CONTENTS

GETTING STARTED ....................................................... 1

Chapter 1: Introducing SOAP API ................................... 1

Customize, Integrate, and Extend Your Salesforce Solutions ........ 2
Supported Salesforce Editions ......................................... 2
Standards Compliance .................................................. 2
Development Platforms ................................................ 2
SOAP API Support Policy .............................................. 3
API End-of-Life .......................................................... 3
Choosing a WSDL ....................................................... 4
Related Resources ....................................................... 4

Quick Start ............................................................... 4
Step 1: Sign up for Salesforce Developer Edition ..................... 4
Step 2: Generate or Obtain the Web Service WSDL .................. 5
Step 3: Import the WSDL File Into Your Development Platform .... 5
Step 4: Walk Through the Sample Code ............................... 7

Chapter 2: Object Basics ................................................. 29

Primitive Data Types .................................................. 30
Field Types .............................................................. 32
Compound Fields ....................................................... 38
  Address Compound Fields ......................................... 39
  Geolocation Compound Field .................................... 41
  Compound Field Considerations and Limitations .................. 42
API Data Types and Salesforce Field Types ......................... 44
Core Data Types Used in API Calls .................................. 45
  sObject .............................................................. 45
  API Fault Element ................................................ 45
  ExceptionCode ...................................................... 46
  Error ................................................................. 50
  StatusCode ........................................................ 51
  ExtendedErrorDetails ............................................. 61
  Duplicate Management Data Types ................................. 61
System Fields .......................................................... 69
Required Fields ....................................................... 70
Frequently-Occurring Fields .......................................... 71
API Field Properties .................................................. 72
Relationships Among Objects ........................................ 73
Relabeling Fields and Tabs and the API .............................. 74
### Contents

- Tooling API Objects in the Enterprise WSDL ........................................ 74
- Salesforce AppExchange Object Prefixes and the API ............................. 74
- Custom Object Behavior ................................................................. 75
- External Objects .............................................................................. 78

#### Chapter 3: Call Basics ................................................................. 80
- Characteristics of API Calls ............................................................. 81
- Factors that Affect Data Access ....................................................... 81
- Package Version Settings ............................................................... 83

#### Chapter 4: Error Handling ......................................................... 85
- Error Handling for Session Expiration ............................................. 86
- More About Error Handling ......................................................... 86

#### Chapter 5: Security ................................................................. 87
- User Authentication ........................................................................ 88
- User Profile and Permission Sets Configuration ................................ 88
- Security Token ............................................................................ 88
- Sharing .......................................................................................... 89
- Implicit Restrictions for Objects and Fields ..................................... 90
- API Access in Salesforce AppExchange Packages ............................. 90
- Outbound Port Restrictions ......................................................... 92

#### Chapter 6: Using the Partner WSDL ........................................... 93
- Obtaining the Partner WSDL File ................................................... 94
- Calls and the Partner WSDL .......................................................... 94
- Objects, Fields, and Field Data and the Partner WSDL ..................... 95
- Queries and the Partner WSDL ....................................................... 95
- Namespaces in the Partner WSDL ................................................ 96
- Package Versions and the Partner WSDL ....................................... 96
- User Interface Themes ................................................................... 97
- Examples Using the Partner WSDL ................................................. 97
  - Sample query and queryMore Calls ............................................ 101
  - Sample search Call ................................................................... 103
  - Sample create Call .................................................................... 106
  - Sample update Call ................................................................... 109

#### Reference ........................................................................................ 112

#### Chapter 7: Data Model ............................................................... 112
- Sales Objects ................................................................................ 113
- Task and Event Objects ................................................................ 113
- Service Cloud Objects .................................................................... 113
- Document, Note, and Attachment Objects .................................... 114
- User, Sharing, and Permission Objects ......................................... 115
Chapter 8: Standard Objects ............................................ 134

AcceptedEventRelation .............................................. 200
Account ............................................................... 202
AccountBrand ......................................................... 223
AccountContactRelation ............................................ 227
AccountCleanInfo ..................................................... 230
AccountContactRole .................................................. 251
AccountInsight ......................................................... 253
AccountOwnerSharingRule ........................................... 257
AccountPartner ......................................................... 260
AccountRelationship .................................................. 262
AccountRelationshipShareRule ....................................... 265
AccountShare .......................................................... 269
AccountTag ............................................................. 273
AccountTeamMember .................................................. 274

Implementing Salesforce Integrations on Lightning Platform ........ 4027
CHAPTER 1  Introducing SOAP API

Salesforce provides programmatic access to your org’s information using simple, powerful, and secure application programming interfaces. To use this document, you should have a basic familiarity with software development, web services, and the Salesforce user interface.

Any functionality described in this guide is available if your org has the API feature enabled. This feature is enabled by default for Performance, Unlimited, Enterprise, and Developer Editions. Some Professional Edition orgs have the API enabled. If you can’t access the features you see in this guide, contact Salesforce.

Salesforce offers several APIs in addition to SOAP API. If you’re wondering whether SOAP API is the right tool to use, check out Which API Do I Use? in Salesforce Help.

Note: Salesforce Education Services offers a suite of training courses to enable developers to design, create, integrate, and extend applications built on the Lightning platform. Be sure to visit http://www.salesforce.com/training to learn more.
Customize, Integrate, and Extend Your Salesforce Solutions

The Lightning Platform allows you to customize, integrate, and extend your Salesforce organization using the language and platform of your choice:

- **Customize Salesforce** with custom fields, links, objects, page layouts, buttons, record types, s-controls, and tabs to meet specific business requirements.
- **Integrate Salesforce** with your org’s ERP and finance systems. Deliver real-time sales and support information to company portals and populate critical business systems with customer information.
- **Extend Salesforce** in presentation, business logic, and data services with new functionality that reflects the business requirements of your org.

For more information about Lightning Platform solutions and developer resources, go to Salesforce Developers.

Supported Salesforce Editions

It is recommended that you use Developer Sandbox to develop Web service client applications. Developer Sandbox is an exact replica of your Salesforce deployment, including all customization and data. For more information, see Deploy Enhancements from Sandboxes.

Developer Edition provides access to all features available with Enterprise Edition. Developer Edition is constrained only by the number of users and the amount of storage space. Developer Edition provides a development context that allows you to build and test your solutions without affecting your org’s live data. Developer Edition accounts are available for free at developer.salesforce.com/gettingstarted.

Standards Compliance

SOAP API is implemented to comply with the following specifications:

<table>
<thead>
<tr>
<th>Standard Name</th>
<th>Website</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Object Access Protocol (SOAP) 1.1</td>
<td><a href="https://www.w3.org/TR/2000/NOTE-SOAP-20000508/">https://www.w3.org/TR/2000/NOTE-SOAP-20000508/</a></td>
</tr>
<tr>
<td>Web Service Description Language (WSDL) 1.1</td>
<td><a href="http://www.w3.org/TR/2001/NOTE-wsdl-20010315">http://www.w3.org/TR/2001/NOTE-wsdl-20010315</a></td>
</tr>
<tr>
<td>WS-I Basic Profile 1.1</td>
<td><a href="http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html">http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html</a></td>
</tr>
</tbody>
</table>

Development Platforms

SOAP API works with current SOAP development environments, including, but not limited to, Visual Studio .NET 2005. In this document, we provide examples in Java and C# (.NET). The Java examples are based on WSC 20.0 (WSC) and JDK 6 (Java Platform Standard Edition Development Kit 6). Other versions of WSC are available at https://github.com/forcedotcom/wsc and http://mvnrepository.com/artifact/com.force.api/force-wsc. To see a complete list of compatible development platforms and more sample code, go to developer.salesforce.com.
**Note:** Development platforms vary in their SOAP implementations. Implementation differences in certain development platforms might prevent access to some or all features of the API. If you are using Visual Studio for .NET development, we recommend that you use Visual Studio 2003 or higher.

### SOAP API Support Policy

Salesforce recommends that your new client applications use the most recent version of the Lightning Platform WSDL file to fully exploit the benefits of richer features and greater efficiency. You can navigate to the most recent WSDL for your organization from Setup by entering **API** in the Quick Find box, then selecting **API**. When a new version is released, use the following steps in Quick Start to update your WSDL:

- Regenerate the WSDL file (see Step 2: Generate or Obtain the Web Service WSDL)
- Import it into your environment (see Step 3: Import the WSDL File Into Your Development Platform)

### Backward Compatibility

Salesforce strives to make backward compatibility easy when using the Lightning platform.

Each new Salesforce release consists of two components:

- A new release of platform software that resides on Salesforce systems
- A new version of SOAP API

For example, the Winter ’07 release included SOAP API version 9.0 and the Summer ’07 release included SOAP API version 10.0.

We maintain support for each SOAP API version across releases of the platform software. SOAP API is backward compatible in that an application created to work with a given SOAP API version will continue to work with that same SOAP API version in future platform software releases.

Salesforce does not guarantee that an application written against one SOAP API version will work with future SOAP API versions: Changes in method signatures and data representations are often required as we continue to enhance SOAP API. However, we strive to keep SOAP API consistent from version to version with minimal, if any, changes required to port applications to newer SOAP API versions.

For example, an application written using SOAP API version 9.0 which shipped with the Winter ’07 release will continue to work with SOAP API version 9.0 on the Summer ’07 release and on future releases beyond that. However, that same application may not work with SOAP API version 10 without modifications to the application.

### API End-of-Life

Salesforce is committed to supporting each API version for a minimum of three years from the date of first release. In order to mature and improve the quality and performance of the API, versions that are more than three years old might cease to be supported.

When an API version is to be deprecated, advance notice is given at least one year before support ends. Salesforce will directly notify customers using API versions planned for deprecation.

**Note:** Versions 7.0 through 20.0 of SOAP API have now been deprecated and are no longer supported. You can continue to access these legacy API versions until Summer ’22 is released, at which point these legacy versions will be retired and will become unavailable. For more information, see this Knowledge Article: Salesforce Platform API Versions 7.0 through 20.0 Retirement.

**Note:** Versions 21.0 through 30.0 of SOAP API will be deprecated in the Summer ’22 release. For more information, see this Knowledge Article: Salesforce Platform API Versions 21.0 through 30.0 Retirement.
Choosing a WSDL

There are two Lightning Platform Web services for which you can obtain WSDL files for API access:

- **Lightning Platform Enterprise WSDL**—This API is for most enterprise users who are developing client applications for their org.
  The enterprise WSDL file is a strongly typed representation of your org’s data. It provides information about your schema, data types, and fields to your development environment, allowing for a tighter integration between it and the Lightning Platform Web service.
  This WSDL changes if custom fields or custom objects are added to, renamed, or removed from, your org’s Salesforce configuration.
  If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL.

  Note the following when generating the enterprise WSDL:
  - If new custom fields or objects are added to, renamed, or removed from your org’s information, you must regenerate the WSDL file to access them.
  - The generated WSDL contains the objects and fields in your org, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.

- **Lightning Platform Partner WSDL**—This API is for Salesforce partners who are developing client applications for multiple orgs.
  As a loosely-typed representation of the Salesforce object model, the partner WSDL can be used to access data within any org.

Related Resources

The Salesforce developer website provides a full suite of developer toolkits, sample code, sample SOAP messages, community-based support, and other resources to help you with your development projects. Be sure to visit developer.salesforce.com for more information, or visit developer.salesforce.com/signup to sign up for a free Developer Edition account.

You can visit these websites to find out more about Salesforce applications:

- **Salesforce** for information about the Salesforce application.
- **Salesforce AppExchange** for access to apps created for Salesforce.
- **Trailblazer Community** for services to ensure Salesforce customer success.

Quick Start

Use this quick start to create a sample application in your development environment.

**Note:** Before you begin building an integration or other client application:

- Install your development platform according to its product documentation.
- Read through all the steps before beginning this quick start. You may also wish to review the rest of this document to familiarize yourself with terms and concepts.

Step 1: Sign up for Salesforce Developer Edition

Use Salesforce Developer Edition to develop, stage, and test your API code against sample data.

Using a separate org to develop your applications protects your live data during testing. This recommendation is especially true for applications that insert, update, or delete data (as opposed to simply reading data). After you’ve tested your code, you can implement it in an edition with API access.
To create a Developer Edition org, go to developer.salesforce.com/signup and follow the instructions for signing up for a Developer Edition organization.

If you already have a Developer Edition organization, verify that your user profile has the API Enabled permission. This permission is enabled by default, but may have been changed by an administrator. For more information, see Salesforce Help.

**Step 2: Generate or Obtain the Web Service WSDL**

To access the Lightning Platform Web service, you need a Web Service Description Language (WSDL) file. The WSDL file defines the Web service that is available to you. Your development platform uses this WSDL to generate an API to access the Lightning Platform Web service it defines. You can either obtain the WSDL file from your organization’s Salesforce administrator or you can generate it yourself if you have access to the WSDL download page in the Salesforce user interface. You can navigate to the most recent WSDL for your organization from Setup by entering API in the Quick Find box, then selecting API.

For more information about WSDL, see http://www.w3.org/TR/wsd1.

**Generating the WSDL File for Your Organization**

Any user with the Modify All Data permission can download the Web Service Description Language (WSDL) file to integrate and extend Salesforce using the API. (The System Administrator profile has this permission.)

The WSDL file is dynamically generated based on which type of WSDL file (enterprise or partner) you download. The generated WSDL defines all of the API calls, objects (including standard and custom objects), and fields that are available for API access for your organization.

To generate the WSDL file for your organization:

1. Log in to your Enterprise, Unlimited, Performance, or Developer Edition Salesforce account. You must log in as an administrator or as a user who has the “Modify All Data” permission. Logins are checked to ensure they are from a known IP address. For more information, see Security and the API.

2. From Setup, enter API in the Quick Find box, then select API to display the WSDL download page.

3. Download the appropriate WSDL:
   - If you’re downloading an enterprise WSDL and you have managed packages installed in your org, click Generate Enterprise WSDL. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.
   - Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the menu, Internet Explorer users can choose Save Target As, while Mozilla Firefox users can choose Save Link As.

**Step 3: Import the WSDL File Into Your Development Platform**

Once you have the WSDL file, you need to import it into your development platform so that your development environment can generate the necessary objects for use in building client Web service applications in that environment. This section provides sample instructions for WSC and Microsoft Visual Studio. For instructions about other development platforms, see your platform’s product documentation.

**Note:** The process for importing WSDL files is identical for the enterprise and partner WSDL files.

**Instructions for Java Environments (WSC)**

Java environments access the API through Java objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization’s WSDL file.

Each SOAP client has its own tool for this process. For WSC, use the wsc utility.
Introducing SOAP API

Step 3: Import the WSDL File Into Your Development Platform

Note: Before you run `wsdlc`, you must have the WSC JAR file installed on your system and referenced in your classpath.

The basic syntax for `wsdlc` is:

```
java -classpath pathToJAR/wsc-22.jar com.sforce.ws.tools.wsdlc pathToWsdl/WsdlFilename
pathToOutputJar/OutputJarFilename
```

This command generates an output jar file based on the specified WSDL file. After the output jar file is created, reference it along with the wsc jar file (for example, `wsc-22.jar`) in your Java program to create a client application.

Instructions for Microsoft Visual Studio

Visual Studio languages access the API through objects that serve as proxies for their server-side counterparts. Before using the API, you must first generate these objects from your organization’s WSDL file.

Once you have the proxy classes for the server-side objects, you need to ensure that you specify whether you have set any values on non-string fields. For more information, see Implementation Considerations.

Visual Studio provides two approaches for importing your WSDL file and generating an XML Web service client: an IDE-based approach and a command line approach. This walkthrough describes how to import your WSDL file through the IDE.

Note: Before you begin, the first step is to create a new application or open an existing application in Visual Studio. In addition, you need to have generated the WSDL file, as described in Generating the WSDL File for Your Organization.

An XML Web service client is any component or application that references and uses an XML Web service. This does not necessarily need to be a client-based application. In fact, in many cases, your XML Web service clients might be other Web applications, such as Web Forms or even other XML Web services. When accessing XML Web services in managed code, a proxy class and the .NET Framework handle all of the infrastructure coding.

To access an XML Web service from managed code:

1. Name your project `Walkthrough` or change the `using` directive in the following sample to `your_project_name.web_reference_name`. Then, add a Web reference to your project for the XML Web service that you want to access. The Web reference creates a proxy class with methods that serve as proxies for each exposed method of the XML Web service.

2. Add the namespace for the Web reference.

3. Create an instance of the proxy class and then access the methods of that class as you would the methods of any other class.

You can add either a .NET 2.0 style Web reference, or a .NET 3.0 style Service reference, depending on your version of Visual Studio and preferred developer environment. A .NET 3.0 style reference uses services like `SoapClient` instead of `SforceService`.

To add a Web reference:

Note: These steps may be different depending on the version of Visual Studio that you’re using. For more information, see “Adding and Removing Web References” in the Visual Studio documentation.

1. If you are using Visual Studio 2010 or earlier, on the Project menu, choose Add Web Reference. For later versions of Visual Studio, on the Project menu, choose Add Service Reference, select Advanced and then select Add Web Reference.

2. In the URL box of the Add Web Reference dialog box, select Advanced and then select Add Web Reference.

3. Click Go to retrieve information about the XML Web service.

4. In the Web reference name box, rename the Web reference to `sforce`, which is the name you will use for this Web reference.
5. Click **Add Reference** to add a Web reference for the target XML Web service.

6. Visual Studio retrieves the service description and generates a proxy class to interface between your application and the XML Web service.

**Note:** If you are using Visual Basic.Net 1.1 and the enterprise WSDL, you will need to modify the generated Web service client to overcome a bug in Visual Studio's client generation utility. The API exposes two objects (Case and Event) whose names conflict with Visual Basic keywords. When the classes that represent these objects are created, Visual Studio wraps the class names with brackets ([Case] and [Event]). This is the method by which you can reuse keywords.

Unfortunately, in the definition of the SObject class, Visual Studio does not wrap Case and Event to class references in the System.Xml.Serialization.XmlIncludeAttribute that are part of the SObject definition. To work around this problem in Visual Studio, you need to edit the XmlIncludeAttribute settings for Case and Event as shown below. This does not apply to C# and only applies when using the enterprise version of the WSDL.

```csharp
System.Xml.Serialization.XmlIncludeAttribute(GetType([Event])), _
System.Xml.Serialization.XmlIncludeAttribute(GetType([Case])), _
```

### Step 4: Walk Through the Sample Code

Once you have imported your WSDL file, you can begin building client applications that use the API. Use the following samples to create a basic client application. Comments embedded in the sample explain each section of code.

#### Java Sample Code

This section walks through a sample Java client application that uses the WSC SOAP client. The purpose of this sample application is to show the required steps for logging into the login server and to demonstrate the invocation and subsequent handling of several API calls.

To run this sample, you must pass the authentication endpoint URL as an argument for your program. You can obtain this URL from the WSDL file. This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds, retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization's data. The `describeGlobal` method determines the objects that are available to the logged in user. This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The DescribeGlobalResult is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string ("SELECT FirstName, LastName FROM Contact"), and iterating through the returned QueryResult.
6. Calls `logout()` to the log the user out.
The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

```java
package com.example.samples;

import java.io.BufferedReader;
import java.io.FileNotFoundException;
import java.io.InputStreamReader;
import java.io.IOException;
import com.sforce.soap.enterprise.DeleteResult;
import com.sforce.soap.enterprise.DescribeGlobalResult;
import com.sforce.soap.enterprise.DescribeGlobalSObjectResult;
import com.sforce.soap.enterprise.DescribeSObjectResult;
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.soap.enterprise.Error;
import com.sforce.soap.enterprise.Field;
import com.sforce.soap.enterprise.FieldType;
import com.sforce.soap.enterprise.GetUserInfoResult;
import com.sforce.soap.enterprise.LoginResult;
import com.sforce.soap.enterprise.PicklistEntry;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.sobject.Account;
import com.sforce.soap.enterprise.sobject.Contact;
import com.sforce.soap.enterprise.sobject.SObject;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;

public class QuickstartApiSample {
    private static BufferedReader reader = new BufferedReader(
        new InputStreamReader(System.in));

    EnterpriseConnection connection;
    String authEndPoint = "";

    public static void main(String[] args) {
        if (args.length < 1) {
            System.out.println("Usage: com.example.samples." +
                "QuickstartApiSamples <AuthEndPoint> ");
            System.exit(-1);
        }

        QuickstartApiSample sample = new QuickstartApiSample(args[0]);
        sample.run();
    }

    public void run() {
        // Make a login call
        if (login()) {
            // Do a describe global
            describeGlobalSample();

            // Describe an object
            describeSObjectsSample();
        }
    }
}
```
// Retrieve some data using a query
querySample();

// Log out
logout();

// Constructor
public QuickstartApiSample(String authEndPoint) {
  this.authEndPoint = authEndPoint;
}

private String getUserInput(String prompt) {
  String result = "";
  try {
    System.out.print(prompt);
    result = reader.readLine();
  } catch (IOException ioe) {
    ioe.printStackTrace();
  }
  return result;
}

private boolean login() {
  boolean success = false;

}
C# Sample Code

This section walks through a sample C# client application. The purpose of this sample application is to show the required steps for logging in and to demonstrate the invocation and subsequent handling of several API calls.
This sample application performs the following main tasks:

1. Prompts the user for their Salesforce username and password.
2. Calls `login()` to log in to the single login server and, if the login succeeds:
   - Sets the returned `sessionId` into the session header, which is required for session authentication on subsequent API calls.
   - Resets the Lightning Platform endpoint to the returned `serverUrl`, which is the target of subsequent API calls.
     - All client applications that access the API must complete the tasks in this step before attempting any subsequent API calls.
   - Retrieves user information and writes it to the console along with session information.
3. Calls `describeGlobal()` to retrieve a list of all available objects for the organization’s data. The `describeGlobal` method determines the objects that are available to the logged in user. This call should not be made more than once per session, since the data returned from the call is not likely to change frequently. The `DescribeGlobalResult` is echoed to the console.
4. Calls `describeSObjects()` to retrieve metadata (field list and object properties) for a specified object. The `describeSObject` method illustrates the type of metadata information that can be obtained for each object available to the user. The sample client application executes a `describeSObjects()` call on the object that the user specifies and then echoes the returned metadata information to the console. Object metadata information includes permissions, field types and lengths, and available values for picklist fields and types for `referenceTo` fields.
5. Calls `query()`, passing a simple query string ("SELECT FirstName, LastName FROM Contact"), and iterating through the returned `QueryResult`.
6. Calls `logout()` to log the user out.

The following sample code uses try/catch blocks to handle exceptions that might be thrown by the API calls.

