `one,three` in the `TagCsv` field to delete `two`. To delete all tags from a ContentVersion you perform a standard API update by setting the field to `null`.

If you create a ContentVersion record and want to revise it via the API, you insert another ContentVersion record but associate it to the same ContentDocument record as the original. This has an impact on tagging:

- If you insert the revision and do not set any value in the `TagCsv` field, any tags applied to the previous version are automatically applied to the new version.
- If you insert the revision and specify a new `TagCsv` field, no tags transfer over and the tags you specify are applied instead.

When you perform a SOQL query for a ContentVersion record and select the `TagCsv` field, all the tags associated with that record are returned. The tags in the string are always ordered alphabetically even if they were inserted in a different order. You can't use the `TagCsv` field as part of a filter in a SOQL query. You can't query all tags in your organization.

Library tagging rules:

- API tagging respects the tagging restrictions that exist on any library that the document is published into. For example, if the library is in restricted tagging mode and only allows tags `one,three`, you can't save a version with a `TagCsv` of `one,two,three`.
- If the library is in guided tagging mode, you can apply tags to the ContentVersion. You can't query the value of guided tags on a library, but you can query the tagging model of a library.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContentVersionHistory
History is available for tracked fields of the object.

SEE ALSO:

ContentDocument
ContentVersionHistory

ContentVersionComment

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the file.
`ContentVersionId`	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description ID of the version of the file.
UserComment	**Type** textarea **Properties** Filter, Nillable, Sort **Description** ID of the user who commented on the file.

ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

- Customer and Partner Portal users must have the "View Content in Portal" permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

Note: To record an event in `contentVersionViewed`, make sure:

- All files are published to a Content Library.
- The details page is viewed in Salesforce Classic.

Fields

Field	Details
ContentVersionId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the version.

Field	Details
`DataType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Data type of the field that was changed.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as “North America,” “Healthcare,” or “Consulting.” Available only if the organization has the Division permission enabled.
`Field`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The name of the field that was changed. Possible values include: • `contentVersionCreated`—A new version is created. • `contentVersionUpdated`—The title, description, or any custom field on the version is changed. • `contentVersionDownloaded`—A version is downloaded. • `contentVersionViewed`—The version details are viewed. • `contentVersionRated`—The version is rated. • `contentVersionCommented`—The version receives a comment. • `contentVersionDataReplaced`—The new version replaces the previous version, which can happen only when the new version is uploaded immediately after the previous version.
`NewValue`	**Type** anyType **Properties** Nillable, Sort **Description** The new value of the field that was changed.

Field	Details
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** The latest value of the field before it was changed.

Usage

Use this read-only object to query the history of a document version.

SEE ALSO:

ContentVersion

ContentVersionRating

Represents a rating on a version of a file. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`ContentVersionId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the version of the file.
`Rating`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Rating of the file.
`UserComment`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Comment made by the user who rated the file.
`UserId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who rated the file.

ContentWorkspace

Represents a content library. This object is available in versions 17.0 and later.

Note: This object doesn't apply to personal libraries.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Note: create( ), update( ) and delete( ) on ContentWorkspace are supported in API version 40.0 and later only.

Special Access Rules

- The Access Libraries user permission allows orgs to make libraries available to users without requiring that they have the legacy Salesforce CRM Content license. This permission is available for profiles and permission sets on most standard user licenses, and isn't available for High Volume Customer Portal, Customer Community, or Chatter Free licenses. Available in API versions 40.0 and later.
- Users with the Create Libraries user perm or the Manage Salesforce CRM Content administrator permission can create libraries (ContentWorkspaces) from the Libraries tab in Salesforce Classic and from the API.
- Customer and Partner Portal users can only edit the library document object if they have a Salesforce CRM Content feature license.
- Customer and Partner Portal users can query this object if they have the "View Content in Portal" permission. A user can query all public libraries where they're members, regardless of library permissions.

- Automated process users can't publish documents to libraries (ContentWorkspaces).

Fields

Field	Details
`DefaultRecordTypeId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the default content type for the library. Content types are the containers for custom fields in Salesforce CRM Content.
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Text description of the content library.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Although libraries aren't a packageable entity, references to libraries with a developer name will be included in the package when asset files are packaged. These links can then be restored in the target org. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Label is Unique Name. This field is available in API version 39.0 and later.
`IsRestrictContentTypes`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read only. Indicates whether content types have been restricted (`true`) or not (`false`).

Field	Details
IsRestrictLinkedContentTypes	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read only. Indicates whether linked content types have been restricted (`true`) or not (`false`).
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the library.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The unique name of the library in the API. Allows a link to the library to be packaged when an asset file is added to a package. Limit: 15 characters. This field is available in API version 39.0 and later.
RootContentFolderId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of root folder of the library. This field is available in API version 39.0 and later.
ShouldAddCreatorMembership	**Type** boolean **Properties** Create, Defaulted on create, Group **Description** Automatically create a library membership for the user creating the library. Note this field isn't meant for query and always returns false in query. This field is available in API version 40.0 and later.
TagModel	**Type** picklist

Field	Details
	Properties Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of tagging assigned to a library. Valid values are: • `U` — Unrestricted. No restrictions on tagging. Users can enter any tag when publishing or editing content. • `G` — Guided. Users can enter any tag when publishing or editing content, but they're also offered a list of suggested tags. • `R` — Restricted. Users must choose from a list of suggested tags.
`WorkspaceImageId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of a library image. Image files can be assigned to libraries for branding and easy identification. Library image is visible to all users, even if they aren't library members. This field is available in API version 43.0 and later.
`WorkspaceType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Differentiates between different types of libraries. Valid values are: • `R` — Regular library • `B` — Org asset library This field is available in API version 39.0 and later.

Usage

Use this object to query libraries to find out where documents can be published.

If the content type isn't specified when publishing a new version into a library, it is determined by the `DefaultRecordTypeId` of the primary library.

As of 40.0, you can create, update, or delete a library via the API.

SEE ALSO:

ContentWorkspaceDoc

ContentWorkspaceDoc

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

Note: This object does not apply to documents and versions in a personal library.

Supported Calls

`create()`, `delete()`, `describeSObjects()` `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Customer and Partner Portal users must have the "View Content in Portal" permission in order to query and obtain content in libraries where they have access.
- Customer and Partner Portal users can only edit documents if they have a Salesforce CRM Content feature license.
- To create a ContentWorkspaceDoc, you must be a member of the library with one of these library privileges enabled:
  - "Add Content"
  - "Add Content On Behalf of Others"
  - "Manage Library"
- To query all library documents in a library, a user must be a member of that library, regardless of library permissions.

Fields

Field	Details
`ContentDocumentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Read only. ID of the library document.
`ContentWorkspaceId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Read only. ID of the library.
`IsOwner`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field	Details
	Description Read only. Indicates whether the library owns the document and determines permissions for that document (`true`) or not (`false`). Documents can belong to more than one library, but only one library owns the document and determines its permissions.

Usage

- Use this object to link a document to one or more libraries.
- To share a document with additional libraries, create additional ContentWorkspaceDoc records which join the document to the additional libraries.
- Inserting a ContentWorkspaceDoc triggers the publish process for public libraries.
- A document can be published into many public libraries, but it will always be owned by one library which controls the security of the document.
- A document can only be published into the document owner's personal library. You can't publish into another user's personal library. Personal libraries are not visible via the API.
- To publish a document into a personal library, you must specify your user ID as the first publish location ID. If you leave the first publish location ID blank, it defaults to the current user's ID.
- A document can be published from a personal library into a public library, but once it has been published into the public library, it can't be published into the personal library again.
- You can't publish a document from a personal library into a public library that has restricted content types.
- You can't update or delete a library document via the API.

SEE ALSO:

ContentWorkspace

ContentWorkspaceMember

Represents a member of a content library. This object is available in API version 40.0 and later.

Manage library membership from the API.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

A user can create/update/delete memberships if they have the Manage Salesforce CRM Content admin perm or the Manage Library permission for the library concerned.

Fields

Field	Details
ContentWorkspaceId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the library.
ContentWorkspacePermissionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The id of the library permission or role.
MemberId	**Type** reference **Properties** Create, Filter, Group,Namepointing, Sort **Description** ID of the library member (the member is either a user or a group).
MemberType	**Type** picklist **Properties** Filter, Group, Nillable,Restricted picklist, Sort **Description** The type of library member. Valid values are: • G - Group • U - User

Usage

Use this object to create, update, or delete members from a library.

ContentWorkspacePermission

Represents a library permission. This object is available in API version 40.0 and later.

A library permission is a group of privileges assigned to each content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

Note: Library permissions do not apply to personal libraries. All library users can save files in their personal libraries.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`,`update()`, `upsert()`

Special Access Rules

The ability to create permissions requires either the Manage Salesforce CRM Content admin perm or the Manage Content Permissions user perm.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description**
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Namefield, Sort, Update **Description** Name of the library.
`PermissionsAddComment`	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.
`PermissionsAddContent`	**Type** boolean **Properties** Create, Filter, Update

Field	Details
	Description Permission for user to publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
PermissionsAddContentOBO	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to choose an author when publishing content in the library.
PermissionsArchiveContent	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to archive and restore any content in the library.
PermissionsChatterSharing	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to make content from this library accessible outside of the library, sharing with a record or in Chatter. From a record or from Chatter, select a file from the library and attach it to a record or a post.
PermissionsDeleteContent	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to delete any content in the library. Authors can undelete their own content from the Recycle Bin.
PermissionsDeliverContent	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to share content outside the org via a content delivery or public link.

Field	Details
PermissionsFeatureContent	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to identify any content in the library as “featured.”
PermissionsManageWorkspace	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to perform any action in the library. This privilege is required to edit a library’s name and description, add or remove library members, or delete a library. Manage Library is a super permission which provides all other permission options listed except Deliver Content. Creating a library requires the Manage Salesforce CRM Content app permission or Create Libraries system permission.
PermissionsModifyComments	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to edit or delete comments made to any content in the library.
PermissionsOrganizeFileAndFolder	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to create, rename, and delete folders in libraries.
PermissionsTagContent	**Type** boolean **Properties** Create, Filter, Update **Description** Permission for user to add tags when publishing content or editing content details in the library.
PermissionsViewComments	**Type** boolean

Field	Details
	Properties Create, Filter, Update **Description** Permission for user to view comments.
`Type`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Provides the type of access a user has to a library. Valid values are: • Library Administrator • Author • Viewer • Custom

ContentWorkspaceSubscription

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

Field	Details
`ContentWorkspaceId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the library.

Field	Details
UserId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user following the library.

Contract

Represents a contract (a business agreement) associated with an Account.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Sort,Update **Description** Required. ID of the Account associated with this contract.
ActivatedById	**Type** reference **Properties** Filter, Group, Nillable, Sort,Update **Description** ID of the User who activated this contract.
ActivatedDate	**Type** dateTime **Properties** Filter, Nillable, Sort, Update **Description** Date and time when this contract was activated.

Field	Details
BillingAddress	**Type** address **Properties** Filter, Nillable **Description** The compound form of the billing address. Read-only. See Address Compound Fields for details on compound address fields.
BillingCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address. Maximum size is 40 characters.
BillingCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 80 characters.
BillingCountryCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO country code for the contract's billing address.
BillingGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The accuracy of the geocode for the billing address. Possible values are: • Address • Block • City • County • ExtendedZip

Field	Details
	• `NearAddress` • `Neighborhood` • `State` • `Street` • `Unknown` • `Zip`
`BillingLatitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `BillingLongitude` to specify the precise geolocation of a billing address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places.
`BillingLongitude`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `BillingLatitude` to specify the precise geolocation of a billing address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places.
`BillingPostalCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address of this account. Maximum size is 20 characters.
`BillingState`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details for the billing address. Maximum size is 80 characters.
`BillingStateCode`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ISO state code for the contract's billing address.
BillingStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Street address for the billing address.
CompanySignedDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date on which the contract was signed by your organization.
CompanySignedId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the User who signed the contract.
ContractNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Number of the contract.
ContractTerm	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Number of months that the contract is valid.
CustomerSignedDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Date on which the customer signed the contract.
`CustomerSignedId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the Contact who signed this contract.
`CustomerSignedTitle`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Title of the customer who signed the contract.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the contract.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, **Description** Read-only. Calculated end date of the contract. This value is calculated by adding the `ContractTerm` to the `StartDate`.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`LastActivityDate`	**Type** date

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Value is one of the following, whichever is the most recent: • Due date of the most recent event logged against the record. • Due date of the most recently closed task associated with the record.
`LastApprovedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Last date the contract was approved.
`LastReferencedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`OwnerExpirationNotice`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Number of days ahead of the contract end date (15, 30, 45, 60, 90, and 120). Used to notify the owner in advance that the contract is ending.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who owns the contract.
`Pricebook2Id`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the pricebook, if any, associated with this contract.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the record type assigned to this object.
`ShippingAddress`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the shipping address. Read-only. See Address Compound Fields for details on compound address fields.
`ShippingCity`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address. City maximum size is 40 characters.
`ShippingCountry`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address. Country maximum size is 80 characters.

Field	Details
ShippingCountryCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ISO country code for the contract's shipping address.
ShippingLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `ShippingLongitude` to specify the precise geolocation of a shipping address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places.
ShippingLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with `ShippingLatitude` to specify the precise geolocation of an address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places.
ShippingPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address. Postal code maximum size is 20 characters.
ShippingState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Details of the shipping address. State maximum size is 80 characters.
ShippingStateCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ISO state code for the contract's shipping address.
ShippingStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street address of the shipping address. Maximum of 255 characters.
SpecialTerms	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Special terms that apply to the contract.
StartDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort,Update **Description** Start date for this contract. Label is **Contract Start Date**.
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The picklist of values that indicate order status. Each value is within one of two status categories defined in `StatusCode`. For example, the status picklist may contain: Ready to Ship, Shipped, Received as values within the Activated `StatusCode`.
StatusCode	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The status category for the contract. A contract can be Draft, InApproval, or Activated. Label is **Status Category**.

Usage

The Contract object represents a business agreement.

The `Status` field specifies the current state of a contract. Status strings (defined in the ContractStatus object) represent its current state (Draft, InApproval, or Activated).

Client applications must initially create a Contract in a non-Activated state. Client applications can subsequently activate a Contract by updating it and setting the value in its `Status` field to Activated; however, the `Status` field is the only field you can update when activating the Contract.

Once a Contract has been activated, your client application can't change its status; however, prior to activation, your client application can change the status value from Draft to InApproval via the API. Also, your client application can delete contracts whose status is Draft or InApproval but not when a contract status is Activated.

Client applications can use the API to create, update, delete, and query any Attachment associated with a contract.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContractFeed (API version 18.0)
Feed tracking is available for the object.

ContractHistory
History is available for tracked fields of the object.

SEE ALSO:

ContractContactRole
ContractStatus

ContractContactRole

Represents the role that a given Contact plays on a Contract.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description ID of the Contact associated with this Contract.
`ContractId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Contract.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`IsPrimary`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort,Update **Description** Specifies whether this Contact plays the primary role on this Contract (`true`) or not (`false`). Note that each contract has only one primary contact role. Default is `false`. Labels is **Primary**.
`Role`	**Type** picklist **Properties** Create, Filter, Nillable, Group, Sort, Update **Description** Name of the role played by the Contact on this Contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the `ContractId`, `ContactId`, and `Role` values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract.

Usage

Use the ContractContactRole object to define the role that a given Contact plays on a given Contract within the context of a specific Opportunity.

SEE ALSO:

ContractStatus

ContractLineItem

Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssetId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** Required. ID of the Asset associated with the contract line item. Must be a valid asset ID.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the contract line item.
`Discount`	**Type** percent **Properties** Create, Filter, Nillable, Update **Description** The discount for the product as a percentage.

Field	Details
	When updating, if you specify `Discount` without specifying `TotalPrice`, the `TotalPrice` will be adjusted to accommodate the new `Discount` value, and the `UnitPrice` will be held constant. If you specify both `Discount` and `Quantity`, you must also specify either `TotalPrice` or `UnitPrice` so the system can determine which one to automatically adjust.
`EndDate`	**Type** date **Properties** Create, Filter, Nillable, Update **Description** The last day the contract line item is in effect.
`LastReferencedDate`	**Type** date **Properties** Filter, Nillable, Sort, Update **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** date **Properties** Filter, Nillable, Sort, Update **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`LineItemNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Update **Description** Automatically-generated number that identifies the contract line item.
`ListPrice`	**Type** currency **Properties** Filter, Nillable

Field	Details
	Description Corresponds to the `UnitPrice` on the PricebookEntry that is associated with this line item, which can be in the standard pricebook or a custom pricebook. A client application can use this information to show whether the unit price (or sales price) of the line item differs from the pricebook entry list price.
`LocationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The location associated with the contract line item.
`ParentContractLineItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The line item's parent line item, if it has one.
`PricebookEntryId`	**Type** reference **Properties** Create, Filter, Update **Description** Required. ID of the associated PricebookEntry. Only exists if Product2 is enabled.
`Product2Id`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The product related to the contract line item.
`Quantity`	**Type** double **Properties** Create, Filter, Update **Description** Number of units of the contract line item (product) included in the associated service contract.

Field	Details
`RootContractLineItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** (Read only) The top-level line item in a contract line item hierarchy. Depending on where a line item lies in the hierarchy, its root could be the same as its parent.
`ServiceContractId`	**Type** reference **Properties** Create, Filter **Description** Required. ID of the ServiceContract associated with the contract line item. Must be a valid asset ID.
`StartDate`	**Type** date **Properties** Create, Filter, Nillable, Update **Description** The first day the contract line item is in effect.
`Status`	**Type** picklist **Properties** Filter, Nillable **Description** Status of the contract line item.
`Subtotal`	**Type** currency **Properties** Filter, Nillable **Description** Contract line item's sales price multiplied by the `Quantity`.
`TotalPrice`	**Type** currency **Properties** Filter, Nillable

Field	Details
	Description This field is available only for backward compatibility. It represents the total price of the ContractLineItem If you specify `Discount` and `Quantity`, this field or `UnitPrice` is required. This field is nillable, but you can't set both `TotalPrice` and `UnitPrice` to null in the same update request. To insert the `TotalPrice` for a contract line item via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity.
`UnitPrice`	**Type** currency **Properties** Create, Filter, Update **Description** The unit price for the contract line item. In the user interface, this field's value is calculated by dividing the total price of the contract line item by the quantity listed for that line item. Label is **Sales Price**. This field or `TotalPrice` is required. You can't specify both. If you specify `Discount` and `Quantity`, this field or `TotalPrice` is required.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ContractLineItemHistory
History is available for tracked fields of the object.

ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`ApiName`	**Type** string

Field	Details
	Properties Filter, Group, idLookup, Sort **Description** Uniquely identifies a picklist value so it can be retrieved without using an id or master label.
`IsDefault`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this is the default contract status value (`true`) or not (`false`) in the picklist.
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Master label for this contract status value. This display value is the internal label that does not get translated.
`SortOrder`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Number used to sort this value in the contract status picklist. These numbers are not guaranteed to be sequential, as some previous contract status values might have been deleted.
`StatusCode`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Code indicating the status of a contract. One of the following values: • `Draft` • `InApproval` • `Activated` Two other values (`Terminated` and `Expired`) are defined but are not available for use via the API.

Usage

This object represents a value in the contract status picklist. The contract status picklist provides additional information about the status of a Contract, such as its current state (`Draft`, `InApproval`, or `Activated`). You can query these records to retrieve the set of values in the contract status picklist, and then use that information while processing Contract objects to determine more information about a given contract. For example, the application could test whether a given contract is activated based on its `Status` value and the value of the `StatusCode` property in the associated ContractStatus object.

SEE ALSO:

ContractContactRole

ContractTag

Associates a word or short phrase with a Contract.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter

Field Name	Details
	Description ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

ContractTag stores the relationship between its parent TagDefinition and the Contract being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Conversation

Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`ConversationChannelId`	**Type** reference **Properties** Filter, Group, idLookup, Sort

Field	Details
	Description The record ID of the channel used to initialize the conversation. This can either be a messaging channel for the Messaging product or a call center for the Service Cloud Voice product. Available in API version 50.0 and later.
`ConversationIdentifier`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** A unique identifier generated for the conversation.
`EndTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that a conversation ends.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated name of the conversation.
`StartTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that a conversation starts.

ConversationContextEntry

Represents the context of a message or an event in the chat history between an agent and a messaging user. This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
ConversationContextEntryName	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated number of the entry.
CustomDetailContextKey	**Type** textarea **Properties** Create, Nillable **Description** The key or name of the pre-chat field specified by the admin in the pre-chat implementation, for example, `customer_email`.
CustomDetailContextValue	**Type** textarea **Properties** Create, Nillable **Description** The value entered in the pre-chat field by a user before starting the chat.
ParentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The Conversation ID this entry is associated with.

ConversationEntry

Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ActorId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the author. The possible values can be `null` or any ID in the following domain set: • `BotDefinition` • `LiveChatVisitor` • `MessagingEndUser` • `User`
ActorName	**Type** string **Properties** Create, Filter, Nillable, Sort **Description** The name of the author sending the message or event.
ActorType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The author of this entry in the chat history. The valid values include: • `Agent` • `Bot` • `EndUser` • `Supervisor`

Field	Details
	• `System`
`ClientDuration`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The length in milliseconds for the entry. This field is used with voice messages and other applicable use cases. This value may be 0 if not set by the client. This field is available in API version 51.0 and later.
`ClientTimestamp`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The timestamp sent by the client when it generated the entry. This field is available in API version 51.0 and later.
`ConversationId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The MessagingSession ID this entry belongs to.
`EntryEndTime`	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** The timestamp that this entry ended in the chat history. This field is available in API version 48.0 and later.
`EntryTime`	**Type** datetime **Properties** Create, Filter, Sort **Description** The timestamp of this entry in the chat history.

Field	Details
`EntryTimeMilliSecs`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The milliseconds value for the time when an entry was received by the server. Note that the related `EntryTime` field does not provide millisecond accuracy. This field is available in API version 51.0 and later.
`EntryType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of entry in the chat history. Can be a message (`text`) or an event. The possible values include: • `Text` • `AdminOptedIn` • `AdminOptedOut` • `BotEscalated` • `ChatbotClosedIdleSession` • `ChatbotEndedChatByAction`—Conversation ended by automated action • `ChatbotEndedTransferNotConfigured`—Conversation ended because transfer fail is not configured • `ChatbotEstablished` • `ChatbotNotEstablished` • `EndUserOptedIn` • `EndUserOptedOut`
`HasAttachments`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether a message has attachments associated with it (`true`) or not (`false`).
`Message`	**Type** textarea **Properties** Create, Nillable

Field	Details
	Description The message or event sent by the author.
MessageDeliverTime	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** Unused field reserved for future use.
MessageIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort
MessageReadTime	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** Unused field reserved for future use.
MessageSendTime	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** Unused field reserved for future use.
MessageStatus	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the message sent by the author. The valid values include: • Delivered • Error • Pending • Read • Sent

Field	Details
MessageStatusCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The code associated with a message status. `MessageStatusCode` is only populated when a message is undeliverable
Seq	**Type** int **Properties** Create, Filter, Group, Sort **Description** The sequence position of this entry in the chat history.
ServerReceivedTimestamp	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The timestamp recorded when the server received the entry. This is a unique value and is used for ordering. This value can also be referred to as the “transcripted timestamp.” This field is available in API version 51.0 and later.

ConversationParticipant

Represents an active participant in a conversation. A new ConversationParticipant record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
AppType	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The type of app used by the participant, such as Facebook, SMS, or Voice. The nillable property is available in API version 51.0 and later.
ConversationId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The record ID of the conversation that this participant is part of.
JoinedTime	**Type** dateTime **Properties** Filter, Sort **Description** The date and time that a participant joined a conversation.
LastActiveTime	**Type** dateTime **Properties** Filter, Sort **Description** The date and time that a participant was last active during a conversation.
LeftTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that a participant left a conversation.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated name of the conversation participants.
ParticipantContext	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** An identifier, such as a Facebook page, to add context about this participant.
`ParticipantEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the record connected to this participant record, such as a Messaging End User or User record.
`ParticipantKey`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A value that uniquely identifies this participant.
`ParticipantRole`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The role of this participant in the conversation, such as Agent, End User, or Supervisor.

CorsWhitelistEntry

Cross-Origin Resource Sharing (CORS) enables web browsers to request resources from origins other than their own. For example, using CORS, JavaScript code at `https://www.example.com` could request a resource from `https://www.salesforce.com`. To access supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the origin serving the code to a Salesforce CORS allowlist.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object's name.

Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** This picklist contains the following fully-supported languages: • Chinese (Simplified): zh_CN • Chinese (Traditional): zh_TW • Danish: da • Dutch: nl_NL • English: en_US • Finnish: fi • French: fr • German: de • Italian: it • Japanese: ja • Korean: ko • Norwegian: no • Portuguese (Brazil): pt_BR • Russian: ru • Spanish: es • Spanish (Mexico): es_MX Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: sv

Field Name	Details
	• Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Primary label for the CORS allowlist entry.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** For managed packages, this field is the namespace prefix assigned to the package. For unmanaged packages, this field is blank.
`UrlPattern`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The origin URL pattern must include the HTTPS protocol (unless you're using your localhost) and a domain name, and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, `https://*.example.com` adds all subdomains of `example.com` to the allowlist. The origin URL pattern can be an IP address. However, an IP address and a domain that resolve to the same address are not the same origin, and you must add them to the CORS allowlist as separate entries.

Usage

CORS is a W3C recommendation that enables web browsers to request resources from origins other than their own (cross-origin request). For example, using CORS, a JavaScript script at `https://www.example.com` could request a resource from `https://www.salesforce.com`.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS allowlist, Salesforce returns the origin in the `Access-Control-Allow-Origin` HTTP header, along with any additional CORS HTTP headers. If the origin is not included in the allowlist, Salesforce returns HTTP status code 403.

Important: CORS does not support requests for unauthenticated resources, including OAuth endpoints. You must pass an OAuth token with requests that require it.

CreditMemo

Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

A credit memo always decreases the balance of an invoice or invoice lines. Users can apply positive credit memos to positive invoices or invoice lines, and negative credit memos to negative invoices or invoice lines. For example, a $10 credit memo would reduce the balance of a $100 invoice line to $90. A -$10 credit memo would reduce the balance of a -$100 credit memo to -$110.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

To access these entities, your org must have a Salesforce Order Management license. These entities are available only in Lightning Experience.

Fields

Field	Details
`Balance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Amount of the credit memo available for allocation.
`BillToContactId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** Inherited from the account's Bill to Account.
`BillingAccountId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** The customer account for this invoice.

Field	Details
CreditDate	**Type** date **Properties** Filter, Group, Sort, Update **Description** The date that the credit memo was posted.
CreditMemoNumber	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** System number for the credit memo.
Description	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Description of the credit memo.
DocumentNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** System-generated number for organization of financial documents. Can be sequential or random.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** The user who owns a credit memo record.
`ReferenceEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the order or order summary that created this credit memo.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update **Description** Status of the credit memo. Possible values are: • `Canceled`: Reserved for future use. • `Draft`: The credit memo is not yet recorded as a financial transaction. Certain fields can still be edited. • `Pending`: Reserved for future use. • `Posted`: The credit memo has been recorded as a financial transaction. Most fields can't be edited.
`TotalAdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of `TotalAmount`values for the credit memo's adjustment lines.
`TotalAmount`	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** Sum of the credit memo's `TotalLineAmount` and `TotalAdjustmentAmount`.
`TotalAmountWithTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Total credit memo amount, with tax included.
`TotalChargeAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of `TotalAmount` values for the credit memo's charge lines. values for all of this credit memo's credit memo lines.
`TotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Sum of `TotalAmount` values for the credit memo's tax lines.

CreditMemoLine

Represents a partial or full application of a credit memo's balance against an invoice or invoice line. This object is available in API version 48.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

To access these entities, your org must have a Salesforce Order Management license. These entities are available only in Lightning Experience.

Fields

Field	Details
AdjustmentAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** Sum of adjustments made to the credit memo.
ChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** Sum of charges made to the credit memo.
CreditMemoId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the parent credit memo.
Description	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Description of the credit memo line.
EndDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** For credit memos made from a time-based service, the end date of the billing for the service.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort, Update

Field	Details
	Description Name of the credit memo line.
`Product2Id`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The product that was charged or ordered to create the credit memo line.
`ReferenceEntityItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The order item or adjustment item that created the credit memo line.
`ReferenceEntityItemType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of transaction that created the credit memo line. Possible values are: • `DeliveryCharge` • `OrderProduct`
`ReferenceEntityItemTypeCode`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of object that created the credit memo line. Possible values are: • `Charge` • `Product`
`RelatedLineId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The original invoice line that was adjusted or taxed.
StartDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** For credit memo lines made from a time-based service, the first date of the billing for the service.
Status	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** State of the credit memo line. Inherited from the invoice's status.
TaxAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** Total tax for the credit memo.
TaxCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The code used to calculate tax rate for the invoice line.
TaxEffectiveDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date used to calculate the credit memo line's TaxAmount.
TaxName	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort, Update **Description** User-defined name for applied tax.
`TaxRate`	**Type** percent **Properties** Filter, Nillable, Sort, Update **Description** Percentage value used for calculating tax.
`TotalAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of the credit memo line before any applicable tax.
`TotalAmountWithTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** Total amount of tax for this credit memo line, with tax included. Sum of TotalAmount and TaxAmount.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Shows the type of transaction for the invoice line. Possible values are: • `Adjustment` • `Charge` • `Tax`

Crisis

Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Work.com uses this object to track and describe crisis situations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

Fields

Field	Details
`CrisisType`	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** Required. The type or category of crisis. Possible values are: • `Economic Crisis` • `Natural Disaster` • `Pandemic` • `War`
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The crisis description.
`EndDate`	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The date the crisis ended.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The crisis record name.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.
`StartDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The date the crisis started.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

CrisisHistory (API version 49.0)
History is available for tracked fields of the object.

CrisisOwnerSharingRule
Sharing rules are available for the object.

CrisisShare (API version 49.0)
Sharing is available for the object.

Workplace Command Center for Work.com Developer Guide: Extend Work.com with Custom Solutions

CronJobDetail

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`JobType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of the associated scheduled job. The following are the available job types. Each job type label is listed with its value in parenthesis. Use the job type value when querying for a specific job type. • `1`—Data Export • `3`—Dashboard Refresh • `4`—Reporting Snapshot • `6`—Scheduled Flow • `7`—Scheduled Apex • `8`—Report Run • `9`—Batch Job • `A`—Reporting Notification

Field	Details
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The name of the associated scheduled job.

Usage

Use this object to query additional information about a scheduled job, such as the job's name and type.

CronTrigger

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`CronExpression`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The cron expression used to initiate the schedule. Syntax: ***`Seconds Minutes Hours Day_of_month Month Day_of_week Optional_year`*** See `schedule(jobName, cronExpression, schedulableClass)` in the *Apex Developer Guide*.
`CronJobDetailId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the CronJobDetail record containing more details about this scheduled job.
`EndTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the job either finished or will finish.
`NextFireTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The next date and time the job is scheduled to run. `null` if the job is not scheduled to run again.
`OwnerId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Owner of the job.
`PreviousFireTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date and time the job ran. `null` if the job has not run before current local time.
`StartTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the most recent iteration of the scheduled job started.
`State`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The current state of the job. The job state is managed by the system. Possible values are: • `WAITING`—The job is waiting for execution. • `ACQUIRED`—The job has been picked up by the system and is about to execute. • `EXECUTING`—The job is executing. • `COMPLETE`—The trigger has fired and is not scheduled to fire again. • `ERROR`—The trigger definition has an error. • `DELETED`—The job has been deleted. • `PAUSED`—A job can have this state during patch and major releases. After the release has finished, the job state is automatically set to `WAITING` or another state. • `BLOCKED`—Execution of a second instance of the job is attempted while one instance is running. This state lasts until the first job instance is completed. • `PAUSED_BLOCKED`—A job has this state due to a release occurring. When the release has finished and no other instance of the job is running, the job's status is set to another state.
`TimesTriggered`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of times this job has been triggered.
`TimeZoneSidKey`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Returns the timezone ID. For example, `America/Los_Angeles`.

Usage

Use this object to query scheduled jobs in your organization.

CspTrustedSite

Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`Context`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Declares the scope of trust for the listed third-party host. Possible values are: • `All`—Whitelists the host for both Lightning Experience and Experience Builder sites. • `Communities`—Whitelists the host for Experience Builder sites only. • `FieldServiceMobileExtension`—Whitelists the host for the Field Service Mobile Extensions only. • `LEX`—Whitelists the host for Lightning Experience only.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the trusted site. Limit: 255 characters.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The developer name of the trusted site.

Field	Details
EndpointUrl	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The URL for the trusted site.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the trusted site is active.
IsApplicableToConnectSrc	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Lightning components can load URLs using script interfaces from this site.
IsApplicableToFontSrc	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Lightning components can load fonts from this site.
IsApplicableToFrameSrc	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Lightning components can load resources contained in `<iframe>` elements from this site.
IsApplicableToImgSrc	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates if Lightning components can load images from this site.
`IsApplicableToMediaSrc`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Lightning components can load audio and video from this site.
`IsApplicableToStyleSrc`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if Lightning components can load style sheets from this site.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language for the trusted site.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Master label for this trusted site.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Namespace prefix for this trusted site.

Usage

CSP is a W3C standard that defines rules to control the source of content that can be loaded on a page. All CSP rules work at the page level, and apply to all components and libraries. By default, the framework's headers allow content to be loaded only from secure (HTTPS) URLs and forbid XHR requests from JavaScript.

When you define a CSP Trusted Site, you can add the site's URL to the list of allowed sites for the following directives in the CSP header.

- `connect-src`
- `frame-src`
- `img-src`
- `style-src`
- `font-src`
- `media-src`

This change to the CSP header directives allows Lightning components to load resources, such as images, styles, and fonts, from the site. It also allows client-side code to make requests to the site.

CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

Supported Calls

`create()`, `describeSObjects()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

- This object is not available in single-currency organizations.
- You need the "Customize Application" permission to edit this object.
- Your client application can't delete this object.
- Customer Portal users can't access this object.

Fields

Field	Details
`ConversionRate`	**Type** double **Properties** Filter **Description** Required. Conversion rate of this currency type against the corporate currency.
`DecimalPlaces`	**Type** int

Field	Details
	Properties Filter **Description** Required. For this currency, specifies the number of digits to the right of the decimal point, such as zero (`0`) for JPY or `2` for USD.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether this currency type is active (`true`) or not (`false`). Inactive currency types do not appear in picklists in the user interface. Label is **Active**. This field defaults to `false` if no value is provided when updating or inserting a record.
`IsCorporate`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether this currency type is the corporate currency (`true`) or not (`false`). Label is **Corporate Currency**. All other currency conversion rates are applied against this corporate currency. If a currency is already defined as the corporate currency in the user interface, it can't be unset. When a non-corporate currency is set to a corporate currency, the system reconfigures all conversion rates based on the new corporate currency.
`IsoCode`	**Type** picklist **Properties** Filter, Restricted picklist **Description** Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as `USD`, `GBP`, or `JPY`. Must be unique within your organization. Label is **Currency ISO Code**.

Usage

This object is for multicurrency organizations only. Use this object to define the currencies your organization uses.

When updating an existing record, make sure to provide values for all fields to avoid undesired changes to the CurrencyType. For example, if a value for `IsActive` is not provided, the default (`false`) is used, which could result in a currently active CurrencyType becoming inactive.

DatedConversionRate

Object Basics

CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

Field Name	Details
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the parent entity that this branding applies to. The parent entity can be an Experience Cloud site, organization, topic, or reputation level. The branding applies to the entity that the `ParentId` references. For example, if the `ParentId` references a network ID, the branding applies to that Experience Cloud site only, and if the `ParentId` references an organization ID, the branding applies to the organization that it is accessed through, and so on. Label is `Branded Entity ID`.

Usage

Use this object along with CustomBrandAsset to apply a custom branding scheme to your Experience Cloud site. The branding scheme for the site shows in both the user interface and in the Salesforce mobile app. You must have Create and Manage Experiences to customize site branding.

You can also use this object to apply a custom branding scheme to your org when it is accessed through the Salesforce mobile app.

SEE ALSO:

Network

CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

Field Name	Details
`AssetCategory`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Values include: • `MotifZeronaryColor`—The background color for the header. Label is `Zeronary motif color`. If this CustomBrandAsset is for a network, this is the header color for the network. If it is for an org, this is the header color when users access the Salesforce mobile app. • `MotifPrimaryColor`—The color used for the active tab. Label is `Primary motif color`. Not used for the Salesforce mobile app branding. • `MotifSecondaryColor`—The color used for the top borders of lists and tables. Label is `Secondary motif color`. Not used for the Salesforce mobile app branding. • `MotifTertiaryColor`—The background color for section headers on edit and detail pages. Label is `Tertiary motif color`.

Field Name	Details
	Not used for the Salesforce mobile app branding. • `MotifQuaternaryColor`—If this CustomBrandAsset is for a network, this is the background color for network pages. If it is for an org, this is the background color on a splash page. Label is `Quaternary motif color`. • `MotifZeronaryComplementColor`—Font color used with `zeronaryColor`. Label is `Zeronary motif colors complement color`. • `MotifPrimaryComplementColor`—Font color used with `primaryColor`. Label is `Primary motif colors complement color`. Not used for the Salesforce mobile app branding. • `MotifTertiaryComplementColor`—Font color used with `tertiaryColor`. Label is `Tertiary motif colors complement color`. Not used for the Salesforce mobile app branding. • `MotifQuaternaryComplementColor`—Font color used with `quaternaryColor`. Label is `Quaternary motif colors complement color`. Not used for the Salesforce mobile app branding. • `PageHeader`—An image that appears on the header of the pages. Can be an .html, .gif, .jpg, or .png file. Label is `Page Header`. Not used for the Salesforce mobile app branding. • `PageFooter`—An image that appears on the footer of the pages. Must be an .html file. Label is `Page Footer`. Not used for the Salesforce mobile app branding. • `LoginFooterText`—The text that appears in the footer of the login page. Label is `Footer text displayed on the login page`. Not used for the Salesforce mobile app branding. • `LoginLogoImageId`—The logo that appears on the login page for external users. In the Salesforce mobile app, this logo also appears on the Experience Cloud site splash page. Label is `Logo image displayed on the login page`. • `LargeLogoImageId`—Only used for the Salesforce mobile app. The logo that appears on the splash page when you start the Salesforce mobile app. Label is `Large logo image`. • `SmallLogoImageId`—Only used for the Salesforce mobile app. The logo that appears on the publisher in the Salesforce mobile app. Label is `Small logo image`.

Field Name	Details
	• `StaticLogoImageURL`—The logo that appears on the login page for external users. Label is `Static logo image url`. • `LoginQuaternaryColor`—The background color that appears on the Experience Cloud site login page for external users. Label is `Login background color`. • `LoginRightFrameUrl`—The URL to the contents that appears on right side of the Experience Cloud site login page for external users. Label is `Login right frame url`. • `LogoAssetId`—Navigation tile menu item images. Label is `Logo asset image`. • `LoginPrimaryColor`—The background color of the login button. Label is `Login primary color`. • `LoginBackgroundImageUrl`—The path to the image URL that appears as the background on the Experience Cloud site's login page. Label is `Background image url`. • `LargeLogoAssetId`—Navigational topic images. Label is `Large logo asset image`. • `MediumLogoAssetId`—Featured topic images. Label is `Medium logo asset image`.
`AssetSourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the document uploaded to the Documents folder if the value of `AssetCategory` is: • `PageHeader` • `PageFooter` • `LoginLogoImageId` • `LargeLogoImageId` • `SmallLogoImageId` ID of the content asset if the value of the `AssetCategory` is: • `LogoAssetId` • `LargeLogoAssetId` • `MediumLogoAssetId`
`CustomBrandId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field Name	Details
	Description ID of the associated CustomBrand .
ForeignKeyAssetId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field was removed in API version 41.0, and is available in earlier versions for backward compatibility only. Use AssetSourceId instead. ID of the document used if the value of AssetCategory is PageHeader, PageFooter, or LoginLogoImageId.
TextAsset	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Text used if the AssetCategory is LoginFooterText.

Usage

Use this object to add basic branding elements—color scheme, header or footer images, login page logo, or footer text—to the branding scheme (CustomBrand) for your Experience Cloud site. You must have Create and Manage Experiences to customize site branding.

If you're using digital experiences in the Salesforce mobile app, the loading page shows the logo.

SEE ALSO:

Network

CustomHelpMenuItem

Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Packaging Considerations

Although you can package custom Help Menu section information, the section won't appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the CustomHelpMenuItem and CustomHelpMenuSection objects and then manually add resources on the Help Menu Setup page. See Define Custom Help for the Lightning Experience Help Menu for more information.

Fields

Field	Details
`LinkUrl`	**Type** url **Properties** Create, Filter, Sort, Update **Description** Required. The URL for the resource. Specify up to 1,000 characters.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The name of the resource. Specify up to 100 characters.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the custom help section the item belongs to.
`SortOrder`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Required. The order of the item within the custom section. Valid values are 1 through 15.

CustomHelpMenuSection

Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Packaging Considerations

Although you can package custom Help Menu section information, the section won't appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the CustomHelpMenuItem and CustomHelpMenuSection objects and then manually add resources on the Help Menu Setup page. See Define Custom Help for the Lightning Experience Help Menu for more information.

Fields

Field	Details
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the custom help section in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to section title in the user interface. Limit: 80 characters. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Required. Language of the label. Possible values are: • da (Danish) • de (German) • en_US (English) • es (Spanish) • es_MX (Spanish (Mexico)) • fi (Finnish) • fr (French) • it (Italian)

Field	Details
	• ja (Japanese) • ko (Korean) • nl_NL (Dutch) • no (Norwegian) • pt_BR (Portuguese (Brazil)) • ru (Russian) • sv (Swedish) • th (Thai) • zh_CN (Chinese (Simplified)) • zh_TW (Chinese (Traditional))
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The name of the resource. Specify up to 100 characters.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

CustomHttpHeader

Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only authenticated internal and external users can access this object.

Fields

Field Name	Details
`Description`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** A text description of the header field's purpose.
`HeaderFieldName`	**Type** string **Properties** Filter, Group, Sort **Description** Name of the header field. The name must contain at least one alphanumeric character or underscore. It can also include: ! # $ % & ' * + - . ^ _ ` | ~
`HeaderFieldValue`	**Type** string **Properties** Filter, Sort **Description** A formula that resolves to the value for the header. The values in the formula must evaluate to a string. If the formula resolves to null and an empty string, the header isn't sent.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field Name	Details
	Description Indicates whether the custom HTTP header is available to use.
`ParentId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the entity that the custom HTTP header is related to.

Usage

For each OData external data source, define up 10 HTTP headers to request data.

Note: HTTP headers aren't supported on named credentials.

CustomNotificationType

Stores information about custom notification types. This object is available in API version 47.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`CustomNotifTypeName`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Unique, Update **Description** Specifies a notification type name. The notification type name is unique within your organization. Maximum number of characters: 80.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Specifies a general description of the notification type, which is displayed with the notification type name. Maximum number of characters: 255.
`Desktop`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the desktop delivery channel is enabled (`true`) or not (`false`). The default is `false`.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Specifies the API name of the notification type.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the language of the custom notification type. The value for this field is the language value of the org.
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Specifies the notification type label.
`Mobile`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the mobile delivery channels is enabled (`true`) or not (`false`). The default is `false`.

Field	Details
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Specifies the namespace of the notification type, if installed with a managed package.

CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Summer ’20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

Fields

Field Name	Details
`Description`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** A description of the custom permission. Limit: 255 characters.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort

Field Name	Details
	Description The unique name of the custom permission in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to **Name** in the user interface. Limit: 80 characters. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`IsLicensed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** When enabled (true) indicates that the appropriate Salesforce license is required before accessing the permission. This field is available in API version 50.0 and later.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the custom permission. Valid values are: • Chinese (Simplified): `zh_CN` • Chinese (Traditional): `zh_TW` • Danish: `da` • Dutch: `nl_NL` • English: `en_US` • Finnish: `fi` • French: `fr` • German: `de` • Italian: `it` • Japanese: `ja` • Korean: `ko` • Norwegian: `no` • Portuguese (Brazil): `pt_BR` • Russian: `ru` • Spanish: `es`

Field Name	Details
	• Spanish (Mexico): `es_MX` Spanish (Mexico) defaults to Spanish for customer-defined translations. • Swedish: `sv` • Thai: `th` The Salesforce user interface is fully translated to Thai, but Help is in English.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** The custom permission label, which corresponds to **Label** in the user interface. Limit: 80 characters.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Usage

Use the CustomPermission object to determine users' access to custom permissions.

For example, to query all permission sets where the Button1 permission is enabled:

```
SELECT Id, DeveloperName,
(select Id, Parent.Name, Parent.Profile.Name from SetupEntityAccessItems)
FROM CustomPermission
WHERE DeveloperName = 'Button1'
```

To query all permission sets and profiles with custom permissions:

```
SELECT Assignee.Name, PermissionSet.Id,
PermissionSet.Profile.Name,
PermissionSet.isOwnedByProfile,
PermissionSet.Label
FROM PermissionSetAssignment
WHERE PermissionSetId
IN (SELECT ParentId
   FROM SetupEntityAccess
   WHERE SetupEntityType =
'CustomPermission')
```

To query for all SetupEntityAccess rows with custom permissions:

```
SELECT Id,ParentId,Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType='CustomPermission'
AND ParentId
IN (SELECT Id
   FROM PermissionSet
   WHERE isOwnedByProfile = false)
```

SEE ALSO:

CustomPermissionDependency

PermissionSet

Profile

SetupEntityAccess

CustomPermissionDependency

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only users with View Setup and Configuration permission can access this object.

Fields

Field Name	Details
`CustomPermissionId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Sort **Description** The ID of the custom permission that requires the permission that's specified in `RequiredCustomPermissionId`.
`RequiredCustomPermissionId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the custom permission that must be enabled when `CustomPermissionId` is enabled.

