Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.
### Supported Calls

describeSObjects(), describeLayout(), query(), retrieve(), search()

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **BackgroundDirection** | **Type**
|                 | picklist         |
| **Properties** | Defaulted on create, Filter, Group, Restricted picklist, Sort |
| **Description** | Returns the direction of the background fade. Available values are:
|                 | • Top to Bottom  |
|                 | • Left to Right  |
|                 | • Diagonal (default value) |
|                 | Label is Background Fade Direction. |
| **BackgroundEnd** | **Type**
|                 | int              |
| **Properties** | Filter, Group, Sort |
| **Description** | Returns the ending fade color in hexadecimal. Label is Ending Color. |
| **BackgroundStart** | **Type**
|                 | int              |
| **Properties** | Filter, Group, Sort |
| **Description** | Returns the starting fade color in hexadecimal. Label is Starting Color. |
| **Description** | **Type**
|                 | string           |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | Returns the description of the dashboard. Limit: 255 characters. |
| **DeveloperName** | **Type**
<p>|                 | string           |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <strong>Dashboard Unique Name</strong>.</td>
</tr>
<tr>
<td></td>
<td>Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
</tbody>
</table>

**FolderId**

<table>

<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Name of the folder that contains the dashboard. Available in API version 35.0 and later.</td>
</tr>
</tbody>
</table>

**IsDeleted**

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter</td>
</tr>
</tbody>
</table>
### Description
Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LastReferencedDate</td>
<td>datetime</td>
<td>Filter, Nillable, Sort</td>
<td>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</td>
</tr>
<tr>
<td>LastViewedDate</td>
<td>datetime</td>
<td>Filter, Nillable, Sort</td>
<td>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (<code>LastReferencedDate</code>) but not viewed it.</td>
</tr>
<tr>
<td>LeftSize</td>
<td>picklist</td>
<td>Filter, Group, Restricted picklist, Sort</td>
<td>Returns the size of the left column of the dashboard. Available values are: <code>Narrow</code>, <code>Medium</code>, <code>Wide</code>.</td>
</tr>
<tr>
<td>MiddleSize</td>
<td>picklist</td>
<td>Filter, Group, Nillable, Restricted picklist, Sort</td>
<td>Returns the size of the middle column of the dashboard. Available values are: <code>Narrow</code>.</td>
</tr>
</tbody>
</table>
### NamespacePrefix

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### RightSize

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
Returns the size of the right column in the dashboard.

Available values are:

- Narrow
- Medium
- Wide

### RunningUserId

**Type**
reference

**Properties**
Filter, Group, Sort

**Description**
Returns the ID of the running user specified for the dashboard.

If the dashboard was created in Lightning Experience and is configured to run as the viewing user, returns the user ID of the dashboard creator.
### Field: Details

If the dashboard was created in Salesforce Classic and is configured to run as the logged-in user, returns the user ID of the last specified running user.

This is a relationship field.

**Relationship Name**
- RunningUser

**Relationship Type**
- Lookup

**Refers To**
- User

### Field: TextColor

**Type**
- int

**Properties**
- Filter, Group, Sort

**Description**
Returns the body text color in hexadecimal. Label is Text Color.

### Field: Title

**Type**
- string

**Properties**
- Filter, Group, idLookup, Sort

**Description**
Returns the title of the dashboard. Limit: 80 characters.

### Field: TitleColor

**Type**
- int

**Properties**
- Filter, Group, Sort

**Description**
Returns the title text color in hexadecimal. Label is Title Color.

### Field: TitleSize

**Type**
- int

**Properties**
- Filter, Group, Sort

**Description**
Returns the title font size in points. Label is Title Size.

### Field: Type

**Type**
- picklist
### Field Details

**Properties**
- Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**
- Returns the dashboard type. Available values are:
  - **SpecifiedUser**—The dashboard displays data according to the access level of one specific running user.
  - **LoggedInUser**—The dashboard displays data according to the access level of the logged-in user.
  - **MyTeamUser**—The dashboard displays data according to the access level of the logged-in user, and managers can view dashboards from the point of view of users beneath them in the role hierarchy.

### Supported Query Scopes

Use these scopes to help specify the data that your SOQL query returns.

- **allPrivate**
  - Records saved in all users’ private folders.
  - Requires the user permission "Manage All Private Reports and Dashboards" and Enhanced Analytics Folder Sharing. If your organization was created after the Summer ‘13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

- **created**
  - Records created by the user running the query.

- **everything**
  - All records except records saved in other users’ private folders.

- **mine**
  - Records saved in the private folder of the user running the query.

### Usage

Provides read only access to the current values in the dashboard fields.

### Example: Dashboards in an Inactive User’s Private Folder

This SOQL query returns dashboards saved in a specific user’s private folder.

```
SELECT Id FROM Dashboard USING SCOPE allPrivate WHERE CreatedByID = '005A0000000Bc2deFG'
```

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
**DashboardFeed**
Feed tracking is available for the object.

SEE ALSO:
- DashboardTag
- Report

**DashboardComponent**

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomReportId</td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Requires the user permission &quot;Manage All Private Reports and Dashboards.&quot; The ID of the report that provides data for the dashboard component. See Report.</td>
</tr>
<tr>
<td>DashboardId</td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The ID of the dashboard that contains the dashboard component. See Dashboard. This is a relationship field.</td>
</tr>
</tbody>
</table>

**Relationship Name**
- Dashboard

**Relationship Type**
- Lookup

**Refers To**
- Dashboard
### Usage

Provides read only access to the current values in dashboard component fields.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **DashboardComponentFeed**
  - Feed tracking is available for the object.

### DashboardTag

 Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong>: Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong>: The name of the dashboard component.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>ItemId</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Type</strong>: reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong>: Create, Filter</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong>: ID of the tagged item.</td>
</tr>
</tbody>
</table>
**Usage**

DashboardTag stores the relationship between its parent TagDefinition and the Dashboard being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

SEE ALSO:
- Dashboard

**DataAssessmentFieldMetric**

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.
**Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

### Child Relationships

DataAssessmentFieldMetric is a child object of DataAssessmentMetric object.

**Usage**

Use the DatacloudCompany object to search the Data.com database for companies with the specific criteria that you enter. Use this object to find company records that you are interested in purchasing for your organization. Data.com APIs use the term “company,” which is similar to Salesforce term “accounts.”

**Important:** DatacloudCompany can’t be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

**DatacloudContact**

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

**Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

**Phone**

**Type**
- phone

**Properties**
- Nillable

**Description**
- The direct-dial telephone number for the contact.

**SocialHandles**

**Type**
- string

**Description**
- The social handles for this contact. Social handles are a normalized URL and user name for social media accounts such as, LinkedIn, Facebook, and Twitter. This field is response-only.
- The DatacloudSocialHandles object is a child of the DatacloudContact object.

**State**

**Type**
- string

**Properties**
- Filter, Nillable, Sort

**Description**
- The state where the company is located, which can also be a province or other equivalent to a state, depending on the country where the company is located.

**Street**

**Type**
- string

**Properties**
- Nillable

**Description**
- The street address for the company where the contact works.

**Title**

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort

**Description**
- Title of the contact such as CEO or Vice President.
Usage

This object searches the Data.com database for contacts with the specific criteria that you enter. Use this object to find contact records that you are interested in purchasing for your organization.

⚠️ **Important:** DatacloudContact can’t be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

DatacloudDandBCompany

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

⚠️ **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

</tr>
</tbody>
</table>

**Usage**

Use this object to return D&B Company information. These fields are read-only.

⚠️ **Important:** DatacloudDandBCompany can’t be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

---

**DatacloudOwnedEntity**

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

📝 **Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

---

**Supported Calls**

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Field Name | Details
---|---
DatacloudEntityTypeName | Type
| picklist
Properties | Create, Filter, Group, Restricted picklist, Sort, Update
Description | The type of Data.com record you want to purchase.
| 0—indicates contact entity type.

Usage

The Datacloud object that tracks records that are purchased and owned by a specific user.

DatacloudPurchaseUsage

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

</tbody>
</table>
Usage

The DatacloudPurchaseUsage object allows you to track Data.com record purchases for CRM users.

DataIntegrationRecordPurchasePermission

Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.
This object is available in API versions 42.0 and later.

Supported Calls

describeSObjects(), create(), delete(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Spring '20 and later, only your Salesforce org’s internal users can access this object.

Fields

</tbody>
</table>
**DatasetExport**

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

**Fields**

|                   | **Description**
|                   | This field is required when a record in an object contains a BLOB (binary large object) field. In the DataExport object, Metadata is the BLOB field. |
| Owner             | **Type**
|                   | string                                                                  |
|                   | **Properties**
|                   | Filter, Group, Nillable, Sort                                           |
|                   | **Description**
|                   | User ID of the owner, as specified in the userId parameter in the export node of the dataflow that created the record. Only the specified owner can read the content of the record. |
| PublisherInfo     | **Type**
|                   | string                                                                  |
|                   | **Properties**
|                   | Filter, idLookUp, Sort                                                  |
|                   | **Description**
|                   | Identifies the export record to facilitate searching when a user has multiple export records. By default, this column is set to the ID of the dataflow that generated the export record, concatenated with the name of the specific export node. PublisherInfo is unique within your organization. |
|                   | **Note:** A dataflow can have multiple export nodes.                   |
| PublisherType     | **Type**
|                   | picklist                                                                |
|                   | **Properties**
|                   | Filter, Group, Restricted picklist, Sort                                |
Details Field

Description
Target of the export, as specified in the `target` parameter in the export node of the dataflow that created the record. The value must be `EinsteinDiscovery`.

Status

Type
picklist

Properties
Filter, Group, Restricted picklist, Sort

Description
Status of the export. The possible values are:
- New
- InProgress
- Completed
- Canceled
- Failed

Note: The content of the Metadata field can be downloaded when the status is Completed.

Usage

This object is used with the DatasetExportPart object for exporting data from a dataset in Tableau CRM for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

SEE ALSO:
DatasetExportPart

DatasetExportPart

Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExportPart contains parts of the .csv file.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

</tbody>
</table>
DetailsField

Description
Used with the DatasetExportId to uniquely identify the data part. Parts are assembled sequentially based on their numbers.

Usage
This object is used with the DatasetExport object for exporting data from a dataset in Tableau CRM for use in Einstein Discovery. An export is initiated using the export node in an Analytics dataflow.

SEE ALSO:
   DatasetExport

DataUseLegalBasis

Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
This object is available if Data Protection and Privacy is enabled.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **DataUseLegalBasisHistory**
  History is available for tracked fields of the object.

- **DataUseLegalBasisOwnerSharingRule**
  Sharing rules are available for the object.

- **DataUseLegalBasisShare**
  Sharing is available for the object.

DataUsePurpose

Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

### DatedConversionRate

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

#### Supported Calls

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(),

#### Special Access Rules

Customer Portal users can't access this object.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| ConversionRate | Type  
double  
Properties  
Filter, Update  
Description  
Required. Conversion rate of this currency type against the corporate currency. |
| IsoCode     | Type  
picklist  
Properties  
Filter, Restricted picklist  
Description  
Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBP, or JPY. Must be unique within your organization. Label is Currency ISO Code. |
| NextStartDate | Type  
date  
Properties  
Filter, Nillable  
Description  
Read only. The date on which the next effective dated exchange rate will start. Effectively the day after the end date for this exchange rate. |
| StartDate   | Type  
date  
Properties  
Filter  
Description  
The date on which the effective dated exchange rate starts. |

## Usage

This object is for multicurrency organizations with advanced currency management enabled. Use this object to define the exchange rates your organization uses for a date range. This object is not available in single-currency organizations, nor is it available if the organization does not have advanced currency management enabled.
DeclinedEventRelation

Represents event participants (invitees or attendees) with the status Declined for a given event. This object is available in API versions 29.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| EventId    | Type: reference  
Properties: Filter, Group, Nillable, Sort  
Description: Indicates the ID of the event.  
This is a relationship field.  
Relationship Name: Event  
Relationship Type: Lookup  
Refers To: Event |
| RelationId | Type: reference  
Properties: Filter, Group, Nillable, Sort  
Description: Indicates the ID of the invitee.  
This is a polymorphic relationship field.  
Relationship Name: Relation  
Relationship Type: Lookup  
Refers To: Calendar, Contact, Lead, User |
| RespondedDate | Type: dateTime |
### Field Name: Details

#### Properties
- Filter, Nillable, Sort

#### Description
Indicates the most recent date and time when the invitee declined an invitation to the event.

### Field Name: Response

#### Type
- string

#### Properties
- Filter, Group, Nillable, Sort

#### Description
Indicates the content of the response field. Label is Comment.

### Field Name: Type

#### Type
- string

#### Properties
- Filter, Group, Nillable, Sort

#### Description
Indicates whether the invitee is a user, lead or contact, or resource.

## Usage

**Query invitees who have declined an invitation to an event**

```sql
SELECT eventId, type, response FROM DeclinedEventRelation WHERE eventid='00UTD000000ZH5LA'
```

**SEE ALSO:**
- AcceptedEventRelation
- UndecidedEventRelation

## DelegatedAccount

Represents the external managed account. This object is available in API version 49.0 and later.

### Supported Calls

- create()
- delete()
- describeLayout()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- search()
- update()
- upsert()
Special Access Rules
You must have a Partner or Customer Community Plus license. You can't edit the visibility of DelegatedAccount metadata on user profiles.

</tr>
</tbody>
</table>
DeleteEvent

Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0. DeleteEvent is a read-only object. You can't create, update, or delete it directly. To create a DeleteEvent record, soft delete a record of another type, like an Account. To remove a DeleteEvent record, use the emptyRecycleBin() API or hard delete the corresponding Record.

Supported Calls

describeSObjects(), query(), retrieve()

</table>
DigitalSignature

Represents a signature captured on a service report in field service.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

Special Access Rules
Field Service must be enabled.

</tr>
<tr>
<td><strong>Place</strong></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The place where the report was signed.</td>
</tr>
<tr>
<td><strong>SignatureType</strong></td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Defaulted on create, Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The role of the person signing the service report. Your org comes with one signature type, Default. A service report template can only contain one signature per type. If you plan to collect multiple signatures on service reports, create additional values for the Signature Type field.</td>
</tr>
</tbody>
</table>
Create at least one value for every role that might need to sign a service report. For example, Technician, Customer, Supervisor, or Supplier. If some service reports will be signed by multiple people in one role—for example, all technicians present at an appointment—create numbered types: Technician 1, Technician 2, and so forth.

Note: You can create up to 1,000 signature types. You can’t delete signature types, but you can deactivate them so they can’t be used in service report templates. When you deactivate a type, it still appears on service report templates that used it, but you can’t use it on new service report templates.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>SignedBy</td>
<td>Type: string, Properties: Create, Filter, Group, Nillable, Sort, Description: The name of the person signing.</td>
</tr>
<tr>
<td>SignedDate</td>
<td>Type: dateTime, Properties: Create, Filter, Nillable, Sort, Description: The date and time of the signing.</td>
</tr>
</tbody>
</table>

Usage

Add signature blocks to service report templates to determine which signatures need to be gathered on reports that use the template. Service report templates can contain up to 20 signatures, and each signature must use a different Signature Type. For example, create a standard service report template that contains a customer signature and a technician signature.

To learn more about digital signatures, see Guidelines for Using Signatures on Service Reports.

DigitalWallet

The digital wallet entity represents a customer’s digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()
## Special Access Rules

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

</tbody>
</table>
DirectMessage

Represented a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve(), update()

**Special Access Rules**

You must have the Manage Chatter Messages and Direct Messages permission enabled to access the DirectMessage object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Filter, Group, idLookup, Sort, Update</td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Description</td>
<td>A default value that isn't visible to users.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Subject</th>
<th>Filter, Group, Nillable, Sort, Update</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Description</td>
<td>Subject of the overall direct message conversation.</td>
</tr>
</tbody>
</table>

**Usage**

DirectMessage is an object used by Salesforce to control DirectMessage conversations. It represents a record of a direct message conversation, but doesn't include conversation data, such as posts or comments. It is most frequently used to moderate direct message data in order to meet data compliance regulations.
Division

A logical segment of your organization’s data. For example, if your company is organized into different business units, you could create a division for each business unit, such as “North America,” “Healthcare,” or “Consulting.” Available only if the organization has the Division permission enabled.

Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

- Divisions must be enabled for your organization to access this object. To discover whether divisions have been enabled for an organization, inspect the User or Group object for the DefaultDivision field—if it is present, then divisions have been enabled, and this field (the field is named Division in objects other than User and Group) will be available in all relevant objects.
- Customer Portal users can’t access this object.

Fields

<table>

<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>A descriptive name for the division. Limit: 80 characters.</td>
</tr>
</tbody>
</table>
### SortOrder

**Type**

int

**Properties**

Create, Filter, Nillable, Update

**Description**

The order in which this division name appears in the Division picklist field when creating or editing users in the Salesforce user interface.

---

### Usage

The values available for that field are the global division ID for the organization, created when divisions are first enabled, and any other division IDs that have been created. The division ID associated with a user is populated in the objects owned or created by the user.

You can use the division ID to make searches, reports, and list views run more quickly and return more relevant results if an organization has very large data sets. For more information, see the Salesforce online help, in the Fields description for the object.

You can use WITH in SOSL to pre-filter results based on division. This is faster than specifying the division in a WHERE clause.

**Note:** The User object has a Division field that is unrelated to this object. The Division field is a standard text field similar to Company or Department that has no special properties. Do not confuse it with the DefaultDivision field, which does relate to this object.

**SEE ALSO:**

Object Basics

### DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
## Fields

<table>

</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Nillable, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The actual translated label for the division. Label is Translation.</td>
</tr>
</tbody>
</table>
Usage

Use this object to translate the labels of your divisions into the different languages supported by Salesforce.

Document

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

You must have the "Edit" permission on documents and the appropriate access to the Folder that contains a document in order to create or update a document in that Folder.

## Field Details

**Description**
Indicates whether the object is available for external use (true) or not (false). Label is **Externally Available**.

### Keywords
- **Type**
  - string
- **Properties**
  - Create, Filter, Group, Nillable, Sort, Update
- **Description**
  - Keywords. Limit: 255 characters.

### LastReferencedDate
- **Type**
  - datetime
- **Properties**
  - Filter, Nillable, Sort
- **Description**
  - The timestamp for when the current user last viewed a record related to this record.

### LastViewedDate
- **Type**
  - datetime
- **Properties**
  - Filter, Nillable, Sort
- **Description**
  - The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.

### Name
- **Type**
  - string
- **Properties**
  - Create, Filter, Group, idLookup, Sort, Update
- **Description**
  - Required. Name of the document. Label is **Document Name**.

### NamespacePrefix
- **Type**
  - string
- **Properties**
  - Filter, Group, Sort, Nillable
- **Description**
  - The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.
### Field Details

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

<table>
<thead>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>URL reference to the file (instead of storing it in the database). If specified, do not specify the Body or BodyLength.</td>
</tr>
</tbody>
</table>

### Usage

When creating or updating a document, you can specify a value in either the **Body** or **Url** fields, but not both.

### Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

### Maximum Document Size

You can only create or update documents to a maximum size of 5 MB.

SEE ALSO:

Object Basics
DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can’t access this object.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CnameTarget</td>
<td></td>
</tr>
</tbody>
</table>

### Details

**Properties**
Create, Filter, Restricted picklist

**Description**
Defines the visibility of a tag.

Valid values:
- **Public**—The tag can be viewed and manipulated by all users in an organization.
- **Personal**—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

### Usage

DocumentTag stores the relationship between its parent TagDefinition and the Document being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

### Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

To access this object, Salesforce Sites, Sites, or Site.com must be enabled for your organization.

### Supported Calls

describeSObjects(), query(), retrieve()

### Special Access Rules

- Customer Portal users can’t access this object.
- To view this object, you must have the “View Setup and Configuration” permission.
- Site.com Publisher users have read-only API access to the Domain and DomainSite objects.

|               | • NoHttps—No HTTPS                                                      |
|               | • OrgDomain—My Domain                                                   |
|               | • Sites—Salesforce Sites Subdomain                                       |
|               | • SitesAlt—Salesforce Sites My Domain                                    |
OptionsExternalHttps

- **Type**: boolean

- **Properties**: Filter

- **Description**: Indicates whether the domain supports secure connections (true) or not (false) via a non-Salesforce content delivery network (CDN) or endpoint. The value of this field is used only if the domain is not pointing to the yourdomain.your18characterOrgId.live.siteforce.com CNAME target. This field is deprecated in API version 47.0 and later. Use HstsOption instead.

OptionsHstsHeaders

- **Type**: boolean

- **Properties**: Filter

- **Description**: Indicates whether the HTTP Strict Transport Security (HSTS) response header is included in requests to this domain (true) or not (false). This field is available in API version 47.0 and higher.

OptionsHstsPreload

- **Type**: boolean

- **Properties**: Filter

- **Description**: Indicates whether the preload directive is added to the HSTS header so that the domain is eligible for HSTS preloading registration (true) or not (false). This field is available in API version 52.0 and later.

After this field is set to true, you must still register the domain at https://hstspreload.org so that HTTPS connections are always used.

We only modify the HSTS headers of domains that are eligible for registration. Domain names can consist of a public suffix plus one additional label. For more information, see Add a Domain in Salesforce Help.

**Usage**

Use this read-only object to query the domains that are associated with each website in your organization.
DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later. To access this object, Salesforce Sites or Site.com must be enabled for your organization.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

- Customer Portal users can’t access this object.
- To view this object, you must have the “View Setup and Configuration” permission.
- Site.com Publisher users have read-only API access to the Domain and DomainSite objects.

DsarPolicy

Usage

Use this read-only object to query or retrieve information about your Lightning Platform site.

DsarPolicy

Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer’s request. This object is available in API version 50.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

This object is for Privacy Center customers with the ReadAllData or PrivacyDataAccess permissions.

Fields

</table>
### Field Details

#### Description
Description of the policy. The description is limited to 255 characters.

#### DeveloperName

**Type**
string

**Properties**
Filter, Group, Sort

**Description**
Developer name of the policy.

- **Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

#### IsActive

**Type**
boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether this policy can be used (true) or not (false) for data subject (customer) requests. The default value is false.

#### Language

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The language of the MasterLabel.

Possible values are:
- da—Danish
- de—German
- en_US—English
- es—Spanish
- es_MX—Spanish (Mexico)

- pt_BR—Portuguese (Brazil)
### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as the object.

**DsarPolicyLog**

Sharing is available for the object.

### DsarPolicyLog

Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

### Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

### Special Access Rules

This object is for Privacy Center customers with the ReadAllData or PrivacyDataAccess permissions.

Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as the object.

**DsarPolicy**
Sharing is available for the object.

**DuplicateJob**

Represents an instance of a job that identifies duplicates among existing records in the system.

This object is available in API versions 42.0 and later.

A duplicate job is the parent of the DuplicateRecordSet instances that it generates. The duplicate record items in a set generated by a duplicate job are of one object type.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()

**Special Access Rules**

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

**Fields**

<table>

### DuplicateJobDefinition

**Setup object defining a job that identifies duplicate record items globally.**

This object is available in API versions 42.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| DeveloperName| **Type**: string  
**Properties**: Filter, Group, Sort  
**Description**: The name of the user who created a duplicate job.  
⚠️ **Note**: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field. |
| Language     | **Type**: picklist  
**Properties**: Filter, Group, Restricted picklist, Sort  
**Description**: The language in the user's personal settings. |
| MasterLabel  | **Type**: string  
**Properties**: Filter, Group, Sort  
**Description**: The label of the duplicate job. |
| SobjectSubtype| **Type**: picklist  
**Properties**: Defaulted on create, Filter, Group, Restricted picklist, Sort  
**Description**: The object subtype. Valid values are Person, Account, or None. |
| SobjectType  | **Type**: picklist  
**Properties**: Filter, Group, Restricted picklist, Sort  
**Description**: The object type: account, contact, or lead. |
**DuplicateJobMatchingRule**

Represents a MatchingRule to be used with a DuplicateJob sharing the corresponding DuplicateJobMatchingRuleDefinition. This object is available in API versions 42.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

**Fields**

<table>

  **Properties** Filter, Group, Sort  
  **Description** The ID of the matching rule defined for the corresponding DuplicateJobMatchingRuleDefinition. |
| MatchingRuleBooleanFilter | Type: textarea  
  **Properties** Filter, Sort  
  **Description** Boolean logic of the MatchingRule for this DuplicateJobMatchingRule. |
| MatchingRuleDescription | Type: textarea  
  **Properties** Filter, Group, Nillable, Sort |
**DuplicateJobMatchingRuleDefinition**

Setup object specifying a MatchingRule to use with DuplicateJob instances that share a DuplicateJobDefinition.

⚠️ **[other]**: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

This object is available in API versions 42.0 and later.

### Supported Calls

describeSObjects(), query(), search()

### Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DuplicateJobDefinitionId</td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> ID of DuplicateJobDefinition (master) for this DuplicateJobMatchingRuleDefinition (detail).</td>
</tr>
<tr>
<td>MatchingRuleId</td>
<td><strong>Type</strong> reference</td>
</tr>
</tbody>
</table>

[1201]
DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

To access this object, enable Duplicate Management. A Salesforce admin can grant access to any user with a Sales Cloud or CRM user license.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DuplicateRecordSetId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The duplicate record set that the duplicate record item is assigned to. This is a relationship field.</td>
</tr>
<tr>
<td>Relationship Name</td>
<td>DuplicateRecordSet</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>Lookup</td>
</tr>
<tr>
<td>Refers To</td>
<td>DuplicateRecordSet</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>string</td>
</tr>
</tbody>
</table>
**DuplicateRecordSet**

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

To access this object, activate duplicate rules. A Salesforce admin must give users read and write access.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DuplicateRuleId</code></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------</td>
</tr>
<tr>
<td><strong>Details</strong></td>
<td></td>
</tr>
<tr>

|                  | **Description**  | The autogenerated name that's given to the duplicate record set. Label is Duplicate Record Set Name. |
| **RecordCount**  | Type  
                           | int                                         |
DuplicateRule

Represents a duplicate rule for detecting duplicate records.

Supported Calls
describeSObjects(), describeLayout(), query(), retrieve(), search()

Special Access Rules
As of Summer ’20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</td>
</tr>
<tr>
<td>IsActive</td>
<td>Type</td>
</tr>
</tbody>
</table>
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether a duplicate rule is active (<code>true</code>) or not (<code>false</code>). This field is read only.</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>Type: picklist</td>

<tr>
<td><strong>MasterLabel</strong></td>
<td>Type: string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The label for the duplicate rule.</td>
</tr>
<tr>
<td><strong>NamespacePrefix</strong></td>
<td>Type: string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values.</td>
</tr>
<tr>
<td><strong>sObjectType</strong></td>
<td>Type: picklist</td>
</tr>
</tbody>
</table>
**Usage**

You can use the API to view a duplicate rule's details. To create, edit, or delete duplicate rules, use the UI.

Use DuplicateRule to get the sObject type.

DuplicateRule is unavailable in some orgs.

---

**ElectronicMediaGroup**

Represents the type of media that you can associate with a product or category. This object is available in API version 49.0 and later.

**Supported Calls**

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

You must have the B2B Commerce license and a CMS workspace to access a web store.

---

</tbody>
</table>
**Details**

**Description**
The ID of the owner of the ElectronicMediaGroup object. For external routing, allows the object to be used in the Streaming API to listen to events whenever a ElectronicMediaGroup record is created, modified, or deleted.

**UsageType**

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
Possible values are:
- Attachment
- Banner
- Listing
- Standard
- Tile

---

**ElectronicMediaUse**

Represents the usage of media. This object is available in API version 49.0 and later.

**Supported Calls**
describeSObjects(), query(), retrieve()

**Special Access Rules**
You must have the B2B Commerce license and a CMS workspace to access a web store.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **CurrencyIsoCode** | **Type**
picklist

**Properties**
Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**
The default value is **USD**. Possible values are:
- **USD**—U.S. Dollar
### Field Details

**ElectronicMediaGroupId**
- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The ID of the electronic media group.

**ElectronicMediaId**
- **Type**: reference
- **Properties**: Filter, Group, Sort
- **Description**: The ID of the electronic media.

**ImplementorType**
- **Type**: string
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The type of implementor. Available implementors of ElectronicMediaUse include:
  - ProductMedia
  - ProductCategoryMedia

**SortOrder**
- **Type**: int
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The order that electronic media is displayed in.

### EmailContent

Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()
### Special Access Rules

EmailContent is only available for orgs that use Pardot. The Manage Email Content user permission is required. Users also need the CRM User, Sales, or Service User permission set. EmailContent isn’t available for custom portal or guest users.

### Fields

<table>

</table>
EmailDomainFilter

Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

You must have the “Email Administration,” “Customize Application,” and “View Setup” user permissions to use this object.

You must create an email relay in Setup or through the EmailRelay object before you can use the EmailDomainFilter object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>EmailRelayId</td>
<td><strong>Type</strong> reference&lt;br&gt;<strong>Properties</strong> Create, Filter, Group, Sort, Update&lt;br&gt;<strong>Description</strong> The ID of the EmailRelay record. This is a relationship field.</td>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>Restricts the email relay to send emails based on the recipient domains (ToDomain) listed in this field. This field is optional, accepts a list of comma-separated values, and supports the wildcard character.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage

⚠️ **Tip:** If you also plan to activate Bounce Management and Email Compliance Management, confirm with your email admin that your company allows relaying email sent from Salesforce. For more information on bounce management, see [Configure Deliverability Settings for Emails Sent from Salesforce](#).  

### EmailDomainKey

Represents a domain key for an organization’s domain, used to authenticate outbound email that Salesforce sends on the organization’s behalf. This object is available in API version 28.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`
**Special Access Rules**

As of Summer '20 and later, only authenticated internal and external users can access this object.

We've upgraded and replaced the original DKIM (DomainKeys Identified Mail) key feature, so that you can create a DKIM key with increased email security. For more information, see Setting Up More Secure DKIM Keys.

Usage

Create DKIM Keys with Increased Security

1. If your Salesforce org was created before Winter ’19, enable the Critical Update. From Setup, enter Critical Updates in the Quick Find box, and then select Critical Updates. For Enable Redesigned DomainKeys Identified Mail (DKIM) Key Feature with Increased Email Security, click Activate.

2. Insert Domain, DomainMatch, Selector, and AlternateSelector. Salesforce publishes your TXT record to DNS.

3. Retrieve the TxtRecordName and AlternateTxtRecordName and use them to create and publish the CNAME and Alternate CNAME record to your domain’s DNS.
   a. Create CNAME record using: `<selector>._domainkey.<domain> IN CNAME txtRecordName`
   b. Create Alternate CNAME record using: `<alternateSelector>._domainkey.<domain> IN CNAME alternateTxtRecordName`

4. Set the IsActive field to true.

Create DKIM Keys (pre-Winter ‘19 Version)

Note: The critical update activates for everyone on October 15, 2019. After that date, this approach to creating DKIM keys will no longer be available.

When you create a DKIM key, Salesforce generates a public and private key pair. Publish the public key in the DNS.

For each domain key you create, we recommend this sequence:

1. Insert the Domain, DomainMatch, and Selector.

2. Update your domain’s DNS records.
   a. Locate the DNS record at `selector._domainkey.domain` For example, `mail._domainkey.mail.example.com`.
   b. Add the PublicKey value, like this: `V=DKIM1; p=public_key`

DKIM Signing Outbound Email

   a. In addition, you can optionally put the record in testing mode, which instructs recipients to not make decisions based on the email signature. Add parameter t=y to the DNS entry: `V=DKIM1; t=y; p=public_key`

3. Update the key via the API or UI to be active.

Salesforce Help: Setting Up More Secure DKIM Keys
EmailMessage

Represents an email in Salesforce.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

EmailMessage is only available for orgs that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

To use reply and forward functionality, FromAddress must specify an email address that exists in EmailMessageRelation, with a RelationType of FromAddress.

Customer Portal users have read access to EmailMessage if the value for the ParentID field is associated with a case. Otherwise, access is determined by sharing access of the associated task.

The Status field is mostly read-only. You can change the status only from New to Read.

update() is supported when an email record is in Draft status, and IsPrivateDraft is false. It is also supported if Status and IsPrivateDraft are true and CreatedBy is associated with the current user. When the email record status is not in Draft status, the IsExternallyVisible field and custom fields only can be updated.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActivityId</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>ID of the activity that is associated with the email. Usually represents an open task that is created for the case owner when a new unread email message is received. ActivityId can only be specified for emails on cases. It’s auto-created for other entities.</td>
</tr>
<tr>
<td>BccAddress</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>A string array of email addresses for recipients who were sent a blind carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the BccIds field instead of adding their email address to the BccAddress field.</td>
</tr>
</tbody>
</table>
### BccIds

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>JunctionIdList</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>A string array of IDs for contacts, leads, and users who were sent a blind carbon copy of the email message. Each ID is linked to an EmailMessageRelation record, which represents the relationship between an email message and a Contact, Lead, or User record. For an Experience Cloud site user who is not the sender of the email, this list is empty.</td>
</tr>
</tbody>
</table>

**Warning:** Adding a JunctionIdList field name to the fieldsToNull property deletes all related junction records. This action can’t be undone.

### CcAddress

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>A string array of email addresses for recipients who were sent a carbon copy of the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the CcIds field instead of adding their email address to the CcAddress field. Then the email message is automatically associated with the contact, lead, or user.</td>
</tr>
</tbody>
</table>

You can’t send emails unless there’s at least one recipient.

| **Description** | The subject line of the email. You can’t send emails unless at least one of these fields has content.  
- Subject field  
- HTML Body or Text Body field  
As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields. |  |
| **TextBody** | **Type**  
textarea  
**Properties**  
Create, Nillable, Update  
**Description**  
The body of the email, in plain text format. If TextBody is not set, then it is extracted from HtmlBody.  
You can’t send emails unless at least one of these fields has content.  
- Subject field  
- HTML Body or Text Body field  
As the sender, you can provide the content, or it can be automatically inserted using predefined values. An email template can also include the content for these fields. |  |
| **ThreadId** | **Type**  
string  
**Properties**  
Create, Filter, Group, idLookup, Nillable, Sort, Update  
**Description**  
The ID of the email thread the email message belongs to. |  |
| **ToAddress** | **Type**  
string  
**Properties**  
Create, Filter, Nillable, Sort, Update  
**Description**  
A string array of email addresses for recipients who were sent the email message. Include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the ToIds field instead of adding their email address to the ToAddress field. Then the email message is automatically associated with the contact, lead, or user.  
You can’t send emails unless there’s at least one recipient. |  |
### Usage

If your org uses Email-to-Case, a case is created when an email is sent to one of your company's addresses. The email, which is related to the case by the `ParentId` field, is stored as an EmailMessage record. When users view the email, they see the EmailMessage record.

If your org uses Enhanced Email, each email is stored as an EmailMessage record and a Task record. When users view an email, they see the EmailMessage record.

### Sample Code—Apex

This sample logs email activity in Salesforce.

```apex
// if EnhancedEmail Perm is not enabled, continue logging the email as a task

// if EnhancedEmail Perm is enabled, create an EmailMessage object
EmailMessage emailMessage = new EmailMessage();
emailMessage.status = '3'; // email was sent
emailMessage.relatedToId = '006B0000003weZGIAY'; // related to record e.g. an opportunity
emailMessage.fromAddress = 'sender@example.com'; // from address
emailMessage.fromName = 'Dan Perkins'; // from name
emailMessage.subject = 'This is the Subject!'; // email subject
```
emailMessage.htmlBody = '<html><body><b>Hello</b></body></html>'; // email body
// Contact, Lead or User Ids of recipients
String[] toIds = new String[]{'003B000000AxcEjIAJ'};
emailMessage.toIds = toIds;
// additional recipients who don't have a corresponding contact, lead or user id in the Salesforce org (optional)
emailMessage.toAddress = 'emailnotinsalesforce@toexample.com, anotherone@toexample.com';
insert emailMessage; // insert

// Add Email Message Relation for id of the sender
EmailMessageRelation emr = new EmailMessageRelation();
emr.emailMessageId = emailMessage.id;
emr.relationId = '005B0000003qHvOIAU'; // user id of the sender
emr.relationType = 'FromAddress';
insert emr;

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**EmailMessageChangeEvent (API version 48.0)**

Change events are available for the object.

SEE ALSO:

- Case
- Object Basics

EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

Special Access Rules

EmailMessageRelation is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| EmailMessageId | **Type**  
reference  

**Properties**  
Create, Filter, Group, Sort  

**Description**  
The ID of the EmailMessage record.  
This is a relationship field. |
| RelationAddress | **Type**  
string  

**Properties**  
Create, Filter, Group, Nillable, Sort  

**Description**  
The email address of the sender or recipient.  

**Note:** If a record relates an email to an existing contact, lead, or user record in Salesforce, the value of RelationAddress is the current value of the email address. If the value is not set, it is auto-populated from RelationId. |
| RelationId | **Type**  
reference  

**Properties**  
Create, Filter, Group, Nillable, Sort, Update  

**Description**  
The RecordId of the sender or recipient.  

**Note:** If a record relates an email to an email address that’s not associated with an existing contact, lead, or user record in Salesforce, the value of RelationId is null.  
This is a polymorphic relationship field. |
| Relationship Name | Relation |
### Usage

EmailMessageRelation allows an email to be related to contacts, leads, and users.

### EmailRelay

Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company's email servers. This object is available in API version 43.0 and later.

### Supported Calls

```
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()
```
**Special Access Rules**

You must have the Email Administration, Customize Application, and View Setup user permissions to use this object.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>

</table>
| AuthType     | Type: **picklist**  
**Properties**: Create, Filter, Group, Restricted Picklist, Sort, Update  
**Description**: Specifies which SASL mechanism Salesforce uses for SMTP authentication. This field is available when Enable SMTP Auth is selected. Select an option:  
- **PLAIN**: Salesforce uses PLAIN SASL mechanism for SMTP authentication. Default.  
- **LOGIN**: Salesforce uses LOGIN SASL mechanism for SMTP authentication. This field is available in API version 52.0 and later. |
| Host         | Type: **string**  
**Properties**: Create, Filter, Group, idLookup, Sort, Update  
**Description**: Indicates the host name or IP address of your company’s SMTP server. |
| IsRequireAuth| Type: **boolean**  
**Properties**: Create, Defaulted on create, Filter, Group, Sort, Update  
**Description**: Indicates whether (true) or not (false) authentication is required. When setting this field to true, the **TlsSetting** must be set to **RequiredVerify**. This field is available in API version 44.0 and later. |
| Password     | Type: **encryptedstring**  
**Properties**: Create, Nillable, Update |
<table>

<tr>
<td>• Off: TLS is turned off. SMTP session continues through an insecure connection.</td>
<td></td>
</tr>
<tr>
<td>• Preferred: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. If TLS is unavailable, Salesforce continues the session without TLS.</td>
<td></td>
</tr>
<tr>
<td>• Required: Salesforce continues the session only if the remote server supports TLS. If TLS is unavailable, Salesforce terminates the session without delivering the email.</td>
<td></td>
</tr>
<tr>
<td>• PreferredVerify: If the remote server supports TLS, Salesforce upgrades the current SMTP session to use TLS. Before the session begins, Salesforce verifies that the certificate is signed by a valid certificate authority, and that the common name presented in the certificate matches the domain or mail exchange of the current connection. If TLS is available but the certificate is not signed or the common name does not match, Salesforce disconnects the session and does not deliver the email. If TLS is unavailable, Salesforce continues the session without TLS.</td>
<td></td>
</tr>
<tr>
<td>• RequiredVerify: Salesforce continues the session only if the remote server supports TLS, the certificate is signed by a valid certificate authority, and the common name presented in the certificate matches the domain or mail exchange.</td>
<td></td>
</tr>
</tbody>
</table>
EmailServicesAddress

An email service address.

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **AuthorizedSenders** | **Type**  
textarea  
**Properties**  
Create, Filter, Nillable, Sort, Update  
**Description**  
Configures the email service address to only accept messages from the email addresses or domains listed in this field. If the email service address receives a message from an unlisted email address or domain, the email service performs the action specified in the AuthorizationFailureAction field of its associated email service. Leave this field blank if you want the email service address to receive email from any email address. |
| **DeveloperName**    | **Type**  
string  
**Properties**  
Create, Defaulted on create, Filter, Group, Sort, Update  
**Description**  
The name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This 25-character field must be unique among other EmailServicesAddress records under the same EmailServiceFunction parent. In managed packages, this field prevents naming conflicts on package installations. This field is automatically generated, but you can supply your own value if you create the record using the API. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.  
**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance might be slow while Salesforce generates one for each record. |
| **EmailDomainName**  | **Type**  
string  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
A read only field you can query that contains the system-generated domain part of this email service address. The system generates a unique domain-part for each email service address to ensure that no two email service addresses are identical. |
| **FunctionId**       | **Type**  
reference |
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
| **Description**       | The ID of the email service for which the email service address receives messages.  
                          | This is a relationship field.               |
| **Relationship Name** | Function                                     |
| **Relationship Type** | Lookup                                       |
| **Refers To**         | EmailServicesFunction                        |
| **IsActive**          | **Type** boolean                             |
| **Properties**        | Create, Defaulted on create, Filter, Group, Sort, Update |
| **Description**       | Indicates whether this object is active (true) or not (false). |
| **LocalPart**         | **Type** string                              |
| **Properties**        | Create, Filter, Group, idLookup, Sort, Update |
| **Description**       | The local-part of the email service address.  
                          | The local-part of the address is the string that  
                          | comes before the @ symbol.                  |
|                       | For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus  
                          | the following special characters:          |
|                       | ! # $ % & `; ' * / = ? ^ _ + - ` { | } ~ , |
|                       | The dot character (.) is also valid as long as it’s not the first or last character. |
|                       | Email addresses aren’t case-sensitive.       |
| **RunAsUserId**       | **Type** reference                           |
| **Properties**        | Create, Filter, Group, Sort, Update          |
| **Description**       | The username of the user whose permissions the email service assumes when processing  
                          | messages sent to this address.             |
Usage
This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

| ApexClassId           | **Type**: reference  
**Properties**: Create, Filter, Group, Nillable, Sort, Update  
**Description**: Required. The ID of the Apex class that the email service uses to process inbound messages. This field is required for API version 12.0 and later. |
| AttachmentOption      | **Type**: picklist  
**Properties**: Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description**: Indicates the types of attachments the email service accepts. One of the following values:  
  - **None**: The email service accepts the message but discards any attachment. (In API version 41.0 and earlier, the value specified for this choice is 0.)  
  - **NoContent**: The attachment metadata (filename, MIME type, and so on) is provided to the Apex class, but the body is set to null. There was no previous numeric value for this choice.  
  - **TextOnly**: The email service only accepts the following types of attachments:  
    - Attachments with a Multipurpose Internet Mail Extension (MIME) type of text.  
    - Attachments with a MIME type of application/octet-stream and a file name that ends with either a .vcf or .vcs extension. These are saved as text/x-vcard and text/calendar MIME types, respectively. (In API version 41.0 and earlier, the value specified for this choice is 1.)  
  - **BinaryOnly**: The email service only accepts binary attachments, such as image, audio, application, and video files. (In API version 41.0 and earlier, the value specified for this choice is 2.)  
  - **All**: The email service accepts any type of attachment. (In API version 41.0 and earlier, the value specified for this choice is 3.) |
| AuthenticationFailureAction | **Type**: picklist  
**Properties**: Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
**Description**: Indicates what the email service does with messages that fail or do not support any of the authentication protocols if the IsAuthenticationRequired field is true. |
### Field: AuthorizationFailureAction

**Type**
- picklist

**Properties**
- Defaulted on create, Group, Sort, Create, Filter, Nillable, Restricted picklist, Update

**Description**
Indicates what the email service does with messages received from senders who are not listed in the `AuthorizedSenders` field on either the email service or email service address.

One of the following values:

- **UseSystemDefault**—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.)
- **Bounce**—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.)
- **Discard**—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.)
- **Requeue**—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)

</tr>
</tbody>
</table>

**Type**
picklist

**Properties**
Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization.

One of the following values:

- **UseSystemDefault**—The system default is used. (In API version 41.0 and earlier, the value specified for this choice is 0.)
- **Bounce**—The email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 1.)
- **Discard**—The email service deletes the message without notifying the sender. (In API version 41.0 and earlier, the value specified for this choice is 2.)
- **Requeue**—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected. (In API version 41.0 and earlier, the value specified for this choice is 3.)

The system calculates the limit by multiplying the number of user licenses by 1,000.

**Usage**
This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

**SEE ALSO:**
EmailServicesAddress
# EmailStatus

Represents the status of email sent.

## Supported Calls

describeSObjects()  

## Special Access Rules

Customer Portal users can’t access this object.

<td>Type int Properties Filter, Group, Nillable, Sort Description Read-only. The total number of emails sent minus hard and soft bounces. Note: this data includes emails that were delivered to the recipient's spam folder. This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.</td>
</tr>
<tr>
<td>TotalHardBounced</td>
<td>Type int Properties Defaulted on create, Filter, Group, Nillable, Sort</td>
</tr>
</tbody>
</table>
**TotalOpens**

**Type**

int

**Properties**

Defaulted on create, Filter, Group, Nillable, Sort

**Description**

Read-only. The total number of times a prospect’s email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) don’t display images by default. Pardot counts an open each time the images load.

This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.

---

**TotalSent**

**Type**

int

**Properties**

Filter, Group, Nillable, Sort

**Description**

Read-only. The total number of emails sent, including bounced, opted-out, and invalid To: addresses.

This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.

---

**TotalSoftBounced**

**Type**

int

**Properties**

Defaulted on create, Filter, Group, Nillable, Sort

---

**Details**

**Description**

Read-only. The total number of emails that permanently bounced back to the sender because the address is invalid. A hard bounce can occur because the domain name doesn’t exist or because the recipient is unknown.

This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.
### Details

**Description**

Read-only. The total number of times a recipient’s mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient’s mailbox is full or the mail server is temporarily unavailable. A soft bounce message can sometimes be delivered at another time. After 5 soft bounces, Pardot opts the prospect out of emails.

This field is available in API version 46.0 and later. To access this field, your org must use High Velocity Sales (HVS) and users need the High Velocity Sales User or High Velocity Sales Cadence Creator permission set. This field value includes emails sent via the ListEmail object or HVS sales cadences.

**Type**

picklist

**Properties**

Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

Indicates the user interface where this template is usable.

Possible values are:

- Aloha
- SFX
- SFX_Sample—SFXSample

### Usage

To retrieve this object, issue a describe call on an object, which returns a query result for each activity since the object was created. You can’t query these records.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**EmailTemplateChangeEvent** *(API version 48.0)*

Change events are available for the object.

SEE ALSO:

- Attachment
- EmailStatus
- DocumentAttachmentMap
EmbeddedServiceDetail

Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don't have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

Supported SOAP Calls
<code>describeSObjects(), query()</code>

Supported REST HTTP Methods
<code>GET</code>

</table>
| **Description**   | The level of accuracy of an employee’s home address geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates. Possible values are:  
  - Address  
  - Block  
  - City  
  - County  
  - ExtendedZip  
  - NearAddress  
  - Neighborhood  
  - State  
  - Street  
  - Unknown  
  - Zip |

| **HomeLatitude**  | **Type** double                              |
| **Properties**    | Create, Filter, Nillable, Sort, Update       |
| **Description**   | Used with HomeLongitude to specify the precise geolocation of the employee’s home address. Acceptable values are numbers between –90 and 90 with up to 15 decimal places. |

| **HomeLongitude** | **Type** double                              |
| **Properties**    | Create, Filter, Nillable, Sort, Update       |
| **Description**   | Used with HomeLatitude to specify the precise geolocation of the employee’s home address. Acceptable values are numbers between –180 and 180 with up to 15 decimal places. |

### Field Details

**Description**
Required. The type of worker for the employee.
Possible values are:
- Alumnus
- Contractor
- Employee
- Intern
- Temporary

#### WorkingHoursEnd
**Type**
picklist
**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update
**Description**
The end time of the employee's working hours.

#### WorkingHoursStart
**Type**
picklist
**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update
**Description**
The start time of the employee's working hours.

### Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as this object.

- **EmployeeHistory (API version 49.0)**
  History is available for tracked fields of the object.
- **EmployeeOwnerSharingRule**
  Sharing rules are available for the object.
- **EmployeesShare (API version 49.0)**
  Sharing is available for the object.

SEE ALSO:

*Workplace Command Center for Work.com Developer Guide: Extend Work.com with Custom Solutions*

### EmployeeCrisisAssessment

Represents a crisis assessment of an Employee. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.
For Work.com, when an employee responds to a wellness survey, an EmployeeCrisisAssessment record is created based on an employee's answers.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

</tbody>
</table>
### LastViewedDate

| **Type** | date |
| **Properties** | Filter, Nillable, Sort, Update |
| **Description** | The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it. |

### Name

| **Type** | string |
| **Properties** | Create, Filter, Update |
| **Description** | Required. Name of the entitlement. |

### SvcApptBookingWindowsId

| **Type** | reference |
| **Properties** | Create, Filter, Group, Sort, Nillable, Update |
| **Description** | The operating hours that the entitlement's work orders should respect. The label in the user interface is Operating Hours. Available only if Field Service is enabled. |

### RemainingCases

| **Type** | int |
| **Properties** | Create, Filter, Nillable, Update |
| **Description** | The number of cases the entitlement can support. This field decreases in value by one each time a case is created with the entitlement.
This field is only available if IsPerIncident is selected. |

### RemainingWorkOrders

| **Type** | int |
| **Properties** | Create, Filter, Group, Nillable, Sort, Update |
| **Description** | The number of agreed work orders remaining to be created. |

### ServiceContractId

<p>| <strong>Type</strong> | reference |</p>

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **EntitlementChangeEvent (API version 44.0)**
  - Change events are available for the object.

- **EntitlementFeed (API version 23.0)**
  - Feed tracking is available for the object.

- **EntitlementHistory**
  - History is available for tracked fields of the object.

SEE ALSO:
- EntitlementContact
- SlaProcess

### EntitlementContact

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrievel()`, `undelete()`

### EntitlementTemplate

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()
Special Access Rules

As of Summer ’20 and later, only Salesforce admins, users with access to the Case, Entitlement, or Work Order objects, and users with the View Setup and Configuration permission can access this object.

</table>

1293
**Field** | **Details**
---|---
**Description** | The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Available in version 34.0 and later.

**Usage**

Use this object to manage entitlement templates.
**EntityHistory**

Represents historical information about an object’s changed field values. This object is only available to users with the “View All Data” permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead.

**Supported Calls**

describeSObjects(), getUpdated(), getDeleted(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

### EntityMilestone

 Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term “object milestone.” This object is available in API version 37.0 and later.

**Note:** Milestones on cases use the **CaseMilestone** object type.

### Supported Calls

- delete()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- undelete()
- update()
Special Access Rules

- As of Summer ’20 and later, only Salesforce admins, users with access to the Case, Entitlement, or Work Order objects, and users with the View Setup and Configuration permission can access this object.
- Entitlement management must be enabled.
- Work orders or Field Service must be enabled.

</tr>
</tbody>
</table>

### Usage

When you create an entitlement process, you select its type based on the type of record that you want the process to run on: Case or Work Order. Processes created before Summer '16 use the Case type. When a Work Order entitlement process runs on a work order, the resulting milestones on the work order are object milestones. Conversely, when a Case entitlement process runs on a case, the resulting milestones are case milestones, a separate standard object.

**Tip:** If an entitlement has an entitlement process associated with it, don’t use the entitlement for multiple types of support records. An entitlement process works only on records that match the process’s type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with that entitlement. If a work order is also associated with the entitlement, the process doesn’t run on the work order. To ensure that the milestones you set up work as expected, associate a customer’s work orders and cases with different entitlements.

Customize page layouts, validation rules, and more for object milestones from the Object Milestones node in Setup under Entitlement Management.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**EntityMilestoneFeed**
- Feed tracking is available for the object.

**EntityMilestoneHistory**
- History is available for tracked fields of the object.

### EntitySubscription

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user’s home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Fields

### SubscriberId

**Type**  
reference

**Properties**  
Create, Filter, Group, Sort

**Description**  
Required. ID of the user who is following the record or user.

This is a relationship field.

**Relationship Name**  
Subscriber

**Relationship Type**  
Lookup

**Refers To**  
User

### Usage

Consider this when following records and users:

- Users can only follow records that they can see.
- Users can see which records other users are following, unless they don’t have access to the records.
- Administrators and users with the “Modify All Users” permission can configure a user to follow records that the user has read access to.
- Administrators and users with the “Modify All Users” permission can configure users to stop following records.
Following topics is available in API version 29.0 and later. For this reason, a topic ID is now a supported value for the `ParentId` field.

If you deactivate a user, any EntitySubscription where the user is associated with the ParentId or SubscriberId field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can’t be restored upon user reactivation.

When using `query()` with EntitySubscription,

- Note the following SOQL restriction. No SOQL limit if logged-in user has "View All Data" permission. If not, specify a LIMIT clause of 1,000 records or fewer.
- A query using a `WHERE` clause can only filter by fields on the EntitySubscription object.
- If user sharing is enabled and the querying user is not an administrator, a SOQL query must be constrained either by the `ParentId` or `SubscriberId`. Otherwise, the query behavior at run time is undefined, meaning the result set can be incomplete or inconsistent from invocation to invocation. For an unconstrained query, the sharing check limits imposed on a non-administrative user are likely to be exceeded before the query completes, because access checks are run against both parent and subject, for each row of the result set. We recommend using the Connect REST API to query EntitySubscription data instead of running a SOQL query.
- Users without the “View All Data” permission
  - Need read access on the object associated with the `ParentId` field to see which users are following records for the object.
  - Can use an `ORDER BY` clause in a query only to order by fields on the EntitySubscription object. For example, if the subscription relates to an Account record, the query can `ORDER BY ParentId`, but it can’t `ORDER BY Account.Name`.
  - Don’t always get all matching subscriptions when running a query. For these users, a query evaluates visibility criteria on a maximum of 500 records to reduce the prospect of long-running queries. If a user runs a query to see the CEO’s subscriptions, it might scan a large number of records. The query only returns matches within the first 500 records scanned. It is possible that there are more subscriptions that are visible to the user, but they are not returned. To mitigate this, we recommend using a `WHERE` clause, if possible, to reduce the scope of the query.