The following code begins the sample C# client application.

```csharp
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using Walkthrough.sforce;

CHAPTER 2 Object Basics

In this chapter ...

- Primitive Data Types
- Field Types
- Compound Fields
- API Data Types and Salesforce Field Types
- Core Data Types Used in API Calls
- System Fields
- Required Fields
- Frequently-Occurring Fields
- API Field Properties
- Relationships Among Objects
- Relabeling Fields and Tabs and the API
- Tooling API Objects in the Enterprise WSDL
- Salesforce AppExchange Object Prefixes and the API
- Custom Object Behavior
- External Objects

Generally speaking, API objects represent database tables that contain your organization’s information. For example, the central object in the Salesforce data model represents accounts—companies and organizations involved with your business, such as customers, partners, and competitors.

The term “record” describes a particular occurrence of an object (such as a specific account like “IBM” or “United Airlines” that is represented by an Account object). A record is analogous to a row in a database table.

Objects already created for you by Salesforce are called standard objects. Objects that you create in your organization with the user interface or with the Metadata API are called custom objects. Objects you create that map to data stored outside your organization are called external objects.

While this document describes all of the objects available in the API, your applications work with only the objects that you are authorized to access. Programmatic access to objects is determined by the objects defined in your organization, your organization configuration, your user permissions and access settings (which are configured by your organization’s system administrator), your data sharing model, and other factors related specifically to the object.

Most of the objects accessible through the API are read-write objects. However, there are a few objects that are read-only. This fact is noted in the description for the object.

For details about the data types and size restrictions for each object’s fields, see the Salesforce Field Reference Guide.
Primitive Data Types

The API uses the following primitive data types:

<table>
<thead>
<tr>
<th>Value</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>base64</td>
<td>Base 64-encoded binary data. Fields of this type are used for storing binary files in Attachment records, Document records, and Scontrol records. In these objects, the Body or Binary field contains the (base64 encoded) data, while the BodyLength field defines the length of the data in the Body or Binary field. In the Document object, you can specify a URL to the document instead of storing the document directly in the record.</td>
</tr>
<tr>
<td>boolean</td>
<td>Boolean fields have one of these values: true (or 1), or false (or 0).</td>
</tr>
<tr>
<td>byte</td>
<td>A set of bits.</td>
</tr>
<tr>
<td>date</td>
<td>Date data. Fields of this type contain date values, such as ActivityDate in the Event object. Unlike dateTime fields, date fields contain no time value—the time portion of a date field is not relevant and is always set to midnight in the Coordinated Universal Time (UTC) time zone. If you specify a date value in a query, you can filter on date fields only.</td>
</tr>
<tr>
<td>dateTime</td>
<td>Date/time values (timestamps). Fields of this type handle date/time values (timestamps), such as ActivityDateTime in the Event object or the CreatedDate, LastModifiedDate, or SystemModstamp in many objects. Regular dateTime fields are full timestamps with a precision of one second. They are always transferred in the Coordinated Universal Time (UTC) time zone. In your client application, you might need to translate the timestamp to or from a local time zone. If you specify a dateTime value in a query, you can filter on dateTime fields only. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation. Note: The Event object has a DurationInMinutes field that specifies the number of minutes for an event. Even though this is a temporal value, it is an integer type—not a dateTime type.</td>
</tr>
<tr>
<td>double</td>
<td>Double values. Fields of this type can contain fractional portions (digits to the right of the decimal place), such as ConversionRate in CurrencyType. In the API, all non-integer values (such as Currency Field Type and Percent Field Type) contain values of type double. Some restrictions may be applied to double values: scale: Maximum number of digits to the right of the decimal place. precision: Total number of digits, including those to the left and the right of the decimal place. The maximum number of digits to the left of the decimal place is equal to precision minus scale. In the Salesforce user interface, precision is defined differently—it is the maximum number of digits allowed to the left of the decimal place. Values can be stored in scientific notation if the number is large enough (or, for negative numbers, small enough), as indicated by the W3C XML Schema Part 2: Datatypes Second Edition specification. Warning: When the user sets the precision in custom fields in the Salesforce application, it displays the precision set by the user, even if the user enters a more precise value than defined for those</td>
</tr>
</tbody>
</table>
Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the `NumberOfEmployees` in an Account. For integer fields, `digits` specifies the maximum number of digits that an int can have.

<table>
<thead>
<tr>
<th>Value</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the <code>NumberOfEmployees</code> in an Account. For integer fields, <code>digits</code> specifies the maximum number of digits that an int can have.</td>
</tr>
<tr>
<td>long</td>
<td>Large integers. They are similar to the int type but can hold a wider range of numbers. The smallest possible value for long is -9223372036854775808 and the largest possible value is 9223372036854775807. For long fields, <code>digits</code> specifies the maximum number of digits that the number can have.</td>
</tr>
<tr>
<td>string</td>
<td>Character strings. Fields that are of data type string contain text and some have length restrictions depending on the data being stored. For example, in the Contact object, the <code>FirstName</code> field is 40 characters, the <code>LastName</code> field is 80 characters, the <code>MailingStreet</code> is 255 characters.</td>
</tr>
</tbody>
</table>

| time | Time values. Fields of this type handle time values, such as `FridayEndTime` in the BusinessHours object, with a precision of one millisecond. Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation. |

Note: For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. `AllowFieldTruncationHeader` allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: `anyType`, `email`, `encryptedstring`, `multipicklist`, `phone`, `picklist`, `string`, and `textarea`.

These data types are used in the SOAP messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these SOAP data types.

The primitive data types are:

- specified in the World Wide Web Consortium’s publication XML Schema Part 2: Data Types at the following URL: [http://www.w3.org/TR/xmlschema-2/](http://www.w3.org/TR/xmlschema-2/).
- enumerated in the `SOAPType` field of the `Field` type, which is described in the `fields` property of the `DescribeSObjectResult`.

Primitive types are used as a standardized way to define, send, receive, and interpret basic data types in the SOAP messages exchanged between client applications and the API. In addition, primitive data types are interpreted in a Salesforce-specific way, which is useful for display formatting and for numeric conversion (adding values of different currencies).

For example, Salesforce chooses to interpret a double value passed via SOAP as a `double` in a number of possible ways, depending on the field definition. If the field type for that data is currency, Salesforce handles the display of the data by prepending it with a currency symbol and inserting a decimal for precision. Similarly, if the field type is percent, Salesforce handles the display of the data by appending a percent sign (%). Regardless of the field type, however, the value is sent in the SOAP message as a double.

The API uses data types called field types that are defined in the WSDLs. For more information, see Field Types.
Field Types

Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

In addition to the primitive data types, the API defines the following data types for fields:

**Note:** For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. `AllowFieldTruncationHeader` allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: anyType, email, encryptedstring, multipicklist, phone, picklist, string, and textarea.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>What the Field Contains</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>A compound data type that contains address field data. See Address Compound Fields.</td>
</tr>
<tr>
<td>anyType</td>
<td>Polymorphic data type that returns string, picklist, reference, Boolean, currency, int, double, percent, ID, date, datetime, url, or email data depending on the kind of field involved. See AnyType Field Type.</td>
</tr>
<tr>
<td>calculated</td>
<td>Fields that are defined by a formula. See Calculated Field Type.</td>
</tr>
<tr>
<td>combobox</td>
<td>A combobox, which includes a set of enumerated values and allows the user to specify a value not in the list. See ComboBox Field Type.</td>
</tr>
<tr>
<td>currency</td>
<td>Currency values. See Currency Field Type.</td>
</tr>
<tr>
<td>DataCategoryGroupReference</td>
<td>Reference to a data category group or a category unique name. See DataCategoryGroupReference Field Type.</td>
</tr>
<tr>
<td>email</td>
<td>Email addresses. See Email Field Type.</td>
</tr>
<tr>
<td>encryptedstring</td>
<td>Encrypted text fields contain any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Available in API versions 11.0 and later.</td>
</tr>
<tr>
<td>ID</td>
<td>Primary key field for the object. See ID Field Type.</td>
</tr>
<tr>
<td>Note:</td>
<td>Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your Web services toolkit documentation for more information.</td>
</tr>
<tr>
<td>JunctionIdList</td>
<td>A string array of referenced ID values that represent the many-to-many relationship of an underlying junction entity. Query and manipulate the string array to query and manipulate the underlying junction entities in a single API call. See JunctionIdList Field Type</td>
</tr>
<tr>
<td>Warning:</td>
<td>Adding a JunctionIdList field name to the fieldsToNull property deletes all related junction records. This action can’t be undone.</td>
</tr>
<tr>
<td>location</td>
<td>A compound data type that contains latitude and longitude values for geolocation fields. See Geolocation Compound Field.</td>
</tr>
<tr>
<td>Field Type</td>
<td>What the Field Contains</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>masterrecord</td>
<td>When records are merged, the ID of the record that is saved (the other records are deleted).</td>
</tr>
<tr>
<td>multipicklist</td>
<td>Multi-select picklists, which include a set of enumerated values from which multiple values can be selected. See Multi-Select Picklist Field Type.</td>
</tr>
<tr>
<td>percent</td>
<td>Percentage values. See Percent Field Type.</td>
</tr>
<tr>
<td>phone</td>
<td>Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting. See Phone Field Type.</td>
</tr>
<tr>
<td>picklist</td>
<td>Picklists, which include a set of enumerated values from which one value can be selected. See Picklist Field Type.</td>
</tr>
<tr>
<td>reference</td>
<td>Cross-references to a different object. Analogous to a foreign key field in SQL. See Reference Field Type.</td>
</tr>
<tr>
<td>textarea</td>
<td>String that is displayed as a multiline text field. See Textarea Field Type.</td>
</tr>
<tr>
<td>url</td>
<td>URL values. Client applications commonly display URLs as hyperlinks. See URL Field Type.</td>
</tr>
</tbody>
</table>

These field types extend primitive data types. Many of these field types follow common data typing conventions that are made explicit in their metadata. However, certain field types have unique characteristics that you must understand before using them in your client application.

These field types apply to both standard and custom fields. They are enumerated in the `type` field of the `Field Types` type, which is described in the `fields` property of the DescribeSObjectResult.

- **Note:** Some numeric fields have precision and scale limits. In addition, certain text fields have length restrictions. These restrictions are enforced when you `create()` or `update()` objects. However, the API can return data that does not meet these restrictions.

### AnyType Field Type

The `anyType` field type is dynamic and returns `string`, `date`, `number`, or `boolean` data depending on the kind of field involved. For example, the element in a SOAP message has an `xsi:type="xsd:string"` attribute if the field is of type `string`. This field type is used in history objects for the `NewValue` and `OldValue` fields. It is also a valid field type for `fieldType` and `soapType`.

- **Note:** Most SOAP toolkits automatically deserialize this element into the correct native type.

### Calculated Field Type

Calculated fields are read-only fields in the API. These fields are defined by a formula, which is an algorithm that derives its value from other fields, expressions, or values. You can filter on these fields in SOQL, but you don’t replicate these fields. The length of text calculated fields is 3900 characters or less—anything longer is truncated.

Calculated fields are called formula fields in the Salesforce user interface.

### ComboBox Field Type

A combobox is a picklist that also allows users to type a value that is not already specified in the list. A combobox is defined as a string value.
Currency Field Type

Currency fields contain currency values, such as the `ExpectedRevenue` field in a Campaign, and are defined as type `double`. For organizations that have the multicurrency option enabled, the `CurrencyIsoCode` field is defined for any object that can have currency fields. The `CurrencyIsoCode` field and currency fields are linked in a special way. On any specific record, the `CurrencyIsoCode` field defines the currency of that record. Therefore, the values of all currency fields on that record are expressed in that currency.

For most cases, clients do not need to consider the linking of the `CurrencyIsoCode` field and the currency fields on an object. However, consider the following:

- The `CurrencyIsoCode` field exists only for those organizations that have enabled multicurrency support.
- When displaying the currency values in a user interface, it is preferred to prepend each currency value with its `CurrencyIsoCode` value and a space separator.
- The `CurrencyIsoCode` field is a restricted picklist field. The set of allowable values, defined in the CurrencyType object, can vary from organization to organization. Attempting to set it to a value that is not defined for an organization causes the operation to be rejected.
- If you update the `CurrencyIsoCode` field on an object, it implicitly converts all currency values on that object to the new currency code. The field uses the conversion rates that are defined for that organization in the Salesforce user interface. If you specify currency values in that same `update()` call, the new currency values you specify are interpreted in the new `CurrencyIsoCode` field value, without conversion.
- The picklist values in a `CurrencyIsoCode` field do not exactly match the labels displayed in Salesforce.

To perform currency conversions, client applications can look up the `CurrencyIsoCode` in the CurrencyType object.

DataCategoryGroupReference Field Type

A data category group has categories that classify articles in Salesforce Knowledge and questions in the Answers feature. Every article and question object has two fields of type `DataCategoryGroupReference` which contain the category group and category unique name. You can use the `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` calls to retrieve the category groups and categories associated to these objects.

Email Field Type

Email fields contain email addresses. Client applications are responsible for specifying valid and properly formatted email addresses in `create()` and `update()` calls.

ID Field Type

With rare exceptions, all objects in the API have a field of type `ID`. The field is named `Id` and contains a unique identifier for each record in the object. It is analogous to a primary key in relational databases. When you `create()` a new record, the Web service generates an ID value for the record, ensuring that it is unique within your organization’s data. You cannot use the `update()` call on ID fields. Because the ID value stays constant over the lifetime of the record, you can refer to the record by its ID value in subsequent API calls. Also, the ID value contains a three-character code that identifies the object type, which client applications can retrieve via the `describeSObjects()` call.

In addition, certain objects, including custom objects, have one or more fields of type `reference` that contain the ID value for a related record. These fields have names that end in the suffix “Id”, for example, `OwnerId` in the account object. `OwnerId` contains
the ID of the user who owns that object. Unlike the field named Id, reference fields are analogous to foreign keys and can be changed via the update() call. For more information, see Reference Field Type.

Some API calls, such as retrieve() and delete(), accept an array of IDs as parameters—each array element uniquely identifies the row to retrieve or delete. Similarly, the update() call accepts an array of sObject records—each sObject contains an Id field that uniquely identifies the sObject.

**Note:** Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Consult your web services toolkit documentation for more information.

### 15-Character and 18-Character IDs, and Case Sensitivity

Salesforce IDs are often represented by 15-character, base-62, strings. Each of the 15 characters can be a numeric digit (0-9), a lowercase letter (a-z), or an uppercase letter (A-Z). These 15-character IDs are case-sensitive. To Salesforce, 000000000000Abc is not the same as 000000000000abc.

Don’t use 15-character IDs in case-insensitive applications like Microsoft Access™. These applications incorrectly consider 000000000000Abc to be the same as 000000000000abc.

To avoid these issues, all API calls return 18-character IDs that are case-safe, meaning that they will be compared correctly by case-insensitive applications. The extra 3 characters at the end of the ID encode the case of the preceding 15 characters. Use 18-character IDs in all API calls when creating, editing, or deleting data.

**Note:** 18-character IDs are case-safe, but not case-insensitive. In other words, if you manually change the case of an 18-character ID, Salesforce detects that the three extra characters do not match the case of the preceding characters and returns an error.
To convert the 18-character ID to a 15-character version, you may truncate the last three characters. However, Salesforce recommends that you use the 18-character ID.

**JunctionIdList Field Type**

Starting in API version 34.0, the JunctionIdList field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. JunctionIdList fields can be queried and updated like any other field on the entity. Queries or updates to JunctionIdList fields act as queries or updates to the underlying junction entity records. Fields of type JunctionIdList appear in the WSDL as an unbounded array of type ID.

Query JunctionIdList fields just like any other field. Here’s an example of a SOQL query that includes the TaskWhoIds JunctionIdList field.

```sql
SELECT Id, Subject, TaskWhoIds
FROM Task
WHERE LastModifiedDate > LAST_WEEK
```

**Note:** The total number of records you can query for in a single SOQL query, when one of the fields being queried on is of type JunctionIdList, can’t exceed 500. If the number of records returned exceeds 500, EXCEPTION: System.UnexpectedException: Truncated appears.

The restriction is <total number of entity records> * <total number of records in the entity's JunctionIdList field> <= 500.

For example, you query on the EventWhoIds JunctionIdList field for a list of events. There are 101 events and for each event, there are 5 records in the EventWhoIds JunctionIdList. Therefore, the SOQL query would be querying for 505 records in total, which is over the 500 limit, and you get an exception.
**Multi-Select Picklist Field Type**

Multi-select picklist fields contain a list of one or more items from which a user can choose multiple items. One of the items can be configured as the default item. Selections are maintained as a string containing a series of attributes delimited by semicolons. For example, a query can return the values of a multivalue picklist as “first value; second value; third value”. For information on querying multi-select picklists, see Querying Multi-Select Picklists in the Salesforce SOQL and SOSL Reference Guide.

**Percent Field Type**

Percent fields contain percent values. Percent fields are defined as type double.

**Phone Field Type**

Phone fields contain phone numbers, which can include alphabetic characters. Client applications are responsible for phone number formatting.

**Picklist Field Type**

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as dropdown lists in the Salesforce user interface. One of the items can be configured as the default item.

In the Field object associated with the DescribeSObjectResult, the `restrictedPicklist` field defines whether the field is a restricted picklist or not. The API does not enforce the list of values for advisory (unrestricted) picklist fields on `create()` or `update()`. When inserting an unrestricted picklist field that does not have a PicklistEntry, the system creates an “inactive” picklist value. This value can be promoted to an “active” picklist value by adding the picklist value in the Salesforce user interface.

When creating new, inactive picklists, the API checks to see if there is a match. This check is case-insensitive.

In the Field object associated with the DescribeSObjectResult, the `picklistValues` field contains an array of items (PicklistEntry objects). Each PicklistEntry defines the item’s label, value, and whether it is the default item in the picklist (a picklist has no more than one default value).

Enumerated fields support localization of the labels to the language of the user. For example, for the `Industry` field on an Account, the value “Agriculture” can be translated to various languages. The enumerated field values are fixed and do not change with a user’s language. However, each value may have a specified “label” field that provides the localized label for that value. Always use the value when inserting or updating a field. The `query()` call always returns the value, not the label. Use the corresponding label for a value in the `describeSObjectResult` when displaying the value to the user in any user interface.

The API supports the retrieval of the certain picklists in the following objects: CaseStatus, ContractStatus, LeadStatus, OpportunityStage, PartnerRole, SolutionStatus, TaskPriority, and TaskStatus. Each object represents a value in the respective picklist. These picklist entries always specify some other piece of information, such as whether the status is converted. Your client application can invoke the `query()` call on any of these objects (such as CaseStatus) to retrieve the set of values in the picklist. The application can then use that information while processing other objects (such as Case objects) to find more information about those objects (such as a given case). These objects are read-only via the API. To modify items in picklists, you must use the Salesforce user interface.

**Reference Field Type**

A reference field contains an `Id` value that points to a unique record (usually the parent record) on another object. A reference field is analogous to the concept of a foreign key in relational databases. The name of a reference field ends, by convention, with the letters `Id` (such as `CaseId` or `OpportunityId`). For example, in the OpportunityCompetitor object, the `OpportunityId` field is a reference field that points to the Opportunity object. It contains an ID value that uniquely identifies an Opportunity record.
Sometimes, an object can refer to another object of its same type. For example, an Account can have a parent link that points to another Account.

The Event and Task objects both have WhoId and WhatId cross-reference ID fields. Each of these cross-reference fields can point to one of several other objects. The WhoId field can point to a Contact or Lead, and the WhatId field can point to an Account, Opportunity, Campaign, or Case. In addition, if the WhoId field refers to a Lead, then the WhatId field must be empty.

You can describe and query each cross-referenced object. When you query a cross-reference ID field, it returns an object ID of the appropriate type. You can then query that ID to get additional information about the object, using the ID in the id field for that query.

The cross-reference ID field value is either:
- a valid record in your organization, or
- an empty value, which indicates an empty reference

The cross-reference ID field value, if non-null, is guaranteed to be an object in your organization. However, it is not guaranteed that you can query that object. Users with the “View All Data” permission can always query that object. Other users can be restricted from viewing or editing the referenced object.

When specifying a value for a cross-reference ID field in a create() or update() call, the value must be a valid value of type ID, and the user must have appropriate access to that object. The exact requirements vary from field to field.

**Textarea Field Type**

Textarea fields contain text that can be longer than 4000 bytes. Unlike string fields, textarea fields cannot be specified in the WHERE clause of a queryString of a query() call. To filter records on this field, you must do so while processing records in the QueryResult. For fields with this restriction, its filterable field in the Field type (described in the fields property of the DescribeSObjectResult) is false.

**URL Field Type**

URL fields contain URLs. Client applications are responsible for specifying valid and properly formatted URLs in create() and update() calls.

**Compound Fields**

Compound fields group together multiple elements of primitive data types, such as numbers or strings, to represent complex data types, such as a location or an address. Compound fields are an abstraction that can simplify application code that handles the values, leading to more concise, understandable code.

Address compound fields are available in the SOAP and REST APIs in API version 30.0 and later. Geolocation fields are available in the SOAP and REST APIs in API version 26.0 and later, with some limitations on SOAP for API versions below 30.0.

Compound fields are accessible as a single, structured field, or as individual component fields. The values contained within the compound field and the values in individual fields both map to the same underlying data stored in Salesforce; they always have identical values. Code that references individual component fields is unaffected by the new compound fields.

Compound fields are read-only. Changes are performed by writing to the individual component fields. This maintains a single, consistent method for performing updates, and avoids the possibility of conflicts. For example, if both the BillingAddress compound field and BillingCity individual component field were updated in the same API call, it would be unclear which value should be saved.

Compound fields are available only through the SOAP and REST APIs. Compound fields are described in both the Enterprise and Partner WSDLs. Update your WSDL to at least API 30.0 to access the new compound data types.
Address Compound Fields

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an Address, a structured compound data type, as well as individual address elements.

The Address type extends the Location type, the data type used for compound geolocation fields. Using API 30.0 and later, standard addresses are available in the SOAP and REST APIs as a compound field of type Address, a structured data type that combines the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accuracy</td>
<td>picklist</td>
<td>Accuracy level of the geocode for the address. For example, this field is known as MailingGeocodeAccuracy on Contact.</td>
</tr>
<tr>
<td>City</td>
<td>string</td>
<td>The city detail for the address. For example, this field is known as MailingCity on Contact.</td>
</tr>
<tr>
<td>Country</td>
<td>string</td>
<td>The country detail for the address. For example, this field is known as MailingCountry on Contact.</td>
</tr>
<tr>
<td>CountryCode</td>
<td>picklist</td>
<td>The ISO country code for the address. For example, this field is known as MailingCountryCode on Contact. CountryCode is always available on compound address fields, whether or not state and country/territory picklists are enabled in your organization.</td>
</tr>
<tr>
<td>Latitude</td>
<td>double</td>
<td>Used with Longitude to specify the precise geolocation of the address. For example, this field is known as MailingLatitude on Contact.</td>
</tr>
<tr>
<td>Longitude</td>
<td>double</td>
<td>Used with Latitude to specify the precise geolocation of the address. For example, this field is known as MailingLongitude on Contact.</td>
</tr>
<tr>
<td>PostalCode</td>
<td>string</td>
<td>The postal code for the address. For example, this field is known as MailingPostalCode on Contact.</td>
</tr>
<tr>
<td>State</td>
<td>string</td>
<td>The state detail for the address. For example, this field is known as MailingState on Contact.</td>
</tr>
<tr>
<td>StateCode</td>
<td>picklist</td>
<td>The ISO state code for the address. For example, this field is known as MailingStateCode on Contact. StateCode is always available on compound address fields, whether or not state and country/territory picklists are enabled in your organization.</td>
</tr>
<tr>
<td>Street</td>
<td>textarea</td>
<td>The street detail for the address. For example, this field is known as MailingStreet on Contact.</td>
</tr>
</tbody>
</table>

Address fields are provided on many standard objects, such as Account, Contact, Quote, and User. Some objects provide fields for multiple addresses. For example, Account provides for four different addresses. In this case, address field names are prefixed with the type of address, for example, BillingAddress, ShippingAddress, and so on.

Note: Standard address compound fields are read-only, and are only accessible using the SOAP and REST APIs. See Compound Field Considerations and Limitations on page 42 for additional details of the restrictions this imposes.

When an address is geocoded, its latitude and longitude fields are populated with coordinates. A related geolocation field is also populated. Typically, geocoding service providers geocode addresses, and rate the accuracy of the geocodes.
The accuracy subfield GeocodeAccuracy stores the accuracy data for a geocoded location. External geolocation apps can get the accuracy level of a geocoded address via the API. When you retrieve an address via the API, any accuracy data is included. You can also retrieve the accuracy information by itself, if needed.

Like its parent, the compound Address field, the GeocodeAccuracy field is only available for standard address fields on standard objects.

**Retrieving Compound Address Fields**

Using compound fields can simplify code that works with addresses, especially for SOQL queries. SOQL SELECT clauses can reference addresses directly, instead of all of the individual component fields.

```sql
SELECT Name, BillingAddress
FROM Account
```

To write code that's compatible with API versions before 30.0, as well as API 30.0 and above, use the individual fields:

```sql
SELECT Name, BillingStreet, BillingCity, BillingState, BillingPostalCode,
      BillingCountry, BillingLatitude, BillingLongitude
FROM Account
```

Compound address field values are returned as a structured data type, Address. Code that works with compound address fields needs to reference the individual components of the returned value. See the code sample below.

**Example: Retrieve a Standard Address Compound Field with the SOAP API**

The following Java method uses the Salesforce SOAP API to retrieve and display the Mailing Address for a list of contacts.

```java
// Modified version of code in the SOAP API QuickStart
private void querySample() {
    String soqlQuery = "SELECT FirstName, LastName, MailingAddress FROM Contact";
    try {
        QueryResult qr = connection.query(soqlQuery);
        boolean done = false;
        if (qr.getSize() > 0) {
            System.out.println("\nLogged-in user can see "+ qr.getRecords().length + " contact records.");
            while (!done) {
                System.out.println("\n");
                SObject[] records = qr.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName(); 
                    String lName = con.getLastName();
                    Address addr = (Address) con.getMailingAddress();
                    String streetAddr = "";
                    if (null != addr) streetAddr = addr.getStreet();
                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName + " -- " + streetAddr);
                    } else {
```

40
Using Compound Address Fields as Locations

Compound address fields include latitude and longitude fields. Address fields can be used as locations in SOQL WHERE and ORDER BY clauses. For example, here’s a SOQL query that uses the GEOLOCATION function to retrieve the 10 accounts closest to San Francisco.