Usage

The following Apex class contains a method that returns the IDs of all custom permissions that are required for the given custom permission ID. To use this class, save it in your organization.

```
public class CustomPermissionUtil {
   public String[] getAllRequiredCustomPermissions(String customPermId) {
      return getAllRequiredHelper(new String[]{customPermId});
   }

   private String[] getAllRequiredHelper(String[] customPermIds) {
      CustomPermissionDependency[] requiredPerms = [SELECT RequiredCustomPermissionId
                                                     FROM CustomPermissionDependency
                                                     WHERE CustomPermissionId
                                                     IN :customPermIds];
      String[] requiredPermIds = new String[]{};
      for (CustomPermissionDependency cpd : requiredPerms) {
         requiredPermIds.add(cpd.RequiredCustomPermissionId);
      }
      if (requiredPermIds.size() > 0) {
         customPermIds.addall(getAllRequiredHelper(requiredPermIds));
         return customPermIds;
      } else {
         return customPermIds;
      }
   }
}
```

For more information about using Apex classes, see the *Lightning Platform Apex Code Developer's Guide*.

SEE ALSO:

CustomPermission

DandBCompany

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Warning: You can update fields in the DandBCompany object; however, field changes may be overwritten by Data.com Clean jobs or by using the Data.com Clean button.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Only organizations with Data.com Premium Prospector or Data.com Premium Clean can access this object.

Fields

Field Name	Details
`Address`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the address. Read-only. See Address Compound Fields for details on compound address fields.
`City`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The city where a company is physically located. Maximum size is 40 characters.
`CompanyCurrencyIsoCode`	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar. Maximum size is 3 characters.
`Country`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The country where a company is physically located. Maximum size is 40 characters.
`CountryAccessCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The required code for international calls. Maximum size is 4 characters.
`CurrencyCode`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The currency in which the company's sales volume is expressed. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 4 characters.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry. Maximum size is 32000 characters.
`DomesticUltimateBusinessName`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure. Maximum size is 255 characters.
`DomesticUltimateDunsNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The D-U-N-S Number for the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure. Maximum size is 9 characters.
`DunsNumber`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. Maximum size is 9 characters.
`EmployeeQuantityGrowthRate`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The yearly growth rate of the number of employees in a company expressed as a decimal percentage. The data includes the total employee growth rate for the past two years.
`EmployeesHere`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The number of employees at a specified location, such as a branch location. Maximum size is 15 characters.

Field Name	Details
EmployeesHereReliability	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The reliability of the `EmployeesHere` figure. Available values include: • 0—Actual number • 1—Low • 2—Estimated (for all records) • 3—Modeled (for non-US records)
EmployeesTotal	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The total number of employees in the company, including all subsidiary and branch locations. This data is only available on records that have a value of *`Headquarters/Parent`* in the `LocationStatus` field. Maximum size is 15 characters.
EmployeesTotalReliability	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The reliability of the `EmployeesTotal` figure. Available values include: • 0—Actual number • 1—Low • 2—Estimated (for all records) • 3—Modeled (for non-US records) A blank value indicates this data is unavailable.
FamilyMembers	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any). Maximum size is 5 characters.

Field Name	Details
Fax	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The company's facsimile number.
FifthNaics	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.
FifthNaicsDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.
FifthSic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FifthSic8	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FifthSic8Desc	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`FifthSicDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`FipsMsaCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget. Maximum size is 5 characters.
`FipsMsaDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's FIPS MSA code. Maximum size is 255 characters.
`FortuneRank`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.
`FourthNaics`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.
FourthNaicsDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.
FourthSic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FourthSic8	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FourthSic8Desc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
FourthSicDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`GeoCodeAccuracy`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The level of accuracy of a location's geographical coordinates compared with its physical address. Available values include: • A – *`Non-US rooftop accuracy`* • B – *`Block level`* • C – *`Places the address in the correct city`* • D – *`Rooftop level`* • I – *`Street intersection`* • M – *`Mailing address level`* • N – *`Not matched`* • P – *`PO BOX location`* • S – *`Street level`* • T – *`Census tract level`* • Z – *`ZIP code level`* • 0 (zero)– *`Geocode could not be assigned`*
`GlobalUltimateBusinessName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The primary name of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 255 characters.
`GlobalUltimateDunsNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The D-U-N-S Number of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 9 characters.

Field Name	Details
`GlobalUltimateTotalEmployees`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The total number of employees at the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries. Maximum size is 15 characters.
`ImportExportAgent`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods. Available values include: • A—Importer/exporter/agent • B—Importer/exporter • C—Importer • D—Importer/agent • E—Exporter/agent • F—Agent (keeps no inventory and does not take title goods) • G—None or data not available • H—Exporter
`IncludedInSnP500`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A true or false value. If `true`, the company is listed in the S&P 500 Index. If `false`, the company isn't listed in the S&P 500 Index.
`Latitude`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Used with longitude to specify a precise location, which is then used to assess the Geocode Accuracy. Maximum size is 11 characters.

Field Name	Details
`LegalStatus`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Identifies the legal structure of an organization.
`LocationStatus`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Identifies the organizational status of a company. Available values are *`Single location`*, *`Headquarters/Parent`*, and *`Branch`*. Available values include: • 0—Single location (no other entities report to the business) • 1—Headquarters/parent (branches and/or subsidiaries report to the business) • 2—Branch (secondary location to a headquarters location)
`Longitude`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Used with latitude to specify a precise location, which is then used to assess the Geocode Accuracy. Maximum size is 11 characters.
`MailingAddress`	**Type** address **Properties** Filter, Nillable **Description** The compound form of the mailing address. Read-only. See Address Compound Fields for details on compound address fields.
`MailingCity`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The city where a company has its mail delivered. Maximum size is 40 characters.

Field Name	Details
`MailingCountry`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The country where a company has its mail delivered. Maximum size is 40 characters.
`MailingPostalCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code that a company uses on its mailing address. Maximum size is 20 characters.
`MailingState`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The state where a company has its mail delivered. Maximum size is 20 characters.
`MailingStreet`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street address where a company has its mail delivered. Maximum size is 255 characters.
`MarketingPreScreen`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The probability that a company will pay with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Available values include: • L—*`Low risk of delinquency`* • M—*`Moderate risk of delinquency`* • H—*`High risk of delinquency`*

Field Name	Details
	Important: Use this information for marketing pre-screening purposes only.
`MarketingSegmentationCluster`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of Dun & Bradstreet data for US organizations.
`MinorityOwned`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether an organization is owned or controlled by a member of a minority group. Available values include: • Y—Minority owned • N—Not minority owned
`Name`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The primary or registered name of a company. Maximum size is 255 characters.
`NationalId`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identification number used in some countries for business registration and tax collection. Maximum size is 255 characters.
`NationalIdType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field Name	Details
	Description A code value that identifies the type of national identification number used. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 5 characters.
OutOfBusiness	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether the company at the specified address has discontinued operations. Available values include: • Y—Out of business • N—Not out of business
OwnOrRent	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether a company owns or rents the building it occupies. Available values include: • 0—Unknown or not applicable • 1—Owns • 2—Rents
ParentOrHqBusinessName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The primary name of the parent or headquarters company. Maximum size is 255 characters.
ParentOrHqDunsNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The D-U-N-S Number for the parent or headquarters. Maximum size is 9 characters.

Field Name	Details
Phone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A company's primary telephone number.
PostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code that corresponds to a company's physical location. Maximum size is 20 characters.
PremisesMeasure	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A numeric value for the measurement of the premises.
PremisesMeasureReliability	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A descriptive accuracy of the measurement such as actual, estimated, or modeled.
PremisesMeasureUnit	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A descriptive measurement unit such as acres, square meters, or square feet.
PrimaryNaics	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 6 characters.
`PrimaryNaicsDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on its NAICS code. Maximum size is 120 characters.
`PrimarySic`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The four-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 4 characters.
`PrimarySic8`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The eight-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 8 characters.
`PrimarySic8Desc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description A brief description of an organization’s line of business, based on its SIC code. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 80 characters.
PrimarySicDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization’s line of business, based on its SIC code. Maximum size is 80 characters.
PriorYearEmployees	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of employees for the prior year.
PriorYearRevenue	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The annual revenue for the prior year.
PublicIndicator	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether ownership of the company is public or private. Available values include: • Y—Public • N—Private
SalesTurnoverGrowthRate	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field Name	Details
	Description The increase in annual revenue from the previous value for an equivalent period expressed as a decimal percentage.
`SalesVolume`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The total annual sales revenue in the headquarters' local currency. Dun & Bradstreet tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters.
`SalesVolumeReliability`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The reliability of the `SalesVolume` figure. Available values include: • 0—Actual number • 1—Low • 2—Estimated (for all records) • 3—Modeled (for non-US records)
`SecondNaics`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.
`SecondNaicsDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.
`SecondSic`	**Type** string

Field Name	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
`SecondSic8`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
`SecondSic8Desc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization’s line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`SecondSicDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization’s line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`SixthNaics`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.
`SixthNaicsDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description A brief description of an organization’s line of business, based on the corresponding NAICS code. Maximum size is 120 characters.
`SixthSic`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
`SixthSic8`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
`SixthSic8Desc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization’s line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`SixthSicDesc`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization’s line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`SmallBusiness`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field Name	Details
	Description Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government. Available values include: • Y—Small business site • N—Not small business site
State	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The state where a company is physically located. Maximum size is 20 characters.
StockExchange	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The corresponding exchange for a company's stock symbol. For example: NASDAQ or NYSE. Maximum size is 16 characters.
StockSymbol	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The abbreviation used to identify publicly traded shares of a particular stock. Maximum size is 6 characters.
Street	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street address where a company is physically located. Maximum size is 255 characters.
Subsidiary	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field Name	Details
	Description Indicates whether a company is more than 50 percent owned by another organization. Available values include: • 0—Not subsidiary of another organization • 3—Subsidiary of another organization
ThirdNaics	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional NAICS code used to further classify an organization by industry. Maximum size is 6 characters.
ThirdNaicsDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding NAICS code. Maximum size is 120 characters.
ThirdSic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
ThirdSic8	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
ThirdSic8Desc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
ThirdSicDesc	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
TradeStyle1	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". Maximum size is 255 characters.
TradeStyle2	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional tradestyle used by the organization. Maximum size is 255 characters.
TradeStyle3	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional tradestyle used by the organization. Maximum size is 255 characters.
TradeStyle4	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional tradestyle used by the organization. Maximum size is 255 characters.

Field Name	Details
TradeStyle5	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An additional tradestyle used by the organization. Maximum size is 255 characters.
URL	**Type** url **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An organization's primary website address. Maximum size is 104 characters.
UsTaxId	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. Maximum size is 9 characters.
WomenOwned	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether a company is more than 50 percent owned or controlled by a woman. Available values include: • Y—Owned by a woman • N—Not owned by a woman, or unknown
YearStarted	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The year the company was established or the year when current ownership or management assumed control of the company. Maximum size is 4 characters.

Usage

Use this object to manage D&B Company records in your organization.

Dashboard

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`, `search()`

Fields

Field	Details
`BackgroundDirection`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Returns the direction of the background fade. Available values are: • `Top to Bottom` • `Left to Right` • `Diagonal` (default value) Label is `Background Fade Direction`.
`BackgroundEnd`	**Type** int **Properties** Filter, Group, Sort **Description** Returns the ending fade color in hexadecimal. Label is `Ending Color`.
`BackgroundStart`	**Type** int **Properties** Filter, Group, Sort **Description** Returns the starting fade color in hexadecimal. Label is `Starting Color`.

Field	Details
Description	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Returns the description of the dashboard. Limit: 255 characters.
DeveloperName	**Type** string **Properties** Filter, Group, Sort **Description** Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is `Dashboard Unique Name`. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
FolderId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. Returns the ID of the Folder that contains the dashboard. See Folder.
FolderName	**Type** string **Properties** Filter, Nillable, Sort **Description** Name of the folder that contains the dashboard. Available in API version 35.0 and later.
IsDeleted	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.
`LastReferencedDate`	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** datetime **Properties** Filter, Nillable, Sort, **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
`LeftSize`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Returns the size of the left column of the dashboard. Available values are: • `Narrow` • `Medium` • `Wide`
`MiddleSize`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Returns the size of the middle column of the dashboard. Available values are:

Field	Details
	• `Narrow` • `Medium` • `Wide`
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`RightSize`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Returns the size of the right column in the dashboard. Available values are: • `Narrow` • `Medium` • `Wide`
`RunningUserId`	**Type** reference **Properties** Filter, Group, Sort **Description** Returns the ID of the running user specified for the dashboard.

Field	Details
	If the dashboard was created in Lightning Experience and is configured to run as the viewing user, returns the user ID of the dashboard creator. If the dashboard was created in Salesforce Classic and is configured to run as the logged-in user, returns the user ID of the last specified running user.
`TextColor`	**Type** int **Properties** Filter, Group, Sort **Description** Returns the body text color in hexadecimal. Label is `Text Color`.
`Title`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Returns the title of the dashboard. Limit: 80 characters.
`TitleColor`	**Type** int **Properties** Filter, Group, Sort **Description** Returns the title text color in hexadecimal. Label is `Title Color`.
`TitleSize`	**Type** int **Properties** Filter, Group, Sort **Description** Returns the title font size in points. Label is `Title Size`.
`Type`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Returns the dashboard type. Available values are: • `SpecificUser`—The dashboard displays data according to the access level of one specific running user.

Field	Details
	• `LoggedInUser`—The dashboard displays data according to the access level of the logged-in user. • `MyTeamUser`—The dashboard displays data according to the access level of the logged-in user, and managers can view dashboards from the point of view of users beneath them in the role hierarchy.

Supported Query Scopes

Use these scopes to help specify the data that your SOQL query returns.

allPrivate

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and Enhanced Analytics Folder Sharing. If your organziation was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

created

Records created by the user running the query.

everything

All records except records saved in other users' private folders.

mine

Records saved in the private folder of the user running the query.

Usage

Provides read only access to the current values in the dashboard fields.

Example: Dashboards in an Inactive User's Private Folder

This SOQL query returns dashboards saved in a specific user's private folder.

```
SELECT Id FROM Dashboard USING SCOPE allPrivate WHERE CreatedByID = '005A0000000Bc2deFG'
```

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DashboardFeed

Feed tracking is available for the object.

SEE ALSO:

DashboardTag

Report

DashboardComponent

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`CustomReportId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Requires the user permission "Manage All Private Reports and Dashboards." The ID of the report that provides data for the dashboard component. See Report.
`DashboardId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the dashboard that contains the dashboard component. See Dashboard.
`Name`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the dashboard component.

Usage

Provides read only access to the current values in dashboard component fields.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DashboardComponentFeed
Feed tracking is available for the object.

DashboardTag

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist

Field Name	Details
	Description Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

DashboardTag stores the relationship between its parent TagDefinition and the Dashboard being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Dashboard

DataAssessmentFieldMetric

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com.This object is available in API version 37.0 and later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Child Relationships

DataAssessmentFieldMetric is a child object of DataAssessmentMetric object.

Fields

Field Name	Details
`DataAssessmentMetricId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Sort **Description** A unique number that identifies the parent DataAssessmentMetric record.
FieldName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the assessed field.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An optional field used to name your record.
NumMatchedBlanks	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of matched records that contain blank fields.
NumMatchedDifferent	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of matched records that have a different value for this field.
NumMatchedInSync	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of matched records that have the same value for this field.
NumUnmatchedBlanks	**Type** int

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of unmatched records that contain blank fields.

DataAssessmentMetric

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records.This object is available in API version 37.0 and later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An optional field used to name your record.
`NumDuplicates`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of duplicate records.
`NumMatched`	**Type** int

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of matched records.
`NumMatchedDifferent`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of records in your org matched with a Data.com record that have different fields.
`NumProcessed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of records processed in the data assessment.
`NumTotal`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of records available for data assessment processing.
`NumUnmatched`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of records not matched.

DataAssessmentValueMetric

Summarizes the number of fields matched for your account records with Data.com account records.This object is available in API version 37.0 and later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Child Relationships

DataAssessmentValueMetric is a child of DataAssessementFieldMetric.

Fields

Field Name	Details
`DataAssessmentFieldMetricId`	**Type** reference **Properties** Filter, Group, Sort **Description** A unique number that identifies the parent DataAssessementFieldMetric record.
`FieldValue`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The value in the matched field.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An optional field used to name your record.
`ValueCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of times this value appears in this field.

DatacloudCompany

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`

Fields

Field Name	Details
ActiveContacts	**Type** int **Properties** Nillable **Description** The number of active contacts that are associated with a company.
AnnualRevenue	**Type** currency **Properties** Filter, Nillable **Description** The amount of money that the company makes in 1 year. Annual revenue is measured in US dollars.
City	**Type** string **Properties** Filter, Nillable, Sort **Description** The name of the city where the company is located.
CompanyId	**Type** string

Field Name	Details
	Properties Filter, Nillable **Description** A unique numerical identifier for the company and theData.com identifier for a company.
`Country`	**Type** string **Properties** Filter, Nillable, Sort **Description** A string that represents the standard abbreviation for the country where the company is located.
`CountryCode`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist **Description** A standardized name for countries of the world.
`Description`	**Type** string **Properties** Nillable **Description** A brief synopsis of the company that provides a general overview of the company and what it does.
`DunsNumber`	**Type** string **Properties** Filter, Nillable **Description** A randomly generated nine-digit number that's assigned by Dun & Bradstreet (D&B) to identify unique business establishments.
`EmployeeQuantityGrowthRate`	**Type** double

Field Name	Details
	Properties Nillable **Description** The yearly growth rate of the number of employees in a company expressed as a decimal percentage. The data includes the total employee growth rate for the past two years.
ExternalId	**Type** string **Properties** Filter, Nillable, Sort **Description** A unique numerical identifier for the company. The ExternalId is a system-generated number.
Fax	**Type** phone **Properties** Nillable **Description** The telephone number that's used to send and receive faxes.
FortuneRank	**Type** int **Properties** Defaulted on create, Group, Nillable **Description** The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.
FullAddress	**Type** string **Properties** Group, Nillable **Description** The complete address of a company, including Street, City, State, and Zip.
IncludedInSnP500	**Type** string **Properties** Group, Nillable

Field Name	Details
	Description A true or false value. If `true`, the company is listed in the S&P 500 Index. If `false`, the company isn't listed in the S&P 500 Index.
`Industry`	**Type** string **Properties** Nillable **Description** A description of the type of industry such as Telecommunications, Agriculture, or Electronics.
`IsInCrm`	**Type** boolean **Properties** Defaulted on create, Group **Description** Whether the record is in Salesforce (true) or not (false).
`IsInactive`	**Type** boolean **Properties** Defaulted on create, Filter **Description** A true or false response. True, the company record is not active. False, the company record is active.
`IsOwned`	**Type** boolean **Properties** Defaulted on create **Description** A true or false value. True, your organization owns the record. False, your organization doesn't own the record.
`NaicsCode`	**Type** string **Properties** Filter, Nillable

Field Name	Details
	Description A value that represents the North American Industry Classification System (NAICS) code. NAICS was created to provide details about a business's service orientation. The code descriptions are focused on what a business does.
`NaicsDesc`	**Type** string **Properties** Nillable **Description** A description of the NAICS classification.
`Name`	**Type** string **Properties** Filter, Nillable, Sort **Description** The company's name.
`NumberOfEmployees`	**Type** int **Properties** Filter, Nillable **Description** The number of employees working for the company.
`Ownership`	**Type** string **Properties** Filter, Nillable **Description** The type of ownership of the company: • `Public` • `Private` • `Government` • `Other`
`Phone`	**Type** phone

Field Name	Details
	Properties Nillable **Description** A numeric string containing the primary telephone number for the company.
PremisesMeasure	**Type** int **Properties** Group, Nillable **Description** A numeric value for the measurement of the premises.
PremisesMeasureReliability	**Type** string **Properties** Group, Nillable **Description** A descriptive accuracy of the measurement such as actual, estimated, or modeled.
PremisesMeasureUnit	**Type** string **Properties** Group, Nillable **Description** A descriptive measurement unit such as acres, square meters, or square feet.
PriorYearEmployees	**Type** int **Properties** Group, Nillable **Description** The total number of employees for the prior year.
PriorYearRevenue	**Type** double **Properties** Nillable **Description** The annual revenue for the prior year.

Field Name	Details
SalesTurnoverGrowthRate	**Type** double **Properties** Nillable **Description** The increase in annual revenue from the previous value for an equivalent period expressed as a decimal percentage.
Sic	**Type** string **Properties** Filter, Nillable **Description** A numeric value that represents the Standard Industrial Codes (SIC). SIC is a numbering convention that indicates what type of service a business provides. It is a four-digit value.
SicCodeDesc	**Type** string **Properties** Group, Nillable **Description** The SIC numeric code and descsciption for a company.
SicDesc	**Type** string **Properties** Nillable **Description** A description of the SIC classification.
Site	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist **Description** An organizational status of the company. • Branch: a secondary location to a headquarter location • Headquarter: a parent company with branches or subsidiaries • Single Location: a single business with no subsidiaries or branches

Field Name	Details
State	**Type** string **Properties** Filter, Nillable, Sort **Description** The two-letter standard abbreviation for a state.
StateCode	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist **Description** A standard two-letter abbreviation for states and territories of the United States. The state where the company is located. The abbreviation can also be a province or other equivalent to a state, depending on the country where the company is located.
Street	**Type** string **Properties** Nillable **Description** A postal address for the company.
TickerSymbol	**Type** string **Properties** Nillable **Description** The symbol that uniquely identifies companies that are traded on public stock exchanges.
TradeStyle	**Type** string **Properties** Nillable **Description** A legal name under which a company conducts business.

Field Name	Details
UpdatedDate	**Type** dateTime **Properties** Nillable, Sort **Description** The last date and time when the information for this company was updated.
Website	**Type** url **Properties** Nillable **Description** The standard URL for the company's home page.
YearStarted	**Type** string **Properties** Nillable **Description** The year when the company was founded.
Zip	**Type** string **Properties** Filter, Nillable **Description** A numeric postal code that's designated for the address.

Usage

Use the DatacloudCompany object to search the Data.com database for companies with the specific criteria that you enter. Use this object to find company records that you are interested in purchasing for your organization. Data.com APIs use the term "company," which is similar to Salesforce term "accounts."

Important: DatacloudCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudContact

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`City`	**Type** string **Properties** Filter, Nillable, Sort **Description** The city where the company is located.
`CompanyId`	**Type** string **Properties** Filter, Nillable **Description** The unique numerical identifier for the company and the Data.com company identification number or Data.com Key.
`CompanyName`	**Type** string **Properties** Filter, Group, Sort **Description** The name of the company.
`ContactId`	**Type** string **Properties** Filter, Nillable **Description** The unique numeric identifier for this contact.

Field Name	Details
Country	**Type** string **Properties** Filter, Nillable, Sort **Description** The standard abbreviation or name for the country where the company is located. Note: You can enter a comma-separated list of countries; however, for a country that uses a comma in its name, leave out the comma. For example, enter "Taiwan, ROC" as `Taiwan ROC`.
Department	**Type** picklist **Properties** Filter, Group, Restricted picklist **Description** The department in the company that the contact is affiliated with. The values of this field are fixed enumerated values. • `Engineering` • `Finance` • `Human Resources` • `IT` • `Marketing` • `Operations` • `Other` • `Sales` • `Support`
Email	**Type** email **Properties** Filter, Nillable **Description** A business email address for the contact.
ExternalId	**Type** string **Properties** Filter, Nillable, Sort

Field Name	Details
	Description A unique system-generated numerical identifier for the contact.
FirstName	**Type** string **Properties** Filter, Nillable **Description** The first name of the contact.
IsInCrm	**Type** boolean **Properties** Defaulted on create, Group **Description** Whether the record is in Salesforce (true) or not (false).
IsInactive	**Type** boolean **Properties** Defaulted on create, Filter **Description** Whether the record is active (false) or not (true).
IsOwned	**Type** boolean **Properties** Defaulted on create **Description** • `True`: You own this record. • `False`: You do not own this record.
LastName	**Type** string **Properties** Filter, Nillable, Sort **Description** The last name of the contact.

Field Name	Details
`Level`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist **Description** A human resource label that designates a person’s level in the company. The values of this field are fixed enumerated values. • `C-Level` • `VP` • `Director` • `Manager` • `Staff` • `Other`
`Phone`	**Type** phone **Properties** Nillable **Description** The direct-dial telephone number for the contact.
`SocialHandles`	**Type** string **Description** The social handles for this contact. Social handles are a normalized URL and user name for social media accounts such as, LinkedIn, Facebook, and Twitter. This field is response-only. The DatacloudSocialHandles object is a child of the DatacloudContact object.
`State`	**Type** string **Properties** Filter, Nillable, Sort **Description** The state where the company is located, which can also be a province or other equivalent to a state, depending on the country where the company is located.
`Street`	**Type** string

Field Name	Details
	Properties Nillable **Description** The street address for the company where the contact works.
`Title`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Title of the contact such as CEO or Vice President.
`UpdatedDate`	**Type** dateTime **Properties** Nillable, Sort **Description** The last date and time when the information for a contact was updated.
`Zip`	**Type** string **Properties** Filter, Nillable **Description** The postal or zip code for the address.

Usage

This object searches the Data.com database for contacts with the specific criteria that you enter. Use this object to find contact records that you are interested in purchasing for your organization.

Important: DatacloudContact can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudDandBCompany

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

> **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.
>
> To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.
>
> For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`City`	**Type** string **Properties** Nillable **Description** The name of the city where the company is physically located.
`CompanyCurrencyIsoCode`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar.
`CompanyId`	**Type** string **Properties** Filter, Nillable, Sort **Description** A unique numeric identifier for a company.
`Country`	**Type** string **Properties** Nillable

Field Name	Details
	Description The country where a company is physically located.
CountryAccessCode	**Type** string **Properties** Nillable **Description** The required code for international calls.
CurrencyCode	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The currency in which the company's sales volume is expressed.
Description	**Type** string **Properties** Nillable **Description** A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry.
DomesticUltimateBusinessName	**Type** string **Properties** Nillable **Description** The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
DomesticUltimateDunsNumber	**Type** string **Properties** Nillable **Description** The D-U-N-S number for the Domestic Ultimate, which is the highest-ranking subsidiary, specified by country, within an organization's corporate structure.

Field Name	Details
DunsNumber	**Type** string **Properties** Filter, Nillable **Description** The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.
EmployeeQuantityGrowthRate	**Type** double **Properties** Nillable **Description** The yearly growth rate of the number of employees in a company expressed as a decimal percentage. The data includes the total employee growth rate for the past two years.
EmployeesHere	**Type** double **Properties** Nillable **Description** The number of employees at a specified location, such as a branch location.
EmployeesHereReliability	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The reliability of the `EmployeesHere` figure. Available values are *Actual number*, *Low*, *Estimated (for all records)*, *Modeled (for non-US records)*. A blank value indicates this data is unavailable.
EmployeesTotal	**Type** double **Properties** Nillable

Field Name	Details
	Description The total number of employees in the company, including all subsidiary and branch locations. This data is available only on records that have a value of *`Headquarters/Parent`* in the `LocationStatus` field.
`EmployeesTotalReliability`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The reliability of the `EmployeesTotal` figure. Available values are *`Actual number`*, *`Low`*, *`Estimated (for all records)`*, *`Modeled (for non-US records)`*. A blank value indicates this data is unavailable.
`ExternalId`	**Type** string **Properties** Filter, Nillable, Sort **Description** A system generated numeric identification.
`FamilyMembers`	**Type** int **Properties** Nillable **Description** The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any).
`Fax`	**Type** phone **Properties** Nillable **Description** The company's facsimile number.
`FifthNaics`	**Type** string **Properties** Nillable

Field Name	Details
	Description A NAICS code that's used to further classify an organization by industry.
FifthNaicsDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding NAICS code.
FifthSic	**Type** string **Properties** Nillable **Description** A Standard Industrial Classification (SIC) code that's used to further classify an organization by industry.
FifthSic8	**Type** string **Properties** Group, Nillable **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FifthSic8Desc	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
FifthSicDesc	**Type** string **Properties** Nillable

Field Name	Details
	Description A brief description of an organization's line of business, based on the corresponding SIC code.
FipsMsaCode	**Type** string **Properties** Nillable **Description** The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget.
FipsMsaDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's FIPS MSA code.
FortuneRank	**Type** int **Properties** Defaulted on create, Group, Nillable **Description** The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.
FourthNaics	**Type** string **Properties** Nillable **Description** A NAICS code used to further classify an organization by industry.
FourthNaicsDesc	**Type** string **Properties** Nillable

Field Name	Details
	Description A brief description of an organization's line of business, based on the corresponding NAICS code.
FourthSic	**Type** string **Properties** Group, Nillable **Description** A SIC code used to further classify an organization by industry.
FourthSic8	**Type** string **Properties** Group, Nillable **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
FourthSic8Desc	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
FourthSicDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code.
GeoCodeAccuracy	**Type** picklist **Properties** Nillable, Restricted picklist

Field Name	Details
	Description The level of accuracy of a location’s geographical coordinates compared with its physical address. Available values include *Rooftop level*, *Street level*, *Block level*, *Census tract level*, *Mailing address level*, *ZIP code level*, *Geocode could not be assigned*, *Places the address in the correct city*, *Not matched*, *State or Province Centroid*, *Street intersection*, *PO BOX location*, *Non-US rooftop accuracy*, *County Centroid*, *Sub Locality-Street Level*, and *Locality Centroid*
GlobalUltimateBusinessName	**Type** string **Properties** Nillable **Description** The primary name of the Global Ultimate, which is the highest entity within an organization’s corporate structure and may oversee branches and subsidiaries.
GlobalUltimateDunsNumber	**Type** string **Properties** Filter, Nillable **Description** The D-U-N-S number of the Global Ultimate, which is the highest-ranking entity within an organization’s corporate structure and can oversee branches and subsidiaries.
GlobalUltimateTotalEmployees	**Type** double **Properties** Nillable **Description** The total number of employees at the Global Ultimate, which is the highest entity within an organization’s corporate structure and may oversee branches and subsidiaries.
ImportExportAgent	**Type** picklist **Properties** Nillable, Restricted picklist

Field Name	Details
	Description Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods.
`IncludedInSnP500`	**Type** string **Properties** Group, Nillable **Description** A true or false value. If `true`, the company is listed in the S&P 500 Index. If `false`, the company isn't listed in the S&P 500 Index.
`Industry`	**Type** string **Properties** Group, Nillable **Description** A description of the type of industry such as Telecommunications, Agriculture, or Electronics.
`IsOwned`	**Type** boolean **Properties** Defaulted on create **Description** A true or false value. True, your organization owns the record. False, your organization doesn't own the record.
`IsParent`	**Type** boolean **Properties** Defaulted on create, **Description** A true or false value. True, the company is a parent company. False, the company isn't a parent company. A parent company owns other companies.
`Latitude`	**Type** string **Properties** Nillable

Field Name	Details
	Description Used with longitude to specify a precise location, which is used to assess the Geocode Accuracy.
`LegalStatus`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Identifies the legal structure of an organization. Available values include *`Cooperative`*, *`Nonprofit organization`*, *`Local government body`*, *`Partnership of unknown type`*, and *`Foreign company`*.
`LocationStatus`	**Type** picklist **Properties** Filter, Nillable, Restricted picklist **Description** Identifies the organizational status of a company. A numeric value represents each value. <table><tr><th>Organizational status</th><th>Numeric value</th></tr><tr><td><code>Single location</code>: The business has no branches or subsidiaries.</td><td><code>0</code></td></tr><tr><td><code>Headquarters/Parent</code>: A parent company that owns more than 50 percent of another company. When the company also has branches, it’s the headquarters.</td><td><code>1</code></td></tr><tr><td><code>Branch</code>: A secondary location of a business.</td><td><code>2</code></td></tr></table> Note: Only the numeric value is accepted in an API request.
`Longitude`	**Type** string **Properties** Nillable

Field Name	Details
	Description Used with latitude to specify a precise location, which is used to assess the Geocode Accuracy.
`MailingCity`	**Type** string **Properties** Nillable **Description** The city where a company has its mail delivered.
`MailingCountry`	**Type** string **Properties** Nillable **Description** The country where a company has its mail delivered.
`MailingState`	**Type** string **Properties** Nillable **Description** The state where a company has its mail delivered.
`MailingStreet`	**Type** string **Properties** Nillable **Description** The street address where a company has its mail delivered.
`MailingZip`	**Type** string **Properties** Nillable **Description** The postal zip code for the company.

Field Name	Details
MarketingPreScreen	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The probability that a company pays with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Available values are *High risk of delinquency*, *Low risk of delinquency*, and *Moderate risk of delinquency*. **Important:** Use this information for marketing pre-screening purposes only.
MarketingSegmentationCluster	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of Dun & Bradstreet data for US organizations. Available values include *High-Tension Branches of Insurance/Utility Industries*, *Rapid-Growth Large Businesses*, *Labor-Intensive Giants*, *Spartans*, *Main Street USA*.
MinorityOwned	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether an organization is owned or controlled by a member of a minority group.
Name	**Type** string **Properties** Filter, Nillable **Description** The primary or registered name of a company.
NationalId	**Type** string

Field Name	Details
	Properties Nillable **Description** The identification number used in some countries for business registration and tax collection.
NationalIdType	**Type** picklist **Properties** Nillable, Restricted picklist **Description** A code value that identifies the type of national identification number that's used.
OutOfBusiness	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether the company at the specified address has discontinued operations.
OwnOrRent	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether a company owns or rents the building it occupies.
ParentOrHqBusinessName	**Type** string **Properties** Nillable **Description** The primary name of the parent or headquarters company.
ParentOrHqDunsNumber	**Type** string **Properties** Filter, Nillable

Field Name	Details
	Description The D-U-N-S number for the parent or headquarters.
Phone	**Type** phone **Properties** Nillable **Description** A company's primary telephone number.
PremisesMeasure	**Type** int **Properties** Group, Nillable **Description** A numeric value for the measurement of the premises.
PremisesMeasureReliability	**Type** string **Properties** Group, Nillable **Description** A descriptive accuracy of the measurement such as actual, estimated, or modeled.
PremisesMeasureUnit	**Type** string **Properties** Group, Nillable **Description** A descriptive measurement unit such as acres, square meters, or square feet.
PrimaryNaics	**Type** string **Properties** Nillable **Description** The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy.

Field Name	Details
PrimaryNaicsDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on its NAICS code.
PrimarySic	**Type** string **Properties** Nillable **Description** The four-digit SIC code that's used to categorize business establishments by industry.
PrimarySic8	**Type** string **Properties** Group, Nillable **Description** The eight-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet. Maximum size is 8 characters.
PrimarySic8Desc	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
PrimarySicDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on its SIC code.

Field Name	Details
PriorYearEmployees	**Type** int **Properties** Group, Nillable **Description** The total number of employees for the prior year.
PriorYearRevenue	**Type** double **Properties** Nillable **Description** The annual revenue for the prior year.
PublicIndicator	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether ownership of the company is public or private.
Revenue	**Type** double **Properties** Nillable **Description** The annual revenue of a company in US dollars.
SalesTurnoverGrowthRate	**Type** double **Properties** Nillable **Description** The increase in annual revenue from the previous value for an equivalent period expressed as a decimal percentage.
SalesVolume	**Type** double **Properties** Nillable

Field Name	Details
	Description The total annual sales revenue in the headquarters' local currency. Dun & Bradstreet tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters.
SalesVolumeReliability	**Type** picklist **Properties** Nillable, Restricted picklist **Description** The reliability of the SalesVolume figure.
SecondNaics	**Type** string **Properties** Nillable **Description** A NAICS code used to further classify an organization by industry.
SecondNaicsDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding NAICS code.
SecondSic	**Type** string **Properties** Nillable **Description** A SIC code used to further classify an organization by industry.
SecondSic8	**Type** string **Properties** Group, Nillable

Field Name	Details
	Description An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
SecondSic8Desc	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
SecondSicDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code.
SixthNaics	**Type** string **Properties** Nillable **Description** A NAICS code used to further classify an organization by industry.
SixthNaicsDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code.
SixthSic	**Type** string **Properties** Nillable **Description** A SIC code used to further classify an organization by industry.

Field Name	Details
SixthSic8	**Type** string **Properties** Group, Nillable **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
SixthSic8Desc	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization’s line of business, based on the corresponding SIC code. Maximum size is 80 characters.
SixthSicDesc	**Type** string **Properties** Nillable **Description** A brief description of an organization’s line of business, based on the corresponding SIC code.
SmallBusiness	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government.
State	**Type** string **Properties** Nillable **Description** The state where a company is physically located.
StockExchange	**Type** string

Field Name	Details
	Properties Nillable **Description** The corresponding exchange for a company's stock symbol, for example, NASDAQ or NYSE.
StockSymbol	**Type** string **Properties** Nillable **Description** The abbreviation that's used to identify publicly traded shares of a particular stock.
Street	**Type** string **Properties** Nillable **Description** The street address where a company is physically located.
Subsidiary	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether a company is more than 50 percent owned by another organization.
ThirdNaics	**Type** string **Properties** Nillable **Description** A NAICS code used to further classify an organization by industry.
ThirdNaicsDesc	**Type** string **Properties** Nillable

Field Name	Details
	Description A brief description of an organization's line of business, based on the corresponding NAICS code.
`ThirdSic`	**Type** string **Properties** Nillable **Description** A SIC code used to further classify an organization by industry.
`ThirdSic8`	**Type** string **Properties** Group, Nillable **Description** An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
`ThirdSic8Desc`	**Type** string **Properties** Group, Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
`ThirdSicDesc`	**Type** string **Properties** Nillable **Description** A brief description of an organization's line of business, based on the corresponding SIC code.
`TradeStyle1`	**Type** string **Properties** Nillable

Field Name	Details
	Description A name, different from its legal name, that an organization may use for conducting business. Similar to “Doing business as” or “DBA”.
TradeStyle2	**Type** string **Properties** Nillable **Description** A tradestyle used by the organization.
TradeStyle3	**Type** string **Properties** Nillable **Description** A tradestyle used by the organization.
TradeStyle4	**Type** string **Properties** Nillable **Description** A tradestyle used by the organization.
TradeStyle5	**Type** string **Properties** Nillable **Description** A tradestyle used by the organization.
UsTaxId	**Type** string **Properties** Nillable **Description** The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number.

Field Name	Details
`Website`	**Type** url **Properties** Filter, Group, Nillable **Description** An organization's primary website address.
`WomenOwned`	**Type** picklist **Properties** Nillable, Restricted picklist **Description** Indicates whether a company is more than 50 percent owned or controlled by a woman.
`YearStarted`	**Type** string **Properties** Nillable **Description** The year when the company was established or the year when current ownership or management assumed control of the company.
`Zip`	**Type** string **Properties** Nillable **Description** A five or nine-digit code that's used to help sort mail.

Usage

Use this object to return D&B Company information. These fields are read-only.

Important: DatacloudDandBCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudOwnedEntity

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
`DataDotComKey`	**Type** string **Properties** Create, Filter, Sort **Description** The Data.com contact or company record identification number used by the DatacloudPurchaseUsage object to keep track of purchased records. This is equivalent to the Data.com record ID for a contact or company.
`DatacloudEntityType`	**Type** picklist **Properties** Create, Filter, Restricted picklist, Sort **Description** The type of Data.com record you want to purchase. • 0—contact • 1—company
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, Sort

Field Name	Details
	Description An optional field used to name your record.
`PurchaseType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** A read only field set by the API to identify the purchase type. • Added • Export • API
`PurchaseUsageId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The unique identification number for the DatacloudPurchaseUsage object created by making a REST POST request. • 0—contact • 1—company
`UserId`	**Type** reference **Properties** Filter, Group, Sort **Description** A unique identifier for the user making the purchase.

Usage

The Datacloud object that tracks records that are purchased and owned by a specific user.

DatacloudPurchaseUsage

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers' needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field Name	Details
`DatacloudEntityType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of Data.com record you want to purchase. • 0—indicates contact entity type. • 1—indicates company entity type.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An optional field. You can add a description for your purchase.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, Sort **Description** An optional field used to name your record.
`PurchaseType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field Name	Details
	Description A read only field set by the API to identify the purchase type. • Added • Export • API
`Usage`	**Type** double **Properties** Filter, Sort **Description** A read only field set by the API. It is used to track the points used to purchase records.
`UserId`	**Type** reference **Properties** Filter, Group, Sort **Description** A read only field set by the API that identifies the user purchasing the records.
`UserType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A read only field set by the API with 2 user types. • Monthly Usage • List Pool User

Usage

The DatacloudPurchaseUsage object allows you to track Data.com record purchases for CRM users.

DataIntegrationRecordPurchasePermission

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field Name	Details
`ExternalObject`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the name of the data service record matched to the Salesforce record.
`UserId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Indicates the ID of a user to whom purchase credits are assigned.
`UserRecordPurchaseLimit`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the number of purchase credits assigned to a user.

DatasetExport

Represents a dataset exported from Einstein Analytics. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`CompressedMetadataLength`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExport object, Metadata is the BLOB field.
`Metadata`	**Type** base64 **Properties** Nillable **Description** Contains the JSON schema that describes the data in the CSV. This schema includes column metadata such as type, format, and defaultValue.
`MetadataLength`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExport object, Metadata is the BLOB field.
`Owner`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** User ID of the owner, as specified in the `userId` parameter in the export node of the dataflow that created the record. Only the specified owner can read the content of the record.
`PublisherInfo`	**Type** string **Properties** Filter, idLookup, Sort **Description** Identifies the export record to facilitate searching when a user has multiple export records. By default, this column is set to the ID of the dataflow that generated the export record,

Field	Details
	concatenated with the name of the specific export node. PublisherInfo is unique within your organization. Note: A dataflow can have multiple export nodes.
`PublisherType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Target of the export, as specified in the `target` parameter in the export node of the dataflow that created the record. The value must be *`EinsteinDiscovery`*.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Status of the export. The possible values are: • New • InProgress • Completed • Canceled • Failed Note: The content of the Metadata field can be downloaded when the status is Completed.

Usage

This object is used with the DatasetExportPart object for exporting data from a dataset in Einstein Analytics for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

SEE ALSO:

DatasetExportPart

DatasetExportPart

Represents a dataset exported from Einstein Analytics. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExportPart contains parts of the .csv file.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`CompressedDataFileLength`	**Type** int **Properties** Filter, Group, Sort **Description** This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExportPart object, DataFile is the BLOB field.
`DataFile`	**Type** base64 **Description** Contains a part of the dataset data from the generated .csv file. Maximum size is 32 MB.
`DataFileLength`	**Type** int **Properties** Filter, Group, Sort **Description** This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExportPart object, DataFile is the BLOB field.
`DatasetExportId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the parent record that the part record is associated with.
`Owner`	**Type** string **Properties** Filter, Group, Sort **Description** User ID of the owner, as specified in the `userId` parameter in the export node of the dataflow that created the record. Only the specified owner can read the content of the record.

Field	Details
`PartNumber`	**Type** int **Properties** Filter, Group, Sort **Description** Used with the DatasetExportId to uniquely identify the data part. Parts are assembled sequentially based on their numbers.

Usage

This object is used with the DatasetExport object for exporting data from a dataset in Einstein Analytics for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

SEE ALSO:
DatasetExport

DataUseLegalBasis

Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of the data use legal basis.

Field Name	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Specifies a name for the legal basis. For example, "billing" or "contract".
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this customer.
Source	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the source of the legal basis. For example, the URL of a contract.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DataUseLegalBasisHistory
History is available for tracked fields of the object.

DataUseLegalBasisOwnerSharingRule
Sharing rules are available for the object.

DataUseLegalBasisShare
Sharing is available for the object.

DataUsePurpose

Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

Fields

Field Name	Details
`CanDataSubjectOptOut`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the customer can decline contact for the described purpose.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the purpose for contacting a customer.
`LastReferencedDate`	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`LegalBasisId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Identifies the legal basis record associated with the data use purpose.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Identifies the reason for contacting a customer. For example, billing or marketing.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the account associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

DataUsePurposeHistory
History is available for tracked fields of the object.

DataUsePurposeOwnerSharingRule
Sharing rules are available for the object.

DataUsePurposeShare
Sharing is available for the object.

DatedConversionRate

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`,

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`ConversionRate`	**Type** double **Properties** Filter, Update **Description** Required. Conversion rate of this currency type against the corporate currency.
`IsoCode`	**Type** picklist **Properties** Filter, Restricted picklist **Description** Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as `USD`, `GBP`, or `JPY`. Must be unique within your organization. Label is **Currency ISO Code**.
`NextStartDate`	**Type** date

Field	Details
	Properties Filter, Nillable **Description** Read only. The date on which the next effective dated exchange rate will start. Effectively the day after the end date for this exchange rate.
StartDate	**Type** date **Properties** Filter **Description** The date on which the effective dated exchange rate starts.

Usage

This object is for multicurrency organizations with advanced currency management enabled. Use this object to define the exchange rates your organization uses for a date range. This object is not available in single-currency organizations, nor is it available if the organization does not have advanced currency management enabled.

DeclinedEventRelation

Represents event participants (invitees or attendees) with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
EventId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the event.
RelationId	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** Indicates the ID of the invitee.
`RespondedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates the most recent date and time when the invitee declined an invitation to the event.
`Response`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates the content of the response field. Label is `Comment`.
`Type`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates whether the invitee is a user, lead or contact, or resource.

Usage

Query invitees who have declined an invitation to an event

```
SELECT eventId, type, response FROM DeclinedEventRelation WHERE eventid='00UTD000000ZH5LA'
```

SEE ALSO:

AcceptedEventRelation

UndecidedEventRelation

DelegatedAccount

Represents the external managed account. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You must have a Partner or Customer Community Plus license.

Fields

Field	Details
`AccessBuyFor`	**Type** boolean **Properties** Create, Filter, Update **Description** The access that an admin authorizes for an external user to buy for other accounts. This field is available in API version 50.0 and later. A B2B Commerce license is required to use AccessBuyFor.
`AccessManageUsers`	**Type** boolean **Properties** Create, Filter, Update **Description** The access that an admin authorizes for an external user to manage external users on other accounts. This includes managing permission sets, membership, passwords, and activation. This field is available in API version 50.0 and later. Delegated External User Administrator permission is required to use AccessManageUsers.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`ManagedById`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the managing user.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the external managed account.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the record owner.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the managing users account. This field is available in API version 50.0 and later.
`TargetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the account being managed.