**Sample—SOQL**

The following SOQL query returns subscriptions for all the accounts that a subscriber is following that have more than 10 employees:

```sql
SELECT Id
FROM EntitySubscription
WHERE SubscriberId = '005U0000000Rg2CIAS'
AND ParentId IN (
    SELECT Id FROM Account
    WHERE NumberOfEmployees > 10
)
LIMIT 200
```

**SEE ALSO:**

- Custom Object__Feed

---

**EnvironmentHubMember**

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.
Supported Calls

dele te(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update()

**Usage**

Use this object to access and modify settings of member orgs in the Environment Hub.

**Event**

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

⚠️ [Other]: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.
Note:

- An EventRelation object can't be related to a child event, and child events don't include the invitee related list.
- `query()`, `delete()`, and `update()` aren't allowed with events related to more than one contact in API versions 25.0 and earlier.
- `create()` and `update()` aren't available for read-only fields on Lightning Experience event series.
- `upsert()` and `undelete()` aren't supported for syncing changes made to events through the API using the feature Lightning Sync.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
<td>Contains the event length, in minutes. Even though this field represents a temporal value, it's an integer type—not a Date/Time type. Required in versions 12.0 and earlier if IsAllDayEvent is false. In versions 13.0 and later, this field is optional, depending on the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If IsAllDayEvent is true, you can supply a value for either DurationInMinutes or EndDateTime. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are null, the duration defaults to one day. • If IsAllDayEvent is false, a value must be supplied for either DurationInMinutes or EndDateTime. Supplying values in both fields is allowed if the values add up to the same amount of time. If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the DurationInMinutes field. API versions 12.0 and earlier can't access event objects whose DurationInMinutes is greater than 1440. For more information, see Multiday Events. Depending on your API version, errors with the DurationInMinutes and EndDateTime fields may appear in different places.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Versions 38.0 and before—Errors always appear in the DurationInMinutes field. • Versions 39.0 and later—If there's no value for the DurationInMinutes field, errors appear in the EndDateTime field. Otherwise, they appear in the DurationInMinutes field.</td>
</tr>
<tr>
<td><strong>EndDate</strong></td>
<td>date</td>
<td>Read-only. Available in versions 46.0 and later. This field supplies the date value that appears in the EndDateTime field. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone.</td>
</tr>
<tr>
<td><strong>EndDateTime</strong></td>
<td>dateTime</td>
<td>Available in versions 13.0 and later. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. This field is optional, depending on the following:</td>
</tr>
</tbody>
</table>
If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day.

If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time.

Depending on your API version, errors with the `DurationInMinutes` and `EndDateTime` fields may appear in different places.

- Versions 38.0 and before—Errors always appear in the `DurationInMinutes` field.
- Versions 39.0 and later—if there’s no value for the `DurationInMinutes` field, errors appear in the `EndDateTime` field. Otherwise, they appear in the `DurationInMinutes` field.

</table>
| IsGroupEvent       | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Indicates whether the event is a group event—that is, whether it has invitees (true) or not (false). |
| IsPrivate          | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** Indicates whether users other than the creator of the event can (false) or can’t (true) see the event details when viewing the event user’s calendar. However, users with the View All Data or Modify All Data permission can see private events in reports and searches, or when viewing other users’ calendars. Private events can’t be associated with opportunities, accounts, cases, campaigns, contracts, leads, or contacts. Label is Private. |
| IsRecurrence       | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort  
**Description** Indicates whether a Salesforce Classic event is scheduled to repeat itself (true) or only occurs one time (false). This field is read-only when updating records, but not when creating them. If this field value is true, then RecurrenceEndDateOnly, RecurrenceStartDateTime, RecurrenceType, and any recurrence fields associated with the given recurrence type must be populated. Label is Create recurring series of events. |
| IsRecurrence2      | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Read-only. This field available in API version 44.0 and later. Indicates whether a Lightning Experience event is scheduled to repeat (true) or only occurs one time (false). If this field value is true, then Recurrence2PatternText and Recurrence2PatternVersion must be populated. Label is Repeat. |

### Description
Indicates the day or days of the week on which the Salesforce Classic recurring event repeats. This field contains a bitmask. The values are as follows:

- Sunday = 1
- Monday = 2
- Tuesday = 4
- Wednesday = 8
- Thursday = 16
- Friday = 32
- Saturday = 64

Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.

### RecurrenceEndDateOnly
- **Type**: date
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: Indicates the last date on which the event repeats. For multiday Salesforce Classic recurring events, this date is the day on which the last occurrence starts. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences.

### RecurrenceInstance
- **Type**: picklist
- **Properties**: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update
- **Description**: Indicates the frequency of the Salesforce Classic event's recurrence. For example, 2nd or 3rd.

### RecurrenceInterval
- **Type**: int
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: Indicates the interval between Salesforce Classic recurring events.

### RecurrenceMonthOfYear
- **Type**: picklist

<td>Represents the time when the reminder is scheduled to fire, if IsReminderSet is set to true. If IsReminderSet is set to false, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.</td>
</tr>
</tbody>
</table>
### Field: ShowAs

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Indicates how this event appears when another user views the calendar: Busy, Out of Office, or Free. Label is **Show Time As**.

### Field: StartDateTime

**Type**
- dateTime

**Properties**
- Create, Filter, Nillable, Sort, Update

**Description**
Indicates the start date and time of the event. Available in versions 13.0 and later.

If the Event IsAllDayEvent flag is set to true (indicating that it's an all-day Event), then the event start date information is contained in the StartDateTime field. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.

If the Event IsAllDayEvent flag is set to false (indicating that it isn't an all-day event), then the event start date information is contained in the StartDateTime field. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. You need to translate the time portion to or from a local time zone for the user or the application, as appropriate.

If this field has a value, then ActivityDate and ActivityDateTime must either be null or match the value of this field.

### Field: Subject

**Type**
- combobox

**Properties**
- Create, Filter, Nillable, Sort, Update

**Description**
The subject line of the event, such as Call, Email, or Meeting. Limit: 255 characters.

### Field: Type

**Type**
- picklist

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Indicates the event type, such as Call, Email, or Meeting.
<table>

|         | **Properties**
|         | Filter, Group, Nillable, Sort                                                                                                               |
|         | **Description**
|         | Available to organizations that have Shared Activities enabled. Represents the count of related EventRelations pertaining to the WhoId. |
| WhoId   | **Type**
|         | reference                                                                                                                                  |
|         | **Properties**
|         | Create, Filter, Group, Nillable, Sort, Update                                                                                              |
|         | **Description**
|         | The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact’s ID or a lead’s ID. The label is Name ID.               |
|         | If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID. |
|         | If the JunctionIdList field is used, all WhoIds are included in the relationship list. Beginning in API version 37.0, if the contact or lead ID in the WhoId field isn’t in the EventWhoIds list, no error occurs and the ID is added to the EventWhoIds as the primary WhoId. If WhoId is set to null, an arbitrary ID from the existing EventWhoIds list is promoted to the primary position. |
|         | This is a polymorphic relationship field.                                                                                                 |
|         | **Relationship Name**
|         | Who                                                                                                                                         |

1325
Usage

Use Event to manage calendar appointments.

Querying and Filtering Events

Queries on events are denied before they time out if they involve amounts of data that are deemed too large. In such cases, the exception code `OPERATION_TOO_LARGE` is returned. If you receive `OPERATION_TOO_LARGE`, refactor your query to return or scan a smaller amount of data.

When querying for events with a specific due date, you must filter on both the `ActivityDateTime`and `ActivityDate` fields. For example to find all events with a due date of February 14, 2003, you need two filters:

- One filter with the `ActivityDate` field equal to the Coordinated Universal Time (UTC) time zone on February 14, 2003.
- One filter with the `ActivityDate` field greater than or equal to midnight on February 14, 2003 in the user’s local time zone AND less than or equal to midnight on February 15, 2003 in the user’s local time zone.

Alternatively, in version 13.0 and later, you can find events with a specific due date by filtering on `StartDateTime`. For example, to find all events with a due date of February 14, 2003, filter with the `StartDateTime` greater than or equal to midnight on February 14, 2003 in the user’s local time zone AND less than or equal to midnight on February 15, 2003 in the user’s local time zone.

The `EventId` field of an `EventRelation` object always points to the master record. An invitee on a group event can query the `EventRelation` object to view the master record.

Multiday Events

- Multiday events are available in version 13.0 and later. Also, in earlier versions SOQL queries don’t return multiday events.
- Multiday events are enabled through the user interface from Setup by entering `Activity Settings` in the Quick Find box, then selecting `Activity Settings`.
- If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can’t access event objects whose `DurationInMinutes` is greater than 1440.
- Multiday events can’t exceed 14 days.

Event Series and Recurring Events

In Lightning Experience, events with multiple occurrences are called event series, and are indicated when the `IsRecurrence2` field is set to `true`. In Salesforce Classic, events with multiple occurrences are called recurring events, and are indicated when the `IsRecurrence` field is set to `true`. Both fields can’t be set to true for the same event.

- Lightning Experience event series are available in API version 44.0 and later as read-only fields. Recurrence patterns, specified by the `Recurrence2PatternText` field, are creatable in API version 52.0 and later. Salesforce Classic recurring events are available in version 7.0 and later. In earlier versions, SOQL queries don’t return any Lightning Experience event series.
- After an event is created, you can’t change the values of `IsRecurrence2` or `IsRecurrence` from `true` to `false` or vice versa.
- You can’t set fields associated with `IsRecurrence2` for events where `IsRecurrence` is set to `true`, or vice versa.
• For Lightning Experience event series where IsRecurrence2 is true, if you'd like to delete a single or all remaining events, use the REST API call. For Salesforce Classic recurring events where IsRecurrence is true, all past and future events in the series are removed when you delete the recurring event series through the API. However, when you delete the recurring event series through the user interface, only future occurrences are removed.

• When creating a Salesforce Classic recurring event series, the duration of the event must be 24 hours or less. When the Salesforce Classic recurring event series is created, you can extend the length of individual occurrences beyond 24 hours if Multiday events are enabled; see Multiday Events.

• For Salesforce Classic recurring events, RecurrenceStartDateTime, RecurrenceEndDateOnly, RecurrenceType, and any properties associated with the given recurrence type (see the Recurrence Field Usage for Salesforce Classic Recurring Events table) must be populated.

• When updating a Salesforce Classic recurring event series, it’s not possible to update the EventRelation for the event series object and the EventRelation for the series object occurrences at the same time.

• Lightning Experience event series have no series ID, so it's not possible to locate other occurrences in the series. In Salesforce Classic recurring events, you can use RecurrenceActivityId to locate other occurrences.

• For both Lightning Experience event series and Salesforce Classic recurring events, when a series repeats every day, month, or year, you can only schedule occurrences one time per day, month, or year. The every week option lets you schedule occurrences multiple days per week.

Limits for Lightning Experience event series and limits for Salesforce Classic recurring events also apply.

Lightning Experience Event Series and Recurring Events

Use the Recurrence2PatternText field to specify the recurrence pattern for Lightning Experience event series. These recurrence patterns, called reference rules or “RRULES”, support a subset of the RFC 5545 standards. This table includes common RRULE examples.

<table>
<thead>
<tr>
<th>Recurrence Pattern</th>
<th>RRULE Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every day for five days</td>
<td>RRULE:FREQ=DAILY;INTERVAL=1;COUNT=5</td>
</tr>
<tr>
<td>Every Monday, Tuesday, Wednesday, Thursday, and Friday with no end date</td>
<td>RRULE:FREQ=WEEKLY;INTERVAL=1;BYDAY=MO, TU, WE, TH, FR</td>
</tr>
<tr>
<td>Every two weeks on Monday and Friday for 10 occurrences</td>
<td>RRULE:FREQ=WEEKLY;INTERVAL=2;BYDAY=MO, FR;COUNT=10</td>
</tr>
<tr>
<td>Monthly on the first day of the month until January 1, 2020</td>
<td>RRULE:FREQ=MONTHLY;INTERVAL=1;UNTIL=20200101T000000Z</td>
</tr>
<tr>
<td>Yearly on July 4th for three years (in this example, specify the date using StartDateTime)</td>
<td>RRULE:FREQ=YEARLY;INTERVAL=1;BYMONTH=7;BYMONTHDAY=4;UNTIL=20220101T000000Z</td>
</tr>
<tr>
<td>Daily until January 1 2022 with no end date</td>
<td>RRULE:FREQ=DAILY;UNTIL=20220101T000000Z</td>
</tr>
<tr>
<td>Every third Friday of the month with no end date</td>
<td>RRULE:FREQ=MONTHLY;BYSETPOS=3;BYDAY=FR</td>
</tr>
</tbody>
</table>

The RRULE defined by Recurrence2PatternText supports a subset of the RFC 5545 standard for internet calendaring and scheduling. Supported RRULE parts include FREQ, BYMONTH, BYMONTHDAY, BYDAY, WKST, BYSETPOS, INTERVAL, UNTIL, and COUNT. When the event record is saved, the RRULE might be modified to follow the required format:

• The RRULE parts are placed in the following order: FREQ, BYMONTH, BYMONTHDAY, BYDAY, WKST, BYSETPOS, INTERVAL, UNTIL, and COUNT.

• Any missing default values are inserted. For example, if the RRULE doesn’t include INTERVAL, then INTERVAL=1 is added.

• The RRULE is prefaced with RRULE: if that preface is missing.
### Supported RFC 5545 Implementation

<table>
<thead>
<tr>
<th>RRule Part</th>
<th>Supported RFC 5545 Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREQ</td>
<td>Required. Indicates the type of recurrence rule. Allowed values are:</td>
</tr>
<tr>
<td></td>
<td>• DAILY— supported parts include FREQ, INTERVAL, UNTIL, and COUNT.</td>
</tr>
<tr>
<td></td>
<td>• WEEKLY— supported parts include INTERVAL, UNTIL, COUNT, BYDAY, and WKST. BYDAY is required, but can’t be preceded by a number.</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate weekly on Tuesday and Thursday until September 1 2023, use RRULE:FREQ=WEEKLY;UNTIL=20230901T000000Z;BYDAY=TU,TH</td>
</tr>
<tr>
<td></td>
<td>• MONTHLY— supported patterns include:</td>
</tr>
<tr>
<td></td>
<td>• BYMONTHDAY</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate monthly on the third day of the month use:</td>
</tr>
<tr>
<td></td>
<td>RRULE:FREQ=MONTHLY;BYMONTHDAY=3</td>
</tr>
<tr>
<td></td>
<td>• BYDAY and BYSETPOS</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate the last weekday of the month, use</td>
</tr>
<tr>
<td></td>
<td>RRULE:FREQ=MONTHLY;BYDAY=MO,TU,WE,TH,FR;BYSETPOS=-1</td>
</tr>
<tr>
<td></td>
<td>• BYDAY, where the BYDAY values are specified with a numeric value</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate monthly on the first Friday for 10 occurrences, use</td>
</tr>
<tr>
<td></td>
<td>RRULE:FREQ=MONTHLY;COUNT=10;BYDAY=1FR</td>
</tr>
<tr>
<td></td>
<td>• YEARLY— supported patterns include:</td>
</tr>
<tr>
<td></td>
<td>• BYMONTH, BYDAY, and BYSETPOS</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate every year on the second Friday of January, use</td>
</tr>
<tr>
<td></td>
<td>RRULE:FREQ=YEARLY;BYMONTH=1;BYDAY=FR;BYSETPOS=2</td>
</tr>
<tr>
<td></td>
<td>• BYMONTH and BYMONTHDAY</td>
</tr>
<tr>
<td></td>
<td>For example, to indicate every year on October 31st, use</td>
</tr>
<tr>
<td></td>
<td>RRULE:FREQ=YEARLY;BYMONTH=10;BYMONTHDAY=31</td>
</tr>
<tr>
<td>BYMONTH</td>
<td>The month. Valid values are 1 to 12.</td>
</tr>
<tr>
<td>BYMONTHDAY</td>
<td>The day of the month. Valid values are 1 to 31. If BYMONTHDAY is 31 and the month has fewer than 31 days, the event is created on the last day of the month.</td>
</tr>
<tr>
<td>BYDAY</td>
<td>A comma-separated list of days of the week. Valid values are SU, MO, TU, WE, TH, FR, SA. For RRULES with yearly or monthly frequency, BYDAY must be one of:</td>
</tr>
<tr>
<td></td>
<td>• a single day</td>
</tr>
<tr>
<td></td>
<td>• weekend days</td>
</tr>
<tr>
<td></td>
<td>• week days</td>
</tr>
<tr>
<td></td>
<td>• every day of the week</td>
</tr>
</tbody>
</table>
|            | Each BYDAY value can be preceded by an integer that indicates the nth occurrence of a specific day within the monthly or yearly RRULE. Allowed values are −1, 1, 2, 3, and 4. You can’t use different numbers in the BYDAY values. For example, this RRULE is **not** supported:
### Supported RFC 5545 Implementation

<table>
<thead>
<tr>
<th>RRULE Part</th>
<th>Supported RFC 5545 Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>RRULE: FREQ=MONTHLY; INTERVAL=2; COUNT=10; BYDAY=1SU, -1SU</td>
<td>If BYDAY values are preaced with a number, the RRULE can't include BYSETPOS.</td>
</tr>
</tbody>
</table>

**WKST**

Specifies the day on which the workweek starts. Valid values are MO, TU, WE, TH, FR, SA, and SU. Default value is based on the user's locale.

**BYSETPOS**

A comma-separated list of values that correspond to the nth occurrence within the set of recurrence instances specified by the rule. Valid values are -1, 1, 2, 3, or 4. Default value is 1.

For example, to indicate the last weekday of the month, use:

```
RRULE: FREQ=MONTHLY; BYDAY=MO, TU, WE, TH, FR; BYSETPOS=-1
```

**INTERVAL**

The repetition interval. Valid values are:

- an integer between 1 and 999 if FREQ=DAILY
- an integer between 1 and 99 if FREQ=WEEKLY or FREQ=MONTHLY
- 1 if FREQ=YEARLY

Default value is 1.

**UNTIL**

Specifies the datetime in UTC format when the recurrence rule stops. The supported format is yyyyMMddTHHmmssZ, for example: 20210419T083000Z.

An RRULE can't contain both UNTIL and COUNT. A recurring event without either UNTIL or COUNT repeats indefinitely.

**COUNT**

The number of occurrences. Allowed values are 1 to 999.

An RRULE can't contain both UNTIL and COUNT. A recurring event without either UNTIL or COUNT repeats indefinitely.

---

### Salesforce Classic Event Series and Recurring Events

This table describes the usage of recurrence fields for Salesforce Classic recurring events. Each recurrence type must have all of its properties set. All unused properties must be set to null.

<table>
<thead>
<tr>
<th>RecurrenceType Value</th>
<th>Properties</th>
<th>Example Pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecursDaily</td>
<td>RecurrenceInterval</td>
<td>Every second day</td>
</tr>
<tr>
<td>RecursEveryWeekday</td>
<td>RecurrenceDayOfWeekMask</td>
<td>Every weekday - can't be Saturday or Sunday</td>
</tr>
<tr>
<td>RecursMonthly</td>
<td>RecurrenceDayOfMonth  RecurrenceInterval</td>
<td>Every second month, on the third day of the month</td>
</tr>
<tr>
<td>RecursMonthlyNth</td>
<td>RecurrenceInterval RecurrenceInstance RecurrenceDayOfWeekMask</td>
<td>Every second month, on the last Friday of the month</td>
</tr>
<tr>
<td>RecursWeekly</td>
<td>RecurrenceInterval RecurrenceDayOfWeekMask</td>
<td>Every three weeks on Wednesday and Friday</td>
</tr>
<tr>
<td>RecursYearly</td>
<td>RecurrenceDayOfMonth RecurrenceMonthOfYear</td>
<td>Every March on the 26th day of the month</td>
</tr>
</tbody>
</table>
### RecurrenceType Value

<table>
<thead>
<tr>
<th>RecurrenceType Value</th>
<th>Properties</th>
<th>Example Pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecursYearlyNth</td>
<td>RecurrenceDayOfWeekMask</td>
<td>The first Saturday in every October</td>
</tr>
<tr>
<td></td>
<td>RecurrenceInstanceRecurrenceMonthOfYear</td>
<td></td>
</tr>
</tbody>
</table>

### Attendees, Invitees, and Resources

The field `GroupEventType` indicates that event participants are included on an event. You can add a resource to an event only when the resource is available. The only attendance status that can be assigned to resources is Accepted. Events can’t be saved when resources you’ve added aren’t available.

### JunctionIdList

To create an event using `JunctionIdList`, IDs are pulled from the related contacts and both the event and the `EventRelation` records are created in one API call. If the `EventRelation` fails, the event is rolled back because it’s all done in a single API call.

```java
public void createEventNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {
        contactIds[i] = contacts[i].getID();
    }
    Event event = new Event();
    event.setSubject("New Event");
    event.setEventWhoIds(contactIds);
    SaveResult[] results = null;
    try {
        results = connection.create(new Event[] { task });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

### Syncing Events with Lightning Sync

Attendee statuses (Accepted or Maybe, Declined, or No Response) sync from Microsoft® Exchange or Google to Salesforce, but not from Salesforce to Exchange or Google. Be wary of creating API flows that update attendee status in Salesforce for users set up to sync both ways. Eventually the original Exchange or Google status overrides the update made in Salesforce.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **EventChangeEvent (API version 44.0)**
  - Change events are available for the object.

- **EventFeed (API version 20.0)**
  - Feed tracking is available for the object.

SEE ALSO:

- Archived Activities
- Object Basics
EventLogFile

EventLogFile represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org's operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The Interval and Sequence fields are available only in API version 37.0 and later.

You can interact with event monitoring data by querying fields on the EventLogFile object (like EventType and LogDate). CreatedDate tracks when the log file was generated. To view the underlying event data, query the LogFile field. The EventType determines the schema of this field. For more information, see EventLogFile Supported Event Types.

Note: Log data schema for each EventType can change. With each new release, use the LogFileFieldNames and LogFileFieldTypes fields to validate the schema changes. In the unlikely case in which no log files are generated for 24 hours, contact Salesforce Customer Support.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Special Access Rules

Accessing this object requires View Event Log Files and API Enabled user permissions. Users with View All Data permission can view event log files.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>

|                       | **Description**  
|                       | The ordered list of field types in the log file data (String, Id, and so forth). |
|                       | Note: LogFileFieldNames and LogFileFieldTypes are specific to each EventType. For example, LogFileFieldTypes has a different value for an API EventType and a Login EventType. |
| LogFileLength         | **Type**  
|                       | double                                                                  |
|                       | **Properties**  
|                       | Filter, Sort                                                           |
|                       | **Description**  
|                       | The log file length in bytes. You can use this field to plan storage needs for your log files. |
| Sequence              | **Type**  
|                       | int                                                                    |
|                       | **Properties**  
|                       | Filter, Group, Sort                                                    |
|                       | **Description**  
|                       | The number for the portion of the event log file data captured in an hour. For 24-hour event log file generation, the value of this field is 0. For hourly event log files, the initial value is 1. This value increases by 1 when events are added in the same hour after the latest event log file is created. The value resets to 1 in the subsequent hour. For example, you have activity between 2:00 and 3:00 PM. Two-log files are generated that contain the event log data for that hour, with Sequence values of 1 and 2. For event log data that occurs at 3:01 PM, the Sequence value resets to 1. This field is available in API version 37.0 and later. |

**EventLogFile Supported Event Types**

The `EventType` field in the EventLogFile object supports these events. Some common fields, such as `CPU_TIME` and `RUN_TIME`, can have null or zero values depending on how the events are generated for a given feature. Sometimes, three quotation marks appear around event data containing special characters in the CSV file. The third quotation mark is necessary for tools and applications to parse the field data at the correct field value boundary.
We generate some text messages in quotes, as in "example message". To preserve the original value, we add two more quotes and the final value looks like ""example message"" in the CSV file.

Note: The Insecure External Assets, Login, and Logout events are available in supported Salesforce editions at no additional cost. Contact Salesforce to purchase the remaining event types.

**Apex Callout Event Type**
Apex Callout events contain details about callouts (external requests) during Apex code execution.

**Apex Execution Event Type**
Apex Execution events contain details about Apex classes that are used.

**Apex REST API Event Type**
Apex REST API events capture information about every Apex REST API request.

**Apex SOAP Event Type**
Apex SOAP events contain details about Web Services API calls.

**Apex Trigger Event Type**
Apex Trigger events contain details about triggers that fire in an organization.

**Apex Unexpected Exception Event Type**
The Apex Unexpected Exception event type captures information about unexpected exceptions in Apex code execution. This event type is available in the EventLogFile object in API version 45.0 and later.

**API Event Type**
API events contain details about your organization’s web services API activity.

**API Total Usage**
API Total usage events contain details about Platform SOAP API, Platform REST API, and Bulk API requests (for API versions up to and including v30.0).

**Asynchronous Report Run Event Type**
Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

**Aura Request Event Type**
Aura Request events contain details of requests to Apex methods from Aura and Lightning web components. For example, you can benchmark request time or identify the URI of an unsuccessful request.

**Bulk API Event Type**
Bulk API events contain details about Bulk API requests.

**Bulk API 2.0 Event Type**
BulkApi2 events contain details about Bulk API 2.0 requests.

**Change Set Operation Event Type**
Change Set Operation events contain information from change set migrations.

**Concurrent Long-Running Apex Limit Event Type**
Concurrent Long-Running Apex Limit events contain information about long-running concurrent Apex requests in your org that Salesforce terminated after reaching your org’s concurrency limit. Requests with an established Apex context that execute for 5 seconds are counted towards your org’s limit of concurrent long-running requests. (Asynchronous requests don’t count towards the limit.) When there are more than 10 long-running requests (org default limit), additional long-running requests are terminated. This event type is available in the EventLogFile object in API version 45.0 and later.
Console Event Type
Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

Content Distribution Event Type
Content Distribution events contain information about content distributions and deliveries to users.

Content Document Link Event Type
Content Document Link events contain sharing information for content documents.

Content Transfer Event Type
Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews. This information includes events performed on files and attachments to records.

Continuation Callout Summary Event Type
Continuation Callout Summary events contain information about all of the asynchronous callouts performed during a transaction, their response status codes, execution times, and URL endpoint destinations. This event type is available in the EventLogFile object in API version 43.0 and later.

CORS Violation Record Event Type
CORS Violation Record events capture information about Cross-Origin Resource Sharing (CORS) violations. Cross-origin requests to Lightning apps are blocked unless the request comes from a URL listed in your CORS allowlist.

Dashboard Event Type
Dashboard events contain details about dashboards that users view.

Document Attachment Downloads Event Type
Document Attachment Downloads events contain details of document and attachment downloads.

External Cross-Org Callout Event Type
External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

External Custom Apex Callout Event Type
External Custom Apex Callout events represent external data callouts via custom adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

External OData Callout Event Type
External OData Callout events represent external data callouts via the OData 2.0 and OData 4.0 adapters for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

Flow Execution Event Type
Flow Execution events contain information about flows that were executed including details such as total execution time, number of interviews, and number of errors.

Insecure External Assets Event Type
Insecure External Assets events contain information about external assets. External assets include images or videos accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain assets hosted insecurely on third-party sites that users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. The INSECURE_URI field contains the URI being used to load the asset insecurely. The Insecure External Assets event type is available in the EventLogFile object in API version 42.0 and later.

Knowledge Article View Event Type
Knowledge Article View events contain user activity with your knowledge base.
Lightning Error Event Type
Lightning Error events represent errors that occurred during user interactions with Lightning Experience and the Salesforce mobile app. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Interaction Event Type
Lightning Interaction events track user actions in Lightning Experience and the Salesforce mobile app, such as the user clicking, tapping, or scrolling on a page. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Page View Event Type
Lightning Page View events represent information about the page on which the event occurred in Lightning Experience and the Salesforce mobile app. A Lightning Page View event tracks the page a user visited, how long the user spent on the page, and the load time for the page. This event type is available in the EventLogFile object in API version 39.0 and later.

Lightning Performance Event Type
Lightning Performance events track trends in Lightning Experience and Salesforce mobile app performance. This event type is available in the EventLogFile object in API version 39.0 and later.

Login Event Type
Login events contain details about your org's user login history.

Login As Event Type
Login As events contain details about what a Salesforce admin did while logged in as another user.

Logout Event Type
Logout events contain details of user logouts.

Metadata API Operation Event Type
Metadata API Operation events contain details of Metadata API retrieval and deployment requests.

Multiblock Report Event Type
Multiblock Report events contain details about Joined Report reports.

Named Credential Event Type
The Named Credential event type captures information about Apex callouts that use named credentials as their endpoints. Use this event type to audit the installed managed packages that use named credentials. If you don’t recognize the package namespace in the named credential event log file, then you can investigate whether a security breach has occurred. This event type is available in the EventLogFile object in API version 53.0 and later.

One Commerce Usage Event Type
One Commerce Usage events capture information about your Commerce instance. This event type is available in the EventLogFile object in API version 51.0 and later.

Package Install Event Type
Package Install events contain details about package installation in the organization.

Platform Encryption Event Type
Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

Queued Execution Event Type
Queued Execution events contain details about queued executions—for example, batch Apex.

Report Event Type
Report events contain information about what happened when a user ran a report. This event type includes all activity that's in the Report Export event type, plus more. For example, it has user activity for reports exported as both Formatted Report and Details Only output.
Report Export Event Type
Report Export events contain details about reports that a user exported. For example, this event type captures when a user exports a report as Details Only output. But it doesn’t capture reports that users export as Formatted Report or XLSX Detail output. For that data, see the Report event type.

REST API Event Type
REST API events contain details about REST-specific requests.

Sandbox Event Type
Sandbox events contain details about sandbox copies.

Search Event Type
Search events contain details about the user’s search query. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won’t have a unique Salesforce user ID.

Search Click Event Type
Search Click events contain details about the user’s interaction with the search results. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won’t have a unique Salesforce user ID.

Sites Event Type
Sites events contain details of Site.com requests. Requests can originate from the browser (UI).

Time-Based Workflow Event Type
Time-Based Workflow events contain details about queue activity monitoring.

Transaction Security Event Type
Transaction Security events contain details about policy execution.

URI Event Type
URI events contain details about user interaction with the web browser UI.

Visualforce Request Event Type
Visualforce Request events contain details of Visualforce requests. Requests can originate from the browser (UI).

Wave Change Event Type
Wave Change events represent route or page changes made in the Tableau CRM user interface. A Wave Change event type is captured every time the user opens a new Tableau CRM asset or tab or switches between tabs. Wave Change events are logged when opening new tabs and switching back to previously opened tabs.

Wave Download Event Type
Wave Download events represent downloads made from lens explorations and dashboard widgets in the Tableau CRM user interface. A Wave Download event type is captured when a user downloads images (.png), Microsoft Excel data (.xls), or comma-separated values (.csv) files.

Wave Interaction Event Type
Wave Interaction events represent route or page changes made in the Tableau CRM user interface. A Wave Interaction event type is captured when a tab is closed. It also collates the interaction statistics over the life of the tab, including total open time, read time, and so on. These statistics are aggregated as you go to other tabs and return, and logged only once when the tab is closed.

Wave Performance Event Type
Wave Performance events help you track trends in your Analytics performance.

## Apex Callout Event Type

Apex Callout events contain details about callouts (external requests) during Apex code execution. For details about event monitoring, see theTrailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: <code>96.43.144.26</code>.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td><strong>Type</strong> Number</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The type of event. The value is always <code>ApexCallout</code>.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: <code>GeJCsym5eyvtEK2I</code>.</td>
</tr>
<tr>
<td>METHOD</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The HTTP method of the callout. <strong>Example</strong> For example: GET, POST, PUT, and so on.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Type Id of the organization.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</td>
</tr>
<tr>
<td>REQUEST_SIZE</td>
<td>The size of the callout request body, in bytes.</td>
</tr>
<tr>
<td>RESPONSE_SIZE</td>
<td>The size of the callout response, in bytes.</td>
</tr>
<tr>
<td>RUN_TIME</td>
<td>Not used for this event type. Use the TIME field instead.</td>
</tr>
<tr>
<td>SESSION_KEY</td>
<td>The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</td>
</tr>
<tr>
<td>SUCCESS</td>
<td>1 if the request was successful, and 0 if not.</td>
</tr>
<tr>
<td>Field</td>
<td>Type</td>

<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CPU_TIME</strong></td>
<td>Number</td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td><strong>DB_TOTAL_TIME</strong></td>
<td>Number</td>
<td>Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to <strong>CPU_TIME</strong> to determine whether performance issues are occurring in the database layer or in your own code.</td>
</tr>
<tr>
<td><strong>ENTRY_POINT</strong></td>
<td>String</td>
<td>The entry point for this Apex execution.</td>
</tr>
<tr>
<td><strong>EVENT_TYPE</strong></td>
<td>String</td>
<td>The type of event. The value is always <strong>ApexExecution</strong>.</td>
</tr>
<tr>
<td><strong>EXEC_TIME</strong></td>
<td>Number</td>
<td>The end-to-end Apex execution time (in milliseconds).</td>
</tr>
<tr>
<td><strong>IS_LONG_RUNNING_REQUEST</strong></td>
<td>Boolean</td>
<td>Indicates whether the request is counted against your org's concurrent long-running Apex request limit (true) or not (false). Note: Asynchronous Apex jobs (batch, queueable, scheduled, and future), background processes, and bulk API requests are not counted against the concurrent long-running limit.</td>
</tr>
<tr>
<td><strong>LOGIN_KEY</strong></td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
### NUMBER_SOQL_QUERIES

**Type**
Number

**Description**
The number of SOQL queries that were executed during the event.

This value is the aggregate across all namespaces, and can exceed the per-namespace limits. For test executions, the aggregate total value across all test methods executed in the request is used. If you are using this value to track limit consumption, consider filtering out test execution quiddities (indicated by the QUIDDITY field).

### ORGANIZATION_ID

**Type**
Id

**Description**
The 15-character ID of the organization.

For example: 00D000000000123.

### QUIDDITY

**Type**
String

**Description**
The type of outer execution associated with this event.

**Example**
- A—ACS Batch Apex
- B—Bulk API and Bulk API 2.0
- BA—Start method of a Batch Apex job
- C—Scheduled Apex
- CI—Commerce Integration
- DL—Discoverable Login page
- E—Inbound Email Service
- F—Future
- FC—Function Callback
- H—Apex REST
- I—Invocable Action
- K—Quick Action
- L—Lightning
<table>
<thead>
<tr>

---

**USER_ID_DERIVED**

**Type**
Id

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.

For example: 00530000009M943
**Description**  
The 18-character case insensitive ID of the user who’s using Salesforce services through the UI or the API.  
For example: 0059000000I1SNIA0.

### Apex SOAP Event Type

Apex SOAP events contain details about Web Services API calls.

For details about event monitoring, see the [Trailhead Event Monitoring module](#) or [REST API Developer's Guide](#).

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLASS_NAME</td>
<td></td>
</tr>
</tbody>
</table>

**Type**
- **String**

**Description**
- The Apex class name. If the class is part of a managed package, this string includes the package namespace.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td>String</td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>CLIENT_NAME</td>
<td>String</td>
<td>The name of the client that’s using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn’t specify a client in the CallOptions header.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td>Number</td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>DB_TOTAL_TIME</td>
<td>Number</td>
<td>Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always ApexSoap.</td>
</tr>
<tr>
<td>LIMIT_USAGE_PERCENT</td>
<td>Number</td>
<td>The percentage of Apex SOAP calls that were made against the organization’s limit.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
### Description
The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring.

For example: GeJCsym5eyvtEK2I.

<table>
<thead>
<tr>
<th>FIELD NAME</th>
<th>TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_NAME</td>
<td>String</td>
<td>The name of the calling Apex method.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization. For example: 00D000000000123.</td>
</tr>
<tr>
<td>QUERY</td>
<td>String</td>
<td>The SOQL query, if one was performed.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWD1K0FKfF5DV.</td>
</tr>
</tbody>
</table>
| REQUEST_STATUS | String | The status of the request for a page view or user interface action. Possible values are:  
  • S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.  
  • F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.  
  • U—Undefined |
<table>
<thead>
<tr>

### Apex Trigger Event Type

Apex Trigger events contain details about triggers that fire in an organization.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Number</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>DB_TOTAL_TIME</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Number</td>
</tr>
</tbody>
</table>
### Time (in milliseconds) spent waiting for database processing

Time (in milliseconds) spent waiting for database processing in aggregate for all operations in the request. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENTITY_NAME</td>
<td>String</td>
<td>The name of the object affected by the trigger.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always ApexTrigger.</td>
</tr>
<tr>
<td>EXEC_TIME</td>
<td>Number</td>
<td>The end-to-end Apex execution time (in milliseconds).</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td>The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization. For example: 00D000000000123.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxBdKWWDIkOFKfF5DV.</td>
</tr>
</tbody>
</table>
### REQUEST_STATUS

**Type**  
String

**Description**  
The status of the request for a page view or user interface action.

Possible values are:
- **S**—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- **F**—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- **U**—Undefined
- **A**—Authorization Error
- **R**—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- **N**—Not Found. 404 error.

### RUN_TIME

**Type**  
Number

**Description**  
The amount of time that the request took in milliseconds.

Requests with a value over five seconds are considered long-running requests for the purposes of the Concurrent Long-Running Apex Limit.

**Note:** HTTP callout processing time isn’t included when calculating the 5-second limit. We pause the timer for the callout and resume it when the callout completes.

### SESSION_KEY

**Type**  
String

**Description**  
The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

For example: `d7DEq/ANa7nNZZVD`.

### TIMESTAMP

**Type**  
String

**Description**  
The access time of Salesforce services in GMT.

For example: `20130715233322.670`.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMESTAMP DERIVED</td>
<td>DateTime</td>
<td>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).</td>
</tr>

</tbody>
</table>
## API Event Type

API events contain details about your organization’s web services API activity.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>API_TYPE</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The type of API request.</td>
</tr>
<tr>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• d—Apex Class</td>
</tr>
<tr>
<td></td>
<td>• E—SOAP Enterprise</td>
</tr>
<tr>
<td></td>
<td>• I—SOAP Cross Instance</td>
</tr>
<tr>
<td></td>
<td>• M—SOAP Metadata</td>
</tr>
<tr>
<td></td>
<td>• o—Old SOAP</td>
</tr>
<tr>
<td></td>
<td>• P—SOAP Partner</td>
</tr>
<tr>
<td></td>
<td>• S—SOAP Apex</td>
</tr>
<tr>

</table>

<table>
<thead>
<tr>
<th>API_VERSION</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The version of the API that’s being used.</td>
</tr>
<tr>
<td></td>
<td>For example: 36.0.0.</td>
</tr>
</tbody>
</table>
### CLIENT_IP

**Type**
String

**Description**
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.

### CLIENT_NAME

**Type**
String

**Description**
The name of the client that’s using Salesforce services. This field is an optional parameter that can be passed in API calls. If blank, the caller didn’t specify a client in the CallOptions header.

### CPU_TIME

**Type**
Number

**Description**
The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

### DB_BLOCKS

**Type**
Number

**Description**
Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

### DB_CPU_TIME

**Type**
Number

**Description**
The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.

### DB_TOTAL_TIME

**Type**
Number

**Description**
The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and `DB_CPU_TIME`. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.
<table>
<thead>
<tr>
<th><strong>Entity</strong></th>
<th><strong>Type</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ENTITY_NAME</strong></td>
<td>Set</td>
<td>API objects that are accessed by the request. For example: Account, Opportunity, Contact, and so on.</td>
</tr>
<tr>
<td><strong>EVENT_TYPE</strong></td>
<td>String</td>
<td>The type of event. The value is always API.</td>
</tr>
<tr>
<td><strong>LOGIN_KEY</strong></td>
<td>String</td>
<td>The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.</td>
</tr>
<tr>
<td><strong>METHOD_NAME</strong></td>
<td>String</td>
<td>The name of the calling Apex method.</td>
</tr>
<tr>
<td><strong>ORGANIZATION_ID</strong></td>
<td>Id</td>
<td>The 15-character ID of the organization. For example: 00D000000000123.</td>
</tr>
<tr>
<td><strong>REQUEST_ID</strong></td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWDIJK0FKfF5DV.</td>
</tr>
<tr>
<td><strong>REQUEST_SIZE</strong></td>
<td>Number</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REQUEST_STATUS</td>
<td>String</td>
<td>The status of the request for a page view or user interface action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• U—Undefined</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A—Authorization Error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• N—Not Found. 404 error.</td>
</tr>
<tr>
<td>RESPONSE_SIZE</td>
<td>Number</td>
<td>The size of the callout response, in bytes.</td>
</tr>
<tr>
<td>ROWS_PROCESSED</td>
<td>Number</td>
<td>The number of rows that were processed in the request. For example: 150.</td>
</tr>
<tr>
<td>RUN_TIME</td>
<td>Number</td>
<td>The amount of time that the request took in milliseconds.</td>
</tr>
<tr>
<td>SESSION_KEY</td>
<td>String</td>
<td>The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.</td>
</tr>
</tbody>
</table>

### EventLogFile Supported Event Types

- [Standard Objects](#)
### Asynchronous Report Run Event Type

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AVERAGE_ROW_SIZE</strong></td>
<td><strong>Type</strong> Number</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The average row size of all rows in the Asynchronous Report Run event, in bytes. A large average size, coupled with a high <strong>ROW_COUNT</strong>, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>700</td>
</tr>
<tr>
<td><strong>CLIENT_IP</strong></td>
<td><strong>Type</strong> String</td>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>ENTITY_NAME</td>
<td>String</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
</tr>
</tbody>
</table>
### Description

The type of event. The value is always `AsynchronousReportRun`.

### LOGIN_KEY

**Type**

String

**Description**

The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

For example: `GeJCsym5eyvtEK2I`.

### NUMBER_BUCKETS

**Type**

Number

**Description**

The number of buckets that were used in the report.

### NUMBER_COLUMNS

**Type**

Number

**Description**

The number of columns in the report.

### NUMBER_EXCEPTION_FILTERS

**Type**

Number

**Description**

The number of exception filters that are used in the report.

### ORGANIZATION_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

For example: `00D000000000123`.

**Example**

### ORIGIN

**Type**

String

**Description**

The context in which the report executed, such as from a UI (Classic, Lightning, Mobile), through an API (synchronous, asynchronous, Apex), or through a dashboard.
Possible Values

- `ReportOpenedFromMobileDashboard`: Report executed when a user clicked a dashboard component on a mobile device and drilled down to a report.
- `DashboardComponentUpdated`: Report executed when a user refreshed a dashboard component.
- `DashboardComponentPreviewed`: Report executed from a Lightning dashboard component preview.
- `ReportRunUsingSynchronousApi`: Report executed from a synchronous API.
- `ReportRunUsingAsynchronousApi`: Report executed from an asynchronous API.
- `ReportRunUsingApexSynchronousApi`: Report executed from the synchronous Apex API.
- `ReportRunUsingApexAsynchronousApi`: Report executed from the asynchronous Apex API.
- `ReportExported`: Report executed from a printable view or report export that was not asynchronous nor an API export.
- `ReportRunFromLightning`: Report executed from the Run option in Lightning Experience from a non-mobile browser.
- `ReportRunFromRestApi`: Report executed from the REST API.
- `ReportPreviewed`: Report executed when a user got preview results while using the report builder.
- `ReportScheduled`: Report was scheduled.
- `ProbeQuery`: Report executed from a probe query.
- `ReportExportedAsynchronously`: Report was exported asynchronously.
- `ReportExportedUsingExcelConnector`: Report was exported using the Excel connector.
- `ChartRenderedInEmbeddedAnalyticsApp`: Report executed from a rendered chart in an embedded Analytics app.
- ReportRunAndNotificationSent: Report executed through the notifications API.
- ChartRenderedOnHomePage: Report executed from a rendered chart on the home page.
- ReportResultsAddedToWaveTrending: Report executed when a user trended a report in Tableau CRM.
- ReportAddedToCampaign: Report was added from an Add to Campaign action.
- ReportResultsAddedToEinsteinDiscovery: Report executed synchronously from Einstein Discovery.
- Unknown: Report execution origin is unknown.
- Test: Report execution resulted from a test.

<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Id</td>
<td>The 15-character ID of the user who's using Salesforce services through the UI or the API.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example: 00530000009M943.</td>
</tr>
</tbody>
</table>
### USER_ID_DERIVED

**Type**
- Id

**Description**
The 18-character case-safe ID of the user who's using Salesforce services through the UI or the API.

For example: 0059000000I1SNIA0.

### USER_TYPE

**Type**
- String

**Description**
The category of user license.

Possible values are:
- **CsnOnly**—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they're organization customers and access the application through a customer portal or an Experience Cloud site.
- **CustomerSuccess**—Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they're partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they're organization customers and access the application through a self-service portal.
Standard—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

Aura Request Event Type

Aura Request events contain details of requests to Apex methods from Aura and Lightning web components. For example, you can benchmark request time or identify the URI of an unsuccessful request.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| ACTION_MESSAGE      | **Type**
|                     | String  |
|                     | **Description**
The action (Apex method) names and times for all the actions in the request in the format:

```
action1Name=action1Time;action2Name=action2Time...
```

| CLIENT_IP           | **Type**
|                     | String  |
|                     | **Description**
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.

| CPU_TIME            | **Type**
|                     | Number  |
|                     | **Description**
The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

| DB_TOTAL_TIME       | **Type**
<p>|                     | Number  |</p>
<table>

<td>String</td>
<td>The HTTP method of the request, such as GET or POST.</td>
</tr>
</tbody>
</table>
Description
The status of the request for a page view or user interface action.
Possible values are:
- S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- U—Undefined
- A—Authorization Error
- R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- N—Not Found. 404 error.

- EventLogFile

**Bulk API 2.0 Event Type**

BulkApi2 events contain details about Bulk API 2.0 requests.

**Note:** This event type does not include Bulk API requests. For information about the BulkApi event type, see Bulk API Event Type on page 1383.

You can monitor the following Bulk API 2.0 parameters:

- The type of data processed via Bulk API 2.0 operations, and how much of that data was processed.
- Bulk API 2.0 limits.
- For jobs, track how long it takes to complete, database, and CPU usage.
- Understand users and the operations they performed.
- Detailed errors and failures.

BulkApi2 events represent the steps in the Bulk API 2.0 workflow and changes in job state.
For a Bulk API 2.0 Ingest job, an event is emitted when a job is marked:

- created
  - Note: For multi-part requests, there is no “created” event emitted, only an uploadComplete event.
- uploadComplete
- inProgress
- with a processing update
- complete
- aborted
- deleted

For a Bulk API 2.0 Query job, an event is emitted when a job is marked:

- created
- uploadComplete
- inProgress
- with a processing update
- complete
- aborted
For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>

<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
</tbody>
</table>

| **CPU_TIME** |                                             |
| **Type**    | Number                                       |
| **Description** | The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer. |

| **ENTITY_TYPE** |                                             |
| **Type**    | String                                       |
| **Description** | The type of entity that Bulk API 2.0 used. For example, Account or Contact. |

| **EVENT_TYPE** |                                             |
| **Type**    | String                                       |
| **Description** | The type of event. The value is always BulkApi2. |

| **JOB_ID** |                                             |
| **Type**    | String                                       |
| **Description** | The 15-character ID of the Bulk API 2.0 job. |

| **JOB_STATUS** |                                             |
| **Type**    | String                                       |
| **Description** | The job’s current status. |

| **LOGIN_KEY** |                                             |
| **Type**    | String                                       |
**Description**  
The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.  
For example: GeJCsym5eyvteK2I.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OPERATION_TYPE</strong></td>
<td>String</td>
<td>The type of Bulk API 2.0 operation that was performed.</td>
</tr>
<tr>
<td><strong>ORGANIZATION_ID</strong></td>
<td>Id</td>
<td>The 15-character ID of the organization.</td>
</tr>
<tr>
<td><strong>RECORDS_FAILED</strong></td>
<td>Number</td>
<td>The total number of records that failed.</td>
</tr>
<tr>
<td><strong>RECORDS_PROCESSED</strong></td>
<td>Number</td>
<td>Number of records processed for this event.</td>
</tr>
<tr>
<td><strong>RESULT_SIZE_MB</strong></td>
<td>Number</td>
<td>Number of megabytes returned in query. Empty for ingest jobs.</td>
</tr>
</tbody>
</table>

**Note:** The number of records processed is reported differently for ingest and query jobs.

- **For ingest jobs:**
  - Events with a status of InProgress report (if applicable) the number of records processed.

- **For query jobs:**
  - Events with a status of JobComplete or InProgress report (if applicable) the number of records processed.
For example: 670.

**Note:** RESULT_SIZE_MB currently does not emit events, but is shown here as a placeholder for future enhancement.

**Concurrent Long-Running Apex Limit Event Type**

Concurrent Long-Running Apex Limit events contain information about long-running concurrent Apex requests in your org that Salesforce terminated after reaching your org’s concurrency limit. Requests with an established Apex context that execute for 5 seconds are counted towards your org’s limit of concurrent long-running requests. (Asynchronous requests don’t count towards the limit.) When there are more than 10 long-running requests (org default limit), additional long-running requests are terminated. This event type is available in the EventLogFile object in API version 45.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

**Fields**

<table>

<td>For example: 20130715233322.670.</td>
</tr>
</tbody>
</table>
**Field** | **Details**
--- | ---
TIMESTAMP_DERIVED | **Type**
| DateTime

**Description**
The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).

For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

**USER_ID**

**Type**
| Id

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.

For example: 00530000009M943

**Usage**

For example, you can monitor Concurrent Long-Running Apex Limit log counts to get a benchmark or plot a count by hour. To identify where the limit was exceeded, see the REQUEST_URI field. Then, cross-reference this data with Apex Execution event data where the average RUN_TIME exceeds 5 seconds. To identify synchronous requests only, cross-reference event data with the QUIDDITY field in Apex Execution event data. For example, QUIDDITY NOT IN (A,BA,F,Q,S) and CALLOUT_TIME (>5000).

**SEE ALSO:**
- EventLogFile Supported Event Types
- EventLogFile
- Salesforce Developers Blog: Designing Force.com Applications That Avoid Hitting Concurrent Request Limits

**Console Event Type**

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

**Fields**

**Field** | **Details**
--- | ---
CLIENT_IP | **Type**
| String

**Description**
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as "Salesforce.com IP".

customers and access the application through a customer portal.

- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.

- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.

- **PowerPartner**—Power Partner license. Users whose access is limited because they're partners and typically access the application through a partner portal or site.

- **SelfService**—Users whose access is limited because they're organization customers and access the application through a self-service portal.

- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

## Standard Objects

### TIMESTAMP_DERIVED

**Type**
DateTime

**Description**
The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).
For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

### USER_ID

**Type**
Id

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.
For example: 00530000009M943

### USER_ID_DERIVED

**Type**
Id

**Description**
The 18-character case-safe ID of the user who's using Salesforce services through the UI or the API.
For example: 00590000000I1SNIA0.

### VERSION_ID

**Type**
Id

**Description**
The 15-character ID of the content version.

---

## Content Document Link Event Type

Content Document Link events contain sharing information for content documents.
For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOCUMENT_ID</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Id</td>
</tr>
<tr>
<td>Field</td>
<td>Type</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
</tr>
<tr>
<td>SHARED_WITH_ENTITY_ID</td>
<td>Id</td>
</tr>
<tr>
<td>SHARING_OPERATION</td>
<td>String</td>
</tr>
<tr>
<td>SHARING_PERMISSION</td>
<td>String</td>
</tr>
</tbody>
</table>
Possible Values

- V: Viewer
- C: Collaborator
- I: Inferred—that is, the sharing permissions were inferred from a relationship between the viewer and document. For example, a document’s owner has a sharing permission to the document itself. Or, a document can be a part of a content collection, and the viewer has sharing permissions to the collection rather than explicit permissions to the document directly.

**TIMESTAMP**

**Continuation Callout Summary Event Type**

Continuation Callout Summary events contain information about all of the asynchronous callouts performed during a transaction, their response status codes, execution times, and URL endpoint destinations. This event type is available in the EventLogFile object in API version 43.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer’s Guide.

<td><strong>Example</strong></td>
<td>TID:5ILoVKlztX_rDDJcp7</td>
</tr>
<tr>
<td><strong>ORIGIN_REQUEST_ID</strong></td>
<td><strong>Type</strong> Id</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID of the request that initiated a callout.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>TID:5ILoVKlztX_rDDJcp7</td>
</tr>
<tr>
<td><strong>REQUEST_FORM_SIZE</strong></td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Continuation request form size, in bytes. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.</td>
</tr>
<tr>
<td><strong>REQUEST_ID</strong></td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWD1k0FKIF5DV.</td>
</tr>
<tr>
<td><strong>RESPONSE_SIZE</strong></td>
<td><strong>Type</strong> String</td>
</tr>
</tbody>
</table>

1409
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The size of the callout response, in bytes. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.</td>
</tr>
<tr>
<td>STATUS_CODE</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td>Description</td>
<td>The HTTP status or internal code returned by the remote endpoint. A status code of 200 indicates that the request was successful. Other status code values indicate the type of problem that was encountered. Depending on how many HTTP requests were used in a continuation, this field can contain up to three space-separated values.</td>
</tr>
</tbody>
</table>
| Examples      | • 2000—The timeout was reached, and the server didn’t get a chance to respond.  
• 2001—There was a connection failure.  
• 2002—Exceptions occurred.  
• 2003—The response hasn’t arrived (which also means that the Apex asynchronous callout framework hasn’t resumed).  
• 2004—The response size is too large (greater than 1 MB). |
| SUCCESS       | **Type** Boolean                                                                                                                                 |
| Description   | Indicates whether the continuation was successful (1) or not (0).                                                                                                                                       |
| TIMESTAMP     | **Type** String                                                                                                                                 |
| Description   | The access time of Salesforce services in GMT.                                                                                                 |
|               | For example: 20130715233322.670.                                                                                                             |

### CORS Violation Record Event Type

CORS Violation Record events capture information about Cross-Origin Resource Sharing (CORS) violations. Cross-origin requests to Lightning apps are blocked unless the request comes from a URL listed in your CORS allowlist.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

**External Cross-Org Callout Event Type**

External Cross-Org Callout events represent external data callouts via the cross-org adapter for Salesforce Connect. This event type is available in the EventLogFile object in API version 40.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer Guide.

⚠️ **Note**: For the cross-org adapter for Salesforce Connect, event monitoring currently doesn't track search callouts.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION</td>
<td></td>
</tr>
</tbody>
</table>

**Type**
String

**Description**
Action performed by the callout.

**Possible Values**
- query
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>• upsert</td>
<td></td>
</tr>
<tr>
<td>• delete</td>
<td></td>
</tr>
</tbody>
</table>

**ENTITY**

**Type**
- String

**Description**
- Name of the external object being accessed.

**Example**
- Order

**EVENT_TYPE**

**Type**
- String

**Description**
- Type of event. Value is always `ExternalCrossOrgCallout`.

**EXECUTE_MS**

**Type**
- Number

**Description**
- How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later.

**Example**
- 1

**FETCH_MS**

**Type**
- Number

**Description**
- How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later.

**Example**
- 452

**FILTER**

**Type**
- Text

**Description**
- Field expressions to filter which rows to return. Corresponds to `WHERE` in SOQL queries.

**Example**
- `WHERE CustomerId='123456'`

**HAVING**

**Type**
- Text

**Description**
- Reserved for future use.
### Field Details

<table>
<thead>
<tr>
<th>Field</th>

<tbody>
<tr>
<td>LIMIT</td>
<td>Number</td>
<td>Maximum number of rows to return for a query. Corresponds to <code>LIMIT</code> in SOQL queries.</td>
<td>200</td>
</tr>
<tr>
<td>MESSAGE</td>
<td>String</td>
<td>Error or warning message associated with the failed query callout. Value is always empty for upsert and delete callouts.</td>
<td>System.UnexpectedException: Query is either selecting too many fields or the filter conditions are too complicated</td>
</tr>
<tr>
<td>OFFSET</td>
<td>Number</td>
<td>Number of rows to skip when paging through a result set.</td>
<td>0 (default)</td>
</tr>
</tbody>
</table>
| ORDERBY        | String     | Field or column to use for sorting query results, and whether to sort the results in ascending (default) or descending order. Corresponds to `ORDER BY` in SOQL queries. | ORDER BY ShipName  
ORDER BY ShipName DESC |
<p>| ORGANIZATION_ID| Id         | 15-character ID of the organization.                                        | 00D000000000123           |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| REQUEST_ID  | Type: String  
Description: Unique ID of a transaction. A transaction can contain one or more events. All events in a transaction have the same REQUEST_ID.  
Example: 4A13-H5Kv3CKs-0FKfceaV |
| ROWS        | Type: Number  
Description: Total number of records in the result set. Value is always 0 for upsert and delete callouts.  
Example: 200 |
| ROWS_FETCHED| Type: Number  
Description: Reserved for future use. |
| SELECT      | Type: String  
Description: Comma-separated list of fields being queried. Corresponds to SELECT in SOQL queries.  
Example: SELECT Id,Name,CustomerID,OrderDate |
| STATUS      | Type: Boolean  
Description: Whether the query was successful. Value is always empty for upsert and delete callouts.  
Possible Values:  
- 1 — Success  
- 0 — Failed |
| SUBQUERIES  | Type: Number  
Description: The number of subqueries that the query is split into. |

</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **BYTES**    | **Type**
                Number

**Description**
Size of the result set in bytes.

| **ENTITY**   | **Type**
                String

**Description**
Name of the external object being accessed.

**Example**
Order

| **EVENT_TYPE** | **Type**
                String

**Description**
Type of event. Value is always `ExternalODataCallout`.

| **EXECUTE_MS** | **Type**
                Number

**Description**
How long it took (in milliseconds) for Salesforce to prepare and execute the query. Available in API version 42.0 and later.

**Example**
21

| **EXPAND**    | **Type**
                String

**Description**
Reserved for future use.

| **FETCH_MS**  | **Type**
                Number

**Description**
How long it took (in milliseconds) to retrieve the query results from the external system. Available in API version 42.0 and later.

**Example**
127

| **FILTER**    | **Type**
                Text
### Field: Description
Field expressions to filter which rows to return. Corresponds to `WHERE` in SOQL queries and `$filter` in OData queries.

**Example**
CustomerID eq 12345

### Field: LIBRARY
**Type** String
**Description** Reserved for future use.

### Field: LIMIT
**Type** Number
**Description** Maximum number of rows to return for a query. Corresponds to `LIMIT` in SOQL queries and `$top` in OData queries.

**Example**
200

### Field: MESSAGE
**Type** String
**Description** Error or warning message associated with the failed call.

**Example**
The OData query result was too large, so the external data didn’t load.

### Field: NEXT_LINK
**Type** String
**Description** OData next link that the callout used to request a subsequent page of rows. A next link is provided in a previous response from the OData producer when the response includes only part of the result set.

Available in API version 42.0 and later. However, this field isn’t supported for the OData 2.0 adapter on orgs created before Spring ’18.

**Example**
http://services.example.org/Warehouse.svc/Orders?$count=true&$select=CustomerID,OrderID,RequiredDate,ShippedDate&$top=301&$skiptoken=10447

### Field: OFFSET
**Type** Number
**Description** Number of rows to skip when paging through a result set.
<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Details</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Corresponds to OFFSET in SOQL queries and $skip in OData queries.</td>

<tr>
<td>PROCESS_TYPE</td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Description: The type of the flow. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• Appointments—A flow for Lightning Scheduler. This value is available in API version 44.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• AutoLaunchedFlow—A flow that doesn’t require user interaction.</td>
</tr>
<tr>
<td></td>
<td>• CheckoutFlow—A flow used in Lightning B2B Commerce to create a checkout in a store. This value is available in API version 48.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• ContactRequestFlow—A flow that lets customers request that customer support get back to them. This flow is used to create contact request records. This value is available in API version 45.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• CustomerLifecycle—A Salesforce Surveys flow that lets you associate survey questions with different stages in customer lifecycles. This value is available in API version 49.0 and later and only when the Customer Lifecycle Designer license is enabled.</td>
</tr>
<tr>
<td></td>
<td>• CustomEvent—A process that is invoked when it receives a platform event message. In the UI, it’s an event process. This value is available in API version 41.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• FieldServiceMobile—A flow for the Field Service mobile app. This value is available in API version 39.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• FieldServiceWeb—A flow for embedded Appointment Booking. Its UI label is Field Service Embedded Flow. This value is available in API version 41.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• Flow—A flow that requires user interaction because it contains one or more screens or local actions, choices, or dynamic choices. In the UI and Salesforce Help, it’s a screen flow. Screen flows can be launched from the UI, such as with a flow action, Lightning page, or web tab.</td>
</tr>
<tr>
<td></td>
<td>• FSCLending—A flow for Financial Services Cloud Mortgage. This value is available in API version 46.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• FSCLending—A flow for login. This value is available in API version 51.0 and later.</td>
</tr>
</tbody>
</table>
- **InvocableProcess**—A process that can be invoked by another process or the Invocable Actions resource in REST API. This value is available in API version 38.0 and later.
- **RoutingFlow**—A flow for Salesforce Omni-Channel routing and other business logic. This value is available in API version 52.0 and later.
- **Survey**—A flow for Salesforce Surveys. From the UI, this type of flow is created in Survey Builder. This value is available in API version 42.0 and later.
- **SurveyEnrich**—A Salesforce Surveys flow that uses the Survey Data Mapper. From the UI, this type of flow is created in the Survey Builder and requires an associated survey flow type. This value is available in API version 49.0 or later and only when the Customer Lifecycle Designer license is enabled.
- **Workflow**—A process that is invoked when a record is created or edited. In the UI and Salesforce Help, it’s a record change process.

These values are reserved for future use.

### Insecure External Assets Event Type

Insecure External Assets events contain information about external assets. External assets include images or videos accessed by users over an insecure HTTP protocol. The event lists all your Salesforce pages that contain assets hosted insecurely on third-party sites that users loaded with a Chrome, Firefox, Microsoft Edge, or Safari browser. The `INSECURE_URI` field contains the URI being used to load the asset insecurely. The Insecure External Assets event type is available in the EventLogFile object in API version 42.0 and later.

Assets over HTTP can be manipulated through man-in-the-middle and other types of attacks. These attacks can trick users into sending their Salesforce credentials to malicious sites. Always use HTTPS in your custom code and templates for any asset you're loading from external sites.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer's Guide.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSET_TYPE</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>Type of insecure asset.</td>
</tr>
<tr>
<td></td>
<td>Possible Values</td>
</tr>
<tr>
<td></td>
<td>• Base URI</td>
</tr>
</tbody>
</table>
## Field Details

- **Connect**
- **Font**
- **Frame Ancestor**: External page that embeds the Salesforce page in an iframe
- **Frame**
- **Image**
- **Media**
- **Object**
- **Other**
- **Plugin Types**
- **Script**
- **Style**

### CLIENT_IP

**Type** String

**Description**
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.

### CPU_TIME

**Type** Number

**Description**
The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

### DOCUMENT_URI

**Type** String

**Description**
URL of the page that contains the insecure asset, excluding the query parameter.

**Example**
https://company.my.salesforce.com/00XXXXXXXXX

### EVENT_TYPE

**Type** String

**Description**
The type of event. The value is always `InsecureExternalAssets`.

### INSECURE_URI

**Type** String
Insecure external asset URL being used to load an asset insecurely. For example, loading Javascript libraries using `http://ajax.googleapis.com/` in your custom code will log an Insecure External Asset Event with the `INSECURE_URI` field set to this URL. Find this reference in your code and update it to use `https://ajax.googleapis.com/` instead.

**Example**

```
```

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
**Field** | **Details**
--- | ---
| URI_ID_DERIVED | For example: /home/home.jsp.
| **Type** | ID
| **Description** | The 18-character case-safe ID of the URI of the page that's receiving the request.
| USER_ID | For example: 00530000009M943
| **Type** | Id
| **Description** | The 15-character ID of the user who's using Salesforce services through the UI or the API.
| USER_ID_DERIVED | For example: 00590000000I1SNIA0
| **Type** | Id
| **Description** | The 18-character case-safe ID of the user who's using Salesforce services through the UI or the API.

**Usage**

**UNIQUE_ID** is used by Salesforce Customer Support to troubleshoot any issues that occur.

**Lightning Error Event Type**

Lightning Error events represent errors that occurred during user interactions with Lightning Experience and the Salesforce mobile app. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the [Trailhead Event Monitoring module](https://trailhead.salesforce.com) or [REST API Developer’s Guide](https://developer.salesforce.com).
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **APP_NAME**     | **Type**  
String  
**Description**  
The name of the application that the user accessed. |
| **BROWSER_NAME** | **Type**  
String  
**Description**  
The name of the browser that the user accessed.  
**Example**  
Chrome, IE, Safari, Gecko |
| **BROWSER_VERSION** | **Type** String  
**Description**  
The version of the browser that the user accessed in major.minor version format. Some browsers don’t provide a minor version. |
| **CLIENT_GEO** | **Type** String  
**Description**  
The geolocation of the client in the form of <Country>/<State|Province>.  
**Example**  
United States/California |
| **CLIENT_ID** | **Type** String  
**Description**  
The API client ID. |
| **CLIENT_IP** | **Type** String  
**Description**  
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26. |
| **COMPONENT_NAME** | **Type** String |
### Field | Details
--- | ---
**Description** | The internal name of the standard component that generated the error. The Salesforce developer assigned the name when the standard component was created.

**Examples**
- SaveEdit
- Lead.CCPM_sendSMS
- ChangeOwnerOne

---

**CONNECTION_TYPE**

**Type** | String
**Description** | The type of connection.

**Possible Values**
- CDMA1x
- CDMA
- EDGE
- EVDO0
- EVDOA
- EVDOB
- GPRS
- HRPD
- HSDPA
- HSUPA
- LTE
- WIFI

---

**DEVICE_ID**

**Type** | String
**Description** | The unique identifier used to identify a device when tracking events. **DEVICE_ID** is a generated value that's created when the mobile app is initially run after installation.

---

**DEVICE_MODEL**

**Type** | String
**Description** | The name of the device model.

**Example**
- iPad, iPhone
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>

### UI_EVENT_TIMESTAMP

**Type**
Number

**Description**
The time at which this event occurred, measured in milliseconds.

**Example**
1479769912796

### UI_EVENT_TYPE

**Type**
String

**Description**
The type of interaction.

**Examples**
- crud — Created, read, updated, or deleted the record.
- reads — Read multiple records.

</thead>
</table>
| USER_AGENT         | **Type**  
|                    | String  |
| **Description**    | The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string. |
| USER_ID            | **Type**  
|                    | String  |
| **Description**    | The 15-character ID of the user accessing Salesforce services through the UI or API. |
|                    | **Example**  
|                    | 00530000009M943  |
| USER_ID_DERIVED    | **Type**  
|                    | Id  |
| **Description**    | The 18-character case-insensitive ID of the user who’s using Salesforce services through the UI or the API. |
|                    | **Example**  
|                    | 005900000001SNIA0  |
| USER_TYPE          | **Type**  
|                    | String  |
| **Description**    | The category of user license of the user accessing Salesforce services through the UI or API. |
| **Possible Values**| • A: Automated Process  
|                    | • b: High Volume Portal  
|                    | • c: Customer Portal User

   - EventLogFile

Lightning Interaction Event Type

Lightning Interaction events track user actions in Lightning Experience and the Salesforce mobile app, such as the user clicking, tapping, or scrolling on a page. This event type is available in the EventLogFile object in API version 39.0 and later.

⚠️ Warning: The Lightning Interaction Event type is a best effort logging of user interactions but is not intended to meet privacy and security audit requirements. Not all interactions or CRUD operations are tracked and data loss may occur.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>APP_NAME</td>
<td>Type String Description The name of the application that the user accessed.</td>
</tr>
<tr>
<td>BROWSER_NAME</td>
<td>Type String Description The name of the browser that the user accessed. Example Chrome, IE, Safari, Gecko</td>
</tr>
<tr>
<td>BROWSER_VERSION</td>
<td>Type String Description The version of the browser that the user accessed in major.minor version format. Some browsers don’t provide a minor version.</td>
</tr>
<tr>
<td>CLIENT_GEO</td>
<td>Type String Description The geolocation of the client in the form of &lt;Country&gt;/&lt;State</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>Example</td>
<td>United States/California</td>
</tr>
<tr>
<td>CLIENT_ID</td>
<td>Type String</td>
</tr>
<tr>
<td>Description</td>
<td>The API client ID.</td>
</tr>
<tr>
<td>CLIENT_IP</td>
<td>Type String</td>
</tr>
<tr>
<td>Description</td>
<td>The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as &quot;Salesforce.com IP&quot;. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>COMPONENT_NAME</td>
<td>Type String</td>
</tr>
<tr>
<td>Description</td>
<td>The internal name of the standard component that the user interacted with. The Salesforce developer assigned the name when the standard component was created.</td>
</tr>
<tr>
<td>Examples</td>
<td>- SaveEdit</td>
</tr>
<tr>
<td></td>
<td>- Lead.CCPM_sendSMS</td>
</tr>
<tr>
<td></td>
<td>- ChangeOwnerOne</td>
</tr>
<tr>
<td>CONNECTION_TYPE</td>
<td>Type String</td>
</tr>
<tr>
<td>Description</td>
<td>The type of connection.</td>
</tr>
<tr>
<td>Possible Values</td>
<td>- CDMA1x</td>
</tr>
<tr>
<td></td>
<td>- CDMA</td>
</tr>
<tr>
<td></td>
<td>- EDGE</td>
</tr>
<tr>
<td></td>
<td>- EVDO0</td>
</tr>
<tr>
<td></td>
<td>- EVDOA</td>
</tr>
<tr>
<td></td>
<td>- EVDOB</td>
</tr>
<tr>
<td></td>
<td>- GPRS</td>
</tr>
<tr>
<td></td>
<td>- HRPD</td>
</tr>
<tr>
<td></td>
<td>- HSDPA</td>
</tr>

</table>

**DEVICE_ID**

**Type**

String

**Description**
The unique identifier used to identify a device when tracking events. DEVICE_ID is a generated value that’s created when the mobile app is initially run after installation.

**DEVICE_MODEL**

**Type**

String

**Description**
The name of the device model.

**Example**

iPad, iPhone

**DEVICE_PLATFORM**

**Type**

String

**Description**
The type of application experience in name:experience:form format.

**Possible Values**

Name

- APP_BUILDER
- CUSTOM
- S1
- SFX

Experience

- BROWSER
- HYBRID

Form

- DESKTOP
- PHONE
- TABLET

**DEVICE_SESSION_ID**

**Type**

Id

**Description**
The unique identifier of the user’s session based on page load time. When the user reloads a page, a new session is started.
<table>
<thead>
<tr>

<tr>
<td>PAGE_CONTEXT</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Context of the page where the event occurred.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong> clients:cardsContainer</td>
</tr>
<tr>
<td>PAGE_ENTITY_ID</td>
<td><strong>Type</strong> Id</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique entity identifier of the event.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong> 0013000000013zJAAAZ</td>
</tr>
<tr>
<td>PAGE_ENTITY_TYPE</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The entity type of the event.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong> Task, contacts</td>
</tr>
<tr>
<td>PAGE_START_TIME</td>
<td><strong>Type</strong> Number</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The time when the page was initially loaded, measured in milliseconds.</td>
</tr>
<tr>
<td></td>
<td><strong>Example</strong> 1471564788642</td>
</tr>
<tr>
<td>PAGE_URL</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Relative URL of the top-level Lightning Experience or Salesforce mobile app page that the user opened. The page can contain one or more Lightning components. Multiple record IDs can be associated with <strong>PAGE_URL</strong>.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>/sObject/0064100000JXITSAA5/view</td>
</tr>
<tr>
<td><strong>PARENT_UI_ELEMENT</strong></td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Parent scope of the page element where the event occurred.</td>
</tr>
<tr>
<td><strong>RECORD_ID</strong></td>
<td><strong>Type</strong> String array</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The IDs of one or more records that the user interacted with. For more information on the user interaction, see <strong>UI_EVENT_TYPE</strong> and <strong>UI_EVENT_SOURCE</strong> fields.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>[&quot;5004100000JaGGLAA3&quot;, &quot;5004100000Dn79CAAR&quot;, &quot;50041000007KeugAAC&quot;]</td>
</tr>
<tr>
<td><strong>RECORD_TYPE</strong></td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td><strong>Description</strong></td>

Id                                                                 |
|                       | **Description**  
The 18-character case-insensitive ID of the user who’s using Salesforce services through the UI or the API. |
|                       | **Example**  
00590000000I1SNIA0                                                   |
| USER_TYPE             | **Type**  
String                                                                 |

Details Field

Description
The category of user license of the user accessing Salesforce services through the UI or API.

Possible Values
- A: Automated Process
- b: High Volume Portal
- C: Customer Portal User
- D: External Who
- E: Self Service
- G: Guest
- I: Package License Manager
- N: Salesforce to Salesforce
- n: CSN Only
- O: Power Custom
- o: Custom
- P: Partner
- p: Customer Portal Manager
- S: Standard
- X: Salesforce Administrator

Lightning Page View Event Type

Lightning Page View events represent information about the page on which the event occurred in Lightning Experience and the Salesforce mobile app. A Lightning Page View event tracks the page a user visited, how long the user spent on the page, and the load time for the page. This event type is available in the EventLogFile object in API version 39.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

Fields

Field | Details
--- | ---
APP_NAME | Type
String

Description
The name of the application that the user accessed.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| BROWSER_NAME        | **Type**
|                     | String  |
| **Description**     | The name of the browser that the user accessed. |
| **Example**         | Chrome, IE, Safari, Gecko |
| BROWSER_VERSION     | **Type**
|                     | String  |
| **Description**     | The version of the browser that the user accessed in `major.minor` version format. Some browsers don’t provide a minor version. |
| CLIENT_GEO          | **Type**
|                     | String  |
| **Description**     | The geolocation of the client in the form of `<Country>/<State|Province>`. |
| **Example**         | United States/California |
| CLIENT_ID           | **Type**
|                     | String  |
| **Description**     | The API client ID. |
| CLIENT_IP           | **Type**
|                     | String  |
| **Description**     | The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26. |
| CONNECTION_TYPE     | **Type**
<p>|                     | String  |
| <strong>Description</strong>     | The type of connection. |
| <strong>Possible Values</strong> |
|                      | CDMA1x |
|                      | CDMA  |

</tbody>
</table>
### Field Details

- **ltn:pageView**
- **ltn:performance**

#### Note:
Any other value, such as `ltn:bootstrap`, is for internal usage only.

### UI_EVENT_SOURCE

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
</table>

**Description**
The user action on the record or records. This field’s value indicates whether the user’s action was on a single record or multiple records. For example, `read` indicates that one record was read (such as on a record detail page); `reads` indicates that multiple records were read (such as in a list view).

**Examples**
- click
- create
- delete
- hover
- read
- update

### UI_EVENT_TIMESTAMP

<table>
<thead>
<tr>
<th>Type</th>
<th>Number</th>
</tr>
</thead>
</table>

**Description**
The time at which this event occurred, measured in milliseconds.

**Example**
1479769912796

### UI_EVENT_TYPE

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
</table>

**Description**
The type of interaction.

**Examples**
- crud — Created, read, updated, or deleted the record.
- reads — Read multiple records.

### USER_AGENT

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
</table>

**Description**
The numeric code for the type of client used to make the request (for example, browser, application, or API) as a string.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| USER_ID             | Type    
|                     | String  |
| Description         | The 15-character ID of the user accessing Salesforce services through the UI or API. |
| Example             | 00530000009M943 |
| USER_ID_DERIVED     | Type    
|                     | Id      |
| Description         | The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or the API. |
| Example             | 00590000000I1SNIA0 |
| USER_TYPE           | Type    
|                     | String  |
| Description         | The category of user license of the user accessing Salesforce services through the UI or API. |
| Possible Values     | • A: Automated Process  
|                     | • b: High Volume Portal  
|                     | • c: Customer Portal User  
|                     | • d: External Who  
|                     | • e: Self Service  
|                     | • G: Guest  
|                     | • l: Package License Manager  
|                     | • n: Salesforce to Salesforce  
|                     | • n: CSN Only  
|                     | • o: Power Custom  
|                     | • o: Custom  
|                     | • P: Partner  
|                     | • p: Customer Portal Manager  
|                     | • s: Standard  
|                     | • X: Salesforce Administrator |

Login Event Type

Login events contain details about your org’s user login history.

**Note:** Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the Platform Events Developer Guide.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>API_TYPE</strong></td>
<td>Type String</td>
</tr>
<tr>
<td><strong>API_VERSION</strong></td>
<td>Type String</td>
</tr>
<tr>
<td><strong>AUTHENTICATION_METHOD_REFERENCE</strong></td>
<td>Type String</td>
</tr>
</tbody>
</table>

**API_TYPE**

**Type** String

**Description**
The type of API request.

Possible values are:

- **D**—Apex Class
- **E**—SOAP Enterprise
- **I**—SOAP Cross Instance
- **M**—SOAP Metadata
- **O**—Old SOAP
- **P**—SOAP Partner
- **S**—SOAP Apex
- **T**—SOAP Tooling
- **X**—XmlRPC
- **F**—Feed
- **L**—Live Agent
- **P**—SOAP ClientSync

**API_VERSION**

**Type** String

**Description**
The version of the API that’s being used.

For example: **36.0**.

**AUTHENTICATION_METHOD_REFERENCE**

**Type** String

**Description**
The authentication method used by a third-party identification provider for an OpenID Connect single sign-on protocol. This field is available in API version 51.0 and later.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BROWSER_TYPE</td>
<td>String</td>
<td>The identifier string returned by the browser used at login. Example values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Go-http-client/1.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Mozilla/5.0 (Macintosh; Intel Mac OS X 10.12; rv%3A50.0) Gecko/20100101 Firefox/50.0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Mozilla/5.0 (Macintosh; Intel Mac OS X 10_11_6) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/51.0.2704.84 Safari/537.36</td>
</tr>
<tr>
<td>CIPHER_SUITE</td>
<td>String</td>
<td>The TLS cipher suite used for the login. Values are OpenSSL-style cipher suite names, with hyphen delimiters. For more information, see OpenSSL Cryptography and SSL/TLS Toolkit.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td>Number</td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>CLIENT_IP</td>
<td>String</td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>DB_TOTAL_TIME</td>
<td>Number</td>
<td>The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and DB_CPU_TIME. Compare this field to CPU_TIME to</td>
</tr>
</tbody>
</table>
determine whether performance issues are occurring in the
database layer or in your own code.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always Login.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td>The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvTek2I.</td>
</tr>
<tr>
<td>LOGIN_STATUS</td>
<td>String</td>
<td>The status of the login attempt. For successful logins, the value is LOGIN_NO_ERROR. All other values indicate errors or authentication issues. For details, see Login Event Type — LOGIN_STATUS Values on page 1484.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgXWbDKWWDIkJ0FKfF5DV.</td>
</tr>
<tr>
<td>REQUEST_STATUS</td>
<td>String</td>
<td>The status of the request for a page view or user interface action.</td>
</tr>
</tbody>
</table>
Possible values are:

- **S**—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- **F**—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- **U**—Undefined
- **A**—Authorization Error
- **R**—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- **N**—Not Found. 404 error.

### RUN_TIME

**Type**  
Number

**Description**  
The amount of time that the request took in milliseconds.

### SESSION_KEY

**Type**  
String

**Description**  
The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For Login Event Type, this field is usually null because the event is captured before a session is created.

**Example**  
d7DEq/ANa7nNZZVD

### SOURCE_IP

**Type**  
IP

**Description**  
The source IP of the login request.

### TIMESTAMP

**Type**  
String

**Description**  
The access time of Salesforce services in GMT.

For example: 20130715233322.670.

### TIMESTAMP_DERIVED

**Type**  
DateTime
The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).
For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

**TLS_PROTOCOL**

**Type**
String

**Description**
The TLS protocol used for the login.

**Example**
There are 3 possible values.
- 1.0
- 1.1
- 1.2

**URI**

**Type**
String

**Description**
The URI of the page that’s receiving the request.
For example: /home/home.jsp.

**URI_ID_DERIVED**

**Type**
ID

**Description**
The 18-character case-safe ID of the URI of the page that’s receiving the request.

**USER_ID**

**Type**
Id

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.
For example: 00530000009M943

**USER_ID_DERIVED**

**Type**
Id

**Description**
The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API.
For example: 00590000000I1SNIA0.
**USER_NAME**

**Type**
String

**Description**
The username that's used for login.

---

**USER_TYPE**

**Type**
String

**Description**
The category of user license.

Possible values are:

- **CsnOnly**—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they're organization customers and access the application through a customer portal or an Experience Cloud site.
- **CustomerSuccess**—Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they're partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they're organization customers and access the application through a self-service portal.
- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.
Login Event Type — LOGIN_STATUS Values

When users attempt to log in to your org, the success or failure of their login attempts is tracked in event log file data. Specifically, the LOGIN_STATUS field in the Login event type contains the result of these login attempts. The data in LOGIN_STATUS can help you determine whether your users' login attempts were successful. This field is available in the Login event type in the EventLogFile object in API version 39.0 and later.

### Login As Event Type

Login As events contain details about what a Salesforce admin did while logged in as another user.

**Note:** Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the Platform Events Developer Guide.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>

1488
### CLIENT_IP
- **Type**: String
- **Description**: The IP address of the client that's using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.

### CPU_TIME
- **Type**: Number
- **Description**: The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

### DELEGATED_USER_ID
- **Type**: Id
- **Description**: The 15-character ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

### DELEGATED_USER_ID_DERIVED
- **Type**: Id
- **Description**: The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

### DELEGATED_USER_NAME
- **Type**: String
- **Description**: The username of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

### EVENT_TYPE
- **Type**: String
- **Description**: The type of event. The value is always LoginAs.

### LOGIN_KEY
- **Type**: String
### Standard Objects

#### Description
The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring.

For example: GeJCSym5eyvteK2I.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ORGANIZATION_ID</strong></td>
<td>The 15-character ID of the organization.</td>
</tr>
<tr>
<td><strong>REQUEST_ID</strong></td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIk0FKf5DV.</td>
</tr>
<tr>
<td><strong>RUN_TIME</strong></td>
<td>The amount of time that the request took in milliseconds.</td>
</tr>
<tr>
<td><strong>SESSION_KEY</strong></td>
<td>The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANa7nNZZVD.</td>
</tr>
<tr>
<td><strong>TIMESTAMP</strong></td>
<td>The access time of Salesforce services in GMT. For example: 20130715233322.670.</td>
</tr>
<tr>
<td><strong>TIMESTAMP_DERIVED</strong></td>
<td>Date/Time</td>
</tr>
</tbody>
</table>

#### EventLogFile Supported Event Types

- Standard Objects
### Description

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).

For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

<table>
<thead>
<tr>
<th>URI</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>String</td>
<td>The URI of the page that's receiving the request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example: /home/home.jsp.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>URI_ID_DERIVED</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ID</td>
<td>The 18-character case-safe ID of the URI of the page that’s receiving the request.</td>
</tr>
</tbody>
</table>

<table>

### Logout Event Type

Logout events contain details of user logouts.

**Note:** Login Event Type is used by EventLogFile (ELF). It is not a real-time event. For the LoginEvent real-time event, which is part of Real-Time Event Monitoring (RTEM), see LoginEvent in the Platform Events Developer Guide.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>API_TYPE</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Type**
- String

**Description**
- The type of API request.
- Possible values are:
  - D — Apex Class
  - E — SOAP Enterprise
  - I — SOAP Cross Instance
  - M — SOAP Metadata
  - O — Old SOAP
  - P — SOAP Partner
  - S — SOAP Apex
  - T — SOAP Tooling
  - X — XmlRPC
  - F — Feed
  - L — Live Agent
  - P — SOAP ClientSync

<table>
<thead>
<tr>
<th><strong>API_VERSION</strong></th>
</tr>
</thead>
</table>

**Type**
- String

**Description**
- The version of the API that's being used.
- For example: 36.0.

<table>
<thead>
<tr>
<th><strong>APP_TYPE</strong></th>
</tr>
</thead>
</table>

**Type**
- Number

**Description**
- The application type that was in use upon logging out.

**Example Values**
- 1007: SFDC Application
- 1014: Chat
- 2501: CTI
- 2514: OAuth
- 3475: SFDC Partner Portal

<table>
<thead>
<tr>
<th><strong>BROWSER_TYPE</strong></th>
</tr>
</thead>
</table>

**Type**
- String
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td>String</td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>CLIENT_VERSION</td>
<td>Number</td>
<td>The version of the client that was in use upon logging out.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always Logout.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td>The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization.</td>
</tr>
</tbody>
</table>

Example values for the CLIENT_IP field:

- Go-http-client/1.1
- Mozilla/5.0 (Macintosh; Intel Mac OS X 10.12; rv:50.0) Gecko/20100101 Firefox/50.0
- Mozilla/5.0 (Macintosh; Intel Mac OS X 10_11_6) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/51.0.2704.84 Safari/537.36
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Example Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLATFORM_TYPE</td>
<td>Number</td>
<td>The code for the client platform. If a timeout caused the logout, this field is null.</td>
<td>1000: Windows</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>2003: Macintosh/Apple OSX</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>5005: Android</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>5006: iPhone</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>5007: iPad</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxBKWDIK0fKf5DV.</td>
<td></td>
</tr>
<tr>
<td>RESOLUTION_TYPE</td>
<td>Number</td>
<td>The screen resolution of the client. If a timeout caused the logout, this field is null.</td>
<td></td>
</tr>
<tr>
<td>SESSION_KEY</td>
<td>String</td>
<td>The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/ANan7nNZZVD.</td>
<td></td>
</tr>
<tr>
<td>SESSION_LEVEL</td>
<td>String</td>
<td>The security level of the session that was used when logging out.</td>
<td></td>
</tr>
</tbody>
</table>
### Possible Values

- **1**: Standard Session
- **2**: High-Assurance Session

<table>

### USER_ID

**Type**
- *Id*

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.

For example: *00530000009M943*

### USER_ID_DERIVED

**Type**
- *Id*

**Description**
The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API.

For example: *00590000001SNIA0*.

### USER_INITIATED_LOGOUT

**Type**
- *Boolean*

**Description**
The value is 1 if the user intentionally logged out of the organization by clicking the **Logout** button. If the user’s session timed out due to inactivity or another implicit logout action, the value is 0.

### USER_TYPE

**Type**
- *String*

**Description**
The category of user license of the user that logged out.

**Possible Values**
- A: Automated Process
- B: High Volume Portal
- C: Customer Portal User
- D: External Who
- E: Self-Service
- G: Guest
- L: Package License Manager
- N: Salesforce to Salesforce
- N: CSN Only
- O: Power Custom
- O: Custom
- P: Partner

|           | String  | The category of user license. Possible values are:
|           |         | • CsNOnly—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
|           |         | • CspLitePortal—CSP Lite Portal license. Users whose access is limited because they’re organization customers |
and access the application through a customer portal or an Experience Cloud site.

- **CustomerSuccess**—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they’re organization customers and access the application through a self-service portal.
- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

## Named Credential Event Type

The Named Credential event type captures information about Apex callouts that use named credentials as their endpoints. Use this event type to audit the installed managed packages that use named credentials. If you don’t recognize the package namespace in the named credential event log file, then you can investigate whether a security breach has occurred. This event type is available in the EventLogFile object in API version 53.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

Standard Objects

**Field** | **Details**
--- | ---
For example: `/home/home.jsp`

**URI_ID_DERIVED**

**Type** | **ID**
**Description** | The 18-character case-safe ID of the URI of the page that's receiving the request.

**USER_ID**

**Type** | **Id**
**Description** | The 15-character ID of the user who's using Salesforce services through the UI or the API.
For example: `00530000009M943`

**USER_ID_DERIVED**

**Type** | **Id**
**Description** | The 18-character case-safe ID of the user who's using Salesforce services through the UI or the API.
For example: `00590000000I1SNIA0`.

- EventLogFile

**One Commerce Usage Event Type**

One Commerce Usage events capture information about your Commerce instance. This event type is available in the EventLogFile object in API version 51.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

**Fields**

**Field** | **Details**
--- | ---
**BROWSER_DEVICE_TYPE**

**Type** | **Number**
**Description** | A code used to identify the browser and device type.
The code is in the format “BBVVVXYZ,” with the following signification:
DetailsField

- BB — Two digits that indicate the browser type.
  - IE: "10"
  - CHROME: "13"
  - FIREFOX: "11"
  - SAFARI: "14"
  - OPERA: "15"
  - ANDROID_WEBKIT: "16"
  - NETSCAPE: "17"
  - OTHER_WEBKIT: "18"
  - OTHER_GECKO: "19"
  - OTHERKHTML: "20"
  - OTHER_MOBILE: "21"
  - SALESFORCE_DESKTOP: "22"
  - BLACKBERRY: "23"
  - GOOD_ACCESS: "24"
  - EDGE: "25"
  - SALESFORCE_MOBILE: "26"

- VVV—Three digits that indicate version, leading zeroes.

- XYZ—Browser-type specific flags or options. Each digit in XYZ represents a different flag depending on the BrowserType:
  - X=1: If the parser recognizes a "touch" browser. Here, touch means the older touch native client, not that the device supports touch.
  - Y=1: If the parser recognizes a browser in compatibility mode. Only for IE.
  - Z=1: If the browser is recognized as MOBILE.
  - Z=2: If the browser is recognized as PHONE.
  - Z=3: If the browser is recognized as TABLET.
  - Z=4: If the browser is a recognized as MEDIA PLAYER.
  - Z=6: Only for Opera Mini.

|                       | For example: 00530000009m943                                                                                                           |
| USER_TYPE             | Type  
|                       | String  
|                       | Description  
|                       | The category of user license.  
|                       | Possible values are:  
|                       | • CsnoOnly—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users. |
Details

- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they're organization customers and access the application through a customer portal or an Experience Cloud site.

- **CustomerSuccess**—Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal.

- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.

- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they're organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.

- **PowerPartner**—Power Partner license. Users whose access is limited because they're partners and typically access the application through a partner portal or site.

- **SelfService**—Users whose access is limited because they're organization customers and access the application through a self-service portal.

- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

</table>
| CLIENT_IP   | Type: String  
             Description: The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26. |

| CPU_TIME    | Type: Number  
             Description: The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer. |

| EVENT_TYPE  | Type: String  
             Description: The type of event. The value is always PackageInstall. |

| FAILURE_TYPE| Type: String  
             Description: A general categorization of any error that’s encountered. |

<p>| IS_MANAGED  | Type: Boolean |</p>

</table>
**Platform Encryption Event Type**

Platform Encryption event contains information about tenant secret and derived encryption key usage. This event type is available in API versions 41.0 and later.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION</td>
<td>Type String</td>
</tr>
</tbody>
</table>
### Description
The name and type of the event.

### Possible Values
- **TS Imported**: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, imported by a customer.
- **TS Generated**: A tenant secret generated by the Shield Key Management Service (KMS).
- **Key Derived**: An encryption key derived from a tenant secret for encryption or decryption.
- **TS Wrapped**: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, encrypted for storage.
- **Key Delivered**: A data encryption key delivered for encryption or decryption.
- **TS Stored**: A tenant secret generated by the Shield Key Management Service (KMS), or customer-supplied key material, stored encrypted in the database.
- **TS Read**: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted customer-supplied key material, that is loaded for encryption or decryption.
- **TS Unwrapped**: An encrypted tenant secret generated by the Shield Key Management Service (KMS), or encrypted customer-supplied key material, unwrapped for use by the KMS.
- **TS Exported**: An encrypted tenant secret exported by a customer.
- **TS Destroyed**: A tenant secret and related data encryption key destroyed by a customer.

<td></td>
</tr>
<tr>
<td><strong>REQUEST_STATUS</strong></td>
<td><strong>Type</strong> String</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The status of the request for a page view or user interface action. Possible values are:</td>
<td></td>
</tr>
</tbody>
</table>
• **S**—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.

• **F**—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.

• **U**—Undefined

• **A**—Authorization Error

• **R**—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.

• **N**—Not Found. 404 error.

<tr>
<td></td>
<td>• <code>CsnOnly</code>—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.</td>
</tr>
<tr>
<td></td>
<td>• <code>CspLitePortal</code>—CSP Lite Portal license. Users whose access is limited because they’re organization customers and access the application through a customer portal or an Experience Cloud site.</td>
</tr>
<tr>
<td></td>
<td>• <code>CustomerSuccess</code>—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.</td>
</tr>
</tbody>
</table>
DetailsField

Guest—Users whose access is limited so that your customers can view and interact with your site without logging in.

PowerCustomerSuccess—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.

PowerPartner—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.

SelfService—Users whose access is limited because they’re organization customers and access the application through a self-service portal.

Standard—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

EventLogFile Supported Event Types

EventLogFile

Report Event Type

Report events contain information about what happened when a user ran a report. This event type includes all activity that’s in the Report Export event type, plus more. For example, it has user activity for reports exported as both Formatted Report and Details Only output.

Note: Exporting a report directly from the report result captures the event in both the Report and Report Export logs.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVERAGE_ROW_SIZE</td>
<td>The average row size of all rows in the Report event, in bytes. A large average size, coupled with a high ROW_COUNT, can indicate that a user is downloading information for fraudulent</td>
</tr>
</tbody>
</table>
purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.

**Example**

```
700
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td>String</td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce</td>
</tr>
<tr>
<td></td>
<td></td>
<td>internal IP (such as a login from Salesforce Workbench or AppExchange) is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td>Number</td>
<td>The CPU time in milliseconds used to complete the request. This field</td>
</tr>
<tr>
<td></td>
<td></td>
<td>indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>DB_BLOCKS</td>
<td>Number</td>
<td>Indicates how much activity is occurring in the database. A high value for</td>
</tr>
<tr>
<td></td>
<td></td>
<td>this field suggests that adding indexes or filters on your queries would</td>
</tr>
<tr>
<td></td>
<td></td>
<td>benefit performance.</td>

</tr>
<tr>
<td></td>
<td></td>
<td>the database layer or in your own code.</td>
</tr>
<tr>
<td>DISPLAY_TYPE</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
### Report Display Type
The report display type, indicating the run mode of the report.

- **D**—Dashboard
- **S**—Show Details
- **H**—Hide Details

#### ENTITY_NAME
- **Type** String
- **Description** The name of the object affected by the trigger.

#### EVENT_TYPE
- **Type** String
- **Description** The type of event. The value is always `Report`.

#### LOGIN_KEY
- **Type** String
- **Description** The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring.
  
  For example: `GeJCsym5eyvtEK2I`.

#### NUMBER_BUCKETS
- **Type** Number
- **Description** The number of buckets that were used in the report.

#### NUMBER_COLUMNS
- **Type** Number
- **Description** The number of columns in the report.

#### NUMBER_EXCEPTION_FILTERS
- **Type** Number
- **Description** The number of exception filters that are used in the report.

#### ORGANIZATION_ID
- **Type** Id
### Description

The 15-character ID of the organization.

For example: 00D000000000123.

### Example

**Type**

String

**Description**

The context in which the report executed, such as from a UI (Classic, Lightning, Mobile), through an API (synchronous, asynchronous, Apex), or through a dashboard.

**Possible Values**

- ReportOpenedFromMobileDashboard: Report executed when a user clicked a dashboard component on a mobile device and drilled down to a report.
- DashboardComponentUpdated: Report executed when a user refreshed a dashboard component.
- DashboardComponentPreviewed: Report executed from a Lightning dashboard component preview.
- ReportRunUsingSynchronousApi: Report executed from a synchronous API.
- ReportRunUsingAsynchronousApi: Report executed from an asynchronous API.
- ReportRunUsingApexSynchronousApi: Report executed from the synchronous Apex API.
- ReportRunUsingApexAsynchronousApi: Report executed from the asynchronous Apex API.
- ReportExported: Report executed from a printable view or report export that was not asynchronous nor an API export.
- ReportRunFromLightning: Report executed from the Run option in Lightning Experience from a non-mobile browser.
- ReportRunFromRestApi: Report executed from REST API.
- ReportPreviewed: Report executed when a user got preview results while using the report builder.
- ReportScheduled: Report was scheduled.
- ProbeQuery: Report executed from a probe query.
- **ReportExportedAsynchronously**: Report was exported asynchronously.
- **ReportExportedUsingExcelConnector**: Report was exported using the Excel connector.
- **ChartRenderedInEmbeddedAnalyticsApp**: Report executed from a rendered chart in an embedded Analytics app.
- **ReportRunAndNotificationSent**: Report executed through the notifications API.
- **ChartRenderedOnHomePage**: Report executed from a rendered chart on the home page.
- **ReportResultsAddedToWaveTrending**: Report executed when a user trended a report in Tableau CRM.
- **ReportAddedToCampaign**: Report was added from an Add to Campaign action.
- **ReportResultsAddedToEinsteinDiscovery**: Report executed synchronously from Einstein Discovery.
- **Unknown**: Report execution origin is unknown.
- **Test**: Report execution resulted from a test.

### RENDERING_TYPE

**Type**

String

**Description**

Describes the format of the report output in Salesforce Classic. If the report was exported in Lightning Experience, this field is blank.

**Possible Values**

- W: Web (HTML)
- E: Email
- P: Printable
- X: Excel
- C: Comma-separated values (CSV)
- J: JavaScript Object Notation (JSON)
- D: Dummy data

### REPORT_ID

**Type**

Id

**Description**

The 15-character ID of the report that was run.
<table>
<thead>
<tr>
<th><strong>REPORT_ID_DERIVED</strong></th>
<th><strong>Type</strong></th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>The 18-character case insensitive ID of the report that was run.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>REQUEST_ID</strong></th>
<th><strong>Type</strong></th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxBdKWWDIk0FKfF5DV.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>REQUEST_STATUS</strong></th>
<th><strong>Type</strong></th>
<th>String</th>
</tr>
</thead>
</table>
| **Description** |          | The status of the request for a page view or user interface action. Possible values are:  
- S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.  
- F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.  
- U—Undefined  
- A—Authorization Error  
- R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.  
- N—Not Found. 404 error. |

<table>
<thead>
<tr>
<th><strong>ROW_COUNT</strong></th>
<th><strong>Type</strong></th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>The number of rows that were processed in the Report event. High row counts, coupled with a high AVERAGE_ROW_SIZE, can indicate that a user is downloading information for fraudulent purposes. For example, a salesperson who downloads all sales leads before departing for a competitor.</td>
</tr>
<tr>

Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PowerPartner—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.</td>
</tr>
</tbody>
</table>
Usage

Example: Identify Large Report Exports by User

Get Report event type data from the EventLogFile object using REST:

```plaintext
/services/data/v40.0/query?q=SELECT+Id+,+EventType+,+LogFile+,+LogDate+,+LogFileLength+FROM+EventLogFile+WHERE+
LogDate+++Yesterday+AND+EventType==='Report'
```

After you download the report data to a ReportData database table, query it and filter on reports that were exported with high row counts and size:

```plaintext
SELECT USER_ID FROM ReportData WHERE (RENDERING_TYPE=C OR RENDERING_TYPE=X OR
RENDERING_TYPE=P) AND ROW_COUNT>150000 AND AVERAGE_ROW_SIZE>1500
```

SEE ALSO:

- EventLogFile Supported Event Types
- EventLogFile

Report Export Event Type

Report Export events contain details about reports that a user exported. For example, this event type captures when a user exports a report as Details Only output. But it doesn’t capture reports that users export as Formatted Report or XLSX Detail output. For that data, see the Report event type.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| CLIENT_IP | Type: String  
Description: The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26. |
<table>
<thead>

EventLogFile Supported Event Types

For example: 20130715233322.670.

1540
USER_TYPE

Type
String

Description
The category of user license.

Possible values are:

- **CsnOnly**—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they’re organization customers and access the application through a customer portal or an Experience Cloud site.
- **CustomerSuccess**—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they’re organization customers and access the application through a self-service portal.
- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID. For example: 3nWgxWbDKWWDIS0FKfF5DV.</td>
</tr>
<tr>
<td>SANDBOX_ID</td>
<td><strong>Type</strong> Id</td>
</tr>
<tr>
<td>Description</td>
<td>The 15-character ID of the sandbox organization.</td>
</tr>
<tr>
<td>STATUS</td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td>Description</td>
<td>The status of the sandbox copy.</td>
</tr>
</tbody>
</table>
**Standard Objects**

### TIMESTAMP

**Type**  
String

**Description**  
The access time of Salesforce services in GMT.
For example: `20130715233322.670`.

### TIMESTAMP_DERIVED

**Type**  
DateTime

**Description**  
The access time of Salesforce services in ISO8601-compatible format (`YYYY-MM-DDTHH:MM:SS.sssZ`).
For example: `2015-07-27T11:32:59.555Z`. Timezone is GMT.

### USER_ID

**Type**  
Id

**Description**  
The 15-character ID of the user who’s using Salesforce services through the UI or the API.
For example: `00530000009M943`.

### USER_ID_DERIVED

**Type**  
Id

**Description**  
The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API.
For example: `00590000000I1SNIA0`.

---

**SEE ALSO:**  
- EventLogFile Supported Event Types
- EventLogFile

**Search Event Type**

Search events contain details about the user’s search query. All searches within the app, including Experience Cloud sites, are included. However, unauthenticated users won’t have a unique Salesforce user ID.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>

1543
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always Search.</td>
</tr>
<tr>
<td>NUM_RESULTS</td>
<td>Number</td>
<td>Number of results returned by the search query.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization.</td>
</tr>
<tr>
<td>PREFIXES_SEARCHED</td>
<td>String</td>
<td>Space-separated list of key prefixes that were searched.</td>
</tr>
<tr>
<td>QUERY_ID</td>
<td>String</td>
<td>Unique ID of the search query.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</td>
</tr>
</tbody>
</table>

**Example**
- Prefixes searched: 001 006 ka0
- Query ID: -2vx8relit08r
- Request ID: 3nWgxBdKWWDik0FKfF5DV
**SEARCH_QUERY**

**Type**
String

**Description**
The first 100 characters of the search query.

**Example**
Salesforce

**TIMESTAMP**

**Type**
String

**Description**
The access time of Salesforce services in GMT.
For example: 20130715233322.670.

**TIMESTAMP_DERIVED**

**Type**
DateTime

**Description**
The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ).
For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.

**USER_ID**

**Type**
Id

**Description**
The 18-character case-safe ID of the user who's using Salesforce services through the UI or the API.
For example: 00590000000I1SNIA0.

<thead>
<tr>
<th><strong>IS_ERROR</strong></th>
<th><strong>Type</strong></th>
<th>Boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>True if this page was an error page.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>IS_FIRST_REQUEST</strong></th>
<th><strong>Type</strong></th>
<th>Boolean</th>
</tr>
</thead>
</table>

1548
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_GUEST</td>
<td>Boolean</td>
<td>1 if this page is the first Visualforce transaction in the request, or 0 if it isn’t.</td>
</tr>
<tr>
<td>IS_SECURE</td>
<td>Boolean</td>
<td>True if this page was a guest (unauthenticated) request.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td>The string that ties together all events in a given user’s login session. It starts with a login event and ends with either a logout event or the user session expiring. For example: GeJCsym5eyvtEK2I.</td>
</tr>
<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization. For example: 00D000000000123.</td>
</tr>
<tr>
<td>PAGE_NAME</td>
<td>String</td>
<td>The name of the Visualforce page that was requested.</td>
</tr>
<tr>
<td>QUERY</td>
<td>String</td>
<td>The SOQL query, if one was performed.</td>
</tr>
<tr>
<td>REQUEST_ID</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
### REQUEST_ID

**Type** String

**Description**
The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

For example: `3nWgxBdKWD1k0FkF5DV`.

### REQUEST_STATUS

**Type** String

**Description**
The status of the request for a page view or user interface action.

Possible values are:
- **S**—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- **F**—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- **U**—Undefined
- **A**—Authorization Error
- **R**—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- **N**—Not Found. 404 error.

### REQUEST_TYPE

**Type** String

**Description**
The request type.

Possible values are:
- **page**—a normal request for a page
- **content(UI)**—a content request for a page that originated in the user interface
- **content(Apex)**—a content request initiated by an Apex call
- **PDF(UI)**—a request for a page in PDF format through the user interface
- **PDF(Apex)**—a request for PDF format by an Apex call (usually a Web Service call)

### RUN_TIME

**Type** Number

**Description**
The amount of time that the request took in milliseconds.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION_KEY</td>
<td>String</td>
<td>The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started. For example: d7DEq/AnaNZZVD.</td>
</tr>
<tr>
<td>SITE_ID</td>
<td>Id</td>
<td>The 15-character ID of the Site.com site.</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td>String</td>
<td>The access time of Salesforce services in GMT.</td>
</tr>
<tr>
<td>TIMESTAMP_DERIVED</td>
<td>DateTime</td>
<td>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.</td>
</tr>
<tr>
<td>URI</td>
<td>String</td>
<td>The URI of the page that’s receiving the request.</td>
</tr>
<tr>
<td>URI_ID_DERIVED</td>
<td>ID</td>
<td>The 18-character case-safe ID of the URI of the page that’s receiving the request.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>Id</td>
<td></td>
</tr>
</tbody>
</table>
**USER_ID_DERIVED**

**Type**
Id

**Description**
The 15-character ID of the user who’s using Salesforce services through the UI or the API.

For example: 00530000009M943

**USER_TYPE**

**Type**
String

**Description**
The category of user license.

Possible values are:

- **CsnOnly**—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they’re organization customers and access the application through a customer portal or an Experience Cloud site.
- **CustomerSuccess**—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they’re organization customers and access the application through a self-service portal.
Standard—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

### Time-Based Workflow Event Type

Time-Based Workflow events contain details about queue activity monitoring.