```
SELECT Id, Name, BillingAddress
FROM Account
WHERE DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi') < 20
ORDER BY DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi')
LIMIT 10
```

Note: In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geodata integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

Geolocation Compound Field

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

In API versions 26.0 and later, geolocation fields are available in the SOAP and REST APIs as a compound field of type `Location`. This structured data type contains the following fields:

- latitude
- longitude

Note: SOAP calls that use API versions earlier than 30.0 return geolocation compound values as strings. See “Returned Geolocation Data Types” later in this topic.
Geolocation fields are provided on many standard objects, such as Account, Contact, Quote, and User, as part of their address field or fields. Geolocation fields can also be added as custom fields to standard or custom objects.

Note:

- A geolocation compound field is read-only, although its longitude and latitude subfields are editable. You can only access compound fields using the SOAP or REST API. For more information about working with compound fields and their subfields, see Compound Field Considerations and Limitations on page 42.
- Although geolocation fields appear as a single field in the user interface, custom geolocation fields count as three custom fields towards your organization’s limits: one for latitude, one for longitude, and one for internal use.

Retrieving Compound Geolocation Fields

Using compound fields can simplify code that works with geolocations, especially for SOQL queries. SOQL SELECT clauses can reference geolocations directly, instead of the individual component fields.

```sql
SELECT location__c
FROM Warehouse__c
```

To write code that’s compatible with API versions earlier than 26.0 and with API versions 26.0 and later, use the individual latitude and longitude fields.

```sql
SELECT location__latitude__s, location__longitude__s
FROM Warehouse__c
```

Returned Geolocation Data Types

A compound geolocation field value is returned as the structured data type Location. Code that works with compound geolocation fields must reference the individual components of the returned value. See the sample code in Address Compound Fields on page 40.

In API versions earlier than 30.0, SOAP calls return compound geolocation field values as strings, instead of as a structured data type, for backward compatibility. If you plan to display your latitude and longitude values or pass them to a service that expects strings, use the values that are returned. If you plan to use the values in mathematical calculations or pass them to a map service that expects numbers, cast the results to numbers.

The string value format is:

```
API location: [latitudeValue longitudeValue]
```

An example of a regular expression to parse out the latitude and longitude values is:

```
API location: ([+-]?\d{1,2}([.]\d+)?) ([+-]?\d{1,3}([.]\d+)?)
```

The first capture is the latitude, and the third is the longitude.

Compound Field Considerations and Limitations

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

Both address and geolocation compound fields have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP API, REST API, and Apex. The compound versions of fields aren’t accessible anywhere in the Salesforce user interface.
Although compound fields can be queried with the Location and Address Apex classes, they’re editable only as components of the actual field. Read and set geolocation field components by appending "__latitude__s" or "__longitude__s" to the field name, instead of the usual "__c." For example:

```apex
Double theLatitude = myObject__c.aLocation__latitude__s;
myObject__c.aLocation__longitude__s = theLongitude;
```

You can’t access or set the compound value.

- You can’t use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Custom geolocation and location fields on standard addresses aren’t supported with email templates.
- You can’t use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are ISBLANK, ISCHANGED, and ISNULL. You can’t use BLANKVALUE, CASE, NULLVALUE, PRIORVALUE, or the equality and comparison operators with compound fields. The equality and comparison operators include = and == (equal), < > and != (not equal), < (less than), > (greater than), <= (less than or equal), => (greater than or equal), & & (AND), and | | (OR).

Address compound fields have the following limitations.

- Compound address fields are available only for address fields that exist as part of the standard objects included in Salesforce. You can’t create custom compound address fields.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.
- The accuracy subfield of address fields is populated only when an address is geocoded. Typically, geocoding service providers provide accuracy data for an address’s latitude and longitude coordinates.
- Address fields can’t be used in WHERE statements in SOQL. Address fields aren’t filterable, but the isFilterable() method of the DescribeFieldResult Apex class erroneously returns true for address fields.

Geolocation compound fields have the following limitations.

- Geolocation fields aren’t supported in custom settings.
- Geolocation fields aren’t available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can’t be used in filter-based workflow updates and approvals.
- DISTANCE formulas are supported in:
  - Entry criteria for workflow rules and approval processes
  - Field update actions in workflow rules and approval processes
  - Custom validation rules
  - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren’t supported in Salesforce to Salesforce.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo data integration
rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search AppExchange.

- Geolocation fields are supported in SOQL with the following limitations.
  - `DISTANCE` and `GEOLOCATION` are supported in `WHERE` and `ORDER BY` clauses in SOQL, but not in `GROUP BY`. `DISTANCE` is supported in `SELECT` clauses.
  - `DISTANCE` supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
  - When using the `GEOLOCATION` function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')` works but `DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km')` doesn't work.
  - Apex bind variables aren't supported for the units parameter in the `DISTANCE` function. This query doesn't work.

```java
String units = 'mi';
List<Account> accountList =
    [SELECT ID, Name, BillingLatitude, BillingLongitude
     FROM Account
     WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the [SOQL and SOSL Reference](#).

## API Data Types and Salesforce Field Types

**[other]:** Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Generally, API data types and field types in the user interface have the same names. For example, a date field is represented by a date data type in the API. However, some field types are represented differently depending on whether you are inspecting an object via the API or the user interface. The following table contains the mapping for field types and data types that are different:

<table>
<thead>
<tr>
<th>API Data Type</th>
<th>Corresponding Field Types in the User Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Lookup relationship, master-detail relationship</td>
</tr>
<tr>
<td>string</td>
<td>Auto number, email, phone, picklist, multi-select picklist, text, text area, long text area, rich text area, data category group reference and URL. Different maximum lengths are specified in the WSDL for text, text area, and long text area.</td>
</tr>
<tr>
<td>boolean</td>
<td>Checkbox</td>
</tr>
<tr>
<td>double</td>
<td>Currency, formula, number, percent, and roll-up summary</td>
</tr>
<tr>
<td>Varies by type</td>
<td>When formula fields are created in the user interface, a type must be specified. This type corresponds to the API data type of the same name: currency, date, date/time, number, percent, or text.</td>
</tr>
</tbody>
</table>

All other fields that you can create in the user interface fall into one of the following categories:

- The field is not available in both the user interface and the API. For example, the BusinessHours object has fields of API data type time, but you cannot create a custom field of this type.
- Field types are the same as their corresponding API data type. For example, if you create a date field in the user interface, that field is the date data type in the API.
For more information about API data types, see Primitive Data Types and Field Types.

Core Data Types Used in API Calls

Many calls in the API use the following data types:

- **sObject**
- **ID (String).** See ID Field Type.

The API also uses several error handling objects. If an error occurs during a SOAP request, the API returns a SOAP fault message. The message contains different content, depending on the type of error:

- If an error affects the entire request, an API Fault Element, is returned, containing an ExceptionCode and the associated error message text.
- If the error affects some records and not others, an Error is returned, containing a Status Code. These errors typically occur during bulk operations, such as creating, updating, or deleting multiple records with a single call.

**sObject**

An sObject represents an object, such as an Account or Campaign. For a list of standard objects, see Standard Objects.

An sObject has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldsToNull</td>
<td>string[]</td>
<td>Array of one or more field names whose value you want to explicitly set to null. When used with <code>update()</code> or <code>upsert()</code>, you can specify only those fields that you can update and that have the nillable property. When used with <code>create()</code>, you can specify only those fields that you can create and that have the nillable or the default on create property. For example, if specifying an ID field or required field results in a runtime error, you can specify that field name in <code>fieldsToNull</code>. Similarly, if a picklist field has a default value and you want to set the value to null instead, specify the field in <code>fieldsToNull</code>.</td>
</tr>
<tr>
<td>ID</td>
<td>ID</td>
<td>Unique ID for this individual object. For the <code>create()</code> call, this value is null. For all other API calls, this value must be specified.</td>
</tr>
</tbody>
</table>

**API Fault Element**

An ApiFault element contains information about a fault that occurs when processing a service request. The ApiFault element has the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exceptionCode</td>
<td>ExceptionCode</td>
<td>A code that characterizes the exception. The full list of exception codes is available in the WSDL file for your org. See Generating the WSDL File for Your Organization.</td>
</tr>
<tr>
<td>exceptionMessage</td>
<td>string</td>
<td>Exception message text.</td>
</tr>
<tr>
<td>extendedErrorDetails</td>
<td>ExtendedErrorDetails</td>
<td>More details about the exception, including an extended error code and extra error properties, when available. Reserved for future use.</td>
</tr>
</tbody>
</table>
The following table lists the API fault elements that represent all the API faults that can occur.

<table>
<thead>
<tr>
<th>Fault</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApiQueryFault</td>
<td>The row and column numbers where the problem occurred.</td>
</tr>
<tr>
<td>LoginFault</td>
<td>An error occurred during the <code>login()</code> call.</td>
</tr>
<tr>
<td>InvalidSObjectFault</td>
<td>An invalid <code>sObject</code> in a <code>describeSObject()</code>, <code>describeSObjects()</code>, <code>describeLayout()</code>, <code>describeDataCategoryGroupStructures()</code>, <code>create()</code>, <code>update()</code>, <code>retrieve()</code>, or <code>query()</code> call.</td>
</tr>
<tr>
<td>InvalidFieldFault</td>
<td>An invalid field in a <code>retrieve()</code> or <code>query()</code> call.</td>
</tr>
<tr>
<td>InvalidNullForRestrictedPicklist</td>
<td>An invalid <code>appMenuType</code> in a <code>describeAppMenu()</code> call.</td>
</tr>
<tr>
<td>MalformedQueryFault</td>
<td>A problem in the <code>queryString</code> passed in a <code>query()</code> call.</td>
</tr>
<tr>
<td>InvalidQueryLocatorFault</td>
<td>A problem in the <code>queryLocator</code> passed in a <code>queryMore()</code> call.</td>
</tr>
<tr>
<td>MalformedSearchFault</td>
<td>A problem in the <code>search</code> passed in a <code>search()</code> call.</td>
</tr>
<tr>
<td>InvalidIdFault</td>
<td>A specified ID was invalid in a <code>setPassword()</code> or <code>resetPassword()</code> call.</td>
</tr>
<tr>
<td>UnexpectedErrorFault</td>
<td>An unexpected error occurred. The error is not associated with any other API fault.</td>
</tr>
</tbody>
</table>

**ExceptionCode**

The following list of `ExceptionCode` values is defined in your WSDL file. Some codes don’t appear in your WSDL, depending on the features you have enabled.

- **API_CURRENTLY_DISABLED**
  Because of a system problem, API functionality is temporarily unavailable.

- **API_DISABLED_FOR_ORG**
  API access has not been enabled for the org. Contact Salesforce to enable API access.

- **CANT_ADD_STANDARD_PORTAL_USER_TO_TERRITORY**
  A user with a standard portal license can’t be added to a territory.

- **CIRCULAR_OBJECT_GRAPH**
  The request failed because it contained a circular object reference.

- **CLIENT_NOT_ACCESSIBLE_FOR_USER**
  The current user does not have permission to access the specified client.

- **CLIENT_REQUIRE_UPDATE_FOR_USER**
  The current user is required to use a newer version of the specified client and doesn’t have access until the client is updated.

- **CLONE_NOT_SUPPORTED**
  This entity does not support the clone operation.

- **CLONE_FIELD_INTEGRITY_EXCEPTION**
  A field integrity exception occurred during the clone operation.
DETAILED_DESCRIPTION

The delete operation triggers a cascade delete on a record, but the logged-in user does not have delete permission on that related object.

DUPLICATE_COMM_NICKNAME

You can’t create a user with the same nickname as another user.

DUPLICATE_VALUE

You can’t supply a duplicate value for a field that must be unique. For example, you can’t submit two copies of the same session ID in a invalidateSessions() call.

EMAIL_BATCH_SIZE_LIMIT_EXCEEDED

A method tried to process more email records than the maximum batch size.

EMAIL_TO_CASE_INVALID_ROUTING

An email to case record has been submitted for processing but the feature is not enabled.

EMAIL_TO_CASE_LIMIT_EXCEEDED

The daily converted email limit for the Email-to-Case feature has been exceeded.

EMAIL_TO_CASE_NOT_ENABLED

The Email-to-Case feature has not been enabled.

EXCEEDED_ID_LIMIT

Too many IDs were specified in a call. For example, more than 2000 IDs were requested in a retrieve() call, or more than 200 session IDs were specified in a logout() call.

EXCEEDED_LEAD_CONVERT_LIMIT

Too many IDs were sent to a convertLead() call.

EXCEEDED_MAX_SIZE_REQUEST

The size of the message sent to the API exceeded 50 MB.

EXCEEDED_MAX_TYPES_LIMIT

The number of object types to describe is too large.

EXCEEDED_QUOTA

The size limit for org data storage was exceeded during a create() call.

FUNCTIONALITY_NOT_ENABLED

Functionality has been temporarily disabled. Other calls continue to work.

INACTIVE_OWNER_OR_USER

The user or record owner is not active.

INACTIVE_PORTAL

The referenced portal is inactive.

INSUFFICIENT_ACCESS

The user does not have sufficient access to perform the operation.

INVALID_ASSIGNMENT_RULE

An invalid AssignmentRuleHeader value was specified.

INVALID BATCH_SIZE

The query options have an invalid batch size value.

INVALID_CLIENT

The client is invalid.
An invalid foreign key can't be set on a field. For example, an object share, such as AccountShare, can't be deleted because the share row is a result of a sharing rule.

The specified field name is invalid.

The specified language can't be used as a filter.

A SOQL query with LIKE specified an invalid character, for example, an incorrectly placed asterisk (*). Correct the query and resubmit.

The specified ID is correctly formatted but isn't valid. For example, the ID is of the wrong type, or the object it identifies no longer exists.

An invalid Salesforce record URL was used when trying to associate a Google Doc to that record. Correct the URL before trying the operation again.

The locator is invalid.

The login() credentials are not valid, or the maximum number of logins have been exceeded. Contact your administrator for more information.

The new password does not conform with the password policies of the org.

The client application tried to modify a record that is locked by an approval process.

Due to password expiration, a valid password must be set using setPassword() before the call can be invoked.

An invalid operator was used in the query() filter clause, at least for that field.

An invalid queryLocator parameter was specified in a queryMore() call. It's also possible that you've exceed the maximum number of calls, which is 10 per user for the API, and 5 for Apex and Visualforce.

The specified search scope is invalid.

The date for replication is out of the allowed range, such as before the org was created.

The setup owner must be an Organization, Profile, or User.

The search() call has invalid syntax or grammar. For more information, see the Salesforce SOQL and SOSL Reference Guide.

The specified search scope is invalid.
INVALID_SESSION_ID
   The specified sessionId is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_SOAP_HEADER
   There is an error in the SOAP header. If you are migrating from an earlier version of the API, be advised that the SaveOptions header can’t be used with API version 6.0 or later. Use AssignmentRuleHeader instead.

INVALID_SSO_GATEWAY_URL
   The URL provided to configure the Single Sign-On gateway was not a valid URL.

INVALID_TYPE
   The specified sObject type is invalid.

INVALID_TYPE_FOR_OPERATION
   The specified sObject type is invalid for the specified operation.

LIMIT_EXCEEDED
   An array is too long. For example, there are too many BCC addresses, targets, or email messages.

LOGIN_DURING_RESTRICTED_DOMAIN
   The user is not allowed to log in from this IP address.

LOGIN_DURING_RESTRICTED_TIME
   The user is not allowed to log in during this time period.

MALFORMED_ID
   An invalid ID string was specified. For information about IDs, see ID Field Type.

MALFORMED_QUERY
   An invalid query string was specified. For example, the query string was longer than 100,000 characters.

MALFORMED_SEARCH
   An invalid search string was specified. For example, the search string was longer than 100,000 characters.

MISSING_ARGUMENT
   A required argument is missing.

MIXED_DML_OPERATION
   There are limits on what kinds of DML operations can be performed in the same transaction. For more information, see Data Manipulation Language in the Apex Developer Guide.

NOT_MODIFIED
   The describe call response has not changed since the specified date.

NO_SOFTPHONE_LAYOUT
   If an org has the CTI feature enabled, but no softphone layout has been defined, this exception is returned if a describe call is issued. This exception is most often caused because no call center has been defined. A default softphone layout is created during call center definition.

   If an org doesn’t have the CTI feature enabled, FUNCTIONALITY_NOT_ENABLED is returned instead.

NUMBER_OUTSIDE_VALID_RANGE
   The number specified is outside the valid range for the field.

OPERATION_TOO_LARGE
   The query has returned too many results. If certain queries are run by a user without the “View All Data” permission and many records are returned, the queries require sharing rule checking. For example, consider queries that are run on objects, such as Task, that use a polymorphic foreign key. These queries return this exception because the operation requires too many resources. To correct, add filters to the query to narrow the scope, or use filters such as date ranges to break the query up into a series of smaller queries.
### ORG_LOCKED
The org has been locked. Contact Salesforce to unlock the org.

### ORG_NOT_OWNED_BY_INSTANCE
The user tried to log in to the wrong server instance. Choose another server instance or log in at https://login.salesforce.com. You can use http instead of https.

### PASSWORD_LOCKOUT
The user has exceeded the allowed number of login attempts. The user must contact an administrator to regain login access.

### PORTAL_NO_ACCESS
Access to the specified portal is not available.

### QUERY_TIMEOUT
The query has timed out. For more information, see the Salesforce SOQL and SOSL Reference Guide.

### QUERY_TOO_COMPLICATED
SOQL query is either selecting too many fields or there are too many filter conditions. Try reducing the number of formula fields referenced in the query.

### REQUEST_LIMIT_EXCEEDED
Exceeded either the concurrent request limit or the request rate limit for your org. For details on API request limits, see API Usage Metering.

### REQUEST_RUNNING_TOO_LONG
A request has taken too long to be processed.

### SERVER_UNAVAILABLE
A server that is necessary for this call is unavailable. Other types of requests could still work.

### SSO_SERVICE_DOWN
The service was unavailable, and an authentication call to the org’s specified Single Sign-On server failed.

### TOO_MANY_APEX_REQUESTS
Too many Apex requests have been issued. If this exception persists, contact Salesforce Customer Support.

### TRIAL_EXPIRED
The trial period for the org has expired. A representative from the company must contact Salesforce to re-enable the org.

### UNSUPPORTED_API_VERSION
A method call was made that doesn't exist in the accessed API version, for example, trying to use upsert() (new in 8.0) against version 5.0.

### UNSUPPORTED_CLIENT
This version of the client is no longer supported.

## Error
An Error contains information about an error that occurred during a create(), merge(), process(), update(), upsert(), delete(), or undelete() call. For more information, see Error Handling. An Error has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statusCode</td>
<td>StatusCode</td>
<td>A code that characterizes the error. The full list of status codes is available in the WSDL file for your org (see Generating the WSDL File for Your Organization).</td>
</tr>
<tr>
<td>message</td>
<td>string</td>
<td>Error message text.</td>
</tr>
</tbody>
</table>
### Description

**TypeName**

Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.

**Fields**

More details about the error, including an extended error code and extra error properties, when available. Reserved for future use.

#### Note:

If your org has active duplicate rules and a duplicate is detected, the SaveResult includes an error with a data type of `DuplicateError`.

### StatusCode

The following table lists API status codes that are returned with an error. Some codes don’t appear in your WSDL, depending on the features you have enabled.

<table>
<thead>
<tr>
<th>StatusCode Object Basics</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td><strong>fields</strong></td>
</tr>
<tr>
<td>extendedErrorDetails</td>
</tr>
</tbody>
</table>

#### ALL_OR_NONE_OPERATION_ROLLED_BACK

The bulk operation was rolled back because one of the records wasn’t processed successfully. See `AllOrNoneHeader`.

#### ALREADY_IN_PROCESS

You can’t submit a record that is already in an approval process. Wait for the previous approval process to complete before resubmitting a request with this record.

#### ASSIGNEE_TYPE_REQUIRED

Designate an assignee for the approval request (ProcessInstanceStep or ProcessInstanceWorkitem).

#### BAD_CUSTOM_ENTITY_PARENT_DOMAIN

The changes you are trying to make can’t be completed because changes to the associated master-detail relationship can’t be made.

#### BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied an email address even though the org’s Compliance BCC Email option is enabled. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can’t BCC any other email address. To disable the option, log in to the user interface and from Setup, enter `Compliance BCC Email` in the Quick Find box, then select `Compliance BCC Email`.

#### BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED

Your client application blind carbon-copied the logged-in user’s email address even though the org’s BCC COMPLIANCE option is set to true. This option specifies a particular email address that automatically receives a copy of all outgoing email. When this option is enabled, you can’t BCC any other email address. To disable the option, log in to the user interface and from Setup, enter `Compliance BCC Email` in the Quick Find box, then select `Compliance BCC Email`.

#### CANNOT_CASCADE_PRODUCT_ACTIVE

An update to a product caused by a cascade can’t be done because the associated product is active.

#### CANNOT_CHANGE_FIELD_TYPE_OF_APEX_REFERENCED_FIELD

You can’t change the type of a field that is referenced in an Apex script.

#### CANNOT_CREATE_ANOTHER_MANAGED_PACKAGE

You can create only one managed package in an org.

#### CANNOT_DEACTIVATE_DIVISION

You can’t deactivate Divisions if an assignment rule references divisions or if the `DefaultDivision` field on a user record isn’t set to null.
**CANNOT_DELETE_LASTDATEDCONVERSION_RATE**
If dated conversions are enabled, you must have at least one DatedConversionRate record.

**CANNOT_DELETE_MANAGED_OBJECT**
You can't modify components that are included in a managed package.

**CANNOT_DISABLE_LAST_ADMIN**
You must have at least one active administrator user.

**CANNOT_ENABLE_IP_RESTRICT_REQUESTS**
If you exceed the limit of five IP ranges specified in a profile, you can't enable restriction of login by IP addresses. Reduce the number of specified ranges in the profile and try the request again.

**CANNOT_INSERT_UPDATE_ACTIVATE_ENTITY**
You do not have permission to create, update, or activate the specified record.

**CANNOT_MODIFY_MANAGED_OBJECT**
You can't modify components that are included in a managed package.

**CANNOT_RENAMEAPEXREFERENCED_FIELD**
You can't rename a field that is referenced in an Apex script.

**CANNOT_RENAMEAPEXREFERENCED_OBJECT**
You can't rename an object that is referenced in an Apex script.

**CANNOT_REPARENT_RECORD**
You can't define a new parent record for the specified record.

**CANNOT_RESOLVE_NAME**
A sendEmail() call could not resolve an object name.

**CANNOT_UPDATE_CONVERTED_LEAD**
A converted lead could not be updated.

**CANT_DISABLE_CORP_CURRENCY**
You can’t disable the corporate currency for an org. To disable a currency that is set as the corporate currency, first use the user interface to change the corporate currency to a different currency. Then disable the original currency.

**CANT_UNSET_CORP_CURRENCY**
You can’t change the corporate currency for an org from the API. Use the user interface to change the corporate currency.

**CHILD_SHARE_FAILS_PARENT**
If you don’t have appropriate permissions on a parent record, you can’t change the owner of or define sharing rules for a child record. For example, you can’t change the owner of a contact record if you can’t edit its parent account record.

**CIRCULAR_DEPENDENCY**
You can’t create a circular dependency between metadata objects in your org. For example, public group A can’t include public group B, if public group B already includes public group A.

**COMMUNITY_NOT_ACCESSIBLE**
You do not have permission to access the Experience Cloud site that this entity belongs to. You must be given permission to access the site before you can access this entity.

**CUSTOM_CLOB_FIELD_LIMIT_EXCEEDED**
You can’t exceed the maximum size for a CLOB field.

**CUSTOM_ENTITY_OR_FIELD_LIMIT**
You have reached the maximum number of custom objects or custom fields for your org.

**CUSTOM_FIELD_INDEX_LIMIT_EXCEEDED**
You have reached the maximum number of indexes on a field for your org.
CUSTOM_INDEX_EXISTS
You can create only one custom index per field.

CUSTOM_LINK_LIMIT_EXCEEDED
You have reached the maximum number of custom links for your org.

CUSTOM_METADATA_LIMIT_EXCEEDED
Your org has reached its custom metadata maximum limit.

CUSTOM_SETTINGS_LIMIT_EXCEEDED
Your org has reached its custom settings maximum limit.