DeleteEvent

Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0.

DeleteEvent is a read-only object. You can't create, update, or delete it directly. To create a DeleteEvent record, soft delete a record of another type, like an Account. To remove a DeleteEvent record, use the emptyRecycleBin() API or hard delete the corresponding `Record`.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`DeletedById`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user who deleted the record.
`DeletedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the record was deleted.
`Record`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the record that was deleted.
`RecordName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the record that was deleted.

Field	Details
SobjectName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The type of record that was deleted, for example, Account.

DigitalSignature

Represents a signature captured on a service report in field service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
DigitalSignatureNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the signature.
DocumentBody	**Type** base64 **Properties** Create **Description** The captured signature image.
DocumentContentType	**Type** picklist

Field Name	Details
	Properties Create, Filter, Group, Restricted picklist, Sort **Description** The data type of the captured signature.
DocumentLength	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The length of the captured signature.
DocumentName	**Type** string **Properties** Create, Filter, Group, Sort **Description** The name of the captured signature image.
ParentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the service appointment, work order, or work order line item that the service report is generated for.
Place	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** The place where the report was signed.
SignatureType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort **Description** The role of the person signing the service report. Your org comes with one signature type, `Default`. A service report template can only contain one

Field Name	Details
	signature per type. If you plan to collect multiple signatures on service reports, create additional values for the Signature Type field. Create at least one value for every role that might need to sign a service report. For example, `Technician`, `Customer`, `Supervisor`, or `Supplier`. If some service reports will be signed by multiple people in one role—for example, all technicians present at an appointment—create numbered types: `Technician 1`, `Technician 2`, and so forth. Note: You can create up to 1,000 signature types. You can't delete signature types, but you can deactivate them so they can't be used in service report templates. When you deactivate a type, it still appears on service report templates that used it, but you can't use it on new service report templates.
`SignedBy`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** The name of the person signing.
`SignedDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time of the signing.

Usage

Add signature blocks to service report templates to determine which signatures need to be gathered on reports that use the template. Service report templates can contain up to 20 signatures, and each signature must use a different Signature Type. For example, create a standard service report template that contains a customer signature and a technician signature.

To learn more about digital signatures, see Guidelines for Using Signatures on Service Reports.

DigitalWallet

The digital wallet entity represents a customer's digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account of the customer owns the digital wallet.
AuditEmail	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Email of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.
Comments	**Type** textarea **Properties** Create, Nillable, Update **Description** Users can provide additional details about the digital wallet. Supports a maximum of 1000 characters.
CompanyName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Company of the digital wallet owner.
Customer	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** Customer name of the digital wallet owner.
DigitalWalletNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** System-generated reference number for the digital wallet.
Email	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Email of the digital wallet owner.
GatewayToken	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Gateway token used when the digital wallet interacts with the payment gateway.
GatewayTokenDetails	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Unique ID generated by the payment gateway for the card for future transactions.
IpAddress	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The IP address of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
MacAddress	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The MAC address of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.
NickName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** User-defined nickname for the digital wallet.
PaymentGatewayId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description Gateway used with transactions for the digital wallet.
PaymentMethodAddress	**Type** address **Properties** Filter, Nillable **Description** Part of the address for the payment method.
PaymentMethodCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodLongitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description Part of the address for the payment method.
PaymentMethodPostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
PaymentMethodStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Part of the address for the payment method.
Phone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Phone number of the digital wallet owner. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own.
ProcessingMode	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Defines whether the digital wallet is used for transactions made inside or outside the payment platform.

Field	Details
	Possible values are: • `External:` Transactions happened outside of the Salesforce payments platform. • `Salesforce:` Salesforce made and recorded an external call to the payment platform. This field is available in API v49.0 and later. It does not appear in the UI by default for Salesforce orgs that upgraded from v48.0. Users must add it to the DigitalWallet page layout on their own. **Important:** `ProcessingMode` is required to create a DigitalWallet entity.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Defines the state of the digital wallet as a payment source. Possible values are: • `Active:` Customers can make payments with the digital wallet. • `Canceled:` The digital wallet can no longer be used for payments. This status can't be changed. • `Inactive:` The digital wallet can't be used for payments until a user changes its status to Active.

DirectMessage

Represents a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You must have the Manage Chatter Messages and Direct Messages permission enabled to access the DirectMessage object.

Fields

Field	Details
`Name`	**Type** string

Field	Details
	Properties Filter, Group, idLookup, Sort, Update **Description** A default value that isn't visible to users.
`Subject`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Subject of the overall direct message conversation.

Usage

DirectMessage is an object used by Salesforce to control DirectMessage conversations. It represents a record of a direct message conversation, but doesn't include conversation data, such as posts or comments. It is most frequently used to moderate direct message data in order to meet data compliance regulations.

Division

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Divisions must be enabled for your organization to access this object. To discover whether divisions have been enabled for an organization, inspect the User or Group object for the `DefaultDivision` field—if it is present, then divisions have been enabled, and this field (the field is named Division in objects other than User and Group) will be available in all relevant objects.
- Customer Portal users can't access this object.

Fields

Field	Details
`IsActive`	**Type** boolean

Field	Details
	Properties Create, Defaulted on create, Filter, Update **Description** Indicates whether the division is active (`true`) or not (`false`). Label is **Active**.
`IsGlobalDivision`	**Type** boolean **Properties** Defaulted on createFilter **Description** Indicates whether the division is your organization's global default division (`true`) or not (`false`). Label is **Global Division**.
`Name`	**Type** string **Properties** Create, Filter, Update **Description** A descriptive name for the division. Limit: 80 characters.
`SortOrder`	**Type** int **Properties** Create, Filter, Nillable, Update **Description** The order in which this division name appears in the Division picklist field when creating or editing users in the Salesforce user interface.

Usage

The values available for that field are the global division ID for the organization, created when divisions are first enabled, and any other division IDs that have been created. The division ID associated with a user is populated in the objects owned or created by the user.

You can use the division ID to make searches, reports, and list views run more quickly and return more relevant results if an organization has very large data sets. For more information, see the Salesforce online help, in the Fields description for the object.

You can use WITH in SOSL to pre-filter results based on division. This is faster than specifying the division in a WHERE clause.

Note: The User object has a `Division` field that is unrelated to this object. The `Division` field is a standard text field similar to Company or Department that has no special properties. Do not confuse it with the `DefaultDivision` field, which does relate to this object.

SEE ALSO:

Object Basics

DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

Fields

Field	Details
`Language`	**Type** string **Properties** Create, Filter, Nillable, Restricted picklist **Description** The language for this translated label.
`NamespacePrefix`	**Type** string **Properties** Filter, Nillable **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

Field	Details
	• In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`ParentId`	**Type** reference **Properties** Create, Filter, Nillable **Description** The ID of the Division associated with the label that is being translated.
`Value`	**Type** string **Properties** Create, Filter, Nillable, Update **Description** The actual translated label for the division. Label is **Translation**.

Usage

Use this object to translate the labels of your divisions into the different languages supported by Salesforce.

Document

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You must have the “Edit” permission on documents and the appropriate access to the Folder that contains a document in order to create or update a document in that Folder.

Fields

Field	Details
`AuthorId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the User who is responsible for the Document.
`Body`	**Type** base64 **Properties** Create, Nillable, Update **Description** Required. Encoded file data. If specified, then do not specify a URL.
`BodyLength`	**Type** int **Properties** Filter, Group, Sort **Description** Size of the file (in bytes).
`ContentType`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Type of content. Label is **Mime Type**. Limit: 120 characters. If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Text description of the Document. Limit: 255 characters.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Document Unique Name**. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`FolderId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. ID of the Folder that contains the document.
`IsBodySearchable`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the contents of the object can be searched using a SOSL `FIND` call. The `ALL FIELDS` search group includes the content as a searchable field.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`IsInternalUseOnly`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the object is only available for internal use (`true`) or not (`false`). Label is **Internal Use Only**.

Field	Details
IsPublic	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the object is available for external use (`true`) or not (`false`). Label is **Externally Available**.
Keywords	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Keywords. Limit: 255 characters.
LastReferencedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** datetime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of the document. Label is **Document Name**.
NamespacePrefix	**Type** string **Properties** Filter, Group, Sort, Nillable

Field	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`Type`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** File type of the Document. In general, the values match the file extension for the type of Document (such as pdf or jpg). Label is **File Extension**.
`Url`	**Type** string **Properties** Create, Filter, Nillable, Group, Sort, Update **Description** URL reference to the file (instead of storing it in the database). If specified, do not specify the `Body` or `BodyLength`.

Usage

When creating or updating a document, you can specify a value in either the `Body` or `Url` fields, but not both.

Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

Maximum Document Size

You can only create or update documents to a maximum size of 5 MB.

SEE ALSO:

Object Basics

DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`DocumentId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the document that this object tracks.
`DocumentSequence`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Represents the order that the attachments will be included in the email defined by the EmailTemplate specified by the `DocumentId`. Label is **Attachment Sequence**. The first attachment is given a value of 0, and each subsequent attachment is given a value incremented by 1.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description ID of the EmailTemplate parent. The attachment identified by `DocumentId` is attached to the EmailTemplate specified in this field.

Usage

Use this object to map the relationship of an EmailTemplate to its attachments, and to specify the order of the attachments.

SEE ALSO:

EmailTemplate

DocumentTag

Associates a word or short phrase with a Document.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference

Field Name	Details
	Properties Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

DocumentTag stores the relationship between its parent TagDefinition and the Document being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the Domain and DomainSite objects.

Fields

Field	Description
CnameTarget	**Type** string **Properties** Filter, Nillable, Sort **Description** The canonical name (CNAME) of the external host or server. If you use a custom domain with a non-Salesforce provider, such as your own external server or CDN provider, to serve your domain, this field points to the CNAME of the external provider. This field is available in API version 43.0 and later.
Domain	**Type** string **Properties** Filter, idLookup, Sort **Description** The branded custom Web address within the global namespace identified by this domain's type. In the Domain Name System (DNS) global namespace, this field is the custom Web address that you registered with a third-party domain name registrar. The custom Web address can be used to access the site of this domain.
DomainType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS. DomainType can have the following value: • `DNS`—Domain Name System (DNS)
HttpsOption	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Current HTTPS option. Values may include: • `CdnPartner`—Content Delivery Network (CDN) partner of Salesforce • `Community`—Experience Cloud site Force.com Subdomain • `CommunityAlt`—Experience Cloud site My Domain

Field	Description
	• `ExternalHttps`—Domain is served by an external host • `NoHttps`—No HTTPS • `OrgDomain`—My Domain • `Sites`—Salesforce Sites Subdomain • `SitesAlt`—Salesforce Sites My Domain • `SitesRuntime`—Salesforce Cloud This field is available in API version 47.0 and higher.
`OptionsExternalHttps`	**Type** boolean **Properties** Filter **Description** Indicates whether the domain supports secure connections (`true`) or not (`false`) via a non-Salesforce content delivery network (CDN) or endpoint. The value of this field is used only if the domain is not pointing to the *`yourdomain.your18characterOrgId`*`.live.siteforce.com` CNAME target. This field is deprecated in API version 47.0 and later. Use HttpsOption instead.
`OptionsHstsHeaders`	**Type** boolean **Properties** Filter **Description** Indicates whether the HTTP Strict Transport Security (HSTS) response header is included in requests to this domain (`true`) or not (`false`). This field is available in API version 47.0 and higher.

Usage

Use this read-only object to query the domains that are associated with each website in your organization.

DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites or Site.com must be enabled for your organization.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the Domain and DomainSite objects.

Fields

Field	Description
DomainId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the associated Domain.
PathPrefix	**Type** string **Properties** Filter, Group, Sort **Description** Shows where a site's root exists on a domain. Can only be set for custom Web addresses. Always begins with a `/`.
SiteId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the associated Site.

Usage

Use this read-only object to query or retrieve information about your Lightning Platform site.

DsarPolicy

Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer's request. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

This object is for Privacy Center customers with the ReadAllData or PrivacyDataAccess permissions.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** Description of the policy. The description is limited to 255 characters.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** Developer name of the policy.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether this policy can be used (`true`) or not (`false`) for data subject (customer) requests. The default value is `false`.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the MasterLabel. Possible values are: • `da`—Danish • `de`—German

Field	Details
	• en_US—English • es—Spanish • es_MX—Spanish (Mexico) • fi—Finnish • fr—French • it—Italian • ja—Japanese • ko—Korean • nl_NL—Dutch • no—Norwegian • pt_BR—Portuguese (Brazil) • ru—Russian • sv—Swedish • th—Thai • zh_CN—Chinese (Simplified) • zh_TW—Chinese (Traditional)
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** Label of the policy.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

DsarPolicyLog
Sharing is available for the object.

DsarPolicyLog

Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

This object is for Privacy Center customers with the ReadAllData or PrivacyDataAccess permissions.

Fields

Field	Details
CompletionDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the data subject access request was completed. Available in API version 51.0 and later.
DataSubjectId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The 15–18 character ID of the data subject making the request. Available in API version 51.0 and later.
DeletedDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the file generated for the data subject's request is deleted. Available in API version 51.0 and later.
DeveloperName	**Type** string **Properties** Filter, Group, Sort **Description** Developer name of the policy.
DownloadedDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The most recent date and time when the data subject downloaded the file generated at their request. Available in API version 51.0 and later.
`DsarError`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Represents an error in generating the file for the data subject access request. Available in API version 51.0 and later.
`DsarPolicyId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the DSAR policy.
`FileURL`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The result of the DSAR policy execution. The URL links to a downloadable file that contains the customer data.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the MasterLabel. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French

Field	Details
	• `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** Label of the policy.
`RequestDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when a data subject requested access to their data in the org. Available in API version 51.0 and later.
`RequestStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the policy execution. Possible values are: • `Complete` • `Deleted` • `Downloaded` • `Expired` • `Failed` • `In Progress`

Field	Details
RequestUserId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the org employee or admin making the request on behalf of the data subject. Available in API version 51.0 and later.

Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as the object.

DsarPolicy
Sharing is available for the object.

DuplicateJob

Represents an instance of a job that identifies duplicates among existing records in the system.

This object is available in API versions 42.0 and later.

A duplicate job is the parent of the DuplicateRecordSet instances that it generates. The duplicate record items in a set generated by a duplicate job are of one object type.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
DuplicateJobDefinitionId	**Type** reference **Properties** Filter, Group, Sort, Update **Description** The ID of the corresponding duplicate job definition.

Field Name	Details
DuplicateJobStatus	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The current status of a duplicate job. Valid values are `Not Started`, `In Progress`, `Completed`, `Canceled`, `Failed`, `Results Deleted`.
EndDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when a duplicate job was completed.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when a duplicate job was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when a duplicate job was last viewed.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort, Update **Description** The name of a duplicate job.
NumDuplicateRecordItems	**Type** int **Properties** Filter, Group, Sort

Field Name	Details
	Description The total number of duplicate records identified as a result of invoking a duplicate job.
NumDuplicateRecordSets	**Type** int **Properties** Filter, Group, Sort **Description** The number of duplicate record sets identified as a result of invoking a duplicate job.
NumRecordsScanned	**Type** int **Properties** Filter, Group, Sort **Description** The number of records scanned as a result of invoking a duplicate job.
ResultListViewId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** List view metadata for displaying the duplicate record sets identified as result of invoking a duplicate job.
StartDateTime	**Type** dateTime **Properties** Filter, Sort **Description** The date and time when a duplicate job was invoked.

DuplicateJobDefinition

Setup object defining a job that identifies duplicate record items globally.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The name of the user who created a duplicate job.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language in the user's personal settings.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** The label of the duplicate job.
`SobjectSubtype`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The object subtype. Valid values are `Person Account` or `None`.
`SobjectType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field Name	Details
	Description The object type: account, contact, or lead.

DuplicateJobMatchingRule

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
`DuplicateJobId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the corresponding DuplicateJob.
`DuplicateJobMatchRuleDefId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the matching rule defined for the corresponding DuplicateJobMatchingRuleDefinition.
`MatchingRuleBooleanFilter`	**Type** textarea **Properties** Filter, Sort

Field Name	Details
	Description Boolean logic of the MatchingRule for this DuplicateJobMatchingRule.
`MatchingRuleDescription`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** Description of the matching rule for this DuplicateJobMatchingRule.
`MatchingRuleName`	**Type** string **Properties** Filter, Group, Sort **Description** The name of the matching rule defined for this particular DuplicateJob invocation.

DuplicateJobMatchingRuleDefinition

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

This object is available in API versions 42.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `search()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
`DuplicateJobDefinitionId`	**Type** reference **Properties** Filter, Group, Sort

Field Name	Details
	Description ID of DuplicateJobDefinition (master) for this DuplicateJobMatchingRuleDefinition (detail).
`MatchingRuleId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the MatchingRule to be used with this DuplicateJobMatchingRuleDefinition.

DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, enable Duplicate Management. A Salesforce admin can grant access to any user with a Sales Cloud or CRM user license.

Fields

Field Name	Details
`DuplicateRecordSetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The duplicate record set that the duplicate record item is assigned to.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field Name	Details
	Description The autogenerated name that's given to the Duplicate Record Item. Label is `Duplicate Record Item Name`.
`RecordId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The name of the record as it appears on the record's detail page.

DuplicateRecordSet

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, activate duplicate rules. A Salesforce admin must give users read and write access.

Fields

Field Name	Details
`DuplicateRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The duplicate rule used to identify this list of duplicate records. **Label** Duplicate Rule ID
`LastReferencedDate`	**Type** dateTime

Field Name	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated name that's given to the duplicate record set. Label is Duplicate Record Set Name.
RecordCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of record items in the set.
ParentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ParentId represents the parent of a duplicate rule or duplicate job. A ParentId is polymorphic. The label is Parent. This field is available in API versions 42.0 and later.

DuplicateRule

Represents a duplicate rule for detecting duplicate records.

Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`, `search()`

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

Field Name	Details
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The developer name for the duplicate rule.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether a duplicate rule is active (`true`) or not (`false`). This field is read only.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language for the duplicate rule.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort

Field Name	Details
	Description The label for the duplicate rule.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`sObjectType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of object the duplicate rule is defined for. For example, account, contact, or lead.

Usage

You can use the API to view a duplicate rule's details. To create, edit, or delete duplicate rules, use the UI.

Use DuplicateRule to get the sObject type.

DuplicateRule is unavailable in some orgs.

ElectronicMediaGroup

Represents the type of media that you can associate with a product or category.This object is available in API version 49.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You must have the B2B Commerce license and a CMS workspace to access a web store.

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The default value is `USD`.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Description of the store.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Name of the media group.
OwnerId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the owner of the ElectronicMediaGroup object. For external routing, allows the object to be used in the Streaming API to listen to events whenever a ElectronicMediaGroup record is created, modified, or deleted.
UsageType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Possible values are: • Attachment • Banner • Listing • Standard • Tile

ElectronicMediaUse

Represents the usage of media. This object is available in API version 49.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

You must have the B2B Commerce license and a CMS workspace to access a web store.

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The default value is `USD`. Possible values are: • `USD`—U.S. Dollar
`ElectronicMediaGroupId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the electronic media group.
`ElectronicMediaId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the electronic media.
`ImplementorType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The type of implementor. Available implementors of ElectronicMediaUse include: • ProductMedia • ProductCategoryMedia

Field	Details
`SortOrder`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The order that electronic media is displayed in.

EmailContent

Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

EmailContent is only available for orgs that use Pardot. The Manage Email Content user permission is required. Users also need the CRM User, Sales, or Service User permission set. EmailContent isn't available for custom portal or guest users.

Fields

Field	Details
`ClickThroughRate`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of visitors who click links contained in emails delivered (sent minus bounces) to them. Multiple clicks for a same link are counted.
`ClickToOpenRatio`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The number of unique clicks divided by unique HTML opens.

Field	Details
DeliveryRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of the emails that were delivered compared to the number that bounced (soft and hard). Note: this data includes emails that were delivered to the recipient's spam folder.
Description	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the email content, for example, Promotion Mass Mailing.
HtmlBody	**Type** textarea **Properties** Nillable **Description** The body of the email in HTML format. The field is read-only.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp that indicates when the current user last viewed the record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, the record could have been referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description Name of the email asset.
OpenRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of unique HTML opens compared to the total number of emails delivered (sent minus bounces).
OptOutRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of users that have opted out compared to the total number of emails sent.
SpamComplaintRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of spam complaints compared to the total number emails sent.
Subject	**Type** textarea **Properties** Create, Filter, Nillable, Update **Description** Content of the subject line.
TemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The Email Template field is mostly read-only. You can populate the Email Template field only during record create to prevent overwriting data on the email content record.
TextBody	**Type** textarea

Field	Details
	Properties Create, Nillable, Update **Description** The body of the email in plain text format. The character limit is 384, 000.
`TotalDelivered`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of emails minus hard and soft bounces. Note: this data includes emails that were delivered to the recipient's spam folder.
`TotalHardBounced`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** The total number of emails that permanently returned to the sender because the address is invalid. A hard bounce can occur because the domain name doesn't exist or because the recipient is unknown.
`TotalOpens`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** The total number of times a prospect's email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) do not display images by default. Pardot counts an open each time the images load.
`TotalSent`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The total number of list emails sent, including bounced, opted-out, and invalid To: addresses.
`TotalSoftBounced`	**Type** int

Field	Details
	Properties Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The total number of times a recipient's mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient's mailbox is full or the mail server is temporarily unavailable. After 5 soft bounces, Pardot opts the prospect out of emails.
`TotalSpamComplaints`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The total number of prospects that reported the email as spam.
`TotalTrackedLinkClicks`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The number of times prospects clicked a link in the email.
`UniqueClickThroughRate`	**Type** percent **Properties** Filter, Nillable, Sort **Description** Read-only field. The percentage of visitors who clicked a link contained in an email
`UniqueOpens`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The number of prospects who loaded the images in the HTML version of the email. The Unique Opens category counts each recipient only one time, even if the prospect loaded images more than once.
`UniqueOptOuts`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort

Field	Details
	Description Read-only field. The total number of prospects that have clicked the link to unsubscribe or opted out of all emails in the Email Preference Center. They are removed from future email sends.
`UniqueTrackedLinkClicks`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only field. The number of times a prospect clicked a link in the email. This metric doesn't include multiple clicks of the same link.

EmailDomainFilter

Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the "Email Administration," "Customize Application," and "View Setup" user permissions to use this object.

You must create an email relay in Setup or through the EmailRelay object before you can use the `EmailDomainFilter` object.

Fields

Field Name	Details
`EmailRelayId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the EmailRelay record.
`FromDomain`	**Type** textarea

Field Name	Details
	Properties Create, Nillable, Update **Description** Restricts the email relay to send emails based on the sender domains (`FromDomain`) listed in this field. This field is optional, accepts a list of comma-separated values, and supports the wildcard character.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the email domain filter is active (`true`) or not (`false`). Use this field to enable or disable the email domain filter.
`PriorityNumber`	**Type** int **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** Indicates the order in which the email domain filter is processed. Filters are evaluated in ascending order. The priority number must be unique. If this field is left blank, it is assigned the next available number and is processed last. Processing stops after the first matching filter is applied.
`ToDomain`	**Type** textarea **Properties** Create, Nillable, Update **Description** Restricts the email relay to send emails based on the recipient domains (`ToDomain`) listed in this field. This field is optional, accepts a list of comma-separated values, and supports the wildcard character.

Usage

Tip: If you also plan to activate Bounce Management and Email Compliance Management, confirm with your email admin that your company allows relaying email sent from Salesforce. For more information on bounce management, see Configure Deliverability Settings for Emails Sent from Salesforce.

EmailDomainKey

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

We've upgraded and replaced the original DKIM (DomainKeys Identified Mail) key feature, so that you can create a DKIM key with increased email security. For more information, see Setting Up More Secure DKIM Keys.

Fields

Field Name	Details
`AlternatePublicKey`	**Type** textarea **Properties** Nillable **Description** Read-only. Alternate public keys are used by Salesforce to auto-rotate domain keys. This field is available in API version 44.0 and later after activating the Critical Update.
`AlternateSelector`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The text used to distinguish the DKIM key from any other DKIM keys your organization uses for the specified domain. This field is available in API version 44.0 and later after activating the Critical Update.
`AlternateTxtRecordName`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description The alternate TXT record name is used to create the CNAME record. Refer to the Usage section for more information. This field is available in API version 44.0 and later after activating the Critical Update.
`Domain`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The organization's domain name that the DKIM key is generated for.
`DomainMatch`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The specificity of match required on the sending domain name before signing with this DKIM key. Valid values are: • `DomainOnly`—Sign if sending domain matches at the domain level only (example.com but not mail.example.com) • `SubdomainsOnly`—Sign if sending domain matches at the subdomain level only (mail.example.com but not example.com) • `DomainAndSubdomains`—Sign if sending domain matches at the domain and subdomain levels (example.com and mail.example.com)
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this DKIM key is active (`true`) or not (`false`).
`KeySize`	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort **Description** Indicates the RSA key size, in bits. The possible values are: • 1024

Field Name	Details
	• 2048 This field is available in API version 45.0 and later.
`PrivateKey`	**Type** textarea **Properties** Create, Nillable, Update **Description** Once you activate the Critical Update, this field is no longer visible. The private portion of the DKIM key pair used to encrypt mail headers from your domain. Salesforce generates an encrypted `PrivateKey` if you don't specify a value when creating the DKIM key. If you do specify a value, it must be an existing valid `PrivateKey` from another EmailDomainKey object. This field doesn't contain the actual private key, but a value that represents the key in our system. Therefore: • The actual private key can't be leaked. • You can't use the value to do your own email signing.
`PublicKey`	**Type** textarea **Properties** Create, Nillable, Update **Description** Part of the domain key pair that mail recipients retrieve to decrypt the DKIM header and verify your domain. Add the `PublicKey` value to your domain's DNS records before you start signing with this domain key.
`Selector`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Text used to distinguish the DKIM key from any other DKIM keys your organization uses for the specified domain.
`TxtRecordName`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description Read-only. The TXT record name is used to create the CNAME record. Refer to the Usage section for more information. This field is available in API version 44.0 and later after activating the Critical Update.
`TxtRecordsPublishState`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The possible values are: • Published • Publishing in progress • Publishing failed This field is available in API version 44.0 and later after activating the Critical Update.

Usage

Create DKIM Keys with Increased Security

1. If your Salesforce org was created before Winter '19, enable the Critical Update. From Setup, enter *`Critical Updates`* in the Quick Find box, and then select **Critical Updates**. For Enable Redesigned DomainKeys Identified Mail (DKIM) Key Feature with Increased Email Security, click **Activate**.
2. Insert `Domain`, `DomainMatch`, `Selector`, and `AlternateSelector`. Salesforce publishes your TXT record to DNS.
3. Retrieve the `TxtRecordName` and `AlternateTxtRecordName` and use them to create and publish the CNAME and Alternate CNAME record to your domain's DNS.
   a. Create CNAME record using: ***`<selector>`***`._domainkey.`***`<domain>`*** `IN CNAME` ***`txtRecordName`***.
   b. Create Alternate CNAME record using: ***`<alternateSelector>`***`._domainkey.`***`<domain>`*** `IN CNAME` ***`alternateTxtRecordName`***.
4. Set the `IsActive` field to true.

Create DKIM Keys (pre-Winter '19 Version)

Note: The critical update activates for everyone on October 15, 2019. After that date, this approach to creating DKIM keys will no longer be available.

When you create a DKIM key, Salesforce generates a public and private key pair. Publish the public key in the DNS.

For each domain key you create, we recommend this sequence:

1. Insert the `Domain`, `DomainMatch`, and `Selector`.
2. Update your domain's DNS records.
   a. Locate the DNS record at ***`selector`***`._domainkey.`***`domain`***. For example, `mail._domainkey.mail.example.com`.

b. Add the `PublicKey` value, like this: `V=DKIM1; p=`***`public_key`***.

DKIM Signing Outbound Email

a. In addition, you can optionally put the record in testing mode, which instructs recipients to not make decisions based on the email signature. Add parameter `t=y` to the DNS entry: `V=DKIM1; t=y; p=`***`public_key`***.

3. Update the key via the API or UI to be active.

EmailMessage

Represents an email in Salesforce.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

EmailMessage is only available for orgs that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

To use reply and forward functionality, `FromAddress` must specify an email address that exists in EmailMessageRelation, with a `RelationType` of `FromAddress`.

Customer Portal users have read access to EmailMessage if the value for the `ParentID` field is associated with a case. Otherwise, access is determined by sharing access of the associated task.

The `Status` field is mostly read-only. You can change the status only from *`New`* to *`Read`*.

`update()` is supported when an email record is in `Draft` status, and `IsPrivateDraft` is `false`. It is also supported if `Status` and `IsPrivateDraft` are `true` and `CreatedBy` is associated with the current user. When the email record status is not in `Draft` status, the `IsExternallyVisible` field and custom fields only can be updated.

Fields

Field	Details
`ActivityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the activity that is associated with the email. Usually represents an open task that is created for the case owner when a new unread email message is received.

Field	Details
	`ActivityId` can only be specified for emails on cases. It's auto-created for other entities.
`BccAddress`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** A string array of email addresses for recipients who were sent a blind carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the `BccIds` field instead of adding their email address to the `BccAddress` field. When adding their ID, the email message is automatically associated with the contact, lead, or user. For an Experience Cloud site user who is not the sender of the email, this field returns null. You can't send emails unless there's at least one recipient.
`BccIds`	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of IDs for contacts, leads, and users who were sent a blind carbon copy of the email message. Each ID is linked to an `EmailMessageRelation` record, which represents the relationship between an email message and a Contact, Lead, or User record. For an Experience Cloud site user who is not the sender of the email, this list is empty. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`CcAddress`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** A string array of email addresses for recipients who were sent a carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the `CcIds` field instead of adding their email address to the `CcAddress` field. Then the email message is automatically associated with the contact, lead, or user. You can't send emails unless there's at least one recipient.

Field	Details
CcIds	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of IDs for contacts, leads, and users who were sent a carbon copy of the email message. Each ID is linked to an EmailMessageRelation record, which represents the relationship between an email message and a Contact, Lead, or User record. Warning: Adding a JunctionIdList field name to the fieldsToNull property deletes all related junction records. This action can't be undone.
ContentDocumentIds	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of IDs for content documents, such as files and attachments, that are associated with an email. Each ID is linked to a ContentDocumentLink record, which represents the relationship between an email message and a content document record. Warning: Adding a JunctionIdList field name to the fieldsToNull property deletes all related junction records. This action can't be undone.
Division	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
EmailTemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The email template, if any, that was chosen for the email. This field is populated in Lightning Experience only.
`FirstOpenedDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date the email was first opened. Note: To see this field, enable email tracking in your org.
`FromAddress`	**Type** email **Properties** Create, Filter, Nillable, Sort, Update **Description** The address that originated the email. When using this field, specify an email address that exists in EmailMessageRelation, with a `RelationType` of `FromAddress`.
`FromName`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The sender's name. When using this field, specify an email address that exists in EmailMessageRelation, with a `RelationType` of `FromAddress`.
`HasAttachment`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the email was sent with an attachment (`true`) or not (`false`).
`Headers`	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description The Internet message headers of the incoming email. Used for debugging and tracing purposes. Does not apply to outgoing emails.
`HtmlBody`	**Type** textarea **Properties** Create, Nillable, Update **Description** The body of the email in HTML format. You can't send emails unless at least one of these fields has content. • Subject field • HTML Body or Text Body field As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields.
`Incoming`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether the email was received (`true`) or sent (`false`).
`IsBounced`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the email bounced. Note: To see this field, enable bounce management in your org.
`IsClientManaged`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** If EmailMessage is created with `IsClientManaged` set to true, users can modify `EmailMessage.ContentDocumentIds` to link file attachments even when the `Status` of the EmailMessage is not set to `Draft`.

Field	Details
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`IsExternallyVisible`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the Experience Cloud site case feed is enabled, `IsExternallyVisible` controls the external visibility of emails in sites. When `IsExternallyVisible` is set to `true`—its default value—email messages are visible to external users in the case feed. Only emails with the `ParentId` field populated are available to be externally visible in sites. This field can't be updated if the email's `Status` is set to `Draft`.
`IsOpened`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the email has been opened. Note: To see this field, enable email tracking in your org.
`IsPrivateDraft`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** If `IsPrivateDraft` is set to `true`, then only the `CreatedById` user can view, update, and send this email draft. If `IsPrivateDraft` is set to `false`, then any user with permissions to work on the case can see these drafts. Once the email is sent (Email Status = Draft), then this field is updated to be `false`. Public drafts are loaded and visible in Salesforce Classic while Private Drafts are only used in Lightning Experience.

Field	Details
IsTracked	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the email is being tracked. Note: To see this field, enable email tracking in your org.
LastOpenedDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date the email was last opened. Note: To see this field, enable email tracking in your org.
MessageDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date the email was created.
MessageIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The ID of the email message.
ParentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the case that's associated with the email.
RelatedToId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The `RelatedToId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. RelatedToIds are polymorphic. Polymorphic means a RelatedToId is equivalent to the ID of a related object.
`ReplyToEmailMessageId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the inbound or outbound email message the current email message is a reply to. It's not possible to reply to a message whose `Status` is `Draft`.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the email. The `Status` field is mostly read-only. You can change the status only from *`New`* to *`Read`*. Possible values are: • `0` (New) • `1` (Read) • `2` (Replied) • `3` (Sent) • `4` (Forwarded) • `5` (Draft) For emails not sent as part of a case, only the status `3` (Sent) is valid.
`Subject`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The subject line of the email. You can't send emails unless at least one of these fields has content. • Subject field

Field	Details
	• HTML Body or Text Body field As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields.
`TextBody`	**Type** textarea **Properties** Create, Nillable, Update **Description** The body of the email, in plain text format. If `TextBody` is not set, then it is extracted from `HtmlBody`. You can't send emails unless at least one of these fields has content. • Subject field • HTML Body or Text Body field As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields
`ThreadIdentifier`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The ID of the email thread the email message belongs to.
`ToAddress`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** A string array of email addresses for recipients who were sent the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the `ToIds` field instead of adding their email address to the `ToAddress` field. Then the email message is automatically associated with the contact, lead, or user. You can't send emails unless there's at least one recipient.
`ToId`	**Type** JunctionIdList **Properties** Create, Update

Field	Details
	Description A string array of IDs for contacts, leads, and users who were sent a carbon copy of the email message. Each ID is linked to an `EmailMessageRelation` record, which represents the relationship between an email message and a Contact, Lead, or User record. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`ValidatedFromAddress`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** A picklist value with either the sender's address, validated org-wide email addresses that originated the email, or Email-to-Case Routing Address. Note: `ValidatedFromAddress` isn't suitable for use in Group By or Sort By statements. Use `FromAddress`instead.

Usage

If your org uses Email-to-Case, a case is created when an email is sent to one of your company's addresses. The email, which is related to the case by the `ParentID` field, is stored as an EmailMessage record. When users view the email, they see the EmailMessage record.

If your org uses Enhanced Email, each email is stored as an EmailMessage record and a Task record. When users view an email, they see the EmailMessage record.

Sample Code—Apex

This sample logs email activity in Salesforce.

```
// if EnhancedEmail Perm is not enabled, continue logging the email as a task

// if EnhancedEmail Perm is enabled, create an EmailMessage object
EmailMessage emailMessage = new EmailMessage();
emailMessage.status = '3'; // email was sent
emailMessage.relatedToId = '006B0000003weZGIAY'; // related to record e.g. an opportunity
emailMessage.fromAddress = 'sender@example.com'; // from address
emailMessage.fromName = 'Dan Perkins'; // from name
emailMessage.subject = 'This is the Subject!'; // email subject
emailMessage.htmlBody = '<html><body><b>Hello</b></body></html>'; // email body
// Contact, Lead or User Ids of recipients
String[] toIds = new String[]{'003B000000AxcEjIAJ'};
emailMessage.toIds = toIds;
// additional recipients who don't have a corresponding contact, lead or user id in the
Salesforce org (optional)
```

```
emailMessage.toAddress = 'emailnotinsalesforce@toexample.com, anotherone@toexample.com';
insert emailMessage; // insert

// Add Email Message Relation for id of the sender
EmailMessageRelation emr = new EmailMessageRelation();
emr.emailMessageId = emailMessage.id;
emr.relationId = '005B0000003qHvOIAU'; // user id of the sender
emr.relationType = 'FromAddress';
insert emr;
```

Case

Object Basics

EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

Special Access Rules

EmailMessageRelation is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
`EmailMessageId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the `EmailMessage` record.
`RelationAddress`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort

Field Name	Details
	Description The email address of the sender or recipient. Note: If a record relates an email to an existing contact, lead, or user record in Salesforce, the value of `RelationAddress` is the current value of the email address. If the value is not set, it is auto-populated from `RelationId`.
`RelationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The `RecordId` of the sender or recipient. Note: If a record relates an email to an email address that's not associated with an existing contact, lead, or user record in Salesforce, the value of `RelationId` is null.
`RelationObjectType`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The API name of the object type of the `RecordId` in the `RelationId` field. It can be a contact, lead, or user.
`RelationType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of relationship the contact, lead, or user has with the email message. Possible values include: • `ToAddress` • `CcAddress` • `BccAddress` • `FromAddress` • `OtherAddress` For an Experience Cloud site user who is not the sender of the email, no `BccAddress` relations are returned.

Usage

EmailMessageRelation allows an email to be related to contacts, leads, and users.

EmailRelay

Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company's email servers. This object is available in API version 43.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You must have the "Email Administration," "Customize Application," and "View Setup" user permissions to use this object.

Fields

Field Name	Details
`Host`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Indicates the host name or IP address of your company's SMTP server.
`IsRequireAuth`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether (true) or not (false) authentication is required. When setting this field to true, the `TlsSetting` must be set to **`RequiredVerify`**. This field is available in API version 44.0 and later.
`Password`	**Type** encryptedstring **Properties** Create, Nillable, Update

Field Name	Details
	Description Specifies the password for relay host STMP authentication. When `IsRequireAuth` is set to true, this field is required. This field is available in API version 44.0 and later.
`Port`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates the port number of your company's SMTP server. • 25 • 587 • 10025 • 11025
`TlsSetting`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies whether Salesforce uses TLS for SMTP sessions. • `Off`: TLS is turned off. SMTP session continues through an insecure connection. • `Preferred`: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. If TLS is unavailable, Salesforce continues the session without TLS. • `Required`: Salesforce continues the session only if the remote server supports TLS. If TLS is unavailable, Salesforce terminates the session without delivering the email. • `PreferredVerify`: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. Before the session begins, Salesforce verifies that the certificate is signed by a valid certificate authority, and that the common name presented in the certificate matches the domain or mail exchange of the current connection. If TLS is available but the certificate is not signed or the common name does not match, Salesforce disconnects the session and does not deliver the email. If TLS is unavailable, Salesforce continues the session without TLS. • `RequiredVerify`: Salesforce continues the session only if the remote server supports TLS, the certificate is signed by a valid certificate authority, and the common name presented in the certificate matches the domain or

Field Name	Details
	mail exchange to which Salesforce is connected. If any of these criteria are not met, Salesforce terminates the session without delivering the email.
`Username`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies the username for relay host STMP authentication. When `IsRequireAuth` is set to true, this field is required. This field is available in API version 44.0 and later.

Usage

An email relay must be associated with an active email domain filter to take effect. If you set up multiple email relays in one org, they are processed in the priority order of their email domain filters.

Tip: If you also plan to activate Bounce Management and Email Compliance Management, confirm with your email admin that your company allows relaying email sent from Salesforce. For more information on bounce management, see Configure Deliverability Settings for Emails Sent from Salesforce.

SEE ALSO:

EmailServicesFunction

EmailDomainFilter

EmailServicesAddress

An email service address.

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
`AuthorizedSenders`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Configures the email service address to only accept messages from the email addresses or domains listed in this field. If the email service address receives a message from an unlisted email address or domain, the email service performs the action specified in the `AuthorizationFailureAction` field of its associated email service. Leave this field blank if you want the email service address to receive email from any email address.
`DeveloperName`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This 25-character field must be unique among other EmailServicesAddress records under the same EmailServiceFunction parent. In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance might be slow while Salesforce generates one for each record.
`EmailDomainName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A read only field you can query that contains the system-generated domain part of this email service address. The system generates a unique domain-part for each email service address to ensure that no two email service addresses are identical.
`FunctionId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The ID of the email service for which the email service address receives messages.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this object is active (true) or not (false).
`LocalPart`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The local-part of the email service address. The local-part of the address is the string that comes before the @ symbol. For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: `! # $ % & amp; ' * / = ? ^ _ + - ` { | } ~ ,` The dot character (.) is also valid as long as it's not the first or last character. Email addresses aren't case-sensitive.
`RunAsUserId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The username of the user whose permissions the email service assumes when processing messages sent to this address.

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

SEE ALSO:

EmailServicesFunction

EmailServicesFunction

An email service.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

Fields

Field	Details
`AddressInactiveAction`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates what the email service does with messages received at an email address that is inactive. One of the following values: • `UseSystemDefault`—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is `0`.) • `Bounce`—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `1`.) • `Discard`—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is `2`.) • `Requeue`—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `3`.)
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The ID of the Apex class that the email service uses to process inbound messages.

Field	Details
	This field is required for API version 12.0 and later.
AttachmentOption	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates the types of attachments the email service accepts. One of the following values: • `None`—The email service accepts the message but discards any attachment. (In API version 41.0 and earlier, the value specified for this choice is `0`.) • `NoContent`—The attachment metadata (filename, MIME type, and so on) is provided to the Apex class, but the body is set to `null`. There was no previous numeric value for this choice. • `TextOnly`—The email service only accepts the following types of attachments: – Attachments with a Multipurpose Internet Mail Extension (MIME) type of text. – Attachments with a MIME type of application/octet-stream and a file name that ends with either a .vcf or .vcs extension. These are saved as text/x-vcard and text/calendar MIME types, respectively. (In API version 41.0 and earlier, the value specified for this choice is `1`.) • `BinaryOnly`—The email service only accepts binary attachments, such as image, audio, application, and video files. (In API version 41.0 and earlier, the value specified for this choice is `2`.) • `All`—The email service accepts any type of attachment. (In API version 41.0 and earlier, the value specified for this choice is `3`.)
AuthenticationFailureAction	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates what the email service does with messages that fail or do not support any of the authentication protocols if the `IsAuthenticationRequired` field is true. One of the following values: • `UseSystemDefault`—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is `0`.) • `Bounce`—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `1`.) • `Discard`—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is `2`.) • `Requeue`—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message

Field	Details
	to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `3`.)
`AuthorizationFailureAction`	**Type** picklist **Properties** Defaulted on create, Group, Sort, Create, Filter, Nillable, Restricted picklist, Update **Description** Indicates what the email service does with messages received from senders who are not listed in the `AuthorizedSenders` field on either the email service or email service address. One of the following values: • `UseSystemDefault`—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is `0`.) • `Bounce`—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `1`.) • `Discard`—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is `2`.) • `Requeue`—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `3`.)
`AuthorizedSenders`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Configures the email service to only accept messages from the email addresses or domains listed in this field. If the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the `AuthorizationFailureAction` field. Leave this field blank if you want the email service to receive email from any email address.
`ErrorRoutingAddress`	**Type** email **Properties** Create, Filter, Nillable, Sort, Update **Description** The destination email address for error notification email messages when `IsErrorRoutingEnabled` is `true`.

Field	Details
FunctionInactiveAction	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates what the email service does with messages it receives when the email service itself is inactive. One of the following values: • UseSystemDefault—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.) • Bounce—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.) • Discard—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.) • Requeue—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)
FunctionName	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the email service.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this object is active (true) or not (false).
IsAuthenticationRequired	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Configures the email service to verify the legitimacy of the sending server before processing a message. The email service uses the SPF, SenderId, and DomainKeys protocols to verify the sender's legitimacy: If the sending server passes at least one of these protocols and does not

Field	Details
	fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the `AuthenticationFailureAction` field.
`IsErrorRoutingEnabled`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** When incoming email messages can't be processed, indicates whether error notification email messages are routed to a chosen address or to the senders.
`IsTextAttachmentsAsBinary`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, text attachments are supplied to the Apex code as a `Messaging.BinaryAttachment` instead of as a `Messaging.TextAttachment`. This means that the body is supplied as an Apex Blob instead of as an Apex String.
`IsTextTruncated`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** This field is deprecated. It is not available as of API version 23.0 and is deprecated and hidden in versions 17.0 through 22.0. In all API versions, the email service now accepts inbound email messages up to the 10 MB size limit, without truncating the text. Previously, it indicated whether the email service truncated and accepted email messages with HTML body text, plain body text, and text attachments over approximately 100,000 characters (`true`) or rejected these email messages and notified the sender (`false`).
`IsTlsRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Not currently in use.
`OverLimitAction`	**Type** picklist

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. One of the following values: • `UseSystemDefault`—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is `0`.) • `Bounce`—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `1`.) • `Discard`—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is `2`.) • `Requeue`—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is `3`.) The system calculates the limit by multiplying the number of user licenses by 1,000.

Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

SEE ALSO:

EmailServicesAddress

EmailStatus

Represents the status of email sent.

Supported Calls

`describeSObjects()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
EmailTemplateName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the EmailTemplate.
FirstOpenDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date when the email was first opened by recipient. Label is **Date Opened**.
LastOpenDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date when the email was last opened by recipient.
TaskId	**Type** reference **Properties** Filter, Group, Sort **Description** The activity (task or event) associated with the email. Label is **Activity ID**.
TimesOpened	**Type** int **Properties** Filter, Group, Sort **Description** Number of times the recipient opened the email.
WhoId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is `Name ID`.

SEE ALSO:

EmailTemplate

EmailTemplate

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

Note: You can't send a mass email using a Visualforce email template.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can't access this object.

Fields

Field	Details
`ApiVersion`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The API version for this class. Every class has an API version specified at creation.
`Body`	**Type** textarea **Properties** Create, Nillable, Update **Description** Content of the email. Limit: 384 KB.