For details about event monitoring, see the Trailhead Event Monitoring module or the REST API Developer’s Guide.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_IP</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td>CPU_TIME</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Number</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td>DATA</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The record details of time queue activity.</td>
</tr>
<tr>

### USER_ID_DERIVED

**Type**  
Id

**Description**  
The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API.  
For example: 00590000000I1SNIA0.

---

**SEE ALSO:**  
- EventLogFile  
  **Supported Event Types**  
- EventLogFile

### URI Event Type

URI events contain details about user interaction with the web browser UI.  
For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| CLIENT_IP     | **Type**  
  String  
  **Description**  
The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”.  
For example: 96.43.144.26.

| CPU_TIME      | **Type**  
  Number  
  **Description**  
The CPU time in milliseconds used to complete the request.  
This field indicates the amount of activity taking place in the app server layer. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_BLOCKS</td>
<td>Number</td>
<td>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.</td>
</tr>
<tr>
<td>DB_CPU_TIME</td>
<td>Number</td>
<td>The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.</td>
</tr>
<tr>
<td>DB_TOTAL_TIME</td>
<td>Number</td>
<td>The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and DB_CPU_TIME. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</td>

<tr>
<td>ORGANIZATION_ID</td>
<td>Id</td>
<td>The 15-character ID of the organization.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example: 00D0000000000123.</td>
</tr>
</tbody>
</table>
REFERRER_URI

**Type**  
String

**Description**  
The referring URI of the page that’s receiving the request.

REQUEST_ID

**Type**  
String

**Description**  
The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.

For example: 3nWgxWbDKWWDIk0FKfF5DV.

REQUEST_STATUS

**Type**  
String

**Description**  
The status of the request for a page view or user interface action.

Possible values are:

- S—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- F—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- U—Undefined
- A—Authorization Error
- R—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- N—Not Found. 404 error.

RUN_TIME

**Type**  
Number

**Description**  
The amount of time that the request took in milliseconds.

SESSION_KEY

**Type**  
String

**Description**  
The user’s unique session ID. You can use this value to identify all user events within a session. When a user logs out and logs in again, a new session is started.

For example: d7DEq/ANa7nNZZVD.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMESTAMP</td>
<td>String</td>
<td>The access time of Salesforce services in GMT. For example: 20130715233322.670</td>
</tr>
<tr>
<td>TIMESTAMP_DERIVED</td>
<td>DateTime</td>
<td>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). For example: 2015-07-27T11:32:59.555Z. Timezone is GMT.</td>
</tr>
<tr>
<td>URI</td>
<td>String</td>
<td>The URI of the page that’s receiving the request. For more granular URI information for Lightning Experience and the Salesforce app, see the Lightning Error, Lightning Interaction, Lightning Page View, and Lightning Performance event types. Examples /aura (Lightning Experience), /lightning (Lightning Experience and the Salesforce app), /home/home.jsp (Salesforce Classic)</td>
</tr>
<tr>
<td>URI_ID_DERIVED</td>
<td>ID</td>
<td>The 18-character case-safe ID of the URI of the page that’s receiving the request.</td>
</tr>
<tr>
<td>USER_ID</td>
<td>Id</td>
<td>The 15-character ID of the user who’s using Salesforce services through the UI or the API. For example: 00530000009M943</td>
</tr>
<tr>
<td>USER_ID_DERIVED</td>
<td>Id</td>
<td>The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API.</td>
</tr>
</tbody>
</table>
For example: 00590000000I1SNIA0.

**USER_TYPE**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The category of user license.</td>
</tr>
</tbody>
</table>

Possible values are:

- **CsnOnly**—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.
- **CspLitePortal**—CSP Lite Portal license. Users whose access is limited because they’re organization customers and access the application through a customer portal or an Experience Cloud site.
- **CustomerSuccess**—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.
- **Guest**—Users whose access is limited so that your customers can view and interact with your site without logging in.
- **PowerCustomerSuccess**—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the customer portal role hierarchy.
- **PowerPartner**—Power Partner license. Users whose access is limited because they’re partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they’re organization customers and access the application through a self-service portal.
- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

# Visualforce Request Event Type

Visualforce Request events contain details of Visualforce requests. Requests can originate from the browser (UI). For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CLIENT_IP</strong></td>
<td><strong>Type</strong> String</td>
</tr>
<tr>
<td><strong>CONTROLLER_TYPE</strong></td>
<td><strong>Type</strong> Number</td>
</tr>
<tr>
<td><strong>CPU_TIME</strong></td>
<td><strong>Type</strong> Number</td>
</tr>
<tr>
<td><strong>DB_BLOCKS</strong></td>
<td><strong>Type</strong> Number</td>
</tr>
</tbody>
</table>

### CLIENT_IP

**Type**: String

**Description**: The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from Salesforce Workbench or AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.

### CONTROLLER_TYPE

**Type**: Number

**Description**: The type of controller that’s used by the requested Visualforce page.

**Possible Values**

- 0: NOT_SPECIFIED
- 1: STANDARD
- 2: STANDARD_SET
- 3: CUSTOM
- 4: JAVA
- 5: SPRING

### CPU_TIME

**Type**: Number

**Description**: The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.

### DB_BLOCKS

**Type**: Number

**Description**: Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_CPU_TIME</td>
<td>Number</td>
<td>The CPU time in milliseconds to complete the request. Indicates the amount of activity taking place in the database layer during the request.</td>
</tr>
<tr>
<td>DB_TOTAL_TIME</td>
<td>Number</td>
<td>The time in nanoseconds for a database round trip. Includes time spent in the JDBC driver, network to the database, and DB_CPU_TIME. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.</td>
</tr>
<tr>
<td>EVENT_TYPE</td>
<td>String</td>
<td>The type of event. The value is always VisualforceRequest.</td>
</tr>
<tr>
<td>HTTP_METHOD</td>
<td>String</td>
<td>The HTTP method of the request. For example: GET, POST, PUT, and so on.</td>
</tr>
<tr>
<td>IS_AJAX_REQUEST</td>
<td>Boolean</td>
<td>The value is true if the request is a partial page request.</td>
</tr>
<tr>
<td>IS_FIRST_REQUEST</td>
<td>Boolean</td>
<td>1 if this page is the first Visualforce transaction in the request, or 0 if it isn’t.</td>
</tr>
<tr>
<td>LOGIN_KEY</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
**EventLogFile Supported Event Types**

<td>String</td>
<td>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</td>
</tr>
</tbody>
</table>

For example: GeJCsym5eyvtEK2I.
### REQUEST_SIZE

<table>
<thead>
<tr>
<th>Type</th>
<th>Number</th>
</tr>
</thead>
</table>

**Description**  
The size of the request body, in bytes. Value is -1 if the request body content is larger than 2GB, or if the request has no body (for example, a typical GET request).

### REQUEST_STATUS

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
</table>

**Description**  
The status of the request for a page view or user interface action.

Possible values are:

- **S**—Success. Salesforce handled the request successfully. If an Apex controller throws an exception, this status is also returned.
- **F**—Failure. Typically 4xx or 5xx HTTP codes, such as no permission to view page, page took too long to render, page is read-only.
- **U**—Undefined
- **A**—Authorization Error
- **R**—Redirect. Typically a 3xx HTTP code, possibly initiated by an Apex controller in a Visualforce page.
- **N**—Not Found. 404 error.

### REQUEST_TYPE

<table>
<thead>
<tr>
<th>Type</th>
<th>String</th>
</tr>
</thead>
</table>

**Description**  
The request type.

Possible values are:

- **page**—a normal request for a page
- **content_UI**—a content request for a page that originated in the user interface
- **content_apex**—a content request initiated by an Apex call
- **PDF_UI**—a request for a page in PDF format through the user interface
- **PDF_apex**—a request for PDF format by an Apex call (usually a Web Service call)

### RESPONSE_SIZE

<table>
<thead>
<tr>
<th>Type</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Type</td>

<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>USER_AGENT</td>
<td>The numeric code for the type of client used to make the request (for example, the browser, application, or API).</td>
</tr>
<tr>
<td>USER_ID</td>
<td>The 15-character ID of the user who’s using Salesforce services through the UI or the API. For example: 00530000000M943</td>
</tr>
<tr>
<td>USER_ID_DERIVED</td>
<td>The 18-character case-safe ID of the user who’s using Salesforce services through the UI or the API. For example: 00590000000I1SNIA0</td>
</tr>
<tr>
<td>USER_TYPE</td>
<td>The category of user license. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• CsnOnly—Users whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users.</td>
</tr>
<tr>
<td></td>
<td>• CspLitePortal—CSP Lite Portal license. Users whose access is limited because they’re organization customers and access the application through a customer portal or an Experience Cloud site.</td>
</tr>
<tr>
<td></td>
<td>• CustomerSuccess—Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal.</td>
</tr>
<tr>
<td></td>
<td>• Guest—Users whose access is limited so that your customers can view and interact with your site without logging in.</td>
</tr>
<tr>
<td></td>
<td>• PowerCustomerSuccess—Power Customer Success license. Users whose access is limited because they’re organization customers and access the application through a customer portal. Users with this license type can view and edit data they directly own or data owned by or shared</td>
</tr>
</tbody>
</table>
with users below them in the customer portal role hierarchy.

- **PowerPartner**—Power Partner license. Users whose access is limited because they're partners and typically access the application through a partner portal or site.
- **SelfService**—Users whose access is limited because they're organization customers and access the application through a self-service portal.
- **Standard**—Standard user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses, and admins for this org.

### VIEW_STATE_SIZE

**Type**  
Number

**Description**  
The size of the Visualforce view state, in bytes.

---

---

### Wave Change Event Type

Wave Change events represent route or page changes made in the Tableau CRM user interface. A Wave Change event type is captured every time the user opens a new Tableau CRM asset or tab or switches between tabs. Wave Change events are logged when opening new tabs and switching back to previously opened tabs.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer’s Guide.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYTICS_MODE</td>
<td></td>
</tr>
</tbody>
</table>

**Type**  
String

**Description**  
The location in which the dashboard is displayed. In the Salesforce mobile app, embedded dashboards are logged as embedded first. When a user interacts with the dashboard, a full screen dashboard is displayed to allow for user interaction, and is logged as mobileNative.

Possible values are:
- **studio**—Analytics Studio
- **tab**—Analytics tab
- **embedded**—Embedded in Aura or Lightning.
- **mobileNative**—Tableau CRM mobile app for iOS/Android or Salesforce mobile app for iOS/Android

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CLIENT_IP</strong></td>
<td>String</td>
<td>The IP address of the client that’s using Salesforce services. A Salesforce internal IP (such as a login from AppExchange) is shown as “Salesforce.com IP”. For example: 96.43.144.26.</td>
</tr>
<tr>
<td><strong>CPU_TIME</strong></td>
<td>Number</td>
<td>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer.</td>
</tr>
<tr>
<td><strong>EVENT_TYPE</strong></td>
<td>String</td>
<td>The type of event. The value is always WaveChange.</td>
</tr>
<tr>
<td><strong>IS_MOBILE</strong></td>
<td>Boolean</td>
<td>If true, the dashboard is displayed in the Tableau CRM mobile app for iOS and Android, in the Salesforce mobile app for iOS and Android, or in a mobile browser.</td>
</tr>
<tr>
<td><strong>IS_NEW</strong></td>
<td>Boolean</td>
<td></td>
</tr>
</tbody>
</table>

**EventLogFile Supported Event Types**
**LOGIN_KEY**

**Type**
String

**Description**
The string that ties together all events in a given user's login session. It starts with a login event and ends with either a logout event or the user session expiring.

For example: GeJCsym5eyvtEK2I.

**ORGANIZATION_ID**

**Type**
Id

**Description**
The 15-character ID of the organization.

For example: 00D000000000123.

**PAGE_CONTEXT**

**Type**
String

**Description**
The context of the page in which the dashboard is displayed. In the Salesforce mobile app, embedded dashboards are logged as aura first. When a user interacts with the dashboard, a full screen dashboard is displayed to allow for user interaction, and is logged as iOS or android.

Possible values are:
- aura—Lightning Components
- vf—Visualforce
- iOS—Tableau CRM or Salesforce mobile app for iOS
- android—Tableau CRM or Salesforce mobile app for Android

</tr>
</tbody>
</table>
DetailsField
Type
Id
Description
The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.
Example
0059000000I1SNIA0

USER_TYPE
Type
String
Description
The type of Salesforce user.

WAVE_SESSION_ID
Type
String
Description
The ID of a particular session of Tableau CRM. Use this field to determine which log lines originated from a particular session.

WAVE_TIMESTAMP
Type
Number
Description
The time at which this log line was generated.

Wave Interaction Event Type

Wave Interaction events represent route or page changes made in the Tableau CRM user interface. A Wave Interaction event type is captured when a tab is closed. It also collates the interaction statistics over the life of the tab, including total open time, read time, and so on. These statistics are aggregated as you go to other tabs and return, and logged only once when the tab is closed.

Note: Because Wave Interaction events are logged only when the tab or browser window is closed, these events might not match Wave Change events exactly if a user allows their Salesforce session to time out before closing.

For details about event monitoring, see the Trailhead Event Monitoring module or REST API Developer's Guide.

</tbody>
</table>
EventRelation

Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees’ responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

EventRelation allows a variable number of relationships and handles deleted events differently, depending on whether Shared Activities is enabled.

A non-recurring event can have up to 1,000 invitees. A recurring event can have up to 100 invitees.

If Shared Activities Isn’t Enabled

- EventRelation records only represent invitees (contacts, users, and resources).
- An event can be related to one contact or lead.

If Shared Activities Is Enabled

- EventRelation records can represent:
  - Invitese (IsInvitee is set to true)
  OR
  - Related contacts or lead (IsParent is set to true)

- An event can be related to up to 50 contacts or one lead. These people may or may not be invitees. The number of allowed invitees is not affected by the number of related contacts. If a contact or lead is also an invitee, there is one EventRelation record for that person with IsInvitee and IsParent are set to true.
- An event can be related to a lead, contact, resource, account, or opportunity.
- An event can be related to a custom object that has the HasActivities attribute set to true.
- If you delete an event, then relations between the event and any specified contacts, leads, and other records are also deleted.
- If you delete the EventRelation record representing a relation then the corresponding relation field may be cleared on the event.
- If you delete the EventRelation record representing the WhoId on an event, then another Who, if any, from the event’s EventWhoIds field will be promoted to the WhoId.
- If you restore a deleted event, relations between the event and any specified contacts, leads, and records are also restored. The WhoId, WhatId, and AccountId field values are recalculated using the field values on EventRelation.

Whether or not Shared Activities is enabled, an event can be related to one other kind of record, such as an account, an opportunity, or a custom object.

Note:

- With API versions 26.0 and later, the EventRelation object replaces the EventAttendee object, and the EventAttendee object is no longer visible. You can still query the EventAttendee object using packages that support API versions 25.0 and earlier, or by using Apex.
- An EventRelation object can’t be created for a child event.
- EventRelation includes deactivated users.
- In API versions 25.0 and earlier, you can’t use query(), delete(), or update() with events related to more than one contact.
### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| AccountId   | **Type**  reference
|             | **Properties** Filter, Group, Nillable, Sort
|             | **Description** Contains the Account ID of the relation. For information on IDs, see ID Field Type. AccountId is visible when Shared Activities is enabled. |
| EventId     | **Type**  reference
|             | **Properties** Create, Filter, Group, Sort
|             | **Description** Contains the ID of the event. This value can’t be changed after it’s been specified. This is a relationship field. |
|             | **Relationship Name** Event |
|             | **Relationship Type** Lookup |
|             | **Refers To** Event |
| IsDeleted   | **Type**  boolean
|             | **Properties** Defaulted on create, Filter, Group, Sort
|             | **Description** Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is Deleted. |
| IsInvitee   | **Type**  boolean
<p>|             | <strong>Properties</strong> Create, Defaulted on create, Filter, Group, Sort, Update |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Description** | Indicates whether the relation is an invitee.  
- *IsInvitee* is visible while Shared Activities is being enabled, after it has been enabled, and while it is being disabled.  
- *IsInvitee* defaults to *true* while Shared Activities is being enabled, after it has been enabled, and while it is being disabled if *IsInvitee*, *IsParent*, and *IsWhat* are not set. This configuration ensures compatibility when Shared Activities isn’t enabled and EventRelation represents event invitees only.  
- *IsInvitee* defaults to *false* when Shared Activities is enabled if *IsParent* is set to *true*. |

**IsParent**  
**Type**: boolean  
**Properties**: Create, Defaulted on create, Filter, Group, Sort, Update  
**Description**: *IsParent* is visible only when Shared Activities is enabled. When *false*, indicates that the relation is an invitee (a contact, lead, or user). When *true*, indicates that the relation is a Who or What, as determined by *IsWhat* field.  

**IsWhat**  
**Type**: boolean  
**Properties**: Create, Defaulted on create, Filter, Group, Sort  
**Description**: *IsWhat* is visible only when Shared Activities is enabled. The value is relevant only if *IsParent* is *true*. When *IsWhat* is *true*, the relation specified by *RelationId* is a What (an account, opportunity, custom object, etc.). When *IsWhat* is *false*, the relation specified by *RelationId* is a Who (a contact, lead, or user).  

**RelationId**  
**Type**: reference  
**Properties**: Create, Filter, Group, Sort  
**Description**: Contains the ID of the person (User, Contact, or Lead) or the resource invited to an event. When Shared Activities is enabled, *RelationId* can also contain the ID of an account, opportunity, or other object related to an event.  
This value can’t be changed after it’s been specified.  
This is a polymorphic relationship field.
### Field Details

<table>
<thead>
<tr>

<td>Calendar, Contact, Lead, User</td>
</tr>
</tbody>
</table>

#### ResponderDate

- **Type**: dateTime
- **Properties**: Create, Filter, Nullable, Sort, Update
- **Description**: Indicates the most recent date and time when the invitee responded to an invitation to an event.

#### Response

- **Type**: string
- **Properties**: Create, Filter, Group, Nullable, Sort, Update
- **Description**: Contains optional text that the invitee can enter when responding to an invitation to an event.

#### Status

- **Type**: picklist
- **Properties**: Create, Filter, Group, Nullable, Restricted picklist, Sort, Update
- **Description**: Indicates the invitee status with one of the following values:
  - **New**: Invitee has received the invitation but hasn’t yet responded. This value is the default.
  - **Declined**: Invitee has declined the invitation.
  - **Accepted**: Invitee has accepted the invitation.

Note: Uninvited and Maybe aren’t currently supported.

### Usage

- Invitee related lists display slightly different content. In the Salesforce mobile app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in the Salesforce mobile app, use the following API queries.
If you use Shared Activities in your Salesforce org, use this query:

```sql
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where `Event_Id` is the child event’s ID.

If you don’t use Shared Activities, use this query:

```sql
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event’s relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

**Assigning resource attendance status**

You can add a resource to an event only when the resource is available. The only attendance status that can be assigned to resources is Accepted. Events can’t be saved when resources you’ve added aren’t available.

Create an invitee if Shared Activities is enabled (or during the process of enabling it or rolling back)

If the invitee is already a contact or lead, update `IsInvitee` to `true`.

If the invitee is not already a contact or lead, create an EventRelation object for the invitee with `IsInvitee` set to `true`.

Create an invitee if Shared Activities is not enabled

Create an EventRelation object for the invitee.

**Insert a contact or lead relation**

```java
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
            RelationId = '003D000000Q8aeV', isParent = true, isInvitee = false);
insert er;
```

**Determine what events a given invitee is attending**

To determine all the events that a particular person is attending during a given time period (for example, next week), you can have a client application query the Event object for a given date range, iterate through the results, and, for each event, query the EventRelation object to determine whether the particular person (RelationId) has accepted an invitation to that event.

**Insert an invitee relation**

If `isParent`, `isWhat` and `IsInvitee` are not set, and RelationId is a contact, lead, user, or calendar, `IsInvitee` defaults to `true`. This means if an EventRelation isn’t specifically inserted as a relation to a contact or lead, it’s treated as an Invitee relation by default.

```java
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
            RelationId = '003D000000Q8adV');
insert er;
```

**Query relations to a contact or a lead**

```java
List<EventRelation> whoRelations = [SELECT Id, Relation.Name FROM EventRelation WHERE EventId = '00UD0000005zijD' AND isParent = true AND isWhat = false];
```

**Query invitee relations**

```java
List<EventRelation> inviteeRelations = [SELECT Id, Relation.Name FROM EventRelation WHERE EventId = '00UD0000005zijD' AND isInvitee = true];
```
Update an invitee relation to a contact or lead invitee relation

```java
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId = '00UD0000005zijD' AND isInvitee = true and isParent = false LIMIT 1];
er.isParent = true;
update er;
```

Update a contact or lead relation to a contact or lead invitee relation

```java
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId = '00UD0000005zijD' AND isParent = true and isInvitee = false LIMIT 1];
er.isInvitee = true;
update er;
```

Reproduce invitee related list functionality in the Salesforce mobile app

Invitee related lists display slightly different content in the Salesforce mobile app and the full site. In the app, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner.

If you use Shared Activities in your Salesforce org, use the following query to reproduce the full site functionality in the Salesforce mobile app:

```sql
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]' 
```

where `Event_Id` is the child event’s ID.

If you don’t use Shared Activities, use this query:

```sql
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]' 
```

These queries get the main event’s relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

Send email notifications

To send email notifications for a given event, query EventRelation for the event, iterate through the list, examine the status, and send email notifications to every person who accepted the invitation.

Syncing Events with Lightning Sync

Attendee statuses (Accepted or Maybe, Declined, or No Response) sync from Microsoft® Exchange or Google to Salesforce, but not from Salesforce to Exchange or Google. Be wary of creating API flows that update attendee status in Salesforce for users set up to sync both ways. Eventually the original Exchange or Google status overrides the update made in Salesforce.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**EventRelationChangeEvent (API version 44.0)**

Change events are available for the object.

SEE ALSO:

- Event
- EventWhoRelation
- Object Basics
EventBusSubscriber

Represents a trigger, process, or flow that’s subscribed to a platform event or a change data capture event. Doesn’t include CometD subscribers.

Supported Calls

describeSObjects(), query()

Special Access Rules

EventBusSubscriber is read only and can only be queried. As of Summer ’20 and later, only your Salesforce org’s internal users can access this object.

</tbody>
</table>
| **Description** | Indicates the status of the subscriber. Can be one of the following values:  
  - **Running**—The subscriber is actively listening to events. If you modify the subscriber, the subscription continues to process events.  
  - **Error**—The subscriber was disconnected and stopped receiving published events. A trigger reaches this state when it exceeds the number of maximum retries with the EventBus.RetryableException. Trigger assertion failures and unhandled exceptions don't cause the error state. We recommend limiting the retries to fewer than nine times to avoid reaching this state. When you fix and save the trigger, or for a managed package trigger, if you redeploy the package, the trigger resumes automatically from the tip, starting from new events. Also, you can resume a trigger subscription in the subscription detail page that you access from the platform event page.  
  - **Suspension**—The subscriber is disconnected and can't receive events because a Salesforce admin suspended it or due to an internal error. You can resume a trigger subscription in the subscription detail page that you access from the platform event page. To resume a process, deactivate it and then reactivate it. If you modify the subscriber, the subscription resumes automatically from the tip, starting from new events.  
  For more information, see View and Manage an Event's Subscribers on the Platform Event's Detail Page in the Platform Events Developer Guide. |
| **Tip** | **Type** int |
| **Properties** | Filter, Group, Nillable, Sort |
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>The replay ID of the last published event.</td>
</tr>
<tr>
<td></td>
<td>![Note] For high-volume platform events and change events, the value for Tip isn’t available and is always -1.</td>

<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The subscriber type (ApexTrigger). If the subscriber is a process or flow Pause element, the type is blank.</td>
</tr>
</tbody>
</table>

### Usage

Use EventBusSubscriber to query details about subscribers to a platform event. You can get all subscribers for a particular event by filtering on the **Topic** field, as follows.

```
SELECT ExternalId, Name, Position, Status, Tip, Type
FROM EventBusSubscriber
WHERE Topic='Low_Ink__e'
```

### EventTag

Associates a word or short phrase with an Event.

### Supported Calls

- create()
- delete()
- describeSObjects()
- query()
- retrieve()
Fields

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Restricted picklist</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Defines the visibility of a tag. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• Public—The tag can be viewed and manipulated by all users in an organization.</td>
</tr>
<tr>
<td></td>
<td>• Personal—The tag can be viewed or manipulated only by a user with a matching OwnerId.</td>
</tr>
</tbody>
</table>

Usage

EventTag stores the relationship between its parent TagDefinition and the Event being tagged. Tag objects act as metadata, allowing users to describe and organize their data.
When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**EventWhoRelation**

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the EventRelation on page 1588 object; that is, IsParent is true and IsWhat is false. It doesn’t represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

EventWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you’ve enabled Shared Activities for your organization.

Note: EventWhoRelation objects aren’t created for child events.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| EventId    | Type: reference  
Properties: Filter, Group, Nillable, Sort  
Description: Indicates the ID of the event. |

| RelationId | Type: reference  
Properties: Filter, Group, Nillable, Sort  
Description: Indicates the ID of the contacts or lead related to the event. |

| Type  | Type: string  
Properties: Filter, Group, Nillable, Sort  
Description: Indicates whether the person related to the event is a contact or lead. |
Usage

Apex example that queries relations to a contact or lead

List<EventWhoRelation> whoRelations = [SELECT Id, Relation.Name FROM EventWhoRelation WHERE EventId = '00UD0000005zijD'];

## Field: Description

**Details**

*Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization.*

**Type:** textarea

**Properties:** Create, Nillable, Update

**Description:** A description for the expense.

## Field: Discount

**Details**

*The percentage deducted from the Subtotal price. Available in version 51.0 and later.*

**Type:** percent

**Properties:** Create, Filter, Nillable, Sort, Update

**Description:** The percentage deducted from the Subtotal price. Available in version 51.0 and later.

## Field: ExpenseEndDate

**Details**

*If the expense was incurred over multiple days, the Expense End Date is the last day that the expense covers.*

**Type:** date

**Properties:** Create, Filter, Group, Nillable, Sort, Update

**Description:** If the expense was incurred over multiple days, the Expense End Date is the last day that the expense covers.

## Field: ExpenseNumber

**Details**

*The number that uniquely identifies the expense.*

**Type:** string

**Properties:** Autonumber, Defaulted on create, Filter, idLookup, Sort

**Description:** The number that uniquely identifies the expense.

## Field: ExpenseStartDate

**Details**

*If the expense was incurred over multiple days, the Expense Start Date is the first day that the expense covers.*

**Type:** date

**Properties:** Create, Filter, Group, Nillable, Sort, Update

**Description:** If the expense was incurred over multiple days, the Expense Start Date is the first day that the expense covers.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ExpenseReportEntryFeed**
  Feed tracking is available for the object.

- **ExpenseReportEntryHistory**
  History is available for tracked fields of the object.

### ExpressionFilter

Represents a logical expression that's used to control the execution of macro instructions. This object is available in API version 46.0 and later.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: Required. The ID of the MacroInstruction object that contains the expression.</td>
</tr>
<tr>
<td>FilterConditionLogic</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: Optional. The filter conditions to use and the order in which to apply them. For example, ‘1 AND 2’ evaluates condition 1 and then condition 2.</td>
</tr>
<tr>
<td>FilterDescription</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: Optional. A description of the filter expression that helps to explain the logic to users. For example, ‘Applies to New cases.’</td>
</tr>
<tr>
<td>Name</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties: Autonumber, Defaulted on create, Filter, idLookup, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: Optional. A label for the expression.</td>
</tr>
</tbody>
</table>

Usage

The ExpressionFilter object is used with the IF and ELSEIF operations in a MacroInstruction. It lets you specify a logical expression that determines whether macro instructions are executed. The object indicates whether any or all conditions must be true.
To represent the conditions that are evaluated, this object uses one or more \texttt{ExpressionFilterCriteria} child objects. The ExpressionFilter to be used with each criteria is specified in the \texttt{ExpressionFilterCriteria}'s \texttt{ExpressionFilterId} field.

For example, to represent the following conditional statement, the ExpressionFilter object specifies the \texttt{FilterConditionLogic} field as 1 \texttt{AND} 2, where 1 and 2 are \texttt{ExpressionFilterCriteria} objects. In this example, condition 1 is \texttt{Case.Status \texttt{EQUALS} New}, and condition 2 is \texttt{Case.Origin \texttt{EQUALS} Phone}.

\begin{verbatim}
IF (Case.Status EQUALS New) AND (Case.Origin EQUALS Phone)
  Select Email QuickAction
  Set Subject...
  Set To...
  Set Body...
  Submit
ENDIF
\end{verbatim}

\section*{ExpressionFilterCriteria}

Represents a condition in an expression that’s used to control the execution of macro instructions. This object is available in API version 46.0 and later.

\subsection*{Supported Calls}

\texttt{create()}, \texttt{delete()}, \texttt{describeSObjects()}, \texttt{getDeleted()}, \texttt{getUpdated()}, \texttt{query()}, \texttt{retrieve()}, \texttt{undelete()}, \texttt{update()}, \texttt{upsert()}

\subsection*{Fields}

\begin{table}[h]
\begin{tabular}{|l|l|}
\hline
\textbf{Field} & \textbf{Details} \\
\hline
ExpressionFilterId & \textbf{Type} \texttt{reference} \\
& \textbf{Properties} Create, Filter, Group, Sort \\
& \textbf{Description} Required. The ID of the ExpressionFilter object that references this condition. \\
\hline
FilterTarget & \textbf{Type} \texttt{string} \\
& \textbf{Properties} Create, Filter, Group, Nillable, Sort, Update \\
& \textbf{Description} Required. The target object or field used in the condition. For example, to create a condition that applies to new cases, use \texttt{Case.Status} as the FilterTarget. \\
\hline
FilterTargetValue & \textbf{Type} \texttt{string} \\
\hline
\end{tabular}
\end{table}
### Usage

ExpressionFilterCriteria is a child object of the ExpressionFilter object. Use these objects with the IF and ELSEIF operations in a MacroInstruction to control instruction execution. Each condition in a ExpressionFilterCriteria compares a target object or field to a value using a condition operator; for example, Case.Status EQUALS New.
**ExternalAccountHierarchy**

Represents the external account hierarchy, which works like a role-based hierarchy. Use ExternalAccountHierarchy to allow partner and customer users to share data with other external accounts in their hierarchy. This object is available in API version 49.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**

You must have a Partner or Customer Community Plus license.

**Fields**

<table>
<thead>
<tr>

</tbody>
</table>
## Field Details

### HierarchyType
- **Type**: picklist
- **Properties**: Create, Defaulted on create, Filter, Group, Restricted picklist, Sort
- **Description**: Possible values are:
  - CustomerPortal — Customer
  - Partner
  - The default value is Partner.

### IsAccessibleToParent
- **Type**: boolean
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: Allows data to be shared with parent account in the account hierarchy. The default value is true.

### IsActive
- **Type**: boolean
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: When true, the hierarchy is turned on. The default value is false.

### LastReferencedDate
- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp for when the current user last viewed a record related to this record.

### LastViewedDate
- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.

|                | **Description**  
|                | The ID of the parent account. |

### ExternalAccountHierarchyHistory

Represents the history of changes to values in the fields of an external account hierarchy. This object is available in API version 50.0 and later.

#### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

#### Special Access Rules

You must have a Partner or Customer Community Plus license.

- OwnerAssignment - Owner (Assignment)
Details

Field | Details
------|-------
• Unlocked - Record unlocked

NewValue

Type | anyType
Properties | Nillable, Sort
Description | The updated value of the changed field.

OldValue

Type | anyType
Properties | Nillable, Sort
Description | The previous value of the changed field.

ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

Note: All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

As of Spring ’20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>

| **NamespacePrefix** | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrincipalType</td>
<td>refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation.</td>
</tr>
</tbody>
</table>

**PrincipalType**

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>

**Properties**
- Filter, Group, Restricted picklist, Sort

**Description**
- Specifies whether the org uses one set (NamedUser), multiple sets (PerUser), or no (Anonymous) credentials to access the external system. Each set of credentials corresponds to a login account on the external system. Corresponds to Identity Type in the user interface.

**Protocol**

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>

**Properties**
- Filter, Group, Restricted picklist, Sort

**Description**
- Specifies whether to use OAuth, password authentication, or no authentication to access the external system.

Some types of external data sources support only one value:
- For cloud-based Files Connect external systems, select **OAuth 2.0**.
- For on-premises systems, select **Password Authentication**.
- For Simple URL data sources, select **No Authentication**.

**Repository**

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>

**Properties**
- Filter, Group, Nillable, Sort

**Description**
- Used for SharePoint Online. An optional name of the repository in the data source. Not applicable to all data source types.

**Type**

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>

**Properties**
- Filter, Group, Restricted picklist, Sort

**Description**
- Specifies the adapter that connects to the external system.
Usage
Define an external data source to connect to data or content that’s stored outside the Salesforce org. Then create external objects, which map to the external system’s data and behave similarly to custom objects.

Note: Some external data source fields rely on per-user authentication to connect with an external system. If an admin edits one of these fields, then the previously authenticated credentials can get invalidated, requiring individual users to reauthenticate.

SEE ALSO:
ExternalDataUserAuth
NamedCredential

ExternalDataUserAuth
Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that’s configured to use per-user authentication. This object is available in API version 27.0 and later.

Note: All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

Supported Calls
create(), delete(), describesSObjects(), query(), retrieve(), update(), upsert()

</table>
### Usage

These authentication settings enable a Salesforce user to access an external system. The external system is defined in Salesforce as one of the following.

- **External data source**—Provides access to external objects, whose data is stored outside the Salesforce organization.
- **Named credential**—Enables the user’s actions to trigger authenticated callouts to the endpoint that’s specified in the named credential.

If you grant users access to the external data source or named credential via permission sets or profiles, those users can manage their own authentication settings. See “Store Authentication Settings for External Systems” in the Salesforce Help.

Usage
Although available, many of the Radian6-related fields are no longer accurate or used. We recommend using Social Engagement Resources in Connect REST API Developer Guide.

FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

Supported Calls
create(), delete(), describeSObjects(), idEnabled(), query(), retrieve(), update(), upsert()

Special Access Rules
- You can read, create, update, or delete a FeedAttachment only if you have the corresponding access to the associated FeedItem.
- Inline images aren’t creatable, updatable, or deletable through SOAP API.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeedEntityId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>

<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The ID of the record that this feed attachment contains. For inline images, RecordId is a ContentDocument ID. For content attachments, RecordId is a ContentVersion ID. For feed items, RecordId is a FeedItem ID.</td>
</tr>
<tr>
<td>Title</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>string</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>
### Field Name

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
</table>
| **Description**  
The title of this feed attachment. When Type is Link, Title value is the label for the attachment link. Otherwise, Title value isn’t used. |

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
</table>
| **Value**  
The string value of this FeedAttachment. This field is optional. If the feed attachment is a Link FeedAttachment, the value is the link URL string. |

#### Type

- **picklist**

#### Properties

Create, Filter, Nillable, Sort, Update

#### Description

The type of this feed attachment. Valid values are:

- 0 **Content**—A content attachment.
- 1 **InlineImage**—An inline image. The system creates an inline image attachment when an image is added to the body of the associated FeedItem. You can’t add an inline image directly using FeedAttachment.
- 2 **Link**—A link.
- 3 **FeedEntity**—A feed entity, for example, a post that is shared. Available in API version 39 and later in Lightning Experience.
- 4 **ChatterExtension**—a Rich Publisher App that’s integrated with the Chatter publisher.
- 5 **Record**—A record.

#### Usage

This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

```java
//create and insert post  
FeedItem post = new FeedItem();  
post.Body = 'HelloThere';  
post.ParentId = 'ID_OF_LEAD_ENTITY';  
post.Title = 'FileName';  
insert post;
```

Then insert the attachment.

```java
//create and associate a content attachment to the post  
FeedAttachment feedAttachment = new FeedAttachment();
```
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;

• You can create only one link attachment (FeedAttachment of type Link) per feed item.

• If the feed item type is one of the following, you can add content or link feed attachments to a FeedItem.
  - AdvancedTextPost
  - TextPost
  - ContentPost
  - LinkPost
  - QuestionPost

• When a FeedAttachment is added or removed from a feed item, Salesforce updates the type of the feed item to its most appropriate value, as follows.
  - If all content feed attachments are removed from a feed item of type ContentPost, the type of this feed item is updated to TextPost.
  - Conversely, if a content feed attachment is added to a feed item of type TextPost, the type of this feed item is updated to ContentPost.
  - If all link feed attachments are removed from a feed item of type LinkPost, the type of this feed item is updated to TextPost.
  - Conversely, if a link feed attachment is added to a feed item of type TextPost, the type of this feed item is updated to LinkPost.
  - The type of all other feed items, such as QuestionPost or AdvancedTextPost feed items, doesn’t change when any feed attachments are added or removed.
  - If a content feed attachment is added to a feed item of type LinkPost, the feed item type is updated to ContentPost.
  - If all content attachments are removed from a feed item of type ContentPost, but there’s also a link attachment, the feed item type is updated to LinkPost.

• Users without administrator privileges can’t retrieve a FeedAttachment by its ID in a SOQL query. They can retrieve attachments by specifying the associated FeedEntityId, as follows:

```
SELECT Id FROM FeedAttachment WHERE FeedEntityId = 'some_feedItem_id'
```

• Alternatively, retrieve attachments by using a SOQL query on FeedItem with a subquery on the FeedAttachments child relationship, as follows.

```
SELECT Body, (SELECT RecordId, Title, Type, Value FROM FeedAttachments)
FROM FeedItem
WHERE Id = 'some_feedItem_id'
```

• FeedAttachment is not a triggerable object. You can access feed attachments in FeedItem update triggers by retrieving them through a SOQL query. For a trigger example, and to learn about trigger considerations for FeedAttachment, see Triggers for Chatter Objects in the Apex Developer Guide.
FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

Note the following when working with feed comments.

• You must have read access to the feed’s parent type to see a FeedComment record.
• You must be able to access the feed to add a comment.
• If the comment is related to a user record, the user can delete the comment. For example, if John Smith makes a comment on Sasha Jones’ profile feed, Sasha can delete the comment.
• If the context user has the Insert System Field Values for Chatter Feeds user permission, the create field property is available on CreatedBy and CreatedDate system fields. During migration, the context user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

• Modify All Data
• Modify All on the object associated with the feed and delete permission on the parent feed
• Moderate Chatter

Note: Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

• Manage Unlisted Groups
  Only users with this permission can delete items in unlisted groups.

Fields

<table>
<thead>
<tr>

## Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
</tbody>
</table>
| **Description** | The type of comment:  
  - ContentComment—an uploaded file on a comment  
  - TextComment—a direct text entry on a comment  
  Before API version 24.0, a text entry was required on a comment. As of version 24.0, a text entry is optional if the CommentType is ContentComment. |

### FeedItemIds

<table>
<thead>
<tr>
<th>Type</th>
<th>reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the feed item containing the comment.</td>
</tr>
</tbody>
</table>

### HasEntityLinks

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
| **Description** | Indicates whether the feed CommentBody includes at least one link to a record.  
  Note: This field is available starting in API version 43.0. |

### InsertedById

<table>
<thead>
<tr>
<th>Type</th>
<th>reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
</tbody>
</table>
| **Description** | ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the InsertedBy value is set to the ID of the context user.  
  This is a relationship field. |
<p>| <strong>Relationship Name</strong> | InsertedBy |
| <strong>Relationship Type</strong> | Lookup |
| <strong>Refers To</strong> | User |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **IsRichText** | Type: boolean <br> **Properties:** Create, Defaulted on create, Filter, Group, Sort, Update <br> **Description:** Indicates whether the feed `Comment.Body` contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the comment is rendered as plain text. <br> Rich text supports the following HTML tags:<br> - `<p>`<br>  **Tip:** Though the `<br>` tag isn’t supported, you can use `<p>&nbsp;</p>` to create lines.<br> - `<a>`<br> - `<b>`<br> - `<code>`<br> - `<i>`<br> - `<u>`<br> - `<s>`<br> - `<ul>`<br> - `<ol>`<br> - `<li>`<br> - `<img>`<br>  The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`
<p>| <strong>IsVerified</strong> | Type: boolean &lt;br&gt; <strong>Properties:</strong> Defaulted on create, Filter, Group, Sort &lt;br&gt; <strong>Description:</strong> Determines whether a comment on a question is marked as Company Verified. &lt;br&gt; This field is available in API version 41.0 and later. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the user who last edited the feed comment.</td>
</tr>
</tbody>
</table>

**LastEditDate**

- **Type**: datetime
- **Properties**: Create, Filter, Nillable, Sort
- **Description**: The date the feed comment was last edited.

**ParentId**

- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: ID of a record associated with the feed comment. For example, if you are commenting on a change to a field on Account, ParentId is set to the account ID.

**RelatedRecordId**

- **Type**: reference
- **Properties**: Create, Group, Nillable, Sort
- **Description**: ID of the ContentVersion record associated with a ContentComment. This field is null for all comments except ContentComment. For example, set this field to an existing ContentVersion ID and set the CommentType to ContentComment.

**Revision**

- **Type**: int
- **Properties**: Create, Filter, Group, Nillable, Sort
- **Description**: The number of times the comment was revised.

**Status**

- **Type**: picklist
- **Properties**: Create, Defaulted on create, Group, Nillable, Restricted picklist, Sort, Update
### Field: Description

Specifies whether this feed comment is published and visible to all who can access the parent feed item. To change a comment’s status, the comment’s parent feed item must be in a published state. This field is available in API version 38.0 and later.

Possible values are:

- **Published** — The comment is visible to all who can access the parent feed item.
- **PendingReview** — The comment is visible to its author. Users see the parent feed item and have View All Data or Can Approve Feed Post and Comment permission also see the comment. The author can delete the comment as can users who see the comment and have Can Approve Feed Post and Comment or Modify All Data permission. If the parent feed item is published, the author can edit the comment. Users who see the comment and have Can Approve Feed Post and Comment or Modify All Data permission can also edit the comment. Users with Can Approve Feed Post and Comment or Modify All Data permission can change comment status from Published to PendingReview and from PendingReview to Published.

Some actions are blocked when a feed comment is pending review:

- **Select as Best** — When a feed comment that is marked as best answer becomes unpublished, it’s removed as the best answer. If the comment is published, its best answer status is not restored.
- **Like and unlike**

### Field: SystemModstamp

**Type**
datetime

**Properties**
Defaulted on create, Filter

**Description**
Date and time when a user or automated process (such as a trigger) last modified this record. In this context, "trigger" refers to Salesforce code that runs to implement standard functionality, and not an Apex trigger. SystemModstamp is a read-only system field, available in FeedComment as of API version 37.0.

### Field: ThreadChildrenCount

**Type**
int

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The count of comments associated with this parent feed object. The feed object can be either a Feed Item or a Feed Comment. The count shows how many comments are directly subordinate to the parent. This field is available on the object when **Allow discussion threads** is selected in the Administration Workspace. This field is available in API version 44.0 and later.
**ThreadLastUpdatedDate**

**Type**
datetime

**Properties**
Create, Filter, Nillable, Sort

**Description**
The date and time the thread on this comment was last updated. This field is available on the object when Allow discussion threads is selected in the Administration Workspace. This field is available in API version 44.0 and later.

**ThreadLevel**

**Type**
date

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The identifier that shows the level of this Feed Comment in a thread. By default, there are a maximum of three levels in a thread. The ThreadLevel value shows in which of the three levels this comment falls. This field is available on the object when Allow discussion threads is selected in the Administration Workspace. This field is available in API version 44.0 and later.

**ThreadParentId**

**Type**
reference

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The identifier of the feed item that is the parent of this comment. This field is available on the object when Allow discussion threads is selected in the Administration Workspace. This field is available in API version 44.0 and later. This is a relationship field.

**Relationship Name**
ThreadParent

**Relationship Type**
Lookup

**Refers To**
FeedComment

**Usage**

- As of API version 23.0 and later, if you have View All Data permission, you can query FeedComment records directly without an ID filter. If you don’t have View All Data permission, you can’t query FeedComment records directly, with or without an ID filter.
For example, the following query returns general information about a feed:

```sql
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName,
       CreatedBy.LastName, ParentId, Parent.Name, Body
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC, Id DESC
```

- You can search for text in comments using SOSL. For example, the following Java class uses `search()` to find the string "foo" in any field of a record:

```java
public void searchSample() {
    try {
        SearchResult sr = connection.search("find {foo} in all fields " +
                "returning feedcomment(Id, FeedItemId, CommentBody)");
        // Put the results into an array of SearchRecords
        SearchRecord[] records = sr.getSearchRecords();
        // Check the length of the returned array of records to see
        // if the search found anything
        if (records != null && records.length > 0) {
            System.out.println("Found " + records.length + " comments: ");
            // Display each comment
            for (SearchRecord record : records) {
                FeedComment comment = (FeedComment) record.getRecord();
                System.out.println(comment.getId() + ": " +
                        comment.getCommentBody());
            }
        } else {
            System.out.println("No records were found for the search.");
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

- If you use an Apex trigger to modify the `Body` of a FeedComment object, all mentions hyperlinks are converted to plain text. The mentioned users don’t get email notifications.

Note: This object is hard deleted. It isn’t sent to the Recycle Bin.

SEE ALSO:
- `Custom Object__Feed`

**FeedItem**

FeedItem represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces FeedPost.
Supported Calls

create(), delete(), describeSObjects(), describeLayout(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

- You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:
  - Modify All Data
  - Modify All on the feed item’s parent object, for example, Account for a feed item on an account feed
  - Moderate Chatter

  Note: Users with the Moderate Chatter permission can delete only the feed items and comments that they can see.

Only users with this permission can delete items in unlisted groups.

- Guest users can’t insert system field values for Chatter feeds. Even if you try to assign the CanInsertFeedSystemFields permission to a Guest User, the permission isn’t granted.

Only users with the Modify All Data permission can delete a feed item of Type TrackedChange.

If the context user has the Insert System Field Values for Chatter Feeds user permission, the create field property is available on CreatedBy and CreatedDate system fields. During migration, the context user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

#### Properties

- Create, Nillable, Sort, Update
- Filter, Group, Sort
- Filter, Group, Nillable, Sort

#### Description

**Body**

The body of the feed item. Required when **Type** is **TextPost** or **AdvancedTextPost**. Optional when **Type** is **ContentPost** or **LinkPost**.

Although a value for **Body** is not required for the **ContentPost** type, an attachment is required. If an attachment isn’t present, the type changes to **TextPost** or **AdvancedTextPost**, depending on the API version. **TextPost** and **AdvancedTextPost** do require a value for **Body**.

**Tip:** See the **IsRichText** field for a list of HTML tags supported in the body of rich text posts.

**CommentCount**

**Type**

- int

**Properties**

- Filter, Group, Sort

**Description**

The number of comments associated with this feed item.

**Tip:** In a feed that supports pre-moderation, **CommentCount** isn’t updated until a comment is published. For example, say that you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there’s only one. In a moderated feed, comments aren’t counted until approved by an admin or someone with Can Approve Feed Post and Comment or Modify All Data.

Feed moderation has implications on how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through **CommentCount**, go through pagination until the end of comments is returned.

**ConnectionId**

**Type**

- reference

**Properties**

- Filter, Group, Nillable, Sort

**Description**

When a PartnerNetworkConnection modifies a record that is tracked, the **CreatedBy** field contains the ID of the system administrator. The **ConnectionId** contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your org.

### Details

#### Properties
Create, Defaulted on create, Filter, Group, Sort, Update

#### Description
Indicates whether the feed item body contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the post is rendered as plain text.

Rich text supports the following HTML tags:

- `<p>`
  - Tip: Though the `<br>` tag isn’t supported, you can use `<p>&nbsp;</p>` to create lines.
- `<a>`
- `<b>`
- `<code>`
- `<i>`
- `<u>`
- `<s>`
- `<ul>`
- `<ol>`
- `<li>`
- `<img>`

The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example:

```html
<img src="sfdc://069B0000000omjh"></img>
```

#### Note:
In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.

### Title

**Type**

string

**Properties**

Create, Filter, Group, Nillable, Sort, Update

**Description**

The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name. The Title field can be updated on posts of Type QuestionPost.

### Type

**Type**

picklist

**Properties**

Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The type of feed item. Except for ContentPost, LinkPost, and TextPost, don’t create feed items of other types directly from the API.

- **ActivityEvent**—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging).
  
  For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.

- **AdvancedTextPost**—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.

- **AnnouncementPost**—Not used.

- **ApprovalPost**—generated when a user submits an approval.

- **BasicTemplateFeedItem**—Not used.

- **CanvasPost**—a post made by a canvas app posted on a feed.

- **CollaborationGroupCreated**—generated when a user creates a public group.

- **CollaborationGroupUnarchived**—Not used.

- **ContentPost**—a post with an attached file.

- **CreatedRecordEvent**—generated when a user creates a record from the publisher.
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DashboardComponentAlert</td>
<td>generated when a dashboard metric or gauge exceeds a user-defined threshold.</td>

</tbody>
</table>

The following values appear in the Type picklist for all feed objects but apply only to CaseFeed:

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AttachArticleEvent</td>
<td>generated event when a user attaches an article to a case.</td>
</tr>
<tr>
<td>CallLogPost</td>
<td>generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.</td>
</tr>
<tr>
<td>CaseCommentPost</td>
<td>generated event when a user adds a case comment for a case object.</td>
</tr>
<tr>
<td>ChangeStatusPost</td>
<td>generated event when a user changes the status of a case.</td>
</tr>
<tr>
<td>ChatTranscriptPost</td>
<td>generated event when Chat transcript is saved to a case.</td>
</tr>
<tr>
<td>EmailMessageEvent</td>
<td>generated event when an email related to a case object is sent or received.</td>
</tr>
<tr>
<td>FacebookPost</td>
<td>generated when a Facebook post is created from a case.</td>
</tr>
<tr>
<td>MilestoneEvent</td>
<td>generated when a case milestone is completed or reaches violation status.</td>
</tr>
<tr>
<td>SocialPost</td>
<td>generated when a social post is created from a case.</td>
</tr>
</tbody>
</table>

**Note**: If you set Type to ContentPost, also specify ContentData and ContentFileName.

<td>Blocked to author; available to admins, moderators, and people with the Close Conversation Threads in Feeds permission</td>
</tr>
<tr>
<td>Company verify; remove verification</td>
<td>Available only to people with the Verify Answers to Chatter Questions permission</td>
</tr>
</tbody>
</table>
This Apex example shows how to add a feed item with an attachment to a lead using API version 36.0 and later. First, post a feed item.