CUSTOM_TAB_LIMIT_EXCEEDED
You have reached the maximum number of custom tabs for your org.

DELETE_FAILED
You can't delete a record because it is in use by another object.

DEPENDENCY_EXISTS
You can't perform the requested operation because of an existing dependency on the specified object or field.

DUPLICATE_CASE_SOLUTION
You can't create a relationship between the specified case and solution because it already exists.

DUPLICATE_CUSTOM_ENTITY_DEFINITION
Custom object or custom field IDs must be unique.

DUPLICATE_CUSTOM_TAB_MOTIF
You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_DEVELOPER_NAME
You can't create a custom object or custom field with a duplicate developer name.

DUPLICATES_DETECTED
Duplicate records have been detected. Used for an Error object with a data type of DuplicateError.

DUPLICATE_EXTERNAL_ID
A user-specified external ID matches more than one record during an upsert.

DUPLICATE_MASTER_LABEL
You can't create a custom object or custom field with a duplicate master name.

DUPLICATE_SENDER_DISPLAY_NAME
A sendEmail() call could not choose between OrgWideEmailAddress.DisplayName or senderDisplayName. Define only one of the two fields.

DUPLICATE_USERNAME
A create, update, or upsert failed because of a duplicate user name.

DUPLICATE_VALUE
You can't supply a duplicate value for a field that must be unique. For example, you can't submit two copies of the same session ID in a invalidateSessions() call.

EMAIL_ADDRESS_BOUNCED
Emails to one or more recipients have bounced. Check the email addresses to make sure that they are valid.

EMAIL_NOT_PROCESSED DUE TO PRIOR_ERROR
Because of an error earlier in the call, the current email was not processed.
EMAIL_OPTED_OUT
A single email message was sent with the REJECT setting in the optOutPolicy field to recipients that have opted out from receiving email. To avoid this error, set the optOutPolicy field to another value.

EMAIL_TEMPLATE_FORMULA_ERROR
The email template is invalid and can't be rendered. Check the template for incorrectly specified merge fields.

EMAIL_TEMPLATE_MERGEFIELD_ACCESS_ERROR
You don't have access to one or more merge fields in this template. To request access, contact your Salesforce administrator.

EMAIL_TEMPLATE_MERGEFIELD_ERROR
One or more merge fields don't exist. Check the spelling of field names.

EMAIL_TEMPLATE_MERGEFIELD_VALUE_ERROR
One or more merge fields have no value. To provide values, update the records before sending the email.

EMAIL_TEMPLATE_PROCESSING_ERROR
The merge fields in this email template can't be processed. Ensure that your template body is valid.

EMPTY_SCONTROL_FILE_NAME
The Scontrol file name was empty, but the binary was not empty.

ENTITY_FAILED_IFLASTMODIFIED_ON_UPDATE
If the value in a record's LastModifiedDate field is later than the current date, you can't update the record.

ENTITY_IS_ARCHIVED
If a record has been archived, you can't access it.

ENTITY_IS_DELETED
You can't reference an object that has been deleted. This status code occurs only in API version 10.0 and later. Previous releases of the API use INVALID_ID_FIELD for this error.

ENTITY_IS_LOCKED
You can't edit a record that is locked by an approval process.

ENVIRONMENT_HUB_MEMBERSHIP_CONFLICT
You can't add an org to more than one Environment Hub.

ERROR_IN_MAILER
An email address is invalid, or another error occurred during an email-related transaction.

FAILED_ACTIVATION
The activation of a Contract failed.

FIELD_CUSTOM_VALIDATION_EXCEPTION
You can't define a custom validation formula that violates a field integrity rule.

FIELD_FILTER_VALIDATION_EXCEPTION
You can't violate field integrity rules.

FILTERED_LOOKUP_LIMIT_EXCEEDED
The creation of the lookup filter failed because it exceeds the maximum number of lookup filters allowed per object.

HTML_FILE_UPLOAD_NOT_ALLOWED
Your attempt to upload an HTML file failed. HTML attachments and documents, including HTML attachments to a Solution, can't be uploaded if the Disallow HTML documents and attachments checkbox is selected on the HTML Documents and Attachments Settings page.

IMAGE_TOO_LARGE
The image exceeds the maximum width, height, and file size.
INACTIVE_OWNER_OR_USER
The owner of the specified item is an inactive user. To reference this item, either reactivate the owner or reassign ownership to another active user.

INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE
Starting with version 32.0, you can’t create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. Before version 32.0, the code is INVALID_READ_ONLY_USER_DML.

INSUFFICIENT_ACCESS_ON_CROSS_REFERENCE_ENTITY
An operation affects an object that is cross-referenced by the specified object, but the logged-in user doesn’t have sufficient permissions on the cross-referenced object. For example, a logged-in user attempts to modify an account record, and the update creates a ProcessInstanceWorkitem. If the user doesn’t have permission to approve, reject, or reassign the ProcessInstanceWorkitem, this exception occurs.

INSUFFICIENT_ACCESS_OR_REDOONLY
You can’t perform the specified action because you don’t have sufficient permissions.

INVALID_ACCESS_LEVEL
You can’t define a new sharing rule that provides less access than the specified org-wide default.

INVALID_ARGUMENT_TYPE
You supplied an argument that is of the wrong type for the operation being attempted.

INVALID_ASSIGNEE_TYPE
You specified an assignee type that is not a valid integer between one and six.

INVALID_ASSIGNMENT_RULE
You specified an assignment rule that is invalid or that isn’t defined in the org.

INVALID_BATCH_OPERATION
The specified batch operation is invalid.

INVALID_CONTENT_TYPE
The outgoing email has an EmailFileAttachment with an invalid contentType property. See RFC2045 - Internet Message Format.

INVALID_CREDIT_CARD_INFO
The specified credit card information is not valid.

INVALID_CROSS_REFERENCE_KEY
The specified value in a relationship field is not valid, or data is not of the expected type.

INVALID_CROSS_REFERENCE_TYPE_FOR_FIELD
The specified cross-reference type is not valid for the specified field.

INVALID_CURRENCY_CONV_RATE
Specify a positive, non-zero value for the currency conversion rate.

INVALID_CURRENCY_CORP_RATE
You can’t modify the corporate currency conversion rate.

INVALID_CURRENCY_ISO
The specified currency ISO code is not valid.

INVALID_EMAIL_ADDRESS
A specified email address is invalid.

INVALID_EMPTY_KEY_OWNER
You can’t set the value for owner to null.
INVALID_EVENT_SUBSCRIPTION
Invalid parameters were specified when subscribing to an event.

INVALID_FIELD
You specified an invalid field name when trying to update or upsert a record.

INVALID_FIELD_FOR_INSERT_UPDATE
You can't combine a person account record type change with any other field update.

INVALID_FIELD_WHEN_USING_TEMPLATE
You can't use an email template with an invalid field name.

INVALID_FILTER_ACTION
The specified filter action can't be used with the specified object. For example, an alert is not a valid filter action for a Task.

INVALID_ID_FIELD
The specified ID field (ID, ownerId), or cross-reference field is invalid.

INVALID_INET_ADDRESS
A specified Inet address is not valid.

INVALID_LINEITEM_CLONE_STATE
You can't clone a Pricebook2 or PricebookEntry record that isn't active.

INVALID_MASTER_OR_TRANSLATED_SOLUTION
The solution is invalid. For example, this exception occurs if you try to associate a translated solution with a master solution that’s associated with another translated solution.

INVALID_MESSAGE_ID_REFERENCE
The outgoing email’s References or In-Reply-To fields are invalid. These fields must contain valid Message-IDs. See RFC2822 - Internet Message Format.

INVALID_OPERATION
There is no applicable approval process for the specified object.

INVALID_OPERATOR
The specified operator is not applicable for the field type when used as a workflow filter.

INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST
You specified an invalid or null value for a restricted picklist.

INVALID_PARTNER_NETWORK_STATUS
The specified partner network status is invalid for the specified template field.

INVALID_PERSON_ACCOUNT_OPERATION
You can't delete a person account.

INVALID_READ_ONLY_USER_DML
Version 31.0 and earlier: You can't create, update, or delete data while the instance where your org resides is being upgraded to the latest release. Try again after the release has completed. For release schedules, see trust.salesforce.com. After version 31.0, the code is INSERT_UPDATE_DELETE_NOT_ALLOWED_DURING_MAINTENANCE.

INVALID_SAVE_AS_ACTIVITY_FLAG
Specify true or false for the saveAsActivity flag.

INVALID_SESSION_ID
The specified sessionId is malformed (incorrect length or format) or has expired. Log in again to start a new session.

INVALID_STATUS
The specified org status change is not valid.
INVALID_TYPE
The specified type is not valid for the specified object.

INVALID_TYPE_FOR_OPERATION
The specified type is not valid for the specified operation.

INVALID_TYPE_ON_FIELD_IN_RECORD
The specified value is not valid for the specified field's type.

IP_RANGE_LIMIT_EXCEEDED
The specified IP address is outside the IP range specified for the org.

JIGSAW_IMPORT_LIMIT_EXCEEDED
The number of records you attempted to purchase from Data.com exceeds your available record addition limit.

LICENSE_LIMIT_EXCEEDED
You have exceeded the number of licenses assigned to your org.

LIGHT_PORTAL_USER_EXCEPTION
You attempted an action with a customer portal that’s not allowed. For example, trying to add the user to a case team.

LIMIT_EXCEEDED
You have exceeded a limit on a field size or value, license, platform event publishing, or other component.

LOGIN_CHALLENGE_ISSUED
An email containing a security token was sent to the user’s email address because the user logged in from an untrusted IP address. The user can’t log in until the security token is added to the end of the password.

LOGIN_CHALLENGE_PENDING
The user logged in from an untrusted IP address, but a security token has not yet been issued.

LOGIN_MUST_USE_SECURITY_TOKEN
The user must add a security token to the end of the password to log in.

MALFORMED_ID
An ID must be either 15 characters, or 18 characters with a valid case-insensitive extension. There is also an exception code of the same name.

MANAGER_NOT_DEFINED
A manager has not been defined for the specified approval process.

MASSMAIL_RETRY_LIMIT_EXCEEDED
A mass mail retry failed because your org has exceeded its mass mail retry limit.

MASS_MAIL_LIMIT_EXCEEDED
The org has exceeded its daily limit for mass email. Mass email messages can’t be sent again until the next day.

MAXIMUM_CCEMAILS_EXCEEDED
You have exceeded the maximum number of specified CC addresses in a workflow email alert.

MAXIMUM_DASHBOARD_COMPONENTS_EXCEEDED
You have exceeded the document size limit for a dashboard.

MAXIMUM_HIERARCHY_LEVELS_REACHED
You have reached the maximum number of levels in a hierarchy.

MAXIMUM_SIZE_OF_ATTACHMENT
You have exceeded the maximum size of an attachment.

MAXIMUM_SIZE_OF_DOCUMENT
You have exceeded the maximum size of a document.
MAX_ACTIONS_PER_RULE_EXCEEDED  
You have exceeded the maximum number of actions per rule.

MAX_ACTIVE_RULES_EXCEEDED  
You have exceeded the maximum number of active rules.

MAX_APPROVAL_STEPS_EXCEEDED  
You have exceeded the maximum number of approval steps for an approval process.

MAX_FORMULAS_PER_RULE_EXCEEDED  
You have exceeded the maximum number of formulas per rule.

MAX_RULES_EXCEEDED  
You have exceeded the maximum number of rules for an object.

MAX_RULE_ENTRIES_EXCEEDED  
You have exceeded the maximum number of entries for a rule.

MAX_TASK_DESCRIPTION_EXCEEDED  
The task description is too long.

MAX_TM_RULES_EXCEEDED  
You have exceeded the maximum number of rules per Territory.

MAX_TM_RULE_ITEMS_EXCEEDED  
You have exceeded the maximum number of rule criteria per rule for a Territory.

MERGE_FAILED  
A merge operation failed.

MISSING_ARGUMENT  
You did not specify a required argument.

NONUNIQUE_SHIPPING_ADDRESS  
You can't insert a reduction order item if the original order shipping address is different from the shipping address of other items in the reduction order.

NO_APPLICABLE_PROCESS  
A process() request failed because the record submitted does not satisfy the entry criteria of any active approval processes for which the user has permission.

NO_ATTACHMENT_PERMISSION  
Your org does not permit email attachments.

NO_INACTIVE_DIVISION_MEMBERS  
You can't add members to an inactive Division.

NO_MASS_MAIL_PERMISSION  
You don't have permission to send the email. You must have "Mass Email" to send mass mail or "Send Email" to send individual email.

NUMBER_OUTSIDE_VALID_RANGE  
The number specified is outside the valid range of values.

NUM_HISTORY_FIELDS_BY_SOBJECT_EXCEEDED  
The number of history fields specified for the sObject exceeds the allowed limit.

OP_WITH_INVALID_USER_TYPE_EXCEPTION  
The operation you attempted can't be performed for one or more users. For example, you can't add high-volume portal users to a group.
**OPTED_OUT_OF_MASS_MAIL**
An email can't be sent because the specified User has opted out of mass mail.

**PACKAGE_LICENSE_REQUIRED**
The logged-in user can't access an object that is in a licensed package without a license for the package.

**PLATFORM_EVENT_ENCRYPTION_ERROR**
The platform event messages could not be published due to a problem with encryption. A misconfiguration in your Salesforce org or a general encryption service error can cause this problem.

**PLATFORM_EVENT_PUBLISHING_UNAVAILABLE**
Publishing platform event messages failed due to a service being temporarily unavailable. Try again later.

**PLATFORM_EVENT_PUBLISH_FAILED**
The platform event message could not be published after one or more attempts because of a system error. Try again later.

**PORTAL_USER_ALREADY_EXISTS_FOR_CONTACT**
A create User operation failed because you can't create a second portal user under a Contact.

**PRIVATE_CONTACT_ON_ASSET**
You can't have a private contact on an asset.

**RECORD_IN_USE_BY_WORKFLOW**
You can't access a record that's in use by a workflow or approval process.

**REQUEST_RUNNING_TOO_LONG**
A request that has been running too long is canceled.

**REQUIRED_FIELD_MISSING**
A call requires a field that was not specified.

**SELF_REFERENCE_FROM_TRIGGER**
You can't recursively update or delete the same object from an Apex trigger. This error often occurs when:
- You try to update or delete an object from within its before trigger.
- You try to delete an object from within its after trigger.

This error occurs with both direct and indirect operations. The following is an example of an indirect operation:

1. A request is submitted to update Object A.
2. A before update trigger on object A creates an object B.
3. Object A is updated.
4. An after insert trigger on object B queries object A and updates it. This update is an indirect update of object A because of the before trigger of object A, so an error is generated.

**SHARE_NEEDED_FOR_CHILD_OWNER**
If a parent record has a child record that needs a sharing rule, you can't delete the sharing rule for the parent record.

**SINGLE_EMAIL_LIMIT_EXCEEDED**
(API version 18.0 and later) The org has exceeded its daily limit for individual emails. Individual email messages can't be sent again until the next day.

**STANDARD_PRICE_NOT_DEFINED**
Custom prices can't be defined without corresponding standard prices.

**STORAGE_LIMIT_EXCEEDED**
You have exceeded your org's storage limit.
### StatusCodeBasics

<table>
<thead>
<tr>
<th>StatusCode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING_TOO_LONG</td>
<td>The specified string exceeds the maximum allowed length.</td>
</tr>
<tr>
<td>TABSET_LIMIT_EXCEEDED</td>
<td>You have exceeded the number of tabs allowed for a tabset.</td>
</tr>
<tr>
<td>TEMPLATE_NOT_ACTIVE</td>
<td>The template specified is unavailable. Specify another template or make the template available for use.</td>
</tr>
<tr>
<td>TERRITORY_REALIGN_IN_PROGRESS</td>
<td>An operation can't be performed because a territory realignment is in progress.</td>
</tr>
<tr>
<td>TEXT_DATA_OUTSIDE_SUPPORTED_CHARSET</td>
<td>The specified text uses a character set that is not supported.</td>
</tr>
<tr>
<td>TOO_MANY_APEX_REQUESTS</td>
<td>Too many Apex requests have been sent. This error is transient. Resend your request after a short wait.</td>
</tr>
<tr>
<td>TOO_MANY_ENUM_VALUE</td>
<td>A request failed because too many values were passed in for a multi-select picklist. You can select a maximum of 100 values for a multi-select picklist.</td>
</tr>
<tr>
<td>TRANSFER_REQUIRES_READ</td>
<td>You can't assign the record to the specified User because the user does not have read permission.</td>
</tr>
<tr>
<td>UNABLE_TO_LOCK_ROW</td>
<td>A deadlock or timeout condition has been detected.</td>
</tr>
<tr>
<td>•</td>
<td>A deadlock involves at least two transactions that are attempting to update overlapping sets of objects. If the transaction involves a summary field, the parent objects are locked, making these transactions especially prone to deadlocks. To debug, check your code for deadlocks and correct. Deadlocks are generally not the result of an issue with Salesforce operations.</td>
</tr>
<tr>
<td>•</td>
<td>A timeout occurs when a transaction takes too long to complete, for example, when replacing a value in a picklist or changing a custom field definition. The timeout state is temporary. No corrective action is needed.</td>
</tr>
<tr>
<td>If an object in a batch can't be locked, the entire batch fails with this error. Errors with this status code contain the IDs of the records that couldn't be locked, when available, in the error message.</td>
<td></td>
</tr>
<tr>
<td>UNAVAILABLE_RECORDTYPE_EXCEPTION</td>
<td>The appropriate default record type could not be found.</td>
</tr>
<tr>
<td>UNDELETE_FAILED</td>
<td>An object could not be undeleted because it does not exist or has not been deleted.</td>
</tr>
<tr>
<td>UNKNOWN_EXCEPTION</td>
<td>The system encountered an internal error. Report this problem to Salesforce.</td>
</tr>
</tbody>
</table>

**Note:** Do not report this exception code to Salesforce if it results from a `sendEmail()` call. The `sendEmail()` call returns this exception code when it is used to send an email to one or more recipients who have the Email Opt Out option selected.

| UNSPECIFIED_EMAIL_ADDRESS                      | The specified user does not have an email address.                          |
| UNSUPPORTED_APEX_TRIGGER_OPERATION            | You can't save recurring events with an Apex trigger.                      |
| UNVERIFIED_SENDER_ADDRESS                     | A `sendEmail()` call attempted to use an unverified email address defined in the OrgWideEmailAddress object. |
**WEBLINK_SIZE_LIMIT_EXCEEDED**
The size of a WebLink URL or JavaScript code exceeds the limit.

**WEBLINK_URL_INVALID**
The WebLink URL has failed the URL string validation check.

**WRONG_CONTROLLER_TYPE**
The controller type for your Visualforce email template does not match the object type being used.

If you receive a status code not listed in the previous table, contact Customer Support.

### ExtendedErrorDetails

Reserved for future use. An `ExtendedErrorDetails` element contains extra detailed information about an error. The `ExtendedErrorDetails` element has the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extendedErrorCode</td>
<td><code>ExtendedErrorCode</code></td>
<td>A code that characterizes the extended error details.</td>
</tr>
<tr>
<td>extended error property</td>
<td>Varies</td>
<td>An extended error property that contains more information about the error. The property name and value vary based on the extended error code.</td>
</tr>
</tbody>
</table>

### Duplicate Management Data Types

**DuplicateError**
Contains information about an error that occurred when an attempt was made to save a duplicate record. Use if your organization has set up duplicate rules, which are part of the Duplicate Management feature.

### Fields

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| duplicateResult | Type `DuplicateResult`  
Description: The details of a duplicate rule and duplicate records found by the duplicate rule. |

<table>
<thead>
<tr>
<th>fields</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string[]</td>
<td>Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>message</th>
<th>Type</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string</td>
<td></td>
</tr>
</tbody>
</table>
### Field | Details
--- | ---
**Description** | Error message text.

#### statusCode

**Type** | StatusCode
--- | ---
**Description** | A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization (see Generating the WSDL File for Your Organization).

### Usage

DuplicateError and its constituent objects are available to organizations that use duplicate rules.

DuplicateError is a data type of Error.

To process duplicates, loop through all the Error objects in the errors field on SaveResult. An Error object with a data type of DuplicateError contains information about an error that occurred when an attempt was made to save a duplicate record. To access information about the duplicates, use the duplicateResult field.

### Java Sample

Here is a sample that shows how to see if there are any errors on the saveResult with a data type of DuplicateError. If so, duplicates were detected. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```java
if (!saveResult.isSuccess()) {
    for (Error e : saveResult.getErrors()) {
        if (e instanceof DuplicateError) {
            System.out.println("Duplicate(s) Detected for lead with ID: " + leads[i].getId());
            System.out.println("ERROR MESSAGE: " + e.getMessage());
            System.out.println("STATUS CODE: " + e.getStatusCode());
            DuplicateResult dupeResult = ((DuplicateError)e).getDuplicateResult();
            System.out.println("Found the following duplicates...");
            for (MatchResult m : dupeResult.getMatchResults()) {
                if (m.isSuccess()) {
                    System.out.println("The match rule that was triggered was " + m.getRule());
                    for (MatchRecord mr : m.getMatchRecords()) {
                        System.out.println("Your record matched " + mr.getRecord().getId() + " of type " + mr.getRecord().getType());
                        System.out.println("The match confidence is " + mr.getMatchConfidence());
                    }
                }
            }
        }
    }
}
```
## DuplicateResult

Represents the details of a duplicate rule that detected duplicate records and information about those duplicate records.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowSave</td>
<td>Type</td>
</tr>
<tr>

<td>Description</td>
</tr>
</tbody>
</table>

### Usage

DuplicateResult and its constituent objects are available to organizations that use duplicate rules.

### Java Sample

Here is a sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```java
package com.doc.example;

import java.io.FileNotFoundException;
```
import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.sobject.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class SaveResultsWithDupeHeader {

    private PartnerConnection partnerConnection = null;
    static SaveResultsWithDupeHeader tester;

    public static void main(String[] args) {
        tester = new SaveResultsWithDupeHeader();
        try {
            tester.demoDuplicateRuleHeader();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }

    /*
     * Make sure that you have an active lead duplicate rule linked to an active matching rule. This method tries to save
     * an array of leads and inspects whether any duplicates were detected
     */
    public void demoDuplicateRuleHeader() throws FileNotFoundException, ConnectionException {

        // Create the configuration for the partner connection
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername("user@domain.com");
        config.setPassword("secret");
        config.setAuthEndpoint("authEndPoint");
        config.setTraceFile("traceLogs.txt");
        config.setTraceMessage(true);
        config.setPrettyPrintXml(true);

        // Initialize the connection
        partnerConnection = new PartnerConnection(config);

        // Get the leads that have to be saved
        SObject[] leads = getLeadsForInsertOrUpdate();

        /* Set a duplicate rule header to return a result if duplicates are detected
         * This sets the allowSave, includeRecordDetails, and runAsCurrentUser flags to true
         */
        partnerConnection.setDuplicateRuleHeader(true, true, true);

        // Save the leads
        SaveResult[] saveResults = partnerConnection.create(leads);

        // Check the results to see if duplicates were detected
        for (int i = 0; i < leads.length; i++) {
            //
        }
SaveResult saveResult = saveResults[i];
if (!saveResult.isSuccess()) {
    for (Error e : saveResult.getErrors()) {
        // See if there are any errors on the saveResult with a data type of
        DuplicateError
            if (e instanceof DuplicateError) {
                System.out.println("Duplicate(s) Detected for lead with ID: " +
                    leads[i].getId());
                System.out.println("ERROR MESSAGE: " + e.getMessage());
                System.out.println("STATUS CODE: " + e.getStatusCode());
                DuplicateResult dupeResult =
                    ((DuplicateError)e).getDuplicateResult();
                System.out.println("Found the following duplicates...");
                for (MatchResult m : dupeResult.getMatchResults()) {
                    if (m.isSuccess()) {
                        System.out.println("The match rule that was triggered was " + m.getRule());
                        for (MatchRecord mr : m.getMatchRecords()) {
                            System.out.println("Your record matched " +
                                mr.getRecord().getId() + " of type " +
                                mr.getRecord().getType());
                            System.out.println("The match confidence is " +
                                mr.getMatchConfidence());
                            for (FieldDiff f : mr.getFieldDiffs()) {
                                System.out.println("For field " + f.getName() + " field difference is " +
                                    f.getDifference().name());
                            }
                        }
                    }
                }
            }
    }
}

// Clear the duplicate rule header
partnerConnection.clearDuplicateRuleHeader();

/**
 * The assumption here is that this method is retrieving leads from either UI, a data
 * source, etc
 */
private SObject[] getLeadsForInsertOrUpdate() {
    return new SObject[0];
}

MatchResult

Represents the duplicate results for a matching rule.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| errors     | **Type** `Error[]`
             | **Description** Errors that occurred during matching for the matching rule. |
| entityType | **Type** `string`
             | **Description** The entity type of the matching rule. |
| matchEngine| **Type** `string`
             | **Description** The match engine for the matching rule. |
| matchRecords| **Type** `MatchRecord[]`
                | **Description** Information about the duplicates detected by the matching rule. |
| rule       | **Type** `string`
             | **Description** The developer name of the matching rule that detected duplicates. |
| size       | **Type** `int`
             | **Description** The number of duplicates detected by the matching rule. |
| success    | **Type** `boolean`
             | **Description** `true` if the matching rule successfully ran. `false` if there's an error with the matching rule. |

## Usage

MatchResult and its constituent objects are available to organizations that use duplicate rules.