Field	Details
BrandTemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. ID of the BrandTemplate associated with this email template. The brand template supplies letterhead information for the email template.
DeliveryRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** Read-only. The percentage of the emails that were delivered compared to the number that bounced (soft and hard). Note: this data includes emails that were delivered to the recipient's spam folder. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
Description	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the template, for example, Promotion Mass Mailing.
DeveloperName	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Template Unique Name**. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.

Field	Details
Encoding	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Character set encoding for the template.
EnhancedLetterheadId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the enhanced letterhead associated with the email template. Note: To use an enhanced letterhead, associate it with a Lightning email template that uses the HML merge language.
EntityType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, **Description** When `UIType` is `2` (Lightning Experience) or `3` (Lightning ExperienceSample), `EntityType` indicates which entities this template can be used with (for example, account or lead). Valid values are standard object ID prefixes: 001 for account, 003 for contact, 006 for opportunity, and 00Q for lead, 500 for case, and 701 for campaign. This field has been removed in API version 39.0. Use `RelatedEntityType` instead.
FolderId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the folder that contains the template.
FolderName	**Type** string **Properties** Filter, Nillable, Sort **Description** The name of the folder that contains the template.

Field	Details
HasSalesforceFiles	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the email template has attachments from Salesforce Files. The default value is false.
HtmlValue	**Type** textarea **Properties** Create, Nillable, Update **Description** This field contains the content of the email message, including HTML coding to render the email message. Limit: 384 KB.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates that this template is active if `true`, or inactive if `false`.
IsBuilderContent	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** If the email template was made in Email Template Builder. The default value is false.
LastUsedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when this EmailTemplate was last used.
Markup	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description The Visualforce markup, HTML, JavaScript, or any other Web-enabled code that defines the content of the template.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the template. Label is **Email Template Name**.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. This field cannot be accessed unless the logged-in user has the Customize Application permission.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the owner of the template.
`RelatedEntityType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** When `UIType` is `2` (Lightning Experience) or `3` (Lightning ExperienceSample), `RelatedEntityType` indicates which entities this template can be used with. Valid values are the entity API name: "Account" for account, "Contact" for contact, "Opportunity" for opportunity, "Lead" for lead, and so on. The value can be any entity the user has read access to (including custom entities) but not virtual entities, setup entities, or platform entities. No restrictions exist at the schema level.
`Subject`	**Type** string **Properties** Create, Group, Nillable, Sort, Update **Description** Content of the subject line.
`TemplateStyle`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Style of the template. Possible values are: • `formalLetter`—Formal Letter • `freeForm`—Free Form Letter • `newsletter`—Newsletter • `none`—No Email Layout • `products`—Products • `promotionLeft`—Promotion (Left) • `promotionRight`—Promotion (Right)
`TemplateType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Type of template. Possible values are: • `custom`—Custom

Field	Details
	• `html`—HTML • `text`—Text • `visualforce`—Visualforce
`TimesUsed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Number of times this template has been used.
`TotalDelivered`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Read-only. The total number of emails sent minus hard and soft bounces. Note: this data includes emails that were delivered to the recipient's spam folder. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
`TotalHardBounced`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only. The total number of emails that permanently bounced back to the sender because the address is invalid. A hard bounce can occur because the domain name doesn't exist or because the recipient is unknown. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
`TotalOpens`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort

Field	Details
	Description Read-only. The total number of times a prospect's email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) do not display images by default. Pardot counts an open each time the images load. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
`TotalSent`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Read-only. The total number of emails sent, including bounced, opted-out, and invalid To: addresses. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
`TotalSoftBounced`	**Type** int **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** Read-only. The total number of times a recipient's mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient's mailbox is full or the mail server is temporarily unavailable. A soft bounce message can sometimes be deliverable at another time. After 5 soft bounces, Pardot opts the prospect out of emails. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
`UIType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description Indicates the user interface where this template is usable. Possible values are: • `Aloha` • `SFX` • `SFX_Sample`—SFXSample

Usage

To retrieve this object, issue a describe call on an object, which returns a query result for each activity since the object was created. You can't query these records.

EmbeddedServiceDetail

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

Supported SOAP Calls

`describeSObjects()`, `query()`

Supported REST HTTP Methods

`GET`

Fields

Field	Details
`AvatarImg`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description URL of the image used as the agent avatar image.
`ContrastInvertedColor`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Accent branding color used in the embedded component, displayed as a hexadecimal value. Changes made to this field in the API aren't reflected in the embedded component.
`ContrastPrimaryColor`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Value of the `ContrastPrimaryColor` field in the EmbeddedServiceBranding setup object.
`CustomMinimizedComponent`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The custom Aura component that's used for the minimized state for this Embedded Chat deployment.
`CustomPrechatComponent`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The custom Aura component that's used for the pre-chat page for this Embedded Chat deployment.
`DurableId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Developer name for the EmbeddedServiceConfig.

Field	Details
FieldServiceConfirmCardImg	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the confirmation card in embedded Appointment Management (beta).
FieldServiceHomeImg	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the home screen in embedded Appointment Management (beta).
FieldServiceLogoImg	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the logo used for the home screen in embedded Appointment Management (beta).
Font	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Font used in the chat text of the Embedded Chat window.
FontSize	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Font size for the embedded component. Possible values are: • Small • Medium • Large

Field	Details
HeaderBackgroundImg	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the header background in Embedded Chat. This field is removed in API version 49.0 and later. The header background image is no longer supported.
Height	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Height of the embedded component.
IsFieldServiceEnabled	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether Field Service is enabled for this Embedded Service deployment (`true`) or not (`false`). Embedded Appointment Management is currently beta.
IsLiveAgentEnabled	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether Chat is enabled for this Embedded Service deployment (`true`) or not (`false`).
IsOfflineCaseEnabled	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether offline support is enabled for this Embedded Chat deployment (`true`) or not (`false`).
IsPrechatEnabled	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Value of the `PrechatEnabled` field in the EmbeddedServiceLiveAgent setup object.
`IsQueuePositionEnabled`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether queue position (displaying the customer's place in line while they wait for an agent) is enabled for this Embedded Chat deployment (`true`) or not (`false`).
`NavBarColor`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Value of the `NavBarColor` field in the EmbeddedServiceBranding setup object.
`NavBarTextColor`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field is used to set the text color for the header.
`OfflineCaseBackgroundImg`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the background for the offline support case form in Embedded Chat.
`PrechatBackgroundImg`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the background for the pre-chat form in Embedded Chat.

Field	Details
PrimaryColor	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Value of the `PrimaryColor` field in the EmbeddedServiceBranding setup object.
SecondaryColor	**Type** string **Properties** Filter, Group, Nillable Sort **Description** Value of the `SecondaryColor` field in the EmbeddedServiceBranding setup object.
SecondaryNavBarColor	**Type** string **Properties** Filter, Group, Nillable Sort **Description** This field is used to set the color of a secondary header.
ShouldHideAuthDialog	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the prompt that the customer log in again during a flow should be hidden (`true`) or not (`false`). When it's hidden, the customer is taken directly to your login page.
ShouldShowExistingAppointment	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether to display a button on the home screen for customers to access their existing appointments (`true`) or not (`false`) for embedded Appointment Management (beta).
ShouldShowNewAppointment	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field	Details
	Description Specifies whether to display a button on the home screen for customers to create a new appointment (`true`) or not (`false`) for embedded Appointment Management (beta).
`Site`	**Type** string **Properties** Filter, Group, Nillable Sort **Description** Value of the `Site` field in the EmbeddedServiceConfig setup object.
`SmallCompanyLogoImg`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the logo image used with Embedded Chat.
`WaitingStateBackgroundImg`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** URL of the image used for the background image in Embedded Chat while the customer waits to be connected with a support agent.
`Width`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Width of the embedded component.

Note: Any changes you make to the image fields override what you've entered in Setup. We recommend setting your image URLs in Setup.

Employee

Represents an employee within a company or organization. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()` `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

Fields

Field	Details
`AboutMe`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Information about the employee, such as areas of interest or skills. Values can be provided on Employee's profile page. This field is available even if Chatter is disabled.
`AlternateEmail`	**Type** email **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's alternate email address.
`Availability`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's availability status. Possible values are: • `In The Office` • `Out Of Office` • `Out Sick` • `PTO` • `Volunteering Time Off` • `Working Remotely`

Field	Details
AvailabilityEndDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The end date of the Employee's availability, inclusive of the date.
AvailabilityStartDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The start date of the Employee's availability, inclusive of the date.
BannerPhotoUrl	**Type** url **Properties** Filter, Nillable, Sort **Description** Read only. The URL for the employee's banner photo. Available in API v51.0 and later.
CurrentWellnessStatus	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's current wellness status. Possible values are: • Available To Work • Remote Work Only • Unavailable • Unknown
DateOfBirth	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's date of birth.

Field	Details
Email	**Type** email **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The employee’s email address. This field is unique within your organization.
EmployeeNumber	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The employee's employment ID for the organization they were hired into. This field is unique within your organization.
EmployeeStatus	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** Required. The employee's current work status. Possible values are: • Active • Inactive • Leave • Terminated
EmploymentType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's full-time or part-time status. Possible values are: • Full-Time • Part-Time
FirstName	**Type** string

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** Required. The employee's first name.
FullPhotoUrl	**Type** url **Properties** Filter, Nillable, Sort **Description** Read only. The URL for the employee's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo isn't guaranteed to return a photo. Query this field for the URL of the most recent photo. Available in API v51.0 and later.
Gender	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's gender. Possible values are: • Female • Male • Non-Binary / Non-Conforming • Other • Prefer Not to State • Transgender Female • Transgender Male
HomeAddress	**Type** address **Properties** Filter, Nillable **Description** The employee's home address.
HomeCity	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The city for the employee’s home address.
HomeCountry	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The county for the employee’s home address.
HomeGeocodeAccuracy	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The level of accuracy of an employee’s home address geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address’s latitude and longitude coordinates. Possible values are: • Address • Block • City • County • ExtendedZip • NearAddress • Neighborhood • State • Street • Unknown • Zip
HomeLatitude	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Used with HomeLongitude to specify the precise geolocation of the employee’s home address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places.
HomeLongitude	**Type** double

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Used with HomeLatitude to specify the precise geolocation of the employee's home address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places.
HomePhone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's home phone number.
HomePostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code for the employee's home address.
HomeState	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The state for the employee's home address.
HomeStreet	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street for the employee's home address.
IndividualId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A reference to the Individual record that this employee is assigned to.

Field	Details
InternalOrganizationUnitId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A reference to the InternalOrganizationUnit this employee is assigned to.
JobProfile	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's job profile at the company.
LastName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The employee's last name.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
LocationId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description A reference to the Location that this employee is assigned to.
`ManagerId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A reference to the Employee record of the employee's manager.
`MediumPhotoUrl`	**Type** url **Properties** Filter, Nillable, Sort **Description** Read only. The URL for the medium-sized employee's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo isn't guaranteed to return a photo. Query this field for the URL of the most recent photo. Available in API v51.0 and later.
`MiddleName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's middle name.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** A compound field of `Employee.FirstName`, `Employee.MiddleName`, and `Employee.LastName`.
`NameSuffix`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's suffix.

Field	Details
`OutOfOfficeMessage`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The message portion of the employee availability. This message can provide reasons or details about the change in availability. The maximum length of this string is 40 characters.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.
`PreferredFirstName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name the employee prefers to be called.
`PreferredPronoun`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's preferred pronoun. Possible values are: • `He/Him/His` • `Other/Ask Me` • `She/Her/Hers` • `They/Them/Theirs`
`RelatedPersonId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Links an employee to a person account with a unique value. Reserved for future use. Don't edit it.
SmallPhotoUrl	**Type** url **Properties** Filter, Nillable, Sort **Description** Read only. The URL for the small-sized employee's profile photo. The URL is updated every time a photo is uploaded and reflects the most recent photo. If a newer photo has been uploaded, the URL returned for an older photo isn't guaranteed to return a photo. Query this field for the URL of the most recent photo. Available in API v51.0 and later.
StatusAsOf	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Required. Start date of the employee's current status.
StatusEndDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Planned end date for the employee's status.
TimeZone	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time zone which the employee's work hours fall within.
UserId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Lookup field to associate an Employee record with a user in the org. The field is optional and unique.

Field	Details
WorkPhone	**Type** phone **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's formatted work phone number including country code and extension.
WorkerType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The type of worker for the employee. Possible values are: • Alumnus • Contractor • Employee • Intern • Temporary
WorkingHoursEnd	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The end time of the employee's working hours.
WorkingHoursStart	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The start time of the employee's working hours.

Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as this object.

EmployeeHistory (API version 49.0)
History is available for tracked fields of the object.

EmployeeOwnerSharingRule

Sharing rules are available for the object.

EmployeesShare (API version 49.0)

Sharing is available for the object.

SEE ALSO:

Workplace Command Center for Work.com Developer Guide: Extend Work.com with Custom Solutions

EmployeeCrisisAssessment

Represents a crisis assessment of an Employee. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

For Work.com, when an employee responds to a wellness survey, an EmployeeCrisisAssessment record is created based on an employee's answers.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

Fields

Field	Details
`Assessment`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The employee's COVID-19 status at the time of the assessment. Possible values are: • `COVID-19 Immune or Recovered` • `COVID-19 No Symptoms` • `COVID-19 Symptoms or Exposed` • `COVID-19 Test Negative` • `COVID-19 Test Positive` • `Declined`

Field	Details
AssessmentDate	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date of the assessment. Required
AssessmentNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The assessment record number.
CrisisId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The Crisis that this assessment is associated with.
EmployeeId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The Employee that this assessment is associated with.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.
`SourceAssessment`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record in the source system that drove this assessment.
`SourceSystem`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The source system that drove this assessment.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

EmployeeCrisisAssessmentHistory (API version 49.0)
History is available for tracked fields of the object.

EmployeeCrisisAssessmentOwnerSharingRule
Sharing rules are available for the object.

EmployeeCrisisAssessmentShare (API version 49.0)
Sharing is available for the object.

Workplace Command Center for Work.com Developer Guide: Extend Work.com with Custom Solutions

EngagementChannelType

Represents a channel through which a customer can be reached for communication. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ContactPointType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The contact point type of the channel. Possible values are: • `Email` • `MailingAddress` • `Phone` • `Social` • `Web`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of the communication subscription consent record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account owner associated with this customer.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

EngagementChannelTypeFeed
Feed tracking is available for the object.

EngagementChannelTypeHistory
History is available for tracked fields of the object.

EngagementChannelTypeOwnerSharingRule
Sharing rules are available for the object.

EngagementChannelTypeShare
Sharing is available for the object.

EmbeddedServiceLabel

Represents a customized label in Embedded Chat or embedded Appointment Management.This object is available in API version 44.0 and later.

Supported SOAP Calls

`describeSObjects()`, `query()`

Supported REST HTTP Methods

`GET`

Fields

Field	Details
CustomLabelName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The developer name for the custom label.
DurableId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The unique name containing `EmbeddedServiceConfig.labelKey`.
EmbeddedServiceConfigDeveloperName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Developer name for the EmbeddedServiceConfig.
LabelKey	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of label for this embedded component. The value corresponds to the label within a label group (substate of chat state or page type).

EnhancedLetterhead

Represents an enhanced letterhead that can be associated with a Lightning email template that doesn't use the Salesforce Merge Language (SML). This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description of the contents of the header and footer.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when this enhanced letterhead was last used.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when this enhanced letterhead was last viewed.
LetterheadFooter	**Type** textarea **Properties** Create, Nillable, Update **Description** The contents of the enhanced letterhead's footer.
LetterheadHeader	**Type** textarea **Properties** Create, Nillable, Update **Description** The contents of the enhanced letterhead's header.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description The name of the enhanced letterhead, such as Standard Company Letterhead.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

EnhancedLetterheadFeed
Feed tracking is available for the object.

Entitlement

Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Account associated with the entitlement.
`AssetId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Required. ID of the Asset associated with the entitlement. Must be a valid asset ID.
`BusinessHoursId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description Required. ID of the BusinessHours associated with the entitlement. Must be a valid business hours ID.
CasesPerEntitlement	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of cases the entitlement supports. This field is only available if `IsPerIncident` is `true`.
ContractLineItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Required. ID of the ContractLineItem associated with the entitlement. Must be a valid ID.
EndDate	**Type** date **Properties** Create, Filter, Nillable, Update **Description** The last day the entitlement is in effect.
IsPerIncident	**Type** boolean **Properties** Defaulted on create, Filter, Update **Description** Indicates whether the entitlement is limited to supporting a specific number of cases (`true`) or not (`false`).
LastReferencedDate	**Type** date **Properties** Filter, Nillable, Sort, Update **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.

Field	Details
LastViewedDate	**Type** date **Properties** Filter, Nillable, Sort, Update **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (`LastReferencedDate`) but not viewed it.
Name	**Type** string **Properties** Create, Filter, Update **Description** Required. Name of the entitlement.
SvcApptBookingWindowsId	**Type** reference **Properties** Create, Filter, Group, Sort, Nillable, Update **Description** The operating hours that the entitlement's work orders should respect. The label in the user interface is `Operating Hours`. Available only if Field Service is enabled.
RemainingCases	**Type** int **Properties** Create, Filter, Nillable, Update **Description** The number of cases the entitlement can support. This field decreases in value by one each time a case is created with the entitlement. This field is only available if `IsPerIncident` is selected.
RemainingWorkOrders	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of agreed work orders remaining to be created.
ServiceContractId	**Type** reference

Field	Details
	Properties Create, Filter, Nillable, Update **Description** Required. ID of the ServiceContract associated with the entitlement. Must be a valid ID.
`SlaProcessId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the SlaProcess associated with the entitlement. This field is available in version 19.0 and later.
`StartDate`	**Type** date **Properties** Create, Filter, Nillable, Update **Description** The first date the entitlement is in effect.
`Status`	**Type** picklist **Properties** Filter, Nillable **Description** Status of the entitlement, such as `Expired`.
`SvcApptBookingWindows`	**Type** reference **Properties** Create, Filter, Group, Sort, Nillable, Update **Description** The operating hours of the entitlement. This field is visible only if Field Service is enabled.
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Nillable, Update **Description** The type of entitlement, such as Web or phone support.

Field	Details
WorkOrdersPerEntitlement	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Total number of work orders available for this entitlement.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

EntitlementFeed (API version 23.0)
Feed tracking is available for the object.

EntitlementHistory
History is available for tracked fields of the object.

SEE ALSO:
EntitlementContact
SlaProcess

EntitlementContact

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

Fields

Field	Details
ContactId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Contact associated with the entitlement. Must be a valid ID.

Field	Details
EntitlementId	**Type** reference **Properties** Create, Filter **Description** Required. ID of the Entitlement associated with the entitlement contact. Must be a valid ID.
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Nillable **Description** Required. Name of the entitlement contact.

Usage

Use to query and manage entitlement contacts.

SEE ALSO:

Entitlement

EntitlementTemplate

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

As of Summer '20 and later, only Salesforce admins, users with access to the Case, Entitlement, or Work Order objects, and users with the View Setup and Configuration permission can access this object.

Fields

Field	Details
`BusinessHoursId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the BusinessHours associated with the entitlement template. Must be a valid business hours ID.
`CasesPerEntitlement`	**Type** int **Properties** Create, Filter, Nillable, Update **Description** The total number of cases the entitlement template supports. This field is only available if `IsPerIncident` is `true`.
`IsPerIncident`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Update **Description** Indicates whether the entitlement template is limited to supporting a specific number of cases (`true`) or not (`false`).
`Name`	**Type** string **Properties** Create, Filter, idLookup, Update **Description** Required. Name of the entitlement template.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation. The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. Available in version 34.0 and later.
`SlaProcessId`	**Type** reference **Properties** Create, Filter, Nillable, Update **Description** ID of the SlaProcess associated with the entitlement template. This field is available in API version 19.0 and later.
`Term`	**Type** int **Properties** Create, Defaulted on create, Filter, Nillable, Update **Description** Number of days that the entitlement template is valid.
`Type`	**Type** picklist **Properties** Create, Filter, Nillable, Update **Description** The type of entitlement template, such as Web or phone support.

Usage

Use this object to manage entitlement templates.

EntityHistory

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific Historyobjects instead.

Supported Calls

`describeSObjects()`, `getUpdated()`, `getDeleted()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Fields

Field	Details
`FieldName`	**Type** picklist **Properties** Filter, Restricted picklist **Description** ID of the standard or custom field.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`NewValue`	**Type** anyType **Properties** Nillable **Description** New value of the modified field.
`OldValue`	**Type** anyType **Properties** Nillable **Description** Previous value of the modified field.

Field	Details
`ParentId`	**Type** reference **Properties** Filter **Description** ID of the object that contains the field.
`ParentSobjectType`	**Type** picklist **Properties** Filter, Restricted picklist **Description** The kind of object that contains the field.

Usage

In API version 7.0 and later, this object works with Case, Contract, and Solution objects:

- This object is always read-only in the online application.
- When a field is modified, this object records both the old and new field values. There are exceptions to this behavior for certain fields such as long text areas and multi-select picklists. These fields appear in this object to indicate that the field was changed, but the old and new values are not recorded.
- Two rows are added to this object when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, "Jane Doe" is recorded as the name of a contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.
- Up to a total of twenty fields (standard or custom) can be tracked for a given object.
- In the online application, you can specify which fields are tracked or not tracked at any time.
- As soon as tracking is turned on for a field, all changes to its value are recorded in the database.
- Turning off tracking for a field stops further changes from being recorded, but the history data is not deleted.
- Be advised that deleting a custom field also permanently deletes the history data for that custom field.

EntityMilestone

Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

Note: Milestones on cases use the CaseMilestone object type.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Special Access Rules

- As of Summer '20 and later, only Salesforce admins, users with access to the Case, Entitlement, or Work Order objects, and users with the View Setup and Configuration permission can access this object.
- Entitlement management must be enabled.
- Work orders or Field Service must be enabled.

Fields

Field Name	Details
`ActualElapsedTimeInDays`	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of days that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time) Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.
`ActualElapsedTimeInHrs`	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of hours that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time) Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.
`ActualElapsedTimeInMins`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of minutes that it took to complete a milestone. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time) Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.

Field Name	Details
BusinessHoursId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The business hours on the milestone. If business hours aren't specified, the entitlement process business hours are used. If business hours are also not specified on the entitlement process, the business hours on the record are used.
CompletionDate	**Type** dateTime **Properties** Filter, Nillable, Sort, Update **Description** The date and time the milestone was completed.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
ElapsedTimeInDays	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of days it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).
ElapsedTimeInHrs	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of hours it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the

Field Name	Details
	business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).
`ElapsedTimeInMins`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of minutes it took to complete a milestone, including time during which the milestone was stopped. Automatically calculated to include the business hours on the record. Elapsed time is calculated only after the Completion Date field is populated. (Elapsed Time) – (Stopped Time) = (Actual Elapsed Time).
`IsCompleted`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Icon ( ) that indicates a milestone completion.
`IsViolated`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Icon ( ) that indicates a milestone violation.
`MilestoneTypeId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the milestone (for instance, First Response).
`Name`	**Type** string **Properties** Filter, Group, Sort, Update **Description** The name of the milestone.

Field Name	Details
ParentEntityId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the record—for example, a work order—that contains the milestone.
SlaProcessId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The entitlement process associated with the milestone.
StartDate	**Type** dateTime **Properties** Filter, Nillable, Sort, Update **Description** The date and time that milestone tracking started.
StoppedTimeInDays	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of days that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information. Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.
StoppedTimeInHrs	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of hours that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information.

Field Name	Details
	Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.
`StoppedTimeInMins`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of minutes that an agent has been blocked from completing a milestone. For example, an agent may be waiting for a customer to reply with more information. Note: To display this field, select **Enable stopped time and actual elapsed time** on the Entitlement Settings page and add the field to the object milestone page layout.
`TargetDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time to complete the milestone.
`TargetResponseInDays`	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of days to complete the milestone. Automatically calculated to include the business hours on the record.
`TargetResponseInHrs`	**Type** double **Properties** Filter, Nillable, Sort **Description** The number of hours to complete the milestone. Automatically calculated to include the business hours on the record.
`TargetResponseInMins`	**Type** int

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of minutes to complete the milestone. Automatically calculated to include the business hours on the record.
`TimeRemainingInDays`	**Type** string **Properties** Filter, Nillable, Sort **Description** The days that remain before a milestone violation. Automatically calculated to include the business hours on the record.
`TimeRemainingInHrs`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The hours that remain before a milestone violation. Automatically calculated to include the business hours on the record.
`TimeRemainingInMins`	**Type** string **Properties** Group, Nillable, Sort **Description** The minutes that remain before a milestone violation. Automatically calculated to include the business hours on the record.
`TimeSinceTargetInDays`	**Type** string **Properties** Filter, Nillable, Sort **Description** The days that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.
`TimeSinceTargetInHrs`	**Type** string **Properties** Filter, Nillable, Sort

Field Name	Details
	Description The hours that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.
`TimeSinceTargetInMins`	**Type** string **Properties** Group, Nillable, Sort **Description** The minutes that have elapsed since a milestone violation. Automatically calculated to include the business hours on the record.

Usage

When you create an entitlement process, you select its type based on the type of record that you want the process to run on: Case or Work Order. Processes created before Summer '16 use the Case type. When a Work Order entitlement process runs on a work order, the resulting milestones on the work order are object milestones. Conversely, when a Case entitlement process runs on a case, the resulting milestones are case milestones, a separate standard object.

Tip: If an entitlement has an entitlement process associated with it, don't use the entitlement for multiple types of support records. An entitlement process works only on records that match the process's type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with that entitlement. If a work order is also associated with the entitlement, the process doesn't run on the work order. To ensure that the milestones you set up work as expected, associate a customer's work orders and cases with different entitlements.

Customize page layouts, validation rules, and more for object milestones from the Object Milestones node in Setup under Entitlement Management.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

EntityMilestoneFeed
Feed tracking is available for the object.

EntityMilestoneHistory
History is available for tracked fields of the object.

EntitySubscription

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`NetworkId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the Experience Cloud site where the user is following the record or user. This field is available in API version 26.0 and later, if digital experiences is enabled for your org.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the record or user which the user is following.
`SubscriberId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the user who is following the record or user.

Usage

Consider this when following records and users:

- Users can only follow records that they can see.
- Users can see which records other users are following, unless they don't have access to the records.
- Administrators and users with the "Modify All Users" permission can configure a user to follow records that the user has read access to.
- Administrators and users with the "Modify All Users" permission can configure users to stop following records.
- Following topics is available in API version 29.0 and later. For this reason, a topic ID is now a supported value for the `ParentId` field.
- If you deactivate a user, any EntitySubscription where the user is associated with the ParentId or SubscriberId field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you

deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can't be restored upon user reactivation.

When using `query()` with EntitySubscription,

- Note the following SOQL restriction. No SOQL limit if logged-in user has "View All Data" permission. If not, specify a LIMIT clause of 1,000 records or fewer.
- A query using a `WHERE` clause can only filter by fields on the EntitySubscription object.
- If user sharing is enabled and the querying user is not an administrator, a SOQL query must be constrained either by the `ParentId` or `SubscriberId`. Otherwise, the query behavior at run time is undefined, meaning the result set can be incomplete or inconsistent from invocation to invocation. For an unconstrained query, the sharing check limits imposed on a non-adminstrative user are likely to be exceeded before the query completes, because access checks are run against both parent and subject, for each row of the result set. We recommend using the Connect REST API to query EntitySubscription data instead of running a SOQL query.
- Users without the "View All Data" permission
  - Need read access on the object associated with the `ParentId` field to see which users are following records for the object.
  - Can use an `ORDER BY` clause in a query only to order by fields on the EntitySubscription object. For example, if the subscription relates to an Account record, the query can `ORDER BY ParentId`, but it can't `ORDER BY Account.Name`.
  - Don't always get all matching subscriptions when running a query. For these users, a query evaluates visibility criteria on a maximum of 500 records to reduce the prospect of long-running queries. If a user runs a query to see the CEO's subscriptions, it might scan a large number of records. The query only returns matches within the first 500 records scanned. It is possible that there are more subscriptions that are visible to the user, but they are not returned. To mitigate this, we recommend using a `WHERE` clause, if possible, to reduce the scope of the query.

Sample—SOQL

The following SOQL query returns subscriptions for all the accounts that a subscriber is following that have more than 10 employees:

```
SELECT Id
FROM EntitySubscription
WHERE SubscriberId = '005U0000000Rg2CIAS'
AND ParentId IN (
  SELECT Id FROM Account
  WHERE NumberOfEmployees > 10
)
LIMIT 200
```

SEE ALSO:

Custom Object__Feed

EnvironmentHubMember

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

Note: You can only create 20 member orgs per day. If you need to create additional orgs, log a case in the Partner Community.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Fields

Field Name	Details
`Description`	**Type** textarea **Properties** Nillable, Update **Description** A brief description of this org.
`DisplayName`	**Type** string **Properties** Filter, Group, Nillable,Sort, Update **Description** The name that the user has specified for this member org.
`EnvironmentHubId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The Org ID of this member's Environment Hub org.
`Instance`	**Type** String **Properties** Filter, Group, Nillable, Sort **Description** Name of the instance where the Environment Hub member org resides.
`IsFedIdSsoMatchAllowed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if single sign-on has been enabled based on matching Federation ID. The default value is `false`.

Field Name	Details
IsSandbox	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if the member org is a sandbox (`true`) or not (`false`). This field is available in API version 36.0 and later.
MemberEntity	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The unique Org ID of the member org for this record.
MemberType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of member org for this record. Possible values include `Branch Org`, `Patch Org`, `Release Org`, `Sandbox Org`, `Trialforce Management Org`, and `Trialforce Source Org`. Note: Only one member type at a time is stored. Member type is determined according to this hierarchy: (1) Sandbox, (2) Release, (3) Trialforce Source Org (TSO), (4) Patch, (5) Branch, and (6) Trialforce Management Org (TMO). For example, if an org is both a sandbox and a TMO, the value of `MemberType` is `Sandbox Org`.
Name	**Type** string **Properties** Defaulted on create, Filter, idLookup, Sort **Description** The name of the member org for this record.
OrgEdition	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The org’s edition, for example, Enterprise Edition or Unlimited Edition.

Field Name	Details
OrgStatus	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The licensing or creation status of this org. Possible values include `Active`, `Demo`, `Deleted`, `Free`, `Inactive`, and `Trial`.
Origin	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The method by which this org was added to the Environment Hub. Possible values are `autoDiscovered`, `userAdded`, and `provisioned`.
SSOMappedUsers	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of mapped users in this member org. This field is available in API version 36.0 and later.
ServiceProviderId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the service provider for this member org. This field is available in API version 36.0 and later.
ShouldAddRelatedOrgs	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Status of the connection of related orgs to the hub. Possible values are `done`, `notRequested`, `pending`, and `requested`.
ShouldEnableSSO	**Type** boolean

Field Name	Details
	Properties Defaulted on create, Filter, Group, Sort, Update **Description** If SSO should be enabled when this member org is added. The default value is `false`.
`SsoStatus`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** If single sign-on has been enabled for this org. Possible values are: • `Enabled`—Single sign-on is enabled. • `Disabled`—Single sign-on is disabled. • `Pending`—Single sign-on is in the process of being enabled. • `Failed`—Single sign-on enablement failed. Contact Salesforce support for assistance.
`SsoUsernameFormula`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The custom formula for matching users in the hub and member orgs.

Usage

Use this object to access and modify settings of member orgs in the Environment Hub.

Event

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

Note:

- An EventRelation object can't be related to a child event, and child events don't include the invitee related list.
- `query()`, `delete()`, and `update()` aren't allowed with events related to more than one contact in API versions 25.0 and earlier.
- `create()` and `update()` aren't available for read-only fields on Lightning Experience event series.
- `upsert()` and `undelete()` aren't supported for syncing changes made to events through the API using the feature Lightning Sync.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AcceptedEventInviteeIds`	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact or lead IDs who accepted this event. This `JunctionIdList` is linked to the `AcceptedEventRelation` child relationship. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Represents the ID of the related account. The `AccountId` is determined as follows. If the value of `WhatId` is any of the following objects, then Salesforce uses that object's `AccountId`. • Account • Opportunity • Contract • Custom object that is a child of Account If the value of the `WhatId` field is any other object, and the value of the `WhoId` field is a contact object, then Salesforce uses that contact's `AccountId`. (If your org uses Shared Activities, Salesforce uses the `AccountId` of the primary contact.) Otherwise, Salesforce sets the value of the `AccountId` field to `null`. For information on IDs, see ID Field Type.
`ActivityDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Contains the event's due date if the `IsAllDayEvent` flag is set to `true`. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences. Label is **Due Date Only**. This field is required in versions 12.0 and earlier if the `IsAllDayEvent` flag is set to `true`. The value for this field and `StartDateTime` must match, or one of them must be `null`.
`ActivityDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Contains the event's due date if the `IsAllDayEvent` flag is set to `false`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is **Due Date Time**. This field is required in versions 12.0 and earlier if the `IsAllDayEvent` flag is set to `false`. The value for this field and `StartDateTime` must match, or one of them must be `null`.
`ClientGuid`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The client globally unique identifier identifies the external API client used to create the event. Label is **Client GUID**.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`DeclinedEventInviteeIds`	**Type** JunctionIdLIst **Properties** Create, Update

Field	Details
	Description A string array of contact, lead, or user IDs who declined this event. This `JunctionIdList` is linked to the `DeclinedEventRelation` child relationship. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Contains a text description of the event. Limit: 32,000 characters.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
`DurationInMinutes`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the event length, in minutes. Even though this field represents a temporal value, it's an integer type—not a Date/Time type. Required in versions 12.0 and earlier if `IsAllDayEvent` is false. In versions 13.0 and later, this field is optional, depending on the following: • If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day. • If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can't access event objects whose `DurationInMinutes` is greater than 1440. For more information, see **Multiday Events**.

Field	Details
	Depending on your API version, errors with the `DurationInMinutes` and `EndDateTime` fields may appear in different places. • Versions 38.0 and before—Errors always appear in the `DurationInMinutes` field. • Versions 39.0 and later—If there's no value for the `DurationInMinutes` field, errors appear in the `EndDateTime` field. Otherwise, they appear in the `DurationInMinutes` field.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Read-only. Available in versions 46.0 and later. This field supplies the date value that appears in the EndDateTime field. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone.
`EndDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Available in versions 13.0 and later. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. This field is optional, depending on the following: • If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day. • If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. Depending on your API version, errors with the `DurationInMinutes` and `EndDateTime` fields may appear in different places. • Versions 38.0 and before—Errors always appear in the `DurationInMinutes` field. • Versions 39.0 and later—If there's no value for the `DurationInMinutes` field, errors appear in the `EndDateTime` field. Otherwise, they appear in the `DurationInMinutes` field.
`EventSubtype`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description Provides standard subtypes to facilitate creating and searching for events. This field isn't updateable.
EventWhoIds	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact or lead IDs used to create many-to-many relationships with a shared event. `EventWhoIds` is available when the shared activities setting is enabled. The first contact or lead ID in the list becomes the primary `WhoId` if you don't specify a primary `WhoId`. If you set the `EventWhoIds` field to null, all entries in the list are deleted and the value of `WhoId` is added as the first entry. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
GroupEventType	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Read-only. Available in API versions 19.0 and later. The possible values are: • `0` (Non–group event)—An event with no invitees. • `1` (Group event)—An event with invitees. • `2` (Proposed event)—An event created when a user requests a meeting with a contact, lead, or person account using the Salesforce user interface. When the user confirms the meeting, the proposed event becomes a group event. You can't create, edit, or delete proposed events in the API. This value is no longer used in API version 41.0 and later. • `3` (IsRecurrence2 Series Pattern)—An event representing an event series recurrence pattern in Lightning Experience.
IsAllDayEvent	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the `ActivityDate` field (`true`) or the `ActivityDateTime` field (`false`) is used to define the date or time of the event. Label is **All-Day Event**. See also `DurationInMinutes` and `EndDateTime`.

Field	Details
IsArchived	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event has been archived.
IsChild	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is a child of another event (`true`) or not (`false`). For a child event, you can update `IsReminderSet` and `ReminderDateTime` only. You can query and delete a child event. If the objects related to the child event are different from those objects related to the parent event (this difference is possible if you use API version 25.0 or earlier) and one of the objects related to the child event is deleted, the objects related to the parent event are updated to ensure data integrity.
IsClientManaged	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is managed by an external client. If the value of this field is false, the event isn't owned or managed by an external client, and Salesforce can be used to update it. If the value is true, Salesforce can be used to change only noncritical fields on the event. Label is **Is Client Managed**.
IsGroupEvent	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is a group event—that is, whether it has invitees (`true`) or not (`false`).
IsPrivate	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates whether users other than the creator of the event can (`false`) or can't (`true`) see the event details when viewing the event user's calendar. However, users with the View All Data or Modify All Data permission can see private events in reports and searches, or when viewing other users' calendars. Private events can't be associated with opportunities, accounts, cases, campaigns, contracts, leads, or contacts. Label is **Private**.
`IsRecurrence`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether a Salesforce Classic event is scheduled to repeat itself (`true`) or only occurs one time (`false`). This field is read-only when updating records, but not when creating them. If this field value is `true`, then `RecurrenceEndDateOnly`, `RecurrenceStartDateTime`, `RecurrenceType`, and any recurrence fields associated with the given recurrence type must be populated. Label is **Create recurring series of events**.
`IsRecurrence2`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read-only. This field available in API version 44.0 and later. Indicates whether a Lightning Experience event is scheduled to repeat (`true`) or only occurs one time (`false)`. If this field value is true, then `Recurrence2PatternText` and `Recurrence2PatternVersion` must be populated. Label is **Repeat**.
`IsRecurrence2Exception`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read-only. This field available in API version 44.0 and later. Indicates whether an individual event in a Lightning Experience event series has a recurrence pattern that's different from the rest of the series, making it an exception.
`IsRecurrence2Exclusion`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field	Details
	Description Read-only. This field available in API version 44.0 and later. Indicates when updates to a Lightning Experience event series recurrence pattern have been made, but affect future event occurrences only. For past event occurrences, `IsRecurrence2Exclusion` is set to `true`, excluding past occurrences from the series recurrence pattern.
`IsReminderSet`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the activity is a reminder (`true`) or not (`false`).
`IsVisibleInSelfService`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether an event associated with an object can be viewed in the Customer Portal (`true`) or not (`false`). If your org has enabled digital experiences, events marked `IsVisibleInSelfService` are visible to any external user in the Experience Cloud site, as long as the user has access to the record the event was created on. This field is available when • Customer Portal or partner portal are enabled OR • Digital experiences is enabled and you have Customer Portal or partner portal licenses
`Location`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the location of the event.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Contains the ID of the user or public calendar who owns the event. Label is **Assigned to ID**.

Field	Details
`Recurrence2PatternStartDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Read-only. This field available in API version 44.0 and later. Indicates the date and time when the Lightning Experience event series begins. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.
`Recurrence2PatternText`	**Type** textarea **Properties** Nillable **Description** Read-only. This field available in API version 44.0 and later. Indicates the recurrence pattern for Lightning Experience event series. `Recurrence2PatternText` is implemented with RFC 5545 standard specifications for internet calendaring and scheduling. See Event Series section in this topic for usage examples. This field has a maximum length of 512 characters.
`Recurrence2PatternTimeZone`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field available in API version 44.0 and later. Indicates the time zone in which the Lightning Experience event series was created or updated. This field uses standard Java TimeZone IDs. For example, America/Los_Angeles.
`Recurrence2PatternVersion`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, **Description** Read-only. This field available in API version 44.0 and later. Indicates the standard specifications for Lightning Experience event series recurrence patterns. The only possible value is `1` (RFC 5545 v4 RRULE)—RFC 5545 is a standard set of specifications for internet calendaring and scheduling that `IsRecurrence2` adheres to for series recurrence patterns. RFC 5545 specifications for series recurrence patterns are called rrules. For examples of rrule usage, see the Event Series section in this topic.

Field	Details
`RecurrenceActivityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Read-only. Not required on create. Contains the ID of the main record of the Salesforce Classic recurring event. Subsequent occurrences have the same value in this field.
`RecurrenceDayOfMonth`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the day of the month on which the event repeats.
`RecurrenceDayOfWeekMask`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the day or days of the week on which the Salesforce Classic recurring event repeats. This field contains a bitmask. The values are as follows: • Sunday = `1` • Monday = `2` • Tuesday = `4` • Wednesday = `8` • Thursday = `16` • Friday = `32` • Saturday = `64` Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.
`RecurrenceEndDateOnly`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the last date on which the event repeats. For multiday Salesforce Classic recurring events, this date is the day on which the last occurrence starts. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences.

Field	Details
RecurrenceInstance	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the frequency of the Salesforce Classic event's recurrence. For example, `2nd` or `3rd`.
RecurrenceInterval	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the interval between Salesforce Classic recurring events.
RecurrenceMonthOfYear	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the month in which the Salesforce Classic recurring event repeats.
RecurrenceStartDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date and time when the Salesforce Classic recurring event begins. The value must precede the `RecurrenceEndDateOnly`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.
RecurrenceTimeZoneSidKey	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the time zone associated with a Salesforce Classic recurring event. For example, "UTC-8:00" for Pacific Standard Time.
RecurrenceType	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates how often the Salesforce Classic event repeats. For example, daily, weekly, or every nth month (where “nth” is defined in `RecurrenceInstance`).
`ReminderDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the time when the reminder is scheduled to fire, if `IsReminderSet` is set to `true`. If `IsReminderSet` is set to `false`, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.
`ShowAs`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates how this event appears when another user views the calendar: Busy, Out of Office, or Free. Label is **Show Time As**.
`StartDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the start date and time of the event. Available in versions 13.0 and later. If the Event `IsAllDayEvent` flag is set to true (indicating that it’s an all-day Event), then the event start date information is contained in the `StartDateTime` field. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. If the Event `IsAllDayEvent` flag is set to false (indicating that it isn’t an all-day event), then the event start date information is contained in the `StartDateTime` field. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. You need to translate the time portion to or from a local time zone for the user or the application, as appropriate. If this field has a value, then `ActivityDate` and `ActivityDateTime` must either be `null` or match the value of this field.

Field	Details
Subject	**Type** combobox **Properties** Create, Filter, Nillable, Sort, Update **Description** The subject line of the event, such as Call, Email, or Meeting. Limit: 255 characters.
Type	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the event type, such as Call, Email, or Meeting.
UndecidedEventInviteeIds	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact, lead, or user IDs who are undecided about this event. This `JunctionIdList` is linked to the `UndecidedEventRelation` child relationship. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
WhatCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Available if your organization has enabled Shared Activities. Represents the count of related EventRelations pertaining to the `WhatId`. The count of the `WhatId` must be *1* or less.
WhatId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The `WhatId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. `WhatId`s are polymorphic. Polymorphic means a `WhatId` is equivalent to the ID of a related object. The label is `Related To ID`.

Field	Details
`WhoCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Available to organizations that have Shared Activities enabled. Represents the count of related EventRelations pertaining to the `WhoId`.
`WhoId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is `Name ID`. If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is `Name ID`. If the `JunctionIdList` field is used, all `WhoIds` are included in the relationship list. Beginning in API version 37.0, if the contact or lead ID in the `WhoId` field isn't in the `EventWhoIds` list, no error occurs and the ID is added to the `EventWhoIds` as the primary `WhoId`. If `WhoId` is set to null, an arbitrary ID from the existing `EventWhoIds` list is promoted to the primary position.

Usage

Use Event to manage calendar appointments.

Querying and Filtering Events

Queries on events are denied before they time out if they involve amounts of data that are deemed too large. In such cases, the exception code `OPERATION_TOO_LARGE` is returned. If you receive `OPERATION_TOO_LARGE`, refactor your query to return or scan a smaller amount of data.

When querying for events with a specific due date, you must filter on both the `ActivityDateTime` and `ActivityDate` fields. For example to find all events with a due date of February 14, 2003, you need two filters:

- One filter with the `ActivityDate` field equal to the Coordinated Universal Time (UTC) time zone on February 14, 2003.
- One filter with the `ActivityDateTime` field greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

Alternatively, in version 13.0 and later, you can find events with a specific due date by filtering on `StartDateTime`. For example, to find all events with a due date of February 14, 2003, filter with the `StartDateTime` greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

The `EventId` field of an EventRelation object always points to the master record. An invitee on a group event can query the EventRelation object to view the master record.

Multiday Events

- Multiday events are available in version 13.0 and later. Also, in earlier versions SOQL queries don't return multiday events.
- Multiday events are enabled through the user interface from Setup by entering *`Activity Settings`* in the `Quick Find` box, then selecting **Activity Settings**.
- If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can't access event objects whose `DurationInMinutes` is greater than 1440.
- Multiday events can't exceed 14 days.

Event Series and Recurring Events

In Lightning Experience, events with multiple occurrences are called event series, and are indicated when the `IsRecurrence2` field is set to `true`. In Salesforce Classic, events with multiple occurrences are called recurring events, and are indicated when the `IsRecurrence` field is set to `true`. Both fields can't be set to true for the same event.

- Lightning Experience event series are available in API version 44.0 and later as read-only fields. Salesforce Classic recurring events are available in version 7.0 and later. In earlier versions, SOQL queries don't return any Lightning Experience event series.
- After an event is created, you can't change the values of `IsRecurrence2` or `IsRecurrence` from `true` to `false` or vice versa.
- You can't set fields associated with `IsRecurrence2` for events where `IsRecurrence` is set to `true`, or vice versa.
- For Lightning Experience event series where `IsRecurrence2` is `true`, if you'd like to delete a single or all remaining events, use the REST API call. For Salesforce Classic recurring events where `IsRecurrence` is `true`, all past and future events in the series are removed when you delete the recurring event series through the API. However, when you delete the recurring event series through the user interface, only future occurrences are removed.
- When creating a Salesforce Classic recurring event series, the duration of the event must be 24 hours or less. When the Salesforce Classic recurring event series is created, you can extend the length of individual occurrences beyond 24 hours if Multiday events are enabled; see **Multiday Events**.
- For Salesforce Classic recurring events, `RecurrenceStartDateTime`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the Recurrence Field Usage for Salesforce Classic Recurring Events table) must be populated.
- When updating a Salesforce Classic recurring event series, it's not possible to update the EventRelation for the event series object and the EventRelation for the series object occurrences at the same time.
- Lightning Experience event series have no series ID, so it's not possible to locate other occurrences in the series. In Salesforce Classic recurring events, you can use `RecurrenceActivityId` to locate other occurrences.
- For both Lightning Experience event series and Salesforce Classic recurring events, when a series repeats every day, month, or year, you can only schedule occurrences one time per day, month, or year. The every week option lets you schedule occurrences multiple days per week.