```apex
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```apex
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

If you are using API version 23.0 or later and have View All Data permission, you can directly query for a FeedItem. The following example returns the 20 most recent feed items.

```sql
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName, CreatedBy.LastName, ParentId, Parent.Name, Body,
(SELECT ID, FieldName, OldValue, NewValue FROM FeedTrackedChanges ORDER BY ID DESC)
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC
```

If you are using an earlier API version than version 23.0, query FeedItem objects through a feed (such as AccountFeed or OpportunityFeed). The following example returns all feed items for a given account, ordered by date descending:

```sql
SELECT Id, Type, FeedItem.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

Note: Provide the ParentId for API version 22.0 and earlier.

A feed item of type UserStatus is automatically created when a user adds a post to update the status. You can’t explicitly create a feed item of type UserStatus.

The FeedItem object doesn’t support aggregate functions in queries.
• If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

• The size limit for an attachment on a feed is 2 GB.

• You can’t use the content fields to update or delete the content.

• You can’t filter or update the content fields.

• Deleting a feed item via the API also deletes the associated content. Likewise, undeleting a feed item restores associated content.

  **Note:** This object is hard deleted. It isn’t sent to the Recycle Bin.

• After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in a FeedItem object appear as `null` in a SOQL query.

• You can’t explicitly create or delete a `FeedTrackedChange` record.

• Imagine that you insert a feed item or feed comment of Type `ContentPost` on a `User` or `Group` to create a file. Then the `NetworkScope` field value of the feed item is passed to the file.

• If you use an Apex trigger to modify the `Body` of a FeedItem object, all mentions hyperlinks are converted to plain text. The mentioned users don’t get email notifications.

• If you insert rich text into the feed item body, make sure that the case of the opening and closing HTML tags matches. For example, `<b>This is bold text</B>` generates an error.

• To check file sharing with Apex triggers, write triggers on `ContentDocumentLink` instead of FeedItem. For an example, see `ContentDocumentLink`.

• In API version 36.0 and later, use `FeedAttachment` to attach one or more content items to a feed item. As a result of support for multiple attachments through `FeedAttachment`, all fields related to content attachments have been removed. These fields are: `ContentData`, `ContentDescription`, `ContentFileName`, `ContentSize`, and `ContentType`.

• For all API versions of FeedItem, you can’t query a FeedItem object using the `System Modstamp` filter.

---

**FeedLike**

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can’t be queried via the API. A FeedLike is a child object of an associated FeedItem, FeedTrackedChange, or object feed, such as AccountFeed.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`

**Special Access Rules**

If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.
Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeedItemId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>FeedEntityId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>InsertedById</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>Relationship Name</td>
</tr>
<tr>
<td></td>
<td>Relationship Type</td>
</tr>
<tr>
<td></td>
<td>Refers To</td>
</tr>
</tbody>
</table>

Usage

You can’t query FeedLike records directly. They can only be queried via the entity feed, such as AccountFeed. FeedLike records represent likes on posts and not likes on comments. Likes on comments can’t be queried via the API.
FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

To delete feed items they didn't create, users must have one of these permissions:

- Modify All Data
- Modify All on the parent object, for example on Account for a poll on an AccountFeed
- Moderate Chatter

Note: Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

Only users with this permission can delete items in unlisted groups.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChoiceBody</td>
<td></td>
</tr>
<tr>

<td>Type</td>
<td>int</td>
</tr>
<tr>
<td>Properties</td>
<td>Group, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>Shows the position of the poll choice.</td>
</tr>
</tbody>
</table>
Usage

Use this object to query all of the choices associated with a particular poll. To view how people voted on the poll, see the FeedPollVote object.

FeedPollVote

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChoiceId</td>

</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: ID of the feed item for the poll.</td>
</tr>
</tbody>
</table>
FeedPost

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

Supported Calls

create(), delete(), describeSObjects(), search()

Special Access Rules

You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the object associated with the feed and delete permission on the parent feed
- "Moderate Chatter"

Note: Users with the “Moderate Chatter” permission can delete only the feed items and comments they can see.

- Manage Unlisted Groups

Only users with the Modify All Data permission can delete a feed item of Type TrackedChange.

If the context user has the Insert System Field Values for Chatter Feeds user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the context user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

</table>
| InsertedById | Type: reference  
Properties: Filter, Group, Sort  
Description: ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the InsertedById value is set to the ID of the context user. |
| IsDeleted | Type: boolean  
Properties: Defaulted on create, Filter, Group, Sort  
Description: Indicates whether the record has been moved to the Recycle Bin (true) or not (false). This field is a standard system field. |
| LinkUrl | Type: url  
Properties: Create, Filter, Nillable, Sort  
Description: The URL of a LinkPost. |
| ParentId | Type: reference  
Properties: Create, Filter, Group, Sort  
Description: ID of the object type to which the FeedPost is related. For example, set this field to a UserId to post to someone's profile feed, or an AccountId to post to a specific account. |
| Title | Type: string  
Properties: Create, Filter, Group, Nillable, Sort  
Description: The title of the FeedPost. When the Type is LinkPost, the Body is the URL and the Title is the label for the link. |
**Details**

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td></td>
</tr>
</tbody>
</table>

**Type**

- Picklist

**Properties**

- Create, Defaulted on Create, Filter, Group, Restricted Picklist, Sort

**Description**

The type of FeedPost:

- **UserStatus**—automatically generated when a user updates their status
- **TrackedChange**—ignore
- **TextPost**—a direct text entry on a feed
- **LinkPost**—a URL posting on a feed
- **ContentPost**—an uploaded file on a feed

**Note:** If you set Type to ContentPost, you must specify ContentData and ContentFileName.

---

**Usage**

- You can't directly query for a FeedPost. FeedPosts are always associated with a feed item, so you can query for them through the feeds. The following example returns all feed items for a given account, ordered by date descending:

  ```sql
  SELECT Id, Type, FeedPost.Body
  FROM AccountFeed
  WHERE ParentId = AccountId
  ORDER BY CreatedDate DESC
  ```

- A FeedPost of type **UserStatus** is automatically created when a user adds a post to update the current status. You can't explicitly create a FeedPost of type **UserStatus**.

- The size limit for an attachment on a profile, news, or record feed is 2 GB.

- You can't use the content fields to update or delete the content.

- You can't filter or update the content fields.

- Deleting a FeedPost via the API also deletes the associated content and FeedPost objects. Likewise, undeleting a FeedPost restores associated content and FeedPost objects.

  **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in FeedPost appear as **null** in a SOQL query.

- You can't explicitly create or delete a FeedTrackedChange record.

---

**FeedRevision**

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.
Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Fields

<table>

</tr>
<tr>
<td><strong>Revision</strong></td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The revision number of the feed item or comment.</td>
</tr>
</tbody>
</table>
**Usage**

This object tracks the changes made to a feed item or feed comment and stores a list of attributes that changed for each revision.

- To query the FeedRevision object, users need the View All Data permission or supply a WHERE clause on the FeedEntityId.

**feedSignal**

Attach feed signals, like UpDownVote, UserVerified, and Verified, to a feed post or comment. This object is available in API version 41.0 and later.

**Supported Calls**

create(), delete(), describeSObjects()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeedEntityId</td>
<td></td>
</tr>
<tr>

**Field** | **Details**
--- | ---
| | • FeedComment

**InsertedById**

**Type**
reference

**Properties**
Filter, Group, Sort

**Description**
ID of user who inserted the signal.
This is a relationship field.

**Relationship Name**
InsertedBy

**Relationship Type**
Lookup

**Refers To**
User

**SignalType**

**Type**
picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
The type of signal.
Possible values are:
•UpDownVote
•UserVerified
•Verified

**SignalValue**

**Type**
int

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The value of the signal. For example, forUpDownVote, the value specifies whether the signal is an upvote or a downvote.

---

**FeedTrackedChange**

Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later.
### Supported Calls

*describeSObjects()*

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **CurrencyIsoCode** | Type: picklist  
**Properties:***  
Defaulted on create, Group, Restricted picklist, Sort  
**Description:***  
Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the field, if *FieldName* is a currency field. |
| **FeedItemId**     | Type: reference  
**Properties:***  
Filter, Group, Sort  
**Description:***  
ID of the parent feed that tracks the field change. |
| **FieldName**      | Type: string  
**Properties:***  
Group, Sort  
**Description:***  
The name of the field that was changed.  
**Note:** This field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of *leadConverted* indicates that a lead has been converted to an opportunity. For a full list of values, see Tracking of Special Events. |
| **NewValue**       | Type: anyType  
**Properties:***  
Nillable, Sort  
**Description:***  
The new value of the field that was changed. |
| **OldCurrencyIsoCode** | Type: string |
Details

Field: OldValue

Properties
- Group, Nillable, Sort

Description
Available only for organizations with the multicurrency feature enabled. Contains the ISO currency code for the OldValue field, if FieldName is a currency field.

Usage

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

If you move a custom field to the Recycle Bin, all FeedTrackedChange records that track historical changes to the custom field are automatically deleted and are not restored if the custom-field is undeleted.

The following sections outline the difference between standard feeds and custom feeds.

Standard Feeds

A standard feed is a record feed, such as AccountFeed. FeedTrackedChange records for standard feeds can only be queried via the parent feed object.

Note the following when working with standard feed items:
- Feed items for standard feeds are read only in the API.
- A FeedTrackedChange record is visible when you have read access on the record feed, and when the field is visible in the field-level security settings.

Custom Feeds

If you want more control over the information provided in a record feed, such as AccountFeed, you can create a custom feed. A custom feed can replace or augment an existing record feed. For example, you might want to:
- Disable the standard account record feed and use an Apex trigger to generate FeedTrackedChange records for the events that you want to track in the feed instead.
- Augment the standard contact record feed by writing an API client that inserts feed items for events that are not tracked in the standard feed.
Tracking of Special Events

The FieldName field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of leadConverted indicates that a lead has been converted to an opportunity.

Valid values for the FieldName field for multiple objects:

• created
• ownerAccepted
• ownerAssignment

Additional valid values for the FieldName field for individual objects:

Account

• accountCreatedFromLead
• accountMerged
• accountUpdatedByLead
• personAccountUpdatedByLead

Case

• closed
• ownerEscalated

Contact

• contactCreatedFromLead
• contactMerged
• contactUpdatedByLead

Contract

• contractActivation
• contractApproval
• contractConversion
• contractExpiration
• contractTermination

Lead

• leadConverted
• leadMerged

Opportunity

• opportunityCreatedFromLead

SEE ALSO:

Custom Object__Feed
FieldHistoryArchive

Represents field history values for all objects that retain field history. FieldHistoryArchive is a big object, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

Each instance of the FieldHistoryArchive object represents a single change in the value of a field. FieldHistoryArchive stores history for both standard and custom fields.

The Field field returns the name of the field unless the parent field or object is deleted, in which case it returns the field ID. You can use the ID to retrieve the old field and object name from the FieldNameAfterArchival and ParentNameAfterArchival fields, respectively.

Supported Calls

describeSObjects(), query()

</tbody>
</table>
Details

Description
The date and time that specifies the beginning of the time period.

ValidTo

Type
dateTime

Properties
Filter

Description
The date and time that specifies the end of the time period.

Usage

Use FieldChangeSnapshot to learn about the first change made to the specified opportunity during the specified time period. Subsequent changes are not returned.

Example: Suppose that last week you changed an opportunity’s close date to June 1, 2021. Assuming the opportunity had the ID '006R0000XXXXXXXXXX', the following query would return the CurrentValueDateOnly of June 1, 2021:

```sql
Select CurrentValueDateOnly from FieldChangeSnapshot where ParentID = '006R0000XXXXXXXXXX' and FieldName = 'CloseDate' and ValidTo = LAST_WEEK AND ValidFrom = LAST_WEEK and CurrentValueDateOnly < 2021-07-01
```

FieldPermissions

Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

To grant a user access to a field, associate a FieldPermissions record with a PermissionSet that’s assigned to a user. FieldPermissions records are only supported in PermissionSet, not in Profile.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

In API version 49.0 and later, only users with the View Setup and Configuration permission can access this object.

Fields

In API version 50.0 and later, for lookup field inserts and queries, you can leave off the Id in the field name or include it. The rows returned always use the API name. For example:

```sql
Select SobjectType, Field From FieldPermissions where Field='Contact.Account'
```
```sql
Select SobjectType, Field From FieldPermissions where Field='Contact.AccountId'
```
both return

```
Contact, Contact.AccountId
```

<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| PermissionsRead | **Type**
|                | boolean |
|                | **Properties**
|                | Create, Defaulted on create, Filter, Group, Sort, Update |
### Usage

FieldPermissions work similarly to ObjectPermissions. However, FieldPermissions includes a **Field** attribute to return the name of the field.

For example, the following query returns all FieldPermissions records that have at least the “Read” permission. The results include the field, object, and permission set names.

```sql
SELECT SobjectType, Field, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE PermissionsRead = True
```

Include the field’s parent object when querying FieldPermissions. For example, to find all rows that match the Account object’s `Type` field, create the following query:

```sql
SELECT Id, SobjectType, Field
FROM FieldPermissions
WHERE Field = 'Account.Type' AND SobjectType = 'Account'
```

To find which permission sets are backed by profiles with the Account object, you can use a query like the following example:

```sql
SELECT Id, ParentId, SobjectType, Field, PermissionsEdit, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE SobjectType = 'Account' and Parent.IsOwnedByProfile = true
ORDER BY SobjectType, Field
```

Both **SobjectType** and **Field** must be included in the `SELECT` line of the query. Provide the full API name of the field in the form of `SobjectType.Field` when querying for a field.

**Note:** When using the FieldPermission object to download records, depending on the SOQL query you use, you might not receive all expected records. Results can also appear incomplete. However, all records do download; fields that don’t support field security and rows for entities not visible to the org are hidden.

### Special Properties for Field Permissions

The auto-number and formula fields have special rules for how field permissions work. Both have FieldPermissions records, but inserting and updating is limited to **PermissionsRead**. **PermissionsEdit** isn’t allowed for either field type, since these fields must be read-only for users.
The following field types don’t return a FieldPermissions record because they are assumed to always be readable.

- Id
- CreatedById
- CreatedDate
- IsDeleted
- LastModifiedById
- LastModifiedDate
- SystemModStamp

The following field types don’t return a FieldPermissions record because they are assumed to always be readable and writable.

- OwnerId
- Master-detail custom (relationship) fields
- Universally required custom fields

As a result, the following query returns no records, even though users do have some access to some of the fields.

```sql
SELECT Field, SobjectType, PermissionsRead
FROM FieldPermissions
WHERE Field='Id'
```

To determine if a field can return a FieldPermissions record, you can call a `describeSObject()` on the field. For example, `describeSObject('Merchandise__c')` returns all the properties of the Merchandise custom object, including field properties. If you use a field whose `permissionable` property is `false` (like the field types listed in this section), you can’t query, insert, update, or delete field permissions records, because they don’t exist.

### Working with Custom Activity Fields

While tasks and events are considered separate objects, they share a common set of activity custom fields. As a result, when a custom task field is created, a custom event field is also created, and vice versa. You can display the custom field on the event layout, task layout, or both event and task layouts.

Although custom activity fields are shared between tasks and events, you see separate FieldPermissions records for the task and event. However, changes made to one field permission record are automatically made to the other. For example, if you create a custom activity field, assign field permissions to it in a permission set, and run the following query, the query returns two records with the same permission value.

```sql
SELECT Field, Id, ParentId, PermissionsEdit, PermissionsRead, SobjectType
FROM FieldPermissions
WHERE SobjectType = 'event' OR SobjectType = 'task'
```

If you then update one of the records with another set of field permission values and run the query, the same permission values for both records are returned.
Nesting Field Permissions

You can nest FieldPermissions in a PermissionSet query. For example, the following returns any permission sets where “Edit Read Only Fields” is true. Also, the result set includes both the “Read” and “Edit” field permission on the Merchandise object. Get similar results by nesting the SOQL with a field permission query using the relationship name for field permissions: FieldPerms.

```sql
SELECT PermissionsEditReadonlyFields,
    (SELECT SobjectType, Field, PermissionsRead, PermissionsEdit
     FROM FieldPerms
     WHERE SobjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadonlyFields = true
```

As a result, it’s possible to traverse the relationship between the PermissionSet and any child-related objects (in this case, FieldPermissions). You can do this from the PermissionSet object by using the child relationship (ObjectPerms, FieldPerms, and so on) or from the child object by referencing the PermissionSet with Parent.permission_set_attribute.

It’s important to consider when to use a conditional WHERE statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```sql
SELECT PermissionsEditReadonlyFields,
    (SELECT SobjectType, Field, PermissionsRead, PermissionsEdit
     FROM FieldPerms
     WHERE SobjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadonlyFields = true
Versus:
SELECT SobjectType, Field, PermissionsRead, PermissionsEdit, Parent.Name,
    Parent.PermissionsEditReadonlyFields
FROM FieldPermissions
WHERE SObjectType='Merchandise__c'
```

SEE ALSO:
- PermissionSet
- ObjectPermissions

FieldSecurityClassification

Represents a field’s data sensitivity value selected from the SecurityClassification picklist. This object is available in API version 46.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()
### Special Access Rules
To view this object, you need the Customize Application or Modify Data Classification permission.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>

</tbody>
</table>

| **Description** | ![Field Security Classification Standard Objects](https://example.com) |
| **Type** | textarea |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | The description of the data sensitivity picklist value. |

| **IsHighRiskLevel** | ![Field Security Classification Standard Objects](https://example.com) |
| **Type** | boolean |
| **Properties** | Defaulted on create, Filter, Group, Sort |
| **Description** | Indicates that fields with this picklist value contain data highly sensitive to your company. |

| **MasterLabel** | ![Field Security Classification Standard Objects](https://example.com) |
| **Type** | string |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | The data sensitivity picklist value. Default values: • Public • Internal |
Usage

Use this object to return information about data sensitivity values in the SecurityClassification picklist. This object is read-only, but you can update the SecurityClassification picklist using the StandardValueSet Metadata API type.

FieldServiceMobileSettings

Represents a configuration of settings that control the Field Service iOS and Android mobile app experience. This object is available in API version 38.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

Field Service must be enabled.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>

The default value is Coarse.

**BgGeoLocationMinUpdateFreqMins**

- **Type**: int
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The frequency of geolocation polling of services resources while the app is running in the background. Less frequent polling decreases battery consumption for mobile devices. The label in the UI is **Minimum Update Frequency of Geo Location in Minutes (Background)**. Available in API version 41.0 and later.

**BrandInvertedColor**

- **Type**: string
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The color of toasts and the contrast color of the floating action button.

**ContrastInvertedColor**

- **Type**: string
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The color of secondary backgrounds in the UI.

**ContrastPrimaryColor**

- **Type**: string
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The color of primary text.

**ContrastQuaternaryColor**

- **Type**: string
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The color of secondary lines that delineate different areas of the UI.

**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** The minimum number of minutes between attempts to update a user’s schedule. |
Usage

Field Service Mobile settings allow you to create sets of settings to apply to different field service mobile users. The settings apply to both the Android and iOS versions of the app.

For example, suppose you want to accommodate workers that are color blind, or who work in dark or bright conditions. You can choose different branding options for different workers to suit their needs, and assign them to their profiles.

FieldServiceOrgSettings

Represents the org settings for Field Service, such as Appointment Assistant settings. If Field Service is enabled, the org contains one read-only record of this object. This object is available in API version 51.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()
### FieldServiceOrgSettings

</tbody>
</table>
FiscalYearSettings

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

As of Spring '20 and later, only partner users and standard users can access this object.
## FiscalYearSettings

</tbody>
</table>
### FlexQueueItem

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the AsyncApexJob. This object is available in API version 36.0 and later.

### Supported Calls

- `describeSObjects()`
- `query()`

### Special Access Rules

The `enableAsyncRequiresViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to enqueue async Apex Jobs”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AsyncApexJobId</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
</tbody>
</table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>The ID of an AsyncApexJob that’s waiting in the flex queue.</td>
</tr>
<tr>
<td></td>
<td>This is a relationship field.</td>
</tr>
<tr>
<td><strong>Relationship Name</strong></td>
<td>AsyncApexJob</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
<td>AsyncApexJob</td>
</tr>
<tr>
<td><strong>FlexQueueItemId</strong></td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The primary key for this FlexQueueItem.</td>
</tr>
<tr>
<td><strong>JobPosition</strong></td>
<td>Type: int</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The position in the flex queue of the waiting job. The highest-priority job in the queue is at position 0.</td>
</tr>
<tr>
<td><strong>JobType</strong></td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Restricted picklist, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The type of the job. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• ApexToken</td>
</tr>
<tr>
<td></td>
<td>• BatchApex</td>
</tr>
<tr>
<td></td>
<td>• BatchApexWorker</td>
</tr>
<tr>
<td></td>
<td>• Future</td>
</tr>
<tr>
<td></td>
<td>• Queueable</td>
</tr>
<tr>
<td></td>
<td>• ScheduledApex</td>
</tr>
<tr>
<td></td>
<td>• SharingRecalculation</td>
</tr>
<tr>
<td></td>
<td>• TestRequest</td>
</tr>
<tr>
<td></td>
<td>• TestWorker</td>
</tr>
</tbody>
</table>
Currently, queries are supported only on BatchApex jobs.

### Usage

To find the position of an AsyncApexJob in the flex queue, query JobPosition. For example:

```sql
SELECT JobPosition FROM FlexQueueItem WHERE JobType = 'BatchApex' AND AsyncApexJobId = '707xx000000DABC'
```

To find the job at a given position, query AsyncApexJobId. For example:

```sql
SELECT AsyncApexJobId FROM FlexQueueItem WHERE JobType = 'BatchApex' AND JobPosition = '2'
```

To find all batch jobs in the flex queue, query JobType. To get other information about the jobs, include AsyncApexJob in your query. For example:

```sql
SELECT JobType, JobPosition, AsyncApexJob.ApexClass.Name, AsyncApexJob.CreatedDate, AsyncApexJob.CreatedBy FROM FlexQueueItem WHERE JobType='BatchApex' AND AsyncApexJob.ApexClass.Name LIKE '%BatchAJob' ORDER BY JobPosition DESC
```

### FlowDefinitionView

Represents the description of a flow definition. This object is available in API version 46.0 and later.

### Supported Calls

`describeSObjects()`, `query()`

Properties

- Filter, Group, Nillable, Restricted picklist, Sort

Description

The type of the flow. Valid values are:

- **Appointments** — A flow for Lightning Scheduler. This value is available in API version 44.0 and later.
- **AutoLaunchedFlow** — A flow that doesn't require user interaction.
- **CheckoutFlow** — A flow used in Lightning B2B Commerce to create a checkout in a store. This value is available in API version 48.0 and later.
- **ContactRequestFlow** — A flow that lets customers request that customer support get back to them. This flow is used to create contact request records. This value is available in API version 45.0 and later.
- **CustomerLifecycle** — A Salesforce Surveys flow that lets you associate survey questions with different stages in customer lifecycles. This value is available in API version 49.0 and later and only when the Customer Lifecycle Designer license is enabled.
- **CustomEvent** — A process that is invoked when it receives a platform event message. In the UI, it’s an event process. This value is available in API version 41.0 and later.
- **FieldServiceMobile** — A flow for the Field Service mobile app. This value is available in API version 39.0 and later.
- **FieldServiceWeb** — A flow for embedded Appointment Booking. Its UI label is Field Service Embedded Flow. This value is available in API version 41.0 and later.
- **Flow** — A flow that requires user interaction because it contains one or more screens or local actions, choices, or dynamic choices. In the UI and Salesforce Help, it’s a screen flow. Screen flows can be launched from the UI, such as with a flow action, Lightning page, or web tab.
- **FSCLending** — A flow for Financial Services Cloud Mortgage. This value is available in API version 46.0 and later.
- **FSCLending** — A flow for login. This value is available in API version 51.0 and later.
- **InvocableProcess** — A process that can be invoked by another process or the Invocable Actions resource in REST API. This value is available in API version 38.0 and later.
- **RoutingFlow** — A flow for Salesforce Omni-Channel routing and other business logic. This value is available in API version 52.0 and later.
- **Survey** — A flow for Salesforce Surveys. From the UI, this type of flow is created in Survey Builder. This value is available in API version 42.0 and later.
- **SurveyEnrich** — A Salesforce Surveys flow that uses the Survey Data Mapper. From the UI, this type of flow is created in the Survey Builder and requires an associated survey flow type. This value is available in API version 49.0 or later and only when the Customer Lifecycle Designer license is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow</td>
<td>A process that is invoked when a record is created or edited. In the UI and Salesforce Help, it’s a record change process. These values are reserved for future use.</td>

</tbody>
</table>

**Note:** This value has significant impact on validation when saving the flow and on the flow’s runtime behavior. Don’t change this value unless you understand the flow properties of the specified type.

Across flow versions, you can change the type only from Flow to AutoLaunchedFlow or vice versa. Before you change the flow type, make sure that the flow contains only elements, resources, and functionality that the new flow type supports.

<table>
<thead>

| `TriggerObjectOrEventLabel` | **Type**  
  string  
  **Properties**  
  Filter, Group, Nillable, Sort  
  **Description**  
  The label of the object or platform event that triggers this flow. This field is available in API version 53.0 and later. |
| `TriggerType`                | **Type**  
  picklist  
  **Properties**  
  Filter, Group, Nillable, Restricted picklist, Sort  
  **Description**  
  Specifies what causes the flow to run. If you exclude this field, the flow has no trigger and starts only when a user or app launches the flow. Valid value is:  
  • **PlatformEvent**—The flow starts when a platform event message is received. This value is available in API version 49.0 and later.  
  • **RecordAfterSave**—The flow starts after a record is saved. This value is available in API version 49.0 and later.  
  • **RecordBeforeSave**—Creating and/or updating a record triggers an autolaunched flow to make additional updates to that record before it’s saved to the database. This value is available in API version 48.0 and later.  
  • **Scheduled**—The flow starts at the scheduled time. This value is available in API version 47.0 and later.  
  Available only when `processType` is `AutoLaunchedFlow`. This field is available in API version 47.0 and later. |

**Usage**
Use this object to query information about flow definitions.

**FlowInterview**

Represents a flow interview. A *flow interview* is a running instance of a flow.

**Supported Calls**

delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
Special Access Rules

To delete a flow interview, you must have the “Manage Flow” user permission. All other calls require the “Run Flows” user permission or the Flow User field enabled on the user detail page. If Override default behavior and restrict access to enabled profiles or permission sets is selected for an individual flow, access to that specific flow and its interviews is given to users by profile or permission set.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**FlowInterviewOwnerSharingRule**
Sharing rules are available for the object.

**FlowInterviewShare**
Sharing is available for the object.

**FlowInterviewOwnerSharingRule**

Represents the rules for sharing a FlowInterview with users other than the owner. This object is available in API version 33.0 and later.
## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AccessLevel</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> A value that represents the type of sharing being allowed. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Read</td>
</tr>
<tr>
<td></td>
<td>• Edit—In API version 42.0 and later, when Let users resume shared flow interviews is enabled for your org, users can resume all flow interviews that they have edit access to.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> A description of the sharing rule. Maximum size is 1000 characters.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.</td>
</tr>
</tbody>
</table>

**Note:** When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance slows down while Salesforce generates one for each record.
### Usage

Use this object to manage the sharing rules for FlowInterview records. General sharing uses this object.

In API version 42.0 and later, when *Let users resume shared flow interviews* is enabled for your org, users can resume all flow interviews that they have edit access to. When that setting is disabled, only the owner or a flow admin can resume a flow interview. To disable this setting, go to your org’s Process Automation Settings in Setup.

### FlowInterviewShare

Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.
### AccessLevel

**Type**  
picklist

**Properties**  
Create, Filter, Group, Restricted picklist, Sort, Update

**Description**  
Level of access that the User or Group has to the FlowInterview. The possible values are:

- **Read**
- **Edit**—In API version 42.0 and later, when Let users resume shared flow interviews is enabled for your org, users can resume all flow interviews that they have edit access to.
- **All**—This value is not valid for creating or deleting records.

### ParentId

**Type**  
reference

**Properties**  
Create, Filter, Group, Sort

**Description**  
ID of the FlowInterview associated with this sharing entry. This is a relationship field.

**Relationship Name**  
Parent

**Relationship Type**  
Lookup

**Refers To**  
FlowInterview

### RowCause

**Type**  
picklist

**Properties**  
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**  
Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default).

Valid values include:

- **Manual**—The User or Group has access because a user with "All" access manually shared the FlowInterview with them.
- **Owner**—The User is the owner of the FlowInterview.
- **Rule**—The User or Group has access via a FlowInterview sharing rule.
- **GuestRule**—The User or Group has access via a FlowInterview guest user sharing rule.
Usage

This object lets you determine which users and groups can view and edit flow interviews that are owned by other users.

In API version 42.0 and later, when **Let users resume shared flow interviews** is enabled for your org, users can resume all flow interviews that they have edit access to. When that setting is disabled, only the owner or a flow admin can resume a flow interview. To disable this setting, go to your org’s Process Automation Settings in Setup.

FlowRecordRelation

Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the $Flow.CurrentRecord global variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

Supported Calls

`create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()`

FlowStageRelation

Represents a relationship between a paused flow interview and its stages. When a flow interview is paused, Salesforce creates a FlowStageRelation record for each stage that’s set to the $Flow.CurrentStage or $Flow.ActiveStages global variable. Available in API version 43.0 and later.

**Supported Calls**

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

<td></td>
<td>• If the type is Active, the order corresponds to the order of the stage in $Flow.ActiveStages.</td>
</tr>
<tr>
<td></td>
<td>• If the type is Current and corresponds to an active stage, the order matches the order of the active stage.</td>
</tr>
<tr>
<td></td>
<td>• If the type is Current and doesn’t correspond to an active stage, the order is 0.</td>
</tr>
</tbody>
</table>
**StageType**

**Details**

- **Type**: picklist
- **Properties**: Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort
- **Description**: Type of stage. The valid values are:
  - **Current**: Identifies that the stage is set to $Flow.CurrentStage.
  - **Active**: Identifies that the stage is set to $Flow.ActiveStages.

---

**Usage**

You can use the FlowStageRelation records to represent the paused interview and its active and current stages visually.

For example, an Online Purchasing flow interview starts with several stages in $Flow.ActiveStages. If the interview is paused, Salesforce creates a FlowStageRelation record for each stage in $Flow.ActiveStages or $Flow.CurrentStage.

**Description**

The type of the flow. Valid values are:

- **Appointments** — A flow for Lightning Scheduler. This value is available in API version 44.0 and later.
- **AutoLaunchedFlow** — A flow that doesn’t require user interaction.
- **CheckoutFlow** — A flow used in Lightning B2B Commerce to create a checkout in a store. This value is available in API version 48.0 and later.
- **ContactRequestFlow** — A flow that lets customers request that customer support get back to them. This flow is used to create contact request records. This value is available in API version 45.0 and later.
- **CustomerLifecycle** — A Salesforce Surveys flow that lets you associate survey questions with different stages in customer lifecycles. This value is available in API version 49.0 and later and only when the Customer Lifecycle Designer license is enabled.
- **CustomEvent** — A process that is invoked when it receives a platform event message. In the UI, it’s an event process. This value is available in API version 41.0 and later.
- **FieldServiceMobile** — A flow for the Field Service mobile app. This value is available in API version 39.0 and later.
- **FieldServiceWeb** — A flow for embedded Appointment Booking. Its UI label is Field Service Embedded Flow. This value is available in API version 41.0 and later.
- **Flow** — A flow that requires user interaction because it contains one or more screens or local actions, choices, or dynamic choices. In the UI and Salesforce Help, it’s a screen flow. Screen flows can be launched from the UI, such as with a flow action, Lightning page, or web tab.
- **FSCLending** — A flow for Financial Services Cloud Mortgage. This value is available in API version 46.0 and later.
- **FSCLending** — A flow for login. This value is available in API version 51.0 and later.
- **InvocableProcess** — A process that can be invoked by another process or the Invocable Actions resource in REST API. This value is available in API version 38.0 and later.
- **RoutingFlow** — A flow for Salesforce Omni-Channel routing and other business logic. This value is available in API version 52.0 and later.
### Details

- **Survey**—A flow for Salesforce Surveys. From the UI, this type of flow is created in Survey Builder. This value is available in API version 42.0 and later.
- **SurveyEnrich**—A Salesforce Surveys flow that uses the Survey Data Mapper. From the UI, this type of flow is created in the Survey Builder and requires an associated survey flow type. This value is available in API version 49.0 or later and only when the Customer Lifecycle Designer license is enabled.
- **Workflow**—A process that is invoked when a record is created or edited. In the UI and Salesforce Help, it’s a record change process.

These values are reserved for future use.

- **ActionCadenceFlow**
- **ActionPlan**
- **AppProcess**
- **CartAsyncFlow**
- **DigitalForm**
- **Journey**
- **JourneyBuilderIntegration**
- **LoginFlow**
- **ManagedContentFlow**
- **OrchestrationFlow**
- **RecommendationStrategy**
- **SalesEntryExperienceFlow**
- **TransactionSecurityFlow**
- **UserProvisioningFlow**

**Note:** This value has significant impact on validation when saving the flow and on the flow’s runtime behavior. Don’t change this value unless you understand the flow properties of the specified type.

Across flow versions, you can change the type only from *Flow* to *AutoLaunchedFlow* or vice versa. Before you change the flow type, make sure that the flow contains only elements, resources, and functionality that the new flow type supports.

### RunInMode

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **RunInMode** | **Type**
|               | picklist                                                                 |
|               | **Properties**                                                          |
|               | Filter, Group, Nillable, Restricted picklist, Sort                      |
|               | **Description**                                                         |
|               | The mode that the flow runs in. Valid values are:                       |
|               | - DefaultMode — The flow version runs in system or user context, depending on how the flow is launched. |
SystemModeWithSharing — The flow version always runs in system mode with sharing. The flow respects org-wide default settings, role hierarchies, sharing rules, manual sharing, teams, and territories. But it doesn’t respect object permissions, field-level access, or other permissions of the running user.

**Status**

<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>The flow’s version number.</td>
</tr>
</tbody>
</table>

**Usage**

Use this object to query information about flow versions. A query must be filtered by DurableId or FlowDefinitionViewId to get results.

**Folder**

Represents a repository for a Dashboard, Document, EmailTemplate, Macro, QuickText, or Report. Only one type of item can be contained in a folder.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

**Special Access Rules**

- You must have the “Modify All Data” permission to create, update, or delete document folders and email template folders.
• Guest and Customer Portal users can’t access this object.
• To query this object, no special permissions are needed.
• As of API version 35.0, when a folder is shared with a role, it is only visible to users in that role. Superior roles in the role hierarchy don’t gain visibility.
• If analytics folder sharing is turned on, then users need these permissions to create and manage report folders and dashboard folders:
  – “Create Dashboard Folders”
  – “Create Report Folders”
• To use folders for macros and quick text, enable folders for these objects in Setup on the Macro Settings and Quick Text Settings pages.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AccessType</strong></td>
<td><strong>Type</strong>                  picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong>            Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>

</table>

**Description**

Required. Type of objects contained in the Folder. This field can’t be updated. Available values include:

- Dashboard
- Document
- Email (for Salesforce Classic email templates)
- EmailTemplate (for Lightning email templates)
- Macro
- QuickText
- Report

**Usage**

Only one type of item can be contained in a folder, either Dashboard, Document, EmailTemplate, Macro, QuickText, or Report.

**SEE ALSO:**

Object Basics

**FolderedContentDocument**

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

**Supported Calls**

describeSObjects()

### ForecastingAdjustment

This object represents an individual forecast manager’s adjustment for a subordinate’s or child territory’s forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users’ adjustments of their own forecasts, including territory forecasts they own.

**Note:** This information only applies to Collaborative Forecasts.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieves()`, `update()`, `upsert()`

#### Special Access Rules

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

| Details |

Commit, Omitted, and Closed. You can add a Most Likely category and can customize forecast category names in single category rollups. The forecast categories display information for that specific category; for example, Best Case only reflects amounts in the Best Case category.

| Type |

picklist

| Properties |

Create, Filter, Group, Sort

| Description |

This field indicates which type of forecast rollup the manager adjustment belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the ForecastsItemCategory field.

**Individual forecast category rollups:**

- PipelineOnly - Rollup from Pipeline opportunities only.
- BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.
- MostLikelyOnly - Rollup from Most Likely opportunities only. Adjustable.
- CommitOnly - Rollup from Commit opportunities only. Adjustable.

**Cumulative forecast rollups:**

- OpenPipeline - Rollup from Pipeline + Best Case + Most Likely + Commit opportunities.
- BestCaseForecast - Rollup from Best Case + Most Likely + Commit + Closed opportunities. Adjustable.
- MostLikelyForecast - Rollup from Most Likely + Commit + Closed opportunities. Adjustable.
- CommitForecast - Rollup from Commit + Closed opportunities. Adjustable.

**Either cumulative or individual forecast category rollups:**

- ClosedOnly - Rollup from Closed opportunities only.

The ForecastsItemCategory field differs from the ForecastsCategoryName field.

- The ForecastsCategoryName field represents the forecast category of the underlying opportunities rolling up to forecast amounts. In organizations using cumulative forecast rollups, the ForecastsCategoryName field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.
- The new ForecastsItemCategory field represents the type of rollup a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.
Details

When inserting manager adjustments, the values you insert for `ForecastCategoryName` and `ForecastingItemCategory` must be compatible with each other. In organizations using cumulative forecast rollups, the `ForecastCategoryName` is nillable. The following pairs are valid.

**Individual forecast category rollups:**
- `ForecastCategoryName`: BestCase, `ForecastingItemCategory`: BestCaseOnly
- `ForecastCategoryName`: MostLikely, `ForecastingItemCategory`: MostLikelyOnly
- `ForecastCategoryName`: Commit, `ForecastingItemCategory`: CommitOnly

**Cumulative forecast category rollups:**
- `ForecastCategoryName`: null, `ForecastingItemCategory`: BestCaseForecast
- `ForecastCategoryName`: null, `ForecastingItemCategory`: MostLikelyForecast
- `ForecastCategoryName`: null, `ForecastingItemCategory`: CommitForecast

</tbody>
</table>
**Usage**

Use this object to obtain a manager’s adjustment detail for a specified ForecastingItem. The ForecastingAdjustment object is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write ForecastingAdjustment records.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The ForecastingQuota, ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingItem, and ForecastingFact objects can all have records with different ForecastingTypeId values. Use the ForecastingType object to determine the ID for each forecast type and then filter ForecastingQuota, ForecastingAdjustment, ForecastingItem, or ForecastingFact records as necessary.

SEE ALSO:
- ForecastingFact
- ForecastingItem
- ForecastingQuota

**ForecastingDisplayedFamily**

Represents the table in Forecasts Settings where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

**Special Access Rules**

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

### Usage

Use this object to get information about opportunities linked to forecasting items.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The ForecastingQuota, ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingItem, and ForecastingFact objects can all have records with different ForecastingTypeId values. Use the ForecastingType object to determine the ID for each forecast type and then filter ForecastingQuota, ForecastingAdjustment, ForecastingItem, or ForecastingFact records as necessary.

SEE ALSO:
- ForecastingAdjustment
- ForecastingItem
- ForecastingQuota

### ForecastingItem

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: AmountWithoutAdjustments, AmountWithoutManagerAdjustment, ForecastAmount, OwnerOnlyAmount. The amounts users see include one of the following when forecasting in quantity: QuantityWithoutAdjustments, QuantityWithoutManagerAdjustment, ForecastQuantity, OwnerOnlyQuantity. Available in API versions 26 and greater.

Additionally, note that users:
• with the “View All Forecasts” permission have access to all ForecastingItem fields.
• without the “View All Forecasts” permission have access to all fields for their own subordinates and child territories.

Other users can see the ForecastingItem object, but not its records.

Note: This information only applies to Collaborative Forecasts.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

Details

Description
This field indicates which type of forecast rollup the forecasting item belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the ForecastingItemCategory field.

Individual forecast category rollups:
- PipelineOnly - Rollup from Pipeline opportunities only.
- BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.
- MostLikelyOnly - Rollup from Most Likely opportunities only. Adjustable.
- CommitOnly - Rollup from Commit opportunities only. Adjustable.

Cumulative forecast rollups:
- OpenPipeline - Rollup from Pipeline + Best Case + Most Likely + Commit opportunities.
- BestCaseForecast - Rollup from Best Case + Most Likely + Commit + Closed opportunities. Adjustable.
- MostLikelyForecast - Rollup from Most Likely + Commit + Closed opportunities. Adjustable.
- CommitForecast - Rollup from Commit + Closed opportunities.

Either cumulative or individual forecast category rollups:
- ClosedOnly - Rollup from Closed opportunities only.

The ForecastingItemCategory field differs from the ForecastCategoryName field.
- The ForecastCategoryName field represents the forecast category of the underlying opportunities rolling up to forecast amounts. In organizations using cumulative forecast rollups, the ForecastCategoryName field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.
- The new ForecastingItemCategory field represents the type of rollup a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.

#### SubordinateOverrides

**Type**

int

**Properties**

Filter, Group, Sort

**Description**

The total number of adjustments made to a forecast down the hierarchical chain. For example, User A has a forecast without adjustments. If User A adjusts User B's forecast, User A's `SubordinateOverrides` value is 1. Then if User B adjusts User C's forecast, User A's `SubordinateOverrides` value is 2. If User A removes his adjustment from User B's forecast, User A's `SubordinateOverrides` value is 1.

This field is available in API version 38.0 and later.

---

**Usage**

Use this object to obtain individual forecast amounts, either with or without adjustments, based on a user’s perspective and forecast role. The ForecastingItem object is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write ForecastingAdjustment records.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The ForecastingQuota, ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingItem, and ForecastingFact objects can all have records with different ForecastingTypeId values. Use the ForecastingType object to determine the ID for each forecast type and then filter ForecastingQuota, ForecastingAdjustment, ForecastingItem, or ForecastingFact records as necessary.

**SEE ALSO:**

- ForecastingAdjustment
- ForecastingFact
- ForecastingQuota

**ForecastingOwnerAdjustment**

This object represents an individual forecast user's adjustment of their own forecast, including territory forecasts they own, via a ForecastingItem. Available in API versions 33 and greater. This object is separate from the ForecastingAdjustment object, which represents managers' adjustments of subordinates' and child territories' forecasts.
Note: This information only applies to Collaborative Forecasts.

Supported Calls

*create*, *delete*, *describeSObjects*, *getDeleted*, *getUpdated*, *query*, *retrieved*, *update*, *upsert*

Special Access Rules

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

|                             | **Description**  
|                             | The category within the sales cycle that an opportunity is assigned to based on its opportunity stage. The standard forecast categories are Pipeline, Best Case, Commit, Omitted, and Closed. You can add a Most Likely category and can customize forecast category names in single category rollups. The forecast categories display information for that specific category; for example, Best Case only reflects amounts in the Best Case category. |
| ForecastingItemCategory     | **Type**  
|                             | picklist                                                                                                                                |
|                             | **Properties**  
|                             | Create, Filter, Group, Sort                                                                                                             |
|                             | **Description**  
|                             | This field indicates which type of forecast rollup the owner adjustment belongs to. Depending on whether your organization uses individual forecast category |
rollups or cumulative forecast rollups, you have these possible values for the `ForecastingItemCategory` field.

**Individual forecast category rollups:**
- PipelineOnly - Rollup from Pipeline opportunities only.
- BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.
- MostLikelyOnly - Rollup from Most Likely opportunities only. Adjustable.
- CommitOnly - Rollup from Commit opportunities only. Adjustable.

**Cumulative forecast rollups:**
- OpenPipeline - Rollup from Pipeline + Best Case + Most Likely + Commit opportunities.
- BestCaseForecast - Rollup from Best Case + Most Likely + Commit + Closed opportunities. Adjustable.
- MostLikelyForecast - Rollup from Most Likely + Commit + Closed opportunities. Adjustable.
- CommitForecast - Rollup from Commit + Closed opportunities. Adjustable.

**Either cumulative or individual forecast category rollups:**
- ClosedOnly - Rollup from Closed opportunities only.

The `ForecastingItemCategory` field differs from the `ForecastCategoryName` field.
- The `ForecastCategoryName` field represents the forecast category of the underlying opportunities rolling up to forecast amounts. In organizations using cumulative forecast rollups, the `ForecastCategoryName` field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.
- The new `ForecastingItemCategory` field represents the type of rollup a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.

When inserting owner adjustments, the values you insert for `ForecastCategoryName` and `ForecastingItemCategory` must be compatible with each other. In organizations using cumulative forecast rollups, the `ForecastCategoryName` is nillable. These are the valid pairs.

**Individual forecast category rollups:**
- `ForecastCategoryName`: BestCase,
  `ForecastingItemCategory`: BestCaseOnly
- `ForecastCategoryName`: Commit,
  `ForecastingItemCategory`: CommitOnly

Details

Field Name | Details
--- | ---
StartDate | **Type** date
**Properties** Create, Filter, Group, Nillable, Sort
**Description** The start of the adjustment, expressed as month and year. The date can include any day in a given month. Stored using the first date of the month.

Territory2Id | **Type** reference
**Properties** Create, Filter, Group, Nillable, Sort
**Description** The ID of the territory to forecast on. Available in API version 43 and later.

Usage
Use this object to obtain a user's adjustment detail for a specified ForecastingItem in their own forecast.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The ForecastingQuota, ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingItem, and ForecastingFact objects can all have records with different ForecastingTypeId values. Use the ForecastingType object to determine the ID for each forecast type and then filter ForecastingQuota, ForecastingAdjustment, ForecastingItem, or ForecastingFact records as necessary.

ForecastingQuota
This object represents an individual user's or territory's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' or child territories' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates and territories below them in the forecast hierarchy.

**Note:** This information only applies to Collaborative Forecasts.

Supported Calls
`create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()`
Special Access Rules

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

### Field Details

Possible values are:

- Opportunity.OwnerId
- OpportunitySplit.SplitOwnerId

### Usage

Use `ForecastingSourceDefinition` to define a forecast type’s structure. A forecasting source definition is joined via `ForecastingTypeSource` to `ForecastingType`.

In this example, a user role-based forecast type called Custom Amount Forecast is based on the Amount and Close Date fields on opportunities.

```java
ForecastingType type = new sforce.SObject("ForecastingType");
type.DeveloperName = "Custom_Amount_Forecast";
type.MasterLabel = "Custom Amount Forecast";
type.IsAmount = true;
type.IsQuantity = false;
type.RoleType = "R";
type.DateType = "OpportunityCloseDate";
String typeId = insert(type);

ForecastingSourceDefinition sourceDefinition = new sforce.SObject("ForecastingSourceDefinition")
sourceDefinition.DeveloperName = "Custom Amount Source";
sourceDefinition.MasterLabel = "Custom_Amount_Source";
sourceDefinition.SourceObject = "Opportunity";
sourceDefinition.MeasureField = "Opportunity.Amount";
sourceDefinition.DateField = "Opportunity.CloseDate";
sourceDefinition.UserField = "Opportunity.OwnerId";
sourceDefinition.CategoryField = "Opportunity.ForecastCategoryName";
String sourceDefinitionId = insert(sourceDefinition);

ForecastingTypeSource typeSource = new sforce.SObject("ForecastingTypeSource");
typeSource.DeveloperName = "Custom Amount Type Source";
typeSource.MasterLabel = "Custom_Amount_Type_Source";
typeSource.ForecastingTypeId = typeId;
typeSource.ForecastingSourceDefinitionId = sourceDefinitionId;
typeSource.SourceGroup = 1;
insert(typeSource);
```

### ForecastingType

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Spring ’20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

| RoleType   | **Type**
|            | picklist |
|            | **Properties**
|            | Create, Filter, Group, Restricted picklist, Sort |
|            | **Description**
|            | Indicates whether the role type has a forecasting type, and if so, which forecasting type. Possible values are R (user role-based forecasting type), T (Territory1-based forecasting type; not used), and Y (Territory2-based forecasting type). Available in API version 41.0 and later. |

| Territory2ModelId | **Type**
|                  | reference |
|                  | **Properties**
|                  | Create, Filter, Group, Nillable, Sort |
|                  | **Description**
|                  | Indicates whether the forecasting type has a Territory2 model, and if so, the name of the Territory2 model. Available in API version 41.0 and later. |

### Usage

Use this object to identify the forecast type of ForecastingAdjustment, ForecastingQuota, ForecastingFact, and ForecastingItem objects.

### ForecastingTypeSource

Maps a forecasting source definition to a forecast type. This object is available in API version 52.0 and later.

**Note:** The information in this topic applies only to forecast types created in Summer '21 and later.

### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

</tr>
<tr>
<td>Description</td>
<td>Required. Represents a grouping of forecasting source definitions.</td>
</tr>
</tbody>
</table>

### Usage
Use this object to define a forecast type’s structure. This junction object links ForecastingSourceDefinition to ForecastingType.

For an example, see ForecastingSourceDefinition.

### ForecastingUserPreference
Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

### Supported Calls
- create(), describeSObjects(), query(), update(), upsert()
### Special Access Rules

As of Spring '20 and later, only standard users with the View All Forecasts or Allow Forecasting permission or delegated forecast manager status can access this object.

</tbody>
</table>
FulfillmentOrder

Represents a group of products and delivery charges on a single order that share the same fulfillment location, delivery method, and recipient. The FulfillmentOrderLineitems belonging to a FulfillmentOrder are associated with OrderItemSummary objects belonging to a single OrderSummary. This object is available in API version 48.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

This object is only available in Salesforce Order Management orgs.

<td>Description: Timestamp for when the current user last viewed this record. A null value can mean that this record has only been referenced (LastReferencedDate) and not viewed.</td>
</tr>
</tbody>
</table>
### OrderId
- **Type:** reference
- **Properties:** Create, Filter, Group, Nillable, Sort
- **Description:** ID of the original Order that generated the FulfillmentOrder.

### OrderSummaryId
- **Type:** reference
- **Properties:** Create, Filter, Group, Nillable, Sort
- **Description:** ID of the OrderSummary associated with the FulfillmentOrder.

### OwnerId
- **Type:** reference
- **Properties:** Create, Defaulted on create, Filter, Group, Sort, Update
- **Description:** ID of the User who currently owns this FulfillmentOrder. Default value is the User logged in to the API to perform the create.

### Status
- **Type:** picklist
- **Properties:** Create, Filter, Group, Sort, Update
- **Description:** Status of the FulfillmentOrder. Each status corresponds to one status category, shown here in parentheses. You can customize the status picklist to represent your business processes, but the status category picklist is fixed because processing is based on those values. If you customize the status picklist, include at least one status value for each status category.

  - Default values are:
    - Allocated (Activated)
    - Assigned (Fulfilling)
    - Cancelled (Cancelled)
    - Draft (Draft)
    - Fulfilled (Closed)
    - Pickpack (Fulfilling)

### StatusCategory
- **Type:** picklist
### Field: **Details**

#### Properties
- Filter, Group, Restricted picklist, Sort

#### Description
Status category of the FulfillmentOrder. Processing of the FulfillmentOrder depends on this value. Each status category corresponds to one or more statuses.

Possible values are:
- **ACTIVATED**—Activated
- **CANCELLED**—Cancelled
- **CLOSED**—Closed
- **DRAFT**—Draft
- **FULFILLING**—Fulfilling

---

### Field: **TaxLocaleType**

#### Type
picklist

#### Properties
- Filter, Group, Nillable, Restricted picklist, Sort

#### Description
The system used to handle tax on the original Order associated with the FulfillmentOrder. Gross usually applies to taxes like value-added tax (VAT), and Net usually applies to taxes like sales tax.

Possible values are:
- **Gross** (displays most prices and taxes as combined values)
- **Net** (displays most prices and taxes as separate values)

This field is available in API version 49.0 and later.

---

### Field: **TotalAdjustmentAmount**

#### Type
currency

#### Properties
- Filter, Nillable, Sort

#### Description
Total amount of the price adjustments applied to the products on the FulfillmentOrder. This value only includes adjustments to FulfillmentOrderLineItems of type code Product.

---

### Field: **TotalAdjustmentAmtWithTax**

#### Type
currency

#### Properties
- Filter, Nillable, Sort

#### Description
Total amount of the price adjustments applied to the products on the FulfillmentOrder, inclusive of tax. This value only includes adjustments to FulfillmentOrderLineItems of type...

please  
**Properties**
Create, Filter, Group, Restricted picklist, Sort  
**Description**
Type of the FulfillmentOrderLineItem. Matches the type of the associated OrderItemSummary. Delivery Charge indicates that the FulfillmentOrderLineItem represents a delivery charge. Order Product indicates that it represents any other type of product, service, or charge. Each type corresponds to one type code, shown here in parentheses. Possible values are:
- Delivery Charge
- Order Product

| **TypeCode**           | **Type**
picklist  

### Field Details

**Properties**
Create, Filter, Group, Restricted picklist, Sort

**Description**
Type code of the FulfillmentOrderLineItem. Matches the type code of the associated OrderItemSummary. Processing depends on this value. Charge indicates that the FulfillmentOrderLineItem represents a delivery charge. Product indicates that it represents any other type of product, service, or charge. Each type category corresponds to one or more types.

Possible values are:
- Charge
- Product

**UnitPrice**

**Type**
currency

**Properties**
Create, Defaulted on create, Filter, Nillable, Sort

**Description**
Unit price of the FulfillmentOrderLineItem.

### FunctionConnection

Represents a connection between an org and Salesforce Functions. This object is available in API version 52.0 and later.

In API version 53.0, the name of this object was changed from SfFunctionsConnection to FunctionConnection.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), undelete(), update(), upsert()
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

<td><strong>Status</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>
Details

The status of the connection between the org and Salesforce Functions. Possible values are:

- Attempted
- None
- TrustedBiDirection
- TrustedUniDirection

The default value is 'None'. TrustedBiDirection indicates the connection is fully established.

Usage

FunctionConnection is not intended for direct use and should be treated as a read-only object that represents the current connection information between your org and Salesforce Functions. To create and manage connections between your org and Salesforce Functions use the steps and commands described in the Salesforce Functions developer documentation.

FunctionConnection is not supported in Trialforce templates or org snapshots.

FunctionInvocationRequest

 Represents invocation information for a Salesforce Function. This object is available in API version 51.0 and later.

When a Salesforce Function is invoked using the Apex functions.Function invoke methods, a FunctionInvocationRequest record is created that contains information on the status and results of the invocation.

Supported Calls

delte(), describeSObjects(), getDeleted(), getUpdated(), query(), undelete(), update()

Fields

<td><strong>Type</strong> textarea</td>
</tr>
</tbody>
</table>
**Field**

**Details**

**Properties**
Nillable, Update

**Description**
If there was an error invoking the function, this field contains the Function stack trace.

**Status**

**Type**
picklist

**Properties**
Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Status of the invoked Function. Functions that are invoked asynchronously can be in a queued *InProgress* state before they are invoked.

Possible values are:
- **Dispatched** - Not used for the Salesforce Functions beta.
- **Error** - The Function failed to execute due to either an error starting the Function, or an error while the Function was running.
- **FunctionInProgress** - The Function invocation has been sent to the Salesforce Functions compute environment, and is running.
- **InProgress** - The Function invocation request has been enqueued.
- **New** - The Function invocation request has been created, but not enqueued yet.
- **Success** - The Function has completed execution. For status on whether the callback has been called, see the CallbackStatus field.

The default value is 'New'.

**Usage**

Treat FunctionInvocationRequest records as read-only records used to get information about a specific Function invocation. To invoke Functions, use the Apex `functions.Function` class invoke methods.

FunctionInvocationRequest is not supported in Trialforce templates or org snapshots.

**FunctionReference**

Represents a deployed Salesforce Function associated with an org. This object is available in API version 52.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type textarea</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description The description of the Function.</td>
</tr>
<tr>
<td>FunctionName</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, idLookup, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description The developer name of the Function. This name is case sensitive and uses the format “project name-function name”. This field is unique within your organization.</td>
</tr>
<tr>
<td>Language</td>
<td>Type picklist</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description The language code for the Function, such as “en_US”.</td>
</tr>
<tr>
<td>MasterLabel</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description The master label for the Function.</td>
</tr>
</tbody>
</table>

Usage

Treat FunctionReference records as read-only records used to get information about a specific Function associated with your org. To invoke Functions, use the Apex functions.Function class invoke methods. To deploy and associate Functions with your org, use Salesforce CLI commands associated with Functions, as described in the Salesforce Functions developer documentation.

FunctionReference is not supported in Trialforce templates or org snapshots.
**GtwyProvPaymentMethodType**

The gateway provider payment method type allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 50.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Users can provide additional details about the gateway provider payment method type record. Supports a maximum of 1000 characters.</td>
</tr>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</td>
</tr>
<tr>
<td>GtwyProviderPaymentMethod</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>

**Note:** When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, Salesforce generates one for each record, which slows performance.
### Field: GtwyProvPaymentMethodType

<table>

</tr>
</tbody>
</table>
Usage

The Salesforce Order Management payment record must have a `ProcessorId` field with the same value as the payment gateway’s `ExternalReferenceId` field. The gateway provider payment method type record must have a `PaymentMethodType` field that looks up to the payment method that you want to associate to your payment. Finally, the payment gateway and gateway provider payment method type must have matching `PaymentGatewayProviderId` fields. When you’ve established these relationships, the payment record can infer your payment method from the gateway provider payment method type record.

Goal

The Goal object represents the components of a goal such as its name, description, and status.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Field Name

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
</table>

### Status

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The status of the goal.