There is 1 MatchResult for each saved record that has duplicates. The MatchResult contains all duplicates for that saved record.
Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when leads are saved. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```java
for (MatchResult m : dupeResult.getMatchResults()) {
    if (m.isSuccess()) {
        System.out.println("The match rule that was triggered was " + m.getRule());
        for (MatchRecord mr : m.getMatchRecords()) {
            System.out.println("Your record matched " + mr.getRecord().getId() + " of type " + mr.getRecord().getType());
            System.out.println("The match confidence is " + mr.getMatchConfidence());
        }
    }
}
```

**MatchRecord**

Represents a duplicate record detected by a matching rule.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| additionalInformation | **Type**
|                 | AdditionalInformationMap                                                 |
|                 | **Description**                                                         |
|                 | Other information about matched records.                                |
| fieldDiffs      | **Type**
|                 | FieldDiff[]                                                             |
|                 | **Description**                                                         |
|                 | Matching rule fields and how each field value compares for the duplicate |
|                 | and its matching record.                                                |
| matchConfidence | **Type**
|                 | double                                                                  |
|                 | **Description**                                                         |
|                 | The ranking of how similar a matched record's data is to the data in     |
|                 | your request. Must be equal to or greater than the value of the minMatch |
|                 | Confidence specified in your request. Returns -1 if unused.             |
| record          | **Type**
|                 | sObject                                                                 |
|                 | **Description**                                                         |
|                 | The fields and field values for the duplicate record.                   |
Usage

MatchRecord and its constituent objects are available to organizations that use duplicate rules.
Each MatchRecord represents a duplicate detected when a record is saved. There can be multiple MatchRecord objects for a saved record if multiple duplicates are detected.

Java Sample

Here is a sample that shows how to display the ID and type of all duplicates detected when a lead is saved. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```java
for (MatchRecord mr : m.getMatchRecords()) {
    System.out.println("Your record matched " + mr.getRecord().getId() + " of type " + mr.getRecord().getType());
    System.out.println("The match confidence is " + mr.getMatchConfidence());
}
```

FieldDiff

Represents the name of a matching rule field and how the values of the field compare for the duplicate and its matching record.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>difference</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>differenceType</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>How the values of the matching rule field compare for the duplicate and its matching record.</td>
</tr>
<tr>
<td></td>
<td>Possible values include:</td>
</tr>
<tr>
<td></td>
<td>• Same: Indicates the field values match exactly.</td>
</tr>
<tr>
<td></td>
<td>• Different: Indicates that the field values do not match.</td>
</tr>
<tr>
<td></td>
<td>• Null: Indicates that the field values are a match because both values are blank.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>The name of a field on a matching rule that detected duplicates.</td>
</tr>
</tbody>
</table>

Java Sample

Here is a sample that shows how to display the matching rule field differences when a duplicate is detected. See DuplicateResult for a full code sample that shows how to block users from entering duplicate leads and display an alert and a list of duplicates.

```java
for (FieldDiff f : mr.getFieldDiffs()) {
    System.out.println("For field " + f.getName() + " field difference is ")
}
```
AdditionalInformationMap

Represents other information, if any, about matched records.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| name  | Type: string  
      | Description: The name of the element. |
| value | Type: string  
      | Description: The value of the element. |

System Fields

The following fields are read-only fields found on most objects. These fields are automatically updated during API operations. For example, the ID field is automatically generated during a create operation and the LastModifiedDate is automatically updated when a user modifies a record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id</td>
<td>ID</td>
<td>Globally unique string that identifies a record. For information on IDs, see ID Field Type. Because this field exists in every object, it is not listed in the field table for each object. Id fields have Defaulted on create and Filter access.</td>
</tr>
<tr>
<td>IsDeleted</td>
<td>boolean</td>
<td>Indicates whether the record has been moved to the Recycle Bin (true) or not (false). Because this field does not appear in all objects, it is listed in the field table for each object.</td>
</tr>
</tbody>
</table>

Audit Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreatedById</td>
<td>reference</td>
<td>ID of the User who created this record. CreatedById fields have Defaulted on create and Filter access.</td>
</tr>
<tr>
<td>CreatedDate</td>
<td>dateTime</td>
<td>Date and time when this record was created. CreatedDate fields have Defaulted on create and Filter access.</td>
</tr>
<tr>
<td>LastModifiedById</td>
<td>reference</td>
<td>ID of the User who last updated this record. LastModifiedById fields have Defaulted on create and Filter access.</td>
</tr>
</tbody>
</table>
### Field Basics

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LastModifiedDate</td>
<td>dateTime</td>
<td>Date and time when a user last modified this record. LastModifiedDate fields have Default on create and Filter access.</td>
</tr>
<tr>
<td>SystemModstamp</td>
<td>dateTime</td>
<td>Date and time when a user or automated process (such as a trigger) last modified this record. In this context, &quot;trigger&quot; refers to Salesforce code that runs to implement standard functionality, and not an Apex trigger. SystemModstamp fields have Default on create and Filter access.</td>
</tr>
</tbody>
</table>

**Note:** Audit Fields with the dateTime field type have a certain range of valid dates. Unlike other dateTime fields, the earliest valid date is 1970-01-01T00:00:00Z GMT, or just after midnight on January 1, 1970. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1969-12-31T16:00:00, or 4:00 PM on December 31, 1969.

If you import data into Salesforce and want to retain the audit field values of the source system, you can set the values for audit fields on the following objects: Account, ArticleVersion, Attachment, CampaignMember, Case, CaseComment, Contact, ContentVersion, Contract, Event, Idea, IdeaComment, Lead, Opportunity, Question, Task, Vote, and custom objects. The only audit field you cannot set a value for is SystemModstamp.

1. From Setup, enter **User Interface** in the Quick Find box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions.**
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation.**
4. Using the API, create a record and set its audit fields.

Not all standard objects have all audit fields. Check the Enterprise WSDL to verify which audit fields are available for a given object.

### Parent Reference Fields

If an object has a relationship to a parent object, two fields are added.

- **Parent_Name** contains the object name of the parent. For example, Case has a Contact field that contains a reference to the contact parent of the case.
- **Parent_NameId** contains the ID of the parent. For example, Case has a ContactId field that refers to the contact parent of the case. This field is used in SOQL relationship queries such as the following:

  ```sql
  SELECT Case.ContactId, Case.Contact.Name FROM Case
  ```

Even if the object can parent itself, these fields occur. For example, the Campaign object has a Campaign and CampaignId field for referencing the parent Campaign.

### Required Fields

Required fields must have a non-null value. This rule affects the create and update calls:

- In a create call, the system automatically populates the data for certain required fields (such as system fields and the object ID fields). Similarly, if a required field has a default value (its defaultedOnCreate attribute is set to true, then the system implicitly assigns a value for this field when the object is created, even if a value for this field is not explicitly passed in on the create...
call. For all other required fields, such as ID fields that are analogous to foreign keys in SQL, a client application must explicitly assign a value when the object is created (it cannot be null).

- In updates, a required field cannot be set to null, and many required fields can't be changed.

Any field not specified as required in the object description is optional, that is, it can be null when updated or created.

Some required fields for some objects require special handling.

**Frequently-Occurring Fields**

In addition to system fields, these fields are found on many objects.

- **OwnerId**
- **RecordTypeId**
- **CurrencyIsoCode**

**OwnerId**

Objects have an ownerId field that is an reference to the user who owns that object. Ownership is an important concept that affects the security model and has other implications throughout the system. Any user can query the owner field for any record they can access. However, setting the ownerId field has the following limitations:

- For most users and most objects, this field can't be set directly upon insert. It is implicitly set to the current user when inserting an object.
- When creating or updating a Case or Lead, a client application (that is logged in with sufficient permissions to transfer a record) can set this field to any valid User in the organization or to any valid queue of the appropriate type in the organization.
- Updating this field via the API changes only the owner of that record. The change of ownership does not cascade to associated records as it does when you transfer record ownership in the Salesforce user interface.
- Updating this field on an account deletes the existing sharing information and reapplies the organization-wide sharing defaults and sharing rules.
- To update the ownerId field, the user must have the "Transfer Record" permission and Read access to the new owner.

In API version 12.0 and later, if your organization has set up opportunity teams, ownerId fields behave the same for Account and Opportunity objects as for other objects. That is, if you update the ownerId field in either object, any AccountShare or OpportunityShare records with RowCause set to Sales Team are kept. In API version 11.0 and earlier, the sharing records are deleted.

**RecordTypeId**

Record types are used to offer different business processes and subsets of picklist values to different User records based on their Profile settings. (In addition, person accounts use record types to manage a number of additional elements.

Record types are configured in the user interface or by creating, editing, or deleting the RecordType object in the API. Retrieve the list of valid record type IDs (String) for an object by querying the RecordType object.

The RecordTypeId field in an object contains the ID of the RecordType record that is associated with a standard or custom object. You can create or update this field.

**Note:** You can't create or update the RecordTypeId field on the CampaignMember records. Set the CampaignMember record type using the CampaignMemberRecordTypeId field on Campaign.

When specified in a create or update call, the record type ID (String) must refer to a valid record type for that object.
Note: The RecordTypeId field is in your organization’s WSDL only if at least one record type is configured for your organization in the Salesforce user interface.

**CurrencyIsoCode**

For organizations that have multicurrency enabled, the CurrencyIsoCode field contains the string representation of the currency ISO code associated with currency values in the object. Note that the User object also has a DefaultCurrencyIsoCode field, which is the default currency for that user. For example, a user in France could have a DefaultCurrencyIsoCode set to Euros, and that would be their default currency in the application. However, the User object could have currency custom fields stored in a different currency, that will correspond to the organization currency at the time the user record is created.

**API Field Properties**

Fields on objects represent the details of each object and are analogous to columns in a database table. Each field on each object has one or more of the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregatable</td>
<td>Can be used by one of the SOQL aggregate functions.</td>
</tr>
<tr>
<td>Autonumber</td>
<td>The API creates an autonumber.</td>
</tr>
<tr>
<td>Create</td>
<td>Value for the field can be specified during create using the API.</td>
</tr>
<tr>
<td>Defaulted on create</td>
<td>If no other value is specified when created, a default value is supplied.</td>
</tr>
<tr>
<td>Delete</td>
<td>Value for the field can be deleted using the API.</td>
</tr>
<tr>
<td>Filter</td>
<td>Can be used as filter criteria in a SOQL query FROM or WHERE clause.</td>
</tr>
<tr>
<td>Group</td>
<td>Can be included in the GROUP BY clause of a SOQL query (true) or not (false).</td>
</tr>
<tr>
<td>idLookup</td>
<td>Can be used to specify a record in an upsert call. The Id field of each object has this property and some Name fields. There are exceptions, so check for the property in any object you wish to upsert.</td>
</tr>
<tr>
<td>Namepointing</td>
<td>Indicates whether the field’s value is the Name of the parent of this object (true) or not (false). Used for objects whose parents can be more than one type of object. For example, a task can have an account or a contact as a parent.</td>
</tr>
<tr>
<td>Nillable</td>
<td>The field can contain a null value.</td>
</tr>
<tr>
<td>Query</td>
<td>The field can be queried with SOQL using the API.</td>
</tr>
<tr>
<td>Restricted picklist</td>
<td>A picklist whose values are restricted to those values defined by a Salesforce admin. Users can’t load unapproved values through the API.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Value of the field can be retrieved using the API.</td>
</tr>
<tr>
<td>Sort</td>
<td>Indicates whether a query can sort on this field (true) or not (false).</td>
</tr>
<tr>
<td>Update</td>
<td>Can be updated using the API.</td>
</tr>
</tbody>
</table>
Relationships Among Objects

[other]: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Relationships associate objects with other objects. For example, a relationship can link a custom object to standard object in a related list, such as linking a custom object called Bugs to cases to track product defects associated with customer cases. To view the parent and child relationships among standard objects, see the ERD diagrams in Data Model.

Note:
- You can use parent-child relationships in SOQL queries. For more information, see Relationship Queries in the Salesforce SOQL and SOSL Reference Guide.
- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported. See “External Object Relationships” in the Salesforce Help.

You can define different types of relationships by creating custom relationship fields on an object. The differences between relationship types include how they handle data deletion, record ownership, security, and required fields in page layouts:

- **Master-Detail (1:n)** — A parent-child relationship in which the master object controls certain behaviors of the detail object:
  - When a record of the master object is deleted, its related detail records are also deleted.
  - The Owner field on the detail object is not available and is automatically set to the owner of its associated master record. Custom objects on the detail side of a master-detail relationship cannot have sharing rules, manual sharing, or queues, as these require the Owner field.
  - The detail record inherits the sharing and security settings of its master record.
  - The master-detail relationship field is required on the page layout of the detail record.
  - By default, records can’t be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the Allow reparenting option in the master-detail relationship definition.

You can define master-detail relationships between custom objects or between a custom object and a standard object. However, the standard object cannot be on the detail side of a relationship with a custom object. In addition, you cannot create a master-detail relationship in which the User or Lead objects are the master.

When you define a master-detail relationship, the custom object on which you are working is the detail side. Its data can appear as a custom related list on page layouts for the other object.

- **Many-to-many** — You can use master-detail relationships to model many-to-many relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you create a custom object called Bug that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. To create a many-to-many relationship, simply create a custom junction object with two master-detail relationship fields, each linking to the objects you want to relate. See the Salesforce online help for details.

Custom objects with two master-detail relationships are supported in API version 11 and later.

Starting in API version 34.0, the JunctionIdList field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. JunctionIdList fields can be queried and updated like any other field on the entity. Queries or updates to JunctionIdList fields act as queries or updates to the underlying junction entity records. Fields of type JunctionIdList appear in the WSDL as an unbounded array of type ID.

JunctionIdList is implemented in the Task and Event objects.
• **Lookup (1:n)** — This type of relationship links two objects together, but has no effect on deletion or security. Unlike master-detail fields, lookup fields are not automatically required. When you define a lookup relationship, data from one object can appear as a custom related list on page layouts for the other object. See the Salesforce online help for details.

To create relationships, use the user interface or Salesforce Metadata API.

### Relabeling Fields and Tabs and the API

The user interface allows you to change the labels on some fields and tabs. Although you cannot relabel fields or tabs using the API, you can retrieve the current values. To do so, issue a `describeSObjects()` call and inspect the label field of the returned `DescribeSObjectResult`.

### Tooling API Objects in the Enterprise WSDL

Some objects used by the Tooling API are included in the Enterprise and Partner WSDL. Use the objects from these WSDLs instead of the Tooling WSDL if you need field-level security.

The following Tooling API objects are exposed in the Enterprise and Partner WSDL.

- BriefcaseDefinition
- DataType
- EntityDefinition
- EntityParticle
- FieldDefinition
- PicklistValueInfo
- Publisher
- SearchLayout
- Service
- ServiceDataType (Reserved for future use.)
- ServiceFieldDataType (Unavailable in version 35.0 and later. Do not use.)
- RelationshipDomain
- RelationshipInfo
- UserEntityAccess
- UserFieldAccess
- WsdlDataType (Reserved for future use.)
- XmlSchema (Reserved for future use.)

For more information, use the Tooling API Developer’s Guide.

### Salesforce AppExchange Object Prefixes and the API

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix__name__c`. To move from an unmanaged package to a managed package version of the same application, export your
data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the ISVforce Guide.

**Custom Object Behavior**

In the user interface, you can extend your org’s data by defining custom objects. Custom objects are custom database tables that allow you to store information unique to your organization. For custom objects, the custom flag—a Boolean field in the describe results—is true.

⚠️ [other]: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Client applications with sufficient permissions can invoke API calls on existing custom objects. You can create custom objects with the user interface, or by using the metadata WSDL with a client application or using the Salesforce Extensions for Visual Studio Code. For more information about using the metadata WSDL to create custom objects, see the Lightning Platform Metadata API Developer’s Guide. For more information about Visual Studio Code, see Salesforce Extensions for Visual Studio Code.

Use the following topics to understand how the API interacts with custom objects and fields:

- Naming Conventions for Custom Objects
- Relationships Among Custom Objects
- Audit Fields for Custom Objects
- Sharing and Custom Objects
- Tags and Custom Objects
- Standard Fields for Custom Objects
- Required Fields in Custom Objects
- Managed Packages and API Names

**Naming Conventions for Custom Objects**

Your Salesforce administrator defines an associated name field for each custom object during setup. Custom objects must have unique names within your organization.

In the API, the names of custom objects include a suffix of two underscores followed by a lowercase “c”. For example, a custom object labeled “Issue” in the Salesforce user interface is **Issue__c** in that organization’s WSDL.

Relationships change the naming convention. See Relationships Among Custom Objects for more information.

For a custom object record to appear in the Salesforce user interface, its name field must be populated. If you use the API to create a custom object record that doesn’t have a name, the record’s ID is used as its name.

**Relationships Among Custom Objects**

Custom objects behave and relate to other objects just like standard objects do, as described in Relationships Among Objects. For example, cascading deletes are supported in custom objects in a Master-Detail relationship.

Custom objects can also have many-to-many relationships with other custom objects or standard objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For more information, see Relationships Among Objects.

Custom objects require special treatment so that they can participate in Relationship Queries. For the relationship field name of a custom object, **__r** is appended to the name to create the ID. Also, **__c** is appended to the name to create the parent object pointer. For
example, if the relationship field name is MyRel, the name of the ID becomes MyRelId__r, the parent object pointer becomes MyRel__c, and the relationship name is MyRel__r. For more information, see Understanding Relationship Names, Custom Objects, and Custom Fields in the Salesforce SOQL and SOSL Reference Guide.

This table summarizes whether a standard object can be:

- The master in a master-detail relationship with a custom object. Master-detail relationships involve cascading deletes and sharing rules that the parent controls.
- The lookup in a lookup relationship on a custom object. In other words, whether a custom object can have a lookup to the standard object.
- Extended with custom fields.

Audit Fields for Custom Objects

Custom objects can have the same audit fields as standard objects. When you create a custom object, the four audit fields, CreatedById, CreatedDate, LastModifiedById, and LastModifiedDate, are created and populated for the object. These fields are read only. If you import data into Salesforce custom objects and want to retain the audit field values from the source system, you can set the values when you create the custom objects. The only audit field you cannot set a value for is SystemModstamp. Your organization must be API enabled, and you must have the "Modify All Data" permission.

1. From Setup, enter User Interface in the Quick Find box, then select User Interface under Customize.
2. Under Setup, select Enable "Set Audit Fields upon Record Creation" and "Update Records with Inactive Owners" User Permissions.
3. In the permission set or profile that you want to set audit fields with, enable the permission Set Audit Fields upon Record Creation.
4. Using the API, create a record and set its audit fields.

Note these restrictions:
- CreatedDate can't be greater than the LastModifiedDate.
• You can’t set any date field to be greater than the current time.

For more information about audit fields, see System Fields.

Sharing and Custom Objects

A sharing rule object is created for each custom object that does not have a master-detail relationship to another object. They are similar to standard object sharing rules, for example AccountOwnerSharingRule. If the user creating the custom object has the “Manage Sharing” permission, a sharing rule object is automatically created for it.

Apex sharing reasons can be retrieved describing the custom object’s sharing object, and examining the information in the rowCause field. The name of a sharing object for each custom object is of the form: MyObjectName__Share, similar to AccountShare and other standard object sharing objects.

Tags and Custom Objects

When a custom object is created, a Tag object related to it is also created. These object names are of the form: MyObjectName__Tag, similar to AccountTag and other standard object tag objects.

Standard Fields for Custom Objects

When a custom object is created, Salesforce assigns some standard fields to the object or entity. For details, see Custom Objects.

Required Fields in Custom Objects

In the user interface, you can mark a custom field as required, and this rule is also enforced in the API. Each custom field has a nillable attribute, with a data type boolean. The default value is false. If set to true, each request supplies a value (or leaves the current value) to this field. Otherwise, the request fails. When the value is set to true, the next time the field is edited or created, the validation applies. If no value is supplied or default value specified, the request fails.

To edit the nillable attribute, you must log in as a user with the “Customize Application” permission.

If you change a custom object field to be required in an existing client application or integration, be sure that a value is supplied for that field. For example, if the custom picklist field Education Level on the contact object is required, supply a default value for that custom field. If a required field does not have a specified or default value, an error with the status code REQUIRED_FIELD_MISSING is returned.

Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: name__c becomes prefix__name__c. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the ISVforce Guide.

SEE ALSO:

Custom Objects
External Objects

External objects are supported in API version 32.0 and later. External objects are similar to custom objects, but external object record data is stored outside your Salesforce organization. For example, perhaps you have data that’s stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

External objects are available with Salesforce Connect and Files Connect. Each external object is associated with an external data source definition in your Salesforce organization.

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that’s stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Lightning Platform use to interact with the external data and content.

By accessing record data on demand, external objects always reflect the current state of the external data. You don’t have to manage a copy of that data in Salesforce, so you’re not wasting storage and resources keeping data in sync.

External objects are best used when you have a large amount of data that you can’t or don’t want to store in your Salesforce organization, and you need to use only a small amount of data at any one time.

See “Define External Objects” in the Salesforce Help for how to create and modify external objects.

Naming Conventions for External Objects

Object names must be unique across all standard, custom, and external objects in the org.

In the API, the names of external objects are identified by a suffix of two underscores immediately followed by a lowercase “x” character. For example, an external object named “ExtraLogInfo” in the Salesforce user interface is seen as ExtraLogInfo__x in that organization’s WSDL.

We recommend that you make object labels unique across all standard, custom, and external objects in the org.

External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that’s stored outside your Salesforce org often doesn’t contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups. See “External Object Relationships” in the Salesforce Help for details.

Feature Support for External Objects

Most of the Salesforce features that support custom objects also support external objects. However, there are exceptions, and some features have special limitations and considerations for external objects. See the following topics in the Salesforce Help.

- External Objects in Salesforce Connect
- Salesforce Platform Features Supported by Salesforce Connect

Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. This table describes the available adapters.
<table>
<thead>
<tr>
<th><strong>Salesforce Connect Adapter</strong></th>
<th><strong>Description</strong></th>
<th><strong>When to Use</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Cross-org</td>
<td>Uses the Lightning Platform REST API to access data that’s stored in other Salesforce orgs.</td>
<td>To seamlessly connect data between your Salesforce orgs. For example, provide your service representatives a unified view of customer transactions by integrating data from different Salesforce orgs.</td>
</tr>
<tr>
<td>OData 2.0</td>
<td>Uses Open Data Protocol to access data that’s stored outside Salesforce. The external data must be exposed via OData producers.</td>
<td>To integrate external data sources into your org that support the ODATA protocol and publish an OData provider. For example, give your account executives a unified data view by pulling data from legacy systems such as SAP, Microsoft, and Oracle in real time.</td>
</tr>
<tr>
<td>OData 4.0</td>
<td>You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren’t suitable for your needs. A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically.</td>
<td>To develop your own adapter with the Apex Connector Framework when the other available adapters aren’t suitable for your needs. For example, when you want to retrieve data via callouts from a REST API.</td>
</tr>
<tr>
<td>Custom adapter created via Apex</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Files Connect Adapters**

Several Files Connect adapters are also available:

- Google Drive
- Box
- SharePoint Online
- OneDrive for Business

For more information about setting up Files Connect adapters see, [The Files Connect Process](#).

For more information about Salesforce Connect, see “Salesforce Connect” in the Salesforce Help.

For details on using the Apex Connector Framework, see “Salesforce Connect” and “DataSource Namespace” in the [Apex Code Developer's Guide](#).
CHAPTER 3 API Call Basics

In this chapter ...