Limits for Lightning Experience event series and limits for Salesforce Classic recurring events also apply.

Recurrence patterns for Lightning Experience event series adhere to RFC 5545 standard specifications for internet calendaring and scheduling. RFC 5545 specifications for series recurrence patterns are called rrules. This table includes common rrule examples. Refer to RFC 5545 standards for additional specifications.

Recurrence Pattern	Rrule Example
Every day for 5 days	`RRULE:FREQ=DAILY;INTERVAL=1;COUNT=5`

Recurrence Pattern	Rrule Example
Every Monday, Tuesday, Wednesday, Thursday, and Friday with no end date	`RRULE:FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,TU,WE,TH,FR`
Every 2 weeks on Monday and Friday for 10 occurrences	`RRULE:FREQ=WEEKLY;INTERVAL=2;BYDAY=MO,FR;WKST=SU;COUNT=10`
Monthly on the 1st of the month until January 1, 2020	`RRULE:FREQ=MONTHLY;INTERVAL=1;BYMONTHDAY=1;UNTIL=20200101T190000Z`
Yearly on July 1st for 3 occurrences (in this example, specify the date using StartDateTime)	`RRULE:FREQ=YEARLY;INTERVAL=1;BYMONTH=1;COUNT=3`

This table describes the usage of recurrence fields for Salesforce Classic recurring events. Each recurrence type must have all of its properties set. All unused properties must be set to null.

RecurrenceType Value	Properties	Example Pattern
RecursDaily	RecurrenceInterval	Every second day
RecursEveryWeekday	RecurrenceDayOfWeekMask	Every weekday - can't be Saturday or Sunday
RecursMonthly	RecurrenceDayOfMonth RecurrenceInterval	Every second month, on the third day of the month
RecursMonthlyNth	RecurrenceInterval RecurrenceInstance RecurrenceDayOfWeekMask	Every second month, on the last Friday of the month
RecursWeekly	RecurrenceInterval RecurrenceDayOfWeekMask	Every three weeks on Wednesday and Friday
RecursYearly	RecurrenceDayOfMonth RecurrenceMonthOfYear	Every March on the twenty-sixth day of the month
RecursYearlyNth	RecurrenceDayOfWeekMask RecurrenceInstanceRecurrenceMonthOfYear	The first Saturday in every October

Attendees, Invitees, and Resources

The field `GroupEventType` indicates that event participants are included on an event. You can add a resource to an event only when the resource is available. The only attendance status that can be assigned to resources is Accepted. Events can't be saved when resources you've added aren't available.

JunctionIdList

To create an event using `JunctionIdList`, IDs are pulled from the related contacts and both the event and the `EventRelation` records are created in one API call. If the `EventRelation` fails, the event is rolled back because it's all done in a single API call.

```
public void createEventNew(Contact[] contacts) {
 String[] contactIds = new String[contacts.size()];
 for (int i = 0; i < contacts.size(); i++) {
  contactIds[i] = contacts[i].getID();
 }
 Event event = new Event();
 event.setSubject("New Event");
 event.setEventWhoIds(contactIds);
```

```
 SaveResult[] results = null;
 try {
  results = connection.create(new Event[] {
   task
  });
 } catch (ConnectionException ce) {
  ce.printStackTrace();
 }
}
```

Syncing Events with Lightning Sync

Attendee statuses (Accepted or Maybe, Declined, or No Response) sync from Microsoft® Exchange or Google to Salesforce, but not from Salesforce to Exchange or Google. Be wary of creating API flows that update attendee status in Salesforce for users set up to sync both ways. Eventually the original Exchange or Google status overrides the update made in Salesforce.

Associated Objects

This object has the following associated objects. Unless otherwise noted, they're available in the same API version as this object.

EventFeed (API version 20.0)
Feed tracking is available for the object.

Archived Activities

Object Basics

EventLogFile

Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org's operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The `Interval` and `Sequence` fields are available only in API version 37.0 and later.

You can interact with event monitoring data by querying fields on the EventLogFile object (like `EventType` and `LogDate`). `CreatedDate` tracks when the log file was generated. To view the underlying event data, query the `LogFile` field. The `EventType` determines the schema of this field. For more information, see EventLogFile Supported Event Types.

Note: Log data schema for each `EventType` can change. With each new release, use the `LogFileFieldNames` and `LogFileFieldTypes` fields to validate the schema changes. In the unlikely case in which no log files are generated for 24 hours, contact Salesforce Customer Support.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Special Access Rules

Accessing this object requires View Event Log Files and API Enabled user permissions. Users with View All Data permission can view event log files.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field	Details
`ApiVersion`	**Type** double **Properties** Filter, Sort **Description** The specific API version for this log file. This field is available in API version 30.0 and later.
`EventType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The event type—API, Login, Report, URI, and so forth. Use to determine which files were generated for your org. For the corresponding `LogFile` schema, see EventLogFile Supported Event Types.
`Interval`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The generation schedule for the event log file. Possible values are: • `Daily` • `Hourly` This field is available in API version 37.0 and later.
`LogDate`	**Type** dateTime **Properties** Filter, Sort **Description** The date and time of the log file's creation. For daily event log files, tracks usage activity for a 24-hour period, from 12:00 a.m. to 11:59 p.m. UTC time. For hourly event log files, indicates the hour in which the log file was generated. For example, for events that occur between 11:00 AM and 12:00 PM on 3/7/2016, this field's value is 2016-03-07T11:00:00.000Z. Note: For hourly event log files, we recommend using `CreatedDate` to query the date and time that an EventLogFile object was created.

Field	Details
LogFile	**Type** base64 **Description** Encoded file data in .csv format. The EventType field defines the schema for this data.
LogFileContentType	**Type** string **Properties** Filter, Group, Sort **Description** The content type of the log file; always .csv.
LogFileFieldNames	**Type** string **Properties** Nillable **Description** The ordered list of fields in the log file data. Note: LogFileFieldNames and LogFileFieldTypes are specific to each EventType. For example, LogFileFieldNames has a different value for an API EventType and a Login EventType.
LogFileFieldTypes	**Type** string **Properties** Nillable **Description** The ordered list of field types in the log file data (String, Id, and so forth). Note: LogFileFieldNames and LogFileFieldTypes are specific to each EventType. For example, LogFileFieldTypes has a different value for an API EventType and a Login EventType.
LogFileLength	**Type** double **Properties** Filter, Sort **Description** The log file length in bytes. You can use this field to plan storage needs for your log files.
Sequence	**Type** int

Field	Details
	Properties Filter, Group, Sort **Description** The number for the portion of the event log file data captured in an hour. For 24-hour event log file generation, the value of this field is 0. For hourly event log files, the initial value is 1. This value increases by 1 when events are added in the same hour after the latest event log file is created. The value resets to 1 in the subsequent hour. For example, you have activity between 2:00 and 3:00 PM. Two-log files are generated that contain the event log data for that hour, with `Sequence` values of 1 and 2. For event log data that occurs at 3:01 PM, the `Sequence` value resets to 1. This field is available in API version 37.0 and later.

EventLogFile Supported Event Types
The `EventType` field in the EventLogFile object supports these events. Some common fields, such as `CPU_TIME` and `RUN_TIME`, can have null or zero values depending on how the events are generated for a given feature. Sometimes, three quotation marks appear around event data containing special characters in the CSV file. The third quotation mark is necessary for tools and applications to parse the field data at the correct field value boundary.

EventLogFile Supported Event Types

The `EventType` field in the EventLogFile object supports these events. Some common fields, such as `CPU_TIME` and `RUN_TIME`, can have null or zero values depending on how the events are generated for a given feature. Sometimes, three quotation marks appear around event data containing special characters in the CSV file. The third quotation mark is necessary for tools and applications to parse the field data at the correct field value boundary.

We generate some text messages in quotes, as in "example message". To preserve the original value, we add two more quotes and the final value looks like """example message""" in the CSV file.

Note: The Insecure External Assets, Login, and Logout events are available in supported Salesforce editions at no additional cost. Contact Salesforce to purchase the remaining event types.

Apex Callout Event Type
Apex Callout events contain details about callouts (external requests) during Apex code execution.

Apex Execution Event Type
Apex Execution events contain details about Apex classes that are used.

Apex REST API Event Type
Apex REST API events capture information about every Apex REST API request.

Apex SOAP Event Type
Apex SOAP events contain details about Web Services API calls.

Apex Trigger Event Type
Apex Trigger events contain details about triggers that fire in an organization.

Apex Unexpected Exception Event Type
The Apex Unexpected Exception event type captures information about unexpected exceptions in Apex code execution. This event type is available in the EventLogFile object in API version 45.0 and later.

API Event Type

API events contain details about your organization's web services API activity.

Asynchronous Report Run Event Type

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

Aura Request Event Type

Aura Request events contain details of requests to Apex methods from Aura and Lightning web components. For example, you can benchmark request time or identify the URI of an unsuccessful request.

Bulk API Event Type

Bulk API events contain details about Bulk API requests.

Change Set Operation Event Type

Change Set Operation events contain information from change set migrations.

Concurrent Long-Running Apex Limit Event Type

Concurrent Long-Running Apex Limit events contain information about long-running concurrent Apex requests in your org that Salesforce terminated after reaching your org's concurrency limit. Requests with an established Apex context that execute for 5 seconds are counted towards your org's limit of concurrent long-running requests. (Asynchronous requests don't count towards the limit.) When there are more than 10 long-running requests (org default limit), additional long-running requests are terminated. This event type is available in the EventLogFile object in API version 45.0 and later.

Console Event Type

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

Content Distribution Event Type

Content Distribution events contain information about content distributions and deliveries to users.

Content Document Link Event Type

Content Document Link events contain sharing information for content documents.

Content Transfer Event Type

Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews. This information includes events performed on files and attachments to records.

Continuation Callout Summary Event Type

Continuation Callout Summary events contain information about all of the asynchronous callouts performed during a transaction, their response status codes, execution times, and URL endpoint destinations. This event type is available in the EventLogFile object in API version 43.0 and later.

Dashboard Event Type

Dashboard events contain details about dashboards that users view.

Document Attachment Downloads Event Type

Document Attachment Downloads events contain details of document and attachment downloads.

External Cross-Org Callout Event Type

External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

External Custom Apex Callout Event Type

External Custom Apex Callout events represent external data callouts via custom adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

External OData Callout Event Type

External OData Callout events represent external data callouts via the OData 2.0 and OData 4.0 adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

Insecure External Assets Event Type

Insecure External Assets events contain information about external assets. External assets include images or videos accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain assets hosted insecurely on third-party sites that users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. The `INSECURE_URI` field contains the URI being used to load the asset insecurely. The Insecure External Assets event type is available in the EventLogFile object in API version 42.0 and later.

Knowledge Article View Event Type

Knowledge Article View events contain user activity with your knowledge base.

Lightning Error Event Type

Lightning Error events represent errors that occurred during user interactions with Lightning Experience and the Salesforce mobile app. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Interaction Event Type

Lightning Interaction events track user actions in Lightning Experience and the Salesforce mobile app, such as the user clicking, tapping, or scrolling on a page. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Page View Event Type

Lightning Page View events represent information about the page on which the event occurred in Lightning Experience and the Salesforce mobile app. A Lightning Page View event tracks the page a user visited, how long the user spent on the page, and the load time for the page. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Performance Event Type

Lightning Performance events track trends in Lightning Experience and Salesforce mobile app performance. This event type is available in the EventLogFile object in API version 39.0 and later.

Login Event Type

Login events contain details about your org's user login history.

Login As Event Type

Login As events contain details about what a Salesforce admin did while logged in as another user.

Logout Event Type

Logout events contain details of user logouts.

Metadata API Operation Event Type

Metadata API Operation events contain details of Metadata API retrieval and deployment requests.

Multiblock Report Event Type

Multiblock Report events contain details about Joined Report reports.

One Commerce Usage Event Type

One Commerce Usage events capture information about your Commerce instance. This event type is available in the EventLogFile object in API version 51.0 and later.

Package Install Event Type

Package Install events contain details about package installation in the organization.

Platform Encryption Event Type

Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

Queued Execution Event Type

Queued Execution events contain details about queued executions—for example, batch Apex.

Report Event Type

Report events contain information about what happened when a user ran a report. This event type includes all activity that's in the Report Export event type, plus more. For example, it has user activity for reports exported as both Formatted Report and Details Only output.

Report Export Event Type

Report Export events contain details about reports that a user exported. For example, this event type captures when a user exports a report as Details Only output. But it doesn't capture reports that users export as Formatted Report output. For that data, see the Report event type.

REST API Event Type

REST API events contain details about REST-specific requests.

Sandbox Event Type

Sandbox events contain details about sandbox copies.

Search Event Type

Search events contain details about the user's search query. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won't have a unique Salesforce user ID.

Search Click Event Type

Search Click events contain details about the user's interaction with the search results. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won't have a unique Salesforce user ID.

Sites Event Type

Sites events contain details of Site.com requests. Requests can originate from the browser (UI).

Time-Based Workflow Event Type

Time-Based Workflow events contain details about queue activity monitoring.

Transaction Security Event Type

Transaction Security events contain details about policy execution.

URI Event Type

URI events contain details about user interaction with the web browser UI.

Visualforce Request Event Type

Visualforce Request events contain details of Visualforce requests. Requests can originate from the browser (UI).

Wave Change Event Type

Wave Change events represent route or page changes made in the Salesforce Einstein Analytics user interface. A Wave Change event type is captured every time the user opens a new Analytics asset or tab or switches between tabs. Wave Change events are logged when opening new tabs and switching back to previously opened tabs.

Wave Download Event Type

Wave Download events represent downloads made from lens explorations and dashboard widgets in the Salesforce Einstein Analytics user interface. A Wave Download event type is captured when a user downloads images (.png), Microsoft® Excel® data (.xls), or comma-separated values (.csv) files.

Wave Interaction Event Type

Wave Interaction events represent route or page changes made in the Salesforce Einstein Analytics user interface. A Wave Interaction event type is captured when a tab is closed. It also collates the interaction statistics over the life of the tab, including total open time, read time, and so on. These statistics are aggregated as you go to other tabs and return, and logged only once when the tab is closed.

Wave Performance Event Type
Wave Performance events help you track trends in your Analytics performance.

EventLogFile

Apex Callout Event Type

Apex Callout events contain details about callouts (external requests) during Apex code execution.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `ApexCallout`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.

`METHOD`	**Type** String **Description** The HTTP method of the callout. **Example** For example: `GET`, `POST`, `PUT`, and so on.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`REQUEST_SIZE`	**Type** Number **Description** The size of the callout request body, in bytes.
`RESPONSE_SIZE`	**Type** Number **Description** The size of the callout response, in bytes.
`RUN_TIME`	**Type** Number **Description** Not used for this event type. Use the `TIME` field instead.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

	For example: `d7DEq/ANa7nNZZVD`.
`SUCCESS`	**Type** Boolean **Description** 1 if the request was successful, and 0 if not.
`TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds (ms).
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TYPE`	**Type** String **Description** The type of Apex callout. For example: `REST` or `AJAX`.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.

`URL`	**Type** String **Description** The callout endpoint URL. **Example** `www.salesforce.com`
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Apex Execution Event Type

Apex Execution events contain details about Apex classes that are used.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CALLOUT_TIME`	**Type** Number **Description** Time spent waiting on webservice callouts, in milliseconds.
`CLIENT_IP`	**Type** String

	Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". If the user's session context isn't available, this field returns a blank value.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_TOTAL_TIME`	**Type** Number **Description** Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`ENTRY_POINT`	**Type** String **Description** The entry point for this Apex execution. **Example** • `GeneralCloner.cloneAndInsertRecords` • `VF- /apex/CloneUser`
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `ApexExecution`.
`EXEC_TIME`	**Type** Number **Description** The end-to-end Apex execution time (in milliseconds).
`IS_LONG_RUNNING_REQUEST`	**Type** Boolean

Field	Details
	Description Indicates whether the request is counted against your org's concurrent long-running Apex request limit (`true`) or not (`false`). Note: Asynchronous Apex jobs (batch, queueable, scheduled, and future), background processes, and bulk API requests are not counted against the concurrent long-running limit.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`NUMBER_SOQL_QUERIES`	**Type** Number **Description** The number of SOQL queries that were executed during the event. This value is the aggregate across all namespaces, and can exceed the per-namespace limits. For test executions, the aggregate total value across all test methods executed in the request is used. If you are using this value to track limit consumption, consider filtering out test execution quiddities (indicated by the QUIDDITY field).
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`QUIDDITY`	**Type** String **Description** The type of outer execution associated with this event. **Example** • `A`–ACS Batch Apex • `B`–Bulk API and Bulk API 2.0

- BA–Start method of a Batch Apex job
- C–Scheduled Apex
- E–Inbound Email Service
- F–Future
- H–Apex REST
- I–Invocable Action
- K–Quick Action
- L–Lightning
- M–Remote Action
- Q–Queueable
- QTXF–Transaction Finalizer for Queueable
- R–Synchronous uncategorized (which is where all transactions not specified elsewhere end up)
- S–QueryLocator Batch Apex (Batch Apex jobs run faster when the start method returns a QueryLocator object that doesn't include related records via a subquery. See Batch Apex Best Practices in Using Batch Apex.)
- TA–Tests Async
- TD–Tests Deployment
- TS–Tests Synchronous
- V–Visualforce
- W–SOAP Webservices
- X–Execute Anonymous

Note: Implementations of the Process.Plugin interface use the quiddity value **R**.

REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds. Requests with a value over five seconds are considered long-running requests for the purposes of the Concurrent Long-Running Apex Limit.

	Note: HTTP callout processing time isn't included when calculating the 5-second limit. We pause the timer for the callout and resume it when the callout completes.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API.

Field	Details
	For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.

EventLogFile

Apex REST API Event Type

Apex REST API events capture information about every Apex REST API request.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide. For information about Apex REST, see Introduction to Apex REST.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_BLOCKS`	**Type** Number

	Description Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
DB_CPU_TIME	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and DB_CPU_TIME. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.
ENTITY_NAME	**Type** Set **Description** API objects that are accessed. For example: Account, Opportunity, Contact, and so on.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always ApexRestApi.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.
MEDIA_TYPE	**Type** String

	Description The media type of the response.
`METHOD`	**Type** String **Description** The HTTP method of the request. For example: `GET`, `POST`, `PUT`, and so on.
`NUMBER_FIELDS`	**Type** Number **Description** The number of fields or columns, where applicable.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_SIZE`	**Type** Number **Description** The size of the callout request body, in bytes.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.

- `N`—Not Found. 404 error.

Possible Values

`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RESPONSE_SIZE`	**Type** Number **Description** The size of the callout response, in bytes.
`ROWS_PROCESSED`	**Type** Number **Description** The number of rows that were processed in the request. For example: `150`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`STATUS_CODE`	**Type** Number **Description** The HTTP status code for the response.
`TIMESTAMP`	**Type** String

	Description The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_AGENT`	**Type** Number **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API).
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

	For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Apex SOAP Event Type

Apex SOAP events contain details about Web Services API calls.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLASS_NAME`	**Type** String **Description** The Apex class name. If the class is part of a managed package, this string includes the package namespace.
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CLIENT_NAME`	**Type** String **Description** The name of the client that's using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn't specify a client in the CallOptions header.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

DB_TOTAL_TIME	**Type** Number **Description** Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always ApexSoap.
LIMIT_USAGE_PERCENT	**Type** Number **Description** The percentage of Apex SOAP calls that were made against the organization's limit.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.
METHOD_NAME	**Type** String **Description** The name of the calling Apex method.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
QUERY	**Type** String **Description** The SOQL query, if one was performed.

REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds. Requests with a value over five seconds are considered long-running requests for the purposes of the Concurrent Long-Running Apex Limit. Note: HTTP callout processing time isn't included when calculating the 5-second limit. We pause the timer for the callout and resume it when the callout completes.
SESSION_KEY	**Type** String

Field	Details
	Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id

Field	Details
	Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_TOTAL_TIME`	**Type** Number **Description** Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`ENTITY_NAME`	**Type** String

	Description The name of the object affected by the trigger.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `ApexTrigger`.
`EXEC_TIME`	**Type** Number **Description** The end-to-end Apex execution time (in milliseconds).
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are:

	• `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • `N`—Not Found. 404 error. **Possible Values**
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds. Requests with a value over five seconds are considered long-running requests for the purposes of the Concurrent Long-Running Apex Limit. Note: HTTP callout processing time isn't included when calculating the 5-second limit. We pause the timer for the callout and resume it when the callout completes.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`).

	For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TRIGGER_ID`	**Type** String **Description** The 15-character ID of the trigger that was fired.
`TRIGGER_NAME`	**Type** String **Description** For triggers coming from managed packages, `TRIGGER_NAME` includes a namespace prefix separated with a `.` character. If no namespace prefix is present, the trigger is from an unmanaged trigger. Examples: • `examplePackage.managedExampleTrigger`- Managed trigger from the examplePackage namespace • `unmanagedExampleTrigger` - Unmanaged trigger
`TRIGGER_TYPE`	**Type** String **Description** The type of this trigger. **Possible Values** • AfterInsert • AfterUpdate • BeforeInsert • BeforeUpdate
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Apex Unexpected Exception Event Type

The Apex Unexpected Exception event type captures information about unexpected exceptions in Apex code execution. This event type is available in the EventLogFile object in API version 45.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `ApexUnexpectedException`.
EXCEPTION_MESSAGE	**Type** Text **Description** The type of exception. **Example** Divide by 0
EXCEPTION_TYPE	**Type** String

Field	Details
	Description The type of exception. **Example** System.MathException
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.

STACK_TRACE	**Type**
	Text
	Description
	The stack trace for the exception.
	Note: If the exception is thrown from a managed package, STACK_TRACE is omitted.
	Example
	`Class.OpportunityUtility.insert: line 22, column 1`
	`AnonymousBlock: line 1, column 1`

TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).

Field	Details
	For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.

EventLogFile Supported Event Types

EventLogFile

API Event Type

API events contain details about your organization's web services API activity.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`API_TYPE`	**Type** String **Description** The type of API request. Possible values are: • `D`—Apex Class • `E`—SOAP Enterprise • `I`—SOAP Cross Instance • `M`—SOAP Metadata • `O`—Old SOAP • `P`—SOAP Partner • `S`—SOAP Apex • `T`—SOAP Tooling • `X`—XmlRPC • `f`—Feed • `l`—Live Agent • `p`—SOAP ClientSync
`API_VERSION`	**Type** String **Description** The version of the API that's being used. For example: `36.0`.

`CLIENT_IP`	**Type** String **Description** The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: `96.43.144.26`.
`CLIENT_NAME`	**Type** String **Description** The name of the client that’s using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn't specify a client in the CallOptions header.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_BLOCKS`	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
`DB_CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
`DB_TOTAL_TIME`	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

ENTITY_NAME	**Type** Set **Description** API objects that are accessed. For example: `Account`, `Opportunity`, `Contact`, and so on.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `API`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
METHOD_NAME	**Type** String **Description** The name of the calling Apex method.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
REQUEST_SIZE	**Type** Number

	Description The size of the callout request body, in bytes.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • `N`—Not Found. 404 error. **Possible Values**
`RESPONSE_SIZE`	**Type** Number **Description** The size of the callout response, in bytes.
`ROWS_PROCESSED`	**Type** Number **Description** The number of rows that were processed in the request. For example: `150`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String

Field	Details
	Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id

Field	Details
	Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

Asynchronous Report Run Event Type

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`AVERAGE_ROW_SIZE`	**Type** Number **Description** The average row size of all rows in the Asynchronous Report Run event, in bytes. A large average size, coupled with a high `ROW_COUNT`, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor. **Example** 700
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number

	Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DASHBOARD_ID`	**Type** String **Description** The 15-character ID of the dashboard that was run.
`DB_TOTAL_TIME`	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`DB_BLOCKS`	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
`DB_CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
`DISPLAY_TYPE`	**Type** String **Description** The report display type, indicating the run mode of the report. Possible values are: • `D`—Dashboard • `S`—Show Details • `H`—Hide Details
`ENTITY_NAME`	**Type** String

	Description The name of the object affected by the trigger.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `AsynchronousReportRun`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`NUMBER_BUCKETS`	**Type** Number **Description** The number of buckets that were used in the report.
`NUMBER_COLUMNS`	**Type** Number **Description** The number of columns in the report.
`NUMBER_EXCEPTION_FILTERS`	**Type** Number **Description** The number of exception filters that are used in the report.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`ORIGIN`	**Type** String

Description

The context in which the report executed, such as from a UI (Classic, Lightning, Mobile), through an API (synchronous, asynchronous, Apex), or through a dashboard.

Possible Values

- `ReportOpenedFromMobileDashboard`: Report executed when a user clicked a dashboard component on a mobile device and drilled down to a report.
- `DashboardComponentUpdated`: Report executed when a user refreshed a dashboard component.
- `DashboardComponentPreviewed`: Report executed from a Lightning dashboard component preview.
- `ReportRunUsingSynchronousApi`: Report executed from a synchronous API.
- `ReportRunUsingAsynchronousApi`: Report executed from an asynchronous API.
- `ReportRunUsingApexSynchronousApi`: Report executed from the synchronous Apex API.
- `ReportRunUsingApexAsynchronousApi`: Report executed from the asynchronous Apex API.
- `ReportExported`: Report executed from a printable view or report export that was not asynchronous nor an API export.
- `ReportRunFromClassic`: Report executed from the Run Report option of Salesforce Classic.
- `ReportRunFromMobile`: Report executed from the Run Report option of the mobile Salesforce app.
- `ReportRunFromLightning`: Report executed from the Run option in Lightning Experience from a non-mobile browser.
- `ReportRunFromRestApi`: Report executed from the REST API.
- `ReportPreviewed`: Report executed when a user got preview results while using the report builder.
- `ReportScheduled`: Report was scheduled.
- `ProbeQuery`: Report executed from a probe query.
- `ReportRunFromReportingSnapshot`: Report executed through Snapshot Analytics.
- `ReportExportedAsynchronously`: Report was exported asynchronously.
- `ReportExportedUsingExcelConnector`: Report was exported using the Excel connector.

	- `ChartRenderedOnVisualforcePage`: Report executed from a rendered chart on a VisualForce Page. - `ChartRenderedInEmbeddedAnalyticsApp`: Report executed from a rendered chart in an embedded Analytics app. - `ReportRunAndNotificationSent`: Report executed through the notifications API. - `ChartRenderedOnHomePage`: Report executed from a rendered chart on the home page. - `ReportResultsAddedToWaveTrending`: Report executed when a user trended a report in Einstein Analytics. - `ReportAddedToCampaign`: Report was added from an Add to Campaign action. - `ReportResultsAddedToEinsteinDiscovery`: Report executed synchronously from Einstein Discovery. - `Unknown`: Report execution origin is unknown. - `Test`: Report execution resulted from a test.
`RENDERING_TYPE`	**Type** String **Description** Describes the format of the report output in Salesforce Classic. If the report was exported in Lightning Experience, this field is blank. **Possible Values** - `W`: Web (HTML) - `E`: Email - `P`: Printable - `X`: Excel - `C`: Comma-separated values (CSV) - `J`: JavaScript Object Notation (JSON) - `D`: Dummy data
`REPORT_ID`	**Type** Id **Description** The 15-character ID of the report that was run.
`REPORT_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the report that was run.

Field	Details
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
ROW_COUNT	**Type** Number **Description** The number of rows that were processed in the Asynchronous Report Run event. High row counts, coupled with a high AVERAGE_ROW_SIZE, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor. **Example** 150
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.

SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
SORT	**Type** String **Description** The sort column and order that was used in the report.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id

	Description The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile

Aura Request Event Type

Aura Request events contain details of requests to Apex methods from Aura and Lightning web components. For example, you can benchmark request time or identify the URI of an unsuccessful request.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`ACTION_MESSAGE`	**Type** String **Description** The action (Apex method) names and times for all the actions in the request in the format: `action1Name=action1Time;action2Name=action2Time...`
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.

CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `AuraRequest`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.

REQUEST_METHOD	**Type** String **Description** The HTTP method of the request, such as GET or POST.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.

TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the resource that's receiving the request. For example: `/aura`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_AGENT	**Type** Number **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API).
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

	For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Bulk API Event Type

Bulk API events contain details about Bulk API requests.

Note: This event type does not include Bulk API 2.0 requests.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`BATCH_ID`	**Type** String **Description** The 15-character ID of the Bulk API batch.
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`ENTITY_TYPE`	**Type** String **Description** The type of entity that the Bulk API used.

`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `BulkApi`.
`JOB_ID`	**Type** String **Description** The 15-character ID of the Bulk API job.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`MESSAGE`	**Type** EscapedString **Description** Any success or error message that's associated with the request.
`NUMBER_FAILURES`	**Type** Number **Description** The number of failures that were returned with the request.
`OPERATION_TYPE`	**Type** String **Description** The type of Bulk API operation that was performed.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String

	Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`ROWS_PROCESSED`	**Type** Number **Description** The number of rows that were processed in the request. For example: `150`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`SUCCESS`	**Type** Boolean **Description** Whether the batch was successful.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.

URI	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

Change Set Operation Event Type

Change Set Operation events contain information from change set migrations.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CHANGE_SET_NAME	**Type** String

Field	Details
	Description The name of the change set.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `ChangeSetOperation`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
OPERATION	**Type** String **Description** The operation that's being performed. **Possible Values** • DELETE • DEPLOY • UPLOAD • VALIDATE

`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TARGET_ORG_ID`	**Type** Id **Description** The 15-character ID of the organization that's receiving the change set.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile

Concurrent Long-Running Apex Limit Event Type

Concurrent Long-Running Apex Limit events contain information about long-running concurrent Apex requests in your org that Salesforce terminated after reaching your org's concurrency limit. Requests with an established Apex context that execute for 5 seconds are counted towards your org's limit of concurrent long-running requests. (Asynchronous requests don't count towards the limit.) When there are more than 10 long-running requests (org default limit), additional long-running requests are terminated. This event type is available in the EventLogFile object in API version 45.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
EVENT_TYPE	**Type** String **Description** The type of event. The value is always ConcurrentLongRunningApexLimit.
NUMBER_REQUESTS	**Type** Number **Description** Count of requests with an established Apex context executing for longer than 5 seconds in your org.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_URI	**Type** String **Description** URI of the long-running Apex request that Salesforce terminated. **Example** /apex/ApexClassName
REQUESTS_LIMIT	**Type** Number **Description** Maximum count of requests with an established Apex context that can execute for longer than 5 seconds. When NUMBER_REQUESTS reaches this limit, then additional long-running

Field	Details
	Apex requests are terminated. (Asynchronous requests don't count towards the limit.) The default limit is 10. **Example** 10
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`

Usage

For example, you can monitor Concurrent Long-Running Apex Limit log counts to get a benchmark or plot a count by hour. To identify where the limit was exceeded, see the REQUEST_URI field. Then, cross-reference this data with Apex Execution event data where the average RUN_TIME exceeds 5 seconds. To identify synchronous requests only, cross-reference event data with the QUIDDITY field in Apex Execution event data. For example, QUIDDITY NOT IN (A,BA,F,Q,S) and CALLOUT_TIME (>5000).

EventLogFile

Salesforce Developers Blog: Designing Force.com Applications That Avoid Hitting Concurrent Request Limits

Console Event Type

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
COMPONENT_ID	**Type** Id **Description** The 15-character ID of the component.
COMPONENT_ID_DERIVED	**Type** Id **Description** The 18-character, case-insensitive ID of the component.
CONSOLE_ID	**Type** Id **Description** The 15-character ID of the console.
CONSOLE_ID_DERIVED	**Type** Id **Description** The 18-character, case-insensitive ID of the console.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to

	determine whether performance issues are occurring in the database layer or in your own code.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `Console`.
`LICENSE_CONTEXT`	**Type** String **Description** The license context in which a user is using a console. **Example** service, salesandservice, sales
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`RECORD_ID`	**Type** Id **Description** The 15-character ID of the record that's associated with the console.
`RECORD_ID_DERIVED`	**Type** Id **Description** The 18-character, case-insensitive ID of the record that's associated with the console.

REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.
TIMESTAMP	**Type** String

	Description The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

Content Distribution Event Type

Content Distribution events contain information about content distributions and deliveries to users.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
ACTION	**Type** String **Description** The action that's used when a delivery is viewed. **Possible Values** • VIEW • INSERT • UPDATE
DELIVERY_ID	**Type** Id **Description** The 15-character ID of the content delivery.
DELIVERY_LOCATION	**Type** String **Description** The location of the delivery.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always ContentDistribution.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
RELATED_ENTITY_ID	**Type** Id

	Description The 15-character ID of the record that's associated with the delivery distribution.
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.
`VERSION_ID`	**Type** Id

Field	Details
	Description The 15-character ID of the content version.

SEE ALSO:

EventLogFile Supported Event Types

EventLogFile

Content Document Link Event Type

Content Document Link events contain sharing information for content documents.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
DOCUMENT_ID	**Type** Id **Description** The 15-character ID of the document that's being shared.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `ContentDocumentLink`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.

Field	Details
SHARED_WITH_ENTITY_ID	**Type** Id **Description** Who the document was shared with.
SHARING_OPERATION	**Type** String **Description** The type of sharing operation on the document. **Possible Values** • INSERT • UPDATE • DELETE
SHARING_PERMISSION	**Type** String **Description** What permissions the document was shared with. **Possible Values** • V: Viewer • C: Collaborator • I: Inferred—that is, the sharing permissions were inferred from a relationship between the viewer and document. For example, a document's owner has a sharing permission to the document itself. Or, a document can be a part of a content collection, and the viewer has sharing permissions to the collection rather than explicit permissions to the document directly.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 0059000000I1SNIA0.

Content Transfer Event Type

Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews. This information includes events performed on files and attachments to records.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
DOCUMENT_ID	**Type** Id **Description** The 15-character ID of the document that's being shared.
DOCUMENT_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the document that's being shared.
EVENT_TYPE	**Type** String

Field	Details
	Description The type of event. The value is always `ContentTransfer`.
`FILE_PREVIEW_TYPE`	**Type** String **Description** The content type of the file version.
`FILE_TYPE`	**Type** String **Description** The content type of the file preview.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`SIZE_BYTES`	**Type** Number **Description** The size of the file transfer, in bytes.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TRANSACTION_TYPE`	**Type** String **Description** The operation that was performed, including operations on files and attachments to records. For example, you can track operations in the Attachments related list on a case. **Possible Values** • `VersionDownloadAction` and `VersionDownloadApi` represent downloads via the user interface and API respectively. • `VersionRenditionDownload` represents a file preview action. • `saveVersion` represents a file that's being uploaded.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.
`VERSION_ID`	**Type** Id **Description** The 15-character ID of the content version.
`VERSION_ID_DERIVED`	**Type** Id

	Description The 18-character case insensitive ID of the content version.

Continuation Callout Summary Event Type

Continuation Callout Summary events contain information about all of the asynchronous callouts performed during a transaction, their response status codes, execution times, and URL endpoint destinations. This event type is available in the EventLogFile object in API version 43.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer's Guide.

Fields

Field	Details
CONTINUATION_ID	**Type** String **Description** A unique ID identifying a sequence of events within a request. **Example** SFDC-Continuation-14e3cg85-961d-389e-7bz1-3d171543162a
DURATION	**Type** Number **Description** Total duration of continuation, in milliseconds.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `ContinuationCalloutSummary`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**

Field	Details
ORIGIN_REQUEST_ID	**Type** Id **Description** The ID of the request that initiated a callout. **Example** TID:5ILoVKlztX_rDDJcp7
REQUEST_FORM_SIZE	**Type** String **Description** Continuation request form size, in bytes. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
RESPONSE_SIZE	**Type** String **Description** The size of the callout response, in bytes. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.
STATUS_CODE	**Type** String **Description** The HTTP status or internal code returned by the remote endpoint. A status code of 200 indicates that the request was successful. Other status code values indicate the type of problem that was encountered. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values. **Examples** • 2000—The timeout was reached, and the server didn't get a chance to respond. • 2001—There was a connection failure. • 2002—Exceptions occurred. • 2003—The response hasn't arrived (which also means that the Apex asynchronous callout framework hasn't resumed). • 2004—The response size is too large (greater than 1 MB).

Field	Details
SUCCESS	**Type** Boolean **Description** Indicates whether the continuation was successful (1) or not (0).
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.
URL	**Type** String **Description** The callout endpoint URL. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values. **Example** http://prod.location.amazonaws.com:1000/orders/order/_search
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.
VF_CONTROLLER_SIZE	**Type** String

Field	Details
	Description Continuation Visualforce controller size, in bytes. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.

Dashboard Event Type

Dashboard events contain details about dashboards that users view.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DASHBOARD_COMPONENT_ID`	**Type** Id **Description** The 15-character ID of the dashboard component.
`DASHBOARD_ID`	**Type** String **Description** The 15-character ID of the dashboard that was run.

`DASHBOARD_ID_DERIVED`	**Type** String **Description** The 18-character case insensitive ID of the dashboard that was run.
`DASHBOARD_TYPE`	**Type** String **Description** The type of dashboard. **Possible Values** • `R`: Run as running user • `C`: Run as context user • `S`: Run as specific user
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `Dashboard`.
`IS_SCHEDULED`	**Type** Boolean **Description** The value is `true` if the dashboard is a scheduled dashboard.
`IS_SUCCESS`	**Type** Boolean **Description** 1 if the dashboard component ran successfully, 0 if it didn't.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`.

	Example
REPORT_ID	**Type** Id **Description** The 15-character ID of the report that was run.
REPORT_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the report that was run.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime

Field	Details
	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types
EventLogFile

External Cross-Org Callout Event Type

External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer Guide.

Note: For the cross-org adapter for Salesforce Connect, event monitoring currently doesn't track search callouts.

Fields

Field	Details
`ACTION`	**Type** String **Description** Action performed by the callout. **Possible Values** • query

Field	Details
	• upsert • delete
ENTITY	**Type** String **Description** Name of the external object being accessed. **Example** Order
EVENT_TYPE	**Type** String **Description** Type of event. Value is always `ExternalCrossOrgCallout`.
EXECUTE_MS	**Type** Number **Description** How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later. **Example** 1
FETCH_MS	**Type** Number **Description** How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later. **Example** 452
FILTER	**Type** Text **Description** Field expressions to filter which rows to return. Corresponds to `WHERE` in SOQL queries. **Example** WHERE CustomerId='123456'
HAVING	**Type** Text **Description** Reserved for future use.

Field	Details
LIMIT	**Type** Number **Description** Maximum number of rows to return for a query. Corresponds to `LIMIT` in SOQL queries. **Example** 200
MESSAGE	**Type** String **Description** Error or warning message associated with the failed query callout. Value is always empty for upsert and delete callouts. **Example** System.UnexpectedException: Query is either selecting too many fields or the filter conditions are too complicated
OFFSET	**Type** Number **Description** Number of rows to skip when paging through a result set. Corresponds to `OFFSET` in SOQL queries. If a SOQL query doesn't define an `OFFSET`, the value is -1. **Example** 0 (default)
ORDERBY	**Type** String **Description** Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to `ORDER BY` in SOQL queries. **Examples** • ORDER BY ShipName • ORDER BY ShipName DESC
ORGANIZATION_ID	**Type** Id **Description** 15-character ID of the organization. **Example** 00D000000000123

Field	Details
REQUEST_ID	**Type** String **Description** Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID. **Example** 4A13-HSKv3CKs-0FKfceaV
ROWS	**Type** Number **Description** Total number of records in the result set. Value is always 0 for upsert and delete callouts. **Example** 200
ROWS_FETCHED	**Type** Number **Description** Reserved for future use.
SELECT	**Type** String **Description** Comma-separated list of fields being queried. Corresponds to `SELECT` in SOQL queries. **Example** SELECT Id,Name,CustomerID,OrderDate
STATUS	**Type** Boolean **Description** Whether the query was successful. Value is always empty for upsert and delete callouts. **Possible Values** • 1—Success • 0—Failed
SUBQUERIES	**Type** Number **Description** The number of subqueries that the query is split into.

Field	Details
THROUGHPUT	**Type** Number **Description** Reserved for future use.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
TOTAL_MS	**Type** Number **Description** How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results. **Example** 453
USER_ID	**Type** Id **Description** 15-character ID of the user accessing the external system. **Example** 00530000009M943
USING_MRU	**Type** Boolean

Field	Details
	Description Reserved for future use.

EventLogFile

External Custom Apex Callout Event Type

External Custom Apex Callout events represent external data callouts via custom adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer Guide.

Fields

Field	Details
ACTION	**Type** String **Description** Action performed by the callout. **Possible Values** • query • upsert • delete
ENTITY	**Type** String **Description** Name of the external object being accessed. **Example** Order
EVENT_TYPE	**Type** String **Description** Type of event. Value is always `ExternalCustomApexCallout`.
EXECUTE_MS	**Type** Number

Field	Details
	Description How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later. **Example** 102
FETCH_MS	**Type** Number **Description** How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later. **Example** 607
FILTER	**Type** Text **Description** Field expressions to filter which rows to return. Corresponds to `WHERE` in SOQL queries. **Example** Filter:[columnName=CustomerID, columnValue=537, subfilters=null, tableName=Order, type=EQUALS]
LIMIT	**Type** Number **Description** Maximum number of rows to return for a query. Corresponds to `LIMIT` in SOQL queries. **Example** 200
MESSAGE	**Type** String **Description** Error or warning message associated with the failed call. **Example** System.UnexpectedException: Query is either selecting too many fields or the filter conditions are too complicated
OFFSET	**Type** Number **Description** Number of rows to skip when paging through a result set. Corresponds to `OFFSET` in SOQL queries.

Field	Details
	Example 0 (default)
`ORDERBY`	**Type** String **Description** Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to `ORDER BY` in SOQL queries. **Examples** (Order:[columnName=OrderDate, direction=ASCENDING, tableName=Order])
`ORGANIZATION_ID`	**Type** Id **Description** 15-character ID of the organization. **Example** 00D000000000123
`REQUEST_ID`	**Type** String **Description** Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID. **Example** 4A13-HSKv3CKs-0FKfceaV
`ROWS`	**Type** Number **Description** Total number of records in the result set. The value is always -1 if the custom adapter's `DataSource.Provider` class doesn't declare the `QUERY_TOTAL_SIZE` capability. **Example** 200
`ROWS_FETCHED`	**Type** Number **Description** Number of rows fetched by the callout. Available in API version 42.0 and later. **Example** 200

Field	Details
SELECT	**Type** String **Description** Comma-separated list of fields being queried. Corresponds to `SELECT` in SOQL queries. **Example** (ColumnSelection:[aggregation=NONE, columnName=Name, tableName=Order], ColumnSelection:[aggregation=NONE, columnName=CustomerID, tableName=Order], ColumnSelection:[aggregation=NONE, columnName=OrderDate, tableName=Order])
STATUS	**Type** Boolean **Description** Whether the query was successful. **Possible Values** • 1—Success • 0—Failed • Empty—Failed with no logged status or message
THROUGHPUT	**Type** Number **Description** Number of records retrieved in one second. **Example** 302.57
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
SUBQUERIES	**Type** Number **Description** Reserved for future use.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`).

Field	Details
	For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TOTAL_MS`	**Type** Number **Description** How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results. **Example** 709
`USER_ID`	**Type** Id **Description** 15-character ID of the user accessing the external system. **Example** 00530000009M943

EventLogFile Supported Event Types

EventLogFile

External OData Callout Event Type

External OData Callout events represent external data callouts via the OData 2.0 and OData 4.0 adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer Guide.

Fields

Field	Details
`ACTION`	**Type** String **Description** Action performed by the callout. **Possible Values** • query • upsert • delete

Field	Details
BYTES	**Type** Number **Description** Size of the result set in bytes.
ENTITY	**Type** String **Description** Name of the external object being accessed. **Example** Order
EVENT_TYPE	**Type** String **Description** Type of event. Value is always `ExternalODataCallout`.
EXECUTE_MS	**Type** Number **Description** How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later. **Example** 21
EXPAND	**Type** String **Description** Reserved for future use.
FETCH_MS	**Type** Number **Description** How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later. **Example** 127
FILTER	**Type** Text

Field	Details
	Description Field expressions to filter which rows to return. Corresponds to `WHERE` in SOQL queries and `$filter` in OData queries. **Example** CustomerID eq 12345
`LIBRARY`	**Type** String **Description** Reserved for future use.
`LIMIT`	**Type** Number **Description** Maximum number of rows to return for a query. Corresponds to `LIMIT` in SOQL queries and `$top` in OData queries. **Example** 200
`MESSAGE`	**Type** String **Description** Error or warning message associated with the failed call. **Example** The OData query result was too large, so the external data didn't load.
`NEXT_LINK`	**Type** String **Description** OData next link that the callout used to request a subsequent page of rows. A next link is provided in a previous response from the OData producer when the response includes only part of the result set. Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18. **Example** http://services.example.org/Warehouse.svc/Orders?$count=true&$select=CustomerID,OrderID,RequiredDate,ShippedDate&$top=301&$skiptoken=10447
`OFFSET`	**Type** Number **Description** Number of rows to skip when paging through a result set.