Possible values:
- Draft
- Published
- Completed
- Canceled
- Not Completed

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **GoalFeed**
  Feed tracking is available for the object.

- **GoalHistory**
  History is available for tracked fields of the object.

- **GoalOwnerSharingRule**
  Sharing rules are available for the object.

- **GoalShare**
  Sharing is available for the object.

## GoalLink

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`
## Fields

<table>
<thead>

<td><strong>Description</strong> The ID of the subgoal.</td>
</tr>
</tbody>
</table>

### GoogleDoc

Represents a link to a Google Document. This object is available in API version 14.0 and later.

### Supported Calls

- create()
- delete()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- search()
- undelete()
- update()
- upsert()

### Special Access Rules

This object is available in **All Editions except Database.com** for Google Apps Premier Edition accounts. See the Salesforce online help for more information.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| Name  | **Type**  
string  
**Properties**  
Create, Filter, Group, Sort, Update  
**Description**  
The name of the Google document. |
| Owner | **Type**  
reference  
**Properties**  
Create, Defaulted on create, Filter, Nillable, Update  
**Description**  
The ID of the user who currently owns this Google Document. Default value is the user logged in to the API to perform the create. |
| ParentId | **Type**  
reference  
**Properties**  
Create, Filter  
**Description**  
Required. ID of the attachment’s parent object. The following objects are supported as parents of Google documents: Account, Asset, Campaign, Case, Contact, Contract, Custom Object Behavior, Lead, Opportunity, Product2, and Solution. |
| Url   | **Type**  
string  
**Properties**  
Create, Filter, Nillable, Update  
**Description**  
The URL of the Google document. |

### Group

A set of User records.

Groups are sets of users. They can contain individual users, other groups, the users in a particular role or territory, or the users in a particular role or territory plus all the users below that role or territory in the hierarchy.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), search(), retrieve(), update(), upsert()

Special Access Rules

As of Spring '20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DefaultDivision</strong></td>
<td>Type</td>
</tr>
<tr>

<td>This record’s default division. Only applicable if divisions are enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>DeveloperName</strong></th>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>The name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. This name is unique by group type and corresponds to Group Name in the user interface. This field is available in API version 24.0 and later.</td>
<td></td>
</tr>
</tbody>
</table>

| Note: | When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record. Only your Salesforce org’s internal users can access this field. |

</table>

| Type                | **Type** picklist                           |
|                     | **Properties** Create, Filter, Group, Restricted picklist, Sort |
|                     | **Description** Required. Type of the group. One of the following values: |
|                     | • AllCustomerPortal—Public group that includes all Customer Portal or Customer Community Plus users. This type is only available when a Customer Portal or a Customer Site is enabled for your org. |
|                     | • ChannelProgramGroup—Public group for partners in a channel program. |
|                     | • CollaborationGroup—Chatter group. |
|                     | • Manager—Public group that includes a user’s direct and indirect managers. This group is read-only. |
|                     | • ManagerAndSubordinatesInternal—Public group that includes a user and the user’s direct and indirect reports. This group is read-only. |
|                     | • Organization—Public group that includes all the User records in the organization. This group is read-only. |
|                     | • Participant—Compliant Data Sharing group that includes internal users who have the Use Compliant Data Sharing permission. A group can contain other |
participant groups only, or a group can contain both internal users with the Use Compliant Data Sharing permission and other participant groups. This value is only available when Compliant Data Sharing is enabled for your org.

- **PRMOrganization**—Public group that includes all the partners in an organization that has the partner site or portal feature enabled.
- **Queue**—Public group that includes all the User records that are members of a queue.
- **Regular**—Standard public group. When you create() a group, its type must be Regular, unless a partner site or portal is enabled for the organization, in which case the type can be Regular or PRMOrganization.
- **Role**—Public group that includes all the User records in a particular UserRole.
- **RoleAndSubordinates**—Public group that includes all the User records in a particular UserRole and all the User records in any subordinate UserRole.
- **RoleAndSubordinatesInternal**—Public group that includes all the User records in an internal UserRole, excluding customer and partner roles, and all the User records in any subordinate internal UserRole.
- **Territory**—Public group that includes all the User records in an organization that has the territory feature enabled.
- **TerritoryAndSubordinates**—Public group that includes all the User records in a particular UserRole and all the User records in any subordinate UserRole in an organization that has the territory feature enabled.

Only Personal, Regular, and Queue can be used when creating a group. The other values are reserved.

**Usage**

Unlike users, this object can be deleted.

Only public groups are accessible via the API. Personal groups are not available.

In API version 34.0 and later, you can query a group using Related.Name to retrieve the group’s name. Related.Name is supported for public groups, user roles, territories, manager groups, and user names.

In API version 13.0 and later, if you delete a public group, it is deleted even if it has been used in sharing, consistent with the behavior for UserRole. In versions before 13.0, such sharing prevents the record from being deleted.

**SEE ALSO:**
- GroupMember
- Object Basics

**GroupMember**

Represents a User or Group that is a member of a public group.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>

</tr>
<tr>
<td></td>
<td>Group</td>
</tr>
</tbody>
</table>

Usage

A record exists for every User or Group who is a direct member of a public group whose Type field is set to Regular. User records that are indirect members of Regular public groups are not listed as group members. A User can be an indirect member of a group if he or she is in a UserRole above the direct group member in the hierarchy, or if he or she is a member of a group that is included as a subgroup in that group.

If you attempt to create a record that matches an existing record, system simply returns the existing record.

</tbody>
</table>
HashtagDefinition

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

Important: Starting in Spring ’16, API access to HashtagDefinition is disabled across all API versions. Any integrations relying on API queries to this object stop working. You can continue to use hashtags in posts and comments, and the hashtags continue to create corresponding topics. We recommend that you redirect all API queries and reports using the HashtagDefinition object to use the Topic object instead. For more information, see Retiring the Legacy HashtagDefinition Object—FAQs.

Supported Calls

delte(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **HealthCareDiagnosisHistory**
  History is available for tracked fields of the object.

- **HealthCareDiagnosisOwnerSharingRule**
  Sharing rules are available for the object.

- **HealthCareDiagnosisShare**
  Sharing is available for the object.

**HealthCareProcedure**

Represents information related to industry-standard healthcare procedure codes.

**Supported Calls**

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Field Name

#### Description
The name of the code that displays in search and lookup fields. Salesforce recommends using the code along with the description to populate this field. For example, use `<Code>: <Description>` or `<Code>-<Description>` such as 95115: Allergy injection.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>OwnerId</td>
<td>Type    reference Properties Create, Defaulted on create, Filter, Group, Sort, Update Description The ID of the user who owns this record. This is a polymorphic relationship field. Relationship Name Owner Relationship Type Lookup Refers To Group, User</td>
</tr>
</tbody>
</table>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **HealthCareProcedureHistory**
  History is available for tracked fields of the object.

- **HealthCareProcedureOwnerSharingRule**
  Sharing rules are available for the object.

- **HealthCareProcedureShare**
  Sharing is available for the object.

### Holiday

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieval()`, `update()`, `upsert()`
Special Access Rules
Customer Portal users can't access this object.
All users, even those without the "View Setup and Configuration" user permission, can view holidays via the API.

Fields

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
Usage

Use this object to view and update holidays, which specify dates and times at which associated business hours and escalation rules are suspended.

IconDefinition

Represents the icon-related metadata for a custom tab. This object is available in API version 43.0 and later.

Supported Calls

describeSObjects(), query()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>

|                  | int |
| **Properties**   | Filter, Group, Nillable, Sort |
Idea

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Note: For other standard objects, the describeLayout() call returns the recordTypeMappings section that contains the layout ID and picklist values for each record type. However, the recordTypeMappings section and the fields it includes are not available for the Idea object.

When performing a SOSL search on Idea objects, IdeaComment objects are also searched.

<tr>
<td></td>
<td>Note: Unlike other fields of type double, you can’t use a SOQL aggregate function with this field.</td>
</tr>
<tr>
<td><strong>VoteTotal</strong></td>
<td>Type double</td>
</tr>
<tr>
<td></td>
<td>Properties Filter, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description An Idea’s total number of points. Each vote a user makes is worth ten points, therefore the value of this field is ten times the number of votes an idea has received.</td>
</tr>
<tr>
<td></td>
<td>Note: Unlike other fields of type double, you can’t use a SOQL aggregate function with this field.</td>
</tr>
</tbody>
</table>

Note: If you are importing Idea data and need to set the value for an audit field, such as CreatedDate, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

**Usage**

Use this object to track ideas, which are written suggestions on which users can vote and comment.

**SEE ALSO:**
- IdeaComment
- Vote

**IdeaComment**

Represents a comment that a user has submitted in response to an idea.
**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

⚠️ **Note:** When performing a SOSL search on IdeaComment objects, Idea objects are also searched.

<td></td>
</tr>
</tbody>
</table>

**Note:** If you import these records, and need to set the value for an audit field, such as CreatedDate, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.
Usage

Use this object to track comments on ideas, which are users' text responses to ideas.

SEE ALSO:
  - Idea
  - Vote

IdeaReputation

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

Supported Calls

query(), retrieve(),

1830
**UpVotesReceivedCount**

**Type**
int

**Properties**
Filter, Group, Nillable, Sort

**Description**
The number of up votes a user has received in a zone or the internal organization.

---

**UserId**

**Type**
reference

**Properties**
Filter, Group, Sort

**Description**
The user ID associated with the reputation.

---

**Usage**
Use to query a user’s reputation within a zone.

**IdeaReputationLevel**

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

**Supported Calls**
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextId</td>
<td></td>
</tr>
</tbody>
</table>

**Type**
reference

**Properties**
Create, Filter, Group, Namepointing, Sort, Update
## IdeaTheme

Represents an invitation to zone members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

### Supported Calls

- `create()`
- `delete()`
- `describeLayout()`
- `query()`
- `retrieve()`
- `search()`
- `undelete()`
- `update()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Categories</td>
<td>Type: multipicklist, Properties: Create, Filter, Nullable, Update</td>
</tr>
</tbody>
</table>

Usage

Use to create or edit reputation levels for an Ideas zone or internal organization.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Customizable multi-select picklist used to organize ideas and idea themes into logical groupings.</td>
</tr>
</tbody>
</table>
| **CommunityId** | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort,  
**Description** The zone ID associated with the idea theme. |
| **CurrencyIsoCode** | **Type** picklist  
**Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
**Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization. |
| **Description** | **Type** textarea  
**Properties** Create, Nillable, Update  
**Description** Description of the idea theme. |
| **EndDate**     | **Type** dateTime  
**Properties** Create, Filter, Nillable, Sort, Update  
**Description** Date marking the end of the idea theme. |
| **LastReferencedDate** | **Type** date  
**Properties** Filter, Nillable, Sort, Update  
**Description** The timestamp for when the current user last viewed a record related to this record. |
Usage

Use the object to track ideas that are submitted to an idea theme.

IdpEventLog

Represents the Identity Provider Event Log. This log records both problems and successes with inbound SAML or OpenID Connect authentication requests from another app provider. It also records outbound SAML responses when Salesforce is acting as an identity provider. This object is available in API version 39.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AppId</strong></td>
<td>Type: reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>The error code for the authentication issue. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• AppAccessDenied—Error: App access denied</td>
</tr>
<tr>
<td></td>
<td>• AppBlocked—Error: App blocked</td>
</tr>
<tr>
<td></td>
<td>• ClientUnapproved—Error: Invalid grant</td>
</tr>
<tr>
<td></td>
<td>• CodeExpired—Error: Expired authorization code</td>
</tr>
<tr>
<td></td>
<td>• ForceAuthNLogout—User logged out due to forced authentication request</td>
</tr>
<tr>
<td></td>
<td>• InternalError—Error: Internal Error</td>
</tr>
<tr>
<td></td>
<td>• InvalidAuthnRequest—Error: Unable to parse AuthnRequest from service provider</td>
</tr>
<tr>
<td></td>
<td>• InvalidClientCredentials—Error: Invalid client credentials</td>
</tr>
<tr>
<td></td>
<td>• InvalidCode—Error: Invalid authorization code</td>
</tr>
<tr>
<td></td>
<td>• InvalidDeviceId—Error: Invalid device ID</td>
</tr>
<tr>
<td></td>
<td>• InvalidIdpEndpoint—Error: Invalid Identity Provider Endpoint URL</td>
</tr>
<tr>
<td></td>
<td>• InvalidIssuer—Error: Invalid Issuer</td>
</tr>
<tr>
<td></td>
<td>• InvalidScope—Error: Invalid scope(s)</td>
</tr>
<tr>
<td></td>
<td>• InvalidSessionLevel—Error: Invalid session level</td>
</tr>
<tr>
<td></td>
<td>• InvalidSettings—Error: IdP certificate is invalid or does not exist</td>
</tr>
<tr>
<td></td>
<td>• InvalidSignature—Error: Invalid Signature</td>
</tr>
</tbody>
</table>
## Field Details

- **InvalidSp**—Error: Misconfigured or invalid service provider
- **InvalidSpokeSp**—Error: Invalid spoke SP settings
- **InvalidUserCredentials**—Error: Invalid user credentials
- **NoAccess**—Error: User does not have access to this service provider
- **NoCustomAttrValue**—Error: User does not have a value for the subject custom attribute
- **NoCustomField**—Error: Custom field not found
- **NoSpokeId**—Error: No Spoke ID found
- **NoSubdomain**—Error: Org has not configured My Domains yet
- **NoUserFedId**—Error: User does not have a Federation Identifier selected
- **OauthError**—OAuth Error
- **Success**
- **UnableToResolve**—Error: Unable to resolve request into a Service Provider
- **UnknownError**—Unknown Error

### IdentityUsed

**Type**
string

**Properties**
Filter, Nillable, Sort

**Description**
The identity (username) of the user being authenticated.

### InitiatedBy

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The code describing how the authentication request was initiated.

Possible values are:
- **IdP**—IdP-Initiated SAML
- **OauthAuthorize**—OAuth Authorization
- **OauthTokenExchange**—OAuth Token Exchange
- **SP**—SP-Initiated SAML

### OptionsHasLogoutUrl

**Type**
boolean

**Properties**
Filter
<table>
<thead>
<tr>

<tr>
<td></td>
<td>Description The ID of the user seeking authentication.</td>
</tr>
</tbody>
</table>

**IframeWhiteListUrl**

Represents a list of trusted external domains that you allow to frame your Embedded Service, Surveys, and Visualforce pages. This object is available in API version 45.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Context</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The type of content in the iframe.</td>
</tr>
<tr>
<td></td>
<td>Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• EmbeddedService—Available in API version 51.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• Surveys</td>
</tr>
<tr>
<td></td>
<td>• VisualforcePages</td>
</tr>
<tr>
<td><strong>Url</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique domain that is allowed to frame your Visualforce pages and surveys. Accepts these formats: example.com, *example.com, and <a href="http://example.com">http://example.com</a>.</td>
</tr>
</tbody>
</table>

Usage

To use this object for framing Visualforce pages, on Session Settings in Setup, select **Enable clickjack protection for customer Visualforce pages** either **with headers disabled** or **with standard headers**. These options both allow framing of Visualforce pages on trusted external domains and provide clickjack protection.

Alternatively, you can customize session settings via the SecuritySettings Metadata API type. To use the IframeWhiteListUrl object, set either the enableClickjackNonsetupUser or enableClickjackNonsetupUserHeaderless field to true. For more information, see **SecuritySettings** in the Metadata API Developer Guide.

Image

Represents the details of an image. This object is available in API version 47.0 and later.
## Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

- Open  
- ProblemCreated  
- Resolved  
The default value is 'New'. |
| **Subject** | **Type**  
string  
**Properties**  
Create, Filter, Group, Sort, Update  
**Description**  
A brief description of the incident. |
| **Urgency** | **Type**  
picklist  
**Properties**  
Create, Defaulted on create, Filter, Group, Sort, Update |
Details

**Description**

Represents a measure of how long the resolution can be delayed until an incident, problem, or change has a significant business impact.

Possible values are:

- High
- Low
- Medium

The default value is 'High'.

---

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **IncidentChangeEvent on page 3724**
  Change events are available for the object.
- **IncidentFeed on page 3697**
  Feed tracking is available for the object.
- **IncidentHistory on page 3709**
  History is available for tracked fields of the object.
- **IncidentOwnerSharingRule on page 3714**
  Sharing rules are available for the object.
- **IncidentShare on page 3719**
  Sharing is available for the object.

---

**Individual**

Represents a customer’s data privacy and protection preferences. Data privacy records based on the Individual object store your customers’ preferences. Data privacy records are associated with related leads, contacts, person accounts, and users. This object is available in API version 42.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), merge(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**

- This object is available if Data Protection and Privacy is enabled.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **IndividualChangeEvent (API version 47.0)**
  Change events are available for the object.

- **IndividualHistory**
  History is available for tracked fields of the object.

- **IndividualShare**
  Sharing is available for the object.

IndividualHistory

Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

- This object is available if Data Protection and Privacy is enabled.
- The Individual object isn’t available to Customer Community, Partner Community, and Customer Portal users.

</tbody>
</table>
**Usage**

Use this object to identify changes to data privacy records.
This object respects field-level security on the parent object.

**IndividualShare**

Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access
to a record because you own it, the IndividualAccessLevel is *All* and RowCause is Owner. This object is available in API
version 42.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

- This object is available if Data Protection and Privacy is enabled.
- The Individual object isn’t available to Customer Community, Partner Community, and Customer Portal users.

**Fields**

<table>
<thead>
<tr>

</tbody>
</table>

**RowCause**

| **Type** | picklist |
| **Properties** | Create, Filter, Group, Nillable, Restricted picklist, Sort |

**Description**

Reason that this sharing entry exists. Write to this field when its value is omitted or set to Manual (default). We give you some of the many possible values, including:

- Manual—The User or Group has access because a user with “All” access manually shared the data privacy record with them.
- Owner—The User is the owner of the data privacy record.
- Rule—The User or Group has access to the data privacy record via an Individual sharing rule.
- LpuImplicit—The User has access to records owned by high-volume Experience Cloud site users via a share group.

**UserOrGroupId**

| **Type** | reference |
| **Properties** | Create, Filter, Group, Sort |

**Description**

ID of the User or Group that has been given access to the data privacy record. This field isn’t available for updates. This is a polymorphic relationship field.

**Relationship Name**

UserOrGroup

**Relationship Type**

Lookup

**Refers To**

Group, User
Usage
This object lets you determine which users and groups can view or edit Individual records owned by other users.

InternalOrganizationUnit
Represents an organization that an Employee belongs to. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

## Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OrganizationCode</strong></td>
<td>The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.</td>
</tr>
<tr>
<td><strong>OrganizationName</strong></td>
<td>The name of the organization the Employee is working in.</td>
</tr>
<tr>
<td><strong>OwnerId</strong></td>
<td>The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.</td>
</tr>
<tr>
<td><strong>ParentOrganizationId</strong></td>
<td>A reference to the parent organization.</td>
</tr>
</tbody>
</table>

### OrganizationCode

- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: Required. The code of the organization the Employee is working in.

### OrganizationName

- **Type**: string
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The name of the organization the Employee is working in.

### OwnerId

- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The ID of the user who currently owns this record. Default value is the user logged in to the API to perform the create operation.

### ParentOrganizationId

- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: A reference to the parent organization.

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **InternalOrganizationUnitHistory (API version 49.0)**
  History is available for tracked fields of the object.

- **InternalOrganizationUnitOwnerSharingRule**
  Sharing rules are available for the object.
Invoice

Represents a financial document describing the total amount a buyer must pay for goods or services provided. This object is available in API version 48.0 and later.

Users can edit non-posted invoices. Posted invoices can’t be deleted. Once an invoice is posted, users can make payments against it to reduce its balance.

Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update()
<table>

| **Description**       | **Type**: string  
                         **Properties**: Filter, Group, Nillable, Sort, Update  
                         **Description**: Users can add more information about this invoice. Maximum of 1000 characters. |
| **DocumentNumber**    | **Type**: string  
                         **Properties**: Autonumber, Defaulted on create, Filter, idLookup, Sort  
                         **Description**: System-generated number that is used to organize financial documents. Can be sequential or random. |
| **DueDate**           | **Type**: date  
                         **Properties**: Filter, Group, Sort, Update |
### Field

#### Description

The customer must pay the invoice by the due date. Unpaid invoices past the due date may be sent to collections.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| InvoiceDate        | **Type**
|                    | date
| **Properties**     | Filter, Group, Sort, Update
| **Description**    | The date that the invoice was posted. Used with payment terms to determine the invoice's DueDate. For example, an invoice with an InvoiceDate of 04/01 and Net 30 payment terms would have a DueDate of 05/01. |
| InvoiceNumber      | **Type**
|                    | string
| **Properties**     | Filter, Group, Nillable, Sort, Update
| **Description**    | System-created unique ID for this invoice.                                                                                               |

### InvoiceLine

Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 48.0 and later.

#### Supported Calls

- `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

#### Special Access Rules

To access these entities, your org must have a Salesforce Order Management license. These entities are available only in Lightning Experience.

JobProfile

Represents a job profile used for shift scheduling. This object is available in API versions 47.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled in your org.

Fields

<table>
<thead>
<tr>

</table>
JobProfileQueueGroup

JobProfileQueueGroup defines the mapping between Queue and JobProfile, and configurations for Omni-Channel Planning. This object is available in API version 53.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Org must have the Workforce Engagement, Workforce Engagement Configuration, and Omni org preferences enabled. User must have the Workforce Engagement Analyst or Planner user permission set.

</table>

---

Knowledge__Feed

Represents the feed for a knowledge article. This object is available in API version 39.0 and later.

For additional information about feeds, see FeedItem on page 1636.
Note: By default, the prefix for this object name is Knowledge and that is the value shown in this reference. However, this prefix can be modified by changing the Object Name for the Knowledge__kav object in Object Manager.

Supported Calls

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

Lightning Knowledge must be enabled in your org.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BestCommentId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>
<td>Properties Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The ID of the comment marked</td>
</tr>
<tr>
<td></td>
<td>as best answer on a question post.</td>
</tr>
<tr>
<td>Body</td>
<td>Type textarea</td>
</tr>
<tr>
<td></td>
<td>Properties Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The body of the feed item.</td>
</tr>
<tr>
<td></td>
<td>Required when Type is TextPost or</td>
</tr>
<tr>
<td></td>
<td>AdvancedTextPost. Optional when Type is</td>
</tr>
<tr>
<td></td>
<td>ContentPost or LinkPost.</td>
</tr>
<tr>
<td></td>
<td>Although a value for Body is not required</td>
</tr>
<tr>
<td></td>
<td>for the ContentPost type, an attachment</td>
</tr>
<tr>
<td></td>
<td>is required. If an attachment isn’t present,</td>
</tr>
<tr>
<td></td>
<td>the type changes to TextPost or</td>
</tr>
<tr>
<td></td>
<td>AdvancedTextPost, depending on the API</td>
</tr>
<tr>
<td></td>
<td>version. TextPost and AdvancedTextPost do</td>
</tr>
<tr>
<td></td>
<td>require a value for Body.</td>
</tr>
<tr>
<td></td>
<td>Tip: See the IsRichText field for a list of</td>
</tr>
<tr>
<td></td>
<td>HTML tags supported in the body of rich</td>
</tr>
<tr>
<td></td>
<td>text posts.</td>
</tr>
<tr>
<td>CommentCount</td>
<td>Type int</td>
</tr>
<tr>
<td></td>
<td>Properties Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description The number of comments</td>
</tr>
<tr>
<td></td>
<td>associated with this feed item.</td>
</tr>
</tbody>
</table>
**Tip:** In a feed that supports pre-moderation, CommentCount isn't updated until a comment is published. For example, say that you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, comments aren't counted until approved by an admin or someone with Can Approve Feed Post and Comment or Modify All Data.

Feed moderation has implications on how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through CommentCount, go through pagination until the end of comments is returned.

<table>
<thead>
<tr>
<th><strong>InsertedById</strong></th>
<th><strong>Type</strong></th>
<th>reference</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td></td>
<td>Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the InsertedBy value is set to the ID of the context user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>IsRichText</strong></th>
<th><strong>Type</strong></th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td></td>
<td>Indicates whether the feed item Body contains rich text. If you post a rich text feed comment using SOAP API, set IsRichText to true and escape HTML entities from the body. Otherwise, the post is rendered as plain text.</td>
</tr>
</tbody>
</table>

Rich text supports the following HTML tags:

- `<p>`

  **Tip:** Though the `<br>` tag isn't supported, you can use `<p>&nbsp;</p>` to create lines.

- `<a>`
- `<b>`
- `<code>`
- `<i>`
- `<u>`
- `<s>`
- `<ul>`
- `<ol>`
- `<li>`
The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`.

**Note:** In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| LikeCount          | Type int  
Properties Filter, Group, Sort  
Description The number of likes associated with this feed item. |
| LinkUrl            | Type url  
Properties Nillable, Sort  
Description The URL of a LinkPost. |
| ParentId           | Type reference  
Properties Filter, Group, Sort  
Description ID of the Knowledge article to which the feed item is related. |
| RelatedRecordId    | Type reference  
Properties Group, Nillable, Sort  
Description ID of the ContentVersion record associated with a ContentPost. For WDC thanks posts, it’s the ID of the WorkThanks object associated with a RypplePost. This field is typically null for all posts except ContentPost and RypplePost.  
For example, set this field to an existing ContentVersion ID and post it to a feed with Type set to ContentPost. |
| Title              | Type string |
Field | Details
--- | ---
Properties | Group, Nillable, Sort
Description | The title of the feed item. When the **Type** is **LinkPost**, the **LinkUrl** is the URL and this field is the link name. The **Title** field can be updated on posts of **Type** **QuestionPost**.

**Type**

**picklist**

**Properties** | Filter, Group, Nillable, Restricted picklist, Sort
**Description** | The type of feed item. Except for **ContentPost**, **LinkPost**, and **TextPost**, don’t create feed items of other types directly from the API.

- **ActivityEvent**—indirectly generated event when a user or the API adds a **Task** associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a **Task** or **Event** associated with a case record (excluding email and call logging).

  For a recurring **Task** with **CaseFeed** disabled, one event is generated for the series only. For a recurring **Task** with **CaseFeed** enabled, events are generated for the series and each occurrence.

- **AdvancedTextPost**—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.

- **AnnouncementPost**—Not used.

- **ApprovalPost**—generated when a user submits an approval.

- **BasicTemplateFeedItem**—Not used.

- **CanvasPost**—a post made by a canvas app posted on a feed.

- **CollaborationGroupCreated**—generated when a user creates a public group.

- **CollaborationGroupUnarchived**—Not used.

- **ContentPost**—a post with an attached file.

- **CreatedRecordEvent**—generated when a user creates a record from the publisher.

- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.

- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.

- **LinkPost**—a post with an attached URL.

- **PollPost**—a poll posted on a feed.

- **ProfileSkillPost**—generated when a skill is added to a user’s Chatter profile.

- **QuestionPost**—generated when a user posts a question.

- **ReplyPost**—generated when Chatter Answers posts a reply.
### Knowledge__ka

Provides access to the concrete object that represents a Knowledge article, the parent object for article versions. This object is available in API version 39.0 and later.

Note: By default, the prefix for this object name is `Knowledge` and that is the value shown in this reference. However, this prefix can be modified by changing the **Object Name** for the Knowledge__kav object in Object Manager.

This object is derived from KnowledgeArticle on page 1888.

#### Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `undelete()`

#### Special Access Rules

Lightning Knowledge must be enabled in your org. A user must have the View Articles permission enabled. Salesforce Knowledge users, unlike customer and partner users, must also be granted the Knowledge User feature license.

|                  | **Description**
|                  | Required. Represents the article's URL. Can contain alphanumeric characters and hyphens but can't begin or end with a hyphen. This value should be unique regardless of context. (For example, a unique value allows you to get expected results when running an Apex test with SeeAllData set to false.) UrlName is case-sensitive and its maximum size is 255 characters. |
### Knowledge__DataCategorySelection

Represents a data category that classifies an article. This object is available in API version 39.0 and later.

**Note:** By default, the prefix for this object name is `Knowledge` and that is the value shown in this reference. However, this prefix can be modified by changing the **Object Name** for the Knowledge__kav object in Object Manager.

#### Supported Calls

- `create()`
- `delete()`
- `describeSObjects()`
- `getDeleted()`
- `getUpdated()`
- `query()`
- `retrieve()`

#### Special Access Rules

Lightning Knowledge must be enabled in your org.

Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use this object to query and manage article categorization in your organization. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

Note: When using this object to classify an article, you can’t select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

KnowledgeableUser

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<tr>
<td><strong>UserId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
</tbody>
</table>

### KnowledgeArticle

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later. Unlike KnowledgeArticleVersion, the ID of a KnowledgeArticle record is identical irrespective of the article’s version (status). Knowledge__ka on page 1875 is derived from this object.

### Supported Calls

describeSObjects(), query(), retrieve()
## Special Access Rules

Knowledge must be enabled in your org. A user must have the View Articles permission enabled. Salesforce Knowledge users, unlike customer and partner users, must also be granted the Knowledge User feature license.

## Fields

<table>
<thead>
<tr>

<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Filter, Group, Nillable, Sort&lt;br&gt;<strong>Description</strong> The ID for the corresponding pre- or post-migration article. Contains values only in orgs that migrate from Knowledge in Salesforce Classic to Lightning Knowledge. This field is available in API version 45.0 and later.</td>
</tr>
</tbody>
</table>
### KnowledgeArticleVersion

Provides a global view of standard article fields across all types of articles depending on their version. This object is available in API version 18.0 and later.

Use this object to:

- Query or search generically across multiple types of articles.
- Filter on a specific version.
- Update standard fields, those fields that are updateable, in draft versions.

When you query on the archived article, the results include both the article and the article's archived versions.

Knowledge__kav on page 1878 is derived from this object.

#### Supported Calls

describeLayout(), describeSObjects(), query(), retrieve(), search()
### Note:
- You can only update draft versions.
- You can’t update draft translations with the knowledgeManagement REST API.
- For Lightning Knowledge, to create, update, or delete a Knowledge article version, use the call on Knowledge__kav. For example, to delete, use Knowledge__kav.delete().
- For Knowledge in Salesforce Classic, to create, update, or delete a Knowledge article version, use the call on ArticleType__kav, where ArticleType is the name of the article’s type. For example, to delete, use ArticleType__kav.delete().

### Special Access Rules
Knowledge must be enabled in your org. A user must have the View Articles permission enabled. Salesforce Knowledge users, unlike customer and partner users, must also be granted the Knowledge User feature license.

</thead>
</table>
| **TranslationExportedDate** | **Type**  
    dateTime  
  **Properties**  
    Filter, Nillable, Sort  
  **Description**  
    Date and time when the article was last exported for translation. Only accessible if your knowledge base supports multiple languages. |
| **TranslationImportedDate** | **Type**  
    dateTime  
  **Properties**  
    Filter, Nillable, Sort  
  **Description**  
    Date and time when the article was last imported for translation. Only accessible if your knowledge base supports multiple languages. |
| **UrlName**           | **Type**  
    string  
  **Properties**  
    Filter, Group, idLookup, Sort  
  **Description**  
    Required. Represents the article's URL. Can contain alphanumeric characters and hyphens but can't begin or end with a hyphen. This value should be unique regardless of context. (For example, a unique value allows you to get expected results when running an Apex test with SeeAllData set to false.) UrlName is case-sensitive and its maximum size is 255 characters. |
| **ValidationStatus**  | **Type**  
    picklist  
  **Properties**  
    Defaulted on create, Filter, Group  
  **Description**  
    Shows whether the content of the article has been validated. Possible values are Validated and Not Validated. The default value is Not Validated. This field is available in API version 24.0 or later. |
| **VersionNumber**     | **Type**  
    int  
  **Details**  
    1899
**Field Name**

<table>

</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>The number assigned to a version of an article. This field is available in API version 24.0 and later.</td>
</tr>
</tbody>
</table>

**Usage**

Use this object to query, retrieve, or search for articles across all types of articles depending on their version. You can update draft master articles. Also, you can delete articles that aren’t drafts. Client applications can use KnowledgeArticleVersion with describeDataCategoryGroups() and describeDataCategoryGroupStructures() to return the category groups and the category structure associated with Salesforce Knowledge.

To access an article independent of its version, use the KnowledgeArticle object.

In Lightning Knowledge, the type of article is determined by the RecordType field on the concrete derived object (for example, Knowledge__kav on page 1878). For Knowledge in Salesforce Classic, the type of article is determined by the ArticleType field and the concrete derived object uses the prefix of the article type name (for example, FAQ__kav for the FAQ article type).

**SOQL Samples**

The following SOQL clause uses KnowledgeArticleVersion to query all published articles from all articles complying with the classification specified in the WITH DATA CATEGORY clause:

```sql
SELECT Title, Summary
FROM KnowledgeArticleVersion
WHERE PublishStatus='Online'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c ABOVE OR BELOW europe__c AND Product__c BELOW All__c
```

The following SOQL clause for Lightning Knowledge uses the Offer record type to limit the query to all draft articles:

```sql
SELECT Id, Title
FROM Knowledge__kav
WHERE PublishStatus='Draft'
AND Language = 'en_US'
AND RecordTypeId = '<specify RecordTypeId for Offer here>'
WITH DATA CATEGORY Geography__c AT (france__c,usa__c) AND Product__c ABOVE dsl__c
```

The following SOQL clause for Salesforce Classic uses the Offer article type to limit the query to all draft articles:

```sql
SELECT Id, Title
FROM Offer__kav
WHERE PublishStatus='Draft'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c AT (france__c,usa__c) AND Product__c ABOVE dsl__c
```

The following SOQL clause uses KnowledgeArticleVersion to query the IDs of all archived versions of a particular article:

```sql
SELECT Id
FROM KnowledgeArticleVersion
```
WHERE PublishStatus='Archived'
AND IsLatestVersion=false
AND KnowledgeArticleId='kA1D00000001PQ6KAM'

SOQL and SOSL with KnowledgeArticleVersion

- Filter on a single value of PublishStatus for best results. To find all versions of each article, omit the PublishStatus filter, but do filter on one or more primary key IDs. To retrieve all archived versions for a given article, specify a SOQL filter where IsLatestVersion is false.
- In API version 46.0 and earlier, queries without a filter on PublishStatus return published articles by default. In API version 47.0 and later, draft, published, and archived articles are returned when Lightning Knowledge is enabled.
- To support security, only users with the “View Draft Articles” permission see articles whose PublishStatus value is Draft. Similarly, only users with the “View Archived Articles” permission see articles whose PublishStatus value is Archived.
- Archived article versions are stored in the Knowledge__kav object. To query archived article versions, specify the article Id and set IsLatestVersion='0'.
- You can’t use binding variables in Apex SOQL statements with KnowledgeArticleVersion objects. For example, the following SOQL statement causes a compilation error.

```java
final String PUBLISH_STATUS_ONLINE = 'Online';
List<Knowledge__kav> articles = [
    SELECT Id FROM Knowledge__kav
    WHERE PublishStatus = :PUBLISH_STATUS_ONLINE
];
```

Instead, use dynamic SOQL as follows. See Dynamic SOQL in Apex Developer Guide.

```java
final String PUBLISH_STATUS_ONLINE = 'Online';
final String q = 'SELECT Id, PublishStatus FROM Knowledge__kav
    WHERE PublishStatus = :PUBLISH_STATUS_ONLINE';
List<Knowledge__kav> articles = Database.query(q);
```

Other Usage for SOQL and SOSL with KnowledgeArticleVersion

To expose the migrated_to_from_id on KnowledgeArticle and KnowledgeArticleVersion to the sObject API: expose MigratedToFromArticleVersion in KnowledgeArticleVersion.

- For SOQL:
  - To filter by MigratedToFromArticleVersion, remove any other filters.
  - When filtering by MigratedToFromArticleVersion, use the ‘=’ or ‘IN’ operator.
  - When filtering by MigratedToFromArticleVersion, the value can’t be null or empty.
- SOSL doesn’t support MigratedToFromArticleVersion.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
KnowledgeArticleVersionHistory

History is available for tracked fields of the object.

SEE ALSO:

Knowledge
KnowledgeArticle
KnowledgeArticleViewStat
KnowledgeArticleVoteStat

KnowledgeArticleVersionHistory

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later. Knowledge__VersionHistory is derived from this object. To access this derived object, turn on field history tracking for Knowledge objects.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

Knowledge must be enabled in your org. This object respects field, entity, and record-level security. You must have at least “Read” permission on the article type or the field to access its history. For data category security, Salesforce determines access based on the categorization of the online version of an article. If there is no online version, then security is applied based on the archived version, followed by the security of the draft version.

| VersionNumber        | **Type**
|                      | int                                                                     |
|                      | **Properties**
|                      | Filter, Group, Sort                                                    |
|                      | **Description**
|                      | The number assigned to a version of an article. This field is available in API version 24.0 and later. |

## Usage

Use this object to query events in the history of an article. For example, you can retrieve the number of edits a particular user has made to an article, how many times the article has been published, and so on.

## KnowledgeArticleViewStat

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20.0 and later.

Knowledge__ViewStat is derived from this object.

## Supported Calls

describeSObjects(), query(), retrieve()

## Special Access Rules

Knowledge must be enabled in your org. Users must have access to the published version of an article to retrieve its views. For more information on published article version, see the PublishStatus field in KnowledgeArticleVersion.
# Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Channel**    | Type: picklist  
                 Properties: Filter, Group, Restricted picklist, Sort  
 **Description**  
 The channel where the article is viewed:  
 - `AllChannels` for article views across all channels.  
 - `App` for the internal Salesforce Knowledge application.  
 - `Pkb` for article views in public knowledge base.  
 - `Csp` for Customer Portal.  
 - `Pm` for article view in partner portal. |
| **NormalizedScore** | Type: double  
 **Properties**: Filter, Nullable, Sort  
 **Description**  
 Article's weighted views in the selected channel. The article with most views has a score of 100. Other article views are then calculated relative to this highest view score. For example, if the best read article has 2000 views and another has 1000. The first one gets a score of 100 while the second gets 50. |
| **ParentId**   | Type: reference  
 **Properties**: Filter, Group, Sort  
 **Description**  
 ID of the viewed article. This corresponds to a KnowledgeArticle record. |
| **ViewCount**  | Type: int  
 **Properties**: Filter, Group, Sort  
 **Description**  
 The number of unique views an article has received in the selected channel. An article with a high number of views may not always have a high normalized score. The normalized score for an article is calculated based on views over time, with more recent views earning a higher score. This field is available in API version 27.0 and later. |
Usage

Use this object to query or retrieve statistics for article views.

Alternatively, client applications can use the article type API Name followed by __ViewStat to query or retrieve most viewed articles from a specific article type.

SOQL Samples

The following SOQL clause uses KnowledgeArticleViewStat to query all the article views in Salesforce Knowledge and return the related articles:

```
SELECT Id, NormalizedScore, Parent.Id
FROM KnowledgeArticleViewStat where Channel = 'App'
ORDER BY NormalizedScore
```

Use the following clause to restrict your query to Offer articles for the Offer article type:

```
SELECT Id, NormalizedScore, Parent.Id
FROM Offer__ViewStat where Channel = 'App'
ORDER BY NormalizedScore
```

SEE ALSO:

- Knowledge
- KnowledgeArticle
- KnowledgeArticleVersion
- KnowledgeArticleVoteStat

KnowledgeArticleVoteStat

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20.0 and later.

Knowledge__VoteStat is derived from this object.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

Knowledge must be enabled in your org. Users must have access to the published version of an article to retrieve its votes. For more information on published article version, see the PublishStatus field in KnowledgeArticleVersion.

LandingPage

Represents a Pardot landing page. A landing page is a web page that a visitor reaches after clicking a link or advertisement. Landing pages can be created in Pardot Classic and synced to Salesforce or created on the core object in Pardot Lightning App. This object is available in API version 42.0 and later.

Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()

Special Access Rules

To access this object, your org must use Pardot and users need the CRM User or Sales User permission set. To create, update, or delete a builder landing page, the Use Pardot Content Experience permission set is required.

### Field Details

**Description**  
The Data Universal Numbering System (D-U-N-S) number, which is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. Industries and companies use D-U-N-S numbers as a global standard for business identification and tracking. Maximum size is 9 characters.

**Note:** This field is only available to organizations that use Data.com Prospector or Data.com Clean.

</tbody>
</table>

**Note:** If you import lead data and need to set the value for an audit field, such as CreatedDate, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.
Converted Leads

Leads have a special state to indicate that they have been converted into an account, a contact, and an opportunity. Your client application can convert leads via the `convertLead()` call. Users can also convert leads in Salesforce. After a lead has been converted, it's read-only. However, you can query converted lead records. Only users with the View and Edit Converted Leads permission can update converted lead records.

Leads have several fields that indicate their converted status. These special fields are set when converting the lead in the user interface.

- ConvertedAccountId
- ConvertedContactId
- ConvertedDate
- ConvertedOpportunityId
- IsConverted
- Status

Note: If person account record types have been enabled, and if the value of Company is null, the lead converts to a person account.

Unread Leads

Leads have a special state to indicate that they have not been viewed or edited by the lead owner. In Salesforce, this is helpful for users to know which leads have been assigned to them but which they have not touched yet. `IsUnreadByOwner` is true if the lead owner has not yet viewed or edited the lead, and false if the lead owner has viewed or edited the lead at least one time.

Lead Status Picklist

Each `Status` value corresponds to either a converted or unconverted status in the lead status picklist, as defined in the user interface. To obtain the lead status values in the picklist, a client application can query LeadStatus.

You can’t convert a lead via the API by changing `Status` to one of the converted lead status values. When you convert qualified leads into an account, contact, and opportunity, you can select one of the converted status types for the lead. Leads with a converted status type are no longer available in the Leads tab, although you can include them in reports.

Usage

To update a lead or to convert one with `convertLead()`, log in to your client application with the “Edit” permission on leads.

When you create, update, or upsert a lead, your client application can have the lead assigned to multiple user records based on assignment rules that have been configured in Salesforce.

To use this feature, your client application needs to set either of the following options (but not both) in the AssignmentRuleHeader used in create or update:

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>assignmentRuleId</td>
<td>reference</td>
<td>ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is true, then the default assignment rule is used. To find the ID for a given assignment rule, query the AssignmentRule object (specifying <code>RuleType=&quot;leadAssignment&quot;</code>), iterate through the returned</td>
</tr>
</tbody>
</table>
AssignmentRule records, find the one you want to use, retrieve its ID, and then specify its ID in this field in the AssignmentRuleHeader.

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>useDefaultRule</td>
<td>boolean</td>
<td>Specifies whether to use the default rule for rule-based assignment (true) or not (false). Default rules are assigned in the user interface.</td>
</tr>
</tbody>
</table>

**Java Sample**

The following Java sample shows how to automatically assign a newly created lead.

```java
package wsc;

import com.sforce.soap.enterprise.Connector;

import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;
import com.sforce.soap.enterprise.sobject.Lead;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.sobject.SObject;

public class LeadAssignment {

    static final String USERNAME = "REPLACE USER NAME";
    static final String PASSWORD = "REPLACE PASSWORD";
    static EnterpriseConnection connection;

    static LeadAssignment _leadAssignment;

    // Main
    public static void main(String[] args) {
        // Establish connection and login
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(USERNAME);
        config.setPassword(PASSWORD);
        try {
            connection = Connector.newConnection(config);
            System.out.println("Logged in, endpoint: " + config.getAuthEndpoint());
        } catch (ConnectionException e1) {
            e1.printStackTrace();
        }

        // Create lead
        _leadAssignment = new LeadAssignment();
        try {
            _leadAssignment.CreateLead();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}
```
try {
    connection.logout();
    System.out.println("Logged out");
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

public void CreateLead() throws ConnectionException {
    // Create a new Lead and assign various properties
    Lead lead = new Lead();

    lead.setFirstName("Joe");
    lead.setLastName("Smith");
    lead.setCompany("ABC Corporation");
    lead.setLeadSource("API");
    // The lead assignment rule will assign any new leads that
    // have "API" as the LeadSource to a particular user

    // In this sample we will look for a particular rule and if found
    // use the id for the lead assignment. If it is not found we will
    // instruct the call to use the current default rule. You can't use
    // both of these values together.
    QueryResult qr = connection.query("SELECT Id FROM AssignmentRule WHERE Name = " +
                                        "'Mass Mail Campaign' AND SobjectType = 'Lead'");
    if (qr.getSize() == 0) {
        connection.setAssignmentRuleHeader(null, true);
    } else {
        connection.setAssignmentRuleHeader(qr.getRecords()[0].getId(), false);
    }

    // Every operation that results in a new or updated lead will
    // use the specified rule until the header is removed from the
    // connection.
    SaveResult[] sr = connection.create(new SObject[] {lead});
    for (int i=0;i<sr.length;i++) {
        if (sr[i].isSuccess()) {
            System.out.println("Successfully created lead with id of: " +
                                sr[i].getId() + ".");
        } else {
            System.out.println("Error creating lead: " +
                                sr[i].getErrors()[0].getMessage());
        }
    }