- Characteristics of API Calls
- Factors that Affect Data Access
- Package Version Settings

API calls represent specific operations that your client applications can invoke at runtime to perform tasks, for example:

- Query data in your organization.
- Add, update, and delete data.
- Obtain metadata about your data.
- Run utilities to perform administration tasks.

Using your development environment, you can construct Web service client applications that use standard Web service protocols to programmatically:

- Log in to the login server (login()) and receive authentication information to be used for subsequent calls
- Query your organization’s information (query(), queryAll(), queryMore(), and retrieve() calls)
- Perform text searches across your organization’s information (search() call)
- Create, update, and delete data (create(), merge(), update(), upsert(), delete(), and undelete() calls)
- Perform administrative tasks, such as retrieving user information (getUserInfo() call), changing passwords (setPassword() and resetPassword() calls), and getting the system time (getServerTimestamp() call)
- Replicate data locally (getDeleted() and getUpdated() calls)
- Obtain and navigate metadata about your organization’s data (describeGlobal(), describeSObject(), describeSObjects(), describeLayout(), and describeTabs() calls)
- Work with approval processes (process())
- Return category groups and categories from your organization (describeDataCategoryGroups() and describeDataCategoryGroupStructures()).

See Core Calls, Describe Calls, and Utility Calls for complete details about each call.

SEE ALSO:

User Permissions
Characteristics of API Calls

All API calls are:

- **Service Requests and Responses**—Your client application prepares and submits a service request to the Lightning Platform Web Service via the API, the Lightning Platform Web Service processes the request and returns a response, and the client application handles the response.

- **Synchronous**—Once the API call is invoked, your client application waits until it receives a response from the service. Asynchronous calls are not supported.

- **Committed Automatically Versus Rollback on Error**—By default, every operation that writes to a Salesforce object is committed automatically. This is analogous to the AUTOCOMMIT setting in SQL. For `create()`, `update()`, and `delete()` calls that attempt to write to multiple records for an object, the write operation for each record is treated as a separate transaction. For example, if a client application attempts to create two new accounts, they're created using mutually exclusive insert operations that succeed or fail individually, not as a group.

For API version 20.0 and later, there is an `AllOrNoneHeader` header that allows a call to roll back all changes unless all records are processed successfully. This header is supported by the `create()`, `delete()`, `undelete()`, `update()`, and `upsert()` calls.

**Note:** The default behavior means that client applications may need to handle some failures: for example, if you create an opportunity that has shipments (a custom object), and the opportunity line item gets created but the shipment creation fails, if your business rules required all opportunities be created with shipment, your client application would need to roll back the opportunity creation. The easiest way to do this is to use `AllOrNoneHeader`.

Factors that Affect Data Access

When using the API, the following factors affect access to your organization’s data:

**Access**

Your organization must be enabled for API access.

Objects may not be available until you contact Salesforce and request access. For example, `Territory2` is visible only if `Enterprise Territory Management` has been enabled in the application. Such requirements are in the "Usage" section for each object.

Sometimes a feature must be used once before objects related to it can be accessed with the API. For example, the `recordTypeIds` is available only after at least one record type has been created for your organization in the user interface.

To investigate data access issues, you can start by inspecting the WSDL:

- **Enterprise WSDL**: The generated enterprise WSDL file contains all of the objects that are available to your organization. By using the API, a client application can access objects that are defined in your enterprise WSDL file.

- **Partner WSDL**: When using the generated partner WSDL file, a client application can access objects that are returned in the `describeGlobal()` call.

**Object-Level and Field-Level Security**

The API respects object-level and field-level security configured in the user interface. You can access objects and fields only if the logged-in user’s permissions and access settings allow such access. For example, fields that are not visible to a given user are not returned in a `query()` or `describeSObjects()` call. Similarly, read-only fields can’t be updated.

**User Permissions**

A user attempting to access the API must have the permission "API Enabled" selected. It’s selected by default.

Your client application logs in as a user called a `logged-in` user. The logged-in user’s permissions grant or deny access to specific objects and fields in your organization:
• **Read**—Users can only view objects of this type.
• **Create**—Users can read and create objects of this type.
• **Edit**—Users can read and update objects of this type.
• **Delete**—Users can read, edit, and delete objects of this type.

User permissions do not affect field-level security. If field-level security specifies that a field is hidden, users with “Read” on that object can view only those fields that are not hidden on the record. In addition, users with “Read” on an object can view only those records that sharing settings allow. The one exception is the “Edit Read Only Fields” permission, which gives users the ability to edit fields marked as read only via field-level security.

**Sharing**

For most API calls, data that is outside of the logged-in user’s sharing model is not returned. Users are granted the most permissive access that is available to them, either through organization-wide defaults or manual record sharing, just as in the application.

**User Permissions that Override Sharing**

• **View All**—Users can view all records associated with this object, regardless of sharing settings.
• **Modify All**—Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.
• **Modify All Data**—users can read, edit, delete, transfer, and approve all records regardless of sharing settings. This permission is not an object-level permission, unlike “View All” and “Modify All.”

To protect the security of your data, give the logged-in user only the permissions needed to successfully execute all the calls made by the application. For large integration applications, “Modify All Data” may speed up call response times. If you are loading a large number of records, use **Bulk API 2.0** instead.

**Related Objects**

Some objects depend on other objects for permission. For example, AccountTeamMember follows sharing on the associated permission-assigned object such as the Account record. Similarly, a Partner depends on the permissions in the associated .

Ownership changes to a record do not automatically cascade to related records. For example, if ownership changes for a given Account, ownership does not then automatically change for any Contract associated with that Account—each ownership change must be made separately and explicitly by the client application.

**Object Properties**

To create an object with the `create()` call, the object’s `createable` attribute must be set to `true`. To determine what operations are allowed on a given object, your client application can invoke the `describeSObjects()` call on the object and inspect the properties in the `DescribeSObjectResult`.

- **Note:** `replicatable` allows `getUpdated()` and `getDeleted()` calls.

**Page Layouts and Record Types**

Requirements defined in the Salesforce user interface for page layouts and record types are not enforced by the API:

• Page layouts can specify whether a given field is required, but the API does not enforce such layout-specific field restrictions or validations in `create()` and `update()` calls. It’s up to the client application to enforce any such constraints, if applicable.
• Record types can control which picklist values can be chosen in a given record and which page layouts users with different profiles can see. However, such rules that are configured and enforced in the user interface are not enforced in the API. For example, the API does not validate whether the value in a picklist field is allowed per any record type restrictions associated with the profile of the logged-in user. Similarly, the API does not prevent a client application from adding data to a particular field simply because that field does not appear in a layout associated with the profile of the logged-in user.

**Referential Integrity**

To ensure referential integrity, the API forces or prevents certain behaviors:

• ID values in reference fields are validated in `create()` and `update()` calls.
• If a client application deletes a record, then its children are automatically deleted as part of the call if the `cascadeDelete` property on ChildRelationship for that child has a value of `true`. For example, if a client application deletes an Opportunity, then any associated OpportunityLineItem records are also deleted. However, if an OpportunityLineItem is not deletable or is currently being used, then deletion of the parent Opportunity fails. For example, if a client application deletes an Invoice_Statement, then any associated Line_Item records are also deleted. However, if a Line_Item is not deletable or is currently being used, then deletion of the parent Invoice_Statement fails. Use DescribeSObjectResult to view the ChildRelationship value if you want to be sure what will be deleted.

There are certain exceptions that prevent the execution of a `cascadeDelete`. For example, you can't delete an account if it has associated cases, if it has related opportunities that are owned by other users, or if associated contacts are enabled for the Customer Portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you or has active contracts, then the delete request for that record will fail.

Package Version Settings

When your API client is referencing components in managed packages, you can specify the version of each installed package that you want to reference for your integration. This allows your API client to continue to function with specific, known behavior even when you install subsequent versions of a package. You can use the PackageVersionHeader SOAP header to set different package versions for different calls, if necessary.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. The SOAP endpoint contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 53.0, and `ID` encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.
1. The PackageVersionHeader SOAP header.

2. An API call from a Visualforce page uses the package versions set for the Visualforce page.

3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, enter API in the Quick Find box, then select API.

2. Click Configure Enterprise Package Version Settings or Configure Partner Package Version Settings. These links are only available if you have at least one managed package installed in your organization.

3. Select a Package Version for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.

4. Click Save.

Note: Installing a new version of a package in your organization does not affect the current default settings.
CHAPTER 4

Error Handling

In this chapter ...

- Error Handling for Session Expiration
- More About Error Handling

The API calls return error data that your client application can use to identify and resolve runtime errors. If an error occurs during the invocation of most API calls, then the API provides the following types of error handling:

- For errors resulting from badly formed messages, failed authentication, or similar problems, the API returns a SOAP fault message with an associated ExceptionCode.
- For most calls, if the error occurs because of a problem specific to the query, the API returns an Error. For example, if a create() request contains more than 200 objects.
Error Handling for Session Expiration

When you sign on via the `login()` call, a new client session begins and a corresponding unique session ID is generated. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking Security Controls. The default is 120 minutes (two hours). If you make an API call, the inactivity timer is reset to zero.

When your session expires, the exception code `INVALID_SESSION_ID` is returned. If this happens, you must invoke the `login()` call again.

More About Error Handling

For more information about errors, see the following topics:

- API Fault Element
- ExceptionCode
- Error
Client apps that access your Salesforce data are subject to the same security protections that are used in the Salesforce user interface. Additional protection is available for orgs that install AppExchange managed packages if those packages contain components that access Salesforce via the API.

In this chapter ...

• User Authentication
• User Profile and Permission Sets Configuration
• Security Token
• Sharing
• Implicit Restrictions for Objects and Fields
• API Access in Salesforce AppExchange Packages
• Outbound Port Restrictions
User Authentication

Client apps must log in using valid credentials. After validating, the server provides the client app with a:

- `sessionId` that is set into the session header so that all subsequent calls to the Web service are authenticated
- URL address (`serverUrl`) for the client app’s web service requests

Salesforce supports only the Transport Layer Security (TLS) protocol and `frontdoor.jsp`. Ciphers must have a key length of at least 128 bits.

User Profile and Permission Sets Configuration

As an org’s Salesforce admin, you control which features and views are available to users by configuring profiles and permission sets and assigning users to them. To access the API to issue calls and receive the call results, a user must have the API Enabled permission. Client apps can query or update only those objects and fields to which they have access via the permissions of the logged-in user.

To create, edit, or delete a profile, from Setup, enter `Profiles` in the Quick Find box, then select `Profiles`. To create, edit, or delete a permission set, from Setup, enter `Permission Sets` in the Quick Find box, then select `Permission Sets`.

Note: The web services WSDL files return all available objects and fields for an org.

Security Token

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce authorizes the login as follows.

1. Salesforce checks whether the user’s profile has login-hour restrictions. If the user’s profile specifies login-hour restrictions, login attempts outside the specified hours are denied.

2. If the user has the Multi-Factor Authentication for User Interface Logins permission, the Salesforce login process prompts the user for an identity verification method in addition to their username and password. If the user’s account isn’t already connected to a verification method, such as the Salesforce Authenticator mobile app, Salesforce prompts the user to register a method.

3. If the user has the Multi-Factor Authentication for API Logins permission and connected an authenticator app to the account, the user must enter a verification code (TOTP) generated by the authenticator app. If the user uses the standard security token, Salesforce returns an error.

4. Salesforce then checks whether the user’s profile defines IP address range restrictions. If so, logins from outside the IP address range are denied. If the `Enforce login IP ranges on every request` session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client apps.

5. If profile-based IP address restrictions aren’t set, Salesforce checks whether the user is logging in from a device that was previously used to access Salesforce.
   - If the user is logging in from a device and browser that Salesforce recognizes, the login is allowed.
   - If the user is logging in from an IP address on your org’s trusted IP address list, the login is allowed.
   - If the user isn’t logging in from a trusted IP address, device, or browser that Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce verifies the user’s identity.

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later) or enter a verification code.
Note: Users aren’t asked for a verification code the first time they log in to Salesforce.

• For access via the API or client app, if the Multi-Factor Authentication on API Logins permission is set on the user profile, users enter a TOTP verification code generated by an authenticator app.

If the permission isn’t set, users must add their security token to the end of their password to log in. A security token is a generated key from Salesforce. For example, if a user’s password is mypassword and the security token is Xxxxxxxxxxx, the user enters mypasswordXXXXX to log in. Some client apps have a separate field for the security token.

Users can get their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user’s Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

Note: Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using Reset My Security Token.

For more information about tokens, see Reset Your Security Token in Salesforce Help.

When a user’s password is changed, the user’s security token is automatically reset. To log in after the reset, the user adds the generated security token to the end of the password. Or the user enters the new password after you add the user’s IP address to the org’s list of trusted IP addresses.

If you reset the password of a user with the API only user permission, the user doesn’t receive a security token reset email. If you want API only users to receive a security token reset email when you reset their password, take these steps.

1. Temporarily assign the user to a profile that doesn’t have the API only user permission. For more information on user profiles and permissions, see User Permissions and Access.

2. Ask the user to manually reset their security token.

3. Reassign the user to a profile with the API only user permission.

If single sign-on (SSO) is enabled, users who access the API or a desktop client can’t log in unless their IP address is included on your org’s list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. The delegated authentication authority usually handles login lockout policies for users with the Uses Single Sign-On permission. However, if the security token is enabled, your login lockout settings determine how many times a user can try to log in with an invalid security token before getting locked out. For more information, see Setting Login Restrictions and Setting Password Policies in Salesforce Help.

Sharing

Sharing refers to the act of granting read or write access to a user or group so that they can view or edit a record owned by other users, if the default access levels don’t permit such access. All API calls respect the sharing model.

The following table describes the types of access levels.

<table>
<thead>
<tr>
<th>API Value</th>
<th>Salesforce User Interface Label</th>
<th>API Picklist Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Private</td>
<td>Private</td>
<td>Only the record owner and Users above that role in the hierarchy can view and edit the record.</td>
</tr>
<tr>
<td>Read</td>
<td>Read Only</td>
<td>Read Only</td>
<td>All Users and Groups can view the record but not edit it. Only the owner and users above that role in the hierarchy can edit the record.</td>
</tr>
<tr>
<td>Edit</td>
<td>Read/Write</td>
<td>Read/Write</td>
<td>All Users and Groups can view and edit the record.</td>
</tr>
</tbody>
</table>
Not all access levels are available for every object. See the Fields table for each object to learn which access levels are available, as well as other sharing details specific to that object.

For more information about sharing in general, see Salesforce Help.

Note: In the API, you can create and update objects such as AccountShare and OpportunityShare that define sharing entries for records.

### Implicit Restrictions for Objects and Fields

Certain objects can be created or deleted only in the Salesforce user interface. Other objects are read-only—client apps cannot create(), delete(), or update() such objects. Similarly, certain fields within some objects can be specified on create() but not on update(). Other fields are read-only—client apps cannot specify field values in create() or update() calls. For more information, see the respective object descriptions in Object Basics.

### API Access in Salesforce AppExchange Packages

The API allows access to objects and calls based on the permissions of the user who logs into the API. To prevent security issues from arising when installed packages have components that access data via the API, Salesforce provides additional security:

- When a developer creates an AppExchange package with components that access the API, the developer can restrict the API access for those components.
- When an administrator installs an AppExchange package, the administrator can accept or reject the access. Rejecting the access cancels the installation.
- After an administrator installs a package, the administrator can restrict the API access of components in the package that access the API.

Editing API access for a package is done in the Salesforce user interface. For more information, see Manage API and Dynamic Apex Access in Packages in Salesforce Help.

API access for a package affects the API requests originating from components within the package; it determines the objects that the API requests can access. If the API access for a package is not defined, then the objects that the API requests have access to are determined by the user's permissions.
The API access for a package never allows users to do more than the permissions granted to the user. API access in a package only reduces what the user's permissions allow.

Choosing Restricted for the API Access setting in a package affects the following:

- API access in a package overrides the following user permissions:
  - Author Apex
  - Customize Application
  - Edit HTML Templates
  - Edit Read Only Fields
  - Manage Billing
  - Manage Call Centers
  - Manage Categories
  - Manage Custom Report Types
  - Manage Dashboards
  - Manage Letterheads
  - Manage Package Licenses
  - Manage Public Documents
  - Manage Public List Views
  - Manage Public Reports
  - Manage Public Templates
  - Manage Users
  - Transfer Record
  - Use Team Reassignment Wizards
  - View Setup and Configuration
  - Weekly Export Data

- If Read, Create, Edit, and Delete access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.

- A package with Restricted API access can’t create new users.

- Salesforce denies access to Web service and executeanonymous requests from an AppExchange package that has Restricted access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.

- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.

- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.

- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.
• S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user’s full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:

  – For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default Unrestricted API access. Once a package has an s-control, you cannot enable Restricted API access.

  – For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.

  – If an installed package has Restricted API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to Unrestricted API access.

To manage API access to packages, see “Manage API and Dynamic Apex Access in Packages” in Salesforce Help.

Note: XML-RPC requests that originate from restricted packages are denied access.

**Outbound Port Restrictions**

For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:

• 80: This port only accepts HTTP connections.

• 443: This port only accepts HTTPS connections.

• 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

The port restriction applies to any feature where a port is specified, for example outbound messages, AJAX proxy, or single-sign on.
CHAPTER 6

Using the Partner WSDL

In this chapter ... 

- Obtaining the Partner WSDL File
- Calls and the Partner WSDL
- Objects, Fields, and Field Data and the Partner WSDL
- Queries and the Partner WSDL
- Namespaces in the Partner WSDL
- Package Versions and the Partner WSDL
- User Interface Themes
- Examples Using the Partner WSDL

The API provides two WSDLs to choose from:

- **Enterprise Web Services WSDL**—Used by enterprise developers to build client applications for a single Salesforce organization. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it when changes are made to the custom objects or fields in their org or when they want to use a different version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter `API` in the Quick Find box. Then, on the API page, select **Generate Enterprise WSDL**.

- **Partner Web Services WSDL**—Used for client applications that are metadata-driven and dynamic in nature. It is particularly—but not exclusively—useful to Salesforce partners who are building client applications for multiple organizations. As a loosely typed representation of the Salesforce data model that works with name-value pairs of field names and values instead of specific data types, it can be used to access data within any organization. This WSDL is most appropriate for developers of clients that can issue a query call to get information about an object before the client acts on the object. The partner WSDL document needs to be downloaded and consumed only once per version of the API. To access the current WSDL for your organization, log in to your Salesforce organization and from Setup, enter `API` in the Quick Find box. Then, on the API page, select **Generate Partner WSDL**.

In general, the enterprise WSDL is more straightforward to use, while the partner WSDL is more flexible and dynamically adaptable to different organizations, allowing you to write a single application that can be used for multiple users and multiple organizations.

**High Precision Versions**

If you require higher precision than the regular WSDLs provide, ask your account team about the “High Precision API” feature. When this feature is enabled, the WSDLs that you download (both Enterprise and Partner) use higher precision data types. For example, this feature is useful if your organization uses complex numerical formulas that are prone to rounding errors.

**Note:** This feature is a limited pilot and is not currently a generally available feature.

If you have been using the regular version of the WSDL and change to the high precision version, perform the following checks:

1. Download the new WSDL.
2. Regenerate the stub code. (See **Setting Up Your Java Developer Environment**.)
3. Verify that the type of variables used to store numeric values in your code can accommodate the new types.
Obtaining the Partner WSDL File

To use the partner WSDL, download a copy of the file using either of the following methods:

- Obtain it from your organization’s Salesforce administrator, or
- Generate from Setup in Salesforce (enter API in the Quick Find box, then select API) according to the instructions in Step 2: Generate or Obtain the Web Service WSDL.

While the enterprise WSDL file needs to be regenerated whenever custom fields or custom objects are added to an organization’s Salesforce information, the partner WSDL file remains the same regardless of underlying changes in the organization’s Salesforce data.

Calls and the Partner WSDL

The partner WSDL file defines exactly the same API calls found in the enterprise WSDL file. A client application using the partner WSDL will likely use the following API calls to determine an organization’s metadata:

<table>
<thead>
<tr>
<th>Task / Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>describeGlobal()</td>
<td>Retrieves a list of available objects for your organization’s data.</td>
</tr>
<tr>
<td>describeLayout()</td>
<td>Retrieves metadata about page layouts for the specified object type.</td>
</tr>
<tr>
<td>describeSObject()</td>
<td>describeSObject() has been superseded by describeSObjects().</td>
</tr>
<tr>
<td>describeSObjects()</td>
<td>Use to obtain metadata for a given object. You can first call to retrieve a list of all objects for your organization, then iterate through the list and use to obtain metadata about individual objects.</td>
</tr>
<tr>
<td>describeTabs()</td>
<td>In the user interface, users have access to standard apps (and may also have access to custom apps) as listed in the Lightning Platform app menu at the top of the page. Selecting a standard app or custom app in the user interface allows the user to switch between the listed apps at any time.</td>
</tr>
</tbody>
</table>

To explore an organization’s metadata, a client application can:

1. Call `describeGlobal()` to obtain a list of available objects.
2. In the returned `DescribeGlobalResult` object, retrieve an array of `DescribeGlobalSObjectResult` objects by calling `sobjects`.
3. Get the `sObject` type name for each returned `sObject` by calling `name` on the `DescribeGlobalSObjectResult` objects.
4. The `DescribeGlobalSObjectResult` object provides some metadata about the `sObject`, such as whether the `sObject` is createable or updateable. If you want to get more information about particular `sObjects`, like their fields and child relationships, call `describeSObjects()` by passing it an array of the `sObject` type names that you’re interested in obtaining more information about.

SObject Reference Reuse

An `sObject` reference can’t be reused within a single operation.

Use a different reference. For example, the following code snippet creates an account and contact with a custom field and an event using two different references:

```java
SObject account = new com.sforce.soap.partner.sobject.wsc.SObject();
account.setType("Account");
```
account.setField("Name","myAccount");
account.setField("XID1__c","1");
SObject refAcc1 = new com.sforce.soap.partner.sobject.wsc.SObject();
refAcc1.setType("Account");
refAcc1.setField("XID1__c","1");
SObject refAcc2 = new com.sforce.soap.partner.sobject.wsc.SObject();
refAcc2.setType("Account");
refAcc2.setField("XID1__c","1");
SObject contact = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Contact");
contact.setField("LastName","LName");
contact.setField("XID2__c","2");
contact.setField("Account", refAcc1);
SObject refCon = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Contact");
contact.setField("XID2__c","2");
SObject event = new com.sforce.soap.partner.sobject.wsc.SObject();
contact.setType("Event");
contact.setField("Subject","myEvent");
contact.setField( "ActivityDateTime", Calendar.getInstance());
contact.setField("DurationInMinutes", 60);
contact.setField("Who", refCon);
contact.setField("What", refAcc2);
client.create(new SObject[] { account, contact, event}); // exception thrown here

Any call that takes a parameter of the form `SObject[] sObjects` is subject to this limitation.

### Objects, Fields, and Field Data and the Partner WSDL

The enterprise WSDL file defines all the specific objects (such as Account and Contact) in a Salesforce org. In contrast, the partner WSDL file defines a single, generic object (`SObject`) that represents all the objects. For a particular object, its type is defined in the `name` field in the returned `DescribeSObjectResult`.

With the partner WSDL, your client application code handles fields as arrays of name-value pairs that represent the field data. When referring to the name of an individual field, use the value in its `name` field of the Field type in the `DescribeSObjectResult`.

Languages vary in the way they handle name-value pairs and map typed values to the primitive XML data types defined in SOAP messages. With the enterprise WSDL, the mapping is handled implicitly. With the partner WSDL, however, you manually manage values and data types when building client applications. Specify the object type before you assign field values. When specifying the value of a particular field, use a value that is valid for the field (range, format, and data type). Make sure that you understand the mapping between data types in your programming language and XML primitive data types. See `SOAPType` for more information.

### Queries and the Partner WSDL

When using the `query()` call with the partner WSDL, consider the following guidelines:

- The `queryString` parameter is case-insensitive. The API will accept field names in the `fieldList` using any combination of uppercase and lowercase letters. However, in the `QueryResult`, the case of field names (both predefined and custom fields) will match exactly
the value in the `name` field of the Field type in the DescribeSObjectResult. It is recommended that you use the proper case when specifying fields in the `fieldList`.