Field	Details
	Corresponds to `OFFSET` in SOQL queries and `$skip` in OData queries. **Example** 10
`ORDERBY`	**Type** String **Description** Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to `ORDER BY` in SOQL queries and `$orderby` in OData queries. **Examples** • ShipName • ShipName desc
`ORGANIZATION_ID`	**Type** Id **Description** 15-character ID of the organization. **Example** 00D000000000123
`PARENT_CALLOUT`	**Type** String **Description** If the callout requested a subsequent page of rows, this field identifies the initial callout whose request resulted in the multi-page result set. Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18. **Example** 4EoZtuBzzRIXSk-ysRdf1F-1
`PROVIDER_TYPE`	**Type** String **Description** Whether the OData 2.0 or OData 4.0 adapter made the callout. **Possible Values** • OData—OData 2.0 adapter • OData4—OData 4.0 adapter
`RATE_LIMIT_USAGE_PERCENT`	**Type** Number

Field	Details
	Description Consumed percentage of the org's limit of OData callouts per hour. **Example** 2.5—2.5% of the hourly callout limit has been consumed
`REQUEST_ID`	**Type** String **Description** Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID. **Example** 4A13-HSKv3CKs-0FKfceaV
`REQUESTS`	**Type** Number **Description** Reserved for future use.
`ROWS`	**Type** Number **Description** Total number of records in the result set. Available in API version 42.0 and later. **Example** 830
`ROWS_FETCHED`	**Type** Number **Description** Number of records fetched by the callout. The records fetched by a callout can be a subset of a large result set. Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18. **Example** 200
`SEARCH`	**Type** String **Description** Search query string. Corresponds to condition expressions in SOSL. **Example** contains(CustomerID,'10248') eq true or contains(ShipName,'10248') eq true

Field	Details
SELECT	**Type** String **Description** Comma-separated list of fields being queried. Corresponds to `SELECT` in SOQL queries and `$select` in OData queries. **Example** CustomerID,OrderDate,OrderID,ShipCity,ShipCountry
STATUS	**Type** Boolean **Description** Whether the query was successful. **Possible Values** • 1—Success • 0—Failed
THROUGHPUT	**Type** Number **Description** Number of records retrieved in one second. Available in API version 42.0 and later. However, this field isn't supported for the OData 2.0 adapter on orgs created before Spring '18. **Example** 3025.67
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
TOTAL_MS	**Type** Number

Field	Details
	Description How long it took (in milliseconds) to prepare and execute the query and to retrieve the query results.
USER_ID	**Type** Id **Description** 15-character ID of the user accessing the external system. **Example** 00530000009M943

SEE ALSO:

EventLogFile Supported Event Types

EventLogFile

Insecure External Assets Event Type

Insecure External Assets events contain information about external assets. External assets include images or videos accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain assets hosted insecurely on third-party sites that users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. The INSECURE_URI field contains the URI being used to load the asset insecurely. The Insecure External Assets event type is available in the EventLogFile object in API version 42.0 and later.

Assets over HTTP can be manipulated through man-in-the-middle and other types of attacks. These attacks can trick users into sending their Salesforce credentials to malicious sites. Always use HTTPS in your custom code and templates for any asset you're loading from external sites.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer's Guide.

Fields

Field	Details
ASSET_TYPE	**Type** String **Description** Type of insecure asset. **Possible Values** • Base URI • Connect • Font • Frame Ancestor: External page that embeds the Salesforce page in an iframe • Frame • Image

Field	Details
	• `Media` • `Object` • `Other` • `Plugin Types` • `Script` • `Style`
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DOCUMENT_URI`	**Type** String **Description** URL of the page that contains the insecure asset, excluding the query parameter. **Example** https://company.my.salesforce.com/00XXXXXXXXX
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `InsecureExternalAssets`.
`INSECURE_URI`	**Type** String **Description** Insecure external asset URL being used to load an asset insecurely. For example, loading Javascript libraries using **`http:`**`//ajax.googleapis.com/` in your custom code will log an Insecure External Asset Event with the `INSECURE_URI` field set to this URL. Find this reference in your code and update it to use **`https:`**`//ajax.googleapis.com/` instead. **Example** http://pbs.twimg.com/profile_images/5699091412070816/Z4Stwts_normal.jpeg

Field	Details
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.
ORGANIZATION_ID	**Type** String **Description** The 15-character ID of the org. **Example** 00D000000000123
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime

Field	Details
	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TYPE`	**Type** String **Description** Type of Salesforce page. **Possible Values** • `Appserver`: Page without My Domain subdomain (for example, https://na44.salesforce.com) • `Communities`: Customer Experience Cloud site • `Email`: Email preview • `Login`: Login page (for example, https://login.salesforce.com) • `Mydomain`: Page on My Domain subdomain (for example, https://mycompany.my.salesforce.com) • `Sites`: Customer site • `Static`: Static content (for example, https://sfdcstatic.com) • `Unknown`: other type of page
`UNIQUE_ID`	**Type** String **Description** The 32-character ID of the event log file in which the insecure external asset event data is found. **Example** 44e128a5-ac7a-4c9a-be4c-224b6bf81b20
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.

Field	Details
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 0059000000I1SNIA0.

Usage

UNIQUE_ID is used by Salesforce Customer Support to troubleshoot any issues that occur.

EventLogFile Supported Event Types

EventLogFile

Knowledge Article View Event Type

Knowledge Article View events contain user activity with your knowledge base.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
ARTICLE_ID	**Type** Id **Description** The 15-character ID of the article. For example: 00Dxx0000001gEb.
ARTICLE_STATUS	**Type** Character **Description** Possible values are: • D—Draft

	• `O`—Online • `A`—Archived
`ARTICLE_VERSION`	**Type** Number **Description** Article version number. For example: `2`.
`ARTICLE_VERSION_ID`	**Type** Id **Description** The 15-character ID of the article version. For example: `ka0R00000005rt6`.
`CONTEXT`	**Type** String **Description** Context of the request. **Description** Possible values are: • `Apex` • `API` • empty string
`ENTITY`	**Type** String **Description** Entity requested. For example: `Knowledge__kav`.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `KnowledgeArticleView`.
`LANGUAGE`	**Type** String **Description** iso-code of the language. For example: `en_US`/

	Example
LAST_VERSION	**Type** Boolean **Description** True if it is the last version. Possible values are: • True • False
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
SESSION_ID	**Type** String **Description** Session ID of the request. For example: gV7pCSW2vGaaJNFi3GSpuPIjNbKVbSxRvx34LJsIvuc=. **Example**
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_TYPE`	**Type** Character **Description** User type of the request. Possible values are: • `A`—App • `C`—Customer Portal • `P`—Partner Portal • `G`—guest •

Lightning Error Event Type

Lightning Error events represent errors that occurred during user interactions with Lightning Experience and the Salesforce mobile app. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`APP_NAME`	**Type** String **Description** The name of the application that the user accessed.
`BROWSER_NAME`	**Type** String

Field	Details
	Description The name of the browser that the user accessed. **Example** Chrome, IE, Safari, Gecko
`BROWSER_VERSION`	**Type** String **Description** The version of the browser that the user accessed in `major.minor version` format. Some browsers don't provide a minor version.
`CLIENT_GEO`	**Type** String **Description** The geolocation of the client in the form of <Country>/<State|Province>. **Example** United States/California
`CLIENT_ID`	**Type** String **Description** The API client ID.
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`COMPONENT_NAME`	**Type** String **Description** The internal name of the standard component that generated the error. The Salesforce developer assigned the name when the standard component was created. **Examples** • SaveEdit • Lead.CCPM_sendSMS • ChangeOwnerOne

Field	Details
CONNECTION_TYPE	**Type** String **Description** The type of connection. **Possible Values** • CDMA1x • CDMA • EDGE • EVDO0 • EVDOA • EVDOB • GPRS • HRPD • HSDPA • HSUPA • LTE • WIFI
DEVICE_ID	**Type** String **Description** The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.
DEVICE_MODEL	**Type** String **Description** The name of the device model. **Example** iPad, iPhone
DEVICE_PLATFORM	**Type** String **Description** The type of application experience in name:experience:form format. **Possible Values** Name • APP_BUILDER • CUSTOM • S1

Field	Details
	• `SFX` Experience • `BROWSER` • `HYBRID` Form • `DESKTOP` • `PHONE` • `TABLET`
`DEVICE_SESSION_ID`	**Type** Id **Description** The unique identifier of the user's session based on page load time. If the user reloads a page, it starts a new session. **Example** 321a1ddfaf924803a075f1e69fc87bc06f53ccd0
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `LightningError`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring. **Example** GeJCsym5eyvtEK2I
`ORGANIZATION_ID`	**Type** String **Description** The 15-character ID of the org. **Example** 00D000000000123
`OS_NAME`	**Type** String **Description** The operating system name, derived from `USER_AGENT`.

Field	Details
	Example Android, iOS, OSX, Windows
`OS_VERSION`	**Type** String **Description** The operating system version, derived from `USER_AGENT`.
`PAGE_APP_NAME`	**Type** String **Description** The internal name of the application that the user accessed from the App Launcher. **Example** LightningSales
`PAGE_CONTEXT`	**Type** String **Description** Context of the page where the event occurred. **Example** clients:cardsContainer
`PAGE_ENTITY_ID`	**Type** Id **Description** The unique entity identifier of the event. **Example** 0013000000I3zJAAAZ
`PAGE_ENTITY_TYPE`	**Type** String **Description** The entity type of the event. **Example** Task, Account
`PAGE_START_TIME`	**Type** Number **Description** The time when the page was initially loaded, measured in milliseconds. **Example** 1471564788642

Field	Details
PAGE_URL	**Type** String **Description** Relative URL of the top-level Lightning Experience or Salesforce mobile app page that the user opened. The page can contain one or more Lightning components. Multiple record IDs can be associated with PAGE_URL. **Example** /sObject/0064100000JXITSAA5/view
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. **Example** 3nWgxWbDKWWDIk0FKfF5DV
SDK_APP_TYPE	**Type** String **Description** The mobile SDK application type. **Possible Values** • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	**Type** String **Description** The mobile SDK application version number. **Example** 5.0
SDK_VERSION	**Type** String **Description** The mobile SDK version number. **Example** 2.1.0

Field	Details
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When a user logs out and logs in again, a new session is started. **Example** cdd09305cb6babf34059e27f70e47f1b11dec868
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
UI_EVENT_ID	**Type** String **Description** ID of the Lightning event type. **Possible Values** • `ltng:error` • `ltng:interaction` • `ltng:pageView` • `ltng:performance`
UI_EVENT_SEQUENCE_NUM	**Type** Number **Description** An auto-incremented sequence number of the current event since the session started.
UI_EVENT_SOURCE	**Type** String **Description** The source of the error event.

Field	Details
	Examples Here are some examples of error flags returned in this field. • AuraError • Error • InvalidStateError • RangeError • ReferenceError • SecurityError • SyntaxError • TypeError • unknown
UI_EVENT_TIMESTAMP	**Type** Number **Description** The time at which this event occurred, measured in milliseconds. **Example** 1479769912796
UI_EVENT_TYPE	**Type** String **Description** The type of interaction. **Examples** • crud — Created, read, updated, or deleted the record. • reads — Read multiple records.
USER_AGENT	**Type** String **Description** The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string.
USER_ID	**Type** String **Description** The 15-character ID of the user accessing Salesforce services through the UI or API. **Example** 00530000009M943

Field	Details
USER_ID_DERIVED	**Type** Id **Description** The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API. **Example** 00590000000I1SNIA0
USER_TYPE	**Type** String **Description** The category of user license of the user accessing Salesforce services through the UI or API. **Possible Values** • A: Automated Process • b: High Volume Portal • C: Customer Portal User • D: External Who • F: Self Service • G: Guest • L: Package License Manager • N: Salesforce to Salesforce • n: CSN Only • O: Power Custom • o: Custom • P: Partner • p: Customer Portal Manager • S: Standard • X: Salesforce Administrator

EventLogFile Supported Event Types

EventLogFile

Lightning Interaction Event Type

Lightning Interaction events track user actions in Lightning Experience and the Salesforce mobile app, such as the user clicking, tapping, or scrolling on a page. This event type is available in the EventLogFile object in API version 39.0 and later.

Warning: The Lightning Interaction Event type is a best effort logging of user interactions but is not intended to meet privacy and security audit requirements. Not all interactions or CRUD operations are tracked and data loss may occur.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
APP_NAME	**Type** String **Description** The name of the application that the user accessed.
BROWSER_NAME	**Type** String **Description** The name of the browser that the user accessed. **Example** Chrome, IE, Safari, Gecko
BROWSER_VERSION	**Type** String **Description** The version of the browser that the user accessed in `major.minor version` format. Some browsers don't provide a minor version.
CLIENT_GEO	**Type** String **Description** The geolocation of the client in the form of <Country>/<State|Province>. **Example** United States/California
CLIENT_ID	**Type** String **Description** The API client ID.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.

Field	Details
COMPONENT_NAME	**Type** String **Description** The internal name of the standard component that the user interacted with. The Salesforce developer assigned the name when the standard component was created. **Examples** • SaveEdit • Lead.CCPM_sendSMS • ChangeOwnerOne
CONNECTION_TYPE	**Type** String **Description** The type of connection. **Possible Values** • CDMA1x • CDMA • EDGE • EVDO0 • EVDOA • EVDOB • GPRS • HRPD • HSDPA • HSUPA • LTE • WIFI
DEVICE_ID	**Type** String **Description** The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.
DEVICE_MODEL	**Type** String **Description** The name of the device model. **Example** iPad, iPhone

Field	Details
DEVICE_PLATFORM	**Type** String **Description** The type of application experience in name:experience:form format. **Possible Values** Name • APP_BUILDER • CUSTOM • S1 • SFX Experience • BROWSER • HYBRID Form • DESKTOP • PHONE • TABLET
DEVICE_SESSION_ID	**Type** Id **Description** The unique identifier of the user's session based on page load time. When the user reloads a page, a new session is started. **Example** 321a1ddfaf924803a075f1e69fc87bc06f53ccd0
DURATION	**Type** Number **Description** The duration in milliseconds since the page start time. Warning: This field is being deprecated.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always LightningInteraction.
GRANDPARENT_UI_ELEMENT	**Type** String

Field	Details
	Description Grandparent scope of the page element where the event occurred.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring. **Example** GeJCsym5eyvtEK2I
ORGANIZATION_ID	**Type** String **Description** The 15-character ID of the org. **Example** 00D000000000123
OS_NAME	**Type** String **Description** The operating system name, derived from USER_AGENT. **Example** Android, iOS, OSX, Windows
OS_VERSION	**Type** String **Description** The operating system version, derived from USER_AGENT.
PAGE_APP_NAME	**Type** String **Description** The internal name of the application that the user accessed from the App Launcher. **Example** LightningSales
PAGE_CONTEXT	**Type** String **Description** Context of the page where the event occurred.

Field	Details
	Example clients:cardsContainer
PAGE_ENTITY_ID	**Type** Id **Description** The unique entity identifier of the event. **Example** 0013000000I3zJAAAZ
PAGE_ENTITY_TYPE	**Type** String **Description** The entity type of the event. **Example** Task, contacts
PAGE_START_TIME	**Type** Number **Description** The time when the page was initially loaded, measured in milliseconds. **Example** 1471564788642
PAGE_URL	**Type** String **Description** Relative URL of the top-level Lightning Experience or Salesforce mobile app page that the user opened. The page can contain one or more Lightning components. Multiple record IDs can be associated with PAGE_URL. **Example** /sObject/0064100000JXITSAA5/view
PARENT_UI_ELEMENT	**Type** String **Description** Parent scope of the page element where the event occurred.
RECORD_ID	**Type** String array

Field	Details
	Description The IDs of one or more records that the user interacted with. For more information on the user interaction, see `UI_EVENT_TYPE` and `UI_EVENT_SOURCE` fields. **Example** ["5004100000JaGGLAA3", "5004100000Dn79CAAR", "50041000007KeugAAC"]
`RECORD_TYPE`	**Type** String **Description** The type of record object that the user interacted with. **Examples** • Account • Opportunity
`RELATED_LIST`	**Type** String **Description** The type of related list that the user clicked. **Example** Opportunity
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. **Example** 3nWgxWbDKWWDIk0FKfF5DV
`SDK_APP_TYPE`	**Type** String **Description** The mobile SDK application type. **Possible Values** • `HYBRID` • `HYBRIDLOCAL` • `HYBRIDREMOTE` • `NATIVE` • `REACTNATIVE`

Field	Details
SDK_APP_VERSION	**Type** String **Description** The mobile SDK application version number. **Example** 5.0
SDK_VERSION	**Type** String **Description** The mobile SDK version number. **Example** 2.1.0
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When the user logs out and logs in again, a new session is started. **Example** cdd09305cb6babf34059e27f70e47f1b11dec868
TARGET_UI_ELEMENT	**Type** String **Description** The target page element where the event occurred. **Example** label bBody truncate, tabitem-link
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`).

Field	Details
	For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`UI_EVENT_ID`	**Type** String **Description** Id of the Lightning event type. **Possible Values** • `ltng:error` • `ltng:interaction` • `ltng:pageView` • `ltng:performance`
`UI_EVENT_SEQUENCE_NUM`	**Type** Number **Description** An auto-incremented sequence number of the current event since the session started.
`UI_EVENT_SOURCE`	**Type** String **Description** The user action on the record or records in `RECORD_ID`. This field's value indicates whether the user's action was on a single record or multiple records. For example, `read` indicates that one record was read (such as on a record detail page); `reads` indicates that multiple records were read (such as in a list view). **Examples** • click • create • delete • hover • read • update
`UI_EVENT_TIMESTAMP`	**Type** Number **Description** The time at which this event occurred, measured in milliseconds. **Example** 1479769912796
`UI_EVENT_TYPE`	**Type** String

Field	Details
	Description The type of interaction with the records in `RECORD_ID`. **Examples** • crud — Created, read, updated, or deleted the record. • reads — Read multiple records.
`USER_AGENT`	**Type** String **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API) as a string.
`USER_ID`	**Type** String **Description** The 15-character ID of the user accessing Salesforce services through the UI or API. **Example** 00530000009M943
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case-insensitive ID of the user who’s using Salesforce services through the UI or the API. **Example** 00590000000I1SNIA0
`USER_TYPE`	**Type** String **Description** The category of user license of the user accessing Salesforce services through the UI or API. **Possible Values** • `A`: Automated Process • `b`: High Volume Portal • `C`: Customer Portal User • `D`: External Who • `F`: Self Service • `G`: Guest • `L`: Package License Manager • `N`: Salesforce to Salesforce

Field	Details
	• `n`: CSN Only • `O`: Power Custom • `o`: Custom • `P`: Partner • `p`: Customer Portal Manager • `S`: Standard • `X`: Salesforce Administrator

EventLogFile

Lightning Page View Event Type

Lightning Page View events represent information about the page on which the event occurred in Lightning Experience and the Salesforce mobile app. A Lightning Page View event tracks the page a user visited, how long the user spent on the page, and the load time for the page. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`APP_NAME`	**Type** String **Description** The name of the application that the user accessed.
`BROWSER_NAME`	**Type** String **Description** The name of the browser that the user accessed. **Example** Chrome, IE, Safari, Gecko
`BROWSER_VERSION`	**Type** String **Description** The version of the browser that the user accessed in `major.minor version` format. Some browsers don't provide a minor version.

Field	Details
CLIENT_GEO	**Type** String **Description** The geolocation of the client in the form of <Country>/<State|Province>. **Example** United States/California
CLIENT_ID	**Type** String **Description** The API client ID.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CONNECTION_TYPE	**Type** String **Description** The type of connection. **Possible Values** • `CDMA1x` • `CDMA` • `EDGE` • `EVDO0` • `EVDOA` • `EVDOB` • `GPRS` • `HRPD` • `HSDPA` • `HSUPA` • `LTE` • `WIFI`
DEVICE_ID	**Type** String

Field	Details
	Description The unique identifier used to identify a device when tracking events. `DEVICE_ID` is a generated value that's created when the mobile app is initially run after installation.
`DEVICE_MODEL`	**Type** String **Description** The name of the device model. **Example** iPad, iPhone
`DEVICE_PLATFORM`	**Type** String **Description** The type of application experience in `name:experience:form` format. **Possible Values** Name • `APP_BUILDER` • `CUSTOM` • `S1` • `SFX` Experience • `BROWSER` • `HYBRID` Form • `DESKTOP` • `PHONE` • `TABLET`
`DEVICE_SESSION_ID`	**Type** Id **Description** The unique identifier of the user's session based on page load time. When the user reloads a page, a new session is started. **Example** 321a1ddfaf924803a075f1e69fc87bc06f53ccd0
`DURATION`	**Type** Number

Field	Details
	Description The duration in milliseconds since the page start time. Warning: This field is being deprecated. Use `EFFECTIVE_PAGE_TIME` instead.
`EFFECTIVE_PAGE_TIME`	**Type** Number **Description** Indicates how many milliseconds it took for the page to load before a user could interact with the page's functionality. Multiple factors can affect effective page time, such as network speed, hardware performance, or page complexity. If an effective page time greater than 60 seconds is detected, the value of this field is set to null.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `LightningPageView`.
`GRANDPARENT_UI_ELEMENT`	**Type** String **Description** The grandparent scope of the page element where the event occurred.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring. **Example** GeJCsym5eyvtEK2I
`ORGANIZATION_ID`	**Type** String **Description** The 15-character ID of the org. **Example** 00D000000000123
`OS_NAME`	**Type** String **Description** The operating system name, derived from `USER_AGENT`.

Field	Details
	Example Android, iOS, OSX, Windows
OS_VERSION	**Type** String **Description** The operating system version, derived from USER_AGENT.
PAGE_APP_NAME	**Type** String **Description** The internal name of the application that the user accessed from the App Launcher. **Example** LightningSales
PAGE_CONTEXT	**Type** String **Description** The context of the page where the event occurred. **Example** clients:cardsContainer
PAGE_ENTITY_ID	**Type** Id **Description** The unique entity identifier of the event. **Example** 0013000000I3zJAAAZ
PAGE_ENTITY_TYPE	**Type** String **Description** The entity type of the event. **Example** Task, contacts
PAGE_START_TIME	**Type** Number **Description** The time when the page was initially loaded, measured in milliseconds. **Example** 1471564788642

Field	Details
PAGE_URL	**Type** String **Description** Relative URL of the top-level Lightning Experience or Salesforce mobile app page that the user opened. The page can contain one or more Lightning components. Multiple record IDs can be associated with PAGE_URL. **Example** /sObject/0064100000JXITSAA5/view
PARENT_UI_ELEMENT	**Type** String **Description** The parent scope of the page element where the event occurred.
PREVPAGE_APP_NAME	**Type** String **Description** The internal name of the previous application that the user accessed from the App Launcher. **Example** LightningSales
PREVPAGE_CONTEXT	**Type** String **Description** The context of the previous page where the event occurred. **Example** clients:cardsContainer
PREVPAGE_ENTITY_ID	**Type** Id **Description** The unique previous page entity identifier of the event.
PREVPAGE_ENTITY_TYPE	**Type** String **Description** The previous page entity type of the event. **Example** Task, contacts
PREVPAGE_URL	**Type** String

Field	Details
	Description The relative URL of the previous Lightning Experience or Salesforce mobile app page that the user opened. **Example** /sObject/006410000
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. **Example** 3nWgxWbDKWWDIk0FKfF5DV
SDK_APP_TYPE	**Type** String **Description** The mobile SDK application type. **Possible Values** • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	**Type** String **Description** The mobile SDK application version number. **Example** 5.0
SDK_VERSION	**Type** String **Description** The mobile SDK version number. **Example** 2.1.0
SESSION_KEY	**Type** String

Field	Details
	Description The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When the user logs out and logs in again, a new session is started. **Example** cdd09305cb6babf34059e27f70e47f1b11dec868
`TARGET_UI_ELEMENT`	**Type** String **Description** The target page element where the event occurred. **Example** label bBody truncate, tabitem-link
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`UI_EVENT_ID`	**Type** String **Description** Id of the Lightning event type. **Possible Values** • `ltng:error` • `ltng:interaction` • `ltng:pageView` • `ltng:performance`
`UI_EVENT_SEQUENCE_NUM`	**Type** Number **Description** An auto-incremented sequence number of the current event since the session started.

Field	Details
UI_EVENT_SOURCE	**Type** String **Description** This field is being deprecated and is mostly null, except in mobile app views where it indicates the page type of views where the context is "native."
UI_EVENT_TIMESTAMP	**Type** Number **Description** The time at which this event occurred, measured in milliseconds. **Example** 1479769912796
USER_AGENT	**Type** String **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API) as a string.
USER_ID	**Type** String **Description** The 15-character ID of the user accessing Salesforce services through the UI or API. **Example** 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API. **Example** 00590000000I1SNIA0
USER_TYPE	**Type** String **Description** The category of user license of the user accessing Salesforce services through the UI or API. **Possible Values** • A: Automated Process • b: High Volume Portal

Field	Details
	• C: Customer Portal User • D: External Who • F: Self Service • G: Guest • L: Package License Manager • N: Salesforce to Salesforce • n: CSN Only • O: Power Custom • o: Custom • P: Partner • p: Customer Portal Manager • S: Standard • X: Salesforce Administrator

EventLogFile

Lightning Performance Event Type

Lightning Performance events track trends in Lightning Experience and Salesforce mobile app performance. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
APP_NAME	**Type** String **Description** The name of the application that the user accessed.
BROWSER_NAME	**Type** String **Description** The name of the browser that the user accessed. **Example** Chrome, IE, Safari, Gecko

<table>
<tr><th>Field</th><th>Details</th></tr>
<tr><td><code>BROWSER_VERSION</code></td><td>Type
String
Description
The version of the browser that the user accessed in <code>major.minor version</code> format. Some browsers don’t provide a minor version.</td></tr>
<tr><td><code>CLIENT_GEO</code></td><td>Type
String
Description
The geolocation of the client in the form of <Country>/<State|Province>.
Example
United States/California</td></tr>
<tr><td><code>CLIENT_ID</code></td><td>Type
String
Description
The API client ID.</td></tr>
<tr><td><code>CLIENT_IP</code></td><td>Type
String
Description
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”.
For example: <code>96.43.144.26</code>.</td></tr>
<tr><td><code>CONNECTION_TYPE</code></td><td>Type
String
Description
The type of connection.
Possible Values
<code>CDMA1x</code>
<code>CDMA</code>
<code>EDGE</code>
<code>EVDO0</code>
<code>EVDOA</code>
<code>EVDOB</code>
<code>GPRS</code>
<code>HRPD</code>
<code>HSDPA</code>
<code>HSUPA</code></td></tr>
</table>

Field	Details
	• LTE • WIFI
DEVICE_ID	**Type** String **Description** The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that's created when the mobile app is initially run after installation.
DEVICE_MODEL	**Type** String **Description** The name of the device model. **Example** iPad, iPhone
DEVICE_PLATFORM	**Type** String **Description** The type of application experience in name:experience:form format. **Possible Values** Name • APP_BUILDER • CUSTOM • S1 • SFX Experience • BROWSER • HYBRID Form • DESKTOP • PHONE • TABLET
DEVICE_SESSION_ID	**Type** Id **Description** The unique identifier of the user's session based on page load time. When the user reloads a page, a new session is started.

Field	Details
	Example 321a1ddfaf924803a075f1e69fc87bc06f53ccd0
DURATION	**Type** Number **Description** The duration in milliseconds since the page start time.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always LightningPerformance.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a user's login session. It starts with a login event and ends with either a logout event or the user session expiring. **Example** GeJCsym5eyvtEK2I
ORGANIZATION_ID	**Type** String **Description** The 15-character ID of the org. **Example** 00D000000000123
OS_NAME	**Type** String **Description** The operating system name, derived from USER_AGENT. **Example** Android, iOS, OSX, Windows
OS_VERSION	**Type** String **Description** The operating system version, derived from USER_AGENT.
PAGE_START_TIME	**Type** Number

Field	Details
	Description The time when the page was initially loaded, measured in milliseconds. **Example** 1471564788642
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. **Example** 3nWgxWbDKWWDIk0FKfF5DV
SDK_APP_TYPE	**Type** String **Description** The mobile SDK application type. **Possible Values** • HYBRID • HYBRIDLOCAL • HYBRIDREMOTE • NATIVE • REACTNATIVE
SDK_APP_VERSION	**Type** String **Description** The mobile SDK application version number. **Example** 5.0
SDK_VERSION	**Type** String **Description** The mobile SDK version number. **Example** 2.1.0
SESSION_KEY	**Type** String

Field	Details
	Description The user's unique session ID. You can use this value to identify all events in Lightning Experience within a session. When the user logs out and logs in again, a new session is started. **Example** cdd09305cb6babf34059e27f70e47f1b11dec868
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`UI_EVENT_ID`	**Type** String **Description** Id of the Lightning event type. **Possible Values** • `ltng:error` • `ltng:interaction` • `ltng:pageView` • `ltng:performance`
`UI_EVENT_SOURCE`	**Type** String **Description** The user action on the record or records. This field's value indicates whether the user's action was on a single record or multiple records. For example, `read` indicates that one record was read (such as on a record detail page); `reads` indicates that multiple records were read (such as in a list view). **Examples** • click • create • delete

Field	Details
	• hover • read • update
UI_EVENT_TIMESTAMP	**Type** Number **Description** The time at which this event occurred, measured in milliseconds. **Example** 1479769912796
UI_EVENT_TYPE	**Type** String **Description** The type of interaction. **Examples** • crud — Created, read, updated, or deleted the record. • reads — Read multiple records.
USER_AGENT	**Type** String **Description** The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string.
USER_ID	**Type** String **Description** The 15-character ID of the user accessing Salesforce services through the UI or API. **Example** 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API. **Example** 00590000000I1SNIA0
USER_TYPE	**Type** String

Field	Details
	Description The category of user license of the user accessing Salesforce services through the UI or API. **Possible Values** • `A`: Automated Process • `b`: High Volume Portal • `C`: Customer Portal User • `D`: External Who • `F`: Self Service • `G`: Guest • `L`: Package License Manager • `N`: Salesforce to Salesforce • `n`: CSN Only • `O`: Power Custom • `o`: Custom • `P`: Partner • `p`: Customer Portal Manager • `S`: Standard • `X`: Salesforce Administrator

EventLogFile Supported Event Types
EventLogFile

Login Event Type

Login events contain details about your org's user login history.

Note: Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the *Platform Events Developer Guide*.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`API_TYPE`	**Type** String **Description** The type of API request. Possible values are:

	• `D`—Apex Class • `E`—SOAP Enterprise • `I`—SOAP Cross Instance • `M`—SOAP Metadata • `O`—Old SOAP • `P`—SOAP Partner • `S`—SOAP Apex • `T`—SOAP Tooling • `X`—XmlRPC • `f`—Feed • `l`—Live Agent • `p`—SOAP ClientSync
`API_VERSION`	**Type** String **Description** The version of the API that's being used. For example: `36.0`.
`AUTHENTICATION_METHOD_REFERENCE`	**Type** String **Description** The authentication method used by a third-party identification provider for an OpenID Connect single sign-on protocol. This field is available in API version 51.0 and later.
`BROWSER_TYPE`	**Type** String **Description** The identifier string returned by the browser used at login. Example values are: • `Go-http-client/1.1` • `Mozilla/5.0 (Macintosh; Intel Mac OS X 10.12; rv%3A50.0) Gecko/20100101 Firefox/50.0` • `Mozilla/5.0 (Macintosh; Intel Mac OS X 10_11_6) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/51.0.2704.84 Safari/537.36`
`CIPHER_SUITE`	**Type** String

Field	Details
	Description The TLS cipher suite used for the login. Values are OpenSSL-style cipher suite names, with hyphen delimiters. For more information, see OpenSSL Cryptography and SSL/TLS Toolkit.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `Login`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.

LOGIN_STATUS	**Type** String **Description** The status of the login attempt. For successful logins, the value is LOGIN_NO_ERROR. All other values indicate errors or authentication issues. For details, see Login Event Type — LOGIN_STATUS Values on page 1291.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**

`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For Login Event Type, this field is usually null because the event is captured before a session is created. **Example** d7DEq/ANa7nNZZVD
`SOURCE_IP`	**Type** IP **Description** The source IP of the login request.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TLS_PROTOCOL`	**Type** String **Description** The TLS protocol used for the login. **Example** There are 3 possible values. • 1.0 • 1.1

	• 1.2
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.
`USER_NAME`	**Type** String **Description** The username that's used for login.

Login Event Type — LOGIN_STATUS Values

When users attempt to log in to your org, the success or failure of their login attempts is tracked in event log file data. Specifically, the LOGIN_STATUS field in the Login event type contains the result of these login attempts. The data in LOGIN_STATUS can help you determine whether your users' login attempts were successful. This field is available in the Login event type in the EventLogFile object in API version 39.0 and later.

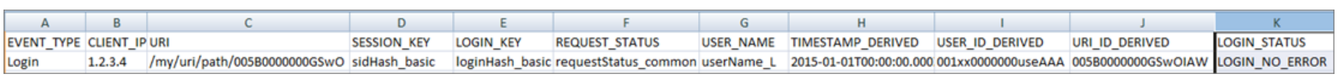
LOGIN_SAML_PROVISION_ERROR	Failed: SAML Provision Error
LOGIN_SAML_REPLAY_ATTEMPTED	Failed: Replay Detected
LOGIN_SAML_SITE_INACTIVE	Failed: Specified Site is Inactive
LOGIN_TWOFACTOR_REQ	Multi-factor (formerly called two-factor) is required

Usage

Use LOGIN_STATUS to determine whether your users' login attempts were successful. For example, you can determine whether a departed employee attempted to log in successfully or unsuccessfully.



A	B	C	D	E	F	G	H	I	J	K
EVENT_TYPE	CLIENT_IP	URI	SESSION_KEY	LOGIN_KEY	REQUEST_STATUS	USER_NAME	TIMESTAMP_DERIVED	USER_ID_DERIVED	URI_ID_DERIVED	LOGIN_STATUS

Login As Event Type

Login As events contain details about what a Salesforce admin did while logged in as another user.

Note: Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the *Platform Events Developer Guide*.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details

`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DELEGATED_USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.
`DELEGATED_USER_ID_DERIVED`	**Type** Id **Description** The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.
`DELEGATED_USER_NAME`	**Type** String **Description** The username of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `LoginAs`.
`LOGIN_KEY`	**Type** String

Field	Details
	Description The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Logout Event Type

Logout events contain details of user logouts.

Note: Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the *Platform Events Developer Guide*.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
API_TYPE	**Type** String **Description** The type of API request. Possible values are: • D—Apex Class • E—SOAP Enterprise • I—SOAP Cross Instance • M—SOAP Metadata • O—Old SOAP • P—SOAP Partner • S—SOAP Apex • T—SOAP Tooling • X—XmlRPC • f—Feed • l—Live Agent • p—SOAP ClientSync
API_VERSION	**Type** String **Description** The version of the API that's being used. For example: 36.0.
APP_TYPE	**Type** Number **Description** The application type that was in use upon logging out. **Example Values** • 1007: SFDC Application • 1014: Chat • 2501: CTI • 2514: OAuth • 3475: SFDC Partner Portal
BROWSER_TYPE	**Type** String

Field	Details
	Description The identifier string returned by the browser used at login. Example values are: • `Go-http-client/1.1` • `Mozilla/5.0 (Macintosh; Intel Mac OS X 10.12; rv%3A50.0) Gecko/20100101 Firefox/50.0` • `Mozilla/5.0 (Macintosh; Intel Mac OS X 10_11_6) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/51.0.2704.84 Safari/537.36`
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CLIENT_VERSION	**Type** Number **Description** The version of the client that was in use upon logging out.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `Logout`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`.

	Example
`PLATFORM_TYPE`	**Type** Number **Description** The code for the client platform. If a timeout caused the logout, this field is null. **Example Values** • `1000`: Windows • `2003`: Macintosh/Apple OSX • `5005`: Android • `5006`: iPhone • `5007`: iPad
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RESOLUTION_TYPE`	**Type** Number **Description** The screen resolution of the client. If a timeout caused the logout, this field is null.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`SESSION_LEVEL`	**Type** String **Description** The security level of the session that was used when logging out.

	Possible Values • `1`: Standard Session • `2`: High-Assurance Session
`SESSION_TYPE`	**Type** String **Description** The session type that was used when logging out. **Possible Values** • `A`: API • `I`: APIOnlyUser • `N`: ChatterNetworks • `Z`: ChatterNetworksAPIOnly • `C`: Content • `P`: OauthApprovalUI • `O`: Oauth2 • `T`: SiteStudio • `R`: SitePreview • `S`: SubstituteUser • `B`: TempContentExchange • `G`: TempOauthAccessTokenFrontdoor • `Y`: TempVisualforceExchange • `F`: TempUIFrontdoor • `U`: UI • `E`: UserSite • `V`: Visualforce • `W`: WDC_API
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`).

	For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.
`USER_INITIATED_LOGOUT`	**Type** Boolean **Description** The value is 1 if the user intentionally logged out of the organization by clicking the **Logout** button. If the user's session timed out due to inactivity or another implicit logout action, the value is 0.
`USER_TYPE`	**Type** String **Description** The category of user license of the user that logged out. **Possible Values** • `A`: Automated Process • `b`: High Volume Portal • `C`: Customer Portal User • `D`: External Who • `F`: Self-Service • `G`: Guest • `L`: Package License Manager • `N`: Salesforce to Salesforce • `n`: CSN Only • `O`: Power Custom • `o`: Custom • `P`: Partner

	- p: Customer Portal Manager - S: Standard - X: Salesforce Administrator

Metadata API Operation Event Type

Metadata API Operation events contain details of Metadata API retrieval and deployment requests.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
API_VERSION	**Type** String **Description** The version of the API that's being used. For example: 36.0.
CLIENT_ID	**Type** String **Description** The API client ID.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: 96.43.144.26.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `MetadataApiOperation`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`OPERATION`	**Type** String **Description** The operation that's being performed. **Possible Values** • `meta_deploy` • `meta_list` • `meta_retrieve` • `meta_synchronous_create` • `meta_synchronous_read` • `meta_synchronous_upsert`
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.

`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id

	Description The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile

Multiblock Report Event Type

Multiblock Report events contain details about Joined Report reports.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_TOTAL_TIME`	**Type** Number

Field	Details
	Description The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `MultiblockReport`.
`HAS_CHART`	**Type** Boolean **Description** True if the report has a chart.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`MASTER_REPORT_ID`	**Type** String **Description** The 15-character ID of the master report.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.

	For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • `N`—Not Found. 404 error. **Possible Values**
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types
EventLogFile

One Commerce Usage Event Type

One Commerce Usage events capture information about your Commerce instance. This event type is available in the EventLogFile object in API version 51.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
BROWSER_DEVICE_TYPE	**Type** Number **Description** A code used to identify the browser and device type. The code is in the format "BBVVVXYZ," with the following signification: • BB — Two digits that indicate the browser type. – IE: "10" – CHROME: "13" – FIREFOX: "11" – SAFARI: "14" – OPERA: "15" – ANDROID_WEBKIT: "16" – NETSCAPE: "17" – OTHER_WEBKIT: "18" – OTHER_GECKO: "19" – OTHER_KHTML: "20" – OTHER_MOBILE: "21" – SALESFORCE_DESKTOP: "22" – BLACKBERRY: "23" – GOOD_ACCESS: "24" – EDGE: "25" – SALESFORCE_MOBILE: "26" • VVV—Three digits that indicate version, leading zeroes. • XYZ—Browser-type specific flags or options. Each digit in XYZ represents a different flag depending on the BrowserType: – X=1: If the parser recognizes a "touch" browser. Here, touch means the older touch native client, not that the device supports touch. – Y=1: If the parser recognizes a browser in compatibility mode. Only for IE. – Z=1: If the browser is recognized as `MOBILE`. – Z=2: If the browser is recognized as `PHONE`. – Z=3: If the browser is recognized as `TABLET`. – Z=4: If the browser is a recognized as `MEDIA PLAYER`.

Field	Details
	– Z=6: Only for Opera Mini.
B2B_EDITION	**Type** String **Description** Edition of B2B Commerce. Edition can include Lightning (LB2B), CCRZ, or future flavors.
B2B_VERSION	**Type** String **Description** This field is optional. For the managed package, then B2B_VERSION includes Major, Minor, Patch revision numbers. For Lightning B2B_VERSION includes the optional service version.
CONTEXT_ID	**Type** String **Description** The contextId (Key Business Domain Value) in which the operation is done. For example, for Cart, the contextId is cartId.
CONTEXT_MAP	**Type** String **Description** This field is optional. It holds a JSON string with additional operational context.
CORRELATION_ID	**Type** String **Description** This field holds correlations, such as client to server and other asynchronous calls to B2B subsystems.
COUNT	**Type** String **Description** The number of records impacted by this operation.
EFFECTIVE_ACCOUNT_ID	**Type** String

Field	Details
	Description The B2B Effective Account ID in context of the operation.
ERROR_CODE	**Type** String **Description** The API error code that appears when an operation fails. If there is no error the value is `null`.
ERROR_MESSAGE	**Type** String **Description** Error message that appears when an operation fails. If there is no error the value is `null`.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always OneCommerceUsage.
IS_RETRY	**Type** String **Description** The field is `True` if the operation resulted in a retry, otherwise it's `False`. Understanding the frequency of operation retries helps determine the health of a service. The default value is `False`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
OPERATION	**Type** String **Description** The name of the B2B service. For example: `CreateCart` or `KeywordSearch`.

Field	Details
OPERATION_STAGE	**Type** String **Description** This field is optional. Used to capture more granular operation level stages.
OPERATION_STATE	**Type** String **Description** This field is optional. An enum for the state of the operation. For example: `CartLocked`, `OrderCancelled`, `InProgress`, `New`, `Update`, and `Pending`.
OPERATION_STATUS	**Type** String **Description** Enum with the outcome of the operation. For example: `Success` or `Fail`.
OPERATION_TIME	**Type** String **Description** Total time of the operation in milliseconds.
OS_VERSION	**Type** String **Description** Code used to identify the operating system and version. The value is equal to 9999 for an unknown platform.
SERVICE_NAME	**Type** String **Description** Enum of B2B Services. For example: `Cart`, `Pricing`, `Products`, `Order`, `Search`, and so on.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API.

Field	Details
	For example: `00530000009M943`
WEBSTORE_ID	**Type** String **Description** This field is optional. The ID of the webstore associated with the store (site).
WEBSTORE_TYPE	**Type** String **Description** The type of webstore. For example: `B2B`, `B2C`, and `OMS`.

EventLogFile Supported Event Types

EventLogFile

Package Install Event Type

Package Install events contain details about package installation in the organization.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

EVENT_TYPE	**Type** String **Description** The type of event. The value is always PackageInstall.
FAILURE_TYPE	**Type** String **Description** A general categorization of any error that's encountered.
IS_MANAGED	**Type** Boolean **Description** True if the operation is performed on a managed package.
IS_PUSH	**Type** Boolean **Description** True if the package was installed as a result of a push upgrade.
IS_RELEASED	**Type** Boolean **Description** True if the operation is performed on a released package.
IS_SUCCESSFUL	**Type** Boolean **Description** True if the package was successfully installed.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.
OPERATION_TYPE	**Type** String **Description** The type of package operation.

	Possible Values • INSTALL • UPGRADE • EXPORT • UNINSTALL • VALIDATE_PACKAGE • INIT_EXPORT_PKG_CONTROLLER
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: 00D000000000123. **Example**
PACKAGE_NAME	**Type** String **Description** The name of the package that's being installed.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.

TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

	For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Platform Encryption Event Type

Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`ACTION`	**Type** String **Description** The name and type of the event. **Possible Values** • TS Imported: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, imported by a customer. • TS Generated: A tenant secret generated by the Shield Key Management Service (KMS). • Key Derived: An encryption key derived from a tenant secret for encryption or decryption. • TS Wrapped: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, encrypted for storage. • Key Delivered: A data encryption key delivered for encryption or decryption. • TS Stored: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, stored encrypted in the database. • TS Read: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted customer-supplied key material, that is loaded for encryption or decryption. • TS Unwrapped: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted

customer-supplied key material, unwrapped for use by the KMS.

- TS Exported: An encrypted tenant secret exported by a customer.
- TS Destroyed: A tenant secret and related data encryption key destroyed by a customer.

`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `PlatformEncryption`.
`KEY_ID`	**Type** String **Description** The 15-character ID of the tenant secret. **Example** 02GD000000096Cb
`KEY_ID_DERIVED`	**Type** String **Description** The 18-character ID of the derived encryption key. **Example** 02GD000000096CbMAI
`KEY_TYPE`	**Type** String

	Description The type of tenant secret. **Possible Values** • Data • DeterministicData • EinsteinAnalytics • SearchIndex
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`METHOD`	**Type** String **Description** The string that identifies a change in tenant secret Active state. For example, tenant secrets become active when they are created, and are made inactive when they are exported. **Examples** • TS Exported: User ID • TS Generated: HSM or BYOK • TS Unwrapped: Tenant Secret or BYOK
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.

`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id

	Description The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types

EventLogFile

Queued Execution Event Type

Queued Execution events contain details about queued executions—for example, batch Apex.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds that it took to complete the batch apex request. This field indicates the amount of activity taking place in the app server layer, allowing you to identify pieces of Apex or Visualforce code that need refactoring.
`DB_TOTAL_TIME`	**Type** Number

Field	Details
	Description The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`ENTRY_POINT`	**Type** String **Description** The name of the Apex class that serves as the execution point for the batch job. **Example** TaskPhoneExtensionBatchUpdate
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `QueuedExecution`.
`JOB_ID`	**Type** String **Description** The ID of the batch Apex job. **Example** 7073000000lDquo
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**

Field	Details
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.

Field	Details
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Field	Details
	For example: 00590000000I1SNIA0.

SEE ALSO:

EventLogFile Supported Event Types

EventLogFile

Report Event Type

Report events contain information about what happened when a user ran a report. This event type includes all activity that's in the Report Export event type, plus more. For example, it has user activity for reports exported as both Formatted Report and Details Only output.

Note: Exporting a report directly from the report result captures the event in both the Report and Report Export logs.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
AVERAGE_ROW_SIZE	**Type** Number **Description** The average row size of all rows in the Report event, in bytes. A large average size, coupled with a high ROW_COUNT, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor. **Example** 700
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: 96.43.144.26.
CPU_TIME	**Type** Number

	Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_BLOCKS	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
DB_CPU_TIME	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and DB_CPU_TIME. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.
DISPLAY_TYPE	**Type** String **Description** The report display type, indicating the run mode of the report. Possible values are: • D—Dashboard • S—Show Details • H—Hide Details
ENTITY_NAME	**Type** String **Description** The name of the object affected by the trigger.
EVENT_TYPE	**Type** String

Field	Details
	Description The type of event. The value is always `Report`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`NUMBER_BUCKETS`	**Type** Number **Description** The number of buckets that were used in the report.
`NUMBER_COLUMNS`	**Type** Number **Description** The number of columns in the report.
`NUMBER_EXCEPTION_FILTERS`	**Type** Number **Description** The number of exception filters that are used in the report.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`ORIGIN`	**Type** String **Description** The context in which the report executed, such as from a UI (Classic, Lightning, Mobile), through an API (synchronous, asynchronous, Apex), or through a dashboard. **Possible Values** • `ReportOpenedFromMobileDashboard`: Report executed when a user clicked a dashboard component on a mobile device and drilled down to a report.