    // This call effectively removes the header, the next lead will
    // be assigned to the default lead owner.
    connection.clearAssignmentRuleHeader();
}
The following C# sample shows how to automatically assign a newly created lead.

```csharp
using System;

LeadCleanInfo

Stores the metadata Data.com Clean uses to determine a lead record’s clean status. Helps you automate the cleaning or related processing of lead records.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Lead Clean Info provides a snapshot of the data in your Salesforce lead record and its matched Data.com record at the time the Salesforce record was cleaned.

Lead Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field IsDifferent has an IsDifferentTitle field. If the IsDifferentTitle field’s value is False, that means the Title field value is the same on the Salesforce lead record and its matched Data.com record.

LeadCleanInfo bit vector fields include:

- **CleanedBy** indicates who (a user) or what (a Clean job) cleaned the lead record.
- **IsDifferent** indicates whether or not a field on the lead record has a value that differs from the corresponding field on the matched Data.com record.
- **IsFlaggedWrong** indicates whether or not a field on the lead record has a value that is flagged as wrong to Data.com.
- **IsReviewed** indicates whether or not a field on the lead record is in a Reviewed state, which means that the value was reviewed but not accepted.

Their individual bits are defined here

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()

</tbody>
</table>
**Usage**

Developers can create triggers that read the Lead Clean Info fields to help automate the cleaning or related processing of lead records.

---

**LeadOwnerSharingRule**

Represents the rules for sharing a lead with users other than the owner.

**Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The [SharingRules](https://developer.salesforce.com/docs/atlas.en-us.api.meta/api/), Metadata API type is enabled for all orgs.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td><strong>Type</strong> textarea&lt;br&gt;<strong>Properties</strong> Create, Filter, Nillable, Sort&lt;br&gt;<strong>Description</strong> A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</td>
</tr>
</tbody>
</table>
### LeadOwnerSharingRule

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later. <strong>Note:</strong> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
<tr>
<td>GroupId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The ID representing the source group. Leads owned by users in the source group trigger the rule to give access.</td>
</tr>
<tr>
<td>LeadAccessLevel</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Restricted picklist, Sort, Update</td>

</tbody>
</table>
| Description         | A value that represents the type of sharing being allowed. The possible values are:  
|                     |  - Read  
|                     |  - Edit  |
| Name                | Type: string             |
|                     | Properties: Create, Filter, Group, Sort, Update |
| Description         | Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface. |
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserOrGroupId</td>
<td></td>
</tr>
</tbody>
</table>

**Type**

- reference

**Properties**

- Create, Filter, Group, Sort

**Description**

The ID representing the target user or group. The target user or group is being given access.

---

#### Usage

Use these objects to manage the sharing rules for leads. General sharing and Territory-related sharing use this object.

- **Note:** The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer ’21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

**SEE ALSO:**

- Lead
- LeadShare

---

### LeadShare

Represents a sharing entry on a Lead.

**Supported Calls**

- create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

As of Summer ’20 and later, only users with access to the Lead object can access this object.

**Fields**

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Details

Description
Reason that this sharing entry exists. You can only write a value in this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Values include:
- Manual—The User or Group has access because a user with "All" access manually shared the Lead with them.
- Owner—The User is the owner of the Lead.
- Rule—The User or Group has access via a Lead sharing rule.
- GuestRule—The User or Group has access via a Lead guest user sharing rule.
- LpuImplicit—The User has access to records owned by high-volume Experience Cloud site users via a share group.
- ARImplicit—The User, who belongs to a partner or customer account, has access to the Lead via an account relationship data sharing rule.

Field | Details
--- | ---
UserOrGroupId | Type
reference | Properties
Create, Filter, Group, Sort | Description
ID of the User or Group that has been given access to the Lead. This field can't be updated. This is a polymorphic relationship field.

Relationship Name
UserOrGroup | Relationship Type
Lookup | Refers To
Group, User

Usage
This object allows you to determine which users and groups can view or edit leads owned by other users. If you attempt to create a record that matches an existing record, the existing record is returned.

SEE ALSO:
- AccountShare
- Case
- CaseShare
- OpportunityShare
LeadStatus

Represents the status of a Lead, such as Open, Qualified, or Converted.

⚠️ Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls
describeSObjects(), query(), retrieve()

Details

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>SortOrder</td>
<td><strong>Type</strong>&lt;br&gt;int&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Filter, Group, Nillable, Sort&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;Number used to sort this value in the lead status picklist. These numbers are not guaranteed to be sequential, as some previous lead status values might have been deleted.</td>
</tr>
</tbody>
</table>

**Usage**

This object represents a value in the lead status picklist (see Lead Status Picklist). The lead status picklist provides additional information about the status of a Lead, such as whether a given status value represents a converted Lead. Query this object to retrieve the set of values in the lead status picklist, and then use that information while processing Lead objects to determine more information about a given lead. For example, the application could test whether a given lead is converted based on its Status value and the value of the IsConverted property in the associated LeadStatus record.

SEE ALSO:

LeadOwnerSharingRule
LeadShare

**LeadTag**

Associates a word or short phrase with a Lead.

**Supported Calls**

create(), delete(), describesObjects(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td><strong>Type</strong>&lt;br&gt;reference&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Create, Filter&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong>&lt;br&gt;string</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>-----------------</td>
<td>----------------------------------------------</td>
</tr>
<tr>
<td>Create, Filter</td>
<td></td>
</tr>
</tbody>
</table>

**Description**

Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.

<table>
<thead>
<tr>
<th>TagDefinitionId</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>reference</td>
<td>Filter</td>
<td>ID of the parent TagDefinition object that owns the tag.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>picklist</td>
<td>Create, Filter, Restricted picklist</td>
<td>Defines the visibility of a tag.</td>
</tr>
</tbody>
</table>

**Usage**

LeadTag stores the relationship between its parent TagDefinition and the Lead being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**LegalEntity**

Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 48.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Field Details

**Name**

- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: The name of the legal entity.

**OwnerId**

- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The ID of the record owner.

**Status**

- **Type**: picklist
- **Properties**: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update
- **Description**: The status of the legal entity.
  - Possible values are:
    - Active
    - Inactive

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **LegalEntityFeed**
  - Feed tracking is available for the object.

- **LegalEntityHistory**
  - History is available for tracked fields of the object.

- **LegalEntityOwnerSharingRule**
  - Sharing rules are available for the object.

- **LegalEntityShare**
  - Sharing is available for the object.

### LightningExperienceTheme

Represents information for a theme in Lightning Experience. This object is available in API Version 42.0 and later.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Language**

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Required. Language of the label. Possible values are:
- da (Danish)
- de (German)
- en_US (English)
- es (Spanish)
- es_MX (Spanish - Mexico)
- fi (Finnish)
- fr (French)
- it (Italian)
- ja (Japanese)
- ko (Korean)
- nl_NL (Dutch)
- no (Norwegian)
- pt_BR (Portuguese (Brazil))
- ru (Russian)
- sv (Swedish)
- th (Thai)
- zh_CN (Chinese - Simplified)
- zh_TW (Chinese - Traditional)

**MasterLabel**

**Type**
- string

**Properties**
- Create, Filter, Group, Sort, Update

**Description**
Required. The name of the theme. Specify up to 70 characters.

**NamespacePrefix**

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort
DetailsField

Description
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

<table>

<td></td>
<td>Description: Indicates whether a custom image overrides the Salesforce loading image (<code>true</code>) or not (<code>false</code>).</td>
</tr>
</tbody>
</table>

**LightningOnboardingConfig**

Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. Available in API version 47.0 and later.

⚠️ **Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

See [Switch to Salesforce Classic Feedback Form](https://help.salesforce.com) in Salesforce Help for more details.

**Supported Calls**

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

LinkedArticle

Represents a knowledge article that is attached to a work order, work order line item, or work type. This object is available in API version 37.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

Knowledge must be enabled in your org. Field Service must be enabled. Only users that have access to the Knowledge article and the parent record linked to it can access this object.

In Knowledge in Salesforce Classic, only Field Service objects such as Work Order, Work Type, and Work Order Line Item are supported for linked articles. In Lightning Knowledge, other social objects such as Chat, Messaging, Voice Call, and Social Post are supported for linked articles.

</tr>
</tbody>
</table>

**Usage**

Admins can customize linked articles’ page layouts, fields, validation rules, and more from the Linked Articles page in Setup.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **LinkedArticleFeed**
  - Feed tracking is available for the object.
- **LinkedArticleHistory**
  - History is available for tracked fields of the object.

**LinkedArticleFeed**

Represents the comment feed on a linked article. This object is available in API version 39.0 and later.

For additional information about feeds, see [FeedItem](#) on page 1636.

**Supported Calls**

- delete()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()

**Special Access Rules**

Knowledge must be enabled in your org.

</tr>
</tbody>
</table>
## Standard Objects

### Field Details

- `<p>`

**Tip:** Though the `<br>` tag isn’t supported, you can use `<p>&nbsp;</p>` to create lines.

- `<a>`
- `<b>`
- `<code>`
- `<i>`
- `<u>`
- `<s>`
- `<ul>`
- `<ol>`
- `<li>`
- `<img>`

The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`

**Note:** In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LikeCount</td>
<td>int</td>
<td>Filter, Group, Sort</td>
<td>The number of likes associated with this feed item.</td>
</tr>
<tr>
<td>LinkUrl</td>
<td>url</td>
<td>Nillable, Sort</td>
<td>The URL of a LinkPost.</td>
</tr>
<tr>
<td>ParentId</td>
<td>reference</td>
<td>Filter, Group, Sort</td>
<td>ID of the object type to which the feed item is related. For example, set this field to a <code>UserId</code> to post to someone’s profile feed, or an <code>AccountId</code> to post to a specific account.</td>
</tr>
<tr>

</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RelatedRecordId</td>
<td>Type: reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Properties**
- Group, Nullable, Sort

**Description**
ID of the ContentVersion record associated with a ContentPost. For WDC thanks posts, it’s the ID of the WorkThanks object associated with a RypplePost. This field is typically null for all posts except ContentPost and RypplePost.

For example, set this field to an existing ContentVersion ID and post it to a feed with Type set to ContentPost.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Type: string</td>
</tr>
</tbody>
</table>

**Properties**
- Group, Nullable, Sort

**Description**
The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name. The Title field can be updated on posts of Type QuestionPost.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type: picklist</td>
</tr>
</tbody>
</table>

**Properties**
- Filter, Group, Nullable, Restricted picklist, Sort

**Description**
The type of feed item. Except for ContentPost, LinkPost, and TextPost, don’t create feed items of other types directly from the API.

- ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging).
  
  For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.

- AdvancedTextPost—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.

- AnnouncementPost—Not used.

- ApprovalPost—generated when a user submits an approval.

- BasicTemplateFeedItem—Not used.

- CanvasPost—a post made by a canvas app posted on a feed.

- CollaborationGroupCreated—generated when a user creates a public group.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CollaborationGroupUnarchived</td>
<td>Not used.</td>
</tr>
<tr>
<td>ContentPost</td>
<td>a post with an attached file.</td>
</tr>
<tr>
<td>CreatedRecordEvent</td>
<td>generated when a user creates a record from the publisher.</td>
</tr>
<tr>
<td>DashboardComponentAlert</td>
<td>generated when a dashboard metric or gauge exceeds a user-defined threshold.</td>
</tr>
<tr>
<td>DashboardComponentSnapshot</td>
<td>created when a user posts a dashboard snapshot on a feed.</td>
</tr>
<tr>
<td>LinkPost</td>
<td>a post with an attached URL.</td>
</tr>
<tr>
<td>PollPost</td>
<td>a poll posted on a feed.</td>
</tr>
<tr>
<td>ProfileSkillPost</td>
<td>generated when a skill is added to a user's Chatter profile.</td>
</tr>
<tr>
<td>QuestionPost</td>
<td>generated when a user posts a question.</td>
</tr>
<tr>
<td>ReplyPost</td>
<td>generated when Chatter Answers posts a reply.</td>
</tr>
<tr>
<td>RypplePost</td>
<td>generated when a user creates a Thanks badge in WDC.</td>
</tr>
<tr>
<td>TextPost</td>
<td>a direct text entry on a feed.</td>
</tr>
<tr>
<td>TrackedChange</td>
<td>a change or group of changes to a tracked field.</td>
</tr>
<tr>
<td>UserStatus</td>
<td>automatically generated when a user adds a post. Deprecated.</td>
</tr>
</tbody>
</table>

The following values appear in the Type picklist for all feed objects but apply only to CaseFeed:

- AttachArticleEvent—generated event when a user attaches an article to a case.
- CallLogPost—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- CaseCommentPost—generated event when a user adds a case comment for a case object.
- ChangeStatusPost—generated event when a user changes the status of a case.
- ChatTranscriptPost—generated event when Chat transcript is saved to a case.
- EmailMessageEvent—generated event when an email related to a case object is sent or received.
- FacebookPost—generated when a Facebook post is created from a case. Deprecated.
- MilestoneEvent—generated when a case milestone is completed or reaches violation status.
- SocialPost—generated when a social post is created from a case.

**Note:** If you set Type to ContentPost, also specify ContentData and ContentFileName.

### LinkedArticleHistory

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.
Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

Knowledge must be enabled in your org.

</tbody>
</table>
ListEmail

Represents a list email sent from Salesforce, or sent from Pardot and synced to Salesforce. When the list email is sent, the recipients are generated by combining recipients in ListEmailIndividualRecipients and ListEmailRecipientSource. Duplicate and other invalid recipients are removed. The result is the recipients who are sent any given list email. Has a one-to-many relationship with ListEmailRecipientSource and ListEmailIndividualRecipient. This object is available in API version 41.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</table>
### FromName

- **Type**: string
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: Read-only except when list email is in draft state. Validated against user's addresses. This field is null for emails sent from Pardot.

### HasAttachment

- **Type**: boolean
- **Properties**: Defaulted on create, Filter, Group, Sort
- **Description**: Read-only. Defaulted on create and update. Value is `true` if the list email has an attachment. This field is null for emails sent from Pardot.

### HtmlBody

- **Type**: textarea
- **Properties**: Create, Nillable, Update
- **Description**: The body of the list email. This field is null for emails sent from Pardot. List emails can contain up to 32,000 characters for the body. These limits include visible characters and other characters in the email, including markup.

### IsTracked

- **Type**: boolean
- **Properties**: Defaulted on create, Filter, Group, Sort
- **Description**: Indicates if email tracking was on when the list email was sent. This field is blank for emails sent from Pardot and synced to Salesforce. This field is null for emails sent from Pardot.

### LastReferencedDate

- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp that indicates when the current user last viewed a record that is related to this list email. This field is null for emails sent from Pardot.
<table>

Defaulted on create, Filter, Group, Nillable, Sort  
**Description**  
The total number of emails that permanently bounced back to the sender because the address is invalid. A hard bounce can occur because the domain name doesn’t exist or because the recipient is unknown.  
This field is available in API version 41.0 and later. To access this field, your org must use Pardot and users need the CRM User or Sales User permission set. |
| TotalOpens            | **Type**  
int  
**Properties**  
Defaulted on create, Filter, Group, Nillable, Sort  
**Description**  
The total number of times a prospect’s email client loaded the images in the HTML version of the email. We also record an open if the prospect clicks a link within the HTML or text email without downloading images. A click indicates that they viewed the message. Some email clients (Outlook, Apple Mail, Thunderbird) don’t display images by default. Pardot counts an open each time the images load.  
This field is available in API version 41.0 and later. To access this field, users need the High Velocity Sales User permission set or your org must use Pardot and users need the CRM User or Sales User permission set. |
| TotalOutOfOffice      | **Type**  
int  
**Properties**  
Defaulted on create, Filter, Group, Nillable, Sort  
**Description**  
The total number of replies received with an out of office message.  
This field is available in API version 41.0 and later. To access this field, your org must use Pardot and users need the Salesforce Engage permission set. |
| TotalReplies          | **Type**  
int  
**Properties**  
Defaulted on create, Filter, Group, Nillable, Sort |

</table>
| **TotalSent**      | **Type**  
 int  
 **Properties**  
 Defaulted on create, Filter, Group, Nillable, Sort  
 **Description**  
 Read-only. The total number of list emails sent, including bounced, opted-out, and invalid To: addresses. |
| **TotalSoftBounced** | **Type**  
 int  
 **Properties**  
 Defaulted on create, Filter, Group, Nillable, Sort  
 **Description**  
 The total number of times a recipient’s mail server acknowledged the email, but returned it to the sender. Sometimes it is because the recipient’s mailbox is full or the mail server is temporarily unavailable. A soft bounce message can sometimes be deliverable at another time. After 5 soft bounces, Pardot opts the prospect out of emails.  
 This field is available in API version 41.0 and later. To access this field, your org must use Pardot and users need the CRM User or Sales User permission set. |
| **TotalSpamComplaints** | **Type**  
 int  
 **Properties**  
 Defaulted on create, Filter, Group, Nillable, Sort  
 **Description**  
 The total number of prospects that reported the email as spam.  
 This field is available in API version 41.0 and later. To access this field, your org must use Pardot and users need the CRM User or Sales User permission set. |
| **TotalTrackedLinkClicks** | **Type**  
 int  
 **Properties**  
 Defaulted on create, Filter, Group, Nillable, Sort  
 **Description**  
 The number of times prospects clicked a link in the email. |

**Properties**
- Defaulted on create, Filter, Group, Nillable, Sort

**Description**
- The number of times a prospect clicked a link in the email. This metric doesn’t include multiple clicks of the same link.
- This field is available in API version 41.0 and later. To access this field, your org must use Pardot and users need the CRM User or Sales User permission set.

## Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **AccountChangeEvent** (API version 44.0)
  - Change events are available for the object.

- **ListEmailOwnerSharingRule**
  - Sharing rules are available for the object.

- **ListEmailShare**
  - Sharing is available for the object.

## ListEmailIndividualRecipient

For a list email in Salesforce, represents a recipient. Each record represents a link from a list email to exactly one recipient for that list email. Recipients can be contacts, leads, or campaign members. Has a one-to-many relationship with ListEmail. This object is available in API version 44.0 and later.

The visibility and accessibility of this object is inherited from the related list email.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

ListEmailRecipientSource

Usage

ListEmailRecipientSource

For a list email in Salesforce, represents the dynamically defined sources of recipient email addresses. Each record represents a link to a single list view or campaign that is examined when the list email is sent. Has a one-to-many relationship with ListEmail. This object is available in API version 41.0 and later.

The visibility and accessibility of this object is inherited from the related list email.

Supported Calls

create(), delete(), describeSObjects(), query(), getDeleted(), getUpdated(), retrieve(), undelete(), update(), upsert()

Fields

Field ListEmailId

Details

Type reference

Properties Create, Filter, Group, Sort

Description The related list email record. Required on record creation; read-only otherwise.

This is a relationship field.

Relationship Name ListEmail
**ListView**

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.
### Supported Calls

describeSObjects(), query(), retrieve(), search()  

### Fields

<table>

<tr>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| DeveloperName       | **Type** string  
|                     | **Properties** Filter, Group, Sort  
|                     | **Description** The fully qualified developer name of the list view. |
| IsSoqlCompatible    | **Type** boolean  
|                     | **Properties** Defaulted on create, Filter, Group, Sort  
|                     | **Description** Whether the list view can be used with SOQL..          |
| LastModifiedBy      | **Type** User  
|                     | **Properties** Filter, Sort  
|                     | **Description** The name of the user who last modified the list view. |
| LastReferencedDate  | **Type** dateTime  
|                     | **Properties** Filter, Nullable, Sort  
|                     | **Description** The date and time when the list view was last referenced, with a precision of one second. |
| LastViewedDate      | **Type** dateTime  
|                     | **Properties** Filter, Nullable, Sort  
|                     | **Description** The date and time when the list view was last viewed, with a precision of one second. |
ListViewChart

Represents a graphical chart that's displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later and is accessible by portal users.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

</tbody>
</table>
| DeveloperName   | **Type** string  
**Properties** Filter, Group, Sort  
**Description** API name of the chart. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.  
**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record. |
| ExternalId      | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** Reserved for future use. |
| GroupingField   | **Type** string  
**Properties** Filter, Group, Sort  
**Description** The field that’s used to divide the data into collections. The field has to be supported by SOQL GROUP BY functionality. GroupingField can’t be the same as AggregateField. |
| IsDeletable     | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Indicates if the chart can be deleted. |
<p>| IsEditable      | <strong>Type</strong> boolean  |</p>

| Filter, Group, Sort |
| Description       |         |
| ID of the list view in context of which the chart is generated. Required to query ListViewChartInstance. This is a relationship field. |
**Usage**

**Example 1. Retrieve all custom and standard charts for Account entity for All Accounts list view**

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId, GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId, ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account' and ListViewContextId='00BR0000000U8Hr'
```

**Example 2. Retrieve metadata for a specific custom chart by ID for Account entity and All Accounts list view**

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId, GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId, ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account' and ListViewContextId='00BR0000000U8Hr' and ListViewChartId='0DdR00000004CBxKAM'
```

**Example 3. Retrieve metadata for a specific standard chart by its developer name for Account entity and All Accounts list view**

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId, GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId, ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account' and ListViewContextId='00BR0000000U8Hr' and DeveloperName='AccountsByIndustry'
```

**LiveAgentSession**

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

**Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update()

**Usage**

Use this object to query and manage chat session records.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **LiveAgentSessionHistory**
  - History is available for tracked fields of the object.

- **LiveAgentSessionOwnerSharingRule**
  - Sharing rules are available for the object.

- **LiveAgentSessionShare**
  - Sharing is available for the object.

**LiveAgentSessionHistory**

This object is automatically created for each Chat session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

**Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **DataType** | **Type** picklist  
**Properties** Filter, Group, Nillable, Restricted picklist, Sort  
**Description** Data type of the field that was changed. |
| **Field** | **Type** picklist  
**Properties** Filter, Group, Restricted picklist, Sort  
**Description** The name of the field that was changed in a session record. |
| **LiveAgentSessionId** | **Type** reference  
**Properties** Filter, Group, Sort  
**Description** ID of the session record that was changed. |
| **NewValue** | **Type** anyType  
**Properties** Nillable, Sort  
**Description** The new value of the field that was changed. |
| **OldValue** | **Type** anyType  
**Properties** Nillable, Sort  
**Description** The original value of the field that was changed. |
Usage

Use this object to identify changes to chat session records.

LiveAgentSessionShare

This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

Note: Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessLevel</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td></td>
<td>Description: Level of access that the User or Group has to the LiveAgentSession. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Read</td>
</tr>
<tr>
<td></td>
<td>• Edit</td>
</tr>
<tr>
<td></td>
<td>• All (This value is not valid for create() or update() calls.)</td>
</tr>
<tr>
<td></td>
<td>This value must be set to an access level that is higher than the organization’s default access level for chat transcripts.</td>
</tr>
<tr>
<td>ParentId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: ID of the parent object, if any.</td>
</tr>
<tr>
<td>RowCause</td>
<td>Type: picklist</td>
</tr>
</tbody>
</table>
Usage
This object lets you determine which users and groups can view and edit LiveAgentSession records owned by other users.
If you attempt to create a new record that matches an existing record, the create() call updates any modified fields and returns the existing record.

LiveChatBlockingRule

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

Supported Calls
create(), delete(), query(), update(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type string</td>

<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The language of the blocking rule.</td>
</tr>
</tbody>
</table>
Usage

Use this object to query and manage rules for blocking customers from starting new chats with agents.

LiveChatButton

Represents a button that allows visitors to request chats with Chat users. This object is available in API version 24.0 and later.

Supported Calls

create(), query(), update(), retrieve()

Fields

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage**

Use this object to query and manage chat buttons and automated chat invitations.
LiveChatButtonDeployment

Associates an automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

Supported Calls

create(), delete(), query(), update(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ButtonId</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>The ID of the automated invitation associated with the deployment.</td>
</tr>
<tr>
<td>DeploymentId</td>

<td>Create, Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>The ID of the deployment that will feature the automated invitation.</td>
</tr>
</tbody>
</table>

Usage

Use this object to associate automated chat invitations with specific deployments.

LiveChatButtonSkill

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

Supported Calls

create(), delete(), update(), query()
Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ButtonID</td>
<td>Type: reference&lt;br&gt;Properties: Create, Filter, Group, Sort&lt;br&gt;Description: The record ID of the button.</td>
</tr>
<tr>
<td>SkillID</td>
<td>Type: reference&lt;br&gt;Properties: Create, Filter, Group, Nillable, Sort&lt;br&gt;Description: The record ID of the skill.</td>
</tr>
</tbody>
</table>

Usage

Use this object to assign a specific skill to a specific button for multi-skill routing. For example:

```java
String myButtonId = "button_Id";
String myButtonDevName = "button_DeveloperName";
List<String> skillIds = new List<String>();

//Get one skill ID from button
for(LiveChatButton lcb : [SELECT SkillId FROM LiveChatButton WHERE DeveloperName =: myButtonDevName]) {
    skillIds.add(lcb.SkillId);
}

//Get remaining skills from LiveChatButtonSkill join object
for(LiveChatButtonSkill lcbs : [SELECT SkillID FROM LiveChatButtonSkill WHERE ButtonId =: myButtonId]) {
    skillIds.add(lcbs.SkillId);
}

//Retrieve all skills into a single list
List<Skill> skills = [SELECT Id, DeveloperName FROM Skill WHERE Id IN :SkillIds];
```

LiveChatDeployment

Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

Supported Calls

create(), query(), update(), retrieve()

2019
## LiveChatSensitiveDataRule

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `update()`, `retrieve()`

### Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

| **IsEnabled**   | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** Specifies whether a sensitive data rule is active (**true**) or not (**false**). Default value (if none is provided) is **false**. |
| **Language**    | **Type** picklist  
**Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
**Description** The language of the sensitive data rule. |
| **MasterLabel** | **Type** string  
**Properties** Create, Filter, Group, Sort, Update  
**Description** Label for the sensitive data rule. |
| **NamespacePrefix** | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 |
### Details

Characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### Pattern

</tbody>
</table>

### Usage

Use this object to mask or delete data of specified patterns, such as credit card, social security, phone and account numbers, or even profanity.
LiveChatTranscript

This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Field Name | Details
---|---
WaitTime | **Type**
| int

**Properties**
Filter, Group, Nillable, Sort

**Description**
The total amount of time in seconds a chat request was waiting to be accepted by an agent.

---

**Usage**
Use this object to query and manage live chat transcripts.

**Associated Objects**
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **LiveChatTranscriptChangeEvent** *(API version 44.0)*
  Change events are available for the object.

- **LiveChatTranscriptFeed** *(API version 47.0)*
  Feed tracking is available for the object.

- **LiveChatTranscriptHistory**
  History is available for tracked fields of the object.

- **LiveChatTranscriptOwnerSharingRule** *(API version 29.0)*
  Sharing rules are available for the object.

- **LiveChatTranscriptShare**
  Sharing is available for the object.

---

**LiveChatTranscriptEvent**

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

**Supported Calls**
create(), delete(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

</tbody>
</table>
Usage

Use this object to query and manage live chat transcript events.

Note: LiveChatTranscriptEvent records are inserted after the chat is closed and the LiveTranscript record updated). However, the trigger on the LiveChatTranscriptEvent sObject fires separately on each LiveChatTranscriptEvent record within the same transaction.

All the LiveChatTranscriptEvent records are inserted in a single transaction but one by one. For example, the trigger is executed for each individual record.

```java
trigger LCTE on LiveChatTranscriptEvent (before insert) {
    // Trigger.New will have only 1 record at a time and trigger will execute for individual record
    for(LiveChatTranscriptEvent l : Trigger.New)
        system.debug(l.Type + '>>' +l.Detail);
}
```

To avoid hitting any governors and limits, design your functionality considering this behavior. You can execute the logic by filtering the records based on the Type field of LiveChatTranscriptEvent.

LiveChatTranscriptShare

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

Supported Calls

create(), delete(), query(), retrieve(), update(), upsert()

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessLevel</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>picklist</td>
</tr>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>
## Standard Objects

### LiveChatTranscriptShare

**Details**

**Description**
Level of access that the User or Group has to the LiveChatTranscript. The possible values are:

- Read
- Edit
- All (This value is not valid for `create()` or `update()` calls.)

This value must be set to an access level that is higher than the organization’s default access level for live chat transcripts.

**ParentId**

**Type**
reference

**Properties**
Create, Filter, Group, Sort

**Description**
ID of the parent object, if any

**RowCause**

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
Reason that this sharing entry exists.

You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Values may include:

- Manual — The User or Group has access because a user with "All" access manually shared the LiveChatTranscript with them.
- Owner — The User is the owner of the LiveChatTranscript or is in a role above the LiveChatTranscript owner in the role hierarchy.

**UserOrGroupId**

**Type**
reference

**Properties**
Create, Filter, Group, Sort

**Description**
ID of the User or Group that has been given access to the LiveChatTranscript.

## Usage

This object lets you determine which users and groups can view and edit LiveChatTranscript records owned by other users.
If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

**LiveChatTranscriptSkill**

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

**Supported Calls**

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

**Fields**

**Usage**

Use this object to assign a specific skill to a specific transcript for multi-skill routing.
LiveChatUserConfig

Represents a setting that controls the console settings for Chat users. This object is available in API version 24.0 and later.

Supported Calls

create(), delete(), update(), query(), retrieve()

Special Access Rules

As of Summer '20 and later, only authenticated internal and external users can access this object.

**Description**

The session key used to uniquely identify the visitor

---

**Usage**

Use this object to query and manage live chat visitors.

**Location**

Represents a warehouse, service vehicle, work site, or other element of the region where your team performs field service work. In API version 49.0 and later, you can associate activities with specific locations. Activities, such as the tasks and events related to a location, appear in the activities timeline when you view the location detail page. Also in API version 49.0 and later, Work.com users can view Employees as a related list on Location records. In API version 51.0 and later, this object is available for Omnichannel Inventory and represents physical locations where inventory is available for fulfilling orders.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

At least one of these features must be enabled:

- Commerce Store
- Contact Tracing for Employees

</tbody>
</table>
### Usage
Before creating any location records, add at least one value to the Location Type picklist. LocationType is a required field.

To track your inventory in Salesforce, create product items, which represent the stock of a particular product a particular location. For example, create a product item that represents the 500 bolts you have in stock at your Warehouse A location. Each product item must be associated with a location.

To get a more granular picture of your field service operation, associate locations with service territories. For example, if a warehouse is located in a particular service territory, add it as a service territory location.

**Important:** “Location” in Salesforce can also refer to the geolocation compound field found on many standard objects. When referencing the Location object in your Apex code, always use `Schema.Location` instead of `Location` to prevent confusion with the standard Location compound field. If referencing both the Location object and the Location field in the same snippet, you can differentiate between the two by using `System.Location` for the field and `Schema.Location` for the object.

### Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **LocationChangeEvent (API version 48.0)**
  Change events are available for the object.

- **LocationFeed**
  Feed tracking is available for the object.

- **LocationHistory**
  History is available for tracked fields of the object.

- **LocationOwnerSharingRule**
  Sharing rules are available for the object.

- **LocationShare**
  Sharing is available for the object.

### See Also:
- LocationGroup
- LocationGroupAssignment
LocationGroup

Represents a group of Omnichannel Inventory locations, providing an aggregate view of inventory availability across those locations. Omnichannel Inventory can create an inventory reservation for an order at the location group level, then assign the reservation to one or more locations in the group as needed. This object is available in API version 51.0 and later.

You can define location groups according to the logic of your business needs. For example, a location group can represent the warehouses in a geographic region, or it can include the fulfillment centers associated with a particular online storefront.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

This object is only available in Omnichannel Inventory orgs.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
**LocationGroupAssignment**

Represents the assignment of a location to a location group. This object is available in API version 51.0 and later.

You can assign a location to multiple location groups, which associates it with one location group assignment for each location group that it’s assigned to. Each location group assignment represents the relationship between one location and one location group, so a location or location group can be associated with multiple location group assignments.

**Supported Calls**

- create()
- delete()
- describeLayout()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- undelete()
- update()
- upsert()

### LocationWaitlist

Represents a queue created for a specific location. Multiple queues can be created for a single location. For example, you can have a queue for each sales agent or a standard queue and a queue for vulnerable groups. The specific party of people in a queue is represented by LocationWaitlistedParty. This object is available in API version 50.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

### LoginEvent

The documentation has moved to LoginEvent in the Platform Events Developer Guide.

### LoginGeo

Represents the geographic location of the user’s IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.
## Supported Calls

describeSObjects(), query(), retrieve()

## Special Access Rules

Only users with Manage Users permissions can access this object.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>City</strong></td>

# LoginGeo

## Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Time of the login attempt, in GMT time zone.</td>
</tr>
</tbody>
</table>

### Longitude

<table>
<thead>
<tr>
<th>Type</th>
<th>double</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The longitude where the user’s IP address is physically located.</td>
</tr>
</tbody>
</table>

### PostalCode

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The postal code where the user’s IP address is physically located. This value is not localized.</td>
</tr>
</tbody>
</table>

### Subdivision

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The name of the subdivision where the user’s IP address is physically located. In the U.S., this value is usually the state name (for example, Pennsylvania). This value is not localized.</td>
</tr>
</tbody>
</table>

## Usage

The API allows you to do many powerful queries. A few examples are:

<table>
<thead>
<tr>
<th>Sample Query</th>
<th>Query String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query showing the country for a login event, where Id=LoginGeoId from AuthSession</td>
<td>SELECT Country FROM LoginGeo WHERE Id = 'OLES0000000000'</td>
</tr>
<tr>
<td>Query showing the city and postal code for a login event, where Id=LoginGeoId from LoginHistory</td>
<td>SELECT City, PostalCode FROM LoginGeo WHERE Id = '0SO0000000000'</td>
</tr>
</tbody>
</table>
LoginHistory

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

With one exception, only users with Manage Users permissions can access this object. The exception is that, in API version 37.0 and later, all users can retrieve their own login history records.

### Field

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>UserId</strong></td>
</tr>
</tbody>
</table>

#### Details

- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: ID of the user logging in. Label is **User ID**.

### Usage

Not all fields are filterable. You can only filter on the following fields:

- AuthenticationServiceId
- CipherSuite
- CountryIso
- Id
- LoginTime
- LoginType
- LoginUrl
- NetworkId
- OptionsIsGet
- OptionsIsPost
- TlsProtocol
- UserId

The API allows you to do many powerful queries. A few examples are:

<table>
<thead>
<tr>
<th>Sample Query</th>
<th>Query String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple query showing UserId &amp; LoginTime for each user</td>
<td>SELECT UserId, LoginTime from LoginHistory;</td>
</tr>
<tr>
<td>Query showing logins only after a specified date and time</td>
<td>SELECT UserId, LoginTime from LoginHistory WHERE LoginTime &gt; 2010-09-20T22:16:30.000Z;</td>
</tr>
<tr>
<td>Query showing logins for a specific time interval</td>
<td>SELECT UserId, LoginTime from LoginHistory WHERE LoginTime &gt; 2010-09-20T22:16:30.000Z AND LoginTime &lt; 2010-09-21T22:16:30.000Z;</td>
</tr>
<tr>
<td>Query showing the authentication service for a SAML login event, where Id=AuthenticationServiceId from LoginHistory</td>
<td>SELECT name, issuer, samlVersion FROM SamlSsoConfig WHERE Id = 'OLE########################';</td>
</tr>
<tr>
<td>Query showing the authentication service for an authentication provider login event, where Id=AuthenticationServiceId from LoginHistory</td>
<td>SELECT Type, DeveloperName FROM AuthProvider WHERE Id = '0SO########################';</td>
</tr>
</tbody>
</table>
LoginIp

Represents a validated IP address. This object is available in version 28.0 and later.

Supported Calls

descrribetoObjects(), delete(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChallengeMethod</td>
<td>Type: picklist, Properties: Filter, Group, Nillable, Restricted picklist, Sort, Description: The challenge method used to confirm the user's identity. Possible values include the following.</td>
</tr>
<tr>
<td></td>
<td>• Email</td>
</tr>
<tr>
<td></td>
<td>• SMS</td>
</tr>
<tr>
<td></td>
<td>• TOTP_CHOICE: The user chooses multi-factor authentication.</td>
</tr>

</tbody>
</table>
## Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The IP address the user logged in from.</td>
</tr>
<tr>
<td>UsersId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The ID of the user associated with this item.</td>
</tr>
<tr>
<td></td>
<td>This is a relationship field.</td>
</tr>
<tr>
<td>Relationship Name</td>
<td>Users</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>Lookup</td>
</tr>
<tr>
<td>Refers To</td>
<td>User</td>
</tr>
</tbody>
</table>

### Usage

At every login, the IP address of the login request is checked against the validated IP addresses using LoginIp. A match means the login IP address is a known IP address. If there's no match, the address is unknown, and the user is asked to confirm their identity.

### LogoutEventStream

The documentation has moved to LogoutEventStream in the Platform Events Developer Guide.

### LookedUpFromActivity

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

### Supported Calls

describeSObjects()
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| AccountId  | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** Indicates the ID of the related account, which is determined as follows:  
- The account associated with the WhatId, if it exists; or  
- The account associated with the WhoId, if it exists; otherwise  
- null  
For information on IDs, see Field Types  
This is a relationship field. |
| ActivityDate | **Type** date  
**Properties** Filter, Group, Nillable, Sort  
**Description** Indicates one of the following:  
- The due date of a task  
- The date of an event if IsAllDayEvent is set to true  
This field has a time stamp that is always set to midnight in the Universal Time Coordinated (UTC) time zone. The time stamp doesn’t represent the time of the activity; don’t attempt to alter it to accommodate time zone differences. Label is Date. |
| ActivityDateTime | **Type** dateTime  
**Properties** Aggregate, Filter, Nillable, Sort  
**Description** Contains the event’s due date if the IsAllDayEvent flag is set to false. The time portion of this field is always transferred in the Coordinated Universal Time (UTC). |
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is <strong>Due Date Time</strong>. The value for this field and <strong>StartDateTime</strong> must match, or one of them must be <strong>null</strong>.</td>
</tr>
</tbody>
</table>
| **ActivitySubtype** | **Type** picklist  
**Properties** Filter, Group, Nillable, Restricted picklist, Sort  
**Description** Provides standard subtypes to facilitate creating and searching for specific activity subtypes. This field isn’t updateable.  
**ActivitySubtype** values:  
• Task  
• Email  
• Call  
• Event  
• List Email  
| **ActivityType** | **Type** picklist  
**Properties** Filter, Group, Nillable, Sort  
**Description** Represents one of the following values: Call, Email, Meeting, or Other. Label is **Type**. These are default values, and can be changed.  
**ActivityType** is the union of **TaskType** and **EventType**. If the same activity appears in both dynamic picklists, duplicate activities appear.  
**TaskType** and **EventType** can each have a Call type. Internally, they are distinct from each other.  
| **CallDisposition** | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** Represents the result of a given call; for example, “we’ll call back,” or “call unsuccessful.” Limit is 255 characters.  
<p>| <strong>CallDurationInSeconds</strong> | <strong>Type</strong> int |</p>
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>

<tr>
<td><strong>Description</strong></td>
<td>The date and time the task was saved with a Closed status.</td>
</tr>
<tr>
<td>- For insert, if the task is saved with a Closed status the field is set. If the task is saved with an Open status the field is set to NULL.</td>
<td></td>
</tr>
<tr>
<td>- For update, if the task is saved with a new Closed status, the field is reset. If the task is saved with a new non-closed status, the field is reset to NULL. If the task is saved with the same closed status (that is, unchanged) there is no change to the field.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> The status is a dynamic enum. If the Closed mapping is changed it won’t cause an update of existing tasks. Only new insert/update operations are affected.</td>
<td></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Type</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Nillable</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Contains a description of the event or task. Limit is 32 KB.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| DurationInMinutes   | **Type**
|                     | int                                                                     |
|                     | **Properties**
|                     | Filter, Group, Nillable, Sort                                          |
|                     | **Description**
|                     | Indicates the duration of the event or task.                           |
| EndDateTime         | **Type**
|                     | dateTime                                                               |
|                     | **Properties**
|                     | Filter, Nillable, Sort                                                 |
|                     | **Description**
|                     | Indicates the end date and time of the event or task. Available in versions 27.0 and later. This field is optional, depending on the following:
|                     |  • If IsAllDayEvent is true, you can supply a value for either DurationInMinutes or EndDateTime. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are null, the duration defaults to one day.
|                     |  • If IsAllDayEvent is false, a value must be supplied for either DurationInMinutes or EndDateTime. Supplying values in both fields is allowed if the values add up to the same amount of time. |
| IsAllDayEvent       | **Type**
|                     | boolean                                                                |
|                     | **Properties**
|                     | Defaulted on create, Filter, Group, Sort                               |
|                     | **Description**
|                     | If the value of this field is set to true, then the activity is an event spanning a full day, and the ActivityDate defines the date of the event. If the value of this field is set to false, then the activity may be an event spanning less than a full day, or it may be a task. Label is All-Day Event. |
| IsClosed            | **Type**
|                     | boolean                                                                |
|                     | **Properties**
|                     | Defaulted on create, Filter, Group, Sort                               |
|                     | **Description**
<p>|                     | Indicates whether a task is closed; value is always false. This field is set indirectly by setting Status on the task—each picklist value has a corresponding IsClosed value. Label is Closed. |</p>
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsHighPriority     | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Indicates a high-priority task. This field is derived from the **Priority** field. |
| IsReminderSet      | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** Indicates whether a reminder is set for an activity (**true**) or not (**false**). |
| IsTask             | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** If the value of this field is set to **true**, then the activity is a task; if the value is set to **false**, then the activity is an event. Label is **Task**. |
| IsVisibleInSelfService | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** If the value of this field is set to **true**, then the activity can be viewed in the self-service portal. Label is **Visible in Self-Service**. |
| Location           | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** If the activity is an event, then this field represents the location of the event. If the activity is a task, then the value is **null**. |
| OwnerId            | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  |

### Status

**Type**
- picklist

**Properties**
- Defaulted on create, Filter, Group, Nillable, Sort

**Description**
- Indicates the current status of a task, such as in progress or complete. Each predefined status field sets a value for `IsClosed`.

### Subject

**Type**
- combobox

**Properties**
- Filter, Nillable, Sort

**Description**
- Contains the subject of the task or event.

### WhatId

**Type**
- reference

**Properties**
- Filter, Group, Nillable, Sort

**Description**
- The `WhatId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. `WhatIds` are polymorphic. Polymorphic means a `WhatId` is equivalent to the ID of a related object. The label is `Related To ID`. This is a polymorphic relationship field.

#### Relationship Name
- What

#### Relationship Type
- Lookup

#### Refers To
- Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProcHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct,

**WhoId**

<table>
<thead>
<tr>
<th>Type</th>
<th>reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
</tbody>
</table>

**Description**

The WhoId represents a human such as a lead or a contact. Whoids are polymorphic. Polymorphic means a WhoId is equivalent to a contact’s ID or a lead’s ID. The label is Name ID. This is a polymorphic relationship field.

**Relationship Name**

Who

**Relationship Type**

Lookup

**Refers To**

Contact, Lead

**Usage**

Query activities related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity custom lookup relationship; for example:

```sql
SELECT id, name,
(SELECT id, subject from sponsoredact__r)
FROM Contact
```

In this example `sponsoredact__r` is a user defined relationship list.

The user interface enforces sharing rules, filtering out related-list items that a user doesn’t have permission to see.

The following restrictions on users who don’t have “View All Data” permission help prevent performance issues:

- In the main clause of the relationship query, you can reference only one record. For example, you can’t filter on all records where the account name starts with ‘A’; instead, you must reference a single account record.
- In the inner clause of the query, you can’t use WHERE.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- You must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order; you can display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

---

### Macro

Represents a macro, which is a set of instructions that tells the system to perform one or more tasks. This object is available in API version 32.0 and later.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

</tbody>
</table>

### Usage

A macro definition consists of a Macro object and several associated MacroInstruction objects.

First, create a Macro object. Then, create Macroinstructions that specify objects, operations, conditions, and targets for the macro.

A macro contains an ordered list of macro instructions whose index field, `sortOrder`, is 0-based. If there’s an incorrect sequence of macro instructions, the macro doesn’t execute.

If you update a macro definition or add or remove instructions from a macro, make sure that the `sortOrder` field that defines the execution order is correct. To delete an entire macro definition, invoke the delete operation on the Macro object.

The table describes the supported macro instruction targets and how they relate to each other.

**Note:** Strings indicated by `<brackets>` are variables. The variable description describes the required type. For example, `Tab.<EntityApiName>` requires the entity name. If your custom entity name is `MyCustomObject`, your target API is `Tab.MyCustomObject__c`.

If a macro instruction listed in the table supports an implicit operation, you can use that operation as a direct child instruction without explicitly specifying a target. The hyphens used in the table illustrate the hierarchical relationship between targets. A target isn’t available if its parent isn’t.

#### Table 1: Macro Instruction Target Grammar and Hierarchy

<table>
<thead>
<tr>
<th>Target API Name</th>
<th>Supported Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Tab.&lt;EntityApiName&gt;</code></td>
<td>SELECT, CLOSE (implicit)</td>
</tr>
<tr>
<td><code>- QuickAction.&lt;EntityApiName&gt;.&lt;QuickActionName&gt;</code></td>
<td>SELECT, SUBMIT (implicit)</td>
</tr>
<tr>
<td><code>- - Field.&lt;QATargetEntityApiName&gt;.&lt;FieldApiName&gt;</code></td>
<td>SET</td>
</tr>
<tr>
<td>Target API Name</td>
<td>Supported Operations</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>Field.&lt;QATargetEntityApiName&gt;.&lt;MultilineTextFieldApiName&gt;.cursor</td>
<td>INSERT</td>
</tr>
<tr>
<td>Field.&lt;QATargetEntityApiName&gt;.&lt;SinglelineTextFieldApiName&gt;.end</td>
<td>INSERT</td>
</tr>
<tr>
<td>QuickAction.Case.Email</td>
<td>SELECT, SUBMIT (implicit)</td>
</tr>
<tr>
<td>Field.EmailMessage.&lt;FieldApiName&gt;</td>
<td>SET</td>
</tr>
<tr>
<td>Field.EmailMessage.&lt;MultilineTextFieldApiName&gt;.cursor</td>
<td>INSERT</td>
</tr>
<tr>
<td>Field.EmailMessage.&lt;SinglelineTextFieldApiName&gt;.end</td>
<td>INSERT</td>
</tr>
<tr>
<td>Field.EmailTemplate</td>
<td>SET</td>
</tr>
<tr>
<td>SidebarCmp.Knowledge</td>
<td>SELECT</td>
</tr>
<tr>
<td>SearchAction.KnowledgeArticle</td>
<td>SELECT</td>
</tr>
<tr>
<td>Field.SearchString</td>
<td>SET, INSERT</td>
</tr>
<tr>
<td>Command.Search</td>
<td>SUBMIT</td>
</tr>
<tr>
<td>SearchResult.KnowledgeArticle.MostRecentItem</td>
<td>SELECT</td>
</tr>
<tr>
<td>Command.AttachToRecord</td>
<td>SUBMIT</td>
</tr>
<tr>
<td>Command.InsertToEmail</td>
<td>SUBMIT</td>
</tr>
<tr>
<td>Command.AttachToEmailAsPDF</td>
<td>SUBMIT</td>
</tr>
</tbody>
</table>

**Example:** This example describes a macro that opens a quick action, sets some fields in the quick action, and submits the quick action.

```
0. SELECT Tab.Case
1. SELECT QuickAction.Case.Email
2. SET Field.EmailMessage.Subject
3. SET Field.EmailMessage.ToAddress
4. INSERT Field.EmailMessage.HtmlBody.cursor
5. SUBMIT
```

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **MacroChangeEvent** *(API version 48.0)*
  
  Change events are available for the object.

- **MacroHistory**

  History is available for tracked fields of the object.
MacroOwnerSharingRule
Sharing rules are available for the object.

MacroShare
Sharing is available for the object.

MacroInstruction

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro’s actions.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| MacroId    | Type: reference  
             Properties: Create, Filter, Group, Sort  
             Description: ID of the macro that contains this instruction. |
| Name       | Type: string  
             Properties: Autonumber, Defaulted on create, Filter, Sort  
             Description: Name of the instruction. |
| Operation  | Type: picklist  
             Properties: Create, Filter, Group, Restricted picklist, Sort, Update  
             Description: The action that the macro instruction performs. Valid values are:  
                        - Select  
                        - Set  
                        - Insert  
                        - Submit |
### Field Name  | Details
--- | ---
• Close  
To create macro instructions that execute conditionally, these values are available in API version 46.0 and later.
• IF
• ELSEIF
• ELSE
• ENDIF

</thead>
<tbody>
<tr>
<td>Value of a field. If the operation is Select, then the value is null, because the operation selects the object on which the macro performs an action. An</td>
</tr>
</tbody>
</table>
MacroInstructions can specify objects, operations, conditions, and targets. For example, a macro containing these instructions performs a quick action that sends an email.

```
Select Email QuickAction
Set Subject...
Set To...
Set Body...
Submit
```

You can create conditional macros using IF, ELSEIF, ELSE, and ENDIF as operations. In a conditional statement, the ExpressionFilter and ExpressionFilterCriteria objects are used to control which instructions execute. The ExpressionFilter object lets you define a logical expression with one or more conditions. It uses a child object, ExpressionFilterCriteria, to represent each condition that is evaluated.

For example, consider the following conditional statement and macro instructions.

```
IF (Case.Status EQUALS New) AND (Case.Origin EQUALS Phone)
    Select Email QuickAction
    Set Subject...
    Set To...
    Set Body...
    Submit
ELSE
    Select Update Case Detail
    Update Case Description...
    Submit
ENDIF
```
The ExpressionFilter object includes a FilterConditionLogic field containing 1 AND 2, where 1 and 2 are ExpressionFilterCriteria objects. The SortOrder field in the ExpressionFilterCriteria object maps condition 1 to Case.Status EQUALS New, and condition 2 to Case.Origin EQUALS Phone. If the conditional statement evaluates to true, then the instructions in the IF block are executed; otherwise, the instructions in the ELSE block are executed.

Any number of macro instructions can be present inside an IF, ELSEIF, or ELSE block. In addition, conditions can be nested.

Data Model

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

MacroInstructionChangeEvent (API version 48.0)

Change events are available for the object.

MacroUsage

Represents macro usage on a record, including which macro was used, who used it, and how they used it. This object is available in API version 47.0 and later.
Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

This object is always read-only.

## MailmergeTemplate

This object represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

**Supported Calls**

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

- All users can view this object, but you need the “Customize Application” permission to modify it.
- Customer Portal users can’t access this object.

### Fields

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**MaintenanceAssetChangeEvent** (API version 48.0)
Change events are available for the object.

**MaintenanceAssetFeed**
Feed tracking is available for the object.

**MaintenanceAssetHistory**
History is available for tracked fields of the object.

MaintenancePlan

Represents a preventive maintenance schedule for one or more assets in field service.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Field Service must be enabled.

</tbody>
</table>
| **Description**                  | The suggested date of service for the first work order (not the date the work order is created). This corresponds to the work order’s SuggestedMaintenanceDate. You can use this field to enforce a delay before the first maintenance visit (for example, if monthly maintenance should be performed on a specific day)
begin one year after the purchase date). Its label in the user interface is Date of the first work order in the next batch.

For example, if you want the first maintenance visit to take place on May 1, enter May 1. When you generate work orders, the earliest work order will list a suggested maintenance date of May 1, and the dates on the later work orders will be based on the **GenerationTimeframe** and **Frequency**.

**Important:** Maintenance assets also list a **NextSuggestedMaintenanceDate**, which is initially inherited from the maintenance plan. If the plan has maintenance assets, this date auto-updates on the maintenance assets after each batch is generated, but doesn’t update on the maintenance plan itself because batch timing is calculated at the maintenance asset level. If the plan doesn’t have maintenance assets, this date auto-updates on the maintenance plan after each batch is generated.

Details

Field Name | Details
--- | ---
Description | The service appointment generation method.
• One service appointment per work order
• One service appointment per work order line item

If your existing maintenance plans have work orders or work order line items associated with them, you can't change their generation methods. To change pre-existing maintenance plan generation methods, either delete the work orders and regenerate them or delete the maintenance plan and recreate it with the needed generation methods.

If Work Order Generation Method is set to One work order per asset, you can't set a Service Appointment Generation Method.

If Work Order Generation Method is set to One work order line item per asset, you must select a Service Appointment Generation Method.

WorkOrderGenerationMethod

Type | picklist
Properties | Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Description | The work order generation method.
• One work order per asset
• One work order line item per asset

If your existing maintenance plans have work orders or work order line items associated with them, you can't change their generation methods. To change pre-existing maintenance plan generation methods, either delete the work orders and regenerate them or delete the maintenance plan and recreate it with the needed generation methods.

If Work Order Generation Method is left as None, the generation is defaulted to one work order per asset.

When One work order line item per asset is set, and all maintenance assets have the same Next Suggested Maintenance Date on the maintenance plan, they are grouped in one work order. However, if maintenance assets have different Next Suggested Maintenance Dates, multiple work orders are created for each date.

If Work Order Generation Method is set to One work order per asset, you can't set a Service Appointment Generation Method.

WorkOrderGenerationStatus

Type | picklist
Properties | Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort
### Field Name Details

**Description**
(Read Only) Indicates the status of work order generation:
- NotStarted—the default value, work order generation has not started
- InProgress—work order generation is underway
- Completed—work order generation is complete
- Unsuccessful—it was not possible to generate work orders

You can generate only one batch at a time.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **MaintenanceWorkRuleFeed**
  - Feed tracking is available for the object.

- **MaintenanceWorkRuleHistory**
  - History is available for tracked fields of the object.

- **MaintenanceWorkRuleOwnerSharingRule**
  - Sharing rules are available for the object.

- **MaintenanceWorkRuleShare**
  - Sharing is available for the object.

### ManagedContentInfo

Allows the creation of relationship to Product using ProductMedia. This object is available in API version 49.0 and later.

**Supported Calls**

- `describeSObjects()`

**Special Access Rules**

You must have the B2B Commerce license and a CMS workspace to access a web store.

**Usage**

The CMS content import process returns a ManageContentInfo ID for each piece of content. The ManagedContentInfo entity has a 1:1 relationship with ProductMedia. To create this relationship, ProductMedia must be associated with a Product entity, for example, Product > ProductMedia > ManagedContentInfo. Use the ID to associate content uploaded through the API with the ProductMedia entity.

### MarketingForm

Represents a Pardot marketing form that has been synched to Salesforce. Use forms on your website and landing pages to collect information about visitors and turn anonymous visitors into identified prospects. This object is available in API version 42.0 and later.

**Supported Calls**

- `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

**Special Access Rules**

To access this object, your org must use Pardot and users need the CRM User or Sales User permission set.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**MarketingFormEvent (API version 44.0)**
- Change events are available for the object.

**MarketingLinkFeed**
- Feed tracking is available for the object.

MatchingRule

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

A matching rule compares field values to determine whether a record is similar enough to existing records to be considered a duplicate. For example, a matching rule can specify that if the Email and Phone values of two records match exactly, the records are possible duplicates. Your organization uses matching rules with duplicate rules to define what happens when duplicates are identified.

If the rule is for a Person Account, `Sobject.SubType` is automatically set to `PersonAccount`.

Supported Calls

*describeSObjects(), query(), retrieve()*

Special Access Rules

*As of Summer ’20 and later, only users with the View Setup and Configuration permission can access this object.*

MatchingRuleItem
DuplicateRule
DuplicateResult
MatchingRule in the Salesforce Metadata API Developer's Guide

MatchingRuleItem

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

A matching rule item determines which field the matching rule uses to identify a duplicate record. It also determines the method used to compare value that two records have for the field. For example, a matching rule item might specify that the Email field values of two records must match exactly in order for the records to be considered duplicates.

When a matching rule has multiple matching rule items, it means that multiple fields must match in order for the records to be identified as duplicates.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>

MessagingChannel

Represents a communication channel that an end user can use to send a message to an agent. A communication channel can be an SMS number, a Facebook page, or another supported messaging channel. This object is available in API version 45.0 and later.

Supported Calls

create(), describeLayout(), describeSObjects(), query(), retrieve(), search(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BusinessHoursId</td>
<td></td>
</tr>
</tbody>
</table>

Type

reference

Properties

Create, Filter, Group, Nillable, Sort, Update

Description

The operating hours for your business, when agents are available. Available only in orgs that use Einstein Bots.

This is a relationship field.

Standard Objects

**MessagingChannelSkill**

Junction object that represents an association between MessagingChannel and Skill. This object is available in API version 45.0 and later. For example, when we want to use Omni-Channel skills-based routing in Live message, this object maintains the mapping between the messaging channel and the skill.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>

## MessagingEndUser

Represents a single address—such as a phone number or Facebook page—communicating with a single Messaging channel. This object is available in API version 45.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>

**Description**  
ID of the account associated with this Messaging end user.
<table>
<thead>
<tr>
<th>Field</th>

### MessagingSession

**Field** | **Details**
--- | ---
PreviewDetails | **Type**
| string
**Properties**
| Nillable
**Description**
The preview shown to an agent for this Messaging session.

**SessionKey**

**Type**
| string
**Properties**
| Create, Filter, Group, Nillable, Sort
**Description**
The identifier for the Messaging session.

**StartTime**

**Type**
| dateTime
**Properties**
| Create, Filter, Nillable, Sort
**Description**
The time when the Messaging session started.

**Status**

**Type**
| picklist
**Properties**
| Create, Filter, Group, Restricted picklist, Sort
**Description**
The status of the Messaging session. Possible values are:
- Active
- Ended
- New
- Waiting

**TargetUserId**

**Type**
| reference
**Properties**
| Create, Filter, Group, Nillable, Sort, Update
**Description**
The ID of the target user associated with this Messaging session.
This is a relationship field.

**Relationship Name**
| TargetUser

Associated Objects

This object has the following associated objects. Unless noted, they're available in the same API version as this object.

- **MessagingSessionFeed**
  Feed tracking is available for the object.

- **MessagingSessionHistory**
  History is available for tracked fields of the object.

- **MessagingSessionOwnerSharingRule**
  Sharing rules are available for the object.

- **MessagingSessionShare**
  Sharing is available for the object.

MessagingTemplate

Represents a Messaging template used to send pre-formatted messages. This object is available in API version 47.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), search(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Type</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Properties</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Description</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td>Type</td>
</tr>
</tbody>
</table>
### Details

**Properties**
Create, Filter, Group, Sort, Update

**Description**
The API name for the Messaging template.

*Note:* Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

### Language

**Type**
picklist

**Properties**
Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The language of the Messaging template.

### MasterLabel

**Type**
string

**Properties**
Create, Filter, Group, idLookup, Sort, Update

**Description**
The label of the Messaging template.

### Message

**Type**
textarea

**Properties**
Create, Update

**Description**
The body text of the Messaging template.

---

### MetadataPackage

Represents a package that has been developed in the org you’re logged in to. Applies to unlocked, unmanaged, first-generation, and second-generation managed packages.

### Supported Calls

describeSObjects(), query(), retrieve()
Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>NamespacePrefix</td>
<td><strong>Type</strong></td>

<td></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>PackageCategory</td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
</tbody>
</table>
|                  | **Description** | The type of package. Valid values are:  
  • Application (internal use only)  
  • Module (internal use only)  
  • Package—Represents either an unmanaged package or a first-generation managed package.  
  • Package2—Represents either an unlocked package or a second-generation managed package.  
The default value is Package.  
This field is available in API version 49.0 and later. |

Usage

Here are examples of the types of API queries you can perform.
### Query

<table>
<thead>
<tr>
<th>SHOW ALL MANAGED AND UNMANAGED PACKAGES IN THE ORG</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT Name, NamespacePrefix FROM MetadataPackage</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SHOW ONLY MANAGED PACKAGES IN THE ORG</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELECT Name, NamespacePrefix FROM MetadataPackage WHERE NamespacePrefix &lt;&gt; ''</td>
</tr>
</tbody>
</table>

---

**MetadataPackageVersion**

Represents a package version (managed or unmanaged) that has been uploaded from the org you’re logged in to.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BuildNumber</strong></td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The build number of the version. For example, if you upload two beta versions, they have build numbers 1 and 2. Then, when you upload a non-beta version, the build number is 3. When you upload a new version, the build number resets to 1.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>IsDeprecated</strong></th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether the package version is deprecated. Available in API version 46.0 and later.</td>
</tr>
</tbody>
</table>

<table>

<td>If the package version is a beta version, the value is Beta. Otherwise, the value is Released.</td>
</tr>
</tbody>
</table>

## Usage

Here are examples of the types of API queries you can perform.

<table>
<thead>
<tr>
<th>Query</th>
<th>String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get all package versions for the package that has a MetadataPackageID of 033D00000001xQlIAI</td>
<td>SELECT Id, Name, ReleaseState, MajorVersion, MinorVersion, PatchVersion FROM MetadataPackageVersion WHERE MetadataPackageId = '033D00000001xQlIAI'</td>
</tr>
<tr>
<td>Get the package version for the package with a specific MetadataPackageID and a major version greater than 1</td>
<td>SELECT Id FROM MetadataPackageVersion WHERE MetadataPackageId = '033D00000001xQlIAI' AND MajorVersion &gt; 1</td>
</tr>
<tr>
<td>Get released package versions for the package with a specific MetadataPackageID</td>
<td>SELECT Id FROM MetadataPackageVersion WHERE MetadataPackageId = '033D00000001xQlIAI' AND ReleaseState = 'Released'</td>
</tr>
</tbody>
</table>

## Java Code Sample

Suppose you want to push version 3.4.6 of your package to all orgs. Let’s write some code to identify the orgs eligible for the upgrade. This example demonstrates how to generate the list of subscriber orgs eligible to be upgraded to version 3.4.6 of a package.