- For the partner WSDL, the ordering of fields in the QueryResult is determined by the field order in the `fieldList`, not the field order in the WSDL file.
- The `fieldList` cannot contain duplicate field names. For example:
  - Invalid (returns an error): "SELECT Firstname, Lastname, Firstname FROM User"
  - Valid: "SELECT Firstname, Lastname FROM User"

- The QueryResult always contains all of the fields specified in the `fieldList`, even if some of the fields contain no data (null). Although SOAP allows you to omit fields that contain no values in the result set, the API always returns an array containing all fields.
- If you use the partner WSDL, a query that includes ID will return the ID field twice in the SOAP XML response data. Similarly, a query that does not include ID will return a single null ID field in the SOAP XML response data. For example, a query for SELECT ID, FirstName, LastName FROM Contact might return a SOAP XML response with records like:

  ```xml
  <records xsi:type="sf:sObject" xmlns="urn:partner.soap.sforce.com">
    <sf:type>Contact</sf:type>
    <sf:Id>0038000000FrjoBQRW</sf:Id>
    <sf:Id>0038000000FrjoBQRW</sf:Id>
    <sf:FirstName>John</sf:FirstName>
    <sf:LastName>Smith</sf:LastName>
  </records>
  ```

  This is expected behavior and something to be aware of if you are accessing the full SOAP XML response data and not using WSC to access the web service response.

### Namespaces in the Partner WSDL

In XML, every tag has a defined namespace. In the `enterprise.wsdl`, namespaces are handled implicitly. When using API calls with the partner WSDL, however, you need to explicitly specify the correct namespaces for API calls, objects, and fields. This rule applies to predefined and custom objects and fields.

<table>
<thead>
<tr>
<th>For</th>
<th>Namespace</th>
</tr>
</thead>
<tbody>
<tr>
<td>API Calls</td>
<td><code>urn:partner.soap.sforce.com</code></td>
</tr>
<tr>
<td>sObjects</td>
<td><code>urn:sobject.partner.soap.sforce.com</code></td>
</tr>
<tr>
<td>Fields</td>
<td><code>urn:sobject.partner.soap.sforce.com</code></td>
</tr>
<tr>
<td>Faults</td>
<td><code>urn:fault.partner.soap.sforce.com</code></td>
</tr>
</tbody>
</table>

### Package Versions and the Partner WSDL

The partner WSDL is loosely typed. This makes it more flexible for partners who want to integrate with multiple organizations. Default package versions for API calls provide fallback settings if package versions are not provided by an API call.

The behavior of a package in partner API calls is defined by the latest installed package version if the default value (Not Specified) is selected for the installed package. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for
an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

An API client developer should communicate with the administrator of the default partner package version settings if these are two different roles in your organization and the developer recommends changing the settings. Alternatively, an API client developer can set the package versions in the PackageVersionHeader SOAP header for the client.

A partner that is developing a package that references another package should always supply version information for the base package in their partner API calls. This ensures that the extension package is not affected by a component being deprecated in the base package.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls with the partner WSDL, see Package Version Settings.

User Interface Themes

Back in the Winter ’06 release, Salesforce started supporting multiple user interface themes, allowing you to use different sets of icons and colors for the user interface. But these user interface themes do not apply when your org is using Lightning Experience.

Two user interface themes match the earlier iterations of Salesforce.

- **Theme3**—The “Salesforce Classic 2010 user interface theme.” This interface was previously referred to as “Salesforce” or “new user interface theme.” You might also be familiar with it as the Salesforce Aloha interface.
- **Theme2**—The “Salesforce Classic 2005 user interface theme.” This interface was previously referred to as “Salesforce Classic” or the “classic user interface theme.”

The `getUserInfo()` call returns a `getUserInfoResult` object, which includes the `userUiSkin` property. This property informs you of the user’s current user interface theme.

Use the `describeQuickActions()`, `describeTabs()`, and `describeTheme()` calls and their return types to get information on theme icons and colors.

Style sheets are available to mimic the look and feel of the older user interfaces. For more information, see Styling Visualforce Pages in the Visualforce Developer’s Guide. But if you’re planning to switch to Lightning Experience, consider the Lightning Component framework, our new UI framework. See the “Lightning Components” module in the Develop for Lightning Experience Trailhead trail to learn more.

Examples Using the Partner WSDL

This section includes examples in Java and C# for making API calls using the partner WSDL. Before running these samples, perform the following steps in the quick start tutorial to get the partner WSDL file and generate the proxy client code for your development environment.

- **Step 2: Generate or Obtain the Web Service WSDL**
- **Step 3: Import the WSDL File Into Your Development Platform**

After you generate the proxy client code and set up your development environment, you can start writing your client application. First, your application needs to log into the Salesforce service using the partner authentication endpoint. After a successful login, you can execute the sample methods.
For your convenience, template classes are provided, one in Java and one in C#, that make a login call. You can use them to execute the sample methods provided later in this section.

**Sample template class for Java:** This sample prompts the user to enter the username, password, and authentication endpoint. Next, it logs the user in. For the authentication endpoint URL, pass in the endpoint found in the partner WSDL file.

```java
import com.sforce.soap.partner.PartnerConnection;
import com.sforce.soap.partner.sobject.*;
import com.sforce.soap.partner.*;
import com.sforce.ws.ConnectorConfig;
import com.sforce.ws.ConnectionException;
import com.sforce.soap.partner.Error;
import java.io.FileNotFoundException;
import java.io.IOException;
import java.io.InputStreamReader;
import java.io.BufferedReader;
import java.util.*;

public class PartnerSamples {
    PartnerConnection partnerConnection = null;
    private static BufferedReader reader =
            new BufferedReader(new InputStreamReader(System.in));

    public static void main(String[] args) {
        PartnerSamples samples = new PartnerSamples();
        if (samples.login()) {
            // Add calls to the methods in this class.
            // For example:
            // samples.querySample();
        }
    }

    private String getUserInput(String prompt) {
        String result = "";
        try {
            System.out.print(prompt);
            result = reader.readLine();
        } catch (IOException ioe) {
            ioe.printStackTrace();
        }
        return result;
    }

    private boolean login() {
        boolean success = false;
        String username = getUserInput("Enter username: ");
        String password = getUserInput("Enter password: ");
        String authEndPoint = getUserInput("Enter auth end point: ");

        try {
            ConnectorConfig config = new ConnectorConfig();
            config.setUsername(username);
            config.setPassword(password);
            config.setAuthEndpoint(authEndPoint);  
        }
    }
}
```
config.setTraceFile("traceLogs.txt");
config.setTraceMessage(true);
config.setPrettyPrintXml(true);

partnerConnection = new PartnerConnection(config);

success = true;
} catch (ConnectionException ce) {
    ce.printStackTrace();
} catch (FileNotFoundException fnfe) {
    fnfe.printStackTrace();
}

return success;

// Add your methods here.
//

Sample template class for C#: This sample prompts the user to enter the username and password. Next, it logs the user in. The project name for this sample is assumed to be TemplatePartner and the Web reference name sforce. If these values are different for your project, make sure to change the using directive to appropriate values for your project: using your_project_name.web_reference_name;

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Collections;
using TemplatePartner.sforce;

namespace TemplatePartner
{
    class PartnerSamples
    {
        private SforceService binding;

        static void Main(string[] args)
        {
            PartnerSamples samples = new PartnerSamples();
            if (samples.login())
            {
                // Add calls to the methods in this class.
                // For example:
                // samples.querySample();
            }
        }

        private bool login()
        {
            Console.Write("Enter username: ");
            // Add your code here.
        }
    }
}
string username = Console.ReadLine();

// Set the SOAP header with the session ID returned by
// the login result. This will be included in all
// API calls.
binding.SessionHeaderValue = new SessionHeader();
binding.SessionHeaderValue.sessionId = lr.sessionId;

// Return true to indicate that we are logged in, pointed
// at the right URL and have our security token in place.
This partner WSDL samples are:

- Sample query and queryMore Calls
- Sample search Call
- Sample create Call
- Sample update Call

Sample query and queryMore Calls

The following Java and C# examples show usage of the `query()` and `queryMore()` calls for the partner WSDL. Each example sets the batch size of the query to 250 items returned. It then performs a query call to get the first name and last name of all contacts and iterates through the contact records returned. For each contact, it writes the contact’s first name and last name to the output, or only the last name if the first name is null. Finally, if there are more items to be returned by the query, as indicated by a `QueryResult.done` property value of `false`, it calls `queryMore()` to get the next batch of items, and repeats the process until no more records are returned.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```java
public void querySample() {
    try {
        // Set query batch size
        partnerConnection.setQueryOptions(250);

        // SOQL query to use
        String soqlQuery = "SELECT FirstName, LastName FROM Contact";
        // Make the query call and get the query results
        QueryResult qr = partnerConnection.query(soqlQuery);

        boolean done = false;
        int loopCount = 0;
        // Loop through the batches of returned results
        while (!done) {
            System.out.println("Records in results set " + loopCount++
                + " - ");
            SObject[] records = qr.getRecords();
            // Process the query results
            for (int i = 0; i < records.length; i++) {
                SObject contact = records[i];
                Object firstName = contact.getField("FirstName");
                Object lastName = contact.getField("LastName");
                if (firstName == null) {
                    System.out.println("Contact " + (i + 1) + " last name ")
                } else {
                    System.out.println("Contact " + (i + 1) + " first name 
```
C# Example

```csharp
public void querySample()
{
    try
    {
        QueryResult qr = null;
        binding.QueryOptionsValue = new sforce.QueryOptions();
        binding.QueryOptionsValue.batchSize = 250;
        binding.QueryOptionsValue.batchSizeSpecified = true;

        qr = binding.query("SELECT FirstName, LastName FROM Contact");

        bool done = false;
        int loopCount = 0;
        while (!done)
        {
            Console.WriteLine("\nRecords in results set " + Convert.ToString(loopCount++) + " - ");
            // Process the query results
            for (int i = 0; i < qr.records.Length; i++)
            {
                sforce.sObject con = qr.records[i];
                string fName = con.Any[0].InnerText;
                string lName = con.Any[1].InnerText;
                if (fName == null)
                    Console.WriteLine("Contact " + (i + 1) + ": " + lName);
                else
                    Console.WriteLine("Contact " + (i + 1) + ": " + fName + " " + lName);
            }
        }
        if (qr.done)
```
Sample search Call

The following Java and C# examples show how to use the search() call for the partner WSDL. Each example accepts a phone number string value that is used in the SOQL query. The search call looks for phone fields that match the passed in phone value in all contacts, leads, and accounts. Next, the example iterates through the returned search results that contain the matching records, adds them to arrays, and writes their field values to the console. The record fields returned correspond to the fields specified in the SOQL query for each record type.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```java
public void searchSample(String phoneNumber) {
    try {
        // Example of phoneNumber format: 4155551212
        String soslQuery = "FIND "+ phoneNumber + " IN Phone FIELDS "+
                            "RETURNING "+
                            "Contact(Id, Phone, FirstName, LastName), "+
                            "Lead(Id, Phone, FirstName, LastName),"+
                            "Account(Id, Phone, Name)";
        // Perform SOSL query
        SearchResult sResult = partnerConnection.search(soslQuery);
        // Get the records returned by the search result
        SearchRecord[] records = sResult.getSearchRecords();
        // Create lists of objects to hold search result records
        List<SObject> contacts = new ArrayList<SObject>();
        List<SObject> leads = new ArrayList<SObject>();
        List<SObject> accounts = new ArrayList<SObject>();

        // Iterate through the search result records
        // and store the records in their corresponding lists
        // based on record type.
        if (records != null && records.length > 0) {
            for (int i = 0; i < records.length; i++) {
                SObject record = records[i].getRecord();
                if (record.getType().toLowerCase().equals("contact")) {
                    contacts.add(record);
                } else if (record.getType().toLowerCase().equals("lead")) {
```
leads.add(record);
} else if (record.getType().toLowerCase().equals("account")) {
    accounts.add(record);
}

// Display the contacts that the search returned
if (contacts.size() > 0) {
    System.out.println("Found " + contacts.size() + " contact(s):");
    for (SObject contact : contacts) {
        System.out.println(contact.getId() + " - " +
                             contact.getField("FirstName") + " - " +
                             contact.getField("LastName") + " - " +
                             contact.getField("Phone")
        );
    }
}

// Display the leads that the search returned
if (leads.size() > 0) {
    System.out.println("Found " + leads.size() + " lead(s):");
    for (SObject lead : leads) {
        System.out.println(lead.getId() + " - " +
                            lead.getField("FirstName") + " - " +
                            lead.getField("LastName") + " - " +
                            lead.getField("Phone")
        );
    }
}

// Display the accounts that the search returned
if (accounts.size() > 0) {
    System.out.println("Found " + accounts.size() + " account(s):");
    for (SObject account : accounts) {
        System.out.println(account.getId() + " - " +
                            account.getField("Name") + " - " +
                            account.getField("Phone")
        );
    }
} else {
    // The search returned no records
    System.out.println("No records were found for the search.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

C# Example

public void searchSample(String phoneNumber)
{
try {
    // Example of phoneNumber format: 4155551212
    String sosqlQuery =
        "FIND {" + phoneNumber + "} IN Phone FIELDS " +
        "RETURNING " +
        "Contact(Id, Phone, FirstName, LastName), " +
        "Lead(Id, Phone, FirstName, LastName)," +
        "Account(Id, Phone, Name)";
    // Perform SOSL query
    SearchResult sResult = binding.search(sosqlQuery);
    // Get the records returned by the search result
    SearchRecord[] records = sResult.searchRecords;
    // Create lists of objects to hold search result records
    ArrayList contacts = new System.Collections.ArrayList();
    ArrayList leads = new System.Collections.ArrayList();
    ArrayList accounts = new System.Collections.ArrayList();

    // Iterate through the search result records
    // and store the records in their corresponding lists
    // based on record type.
    if ((records != null) && (records.Length > 0)) {
        for (int i = 0; i < records.Length; i++) {
            sObject record = records[i].record;
            if (record.type.ToLower().Equals("contact")) {
                contacts.Add(record);
            } else if (record.type.ToLower().Equals("lead")) {
                leads.Add(record);
            } else if (record.type.ToLower().Equals("account")) {
                accounts.Add(record);
            }
        }
        // Display the contacts that the search returned
        if (contacts.Count > 0) {
            Console.WriteLine("Found " + contacts.Count + " contact(s):");
            for (int i = 0; i < contacts.Count; i++) {
                sObject c = (sObject)contacts[i];
                Console.WriteLine(c.Any[0].InnerText + " - " +
                    c.Any[2].InnerText + " - " +
                    c.Any[3].InnerText + " - " + c.Any[1].InnerText);
            }
        }
        // Display the leads that the search returned
        if (leads.Count > 0)
Sample create Call

The following Java and C# examples show how to use the `create()` call for the partner WSDL. Each example creates a contact record with several fields. It iterates through the results of the create call and checks whether the operation was successful or not. If the create operation was successful, it writes the ID of the contact created to the console. Otherwise, it iterates through the errors and writes details of each error to the console. In this case, the output of the example is the ID of the new contact.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```java
public String createSample() {
    String result = null;
    try {
        // Create a new sObject of type Contact
        // and fill out its fields.
        SObject contact = new SObject();
```
contact.setType("Contact");
contact.setField("FirstName", "Otto");
contact.setField("LastName", "Jespersen");
contact.setField("Salutation", "Professor");
contact.setField("Phone", "(999) 555-1234");
contact.setField("Title", "Philologist");

// Add this sObject to an array
SObject[] contacts = new SObject[1];
contacts[0] = contact;

// Make a create call and pass it the array of sObjects
SaveResult[] results = partnerConnection.create(contacts);

// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.length; j++) {
    if (results[j].isSuccess()) {
        result = results[j].getId();
        System.out.println("A contact was created with an ID of: " + result);
    } else {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].getErrors().length; i++) {
            Error err = results[j].getErrors()[i];
            System.out.println("Errors were found on item " + j);
            System.out.println("Error code: " + err.getStatusCode().toString());
            System.out.println("Error message: " + err.getMessage());
        }
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
return result;
}
// Create the contact's fields
System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
contactFields[0] = doc.CreateElement("FirstName");
contactFields[0].InnerText = "Otto";
contactFields[1] = doc.CreateElement("LastName");
contactFields[1].InnerText = "Jespersen";
contactFields[2].InnerText = "Professor";
contactFields[3] = doc.CreateElement("Phone");
contactFields[3].InnerText = "(999) 555-1234";
contactFields[4] = doc.CreateElement("Title");
contactFields[4].InnerText = "Philologist";

contact.type = "Contact";
contact.Any = contactFields;

// Add this sObject to an array
sObject[] contactList = new sObject[1];
contactList[0] = contact;

// Make a create call and pass it the array of sObjects
SaveResult[] results = binding.create(contactList);
// Iterate through the results list
// and write the ID of the new sObject
// or the errors if the object creation failed.
// In this case, we only have one result
// since we created one contact.
for (int j = 0; j < results.Length; j++)
{
    if (results[j].success)
    {
        Console.Write("\nA contact was created with an ID of: "
            + results[j].id);
    }
    else
    {
        // There were errors during the create call,
        // go through the errors array and write
        // them to the console
        for (int i = 0; i < results[j].errors.Length; i++)
        {
            Error err = results[j].errors[i];
            Console.WriteLine("Errors were found on item "+ j.ToString());
            Console.WriteLine("Error code is: " + err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}

} catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
        " Stack trace: " + e.StackTrace);
}
Sample update Call

The following Java and C# examples show how to use the `update()` call for the Partner WSDL. Each example takes the ID of the contact to update as an argument. It creates two sObject records of type Contact—one to hold the valid passed in ID and the other has an invalid ID. Next, it sets a new phone number for the valid contact and `null` for the last name of the invalid contact. It then makes the update call and iterates through the results. For a successful update operation, it writes the ID of the contact that got updated. For a failed update operation, it writes the details of all returned errors to the console. In this case, the output is the ID of the contact that was successfully updated and an error for the invalid contact update.

To execute the sample method, you can use the corresponding Java or C# template class provided in Examples Using the Partner WSDL.

Java Example

```java
public void updateSample(String id) {
    try {
        // Create an sObject of type contact
        SObject updateContact = new SObject();
        updateContact.setType("Contact");

        // Set the ID of the contact to update
        updateContact.setId(id);

        // Set the Phone field with a new value
        updateContact.setField("Phone", "(415) 555-1212");

        // Create another contact that will cause an error
        // because it has an invalid ID.
        SObject errorContact = new SObject();
        errorContact.setType("Contact");

        // Set an invalid ID on purpose
        errorContact.setId("SLFKJLFKJ");

        // Set the value of LastName to null
        errorContact.setFieldsToNull(new String[] {"LastName"]);

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = partnerConnection.update(
            new SObject[] {updateContact, errorContact}
        );

        // Iterate through the results and write the ID of
        // the updated contacts to the console, in this case one contact.
        // If the result is not successful, write the errors
        // to the console. In this case, one item failed to update.
        for (int j = 0; j < saveResults.length; j++) {
            System.out.println("\nItem: " + j);
            if (saveResults[j].isSuccess()) {
                System.out.println("Contact with an ID of " +
                    saveResults[j].getId() + " was updated.");
            }
            else {
```
// There were errors during the update call, 
// go through the errors array and write 
// them to the console.
for (int i = 0; i < saveResults[j].getErrors().length; i++) {
    Error err = saveResults[j].getErrors()[i];
    System.out.println("Errors were found on item "+ j);
    System.out.println("Error code: " +
                      err.getStatusCode().toString());
    System.out.println("Error message: " + err.getMessage());
}

} catch (ConnectionException ce) {
    ce.printStackTrace();
}

For more information about setFieldsToNull (or its equivalent in client tools other than WSC), see fieldsToNull and Resetting Values to null.

C# Example

```csharp
public void updateSample(String id) {
    try {
        // Create an sObject of type contact
        sObject updateContact = new sObject();
        updateContact.type = "Contact";

        // Set the ID of the contact to update
        updateContact.Id = id;
        // Set the Phone field to a new value.
        // The Phone field needs to be created as an XML element.
        System.Xml.XmlDocument doc = new System.Xml.XmlDocument();
        System.Xml.XmlElement phoneField = doc.CreateElement("Phone");
        phoneField.InnerText = "(415) 555-1212";

        // Add the Phone field to the contact
        updateContact.Any = new System.Xml.XmlElement[] {phoneField};

        // Create another contact that will cause an error
        // because it has an invalid ID.
        sObject errorContact = new sObject();
        errorContact.type = "Contact";
        // Set an invalid ID on purpose
        errorContact.Id = "SLFKJLFKJ";
        // Set the value of LastName to null
        errorContact.fieldsToNull = new String[] {"LastName"};