- `DashboardComponentUpdated`: Report executed when a user refreshed a dashboard component.
- `DashboardComponentPreviewed`: Report executed from a Lightning dashboard component preview.
- `ReportRunUsingSynchronousApi`: Report executed from a synchronous API.
- `ReportRunUsingAsynchronousApi`: Report executed from an asynchronous API.
- `ReportRunUsingApexSynchronousApi`: Report executed from the synchronous Apex API.
- `ReportRunUsingApexAsynchronousApi`: Report executed from the asynchronous Apex API.
- `ReportExported`: Report executed from a printable view or report export that was not asynchronous nor an API export.
- `ReportRunFromClassic`: Report executed from the Run Report option of Salesforce Classic.
- `ReportRunFromMobile`: Report executed from the Run Report option of the mobile Salesforce app.
- `ReportRunFromLightning`: Report executed from the Run option in Lightning Experience from a non-mobile browser.
- `ReportRunFromRestApi`: Report executed from REST API.
- `ReportPreviewed`: Report executed when a user got preview results while using the report builder.
- `ReportScheduled`: Report was scheduled.
- `ProbeQuery`: Report executed from a probe query.
- `ReportRunFromReportingSnapshot`: Report executed through Snapshot Analytics.
- `ReportExportedAsynchronously`: Report was exported asynchronously.
- `ReportExportedUsingExcelConnector`: Report was exported using the Excel connector.
- `ChartRenderedOnVisualforcePage`: Report executed from a rendered chart on a VisualForce Page.
- `ChartRenderedInEmbeddedAnalyticsApp`: Report executed from a rendered chart in an embedded Analytics app.
- `ReportRunAndNotificationSent`: Report executed through the notifications API.
- `ChartRenderedOnHomePage`: Report executed from a rendered chart on the home page.

- `ReportResultsAddedToWaveTrending`: Report executed when a user trended a report in Einstein Analytics.
- `ReportAddedToCampaign`: Report was added from an Add to Campaign action.
- `ReportResultsAddedToEinsteinDiscovery`: Report executed synchronously from Einstein Discovery.
- `Unknown`: Report execution origin is unknown.
- `Test`: Report execution resulted from a test.

`RENDERING_TYPE`	**Type** String **Description** Describes the format of the report output in Salesforce Classic. If the report was exported in Lightning Experience, this field is blank. **Possible Values** • `W`: Web (HTML) • `E`: Email • `P`: Printable • `X`: Excel • `C`: Comma-separated values (CSV) • `J`: JavaScript Object Notation (JSON) • `D`: Dummy data
`REPORT_ID`	**Type** Id **Description** The 15-character ID of the report that was run.
`REPORT_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the report that was run.
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.

REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
ROW_COUNT	**Type** Number **Description** The number of rows that were processed in the Report event. High row counts, coupled with a high AVERAGE_ROW_SIZE, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor. **Example** 150
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.

SORT	**Type** String **Description** The sort column and order that was used in the report.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

For example: `00590000000I1SNIA0`.

Usage

Example: Identify Large Report Exports by User

Get Report event type data from the EventLogFile object using REST:

```
/services/data/v40.0/query?q=SELECT+Id+,+EventType+,+LogFile+,+LogDate+,+LogFileLength+FROM+EventLogFile+WHERE+

    LogDate+>+Yesterday+AND+EventType+=+'Report'
```

After you download the report data to a ReportData database table, query it and filter on reports that were exported with high row counts and size:

```
SELECT USER_ID FROM ReportData WHERE (RENDERING_TYPE=C OR RENDERING_TYPE=X OR
RENDERING_TYPE=P) AND ROW_COUNT>150000 AND AVERAGE_ROW_SIZE>1500
```

EventLogFile Supported Event Types
EventLogFile

Report Export Event Type

Report Export events contain details about reports that a user exported. For example, this event type captures when a user exports a report as Details Only output. But it doesn't capture reports that users export as Formatted Report output. For that data, see the Report event type.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CLIENT_INFO`	**Type** String **Description** Information about the client that's using Salesforce services.

`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `ReportExport`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REPORT_DESCRIPTION`	**Type** String **Description** Information about the report that was run.
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RUN_TIME`	**Type** Number

	Description The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`

Field	Details
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.

EventLogFile

REST API Event Type

REST API events contain details about REST-specific requests.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: 96.43.144.26.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_BLOCKS	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

Field	Details
DB_CPU_TIME	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
ENTITY_NAME	**Type** Set **Description** API objects that are accessed. For example: `Account`, `Opportunity`, `Contact`, and so on.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `RestApi`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
MEDIA_TYPE	**Type** String **Description** The media type of the response.
METHOD	**Type** String

	Description The HTTP method of the request. For example: `GET`, `POST`, `PUT`, and so on.
`NUMBER_FIELDS`	**Type** Number **Description** The number of fields or columns, where applicable.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REQUEST_SIZE`	**Type** Number **Description** The size of the callout request body, in bytes.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • `N`—Not Found. 404 error. **Possible Values**
`REQUEST_ID`	**Type** String

Field	Details
	Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RESPONSE_SIZE`	**Type** Number **Description** The size of the callout response, in bytes.
`ROWS_PROCESSED`	**Type** Number **Description** The number of rows that were processed in the request. For example: `150`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`STATUS_CODE`	**Type** Number **Description** The HTTP status code for the response.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime

	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_AGENT`	**Type** Number **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API).
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

Sandbox Event Type

Sandbox events contain details about sandbox copies.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CURRENT_SANDBOX_ORG_ID	**Type** Id **Description** The 15-character ID of the current sandbox organization.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `Sandbox`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
PENDING_SANDBOX_ORG_ID	**Type** Id **Description** The 15-character ID of the target sandbox org.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
SANDBOX_ID	**Type** Id **Description** The 15-character ID of the sandbox organization.

STATUS	**Type** String **Description** The status of the sandbox copy.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

EventLogFile Supported Event Types
EventLogFile

Search Event Type

Search events contain details about the user's search query. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won't have a unique Salesforce user ID.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `Search`.
`NUM_RESULTS`	**Type** Number **Description** Number of results returned by the search query. **Possible Values** • 0 • 25 • 1000
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`PREFIXES_SEARCHED`	**Type** String **Description** Space-separated list of key prefixes that were searched. **Example** 001 006 ka0
`QUERY_ID`	**Type** String **Description** Unique ID of the search query. **Example** -2vx8relit08r
`REQUEST_ID`	**Type** String

	Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
SEARCH_QUERY	**Type** String **Description** The first 100 characters of the search query. **Example** Salesforce
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.
USER_ID	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.

EventLogFile

Search Click Event Type

Search Click events contain details about the user's interaction with the search results. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won't have a unique Salesforce user ID.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLICKED_RECORD_ID`	**Type** String **Description** The 15-character ID of the result the user clicked in the search results page. **Example** a07B00000031pRV
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `SearchClick`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`QUERY_ID`	**Type** String **Description** Unique ID of the search query. **Example** -2vx8relit08r
`RANK`	**Type** Number **Description** Ranking of the result clicked in the search results page. **Example** 2
`REQUEST_ID`	**Type** String

	Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.
USER_ID	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.

EventLogFile

Sites Event Type

Sites events contain details of Site.com requests. Requests can originate from the browser (UI).

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String

	Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`DB_TOTAL_TIME`	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `Sites`.
`HTTP_HEADERS`	**Type** String **Description** The HTTP headers that were sent in the request.
`HTTP_METHOD`	**Type** String **Description** The HTTP method of the request. For example: `GET`, `POST`, `PUT`, and so on.
`IS_API`	**Type** Boolean **Description** True if this page was an API or Web Services request.

`IS_ERROR`	**Type** Boolean **Description** True if this page was an error page.
`IS_FIRST_REQUEST`	**Type** Boolean **Description** 1 if this page is the first Visualforce transaction in the request, or 0 if it isn't.
`IS_GUEST`	**Type** Boolean **Description** True if this page was a guest (unauthenticated) request.
`IS_SECURE`	**Type** Boolean **Description** True if this request is secure.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`PAGE_NAME`	**Type** String **Description** The name of the Visualforce page that was requested.
`QUERY`	**Type** String

	Description The SOQL query, if one was performed.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
REQUEST_STATUS	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • U—Undefined • A—Authorization Error • R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • N—Not Found. 404 error. **Possible Values**
REQUEST_TYPE	**Type** String **Description** The request type. Possible values are: • page—a normal request for a page • content_UI—a content request for a page that originated in the user interface • content_apex—a content request initiated by an Apex call • PDF_UI—a request for a page in PDF format through the user interface

Field	Details
	• `PDF_apex`—a request for PDF format by an Apex call (usually a Web Service call)
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`SITE_ID`	**Type** Id **Description** The 15-character ID of the Site.com site.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID

	Description The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

Time-Based Workflow Event Type

Time-Based Workflow events contain details about queue activity monitoring.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number

Field	Details
	Description The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DATA	**Type** String **Description** The record details of time queue activity.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `TimeBasedWorkflow`.
LOG_GROUP_ID	**Type** String **Description** Marks log records that are committed or rolled back.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
NUMBER_OF_RECORDS	**Type** Number **Description** The number of processed records.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
REQUEST_ID	**Type** String

	Description The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TYPE`	**Type** String **Description** The type of time-based workflow event. • `UIDEL`—An entry was deleted from the Time-Based Workflow page in Setup. • `ERRDEL`—An entry was deleted from the workflow queue, because there was an error reading the record that triggered the workflow rule. The associated time-dependent actions weren't processed.

Field	Details
	• `DELETE`—An entry was deleted from the workflow queue, because it's no longer relevant. For example, the criteria are no longer met by the associated record. If the evaluation date for the entry changed, the entry is re-added with the updated evaluation date. • `PROC`—An entry was deleted from the workflow queue after processing a time-dependent action.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `0059000000I1SNIA0`.

Transaction Security Event Type

Transaction Security events contain details about policy execution.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
EVALUATION_TIME_MS	**Type** Number **Description** The time in milliseconds used to evaluate the policy.
EVENT_TIMESTAMP	**Type** String **Description** The time at which the Transaction Security event was generated in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). This value can be earlier than TIMESTAMP_DERIVED by the amount of time taken to log the event. For example: `2015-07-27T11:32:59.555Z`.
EVENT_TYPE	**Type** String

	Description The type of event. The value is always `TransactionSecurity`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`POLICY_ID`	**Type** Id **Description** The 15-character ID of the policy being evaluated. For example: `00530000009M943`
`POLICY_ID_DERIVED`	**Type** Id **Description** The 18-character case-insensitive ID of the policy being evaluated. For example: `00590000000I1SNIA0`
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.

	For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RESULT`	**Type** String **Description** The outcome of evaluating the policy. For example: `TRIGGEREDzzz` or `NOT TRIGGERED`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.

`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

URI Event Type

URI events contain details about user interaction with the web browser UI.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_BLOCKS	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
DB_CPU_TIME	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
DB_TOTAL_TIME	**Type** Number **Description** The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
EVENT_TYPE	**Type** String

Field	Details
	Description The type of event. The value is always `URI`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`REFERRER_URI`	**Type** String **Description** The referring URI of the page that's receiving the request.
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are: • `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.

- U—Undefined
- A—Authorization Error
- R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- N—Not Found. 404 error.

Possible Values

RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. For more granular URI information for Lightning Experience and the Salesforce app, see the Lightning Error, Lightning Interaction, Lightning Page View, and Lightning Performance event types.

Field	Details
	Examples `/aura` (Lightning Experience), `/lightning` (Lightning Experience and the Salesforce app), `/home/home.jsp` (Salesforce Classic)
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `005900000001lSNIA0`.

Visualforce Request Event Type

Visualforce Request events contain details of Visualforce requests. Requests can originate from the browser (UI).

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
`CLIENT_IP`	**Type** String

Field	Details
	Description The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CONTROLLER_TYPE	**Type** Number **Description** The type of controller that's used by the requested Visualforce page. **Possible Values** • `0`: NOT_SPECIFIED • `1`: STANDARD • `2`: STANDARD_SET • `3`: CUSTOM • `4`: JAVA • `5`: SPRING
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DB_BLOCKS	**Type** Number **Description** Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
DB_CPU_TIME	**Type** Number **Description** The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.
DB_TOTAL_TIME	**Type** Number

Field	Details
	Description The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `VisualforceRequest`.
`HTTP_METHOD`	**Type** String **Description** The HTTP method of the request. For example: `GET`, `POST`, `PUT`, and so on.
`IS_AJAX_REQUEST`	**Type** Boolean **Description** The value is `true` if the request is a partial page request.
`IS_FIRST_REQUEST`	**Type** Boolean **Description** 1 if this page is the first Visualforce transaction in the request, or 0 if it isn't.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
`MANAGED_PACKAGE_NAMESPACE`	**Type** String **Description** If the page is part of a managed package, the namespace of that package.

`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
`PAGE_NAME`	**Type** String **Description** The name of the Visualforce page that was requested.
`QUERY`	**Type** String **Description** The query string used to access the requested Visualforce page. **Example** Let's assume that the requested Visualforce page (`/apex/myAccountDetailPage?id=001xx000003GYv6AAG`) shows details of the account whose ID is in the URL. The value of `QUERY` in this case is `?id=001xx000003GYv6AAG`.
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`REQUEST_SIZE`	**Type** Number **Description** The size of the request body, in bytes. Value is -1 if the request body content is larger than 2GB, or if the request has no body (for example, a typical GET request).
`REQUEST_STATUS`	**Type** String **Description** The status of the request for a page view or user interface action. Possible values are:

	• `S`—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned. • `F`—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only. • `U`—Undefined • `A`—Authorization Error • `R`—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page. • `N`—Not Found. 404 error. **Possible Values**
`REQUEST_TYPE`	**Type** String **Description** The request type. Possible values are: • `page`—a normal request for a page • `content_UI`—a content request for a page that originated in the user interface • `content_apex`—a content request initiated by an Apex call • `PDF_UI`—a request for a page in PDF format through the user interface • `PDF_apex`—a request for PDF format by an Apex call (usually a Web Service call)
`RESPONSE_SIZE`	**Type** Number **Description** The size of the response, in bytes.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String

Field	Details
	Description The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_AGENT`	**Type** Number **Description** The numeric code for the type of client used to make the request (for example, the browser, application, or API).
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API.

	For example: 00530000009M943
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.
VIEW_STATE_SIZE	**Type** Number **Description** The size of the Visualforce view state, in bytes.

SEE ALSO:

EventLogFile Supported Event Types

EventLogFile

Wave Change Event Type

Wave Change events represent route or page changes made in the Salesforce Einstein Analytics user interface. A Wave Change event type is captured every time the user opens a new Analytics asset or tab or switches between tabs. Wave Change events are logged when opening new tabs and switching back to previously opened tabs.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
ANALYTICS_MODE	**Type** String **Description** The location in which the dashboard is displayed. In the Salesforce mobile app, embedded dashboards are logged as embedded first. When a user interacts with the dashboard, a full screen dashboard is displayed to allow for user interaction, and is logged as mobileNative. Possible values are: • studio—Analytics Studio • tab—Analytics tab

	• `embedded`— Embedded in Aura or Lightning. • `mobileNative`— Analytics mobile app for iOS/Android or Salesforce mobile app for iOS/Android
`CLIENT_IP`	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
`CPU_TIME`	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
`EVENT_TYPE`	**Type** String **Description** The type of event. The value is always `WaveChange`.
`IS_MOBILE`	**Type** Boolean **Description** If `true`, the dashboard is displayed in the Analytics mobile app for iOS and Android, in the Salesforce mobile app for iOS and Android, or in a mobile browser.
`IS_NEW`	**Type** Boolean **Description** The field indicates that this action opens a new tab or goes back to a previously opened tab. If the change routes to a

	new page, the value of this field is true. If it routes to an existing page, this field is false.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`.
PAGE_CONTEXT	**Type** String **Description** The context of the page in which the dashboard is displayed. In the Salesforce mobile app, embedded dashboards are logged as `aura` first. When a user interacts with the dashboard, a full screen dashboard is displayed to allow for user interaction, and is logged as `iOS` or `android`. Possible values are: • `aura`—Lightning Components • `vf`—Visualforce • `iOS`— Analytics or Salesforce mobile app for iOS • `android`— Analytics or Salesforce mobile app for Android
RECORD_ID	**Type** String **Description** The Salesforce ID of the Analytics object.

REOPEN_COUNT	**Type** Number **Description** If IS_NEW is false, the number of times that an existing page opens.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.
TAB_ID	**Type** String **Description** The ID of the particular Analytics tab in the user interface. For example: dashboard-0FKB0000000Ec64GDK.
TIMESTAMP	**Type** String

	Description The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TYPE`	**Type** String **Description** The Analytics object type.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`.

USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0.
WAVE_SESSION_ID	**Type** String **Description** The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.
WAVE_TIMESTAMP	**Type** Number **Description** The time at which this log line was generated.

EventLogFile

Wave Download Event Type

Wave Download events represent downloads made from lens explorations and dashboard widgets in the Salesforce Einstein Analytics user interface. A Wave Download event type is captured when a user downloads images (.png), Microsoft® Excel® data (.xls), or comma-separated values (.csv) files.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
ASSET_ID	**Type** ID **Description** The ID of the asset the user downloads from.

Field	Details
ASSET_TYPE	**Type** String **Description** The type of the asset the user downloads from. **Values** • Lens—A *lens* is a view into a dataset used in an exploratory mode or to get insight to a specific business question. The lens can be saved and shared independently. It can also be clipped to a dashboard. • Dashboard—A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". **Example** 96.43.144.26
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
DATASET_IDS	**Type** String **Description** Comma-separated list of IDs of utilized data sets.
DOWNLOAD_FORMAT	**Type** String **Description** The data format of the export. **Values** • png—Image • csv—Comma-separated values • xls— Microsoft Excel
EVENT_TYPE	**Type** String

Field	Details
	Description The type of event. The value is always `WaveChange`.
`LOGIN_KEY`	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. **Example** GeJCsym5eyvtEK2I
`NUMBER_OF_RECORDS`	**Type** Number **Description** The number of records exported.
`ORGANIZATION_ID`	**Type** Id **Description** The 15-character ID of the organization. **Example** 00D000000000123
`REQUEST_ID`	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`. **Example** 3nWgxWbDKWWDIk0FKfF5DV
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

Field	Details
	Example d7DEq/ANa7nNZZVD
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
TIMESTAMP_DERIVED	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
URI	**Type** String **Description** The URI of the page that's receiving the request. **Example** `/home/home.jsp`
URI_ID_DERIVED	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
USER_ID	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. **Example** `00530000009M943`
USER_ID_DERIVED	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

Field	Details
	Example 0059000000I1SNIA0
USER_TYPE	**Type** String **Description** The type of Salesforce user.
WAVE_SESSION_ID	**Type** String **Description** The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.
WAVE_TIMESTAMP	**Type** Number **Description** The time at which this log line was generated.

Wave Interaction Event Type

Wave Interaction events represent route or page changes made in the Salesforce Einstein Analytics user interface. A Wave Interaction event type is captured when a tab is closed. It also collates the interaction statistics over the life of the tab, including total open time, read time, and so on. These statistics are aggregated as you go to other tabs and return, and logged only once when the tab is closed.

Note: Because Wave Interaction events are logged only when the tab or browser window is closed, these events might not match Wave Change events exactly if a user allows their Salesforce session to time out before closing.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: 96.43.144.26.

CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
EVENT_TYPE	**Type** String **Description** The type of event. The value is always `WaveInteraction`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
NUM_CLICKS	**Type** Number **Description** The number of clicks performed on a page in the Analytics user interface.
NUM_SESSIONS	**Type** Number **Description** The number of times a user returned to a particular page.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
READ_TIME	**Type** Number **Description** The amount of time a user spent on a particular tab.

RECORD_ID	**Type** String **Description** The Salesforce ID of the Analytics object.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKfF5DV.
RUN_TIME	**Type** Number **Description** The amount of time that the request took in milliseconds.
SESSION_KEY	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.
TAB_ID	**Type** String **Description** The ID of the particular Analytics tab in the user interface. **Example** dashboard-0FKB0000000Ec64GDK
TIMESTAMP	**Type** String **Description** The access time of Salesforce services in GMT. For example: 20130715233322.670.
TIMESTAMP_DERIVED	**Type** DateTime

Field	Details
	Description The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TOTAL_TIME`	**Type** Number **Description** The total amount of time a tab was open in milliseconds.
`TYPE`	**Type** String **Description** The Analytics object type.
`URI`	**Type** String **Description** The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.

WAVE_SESSION_ID	**Type** String **Description** The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.
WAVE_TIMESTAMP	**Type** Number **Description** The time at which this log line was generated.

Wave Performance Event Type

Wave Performance events help you track trends in your Analytics performance.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field	Details
CLIENT_IP	**Type** String **Description** The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP". For example: `96.43.144.26`.
CPU_TIME	**Type** Number **Description** The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.
EPT	**Type** Number **Description** The experienced page time in milliseconds.

EVENT_TYPE	**Type** String **Description** The type of event. The value is always `WavePerformance`.
LOGIN_KEY	**Type** String **Description** The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: `GeJCsym5eyvtEK2I`.
NAME	**Type** String **Description** The asset title or query string.
ORGANIZATION_ID	**Type** Id **Description** The 15-character ID of the organization. For example: `00D000000000123`. **Example**
QUERY_ID	**Type** String **Description** This field is deprecated in API version 50.0. The number of queries can be determined using the Uri Event type logs, referenced here on page 1359
RECORD_ID	**Type** String **Description** The Salesforce ID of the Analytics object.
REQUEST_ID	**Type** String **Description** The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same `REQUEST_ID`.

Field	Details
	For example: `3nWgxWbDKWWDIk0FKfF5DV`.
`RUN_TIME`	**Type** Number **Description** The amount of time that the request took in milliseconds.
`SESSION_KEY`	**Type** String **Description** The user's unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: `d7DEq/ANa7nNZZVD`.
`TAB_ID`	**Type** String **Description** The ID of the particular Analytics tab in the user interface. **Example** dashboard-0FKB0000000Ec64GDK
`TIMESTAMP`	**Type** String **Description** The access time of Salesforce services in GMT. For example: `20130715233322.670`.
`TIMESTAMP_DERIVED`	**Type** DateTime **Description** The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`). For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.
`TYPE`	**Type** String **Description** The Analytics object type.
`URI`	**Type** String

	Description The URI of the page that's receiving the request. For example: `/home/home.jsp`.
`URI_ID_DERIVED`	**Type** ID **Description** The 18-character case insensitive ID of the URI of the page that's receiving the request.
`USER_ID`	**Type** Id **Description** The 15-character ID of the user who's using Salesforce services through the UI or the API. For example: `00530000009M943`
`USER_ID_DERIVED`	**Type** Id **Description** The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API. For example: `00590000000I1SNIA0`.
`WAVE_SESSION_ID`	**Type** String **Description** The ID of a particular session of Analytics. Use this field to determine which log lines originated from a particular session.
`WAVE_TIMESTAMP`	**Type** Number **Description** The time at which this log line was generated.

SEE ALSO:

EventLogFile Supported Event Types

EventLogFile

EventRelation

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

EventRelation allows a variable number of relationships and handles deleted events differently, depending on whether Shared Activities is enabled.

A non-recurring event can have up to 1,000 invitees. A recurring event can have up to 100 invitees.

If Shared Activities Isn't Enabled

- EventRelation records only represent invitees (contacts, users, and resources).
- An event can be related to one contact or lead.

If Shared Activities Is Enabled

- EventRelation records can represent:
  - Invitees (`IsInvitee=` is set to `true`)

    OR

  - Related contacts or lead (`IsParent` is set to `true`)
- An event can be related to up to 50 contacts or one lead. These people may or may not be invitees. The number of allowed invitees is not affected by the number of related contacts. If a contact or lead is also an invitee, there is one EventRelation record for that person with `IsInvitee` and `IsParent` are set to `true`.
- An event can be related to a lead, contact, resource, account, or opportunity.
- An event can be related to a custom object that has the `HasActivities` attribute set to `true`.
- If you delete an event, then relations between the event and any specified contacts, leads, and other records are also deleted.
- If you delete the EventRelation record representing a relation then the corresponding relation field may be cleared on the event.
- If you delete the EventRelation record representing the `WhoId` on an event, then another Who, if any, from the event's `EventWhoIds` field will be promoted to the `WhoId`.
- If you restore a deleted event, relations between the event and any specified contacts, leads, and records are also restored. The `WhoId`, `WhatId`, and `AccountId` field values are recalculated using the field values on EventRelation.

Whether or not Shared Activities is enabled, an event can be related to one other kind of record, such as an account, an opportunity, or a custom object.

Note:

- With API versions 26.0 and later, the EventRelation object replaces the EventAttendee object, and the EventAttendee object is no longer visible. You can still query the EventAttendee object using packages that support API versions 25.0 and earlier, or by using Apex.
- An EventRelation object can't be created for a child event.
- EventRelation includes deactivated users.
- In API versions 25.0 and earlier, you can't use `query()`, `delete()`, or `update()` with events related to more than one contact.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Contains the Account ID of the relation. For information on IDs, see ID Field Type. `AccountId` is visible when Shared Activities is enabled.
`EventId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Contains the ID of the event. This value can't be changed after it's been specified.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.
`IsInvitee`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the relation is an invitee. • `IsInvitee` is visible while Shared Activities is being enabled, after it has been enabled, and while it is being disabled. • `IsInvitee` defaults to `true` while Shared Activities is being enabled, after it has been enabled, and while it is being disabled if `IsInvitee`, `IsParent`, and `IsWhat` are not set. This configuration ensures compatibility when Shared Activities isn't enabled and EventRelation represents event invitees only.

Field	Details
	• `IsInvitee` defaults to `false` when Shared Activities is enabled if `IsParent` is set to `true`.
`IsParent`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** `IsParent` is visible only when Shared Activities is enabled. When `false`, indicates that the relation is an invitee (a contact, lead, or user). When `true`, indicates that the relation is a Who or What, as determined by `IsWhat` field.
`IsWhat`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** `IsWhat` is visible only when Shared Activities is enabled. The value is relevant only if `IsParent` is `true`. When `IsWhat` is `true`, the relation specified by `RelationId` is a What (an account, opportunity, custom object, etc.). When `IsWhat` is `false`, the relation specified by `RelationId` is a Who (a contact, lead, or user).
`RelationId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Contains the ID of the person (User, Contact, or Lead) or the resource invited to an event. When Shared Activities is enabled, `RelationId` can also contain the ID of an account, opportunity, or other object related to an event. This value can’t be changed after it’s been specified.
`RespondedDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the most recent date and time when the invitee responded to an invitation to an event.
`Response`	**Type** string

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Contains optional text that the invitee can enter when responding to an invitation to an event.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the invitee status with one of the following values: • `New`: Invitee has received the invitation but hasn't yet responded. This value is the default. • `Declined`: Invitee has declined the invitation. • `Accepted`: Invitee has accepted the invitation. Note: `Uninvited` and `Maybe` aren't currently supported.

Usage

- Invitee related lists display slightly different content. In the Salesforce mobile app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in the Salesforce mobile app, use the following API queries.

  If you use Shared Activities in your Salesforce org, use this query:

  ```
  SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
  ```

  where *`Event_Id`* is the child event's ID.

  If you don't use Shared Activities, use this query:

  ```
  SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
  ```

  These queries get the main event's relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

Assigning resource attendance status

You can add a resource to an event only when the resource is available. The only attendance status that can be assigned to resources is Accepted. Events can't be saved when resources you've added aren't available.

Create an invitee if Shared Activities is enabled (or during the process of enabling it or rolling back)

If the invitee is already a contact or lead, update `IsInvitee to true`.

If the invitee is not already a contact or lead, create an EventRelation object for the invitee with `IsInvitee` set to `true`.

Create an invitee if Shared Activities is not enabled

Create an EventRelation object for the invitee.

Insert a contact or lead relation

```
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
    RelationId = '003D000000Q8aeV', isParent = true, isInvitee = false);
insert er;
```

Determine what events a given invitee is attending

To determine all the events that a particular person is attending during a given time period (for example, next week), you can have a client application query the Event object for a given date range, iterate through the results, and, for each event, query the EventRelation object to determine whether the particular person (`RelationId`) has accepted an invitation to that event.

Insert an invitee relation

If `isParent`, `isWhat` and `IsInvitee` are not set, and `RelationId` is a contact, lead, user, or calendar, `IsInvitee` defaults to `true`. This means if an EventRelation isn't specifically inserted as a relation to a contact or lead, it's treated as an Invitee relation by default.

```
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
    RelationId = '003D000000Q8adV');
insert er;
```

Query relations to a contact or a lead

```
List<EventRelation> whoRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD0000005zijD' AND isParent = true AND isWhat =
false];
```

Query invitee relations

```
List<EventRelation> inviteeRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD0000005zijD' AND isInvitee = true];
```

Update an invitee relation to a contact or lead invitee relation

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD0000005zijD' AND isInvitee = true and isParent = false LIMIT 1];
er.isParent = true;
update er;
```

Update a contact or lead relation to a contact or lead invitee relation

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD0000005zijD' AND isParent = true and isInvitee = false LIMIT 1];
er.isInvitee = true;
update er;
```

Reproduce invitee related list functionality in the Salesforce mobile app

Invitee related lists display slightly different content in the Salesforce mobile app and the full site. In the app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner.

If you use Shared Activities in your Salesforce org, use the following query to reproduce the full site functionality in the Salesforce mobile app:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where *`Event_Id`* is the child event's ID.

If you don't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event's relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

Send email notifications

To send email notifications for a given event, query EventRelation for the event, iterate through the list, examine the status, and send email notifications to every person who accepted the invitation.

Syncing Events with Lightning Sync

Attendee statuses (Accepted or Maybe, Declined, or No Response) sync from Microsoft® Exchange or Google to Salesforce, but not from Salesforce to Exchange or Google. Be wary of creating API flows that update attendee status in Salesforce for users set up to sync both ways. Eventually the original Exchange or Google status overrides the update made in Salesforce.

SEE ALSO:

Event

EventWhoRelation

Object Basics

EventBusSubscriber

Represents a trigger, process, or flow that's subscribed to a platform event or a change data capture event. Doesn't include CometD subscribers.

Supported Calls

`describeSObjects()`, `query()`

Special Access Rules

EventBusSubscriber is read only and can only be queried. As of Summer '20 and later, only your Salesforce org's internal users can access this object.

Fields

Field	Details
`ExternalId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the subscriber. For example, the trigger ID.

Field	Details
LastError	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The error message that the last thrown `EventBus.RetryableException` contains. This field applies to Apex triggers only. Available in API version 43.0 and later.
Name	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the subscribed item, such as the trigger or process name. If the subscribed item's name is "Process", at least one flow Pause element is subscribed to the event.
Position	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The replay ID of the last event that the subscriber processed.
Retries	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of times the trigger was retried due to throwing the `EventBus.RetryableException`. This field applies to Apex triggers only. Available in API version 43.0 and later.
Status	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the status of the subscriber. Can be one of the following values: • `Running`—The subscriber is actively listening to events. If you modify the subscriber, the subscription continues to process events. • `Error`— The subscriber was disconnected and stopped receiving published events. A trigger reaches this state when it exceeds the number of maximum retries with the

Field	Details
	EventBus.RetryableException. Trigger assertion failures and unhandled exceptions don't cause the error state. We recommend limiting the retries to fewer than nine times to avoid reaching this state. When you fix and save the trigger, or for a managed package trigger, if you redeploy the package, the trigger resumes automatically from the tip, starting from new events. Also, you can resume a trigger subscription in the subscription detail page that you access from the platform event page. • Suspended—The subscriber is disconnected and can't receive events because a Salesforce admin suspended it or due to an internal error. You can resume a trigger subscription in the subscription detail page that you access from the platform event page. To resume a process, deactivate it and then reactivate it. If you modify the subscriber, the subscription resumes automatically from the tip, starting from new events. For more information, see View and Manage an Event's Subscribers on the Platform Event's Detail Page in the *Platform Events Developer Guide*.
Tip	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The replay ID of the last published event. Note: For high-volume platform events and change events, the value for Tip isn't available and is always -1.
Topic	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the subscription channel that corresponds to a platform event or change event. For a platform event, the topic name is the event name appended with __e, such as MyEvent__e. For a change event, the topic is the name of the change event, such as AccountChangeEvent.
Type	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The subscriber type (ApexTrigger). If the subscriber is a process or flow Pause element, the type is blank.

Usage

Use EventBusSubscriber to query details about subscribers to a platform event. You can get all subscribers for a particular event by filtering on the `Topic` field, as follows.

```
SELECT ExternalId, Name, Position, Status, Tip, Type
FROM EventBusSubscriber
WHERE Topic='Low_Ink__e'
```

EventTag

Associates a word or short phrase with an Event.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.

Field Name	Details
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

EventTag stores the relationship between its parent TagDefinition and the Event being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

EventWhoRelation

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the EventRelation on page 1386 object; that is, IsParent is `true` and IsWhat is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

EventWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

Note: EventWhoRelation objects aren't created for child events.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`EventId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description Indicates the ID of the event.
RelationId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Indicates the ID of the contacts or lead related to the event.
Type	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Indicates whether the person related to the event is a contact or lead.

Usage

Apex example that queries relations to a contact or lead

```
List<EventWhoRelation> whoRelations = [SELECT Id, Relation.Name FROM
EventWhoRelation WHERE EventId = '00UD0000005zijD'];
```

SEE ALSO:

Event
EventRelation

Expense

Represents an expense linked to a work order. Service resource technicians can log expenses, such as tools or travel costs. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the account associated with the linked work order.
Amount	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The amount of the expense.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization.
Description	**Type** textarea **Properties** Create, Nillable, Update **Description** A description for the expense.
Discount	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage deducted from the `Subtotal` price. Available in version 51.0 and later.
ExpenseEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description If the expense was incurred over multiple days, the Expense End Date is the last day that the expense covers.
ExpenseNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The number that uniquely identifies the expense.
ExpenseStartDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** If the expense was incurred over multiple days, the Expense Start Date is the first day that the expense covers.
ExpenseType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The type of expense. Possible values are: • Billable • Non-Billable The default value is Billable.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns the expense record.
`Quantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The number of items purchased in this record. Available in version 51.0 and later.
`Subtotal`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The subtotal price calculated as the product of `Quantity` and `UnitPrice`. Available in version 51.0 and later. This is a calculated field.
`Title`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A title that identifies the expense. This field is available in API version 50.0 and later.
`TotalPrice`	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The total price of the transaction which is equal to the discounted subtotal: `Subtotal - (Discount * Subtotal)`. Available in version 51.0 and later. This is a calculated field.
`TransactionDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The day that the expense was incurred, or the payment date for the expense.
`UnitPrice`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The price of one item on the record. Available in version 51.0 and later.
`WorkOrderId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the work order associated with the expense.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ExpenseFeed
Feed tracking is available for the object.

ExpenseHistory
History is available for tracked fields of the object.

ExpenseOwnerSharingRule
Sharing rules are available for the object.

ExpenseShare
Sharing is available for the object.

ExpenseReport

Represents a report that summarizes expenses. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A description for the expense report.
`ExpenseReportNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the expense report.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns the expense report record.
Title	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A title that identifies the expense report.
TotalExpenseAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of all expense entries in the report. This is a calculated field.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ExpenseReportFeed
Feed tracking is available for the object.

ExpenseReportHistory
History is available for tracked fields of the object.

ExpenseReportShare
Sharing is available for the object.

ExpenseReportEntry

Represents an entry in an expense report. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Amount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the expense.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization.
`ExpenseId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The expense that corresponds to the expense report entry.
`ExpenseReportEntryNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the expense report entry.

Field	Details
ExpenseReportId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The expense report that's associated with the expense report entry.
ExpenseType	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Sort **Description** The type of expense. Possible values are: • Billable • Non-Billable The default value is Billable.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
Title	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A title that identifies the expense.
TransactionDate	**Type** date

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The day that the expense was incurred, or the payment date for the expense.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

ExpenseReportEntryFeed
Feed tracking is available for the object.

ExpenseReportEntryHistory
History is available for tracked fields of the object.

ExpressionFilter

Represents a logical expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ContextId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the MacroInstruction object that contains the expression.
`FilterConditionLogic`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. The filter conditions to use and the order in which to apply them. For example, '1 AND 2' evaluates condition 1 and then condition 2.

Field	Details
FilterDescription	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. A description of the filter expression that helps to explain the logic to users. For example, 'Applies to New cases.'
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Optional. A label for the expression.

Usage

The ExpressionFilter object is used with the `IF` and `ELSEIF` operations in a MacroInstruction. It lets you specify a logical expression that determines whether macro instructions are executed. The object indicates whether any or all conditions must be true.

To represent the conditions that are evaluated, this object uses one or more ExpressionFilterCriteria child objects. The ExpressionFilter to be used with each criteria is specified in the ExpressionFilterCriteria's ExpressionFilterId field.

For example, to represent the following conditional statement, the ExpressionFilter object specifies the `FilterConditionLogic` field as `1 AND 2`, where 1 and 2 are ExpressionFilterCriteria objects. In this example, condition 1 is `Case.Status EQUALS New`, and condition 2 is `Case.Origin EQUALS Phone`.

```
IF (Case.Status EQUALS New) AND (Case.Origin EQUALS Phone)
      Select Email QuickAction
      Set Subject…
      Set To…
      Set Body…
      Submit
ENDIF
```

ExpressionFilterCriteria

Represents a condition in an expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ExpressionFilterId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the ExpressionFilter object that references this condition.
`FilterTarget`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The target object or field used in the condition. For example, to create a condition that applies to new cases, use `Case.Status` as the `FilterTarget`.
`FilterTargetValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. The value that's compared to the value of the FilterTarget. For example, to create a condition that applies to new cases, use `New` as the `FilterTargetValue`.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Optional. A label for the condition.
`Operation`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies the operator used to compare the target field and the target value. For example, to create a condition that applies to new cases, use EQUALS for the `Operation` field, as in `Case.Status EQUALS New`. • `EQUALS`

Field	Details
	• NOTEQUALS • CONTAINS • NOTCONTAIN
SortOrder	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The order in which the criteria are evaluated.

Usage

ExpressionFilterCriteria is a child object of the ExpressionFilter object. Use these objects with the `IF` and `ELSEIF` operations in a MacroInstruction to control instruction execution. Each condition in a ExpressionFilterCriteria compares a target object or field to a value using a condition operator; for example, `Case.Status EQUALS New`.

ExternalAccountHierarchy

Represents the external account hierarchy, which works like a role-based hierarchy. Use ExternalAccountHierarchy to allow partner and customer users to share data with other external accounts in their hierarchy.This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You must have a Partner or Customer Community Plus license.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the account in the external account hierarchy.

Field	Details
CurrencyISOCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Possible values are: • `GBP`— British Pound • `USD`— U.S. Dollar The default value is `USD`.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the external account hierarchy.
`HierarchyType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Possible values are: • `CustomerPortal` — Customer • `Partner` The default value is `Partner`.
`IsAccessibleToParent`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Allows data to be shared with parent account in the account hierarchy. The default value is `true`.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description When true, the hierarchy is turned on. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the external account hierarchy.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the account owner.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the parent account.

ExternalAccountHierarchyHistory

Represents the history of changes to values in the fields of an external account hierarchy. This object is available in API version 50.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

You must have a Partner or Customer Community Plus license.

Fields

Field	Details
`DataType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Possible values are: • Address • AnyType • AutoNumber • Base64 • BitVector • Boolean • Content • Currency • DataCategoryGroupReference • DateOnly • DateTime • Division • Double • DynamicEnum • Email • EncryptedBase64 • EncryptedText

Field	Details
	• EntityId • EnumOrId • ExternalId • Fax • File • HtmlMultiLineText • HtmlStringPlusClob • InetAddress • Json • Location • MultiEnum • MultiLineText • Namespace • Percent • PersonName • Phone • Raw • RecordType • SfdcEncryptedText • SimpleNamespace • StringPlusClob • Switchable_PersonName • Text • TimeOnly • Url • YearQuarter
ExternalAccountHierarchyId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the external account hierarchy.
Field	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Possible values are: • Account • HierarchyType - Hierarchy Type • IsAccessibleToParent - Is Accessible to Parent • IsActive - Is Hierarchy Active • Name • Owner • Parent • Created - Created. • FeedEvent - Feed Event • IndividualMerged - Individual Merged • Locked - Record Locked • OwnerAccepted - Owner (Accepted) • OwnerAssignment - Owner (Assignment) • Unlocked - Record unlocked
`NewValue`	**Type** anyType **Properties** Nillable, Sort **Description** The updated value of the changed field.
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** The previous value of the changed field.

ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

Note: All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

As of Spring ’20 and later, only authenticated internal and external users can access this object.

Fields

Field Name	Details
`AuthProviderId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Salesforce ID of the authentication provider, which defines the service that provides the login process and approves access to the external system. Only users with the “Customize Application” and “Manage AuthProviders” permissions can view this field. This field is available in API version 39.0 and later.
`CustomConfiguration`	**Type** textarea **Properties** Nillable **Description** A JSON-encoded configuration string that defines parameters specific to the type of external data source.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.

Field Name	Details
	Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`Endpoint`	**Type** textarea **Properties** Nillable **Description** The URL of the external system, or if that URL is defined in a named credential, the named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example: `callout:`*`My_Named_Credential`*`/`*`some_path`*. You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: `callout:`*`My_Named_Credential`*`/`*`some_path`*`?format=json`.
`isWritable`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Lets the Lightning Platform and users in this org create, update, and delete records for external objects associated with the external data source. The external object data is stored outside the org. By default, external objects are read only. Available only for Salesforce Connect external data sources. Available in API version 35.0 and later. However, with the cross-org adapter for Salesforce Connect, you can set this field to `true` only in API version 39.0 and later.
`Language`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The language of the `MasterLabel`.
`MasterLabel`	**Type** string **Properties** Filter, Group, Sort **Description** Master label for the external data source. This internal label doesn't get translated.

Field Name	Details
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***namespacePrefix__componentName*** notation.
PrincipalType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies whether the org uses one set (`NamedUser`), multiple sets (`PerUser`), or no (`Anonymous`) credentials to access the external system. Each set of credentials corresponds to a login account on the external system. Corresponds to `Identity Type` in the user interface.
Protocol	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies whether to use OAuth, password authentication, or no authentication to access the external system. Some types of external data sources support only one value. • For cloud-based Files Connect external systems, select **Oauth 2.0**. • For on-premises systems, select **Password Authentication**. • For Simple URL data sources, select **No Authentication**.
Repository	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Used for SharePoint Online. An optional name of the repository in the data source. Not applicable to all data source types.
Type	**Type** picklist

Field Name	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** Specifies the adapter that connects to the external system.

Usage

Define an external data source to connect to data or content that's stored outside the Salesforce org. Then create external objects, which map to the external system's data and behave similarly to custom objects.

Note: Some external data source fields rely on per-user authentication to connect with an external system. If an admin edits one of these fields, then the previously authenticated credentials can get invalidated, requiring individual users to reauthenticate.

SEE ALSO:

ExternalDataUserAuth

NamedCredential

ExternalDataUserAuth

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

Note: All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field Name	Details
`AuthProviderId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Salesforce ID of the authentication provider, which defines the service that provides the login process and approves access to the external system.

Field Name	Details
	Only users with the “Customize Application” and “Manage AuthProviders” permissions can view this field. This field is available in API version 39.0 and later.
ExternalDataSourceId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Salesforce ID of the external data source or named credential that defines the external system.
Password	**Type** textarea **Properties** Create, Nillable, Update **Description** Password portion of the credentials for the Salesforce user to access the external system.
Protocol	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to use OAuth, password authentication, or no authentication when the user accesses the external system.
UserId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** ID of the Salesforce user who’s accessing the external system.
Username	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Username portion of the credentials for the Salesforce user to access the external system.

Usage

These authentication settings enable a Salesforce user to access an external system. The external system is defined in Salesforce as one of the following.

- External data source—Provides access to external objects, whose data is stored outside the Salesforce organization.
- Named credential—Enables the user's actions to trigger authenticated callouts to the endpoint that's specified in the named credential.

If you grant users access to the external data source or named credential via permission sets or profiles, those users can manage their own authentication settings. See "Store Authentication Settings for External Systems" in the Salesforce Help.

SEE ALSO:

ExternalDataSource

NamedCredential

ExternalSocialAccount

Represents a managed social media account on a social network such as Facebook or Twitter. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`AuthorizedBy`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of the Radian6 user who added the social account to Radian6.
`DataSourceId`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** ID of the Radian6 data source for the social account.
`DefaultResponseAccountId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** ID of the managed social account to use by default when responding.
`DeveloperName`	**Type** string **Properties** Filter, Group, Sort **Description** The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API. Note: When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance may slow while Salesforce generates one for each record.
`ExternalAccountId`	**Type** string **Properties** Filter, Group, Sort **Description** ID of the social account on the social network.
`ExternalPictureURL`	**Type** url **Properties** Filter, Group, Nillable, Sort **Description** URL to the picture of the social account on the social network.
`IsActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the social account is active or not.

Field Name	Details
IsAuthenticated	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the social account is authenticated or not.
IsCaseCreationEnabled	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether case creation for the social account is enabled or not.
IsDataSourceActive	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Specifies whether the data source is active or not.
Language	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies the language of the social account.
MasterLabel	**Type** string **Properties** Filter, Group, Sort **Description** Master label for the social account. This display value is the internal label and does not get translated.
ProfileUrl	**Type** url **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description URL for the profile.
Provider	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Social network, such as Facebook or Twitter, of the social account.
ProviderUserId	**Type** string **Properties** Filter, Group, Sort **Description** User ID for the social network of the social account.
RuleId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** ID of the Radian6 rule for the account.
SocialPropertyId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** ID of the Radian6 social property for the account.
TopicId	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** ID of the topic for the social account.
UniqueName	**Type** string **Properties** Filter, Group, Nillable, Sort

Field Name	Details
	Description Unique name for the social account.
`Username`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Username for the social account.