This code sample uses the Web Services Connector (WSC).

```java
// Finds all Active subscriber orgs that have the package installed
String PACKAGE_SUBSCRIBER_ORG_KEY_QUERY = "Select OrgKey from PackageSubscribers where OrgStatus = 'Active' and InstalledStatus = 'I'";

// Finds all MetadataPackageVersions lower than the version given, including the list // of subscribers for each version
String METADATA_PACKAGE_VERSION_QUERY = "Select Id, Name, ReleaseState, (%s) from" + " MetadataPackageVersion where MetadataPackageId = '%s' AND ReleaseState = 'Released'" + " AND (MajorVersion < 3 OR (MajorVersion = 3 and MinorVersion < 4))" + " OR (MajorVersion = 3 and MinorVersion = 4 and PatchVersion < 6))";

// conn is an EnterpriseConnection instance initialized with a ConnectionConfig object // representing a connection to the developer org of the package
QueryResult results = conn.query(String.format(METADATA_PACKAGE_VERSION_QUERY, PACKAGE_SUBSCRIBER_ORG_KEY_QUERY));

// This list will hold all of the PackageSubscriber objects that are eligible for upgrade // to the given version
```
List<PackageSubscriber> subscribers = new ArrayList<>();
for (SObject mpvso : results.getRecords()) {
    // Cast the sObject to a MetadataPackageVersion
    MetadataPackageVersion mpv = (MetadataPackageVersion) mpvso;
    // Add subscribers to our list
    if (mpv.getPackageSubscribers() != null) {
        for (SObject psso : mpv.getPackageSubscribers().getRecords()) {
            subscribers.add((PackageSubscriber) psso);
        }
    }
}

Next Step
Create a push request using PackagePushRequest.

Metric

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

## Field Name

### Details

#### Description
The last time the data was synchronized.

### Name

#### Type
string

#### Properties
Autonumber, Defaulted on create, Filter, Sort

#### Description
The name given to the data link record.

### TargetId

#### Type
reference

#### Properties
Create, Filter, Group, Sort

#### Description
The ID of the metric that the data is linked to.

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**MetricDataLinkHistory**
History is available for tracked fields of the object.

**MetricsDataFile**

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

**Note:** Usage Metrics is now unavailable. For more information, see Usage Metrics Retirement. Enable AppExchange App Analytics in your security-reviewed managed packages to retrieve usage data about how subscribers interact with your AppExchange solutions. You can use these details to identify attrition risks, inform feature development decisions, and improve user experience. To enable App Analytics, follow the instructions in Request AppExchange App Analytics.

## Supported Calls

- `query()`,
- `delete()`

2161
Usage

Use this object to access customer usage metrics for a managed package. Each record contains one day’s data, on either custom objects or Visualforce pages, for all organizations in a Salesforce instance that have the package installed. The following data is collected each day.

- **Custom objects** — the number of records stored in each custom object.
- **Visualforce pages** — the number of times each Visualforce page was accessed, the number of unique users who accessed it, and the average loading time (in milliseconds).

The custom objects data is a snapshot that reflects the state of the organization at the time the database was sampled, while the Visualforce data covers usage over a 24-hour period.

This feature is intended for API access only. The owner of the package must write a secondary process to retrieve the metrics data from the reporting organization, and export it to another system for analysis.

The usage metrics data for all production organizations in a given instance is merged and written into a text file in a specified format one time each day. If an instance doesn’t have any organizations with the package installed or any organizations that accessed Visualforce pages in the package, a blank record is created for that day, with `MetricsDataFileLength` set to zero.

In a record for custom objects, each row of the text file contains usage data in the following order.
The custom object count is a snapshot captured one time each day. Here's a section of a sample data file for custom objects. It shows there were 3500 and 1500 records in the Alpha and Beta custom objects, respectively, in the specified customer organization on the specified day.

```
"00Dxx00000000gbk","org1","Enterprise Edition","TRIAL","Alpha", "3500"
"00Dxx00000000gbk","org1","Enterprise Edition","TRIAL","Beta", "1500"
```

In a record for Visualforce pages, each row of the text file contains usage data in the following order.

- Organization ID
- Organization name
- Organization edition
- Organization status
- Package version number
- Name of the Visualforce page
- Number of times the page was accessed
- Number of unique users who accessed the page
- Average loading time of the page, in milliseconds

The Visualforce counts for each organization measure the number of times the page was viewed in the duration between the start and end times. Here's a section of a sample data file for Visualforce pages.

```
"00Dxx00000000gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f1","1","1","66.0"
"00Dxx00000000gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f2","1","1","128.0"
"00Dxx00000000gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f3","1","1","107.0"
"00Dxx00000000gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f1","5","1","73.6"
"00Dxx00000000gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f2","1","1","72.0"
"00Dxx00000000gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gm12__f3","7","1","50.8"
```

| DeveloperName | **Type**  
string  

**Properties**  
Filter, Group, Sort  

**Description**  
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.

Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

| Language | **Type**

## MLRecommendationDefinition

For internal use only.

### MobileSecurityPolicy

Enables mobile security policies on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 50.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

Accessing this object requires the Enhanced Mobile App Security add-on subscriptions and the Enforce Enhanced Mobile App Security user permission.

</table>
MobileSecurityUserMetric

Represents the metrics for users who have Enhanced Mobile Security policies enforced. This object is available in API version 51.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

Accessing this object requires the Enhanced Mobile App Security add-on subscriptions and the Enforce Enhanced Mobile App Security user permission.

Fields

<table>
<thead>
<tr>
<th>Field</th>

<td>The number of users who have mobile security policies enforced.</td>
</tr>
</tbody>
</table>
Usage

A user with the Manage Enhanced Mobile App Security permission can run this SOQL query.

```sql
SELECT MetricsDate, UserCount
FROM MobileSecurityUserMetric
ORDER BY MetricsDate DESC
```

**MobileSettingsAssignment**

Represents the assignment of a particular field service mobile settings configuration to a user profile. This object is available in API version 41.0 and later.

**Supported Calls**

```
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()
```

**Special Access Rules**

Field Service must be enabled.

**Fields**

</tr>
</tbody>
</table>

**MobSecurityCertPinConfig**

Configuration of mobile security certificate pinning on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 53.0 and later.

2174
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

Accessing this object requires the Enhanced Mobile App Security add-on subscriptions and the Enforce Enhanced Mobile App Security user permission.

**DetailsField**

This is polymorphic relationship field.

**Relationship Name**
User

**Relationship Type**
Lookup

**Refers To**
User

**WebkitVersion**

**Type**
string

**Properties**
Create, Nillable

**Description**
The version of the web browser engine developed by Apple.

---

**MsgChannelLanguageKeyword**

Represents the consent configuration for a Messaging channel. This object is available in API version 48.0 and later.

**Supported Calls**

describeSObjects(), delete(), query(), retrieve(), search()
### Field Details

**Description**
The automated response sent when a Messaging end user sends a Custom Keyword.

**DoubleOptInKeywords**
- **Type**: textarea
- **Properties**
  - Nillable
- **Description**
The keywords a Messaging end user can send to doubly opt in to receiving messages.

**HelpKeywords**
- **Type**: textarea
- **Properties**
  - Nillable
- **Description**
The keywords a Messaging end user can send to request help during a Messaging session.

**HelpResponse**
- **Type**: textarea
- **Properties**
  - Nillable
- **Description**
The automated response sent when a Messaging end user requests help.

**MasterLanguage**
- **Type**: textarea
- **Properties**
- **Description**
The language used for this consent configuration.

**MessagingChannelId**
- **Type**: reference
- **Properties**
  - Filter, Group, Sort
- **Description**
The ID of the associated Messaging channel.
  - This is a relationship field.
  - **Relationship Name**: MessagingChannel
  - **Relationship Type**: Lookup
### MyDomainDiscoverableLogin

Represents configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This object is available in API version 45.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

| **Properties** | Create, Filter, Group, Sort, Update |
| **Description** | The name of the action link group template. |

| UsernameLabel |  |
| **Type** | string |

2184
Usage

Use this object to access the My Domain Login Discovery Page, which is a login page type that prompts users to identify themselves with an email address, phone number, or custom identifier. My Domain Login Discovery performs an interview-based login process, where users are first prompted to provide identity and then authenticated. For example, users receive a verification code that they enter to complete the login process.

MutingPermissionSet

Represents a set of disabled permissions and is used in conjunction with PermissionSetGroup. This object is available in API version 46.0 and later.

Use a muting permission set with a permission set group to mute certain permissions. For instance, you have a subscriber org using a managed package that contains a permission set group. To use the existing permission set group, the subscriber org can disable specific permissions with a muting permission set. Or, perhaps you have a permission set group that contains several permission sets managed by different departments. Use a muting permission set to disable specific permissions based on your organization’s needs.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Summer ’20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td></td>

<th>Details</th>
</tr>
</thead>
</table>
| **Description** | The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.  

⚠️ **Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance can slow while Salesforce generates one for each record.  

⚠️ **Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field. |

  - no (Norwegian)  
  - pt_BR (Portuguese - Brazilian)  
  - ru (Russian)  
  - sv (Swedish)  
  - th (Thai)  
  - zh_CN (Chinese - Simplified)  
  - zh_TW (Chinese - Traditional) |
Usage

Use MutingPermissionSet to disable specified permissions within a permission set group.

Name

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

This object is used to retrieve information from related records where the related record may be from more than one object type (a polymorphic foreign key). For example, the owner of a case can be either a user or a group (queue). This object allows retrieval of the owner name, whether the owner is a user or a group (queue). You can use a describe call to access the information about parents for an object, or you can use the who, what, or owner fields (depending on the object) in SOQL queries. This object cannot be directly accessed.

Supported Calls

describeSObjects()

| FirstName     | **Type**
                 | string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The first name of the user, contact, or lead.

| IsActive      | **Type**
                 | boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether the related record is an active user (true) or not (false). This field contains a value only if the related record is a user.

| LastName      | **Type**
                 | string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The last name of the user, contact, or lead.

| LastReferencedDate | **Type**
                    | datetime

**Properties**
Filter, Nillable, Sort

**Description**
The timestamp when the current user last accessed this record, a record related to this record, or a list view.

| LastViewedDate  | **Type**
                    | datetime

**Properties**
Filter, Nillable, Sort

**Description**
The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

| MiddleName     | **Type**
<pre><code>             | string |

| **Suffix** | **Type**  
string  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
The name suffix of the user, contact, or lead. |
| **Title**  | **Type**  
string  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
The title of the user, for example CFO or CEO. |
| **Type**   | **Type**  
picklist  
**Properties**  
Filter, Group, Nillable, Restricted picklist, Sort  
**Description**  
A list of the types of sObjects that can be an owner of this object. You can use this field to filter on a type of owner, for example, return only the leads owned by a user. |
| **Username** | **Type**  
string  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
Contains the name that a user enters to log into the API or the user interface. The value for this field is in the form of an email address, and is only populated if the related record is a user. |
| **UserRole** | **Type**  
picklist  
**Properties**  
Filter, Nillable  
**Description**  
Name of the Role played by the user. Only populated for user rows. |
| **UserRoleId** | **Type**  
reference  
**Properties**  
Filter, Group, Nillable, Sort |
**NamedCredential**

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

**Note:** All credentials stored within this entity are encrypted under a framework that is consistent with other encryption frameworks on the platform. Salesforce encrypts your credentials by auto-creating org-specific keys. Credentials encrypted using the previous encryption scheme have been migrated to the new framework.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

As of Spring ’20 and later, only users with the View Setup and Configuration permission can access this object.

</tbody>
</table>
Details

Field Name | Details
---|---

external system access. Named Principal uses one user identity for all users to access the external system.

Usage

Use the NamedCredential object to query named credentials in your organization.

Note: Some named credential fields rely on per-user authentication to connect with an external system. If an admin edits one of these fields, then the previously authenticated credentials can get invalidated, requiring individual users to reauthenticate.

SEE ALSO:

- ExternalDataUserAuth
- ExternalDataSource

NamespaceRegistry

Represents a namespace that you can link to scratch orgs that were created from your org’s Dev Hub. You use the namespace when developing, packaging, and releasing an app. You can’t create this object with the API. Use the Link Namespace action in the Dev Hub graphical interface to insert a NamespaceRegistry record. This object is available in API version 41.0 and later.

Supported Calls

delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()
**Field Name** | **Details**
---|---
**Description** | The org ID of the Developer Edition org where you've registered the namespace you want to link.

**NamespacePrefix**

**Type** | string
**Properties** | Filter, Group, Sort
**Description** | The namespace prefix that you want to link to the scratch org.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **NamespaceRegistryFeed**
  Feed tracking is available for the object.

- **NamespaceRegistryHistory**
  History is available for tracked fields of the object.

**SEE ALSO:**
- **ActiveScratchOrg**
- **ScratchOrgInfo**

**NavigationLinkSet**

Represents the navigation menu in an Experience Cloud site. A navigation menu consists of items that users can click to go to other parts of the site. This object is available in API version 35.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`  
- `create()`, `delete()`, `update()`, and `upsert()` are available in API version 45.0 and later.

**Special Access Rules**

Navigation menus are available only in Experience Cloud sites created using Experience Builder templates. To use navigation menus in the Build Your Own template, you must build a custom navigation menu component.

### NavigationMenuItem

Represents a single menu item in a NavigationLinkSet. Use this object to create, delete, or update menu items in your Experience Cloud site's navigation menu. This object is available in API version 35.0 and later.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

#### Special Access Rules

Navigation menus are available only in Experience Cloud sites created using Experience Builder templates. To use navigation menus in the Build Your Own template, you must build a custom navigation menu component.

</tr>
</tbody>
</table>

### Usage

You can add up to 20 navigation menu items. You can translate navigation menu items using the Translation Workbench.

### NavigationMenuItemLocalization

Represents the translated value of a navigation menu item in an Experience Cloud site. This object is available in API version 36.0 and later.

#### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

#### Special Access Rules

Navigation menus are available only in Experience Cloud sites created using Experience Builder templates. To use navigation menus in the Build Your Own template, you must build a custom navigation menu component.

|                  | • Russian: ru  
|                  | • Spanish: es  
|                  | • Spanish (Mexico): es_MX  
|                  | The Salesforce user interface is fully translated to Thai, but Help is in English.  
| **NamespacePrefix** | **Type**: string  
|                  | **Properties**: Filter, Group, Nillable, Sort  
|                  | **Description**: The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.  
|                  | The namespace prefix can have one of the following values.
In Developer Edition orgs, **NamespacePrefix** is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

In orgs that are not Developer Edition orgs, **NamespacePrefix** is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

**Description** The translated text for the navigation menu item. Label is **Translation Text**. |

**Network**

Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they’re communities, sites, or portals, to meet your business needs, then transition seamlessly between them. Experience Cloud sites let you share information, records, and files with coworkers and stakeholders all in one place. This object is available in API version 26.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve(), update()

**Special Access Rules**

This object is available only when your org has digital experiences enabled.

### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> To change the <code>EmailSenderAddress</code> value, you must first specify <code>NewSenderAddress</code>, which triggers the sending of an address change verification email. After you complete the address verification process, <code>EmailSenderAddress</code> changes to the specified <code>NewSenderAddress</code>.</td>
</tr>
</tbody>
</table>

**EmailSenderName**

- **Type**: string
- **Properties**: Filter, Group, Sort, Update
- **Description**: Name from which emails are sent.

**FirstActivationDate**

- **Type**: date
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The date the site was first activated.
  
  This field is available in API version 34.0 and later. If the site was activated or inactive before the release of API version 34.0, this field returns the date that the site was first created.

**ForgotPasswordEmailTemplateId**

- **Type**: reference
- **Properties**: Filter, Group, Sort, Update
- **Description**: ID of the email template used when users forget their password.

**LockoutEmailTemplateId**

- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort, Update
- **Description**: ID of the email template used when users try to reset their password after locking themselves out because of too many login attempts.
  
  This field is available in API version 43.0 and later.

**MaxFileSizeKb**

- **Type**: int

| **Description**                                   | Determines whether user nicknames display instead of their first and last names in most places in the site. A few restrictions to keep in mind about nickname display:  
- Records and user lookups on records show full names. Keep in mind, though, that you can control record and user visibility with sharing rules.  
- Mobile notifications in the Salesforce mobile app show full names. You can turn off mobile notifications in the app to avoid this display.  
- Searches by first, last, and full names aren’t restricted and return matches, but the search results display only nicknames. Global search auto-complete recommendations show any first, last, and full names that the user has searched by or accessed via a record or another location. The recent items list also shows first, last, and full under the same conditions. |
<p>| <strong>OptionPrivateMessagesEnabled</strong>                  | <strong>Type</strong> boolean                                                        |

**Usage**

Use this object to find, view, and update sites in your org. If you’re assigned the Modify All Data, View All Data, or Create and Set Up Experiences permission, you can view all sites in the org. Users without these permissions see only the Preview or Published sites that they’re members of. If you’re assigned the Create and Set Up Experiences permission, you can customize site settings.

**NetworkActivityAudit**

Represents an audit trail of moderation actions in Experience Cloud sites. This object is available in API version 30.0 and later.

**Supported Calls**

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()
Special Access Rules
This object is available only when your org has digital experiences enabled.

</thead>
<tbody>
<tr>
<td>Action</td>
<td></td>
</tr>
</tbody>
</table>

**Type**
picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The moderation action a member performed on a post, comment, or file in an Experience Cloud site.

Values are:
- Flagged as Inappropriate—A member flagged a post, comment, or file as inappropriate.
- Flagged as Spam—A member flagged a post, comment, or file as spam.
- Unflagged—A member removed the flag from a post, comment, or file.
- RemovedFlags—A moderator removed all flags from a post, comment, or file.
- DeletedFlaggedItem—A moderator deleted a flagged post, comment, message, or file.
- DeletedPendingReviewItem—A moderator deleted a post or comment with pending status.
- ModerationRuleFlag—A moderation rule flagged member-generated content.
- ModerationRuleBlock—A moderation rule blocked member-generated content.
- ModerationRuleReplace—A moderation rule replaced member-generated content.
- ModerationRuleReview—A moderation rule sent member-generated content to be reviewed and approved by a moderator.
- ModerationRuleFreeze—A moderation rule froze a member because they created content too frequently within a specific time frame.
- ModerationRuleNotify—A moderation rule notified moderators because a member created content too frequently within a specific time frame.

**Usage**

Use this object to view an audit trail of moderation activity for your Experience Cloud sites. You must have the Modify All Data permission to access this object.

Users with Moderate Experiences Feeds, Moderate Experiences Files, or View All Data can view the audit trail using reports in the Salesforce user interface.

**NetworkAffinity**

Represents a junction object that associates a user profile with a Network object, that is, with an Experience Cloud site. Use NetworkAffinity to assign a default Experience Cloud site to a user profile. This object is available in API version 41.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

To work with the NetworkAffinity object, you must have View Setup or Customize Application permission.

<td>reference</td>
</tr>
</tbody>
</table>
### Usage

The default Experience Cloud site allows you to stamp site-agnostic email notifications to all users with that profile with the selected site's branding. The default Experience Cloud site also becomes the target destination for email notification links. Site-agnostic email notifications include notifications about records, such as cases, accounts, and opportunities.

The `NetworkId` field is not updatable through the API in Workbench, Apex, or SOAP. If you want to change the value for `NetworkId`, you must delete the record and create one with the right value.

### NetworkDiscoverableLogin

Represents the Login Discoverable page from where customers and partners log in to an Experience Cloud site. Customers and partners are users with an External Identity license or any communities license for Experience Cloud. This object is available in API version 44.0 and later.

### Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApexHandlerId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>The ID of the Apex handler created by the Login Discovery page type.</td>
</tr>
</tbody>
</table>
### Usage

Use this object to access the Login Discovery Page, which is a login page type that prompts users to identify themselves with an email address, phone number, or custom identifier. DiscoverableLogin performs an interview-based login process, where users are first prompted to provide identity and then authenticated. For example, users receive a verification code that they enter to complete the login process.

**Note:** The NetworkDiscoverableLogin object is created when Login Discovery Page is selected as the login page type on the Login & Registration (L&R) page. If you later switch to another login page type, such as a Visualforce Page or Experience Builder Page, the object isn’t deleted. The object persistence means you can’t delete the Apex class associated with the NetworkDiscoverableLogin object. To delete the Apex class, return to the L&R page and change the login page type back to Login Discovery page. Select another Apex class, and then you can delete the first one.

### NetworkFeedResponseMetric

Represents an object that stores the date and time values of question posts. It captures information for question creation, answer creation, and when an answer is marked as best answer. This object is available in API version 51.0 and later.
## Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

## Special Access Rules

The NetworkFeedResponseMetric object is available only if both NetworksEnabled and ChatterEnabled org preferences are enabled.

## Fields

<table>

</tr>
</tbody>
</table>
NetworkMember

 Represents a member of an Experience Cloud site. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

Supported Calls

describeSObjects(), query(), retrieve(), update()

Special Access Rules

This object is available only when your org has digital experiences enabled.

</tr>
<tr>
<td><strong>Properties</strong> Filter, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong> The number of reputation points the user has accumulated by performing actions in the Experience Cloud site.</td>
</tr>
</tbody>
</table>

### Usage

Use this object to query members of a certain Experience Cloud site and to update their email notification settings. If you have Modify All Data, View All Data, or Create and Set Up Experiences, you can view all members of any Experience Cloud site, regardless of your own membership. If you have Modify All Data or Create and Set Up Experiences, you can also update any member’s email settings. Users without these permissions can update their own email settings and can see members of the Experience Cloud sites that they’re also members of.

**Tip:** You can directly update reputation points for a member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

### NetworkMemberGroup

Represents a group of members in an Experience Cloud site. Members can be either users in your internal org or external users assigned portal profiles. An administrator adds members to an Experience Cloud site by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the site. This object is available in API version 26.0 and later.

**Note:** If a Chatter customer (from a customer group) is assigned a permission set that is also associated with an Experience Cloud site, the Chatter customer won’t be added to the site.

Prior to API version 27.0, this object was called NetworkProfile.
Supported Calls

create(), describeSObjects(), query(), retrieve(), update()

Note: The upsert() call is not supported for this object.

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssignmentStatus</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>

<td>The ID of the Experience Cloud site that this group of members is associated with.</td>
</tr>
<tr>
<td>ParentId</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID of the profile or permission set associated with the Experience Cloud site.</td>
</tr>
</tbody>
</table>
Usage

Use this object to view the profiles or permission sets associated with a particular Experience Cloud site. Profiles and permission sets are added and removed asynchronously, so you can also check the status of a profile or permission set that was updated in a site.

If you have Modify All Data, View All Data, or Create and Set Up Experiences, you can view all profiles or permission sets for any Experience Cloud site in the org, regardless of your membership. If you have Modify All Data or Create and Set Up Experiences, you can also add profiles or permission sets. Users without these permissions can only find profiles and permission sets for Experience Cloud sites that they're members of.

Sample Code

```java
// Create a new NetworkMemberGroup with a profile as the ParentId
NetworkMemberGroup nmgInsert = new NetworkMemberGroup();
nmg.setNetworkId("0DBD0000000029o");
nmg.setParentId("00eD0000000z1Ww");
SaveResult[] results = connection.create(new SObject[] { nmgInsert });

// Update an existing NetworkMemberGroup to be removed from the Network
NetworkMemberGroup nmgUpdate = new NetworkMemberGroup();
nmg.setId("0DLDD000000003enOAA");
nmg.setAssignmentStatus("WaitingForRemove");
SaveResult[] results = connection.update(new SObject[] { nmgUpdate });
```

NetworkModeration

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Special Access Rules

This object is available only when your org has digital experiences enabled.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>EntityId</td>
<td></td>
</tr>
</tbody>
</table>

  **Type**
  - reference

  **Properties**
  - Create, Filter, Group, Nillable, Sort

  **Description**
  - ID of the post, comment, or file that was flagged.
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ModerationType</td>
<td><strong>Type</strong>&lt;br&gt;picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong>&lt;br&gt;Create, Defaulted on create, Filter, Group, Nillable, Sort</td>

</tr>
<tr>
<td></td>
<td><strong>Description</strong>&lt;br&gt;Determines visibility of a flagged item. Values are:</td>
</tr>
<tr>
<td></td>
<td>• SelfAndModerators—The user who flagged the item and any moderators can see the flagged item. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• ModeratorsOnly—Only moderators can see the flagged item. If ModeratorsOnly is selected, only moderators can set flags using the API.</td>
</tr>
</tbody>
</table>

### Usage

Use this object to view the items flagged for moderation within a community. Additionally, users with “Moderate Feeds” and “Modify All Data” can remove flags.

Flags on items are created either when a member manually flags an item in a community (if flagging is enabled for that community), or when a trigger automatically flags an item because the item met the trigger criteria.

### NetworkPageOverride

Represents information about custom pages used to override the default pages in Experience Cloud sites. You can create Experience Builder or Visualforce pages and override the default pages in a site. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.
**Supported Calls**

describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

- Only users with the Create and Setup Experiences permission can update this object.
- You can’t override the Change Password Page with a page created using Experience Builder. You can only override it with a Visualforce page.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkId</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>reference</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>- LoginRequired</td>
</tr>
</tbody>
</table>
NetworkSelfRegistration

Represents the account that self-registering Experience Cloud users are associated with by default. Self-registering users in an Experience Cloud site are required to be associated with an account, which the administrator must specify while setting up self-registration for the site. If an account isn’t specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

Supported Calls

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

</table>
NetworkUserHistoryRecent

Represents an Experience Cloud site user’s history of accessed records. This object is available in API version 42.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), undelete()

Special Access Rules

Only users with the Modify All Data permission can view and delete these data.

 - CSN Only  
 - Self Service |

### Usage

Use the `NetworkUserHistoryRecent` object to delete comments, posts, or record access by Experience Cloud site users who would like all such activity to be removed.

### Note

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Fields

</tr>
<tr>
<td><strong>Title</strong></td>
<td>Type string</td>
</tr>
</tbody>
</table>
NoteTag

Associates a word or short phrase with a Note.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter</td>
</tr>
<tr>
<td></td>
<td>Description: ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter</td>
</tr>
</tbody>
</table>
Usage

NoteTag stores the relationship between its parent TagDefinition and the Note being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

OauthCustomScope

Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider.

An OAuth custom scope tells an external entity about a connected app’s permissions to access protected data. The OAuth custom scope that you create in your Salesforce org corresponds to the same custom scope defined in your external entity, and assigned to the resource.

For example, you define an Order Status custom scope in your external entity that allows access to customer order status data in your order system’s API. In Salesforce, you create an OAuth custom scope that you also name Order Status. You assign this custom scope to the connected app requesting access to the order status API. When the external entity receives the connected app’s request to access a customer’s order status, it validates the connected app’s access token and Order Status scope. With a successful validation, the app can access the customer order status information in the order system’s API.
## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()` 

## Special Access Rules

You must have the “Manage Connected Apps” permission to access this object.

## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The description of the permission provided to the connected app by the scope. The custom scope's description must be unique, can only include alphanumeric characters, and can be up to 60 characters long. You can enter a custom label in place of a description. An advantage of using a custom label is that you can maintain reusable text in a single location and translate the text into multiple languages. See Custom Labels.</td>
</tr>
<tr>
<td><strong>Note:</strong> The description formatting requirements that apply to custom scopes also apply to custom labels.</td>
<td></td>
</tr>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string</td>

</tr>
<tr>
<td></td>
<td><strong>Description</strong> Indicates whether the object is included in the connected app's OpenID Connect discovery endpoint. For more information, see OpenID Connect Discovery Endpoint.</td>
</tr>
</tbody>
</table>
### OauthCustomScopeApp

Represents the name of the connected app to which the custom scope is assigned. This object is available in API version 49.0 and later.

**Supported Calls**

`create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()`

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>OauthCustomScopeId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>

<tr>
<td>Description</td>
<td>The name of the connected app to which the custom scope is assigned. If the connected app is part of a package, include the package’s namespace prefix with the connected app’s name. Use the following format: <code>&lt;namespace_prefix&gt;__&lt;connected_app&gt;</code>. Use two underscores (_) between the namespace prefix and connected app’s name. This is a relationship field.</td>
</tr>
<tr>
<td>Relationship Name</td>
<td>OauthCustomScope</td>
</tr>
</tbody>
</table>
OauthToken

Represents an OAuth access token for connected app authentication. Use this object to create a user interface for token management. This object is available in API version 32.0 and later.

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide single sign-on, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected apps allow Salesforce admins to set various security policies and have explicit control over who can use the corresponding apps. Each time that a user grants access to an application, the application obtains a new access token.

Supported Calls

describeSObjects(), query()

Special Access Rules

Users with the Customize Application permission see all tokens for all users in the org. Otherwise, you see only your own tokens.

Fields

</tr>
</thead>
<tbody>
<tr>
<td>Filter, Group, Nillable, Sort</td>
<td></td>
</tr>
</tbody>
</table>

**Description**
The owner of the token.

This is a relationship field.

**Relationship Name**
User

**Relationship Type**
Lookup

**Refers To**
User

### Usage

To delete an AccessToken, send a request to the revoke OAuth token endpoint with the DeleteToken as the parameter. For example, the URL [https://login.salesforce.com/services/oauth2/revoke?token=(the Delete Token)](https://login.salesforce.com/services/oauth2/revoke?token=(the Delete Token)) causes the deletion of the token.

In API version 34.0 and later, this object was enhanced to help manage high instance counts. A `query()` call returns up to 500 rows. A `queryMore()` call returns 500 more, up to 2500 total. No more records are returned after 2500. To make sure that you don’t miss any records, issue a `COUNT()` query in a `SELECT` clause for OauthToken. This query gives you the total number of records. If there are more than 2500 records, divide your query by filtering on fields, like `UserId`, to return subsets of less than 2500 records.
ObjectPermissions

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

To grant a user access to an object, associate an ObjectPermissions record with a PermissionSet that’s assigned to a user. ObjectPermissions records are only supported in PermissionSet, not in Profile.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Summer '20 and later, only users with the View Setup and Configuration permission can access this object.

Fields

**Properties** | Create, Filter, Update
**Description** | If true, users assigned to the parent PermissionSet can edit all records for this object, regardless of sharing settings. Requires PermissionsRead, PermissionsDelete, PermissionsEdit, and PermissionsViewAllRecords for the same object to be true.

| PermissionsRead | Type | boolean
--- | --- | ---
**Properties** | Create, Filter, Update
**Description** | If true, users assigned to the parent PermissionSet can view records for this object.

| PermissionsViewAllRecords | Type | boolean
--- | --- | ---
**Properties** | Create, Filter, Update
**Description** | If true, users assigned to the parent PermissionSet can view all records for this object, regardless of sharing settings. Requires PermissionsRead for the same object to be true.
### Field Name

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SObjectType</strong></td>
</tr>
</tbody>
</table>

#### Type
- picklist

#### Properties
- Create, Filter, Group, Restricted picklist, Sort

#### Description
- The object’s API name. For example, Merchandise__c.

### Permission Dependencies

Some user permissions have dependencies on object permissions. For example, if a permission set has the “Transfer Leads” permission, it also has “Read” and “Create” on the leads object.

You can query from ObjectPermissions up to the parent PermissionSet object. For example:

```sql
SELECT Parent.Name, Parent.PermissionsTransferAnyLead, PermissionsRead, PermissionsCreate
FROM ObjectPermissions
WHERE SobjectType = 'Lead'
```

### Determining Object Access with “Modify All Data”

When using SOQL to query object permissions, be aware that some object permissions are enabled because a user permission requires them.

The exception to this rule is when “Modify All Data” is enabled. While it enables all object permissions, it doesn’t physically store any object permission records in the database. As a result, unlike object permissions that are required by a user permission—such as “View All Data” or “Import Leads”—the query still returns permission sets with “Modify All Data,” but the object permission record will contain an invalid ID that begins with “000”. This ID indicates that the object has full access due to “Modify All Data” and the object permission record can’t be updated or deleted. To remove full access from these objects, disable “Modify All Data” and then delete the resulting object permission record. This ensures that when using SOQL to find all the objects that have full access, it returns all objects that have this access regardless of whether it’s due to “Modify All Data” or because an administrator set full access.

For example, the following will return all permission sets that have “Read” on the Merchandise__c object, regardless of whether it’s explicitly defined on the object or implicitly defined through “Modify All Data.”

```sql
SELECT Id, Parent.label, SobjectType, PermissionsRead,
       Parent.PermissionsModifyAllData, ParentId
FROM ObjectPermissions
WHERE PermissionsRead = true and SobjectType = 'Merchandise__c'
```

### Nesting Object Permissions

You can nest ObjectPermissions in a PermissionSet query. For example, the following returns any permission sets where “Transfer Leads” is true. Additionally, the result set will include the “Read” object permission on leads. This is done by nesting the SOQL with an object permission query using the relationship name for object permissions: ObjectPerms.

```sql
SELECT Id, Name, PermissionsTransferAnyLead,
       (SELECT Id, PermissionsRead from ObjectPerms where SobjectType='Lead')
```
FROM PermissionSet
WHERE PermissionsTransferAnyLead = true

As a result, it’s possible to traverse the relationship between the PermissionSet and any child-related objects (in this case, ObjectPermissions). You can do this from the PermissionSet object by using the child relationship (ObjectPerms, FieldPerms, and so on) or from the child object by referencing the PermissionSet with Parent.permission_set_attribute.

It’s important to consider when to use a conditional WHERE statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```
SELECT Id, Name, PermissionsModifyAllData,
(SELECT Id, SobjectType, PermissionsRead from Objectperms)
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

versus:

```
SELECT Id, SObjectType, PermissionsRead, Parent.Id, Parent.Name,
Parent.PermissionsModifyAllData
FROM ObjectPermissions
WHERE SObjectType='Merchandise__c'
```

ObjectTerritory2AssignmentRule

Represents a territory assignment rule that’s associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is null. Available only if Enterprise Territory Management has been enabled for your organization.

⚠️ Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules
As of Summer ’20 and later, only standard users can access this object. If a territory model is in Active state, any standard user can view that model, including its territories, assignment rules, assigned records, and assigned users. Users cannot view territory models in other states (such as Planning or Archived).
### Fields

<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>Description</strong></td>
<td>Represents advanced filter conditions that were specified for the rule in the online application. For example, “(1 AND 2) OR 3.”</td>
</tr>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
| **Description** | Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The field label in the user interface is *Unique Name*.  

**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.  

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field. |
| IsActive        | **Type**  |
|                 | boolean  |
| **Properties**  | Create, Defaulted on create, Filter, Group, Sort, Update |
| **Description** | Indicates whether the rule is active (true) or inactive (false). Via the API, active rules run automatically when object records are created and edited. The exception is when the value of the IsExcludedFromRealign field on an object record is true, which prevents record assignment rules from evaluating that record. |
| Language        | **Type**  |
|                 | picklist |
| **Properties**  | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update |

2255
### Field Name | Details
--- | ---
**Description** | The language of the label in the user interface.

**MasterLabel** | **Type** string
**Properties** | Create, Filter, Group, Sort, Update
**Description** | Required. The user interface label for the territory type.

**ObjectType** | **Type** picklist
**Properties** | Create, Filter, Group, Restricted picklist, Sort
**Description** | The object that the rule is defined for. For API version 31, Account only.

**Territory2ModelId** | **Type** reference
**Properties** | Create, Filter, Group, Sort
**Description** | The ID of the territory model.

---

### ObjectTerritory2AssignmentRuleItem

A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule object is a null value. Available only if Enterprise Territory Management has been enabled for your organization.

### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()  

### Special Access Rules

As of Summer '20 and later, only standard users can access this object. If a territory model is in Active state, any standard user can view that model, including its territories and assignment rules. For territories in an active model, any standard user can view assigned records and assigned users subject to your organization’s sharing settings. Users cannot view territory models in other states (such as Planning or Archived).

</table>
| Field      | **Type**
|            | picklist |
|            | **Properties**
|            | Create, Filter, Group, Restricted picklist, Sort, Update |
|            | **Description**
|            | The standard or custom object field that the rule item will operate on. |
| Operation  | **Type**
|            | picklist |
|            | **Properties**
|            | Create, Filter, Group, Restricted picklist, Sort, Update |
|            | **Description**
|            | The criterion to apply for the rule item. For example: *equals* or *starts with*. |
| RuleId     | **Type**
|            | reference |
|            | **Properties**
|            | Create, Filter, Group, Sort |
|            | **Description**
|            | The ID of the associated ObjectTerritory2AssignmentRule. |
| SortOrder  | **Type**
|            | int |
|            | **Properties**
|            | Create, Filter, Group, Sort, Update |
|            | **Description**
|            | The order in which this row is evaluated in relation to other ObjectTerritoryAssignmentRuleItem objects for the given ObjectTerritoryAssignmentRule. This field is required for assignment rule items, which are used in the Boolean conditions in assignment rule formulas. |
| Value      | **Type**
|            | string |
|            | **Properties**
|            | Create, Filter, Nillable, Sort, Update |
|            | **Description**
|            | The field value or values to evaluate. For example: if the field is **Billing ZIP/Postal Code**, a value might be 94105.. |
ObjectTerritory2Association

Represents an association (by assignment) between a territory and an object record, such as an account. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Summer ’20 and later, only standard and partner users can access this object. If a territory model is in Active state, any standard or partner user can view that model, including its territories and assignment rules. For territories in an active model, any standard or partner user can view assigned records and assigned users subject to your org’s sharing settings. Users cannot view territory models in other states (such as Planning or Archived).

<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td><code>Filter</code>, <code>Group</code>, <code>Nillable</code>, <code>Sort</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The <code>WhoId</code> represents a human such as a lead or a contact. <code>WhoIds</code> are polymorphic. Polymorphic means a <code>WhoId</code> is equivalent to a contact’s ID or a lead’s ID. The label is <code>Name ID</code>.</td>
</tr>
</tbody>
</table>
If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID.

This is a polymorphic relationship field.

### Refers To
Contact, Lead

## Usage

### Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you want to query, to get a suggestion of the correct SOQL query to use.

2. Issue a SOQL relationship query with a main clause that references the object and an inner clause that references the activity history. For example:

   ```sql
   SELECT (SELECT ActivityDate, Description FROM OpenActivities)
   FROM Account
   WHERE Name Like 'XYZ'
   ```

The user interface enforces sharing rules, filtering out related-list items that a user doesn’t have permission to see.

The following constraints on users who don’t have the “View All Data” permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can’t filter on all records where the account name starts with “A.” Instead, you must reference a single account record.

  ```sql
  SELECT (SELECT ActivityDate, Description FROM OpenActivities
          ORDER BY ActivityDate ASC NULLS LAST, LastModifiedDate DESC
          LIMIT 500)
  FROM Account
  WHERE Name = 'Acme'
  LIMIT 1
  ```

- In the inner clause of the query, you can’t use WHERE.

- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
In the inner clause of the query, you must sort on `ActivityDate` in ascending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate ASC NULLS LAST, LastModifiedDate DESC`.

**SEE ALSO:**
- Task

### OperatingHours

Represents the hours in which a service territory, service resource, or account is available for field service work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

#### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

#### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Nullable, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The description of the operating hours. Add any details that aren’t included in the name.</td>
</tr>
<tr>
<td><strong>LastReferencedDate</strong></td>
<td><strong>Type</strong> dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The date when the operating hours record was last modified. Its label in the user interface is Last Modified Date.</td>
</tr>
<tr>
<td><strong>LastViewedDate</strong></td>
<td><strong>Type</strong> dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The date when the operating hours record was last viewed.</td>
</tr>
</tbody>
</table>
### Usage

By default, only System Administrators can view, create, and assign operating hours.

Service territory members—which are service resources who can work in the territory—automatically use their service territory’s operating hours. If a resource needs different operating hours than their territory, create separate operating hours for them from the Operating Hours tab. Then, select the desired hours in the Operating Hours lookup field on the service territory member detail page.

To view a service resource’s operating hours for a particular territory, navigate to their Service Territories related list and click the Member Number for the territory. This takes you to the service territory member detail page, which lists the member’s operating hours and dates during which they belong to the territory.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **OperatingHoursFeed**
  Feed tracking is available for the object.

### OperatingHoursHistory

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

### Supported Calls

- `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).
## Special Access Rules
Field Service must be enabled in your organization, and field tracking for operating hours fields must be configured.

The field labels are localized to the language of the user performing the operation, if localized versions of those labels are available for that language in the user interface.</td>
</tr>
</tbody>
</table>
## Field Type

In API version 12.0 and later, the value of this field is automatically set based on the value of the `ForecastCategoryName` and can’t be updated any other way. The field properties Create, Defaulted on create, Nillable, and Update are not available in version 12.0.

Possible values are:
- BestCase
- Closed
- Forecast
- MostLikely
- Omitted
- Pipeline

### ForecastCategoryName

**Type**

picklist

**Properties**

Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**

The name of the forecast category. It is implied, but not directly controlled, by the `StageName` field. You can override this field to a different value than is implied by the `StageName` value. Available in API version 12.0 and later.

Possible values are:
- Best Case
- Closed
- Commit
- Most Likely
- Omitted
- Pipeline

### HasOpenActivity

**Type**

boolean

**Properties**

Defaulted on create, Group,

**Description**

Indicates whether an opportunity has an open event or task (`true`) or not (`false`). Available in API version 35.0 and later.

### HasOpportunityLineItem

**Type**

boolean

**Properties**

Defaulted on create, Filter, Group, Sort
### Field Type

<tr>
<td>Properties</td>
<td>Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
</tbody>
</table>
| Description   | ID of the User who has been assigned to work this opportunity. If you update this field, the previous owner’s access becomes Read Only or the access specified in your organization-wide default for opportunities, whichever is greater. If you have set up opportunity teams in your organization, updating this field has different consequences depending on your version of the API:  
  - For API version 12.0 and later, sharing records are kept, as they are for all objects.  
  - For API version before 12.0, sharing records are deleted. |
For API version 16.0 and later, users must have the “Transfer Record” permission in order to update (transfer) account ownership using this field.

This is a relationship field.

**Relationship Name**
Owner

**Relationship Type**
Lookup

**Refers To**
User

### PartnerAccountId
- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: ID of the partner account for the partner user that owns this opportunity. Available if Partner Relationship Management is enabled or if digital experiences is enabled and you have partner portal licenses.

*Note*: If you are uploading opportunities using API version 15.0 or earlier, and one of the opportunities in the batch has a partner user as the owner, the Partner Account field on all opportunities in the batch is set to that partner user’s account regardless of whether the partner user is the owner. In version 16.0, the Partner Account field is set to the appropriate account for the partner user that owns the opportunity. If the owner of the opportunity is not a partner user, this field remains empty.

### Pricebook2Id
- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Nillable, Sort, Update
- **Description**: ID of a related Pricebook2 object. The Pricebook2Id field indicates which Pricebook2 applies to this opportunity. The Pricebook2Id field is defined only for those organizations that have products enabled as a feature. You can specify values for only one field (Pricebook2Id or PricebookId)—not both fields. For this reason, both fields are declared nillable.

This is a relationship field.

**Relationship Name**
Pricebook2

**Relationship Type**
Lookup
### Field

Usage

Use the Opportunity object to manage information about a sale or pending deal. You can also sync this object with a child Quote. To update an Opportunity, your client application needs “Edit” permission on opportunities. You can create, update, delete, and query Attachment records associated with an opportunity via the API. To split credit for an opportunity among multiple opportunity team members, use the OpportunitySplit object.

Client applications can also create or update opportunity objects by converting a Lead with `convertLead()`.

Note: On opportunities and opportunity products, the workflow rules, validation rules, and Apex triggers fire when an update to a child opportunity product or schedule causes an update to the parent record. This means your custom application logic is enforced when there are updates to the parent record, ensuring higher data quality and compliance with your organization’s business policies.

Sample Code—Java

This code starts the sync between an object and a child quote.

```java
public void startQuoteSync() {
    Opportunity opp = new Opportunity();
    opp.setId(new ID("006D000000CpOSy"));
    opp.setSyncedQuoteId(new ID("0Q0D000000002OZ"));
    // Invoke the update call and save the results
    try {
        SaveResult[] saveResults = binding.update(new SObject[] {opp});
        // check results and do more processing after the update call ...
    } catch (Exception ex) {
        System.out.println("An unexpected error has occurred." + ex.getMessage());
        return;
    }
}
```

This code stops the sync between an object and a child quote.

```java
public void stopQuoteSync() {
    Opportunity opp = new Opportunity();
}
```
opp.setId(new ID("006D000000CpOSy"));
opp.setFieldsToNull(new String[] {"SyncedQuoteId"});

// Invoke the update call and save the results
try {
    SaveResult[] saveResults = binding.update(new SObject[] {opp});
    // check results and do more processing after the update call ...
} catch (Exception ex) {
    System.out.println("An unexpected error has occurred." + ex.getMessage());
    return;
}

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**OpportunityChangeEvent** (API version 44.0)

Change events are available for the object.

**OpportunityFeed** (API version 18.0)

Feed tracking is available for the object.

**OpportunityHistory**

History is available for tracked fields of the object.

**OpportunityOwnerSharingRule**

Sharing rules are available for the object.

**OpportunityShare**

Sharing is available for the object.

Additional Considerations

If you are using before triggers to set **Stage** and **Forecast Category** for an opportunity record, the behavior is as follows:

- If you set **Stage** and **Forecast Category**, the opportunity record contains those exact values.
- If you set **Stage** but not **Forecast Category**, the **Forecast Category** value on the opportunity record defaults to the one associated with trigger **Stage**.
- If you reset **Stage** to a value specified in an API call or incoming from the user interface, the **Forecast Category** value should also come from the API call or user interface. If no value for **Forecast Category** is specified and the incoming **Stage** is different than the trigger **Stage**, the **Forecast Category** defaults to the one associated with trigger **Stage**. If the trigger **Stage** and incoming **Stage** are the same, the **Forecast Category** is not defaulted.

If you are cloning an opportunity with products, the following events occur in order:

1. The parent opportunity is saved according to the order of execution.
2. The opportunity products are saved according to the order of execution.
Note: If errors occur on an opportunity product, you must return to the opportunity and fix the errors before cloning.

If any opportunity products contain unique custom fields, you must null them out before cloning the opportunity.

**Usage**

Use this object to manage competitors on an Opportunity, associating multiple competitors on a opportunity and specifying the strengths and weaknesses of each competitor.

SEE ALSO:

- **Opportunity**

**OpportunityContactRole**

Represents the role that a Contact plays on an Opportunity.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Details**

**Description**

Name of the role played by the associated Contact on the Opportunity, such as Business User or Decision Maker.

**Usage**

Use the Opportunity Contact Role object to manage information about contacts and roles related to opportunities. Records of this type appear in the user interface in the Opportunity Contact Role related list and on the Opportunity detail page.

Although allowed, we do not recommend that you create multiple relationships between the same Opportunity and a Contact.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**OpportunityContactRoleChangeEvent (API version 45.0)**

Change events are available for the object.

SEE ALSO:

Object Basics

**OpportunityContactRoleSuggestionInsight**

Represents a suggestion for a new opportunity contact role. Available in API versions 45.0 and later.

**Supported Calls**

describeLayout(), describeSObjects(), getDeleted(), getDeleted(), query(), retrieve()

**Special Access Rules**

To add or decline opportunity contact role suggestions, users need a Sales Cloud Einstein license, edit access on opportunities, and read or edit access on contacts. As of the Spring ’20 release, Pardot and High Velocity Sales users no longer have access to this object.

### Usage

This object is read-only and isn’t supported in workflows, triggers, or process builder.

### OpportunityFieldHistory

Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

### Usage

Use this object to identify changes to any fields on an Opportunity. The OpportunityHistory object represents the history of a change to the Amount, Probability, Stage, or Close Date fields of an Opportunity.

This object respects field level security on the parent object.

SEE ALSO:

- **Opportunity**

### OpportunityHistory

Represents the stage history of an Opportunity.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Description** The value in the opportunity’s Close Date field before the update of the opportunity.  
[Note:](#) In OpportunityHistory records created before Winter ’21, the value is null.  
Available in API version 50.0 and later. |
Usage

This object represents the history of a change to the Amount, Probability, Stage, or Close Date fields of an Opportunity. The OpportunityFieldHistory object represents the history of a change to any of the fields of an Opportunity. To obtain information about how a particular opportunity is progressing, query the OpportunityHistory records associated with a given Opportunity. Please note that if an opportunity’s Amount, Probability, Stage, or Close Date fields have not changed, nothing will be returned in the OpportunityHistory objects. In this case, query the OpportunityFieldHistory records associated with a given Opportunity to get more information about changes to the opportunity.

This object is read-only. The system generates a new record whenever a user or client application changes the value of any of the above fields; the then-current values of all of these major fields are saved in the newly-generated object.

This object respects field-level security on the parent object.

Note: The record is automatically deleted if its parent Opportunity is deleted.

SEE ALSO:

Opportunity

OpportunityInsight

Represents an individual insight (deal prediction, follow-up reminder, or key moment) related to an opportunity record.

Supported Calls

describeLayout(), describeSObjects(), getDeleted(), query(), retrieve()
## Special Access Rules

To see an insight related to a specific opportunity, users need a Sales Cloud Einstein license and access to the opportunity record. As of the Spring ‘20 release, Pardot and High Velocity Sales users no longer have access to this object.

Usage

This object is read-only and isn’t supported in workflows, triggers, or process builder.

OpportunityLineItem

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

The user must have the “Edit” permission on Opportunity records to create or update opportunity line items on an opportunity.

<tr>
<td></td>
<td>ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.</td>
</tr>
</tbody>
</table>
### Field: ConnectionSentId

**Type**: reference  
**Properties**: Filter, Group, Nillable, Sort  
**Description**: ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field’s value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.

### Field: CurrencyIsoCode

**Type**: picklist  
**Properties**: Defaulted on create, Filter, Group, Restricted picklist, Sort  
**Description**: Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization. If the organization has multicurrency enabled, and a Pricebook2 is specified on the parent opportunity (that is, the Pricebook2Id field is not blank on the opportunity referenced by this object’s OpportunityId), then the value of this field must match the currency of the CurrencyIsoCode field on the PricebookEntry records that are associated with this object.

### Field: Description

**Type**: string  
**Properties**: Create, Filter, Group, Nillable, Sort, Update  
**Description**: Text description of the opportunity line item. Limit: 80 characters.

### Field: Discount

**Type**: percent  
**Properties**: Create, Filter, Nillable, Sort, Update  
**Description**: Discount for the product as a percentage. When updating these records:  
- If you specify Discount without specifying TotalPrice, the TotalPrice is adjusted to accommodate the new Discount value, and the UnitPrice is held constant.

<tr>
<td></td>
<td><strong>Description</strong> This field is available only for backward compatibility. It represents the total price of the OpportunityLineItem. If you do not specify UnitPrice, this field is required. If you specify Discount and Quantity, this field or UnitPrice is required. When updating these records, you can change either this value or the UnitPrice, but not both at the same time. This field is nillable, but you can’t set both TotalPrice and UnitPrice to null in the same update request. To insert the TotalPrice via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity. This field is read-only if the opportunity line item has a revenue schedule. If the opportunity line item does not have a schedule or only has quantity schedule, this field can be updated.</td>
</tr>

<tr>
<td></td>
<td><strong>Properties</strong> Create, Defaulted on create, Filter, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>
**Field** | **Details**
--- | ---

**Description**
- The unit price for the opportunity line item. In the Salesforce user interface, this field’s value is calculated by dividing the total price of the opportunity line item by the quantity listed for that line item. Label is *Sales Price*.
- This field or *TotalPrice* is required. You can’t specify both.

If you specify *Discount* and *Quantity*, this field or *TotalPrice* is required.

**Usage**

An Opportunity can have associated OpportunityLineItem records only if the Opportunity has a Pricebook2. An OpportunityLineItem must correspond to a Product2 that is listed in the opportunity's Pricebook2. For information about inserting OpportunityLineItem for an opportunity that does not have an associated Pricebook2 or any existing line items, see Effects on Opportunities.

This object is defined only for orgs with products enabled as a feature. If the products feature isn’t enabled, this object doesn’t appear in the `describeGlobal()` call, and you can’t use `describeSObjects()` or query the OpportunityLineItem object.

For a visual diagram of the relationships between OpportunityLineItem and other objects, see Product and Price Book Objects.

**Note:**
- If the multicurrency option is enabled, the *CurrencyIsoCode* field is present. It can’t be modified, and is always set to the value of the *CurrencyIsoCode* of the parent Opportunity.
- If customizable product schedules are enabled, you can use custom fields in default schedules and customize their layout. But if you’ve applied validation rules or Apex triggers, they’re bypassed when they’re first inserted.

**Effects on Opportunities**

Opportunities with associated OpportunityLineItem records are affected in the following ways:

- Creating an OpportunityLineItem increments the Opportunity *Amount* value by the *TotalPrice* of the OpportunityLineItem. Additionally, inserting an OpportunityLineItem increments the *ExpectedRevenue* on the opportunity by the *TotalPrice* times the opportunity *Probability*.
- The Opportunity *Amount* becomes a read-only field when the opportunity has line items. The API ignores any attempt to update this field on an opportunity with line items. Update requests are not rejected, but the updated value is ignored.
- You can’t update the *PricebookId* field or the *CurrencyIsoCode* field on the opportunity if line items exist. The API rejects any attempt to update these fields on an opportunity with line items.
- When you create or update an OpportunityLineItem, the API verifies that the line item corresponds to a PricebookEntry in the Pricebook2 that is associated with the opportunity. If the opportunity does not have an associated Pricebook2, the API automatically sets the price book on the opportunity if the line item corresponds to a PricebookEntry in an active Pricebook2, and if the PricebookEntry has a *CurrencyIsoCode* field that matches the *CurrencyIsoCode* field of the opportunity. If the Pricebook2 is not active or the *CurrencyIsoCode* fields do not match, an error is returned.
- The Opportunity *HasOpportunityLineItem* field is set to true when an OpportunityLineItem is inserted for that Opportunity.

**SEE ALSO:**
- OpportunityLineItemSchedule
OpportunityLineItemSchedule

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

In API version 38.0 and later, when an OpportunityLineItem record is created for a product with a previously established schedule, an OpportunityLineItemSchedule record is also created.