Usage

Although available, many of the Radian6-related fields are no longer accurate or used. We recommend using Social Engagement Resources in *Connect REST API Developer Guide*.

FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `idEnabled()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

- You can read, create, update, or delete a FeedAttachment only if you have the corresponding access to the associated FeedItem.
- Inline images aren’t creatable, updatable, or deletable through SOAP API.

Fields

Field Name	Details
`FeedEntityId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated feed entity that contains this attachment.

Field Name	Details
RecordId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the record that this feed attachment contains. For inline images, `RecordId` is a ContentDocument ID. For content attachments, `RecordId` is a ContentVersion ID, For feed items, `RecordId` is a FeedItem ID.
Title	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The title of this feed attachment. When `Type` is `Link`, `Title` value is the label for the attachment link. Otherwise, `Title` value isn't used.
Type	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of this feed attachment. Valid values are: • 0 `Content`—A content attachment. • 1 `InlineImage`—An inline image. The system creates an inline image attachment when an image is added to the body of the associated FeedItem. You can't add an inline image directly using FeedAttachment. • 2 `Link`—A link. • 3 `FeedEntity`—A feed entity, for example, a post that is shared. Available in API version 39 and later in Lightning Experience. • 4 `ChatterExtension`—a Rich Publisher App that's integrated with the Chatter publisher. • 5 `Record`—A record.
Value	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The string value of this FeedAttachment. This field is optional. If the feed attachment is a Link FeedAttachment, the value is the link URL string.

Usage

- This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

  ```
  //create and insert post
  FeedItem post = new FeedItem();
  post.Body = 'HelloThere';
  post.ParentId = 'ID_OF_LEAD_ENTITY';
  post.Title = 'FileName';
  insert post;
  ```

  Then insert the attachment.

  ```
  //create and associate a content attachment to the post
  FeedAttachment feedAttachment = new FeedAttachment();
  feedAttachment.FeedEntityId = post.Id;
  feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
  feedAttachment.Title = 'FileName';
  feedAttachment.Type = 'CONTENT';
  insert feedAttachment;
  ```

- You can create only one link attachment (`FeedAttachment` of type `Link`) per feed item.
- If the feed item type is one of the following, you can add content or link feed attachments to a FeedItem.
  - `AdvancedTextPost`
  - `TextPost`
  - `ContentPost`
  - `LinkPost`
  - `QuestionPost`
- When a `FeedAttachment` is added or removed from a feed item, Salesforce updates the type of the feed item to its most appropriate value, as follows.
  - If all content feed attachments are removed from a feed item of type `ContentPost`, the type of this feed item is updated to `TextPost`.
  - Conversely, if a content feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `ContentPost`.
  - If all link feed attachments are removed from a feed item of type `LinkPost`, the type of this feed item is updated to `TextPost`.
  - Conversely, if a link feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `LinkPost`.
  - The type of all other feed items, such as `QuestionPost` or `AdvancedTextPost` feed items, doesn't change when any feed attachments are added or removed.
  - If a content feed attachment is added to a feed item of type `LinkPost`, the feed item type is updated to `ContentPost`.
  - If all content attachments are removed from a feed item of type `ContentPost`, but there's also a link attachment, the feed item type is updated to `LinkPost`.
- Users without administrator privileges can't retrieve a FeedAttachment by its ID in a SOQL query. They can retrieve attachments by specifying the associated `FeedEntityId`, as follows:

  ```
  SELECT Id FROM FeedAttachment WHERE FeedEntityId = 'some_feedItem_id'
  ```

- Alternatively, retrieve attachments by using a SOQL query on FeedItem with a subquery on the FeedAttachments child relationship, as follows.

```
SELECT Body, (SELECT RecordId, Title, Type, Value FROM FeedAttachments)
FROM FeedItem
WHERE Id = 'some_feedItem_id'
```

- FeedAttachment is not a triggerable object. You can access feed attachments in FeedItem *update* triggers by retrieving them through a SOQL query. For a trigger example, and to learn about trigger considerations for FeedAttachment, see Triggers for Chatter Objects in the *Apex Developer Guide*.

FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

Note the following when working with feed comments.

- You must have read access to the feed's parent type to see a FeedComment record.
- You must be able to access the feed to add a comment.
- If the comment is related to a user record, the user can delete the comment. For example, if John Smith makes a comment on Sasha Jones' profile feed, Sasha can delete the comment.
- If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- Modify All Data
- Modify All on the object associated with the feed and delete permission on the parent feed
- Moderate Chatter

  Note: Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

- Manage Unlisted Groups

  Only users with this permission can delete items in unlisted groups.

Fields

Field	Details
CommentBody	**Type** textarea **Properties** Create, Filter, Sort, Update **Description** The text in the comment.
CommentType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of comment: • ContentComment—an uploaded file on a comment • TextComment—a direct text entry on a comment Before API version 24.0, a text entry was required on a comment. As of version 24.0, a text entry is optional if the CommentType is ContentComment.
FeedItemId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the feed item containing the comment.
HasEntityLinks	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the feed CommentBody includes at least one link to a record. Note: This field is available starting in API version 43.0.
InsertedById	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the context user.
`IsRichText`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the feed `CommentBody` contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the comment is rendered as plain text. Rich text supports the following HTML tags: • `<p>` Tip: Though the ` ` tag isn't supported, you can use `<p> </p>` to create lines. • `<a>` • `<b>` • `<code>` • `<i>` • `<u>` • `<s>` • `<ul>` • `<ol>` • `<li>` • `<img>` The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>` Note: This attribute is available as of API version 38.0. In API version 38.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 37.0 and prior, all rich text appears as a plain-text representation.
`IsVerified`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Determines whether a comment on a question is marked as Company Verified.

Field	Details
	This field is available in API version 41.0 and later.
`LastEditById`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the user who last edited the feed comment.
`LastEditDate`	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** The date the feed comment was last edited.
`ParentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of a record associated with the feed comment. For example, if you are commenting on a change to a field on Account, `ParentId` is set to the account ID.
`RelatedRecordId`	**Type** reference **Properties** Create, Group, Nillable, Sort **Description** ID of the ContentVersion record associated with a `ContentComment`. This field is null for all comments except `ContentComment`. For example, set this field to an existing ContentVersion ID and set the `CommentType` to `ContentComment`.
`Revision`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The number of times the comment was revised.

Field	Details
Status	**Type** picklist **Properties** Create, Defaulted on create, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether this feed comment is published and visible to all who can access the parent feed item. To change a comment’s status, the comment’s parent feed item must be in a published state. This field is available in API version 38.0 and later. Possible values are: • `Published`—The comment is visible to all who can access the parent feed item. • `PendingReview`—The comment is visible to its author. Users see the parent feed item and have View All Data or Can Approve Feed Post and Comment permission also see the comment. The author can delete the comment as can users who see the comment and have Can Approve Feed Post and Comment or Modify All Data permission. If the parent feed item is published, the author can edit the comment. Users who see the comment and have Can Approve Feed Post and Comment or Modify All Data permission can also edit the comment. Users with Can Approve Feed Post and Comment or Modify All Data permission can change comment status from Published to PendingReview and from PendingReview to Published. Some actions are blocked when a feed comment is pending review: – Select as Best—When a feed comment that is marked as best answer becomes unpublished, it’s removed as the best answer. If the comment is published, its best answer status is not restored. – Like and unlike
SystemModstamp	**Type** datetime **Properties** Defaulted on create, Filter **Description** Date and time when a user or automated process (such as a trigger) last modified this record. In this context, "trigger" refers to Salesforce code that runs to implement standard functionality, and not an Apex trigger. `SystemModstamp` is a read-only system field, available in FeedComment as of API version 37.0.
ThreadChildrenCount	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The count of comments associated with this parent feed object. The feed object can be either a Feed Item or a Feed Comment. The count shows how many comments are directly

Field	Details
	subordinate to the parent. This field is available on the object when **Allow discussion threads** is selected in the Administration Workspace. This field is available in API version 44.0 and later.
`ThreadLastUpdatedDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time the thread on this comment was last updated. This field is available on the object when **Allow discussion threads** is selected in the Administration Workspace. This field is available in API version 44.0 and later.
`ThreadLevel`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The identifier that shows the level of this Feed Comment in a thread. By default, there are a maximum of three levels in a thread. The `ThreadLevel` value shows in which of the three levels this comment falls. This field is available on the object when **Allow discussion threads** is selected in the Administration Workspace. This field is available in API version 44.0 and later.
`ThreadParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The identifier of the feed item that is the parent of this comment. This field is available on the object when **Allow discussion threads** is selected in the Administration Workspace. This field is available in API version 44.0 and later.

Usage

- As of API version 23.0 and later, if you have View All Data permission, you can query FeedComment records directly without an ID filter. If you don't have View All Data permission, you can't query FeedComment records directly, with or without an ID filter.

  For example, the following query returns general information about a feed:

  ```
  SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName,
             CreatedBy.LastName, ParentId, Parent.Name, Body
  FROM FeedItem
  WHERE CreatedDate > LAST_MONTH
  ORDER BY CreatedDate DESC, Id DESC
  ```

- You can search for text in comments using SOSL. For example, the following Java class uses `search()` to find the string "foo" in any field of a record:

```
public void searchSample() {
  try {
    SearchResult sr = connection.search("find {foo} in all fields " +
        "returning feedcomment(Id, FeedItemId, CommentBody)");
    // Put the results into an array of SearchRecords
    SearchRecord[] records = sr.getSearchRecords();
    // Check the length of the returned array of records to see
    // if the search found anything
    if (records != null && records.length > 0) {
      System.out.println("Found " + records.length + " comments: ");
      // Display each comment
      for (SearchRecord record : records) {
        FeedComment comment = (FeedComment) record.getRecord();
        System.out.println(comment.getId() + ": " +
            comment.getCommentBody());
      }
    } else {
      System.out.println("No records were found for the search.");
    }
  } catch (ConnectionException ce) {
    ce.printStackTrace();
  }
}
```

- If you use an Apex trigger to modify the `Body` of a FeedComment object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.

Note: This object is hard deleted. It isn't sent to the Recycle Bin.

SEE ALSO:

Custom Object__Feed

FeedItem

FeedItem represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces FeedPost.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

- You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:
  - Modify All Data

- Modify All on the feed item's parent object, for example, Account for a feed item on an account feed
- Moderate Chatter

  Note: Users with the Moderate Chatter permission can delete only the feed items and comments that they can see.

Only users with this permission can delete items in unlisted groups.

- Guest users can't insert system field values for Chatter feeds. Even if you try to assign the CanInsertFeedSystemFields permission to a Guest User, the permission isn't granted.

Only users with the Modify All Data permission can delete a feed item of `Type` `TrackedChange`.

If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

Fields

Field Name	Details
`BestCommentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the comment marked as best answer on a question post.
`Body`	**Type** textarea **Properties** Create, Nillable, Sort, Update **Description** The body of the feed item. Required when `Type` is `TextPost` or `AdvancedTextPost`. Optional when `Type` is `ContentPost` or `LinkPost`. Although a value for `Body` is not required for the `ContentPost` type, an attachment is required. If an attachment isn't present, the type changes to `TextPost` or `AdvancedTextPost`, depending on the API version. `TextPost` and `AdvancedTextPost` do require a value for `Body`. Tip: See the `IsRichText` field for a list of HTML tags supported in the body of rich text posts.
`CommentCount`	**Type** int **Properties** Filter, Group, Sort

Field Name	Details
	Description The number of comments associated with this feed item. Tip: In a feed that supports pre-moderation, `CommentCount` isn't updated until a comment is published. For example, say that you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, comments aren't counted until approved by an admin or someone with Can Approve Feed Post and Comment or Modify All Data. Feed moderation has implications on how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through `CommentCount`, go through pagination until the end of comments is returned.
`ConnectionId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** When a PartnerNetworkConnection modifies a record that is tracked, the `CreatedBy` field contains the ID of the system administrator. The `ConnectionId` contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your org.
`ContentData`	**Type** base64 **Properties** Create, Nillable **Description** This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is required if `Type` is `ContentPost`. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets `Type` to `ContentPost`.
`ContentDescription`	**Type** textarea **Properties** Create, Nillable, Sort **Description** This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The description of the file specified in `ContentData`.

Field Name	Details
`ContentFileName`	**Type** string **Properties** Create, Group, Nillable, Sort **Description** This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. The name of the file uploaded to the feed. Setting `ContentFileName` automatically sets `Type` to `ContentPost`.
`ContentSize`	**Type** int **Properties** Group, Nillable, Sort **Description** This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is the size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.
`ContentType`	**Type** string **Properties** Group, Nillable, Sort **Description** This field was removed in API version 35.0, and is available in earlier versions for backward compatibility only. This field is the MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.
`FeedPostId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in a feed item: changes to tracked fields, text posts, link posts, and content posts.
`HasContent`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field Name	Details
	Description Indicates whether the feed item has content.
`HasFeedEntity`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the feed item has a feed entity, for example, a post, as an attachment. Available in API version 39 and later when sharing a feed entity in Lightning Experience.
`HasLink`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the feed item has a link attached.
`HasVerifiedComment`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Determines whether a question has an answer that is marked as Company Verified. This field is available in API version 41.0 and later.
`InsertedById`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the context user.
`IsClosed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field Name	Details
	Description As of API version 43, a read-only field that indicates whether the feed item is open or closed to new actions. A value of `true` places restrictions on the actions a user can take on a feed item and its comments. For more information, see the Usage section.
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Standard system field. Indicates whether the record has been moved to the Recycle Bin (`true`) or not (`false`).
`IsRichText`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the feed item `Body` contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags: • `<p>` Tip: Though the ` ` tag isn't supported, you can use `<p> </p>` to create lines. • `<a>` • `<b>` • `<code>` • `<i>` • `<u>` • `<s>` • `<ul>` • `<ol>` • `<li>` • `<img>` The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`

Field Name	Details
	Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.
`LastEditById`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the user who last edited the feed item.
`LastEditDate`	**Type** datetime **Properties** Create, Filter, Nillable, Sort **Description** The date the feed item was last edited.
`LikeCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of likes associated with this feed item.
`LinkUrl`	**Type** url **Properties** Create, Nillable, Sort **Description** The URL of a `LinkPost`.
`NetworkScope`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether this feed item is available in the default Experience Cloud site, a specific Experience Cloud site, or all sites. This field is available in API version 26.0 and later, if digital experiences is enabled for your org. `NetworkScope` can have the following values:

Field Name	Details
	• `NetworkId`—The ID of the Experience Cloud site in which the FeedItem is available. If left empty, the feed item is only available in the default Experience Cloud site. • `AllNetworks`—The feed item is available in all Experience Cloud sites. Note the following exceptions for `NetworkScope`: • Only feed items with a Group or User parent can set a `NetworkId` or a null value for `NetworkScope`. • For feed items with a record parent, users can set `NetworkScope` only to `AllNetworks`. • You can't filter a feed item on the `NetworkScope` field.
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the object type to which the feed item is related. For example, set this field to a `UserId` to post to someone's profile feed, or an `AccountId` to post to a specific account.
`RelatedRecordId`	**Type** reference **Properties** Create, Group, Nillable, Sort **Description** ID of the ContentVersion record associated with a `ContentPost`. For WDC thanks posts, it's the ID of the WorkThanks object associated with a `RypplePost`. This field is typically null for all posts except `ContentPost` and `RypplePost`. For example, set this field to an existing ContentVersion ID and post it to a feed with `Type` set to `ContentPost`.
`Revision`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The revision number of the feed item.
`Status`	**Type** picklist

Field Name	Details
	Properties Create, Defaulted on create, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether this feed item is published and visible to all who can access the feed. This field is available in API version 37.0 and later. Possible values are: • `Published`—The item's visible to all with access to the feed. • `PendingReview`—The item's visible to its author and users who see the item and have View All Data or Can Approve Feed Post and Comment permission. Some people can delete and edit the item. They include the author and users who see the item and have Can Approve Feed Post and Comment or Modify All Data permission. Some actions are blocked when a feed item is pending review: – Comment – Like and unlike – Bookmark – Share
`Title`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The title of the feed item. When the `Type` is `LinkPost`, the `LinkUrl` is the URL and this field is the link name. The `Title` field can be updated on posts of `Type QuestionPost`.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of feed item. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create feed items of other types directly from the API. • `ActivityEvent`—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.

Field Name	Details
	• `AdvancedTextPost`—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • `AnnouncementPost`—Not used. • `ApprovalPost`—generated when a user submits an approval. • `BasicTemplateFeedItem`—Not used. • `CanvasPost`—a post made by a canvas app posted on a feed. • `CollaborationGroupCreated`—generated when a user creates a public group. • `CollaborationGroupUnarchived`—Not used. • `ContentPost`—a post with an attached file. • `CreatedRecordEvent`—generated when a user creates a record from the publisher. • `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold. • `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed. • `LinkPost`—a post with an attached URL. • `PollPost`—a poll posted on a feed. • `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile. • `QuestionPost`—generated when a user posts a question. • `ReplyPost`—generated when Chatter Answers posts a reply. • `RypplePost`—generated when a user creates a Thanks badge in WDC. • `TextPost`—a direct text entry on a feed. • `TrackedChange`—a change or group of changes to a tracked field. • `UserStatus`—automatically generated when a user adds a post. Deprecated. The following values appear in the `Type` picklist for all feed objects but apply only to CaseFeed: • `AttachArticleEvent`—generated event when a user attaches an article to a case. • `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • `CaseCommentPost`—generated event when a user adds a case comment for a case object. • `ChangeStatusPost`—generated event when a user changes the status of a case. • `ChatTranscriptPost`—generated event when Chat transcript is saved to a case.

Field Name	Details
	• EmailMessageEvent—generated event when an email related to a case object is sent or received. • FacebookPost—generated when a Facebook post is created from a case. Deprecated. • MilestoneEvent—generated when a case milestone is completed or reaches violation status. • SocialPost—generated when a social post is created from a case. Note: If you set Type to ContentPost, also specify ContentData and ContentFileName.
Visibility	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if digital experiences is enabled for your org. Visibility can have the following values: • AllUsers—The feed item is available to all users who have permission to see the feed item. • InternalUsers—The feed item is available to internal users only. Note the following exceptions for Visibility: • For record posts, Visibility is set to InternalUsers for all internal users by default. • External users can set Visibility only to AllUsers. • Visibility can be updated on record posts. • The Update property is supported only for feed items posted on records.

Usage

- When a feed item's IsClosed field is set to true, some actions are blocked and others are blocked to most users. This table sets out the actions that are blocked when a feed item is closed.

Action	Availability on a Closed Conversation
Add a comment	Blocked
Answer a question	Blocked
Vote on a poll	Blocked

Action	Availability on a Closed Conversation
Edit a feed item or its comments or answers	Blocked to author; available to admins, moderators, and people with the Close Conversation Threads in Feeds permission Editing is blocked specifically for the feed item title, feed item body, and feed content body fields.
Edit a topic	Available
Delete a feed item or its comments or answers	Blocked to author; available to admins, moderators, and people with the Close Conversation Threads in Feeds permission
Publish a pending review comment (moderation)	Available to admins and moderators
Like or unlike; upvote or downvote	Available
Select or remove a best answer	Blocked to author; available to admins, moderators, and people with the Close Conversation Threads in Feeds permission
Company verify; remove verification	Available only to people with the Verify Answers to Chatter Questions permission
Flag	Available
Share	Available
Bookmark	Available
Mute and unmute	Available
Escalate to case	Available only to people permitted to escalate a feed item to a case

- This Apex example shows how to add a feed item with an attachment to a lead using API version 36.0 and later. First, post a feed item.

```
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

- If you are using API version 23.0 or later and have View All Data permission, you can directly query for a FeedItem. The following example returns the 20 most recent feed items.

```
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName, CreatedBy.LastName, ParentId,
 Parent.Name, Body,
 (SELECT ID, FieldName, OldValue, NewValue FROM FeedTrackedChanges ORDER BY ID DESC)
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC
```

- If you are using an earlier API version than version 23.0, query FeedItem objects through a feed (such as AccountFeed or OpportunityFeed). The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedItem.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

Note: Provide the `ParentId` for API version 22.0 and earlier.

- A feed item of type `UserStatus` is automatically created when a user adds a post to update the status. You can't explicitly create a feed item of type `UserStatus`.
- The FeedItem object doesn't support aggregate functions in queries.
- If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post's author and creation date. The fields can't be updated after migration.
- The size limit for an attachment on a feed is 2 GB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.
- Deleting a feed item via the API also deletes the associated content. Likewise, undeleting a feed item restores associated content.

Note: This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in a FeedItem object appear as `null` in a SOQL query.
- You can't explicitly create or delete a FeedTrackedChange record.
- Imagine that you insert a feed item or feed comment of `Type ContentPost` on a User or Group to create a file. Then the `NetworkScope` field value of the feed item is passed to the file.
- If you use an Apex trigger to modify the `Body` of a FeedItem object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.
- If you insert rich text into the feed item body, make sure that the case of the opening and closing HTML tags matches. For example, `<b>This is bold text</B>` generates an error.
- To check file sharing with Apex triggers, write triggers on ContentDocumentLink instead of FeedItem. For an example, see ContentDocumentLink.
- In API version 36.0 and later, use FeedAttachment to attach one or more content items to a feed item. As a result of support for multiple attachments through FeedAttachment, all fields related to content attachments have been removed. These fields are: `ContentData`, `ContentDescription`, `ContentFileName`, `ContentSize`, and `ContentType`.
- For all API versions of FeedItem, you can't query a FeedItem object using the `System Modstamp` filter.

FeedLike

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API. A FeedLike is a child object of an associated FeedItem, FeedTrackedChange, or object feed, such as AccountFeed.

Supported Calls

`create()`, `delete()`, `describeSObjects()`

Special Access Rules

If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

Fields

Field Name	Details
`FeedItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** ID of the feed item that the user liked.
`FeedEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of a feed item or feed comment the user liked. If the user liked a comment, `FeedEntityId` is set to the ID of the comment. If the user liked a feed item, `FeedEntityId` is set to the ID of the feed item. This field is optional. The default value is the ID of the feed item.
`InsertedById`	**Type** reference **Properties** Filter, Group, Sort

Field Name	Details
	Description ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the context user.

Usage

You can't query FeedLike records directly. They can only be queried via the entity feed, such as AccountFeed.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API.

FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

To delete feed items they didn't create, users must have one of these permissions:

- Modify All Data
- Modify All on the parent object, for example on Account for a poll on an AccountFeed
- Moderate Chatter

Note: Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

Only users with this permission can delete items in unlisted groups.

Fields

Field Name	Details
`ChoiceBody`	**Type** textarea **Properties** Group **Description** A choice in the poll.

Field Name	Details
`FeedItemId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the feed item for the poll.
`Position`	**Type** int **Properties** Group, Sort **Description** Shows the position of the poll choice.

Usage

Use this object to query all of the choices associated with a particular poll. To view how people voted on the poll, see the FeedPollVote object.

FeedPollVote

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ChoiceId`	**Type** reference **Properties** Filter, Group **Description** Indicates which choice a user selected on a poll posted in a feed.
`FeedItemId`	**Type** reference

Field Name	Details
	Properties Filter, Group, Sort **Description** ID of the feed item for the poll.

Usage

Use this object to query how users voted on a particular poll.

FeedPost

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `search()`

Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the object associated with the feed and delete permission on the parent feed
- "Moderate Chatter"

  Note: Users with the "Moderate Chatter" permission can delete only the feed items and comments they can see.

- Manage Unlisted Groups

  Only users with this permission can delete items in unlisted groups.

Only users with the Modify All Data permission can delete a feed item of `Type TrackedChange`.

If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

Fields

Field	Details
`Body`	**Type** string

Field	Details
	Properties Create, Filter, Nillable, Sort **Description** The content of the FeedPost. Required when `Type` is `TextPost` or `AdvancedTextPost`. Optional when `Type` is `ContentPost` or `LinkPost`.
`ContentData`	**Type** base64 **Properties** Create, Nillable **Description** This field is required if `Type` is `ContentPost`. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets `Type` to `ContentPost`.
`ContentDescription`	**Type** string **Properties** Create, Nillable, Sort **Description** The description of the file specified in `ContentData`.
`ContentFileName`	**Type** string **Properties** Create, Group, Nillable, Sort **Description** This field is required if `Type` is `ContentPost`. The name of the file uploaded to the feed. Setting `ContentFileName` automatically sets `Type` to `ContentPost`.
`ContentSize`	**Type** int **Properties** Group, Nillable, Sort **Description** This field is the size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.
`ContentType`	**Type** string **Properties** Group, Nillable, Sort

Field	Details
	Description This field is the MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.
FeedItemId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the feed containing the FeedPost.
InsertedById	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the context user.
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the record has been moved to the Recycle Bin (`true`) or not (`false`). This field is a standard system field.
LinkUrl	**Type** url **Properties** Create, Filter, Nillable, Sort **Description** The URL of a `LinkPost`.
ParentId	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description ID of the object type to which the FeedPost is related. For example, set this field to a `UserId` to post to someone's profile feed, or an `AccountId` to post to a specific account.
`Title`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** The title of the FeedPost. When the `Type` is `LinkPost`, the `Body` is the URL and the `Title` is the label for the link.
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** The type of FeedPost: • `UserStatus`—automatically generated when a user updates their status • `TrackedChange`—ignore • `TextPost`—a direct text entry on a feed • `LinkPost`—a URL posting on a feed • `ContentPost`—an uploaded file on a feed Note: If you set `Type` to `ContentPost`, you must specify `ContentData` and `ContentFileName`.

Usage

- You can't directly query for a FeedPost. FeedPosts are always associated with a feed item, so you can query for them through the feeds. The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedPost.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

- A FeedPost of type `UserStatus` is automatically created when a user adds a post to update the current status. You can't explicitly create a FeedPost of type `UserStatus`.
- The size limit for an attachment on a profile, news, or record feed is 2 GB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.

- Deleting a FeedPost via the API also deletes the associated content and FeedPost objects. Likewise, undeleting a FeedPost restores associated content and FeedPost objects.

  Note: This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in FeedPost appear as `null` in a SOQL query.
- You can't explicitly create or delete a FeedTrackedChange record.

FeedRevision

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field Name	Details
`Action`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Holds the type of modification to the underlying feed item or comment attribute. `Action` can have the value `Changed`.
`EditedAttribute`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Identifies the part of the feed item or comment which was modified. A single revision can have many edited attributes.
`FeedEntityId`	**Type** reference **Properties** Filter, Group, Sort **Description** Identifies the modified feed item or comment.

Field Name	Details
IsDeleted	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the record has been moved to the Recycle Bin (`true`) or not (`false`). This field is a standard system field.
IsValueRichText	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the feed item `Body` contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags: • `<p>` Tip: Though the ` ` tag isn't supported, you can use `<p> </p>` to create lines. • `<a>` • `<b>` • `<code>` • `<i>` • `<u>` • `<s>` • `<ul>` • `<ol>` • `<li>` • `<img>` The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>` Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.
OriginNetworkId	**Type** reference

Field Name	Details
	Properties Filter, Group, Nillable, Sort **Description** The ID of the Experience Cloud site in which a user modified the feed item or comment. This field is only available, if digital experiences is enabled for your org.
`Revision`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The revision number of the feed item or comment.
`Value`	**Type** textarea **Properties** Nillable **Description** Identifies the value of the `EditedAttribute` field before the update.

Usage

This object tracks the changes made to a feed item or feed comment and stores a list of attributes that changed for each revision.

- To query the FeedRevision object, users need the View All Data permission or supply a WHERE clause on the `FeedEntityId`.

feedSignal

Attach feed signals, like `UpDownVote`, `UserVerified`, and `Verified`, to a feed post or comment. This object is available in API version 41.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`

Fields

Field	Details
`FeedEntityId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The ID of the Feed entity.
`FeedItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the feed post or comment. Possible values are: • `FeedItem` • `FeedComment`
`InsertedById`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of user who inserted the signal.
`SignalType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of signal. Possible values are: • `UpDownVote` • `UserVerified` • `Verified`
`SignalValue`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The value of the signal. For example, for `UpDownVote`, the value specifies whether the signal is an upvote or a downvote.

FeedTrackedChange

Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later.

Supported Calls

`describeSObjects()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Group, Restricted picklist, Sort **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the field, if `FieldName` is a currency field.
`FeedItemId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the parent feed that tracks the field change.
`FieldName`	**Type** string **Properties** Group, Sort **Description** The name of the field that was changed. Note: This field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of `leadConverted` indicates that a lead has been converted to an opportunity. For a full list of values, see Tracking of Special Events.
`NewValue`	**Type** anyType **Properties** Nillable, Sort

Field	Details
	Description The new value of the field that was changed.
`OldCurrencyIsoCode`	**Type** string **Properties** Group, Nillable, Sort **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the `OldValue` field, if `FieldName` is a currency field.
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** The last value of the field before it was changed.

Usage

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

If you move a custom field to the Recycle Bin, all FeedTrackedChange records that track historical changes to the custom field are automatically deleted and are not restored if the custom-field is undeleted.

The following sections outline the difference between standard feeds and custom feeds.

Standard Feeds

A standard feed is a record feed, such as AccountFeed. FeedTrackedChange records for standard feeds can only be queried via the parent feed object.

Note the following when working with standard feed items:

- Feed items for standard feeds are read only in the API.
- A FeedTrackedChange record is visible when you have read access on the record feed, and when the field is visible in the field-level security settings.

Custom Feeds

If you want more control over the information provided in a record feed, such as AccountFeed, you can create a custom feed. A custom feed can replace or augment an existing record feed. For example, you might want to:

- Disable the standard account record feed and use an Apex trigger to generate FeedTrackedChange records for the events that you want to track in the feed instead.
- Augment the standard contact record feed by writing an API client that inserts feed items for events that are not tracked in the standard feed.

Tracking of Special Events

The `FieldName` field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of `leadConverted` indicates that a lead has been converted to an opportunity.

Valid values for the `FieldName` field for multiple objects:

- `created`
- `ownerAccepted`
- `ownerAssignment`

Additional valid values for the `FieldName` field for individual objects:

Account

- `accountCreatedFromLead`
- `accountMerged`
- `accountUpdatedByLead`
- `personAccountUpdatedByLead`

Case

- `closed`
- `ownerEscalated`

Contact

- `contactCreatedFromLead`
- `contactMerged`
- `contactUpdatedByLead`

Contract

- `contractActivation`
- `contractApproval`
- `contractConversion`
- `contractExpiration`
- `contractTermination`

Lead

- `leadConverted`
- `leadMerged`

Opportunity

- `opportunityCreatedFromLead`

SEE ALSO:

Custom Object__Feed

FieldHistoryArchive

Represents field history values for all objects that retain field history. `FieldHistoryArchive` is a big object, available only to users with the "Retain Field History" permission. This object is available in API version 29.0 and later.

Each instance of the `FieldHistoryArchive` object represents a single change in the value of a field. `FieldHistoryArchive` stores history for both standard and custom fields.

The `Field` field returns the name of the field unless the parent field or object is deleted, in which case it returns the field ID. You can use the ID to retrieve the old field and object name from the `FieldNameAfterArchival` and `ParentNameAfterArchival` fields, respectively.

Supported Calls

`describeSObjects()`, `query()`

Fields

Field Name	Details
`ArchiveFieldName`	**Type** string **Properties** Nillable **Description** The name of the field at the time the data was archived. If the field name changed, the name is sometimes not the same for all records related to a single field.
`ArchiveParentName`	**Type** string **Properties** Nillable **Description** The name of the parent object at the time the data was archived. If the object name changed, the name is sometimes not the same for all records related to a single field.
`ArchiveParentType`	**Type** string

Field Name	Details
	Properties Nillable **Description** The type of the field at the time the data was archived. If the field type changed, the type is sometimes not the same for all records related to a single field.
`ArchiveTimestamp`	**Type** dateTime **Properties** Nillable **Description** The date and time at which the data was archived.
`CreatedById`	**Type** reference **Properties** Nillable **Description** The user ID of the user who created the original record.
`CreatedDate`	**Type** dateTime **Properties** Nillable, Sort **Description** The date and time at which the original record was created.
`Field`	**Type** picklist **Properties** Restricted picklist **Description** The name of the field that was changed. If the field is deleted from the parent object, the `Field` field contains the field ID instead.
`FieldHistoryType`	**Type** picklist **Properties** Filter, Nillable, Restricted picklist, Sort **Description** The name of the object that contains the field history. Possible values are:

Field Name	Details
	• Account • Article • Asset • Campaign • Case • Contact • Contract • ContractLineItem • Crisis • Employee • EmployeeCrisisAssessment • Entitlement • Individual • InternalOrganizationUnit • Knowledge • Lead • Opportunity • Order • OrderItem • Pricebook2 • PricebookEntry • Product2 • ServiceAppointment • ServiceContract • Solution • WorkOrder • WorkOrderLineItem
HistoryId	**Type** reference **Properties** Filter, Sort **Description** The ID of the relevant history object (for example, AccountHistory). This field is available in versions 42.0 and later.
Id	**Type** ID

Field Name	Details
	Properties Defaulted on create, Filter, idLookup **Description** The ID of the archived record. It's useful to have a field's ID for fields that you've deleted. (Field names aren't retained in history when you delete fields from Salesforce.)
`NewValue`	**Type** anyType **Properties** Nillable **Description** The new value of the modified field.
`OldValue`	**Type** anyType **Properties** Nillable **Description** The previous value of the modified field.
`ParentId`	**Type** reference **Properties** Filter, Sort **Description** The ID of the object that contains the field (the parent object).

Usage

When sorting fields, order them as follows:

1. `FieldHistoryType ASC`
2. `ParentID ASC`
3. `CreatedDate DESC`

SEE ALSO:

*Developer Guide:*Big Objects Implementation Guide

FieldPermissions

Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

To grant a user access to a field, associate a FieldPermissions record with a PermissionSet that's assigned to a user. FieldPermissions records are only supported in PermissionSet, not in Profile.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

In API version 49.0 and later, only users with the View Setup and Configuration permission can access this object.

Fields

In API version 50.0 and later, for lookup field inserts and queries, you can leave off the Id in the field name *or* include it. The rows returned always use the API name. For example:

```
Select SobjectType, Field From FieldPermissions where Field='Contact.Account'
```

and

```
Select SobjectType, Field From FieldPermissions where Field='Contact.AccountId'
```

both return

```
Contact, Contact.AccountId
```

Field Name	Details
`Field`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The field's API name. This name must be prefixed with the `SobjectType`. For example, `Merchandise__c.Description__c`
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The `Id` of the field's parent PermissionSet.

Field Name	Details
`PermissionsEdit`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, users assigned to the parent PermissionSet can edit this field. Requires `PermissionsRead` for the same field to be `true`.
`PermissionsRead`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If `true`, users assigned to the parent PermissionSet can view this field. A FieldPermissions record must have at minimum `PermissionsRead` set to `true`, or it will be deleted.
`SobjectType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The object's API name. For example, `Merchandise__c`.

Usage

FieldPermissions work similarly to ObjectPermissions. However, FieldPermissions includes a `Field` attribute to return the name of the field.

For example, the following query returns all FieldPermissions records that have at least the "Read" permission. The results include the field, object, and permission set names.

```
SELECT SobjectType, Field, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE PermissionsRead = True
```

Include the field's parent object when querying FieldPermissions. For example, to find all rows that match the Account object's `Type` field, create the following query:

```
SELECT Id, SobjectType, Field
FROM FieldPermissions
WHERE Field = 'Account.Type' AND SobjectType = 'Account'
```

To find which permission sets are backed by profiles with the Account object, you can use a query like the following example:

```
SELECT Id, ParentId, SobjectType, Field, PermissionsEdit, PermissionsRead, Parent.Name
FROM FieldPermissions
```

```
WHERE SobjectType = 'Account' and Parent.IsOwnedByProfile = true
ORDER BY SObjectType, Field
```

Both `SobjectType` and `Field` must be included in the `SELECT` line of the query. Provide the full API name of the field in the form of `SobjectType.Field` when querying for a field.

Note: When using the FieldPermission object to download records, depending on the SOQL query you use, you might not receive all expected records. Results can also appear incomplete. However, all records do download; fields that don't support field security and rows for entities not visible to the org are hidden.

Special Properties for Field Permissions

The auto-number and formula fields have special rules for how field permissions work. Both have FieldPermissions records, but inserting and updating is limited to `PermissionsRead`. `PermissionsEdit` isn't allowed for either field type, since these fields must be read-only for users.

The following field types don't return a FieldPermissions record because they are assumed to always be readable.

- `Id`
- `CreatedById`
- `CreatedDate`
- `IsDeleted`
- `LastModifiedById`
- `LastModifiedDate`
- `SystemModStamp`

The following field types don't return a FieldPermissions record because they are assumed to always be readable and writable.

- `OwnerId`
- Master-detail custom (relationship) fields
- Universally required custom fields

As a result, the following query returns no records, even though users do have some access to some of the fields.

```
SELECT Field, SobjectType, PermissionsRead
FROM FieldPermissions
WHERE Field='Id'
```

To determine if a field can return a FieldPermissions record, you can call a `describeSObject()` on the field. For example, `describeSObject('Merchandise__c')`, returns all the properties of the Merchandise custom object, including field properties. If you use a field whose `permissionable` property is `false` (like the field types listed in this section), you can't query, insert, update, or delete field permissions records, because they don't exist.

Working with Custom Activity Fields

While tasks and events are considered separate objects, they share a common set of activity custom fields. As a result, when a custom task field is created, a custom event field is also created, and vice versa. You can display the custom field on the event layout, task layout, or both event and task layouts.

Although custom activity fields are shared between tasks and events, you see separate FieldPermissions records for the task and event. However, changes made to one field permission record are automatically made to the other. For example, if you create a custom activity field, assign field permissions to it in a permission set, and run the following query, the query returns two records with the same permission value.

```
SELECT Field, Id, ParentId, PermissionsEdit, PermissionsRead, SobjectType
FROM FieldPermissions
WHERE SobjectType = 'event' OR SobjectType ='task'
```

If you then update one of the records with another set of field permission values and run the query, the same permission values for both records are returned.

Nesting Field Permissions

You can nest FieldPermissions in a PermissionSet query. For example, the following returns any permission sets where "Edit Read Only Fields" is `true`. Also, the result set includes both the "Read" and "Edit" field permission on the Merchandise object. Get similar results by nesting the SOQL with a field permission query using the relationship name for field permissions: `FieldPerms`.

```
SELECT PermissionsEditReadonlyFields,
(SELECT SobjectType, Field, PermissionsRead, PermissionsEdit
FROM FieldPerms
WHERE SobjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadonlyFields = true
```

As a result, it's possible to traverse the relationship between the PermissionSet and any child-related objects (in this case, FieldPermissions). You can do this from the PermissionSet object by using the child relationship (`ObjectPerms`, `FieldPerms`, and so on) or from the child object by referencing the PermissionSet with `Parent.`***`permission_set_attribute`***.

It's important to consider when to use a conditional `WHERE` statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```
SELECT PermissionsEditReadonlyFields,
(SELECT SobjectType, Field, PermissionsRead, PermissionsEdit
FROM FieldPerms
WHERE SobjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadonlyFields = true
```

Versus:

```
SELECT SobjectType, Field, PermissionsRead, PermissionsEdit, Parent.Name,
   Parent.PermissionsEditReadonlyFields
FROM FieldPermissions
WHERE SObjectType='Merchandise__c'
```

FieldSecurityClassification

Represents a field's data sensitivity value selected from the SecurityClassification picklist. This object is available in API version 46.0 and later.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

To view this object, you need the Customize Application or Modify Data Classification permission.

Fields

Field Name	Details
`ApiName`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** The API name of the data sensitivity picklist value. Default values: • Public • Internal • Confidential • Restricted • MissionCritical
`Description`	**Type** textarea **Properties** Filter, Group, Nillable, Sort **Description** The description of the data sensitivity picklist value.
`IsHighRiskLevel`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates that fields with this picklist value contain data highly sensitive to your company.

Field Name	Details
`MasterLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The data sensitivity picklist value. Default values: • Public • Internal • Confidential • Restricted • MissionCritical
`SortOrder`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The value's position in the picklist.

Usage

Use this object to return information about data sensitivity values in the SecurityClassification picklist. This object is read-only, but you can update the SecurityClassification picklist using the StandardValueSet Metadata API type.

FieldServiceMobileSettings

Represents a configuration of settings that control the Field Service iOS and Android mobile app experience. This object is available in API version 38.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

Fields

Field Name	Details
BgGeoLocationAccuracy	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Controls the accuracy of geolocation tracking of services resources while the app is running in the background. Lowering accuracy reduces battery consumption for mobile devices. Available in API version 41.0 and later. Picklist options: 1. Medium: Accurate to within about 100 meters. The API name for this value is `Medium`. 2. Coarse: Accurate to within about 1 kilometer. The API name for this value is `Coarse`. 3. Very Coarse: Accurate to within about 3 kilometers. The API name for this value is `VeryCoarse`.
BgGeoLocationMinUpdateFreqMins	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls the frequency of geolocation poling of services resources while the app is running in the background. Less frequent poling decreases battery consumption for mobile devices. The label in the UI is Minimum Update Frequency of Geo Location in Minutes (Background). Available in API version 41.0 and later.
BrandInvertedColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of toasts and the contrast color of the floating action button.
ContrastInvertedColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of secondary backgrounds in the UI.

Field Name	Details
ContrastPrimaryColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of primary text.
ContrastQuaternaryColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of secondary lines that delineate different areas of the UI.
ContrastQuinaryColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of primary backgrounds in the UI.
ContrastSecondaryColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of secondary text.
ContrastTertiaryColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of the icons on the settings screen and of primary lines that delineate different areas of the UI.
DefaultListViewDeveloperName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field Name	Details
	Description The API name of the default service appointment list view on the schedule screen.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The API name of the set of field service mobile settings.
`FeedbackPrimaryColor`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of error messages.
`FeedbackSecondaryColor`	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of success messages.
`FeedbackSelectedColor`	**Type** string **Properties** Create, Defaulted on create, Group, Sort, Update **Description** The color indicating the user's current selection.
`FutureDaysInDatePicker`	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The number of days into the future that a user can select from the date picker on the schedule screen.
`GeoLocationAccuracy`	**Type** picklist

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The accuracy of service resource geolocation tracking. Lowering accuracy reduces battery consumption for mobile devices. Picklist values: • Fine: Accurate to within 10 meters. The API name for this value is `Fine`. • Medium: Accurate to within 100 meters. The API name for this value is `Medium`. • Coarse: Accurate to within 1 kilometer. The API name for this value is `Coarse`.
GeoLocationMinUpdateFreqMins	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The minimum number of minutes between attempts to poll geolocation.
IsAssignmentNotification	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls whether service appointment notifications are sent when the service resource is assigned the appointment (`true`) or not (`false`). This field is available in API version 46.0 and later.
IsDefault	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates that the set of field service mobile settings is the default set that is automatically assigned to users. You can't make a different settings record the default, but you can modify the default settings record. Available in API version 41.0 and later.
IsDispatchNotification	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field Name	Details
	Description Controls whether service appointment notifications are sent when the service resource is dispatched for the appointment (`true`) or not (`false`). This field is available in API version 46.0 and later.
`IsSendLocationHistory`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls whether geolocation tracking of services resources is enabled (`true`) or not (`false`).
`IsShowEditFullRecord`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls whether users can edit records with the field service mobile app (`true`) or not (`false`).
`IsTimeSheetEnabled`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls whether users can access time sheets on their mobile devices (`true`) or not (`false`) (Beta).
`IsTimeZoneEnabled`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Controls whether the time zone of timesheet entries on the mobile app is recorded (`true`) or not (`false`). The current time zone is recorded in the `LocationTimeZone` field of the TimeSheetEntry object. Available in API version 50.0 and later.
`IsUseSalesforceMobileActions`	**Type** boolean

Field Name	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Reserved for future use.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The localization preference for a user.
MasterLabel	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label in the UI for the set of field service mobile settings. Available in API version 41.0 and later.
MetadataCacheTimeDays	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The number of days that org metadata, such as layouts, is kept in the app's local cache of memory.
NavbarBackgroundColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of the top bar in the app.
NavbarInvertedColor	**Type** string **Properties** Create, Defaulted on create, Group, Sort, Update **Description** The secondary color of the tap bar in the app.

Field Name	Details
PastDaysInDatePicker	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The number of days into the past that a user can select from the date picker on the schedule screen.
PrimaryBrandColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The main branding color used throughout the UI.
QuickStatusChangeFlowName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of an existing Field Service flow with a Quick Status Change action to change the work order or service appointment status or both. This applies to flows invoked on the mobile app only. This field is available in API version 51.0 and later.
RecordDataCacheTimeMins	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The number of minutes that record data is kept in the app's local cache of memory.
SecondaryBrandColor	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The color of action buttons.
TimeIntervalSetupMins	**Type** picklist

Field Name	Details
	Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Controls the spacing of picklist options for time values such as when creating resource absences.
`UpdateScheduleTimeMins`	**Type** int **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The minimum number of minutes between attempts to update a user's schedule. Note: The user's schedule might not refresh on this cadence if the user's device isn't connected to a network or doesn't have adequate battery life.

Usage

Field Service Mobile settings allow you to create sets of settings to apply to different field service mobile users. The settings apply to both the Android and iOS versions of the app.

For example, suppose you want to accommodate workers that are color blind, or who work in dark or bright conditions. You can choose different branding options for different workers to suit their needs, and assign them to their profiles.

FiscalYearSettings

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

As of Spring '20 and later, only partner users and standard users can access this object.

Fields

Field	Details
`Description`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** Description of the setting.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** End date of the fiscal year.
`IsStandardYear`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the fiscal year is a standard calendar year (`true`) or a custom fiscal year (`false`).