        // Make the update call by passing an array containing
        // the two objects.
        SaveResult[] saveResults = binding.update(
            new sObject[] {updateContact, errorContact});
        // Iterate through the results and write the ID of
```
// the updated contacts to the console, in this case one contact.
// If the result is not successful, write the errors
// to the console. In this case, one item failed to update.
for (int j = 0; j < saveResults.Length; j++) {
    Console.WriteLine("\nItem: " + j);
    if (saveResults[j].success)
    {
        Console.WriteLine("Contact with an ID of " +
            saveResults[j].id + " was updated.");
    }
    else
    {
        // There were errors during the update call,
        // go through the errors array and write
        // them to the console.
        for (int i = 0; i < saveResults[j].errors.Length; i++) {
            Error err = saveResults[j].errors[i];
            Console.WriteLine("Errors were found on item " + j.ToString());
            Console.WriteLine("Error code: " +
                err.statusCode.ToString());
            Console.WriteLine("Error message: " + err.message);
        }
    }
}
}
catch (SoapException e) {
    Console.WriteLine("An unexpected error has occurred: " + e.Message +
            " Stack trace: " + e.StackTrace);
}
CHAPTER 7  Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. Salesforce ERDs use crow’s foot notation. The following ERDs are available.

We’re updating our data models, one at a time, and moving all diagrams to Salesforce Architects. We’ll share a direct link to the new version of each diagram as they become available, and retire this page when all data models have been updated and moved.

- Sales Objects—including accounts, contacts, opportunities, leads, campaigns, and other related objects
- Task and Event Objects—including tasks and events and their related objects
- Support Objects—including cases and solutions and their related objects
- Salesforce Knowledge Objects—including view and vote statistics, article versions, and other related objects
- Document, Note, and Attachment Objects—including documents, notes, and attachments and their related objects
- User, Sharing, and Permission Objects—including users, profiles, and roles
- User Email Objects
- Profile and Permission Objects—including users, profiles, permission sets, and related permission objects
- Record Type Objects—including record types and business processes and their related objects
- Product and Schedule Objects—including opportunities, products, and schedules
- Sharing and Team Selling Objects—including account teams, opportunity teams, and sharing objects
- Forecasts Objects—including objects for Collaborative Forecasts.
- Territory Management 2.0 Objects—including territories and related objects associated with Territory Management 2.0
- Original Territory Management—including territories and related objects
- Process Objects—including approval processes and related objects
- Content Objects—including content and libraries and their related objects
- Chatter Feed Objects—including objects related to feeds
- Consent Management Objects—including consent, authorization form, and communication subscription objects
- WDC Badge and Reward Objects—including badge and reward objects
- WDC Feedback and Performance Cycle Objects—including feedback and performance cycle objects

Each ERD includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

Content Note Objects

The ContentNote object represents notes created with the enhanced version of the Salesforce note-taking tool.
Chatter Objects

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that’s being followed, an updated post, or a user status change.
- All feed items have a ParentId, which is either:
  - a record
  - a user
  - a group
Chatter Feed Objects

For a list of standard objects with feeds, see StandardObjectNameFeed.

CHAPTER 8 Standard Objects

This section provides a list of standard objects and their standard fields. 
Some fields may not be listed for some objects. To see the system fields for each object, see System Fields.

To verify the complete list of fields for an object, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

AcceptedEventRelation
Represents event participants (invitees or attendees) with the status Accepted for a given event.

Account
Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

AccountBrand
Represents the brand details of a Partner Account. This object is available in API version 43.0 and later.

AccountContactRelation
Represents a relationship between a contact and one or more accounts.

AccountCleanInfo
Stores the metadata Data.com Clean uses to determine an account record’s clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

AccountContactRole
Represents the role that a Contact plays on an Account.

AccountInsight
Represents an individual insight (a key business development) related to an account record.

AccountOwnerSharingRule
Represents the rules for sharing an account with a User other than the owner.

AccountPartner
This object represents a partner relationship between two Account records. An AccountPartner record is created automatically when a Partner record is created for a partner relationship between two accounts.

AccountRelationship
Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.

AccountRelationshipShareRule
Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

AccountShare
Represents a sharing entry on an Account.
Standard Objects

**AccountTag**
Associates a word or short phrase with an Account.

**AccountTeamMember**
Represents a User who is a member of an Account team.

**AccountTerritoryAssignmentRule**
An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

**AccountTerritoryAssignmentRuleItem**
A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

**AccountTerritorySharingRule**
Represents the rules for sharing an Account within a Territory.

**AccountUserTerritory2View**
Represents the view of the Users in Assigned Territories related list in Lightning Experience. Available in API version 42.0 and later.

**ActionCadence**
Represents the definition of a sales cadence. This object is available in API version 45.0 and later.

**ActionCadenceRule**
Represents the logic that a branch step uses to make decisions in your sales cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

**ActionCadenceRuleCondition**
Represents the logic for a branch step. This object is available in API version 48.0 and later.

**ActionCadenceStep**
Represents a step in a sales cadence. Use ActionCadenceStep to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

**ActionCadenceStepTracker**
Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

**ActionCadenceStepVariant**
Represents an email template or call script variant associated with an action cadence step. Email and call steps can have up to 3 variants associated so sales teams can compare the engagement results. This object is available in API version 53.0 and later.

**ActionCadenceTracker**
Represents an active sales cadence target. This object is available in API version 45.0 and later.

**ActionLinkGroupTemplate**
Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

**ActionLinkTemplate**
Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.
Standard Objects

ActionPlan
Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

ActionPlanItem
Represents the instance of an action plan item. This object is used by more than one cloud in Industries.

ActionPlanTemplate
Represents the instance of an action plan template. This object is used by more than one cloud in Industries.

ActionPlanTemplateItem
Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

ActionPlanTemplateItemValue
Represents the value associated with an action plan template item. This object is used by more than one cloud in Industries.

ActionPlanTemplateVersion
Represents the version of an action plan template. This object is used by more than one cloud in Industries.

ActiveFeatureLicenseMetric
Represents the number of active, assigned, and purchased feature licenses in the org. This object is available in API version 52.0 and later.

ActivePermSetLicenseMetric
Represents the number of active, assigned, and purchased permission set licenses in the org. This object is available in API version 52.0 and later.

ActiveProfileMetric
Represents the profile associated with the active, assigned, and purchased user licenses. This object is available in API version 52.0 and later.

ActiveScratchOrg
Represents an active scratch org. This object is available in API version 41.0 and later.

ActivityHistory
This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

ActivityMetric
Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

AdditionalNumber
Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

Address
Represents a mailing, billing, or home address.

AgentWork
Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

AgentWorkSkill
Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

AIApplication
Represents an AI application such as Einstein Prediction Builder. This object is available in API version 50.0 and later.
Standard Objects

AIApplicationConfig
Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

AIInsightAction
Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

AIInsightFeedback
Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

AIInsightReason
Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

AIInsightValue
Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

AIRecordInsight
Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

AllowedEmailDomain
Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user’s Email field. This object is available in API version 29.0 and later.

AlternativePaymentMethod
Represents a payment method that doesn’t have a defined Commerce Orders entity such as CardPaymentMethod on page 673 or DigitalWallet on page 1168. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. AlternativePaymentMethod functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.

AnalyticsLicensedAsset
Represents a licensed Analytics asset. In this context, Analytics is Tableau CRM or Sonic. Available in API version 52.0 and later.

Announcement
Represents a Chatter group announcement. This object is available in API version 30.0 and later.

ApexClass
Represents an Apex class.

ApexComponent
Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as <apex:relatedList> and <apex:dataTable>.

ApexLog
Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

ApexPage
Represents a single Visualforce page.

ApexPageInfo
Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

ApexTestQueueItem
Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

ApexTestResult
Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.
**ApexTestResultLimits**
Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

**ApexTestRunResult**
Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

**ApexTestSuite**
Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

**ApexTrigger**
Represents an Apex trigger.

**AppAnalyticsQueryRequest**
Represents a request for AppExchange App Analytics data.

**AppDefinition**
Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

**AppExtension**
Represents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

**AppMenuItem**
Represents the organization’s default settings for items in the app menu or App Launcher.

**AppointmentAssignmentPolicy**
Stores information about resource assignment rules. This object is available in API version 52.0 and later.

**AppointmentScheduleAggr**
Records the utilization of a service resource, by date, for the Load Balancing appointment assignment policy. This object is available in API version 52.0 and later.

**AppointmentScheduleLog**
Stores service appointments of each service Resource. This object is used to calculate the utilization of a service resource for the AppointmentScheduleAggr object. This object is available in API version 52.0 and later.

**AppointmentSchedulingPolicy**
Represents a set of rules for scheduling appointments using Salesforce Scheduler. This object is available in API version 45.0 and later.

**AppointmentTopicTimeSlot**
Junction object that is a lookup to a work type or a work type group for a time slot. This object is available in API version 52.0 and later.

**Approval**
Represents an approval request for a Contract.

**AppTabMember**
Represents the list of tabs for each of the available apps. This object is available in API version 43.0 and later.

**Article Type__DataCategorySelection**
A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.
Asset
Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

AssetAction
Represents a change made to a lifecycle-managed asset. The fields can't be edited. This object is available in API version 50.0 and later.

AssetActionSource
Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can't be edited. This object is available in API version 50.0 and later.

AssetDowntimePeriod
Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

AssetOwnerSharingRule
Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

AssetRelationship
Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances.

AssetShare
Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

AssetStatePeriod
Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can't be edited. This object is available in API version 50.0 and later.

AssetTag
Associates a word or short phrase with an Asset.

AssetTokenEvent
The documentation has moved to AssetTokenEvent in the Platform Events Developer Guide.

AssetWarranty
Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

AssignedResource
Represents a service resource who is assigned to a service appointment in Field Service and Lightning Scheduler. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

AssignmentRule
Represents an assignment rule associated with a Case or Lead.

AssociatedLocation
Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

AsyncApexJob
Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the future annotation, or a job that implements Queueable. Use this object to query Apex batch jobs in your organization.
AsyncOperationLog
Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

AttachedContentDocument
This read-only object contains all ContentDocument objects associated with an object.

AttachedContentNote
This read-only object contains all ContentNote objects associated with an object. This object is available in API version 35.0 and later.

Attachment
Represents a file that a User has uploaded and attached to a parent object.

Audience
Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

AuraDefinition
Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

AuraDefinitionBundle
Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

AuraDefinitionBundleInfo
For internal use only.

AuraDefinitionInfo
For internal use only.

AuthConfig
Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

AuthConfigProviders
Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

AuthorizationForm
Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

AuthorizationFormConsent
Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

AuthorizationFormDataUse
Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

AuthorizationFormText
Represents an authorization form's text and language settings. This object is available in API version 46.0 and later.

AuthProvider
Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.
Standard Objects

**AuthSession**
The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

**BackgroundOperation**
Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

**BackgroundOperationResult**
Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

**BatchApexErrorEvent**
The documentation has moved to BatchApexErrorEvent in the Platform Events Developer Guide.

**Bookmark**
Represents a link between opportunities that share common information.

**BrandTemplate**
Letterhead for HTML EmailTemplate.

**BriefcaseAssignment**
Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

**BriefcaseDefinition**
Represents a briefcase definition. A briefcase makes selected records available for users to view when they’re offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.

**BriefcaseRule**
Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

**BriefcaseRuleFilter**
Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

**Budget**
Tracks an estimate of future revenue or expenses during a specific time period. This object is available in API version 53.0 and later.

**BudgetAllocation**
Represents a subsection of a Budget that shows where allocated resources are being applied. This object is available in API version 53.0 and later.

**BusinessBrand**
Represents a unique brand for a business that belongs to a parent entity. This object is available in API version 53.0 and later.

**BusinessHours**
Specifies the business hours of your support organization. Escalation rules are run only during these hours.

**BusinessProcess**
Represents a business process.

**BusinessProcessDefinition**
Setup object that stores information about stages in a customer lifecycle map. The stages are associated with surveys and questions created using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

**BusinessProcessFeedback**
Setup object that stores information about the survey and the question associated with each stage in a customer lifecycle map. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.
**BusinessProcessGroup**
Setup object that stores information about customer lifecycle maps. Customer lifecycle maps are used to track the scores provided by customers across their lifecycle using Salesforce Surveys. This object is reserved for internal use, and is available in API version 49.0 and later.

**BuyerAccount**
Represents an account that is enabled as a buyer for Lightning B2B Commerce. This object is available in API version 48.0 and later.

**BuyerGroupPricebook**
Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

**CalcProcStepRelationship**
Defines a parent-child relationship between two Expression Set Steps in an Expression Set Version. The label for this object is Expression Set Step Relationship. This object is available in API version 53.0 and later.

**CalculationMatrix**
Matches input values to a table row and returns the row’s output values. The label for this object is Decision Matrix. This object is available in API version 53.0 and later.

**CalculationMatrixColumn**
Defines a column in a Decision Matrix. The label for this object is Decision Matrix Column. This object is available in API version 53.0 and later.

**CalculationMatrixRow**
Defines a row in a Decision Matrix. The label for this object is Decision Matrix Row. This object is available in API version 53.0 and later.

**CalculationMatrixVersion**
Defines a version of a Decision Matrix. The label for this object is Decision Matrix Version. This object is available in API version 53.0 and later.

**CalculationProcedure**
Performs a series of calculations using matrix lookups and user-defined variables and constants. The label for this object is Expression Set. This object is available in API version 53.0 and later.

**CalculationProcedureStep**
Defines a step in an Expression Set. The label for this object is Expression Set Step. This object is available in API version 53.0 and later.

**CalculationProcedureVariable**
Defines a variable in an Expression Set. The label for this object is Expression Set Variable. This object is available in API version 53.0 and later.

**CalculationProcedureVersion**
Defines a version of an Expression Set. The label for this object is Expression Set Version. This object is available in API version 53.0 and later.

**Calendar**
Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.

**CalendarView**
These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.
Standard Objects

**CallCenter**
Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

**CallCenterRoutingMap**
Stores a mapping between a user or queue in a Salesforce org to a user or queue in an external system’s call center. This object is available in API version 53.0 and later.

**CallCoachConfigModifyEvent**
Represents a Conversation Insights configuration change. This object is available in API version 49.0 and later.

**CallCoachingMediaProvider**
Represents the media provider for call recordings. This object is available in API version 49.0 and later.

**CallDisposition**
Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

**CallDispositionCategory**
Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

**CallTemplate**
Represents a call script for users to read when making calls.

**Campaign**
Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

**CampaignInfluence**
Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

**CampaignInfluenceModel**
This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group CampaignInfluence records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

**CampaignMember**
Represents the association between a campaign and either a lead or a contact.

**CampaignMemberStatus**
One or more member status values defined for a campaign.

**CampaignOwnerSharingRule**
Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

**CampaignShare**
Represents a sharing entry on a Campaign.

**CampaignTag**
Associates a word or short phrase with a Campaign.

**CardPaymentMethod**
References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.

**CartCheckoutSession**
Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later.
Standard Objects

**CartDeliveryGroup**
Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

**CartDeliveryGroupMethod**
Represents the selected delivery method for a cart delivery group used in Lightning B2B Commerce checkout. This object is available in API version 49.0 and later.

**CartItem**
 Represents an item in a WebCart that’s active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type Product or Charge. This object is available in API version 49.0 and later.

**CartItemPriceAdjustment**
Price adjustment for a cart item. This object is available in API version 52.0 and later.

**CartTax**
Represents taxes for a line item in a WebCart that’s active in a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

**CartValidationOutput**
Associate errors to cart entities, such as cart line items, delivery groups, and the like, in a store built with B2B Commerce on Lightning Experience. An example error is “Out of stock.” Available in API version 49.0 and later.

**Case**
Represents a case, which is a customer issue or problem.

**CaseArticle**
Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

**CaseComment**
Represents a comment that provides additional information about the associated Case.

**CaseContactRole**
Represents the role that a given Contact plays on a Case.

**CaseHistory**
Represents historical information about changes that have been made to the associated Case.

**CaseMilestone**
Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

**CaseOwnerSharingRule**
Represents the rules for sharing a case with users other than the owner.

**CaseRelatedIssue**
This object acts as a junction between a customer issue (Case) and the Incident or Problem that represents an associated service failure. This object is available in API version 53.0 and later.

**CaseShare**
Represents a sharing entry on a Case.

**CaseSolution**
Represents the association between a Case and a Solution.

**CaseStatus**
Represents the status of a Case, such as New, On Hold, or In Process.
CaseSubjectParticle
Represents the Social Business Rules custom format for the **Case Subject** field on cases created from inbound social posts. This object is available in API version 41.0 and later.

CaseTag
Associates a word or short phrase with a Case

CaseTeamMember
Represents a case team member, who works with a team of other users to help resolve a case.

CaseTeamRole
Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

CaseTeamTemplate
Represents a predefined case team, which is a group of users that helps resolve a case.

CaseTeamTemplateMember
Represents a member on a predefined case team, which is a group of users that helps resolve cases.

CaseTeamTemplateRecord
The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the **ParentId** to the case and the **TeamTemplateId** to the predefined case team.

CategoryData
Represents a logical grouping of Solution records.

CategoryNode
Represents a tree of Solution categories.

CategoryNodeLocalization
When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

ChangeRequest
Represents a decision to implement a formal request for a change (RFC). This object is available in API version 53.0 and later.

ChangeRequestRelatedIssue
This object acts as a junction between a Change Request and an Incident or a Problem that represents a service failure. This object is available in API version 53.0 and later.

ChannelObjectLinkingRule
Represents a rule for linking a channel interaction with an object (such as Lead or Contact). This object is available in API version 47.0 and later.

ChannelProgram
Represents a channel program that vendors use to market and sell their products through channel partners. This object is available in API version 41.0 and later.

ChannelProgramLevel
Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

ChannelProgramMember
Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

ChatterActivity
ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.
Standard Objects

ChatterAnswersActivity
Represents the reputation of a User in Chatter Answers zones. This object is available in API version 25.0 and later.

ChatterAnswersReputationLevel
Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

ChatterConversation
Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

ChatterConversationMember
Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

ChatterExtension
Represents a Rich Publisher App that’s integrated with the Chatter publisher. This object is available in API version 41.0 and later.

ChatterExtensionConfig
Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

ChatterMessage
Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

ClientBrowser
Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

CollaborationGroup
Represents a Chatter group. This object is available in API version 19.0 and later.

CollaborationGroupMember
Represents a member of a Chatter group. This object is available in API version 19.0 and later.

CollaborationGroupMemberRequest
Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

CollaborationGroupRecord
Represents the records associated with Chatter groups.

CollaborationInvitation
Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

CollabDocumentMetric
Represents the engagement metrics for a Quip thread (document or spreadsheet) that’s linked to a Salesforce record. This object is available in API version 50.0 and later.

CollabDocumentMetricRecord
Represents an association between a CollabDocumentMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip thread for which metrics were gathered using CollabDocumentMetric. CollabDocumentMetricRecord is available in API version 50.0 and later.

CollabTemplateMetric
Represents the engagement metrics for a Quip template. This object is available in API version 50.0 and later.

CollabTemplateMetricRecord
Represents an association between a CollabTemplateMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is linked to a Quip template for which metrics were gathered using CollabTemplateMetric. CollabTemplateMetricRecord is available in API version 50.0 and later.
Standard Objects

**CollabUserEngagementMetric**
Represents the user engagement metrics for a Quip thread in a Quip template or document. This object is available in API version 50.0 and later.

**CollabUserEngmtRecordLink**
Represents an association between a CollabUserEngagementMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

**ColorDefinition**
Represents the color-related metadata for a custom tab. This object is available in API version 43.0 and later.

**CombinedAttachment**
This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

**CommerceEntitlementBuyerGroup**
Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

**CommerceEntitlementPolicy**
Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

**CommerceEntitlementPolicyShare**
Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

**CommerceEntitlementProduct**
Represents the entitlement policy for a product. This object is available in API version 49.0 and later.

**CommissionSchedule**
Represents a commission calculation and rate definition. Calculates commission values for a commissionable event.

**CommissionScheduleAssignment**
Represents the commission calculation applicable to a specific product or producer for one or multiple commissionable events.

**CommSubscription**
Represents a customer's subscription preferences for a specific communication. This object is available in API version 48.0 and later.

**CommSubscriptionChannelType**
Represents the engagement channel through which you can reach a customer for a communication subscription. This object is available in API version 48.0 and later.

**CommSubscriptionConsent**
Represents a customer's consent to a communication subscription. This object is available in API version 48.0 and later.

**CommSubscriptionTiming**
Represents a customer's timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

**Community (Zone)**
Represents a zone that contains Idea or Question objects.

**ConnectedApplication**
Represents a connected app and its details; all fields are read-only.

**Consumption Rate**
Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.
**Standard Objects**

**Consumption Schedule**
A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

**Contact**
Represents a contact, which is a person associated with an account.

**ContactCleanInfo**
Stores the metadata Data.com Clean uses to determine a contact record’s clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

**ContactPointAddress**
Represents a contact’s billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

**ContactPointConsent**
Represents a customer’s consent to be contacted via a specific contact point, such as an email address or phone number. This object is available in API version 48.0 and later.

**ContactPointEmail**
Represents a contact’s email, which is associated with an individual or person account. This object is available in API version 48.0 and later.

**ContactPointPhone**
Represents a contact’s phone number, which is associated with an individual or person account. This object is available in API version 48.0 and later.

**ContactPointTypeConsent**
Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

**ContactOwnerSharingRule**
Represents the rules for sharing a contact with a User other than the owner.

**ContactRequest**
Represents a customer’s request for support to get back to them about an issue. This object is available in API version 45.0 and later.

**ContactRequestShare**
Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

**ContactShare**
Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the ContactAccessLevel is All and RowCause is Owner.

**ContactSuggestionInsight**
Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

**ContactTag**
Associates a word or short phrase with a Contact.

**ContentAsset**
Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

**ContentBody**
Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.
Standard Objects

**ContentDistribution**
Represents information about sharing a document externally. This object is available in API version 32.0 and later.

**ContentDistributionView**
Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

**ContentDocument**
Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

**ContentDocumentHistory**
Represents the history of a document. This object is available in versions 17.0 and later.

**ContentDocumentLink**
Represents the link between a Salesforce CRM Content document, Salesforce file, or ContentNote and where it’s shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

**ContentDocumentListViewMapping**
Represents an association between a ListView and a Quip ContentDocument. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

**ContentDocumentSubscription**
Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

**ContentFolder**
Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

**ContentFolderItem**
Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

**ContentFolderLink**
Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

**ContentFolderMember**
Defines the association between a file and a folder. This object is available in API version 34.0 and later.

**ContentHubItem**
Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

**ContentHubRepository**
Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

**ContentNote**
Represents a note created with the enhanced note taking tool, released in Winter ’16. This object is available in API version 32.0 and later.

**ContentNotification**
Represents a notification for a file. This object is available in API version 42.0 and later.

**ContentTagSubscription**
Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.
Standard Objects

**ContentUserSubscription**
Represents a subscription for a user following another user. This object is available in API version 42.0 and later.

**ContentVersion**
Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

**ContentVersionComment**
Represents a comment on a version of a file. This object is available in API version 42.0 and later.

**ContentVersionHistory**
Represents the history of a specific version of a document. This object is available in version 17.0 and later.

**ContentVersionRating**
Represents a rating on a version of a file. This object is available in API version 42.0 and later.

**ContentWorkspace**
Represents a content library. This object is available in versions 17.0 and later.

**ContentWorkspaceDoc**
Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

**ContentWorkspaceMember**
Represents a member of a content library. This object is available in API version 40.0 and later.

**ContentWorkspacePermission**
Represents a library permission. This object is available in API version 40.0 and later.

**ContentWorkspaceSubscription**
Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

**Contract**
Represents a contract (a business agreement) associated with an Account.

**ContractContactRole**
Represents the role that a given Contact plays on a Contract.

**ContractLineItem**
Represents a product covered by a service contract (customer support agreement). This object is available in API version 18.0 and later.

**ContractStatus**
Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

**ContractTag**
Associates a word or short phrase with a Contract.

**Conversation**
Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

**ConversationContextEntry**
Represents the context of a message or an event in the chat history between an agent and a messaging user. This object is available in API version 47.0 and later.

**ConversationEntry**
Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.
ConversationParticipant
Represents an active participant in a conversation. A new ConversationParticipant record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

CorsWhitelistEntry
Represents an entry in the cross-origin resource sharing (CORS) allowlist. Origins included in the allowlist can request REST resources from that Salesforce org.

CreditMemo
Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

CreditMemoLine
Represents a partial or full application of a credit memo’s balance against an invoice or invoice line. This object is available in API version 48.0 and later.

Crisis
Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

CronJobDetail
Contains details about the associated scheduled job, such as the job’s name and type. This object is available in API version 29.0 and later.

CronTrigger
Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

CspTrustedSite
Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

CurrencyType
Represents the currencies used by an organization for which the multicurrency feature is enabled.

CustomBrand
Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

CustomBrandAsset
Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

CustomHelpMenuItem
Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

CustomHelpMenuSection
Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.
**CustomHttpHeader**
Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

**CustomNotificationType**
Stores information about custom notification types. This object is available in API version 47.0 and later.

**CustomPermission**
Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

**CustomPermissionDependency**
Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

**Customer**
Represents the customer role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

**DandBCompany**
Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

**Dashboard**
Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

**DashboardComponent**
Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

**DashboardTag**
Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

**DataAssessmentFieldMetric**
Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

**DataAssessmentMetric**
Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

**DataAssessmentValueMetric**
Summarizes the number of fields matched for your account records with Data.com account records. This object is available in API version 37.0 and later.

**DatacloudCompany**
Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

**DatacloudContact**
The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

**DatacloudDandBCompany**
Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.
Standard Objects

**DatacloudOwnedEntity**
Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

**DatacloudPurchaseUsage**
Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

**DataIntegrationRecordPurchasePermission**
Indicates Lightning Data purchase credits that a Salesforce admin has granted to users.

**DatasetExport**
Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExport acts as the header and includes the JSON schema.

**DatasetExportPart**
Represents a dataset exported from Tableau CRM. When a dataset is exported, the data is converted into a .csv file and the schema is stored in a separate JSON file. These files are stored in two objects: DatasetExport and DatasetExportPart. DatasetExportPart contains parts of the .csv file.

**DataUseLegalBasis**
Represents the legal basis for contacting a customer, such as billing or contract. This object is available in API version 45.0 and later.

**DataUsePurpose**
Represents the reason for contacting a prospect or customer, such as for billing, marketing, or surveys. This object is available in API version 45.0 and later.

**DatedConversionRate**
Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

**DeclinedEventRelation**
Represents event participants (invitees or attendees) with the status Declined for a given event. This object is available in API versions 29.0 and later.

**DelegatedAccount**
Represents the external managed account. This object is available in API version 49.0 and later.

**DeleteEvent**
Represents a record that has been soft deleted. Search on this object was available in API version 48.0, then removed in API version 50.0.

**DigitalSignature**
Represents a signature captured on a service report in field service.

**DigitalWallet**
The digital wallet entity represents a customer’s digital wallet service. Commerce Payments can use a digital wallet as a payment source when processing payments through a payment gateway. This object is available in API version 48.0 and later.

**DirectMessage**
Represents a direct message conversation between multiple users in Chatter. This object is available in API version 38.0 and later.

**Division**
A logical segment of your organization’s data. For example, if your company is organized into different business units, you could create a division for each business unit, such as “North America,” “Healthcare,” or “Consulting.” Available only if the organization has the Division permission enabled.
Division Localization
When the Translation Workbench is enabled for your organization, the Division Localization object provides the translation of the label for a division.

Document
Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

Document Attachment Map
Maps the relationship between an Email Template and its attachment, which is stored as a Document.

Document Tag
Associates a word or short phrase with a Document.

Domain
Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

Domain Site
Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

Dsar Policy
Represents a Data Subject Access Request (DSAR) policy created in the Privacy Center managed package. DSAR policies anonymize or transfer personal data from your org at your customer’s request. This object is available in API version 50.0 and later.

Dsar Policy Log
Represents the history of Data Subject Access Request (DSAR) policy execution requests. This log records the status and results of executed DSAR policies for a customer. This object is available in API version 50.0 and later.

Duplicate Job
Represents an instance of a job that identifies duplicates among existing records in the system.

Duplicate Job Definition
Setup object defining a job that identifies duplicate record items globally.

Duplicate Job Matching Rule
Represents a Matching Rule to be used with a Duplicate Job sharing the corresponding Duplicate Job Matching Rule Definition.

Duplicate Job Matching Rule Definition
Setup object specifying a Matching Rule to use with Duplicate Job instances that share a Duplicate Job Definition.

Duplicate Record Item
Represents an individual record that’s part of a duplicate record set. Use this object to create custom report types.

Duplicate Record Set
Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types and view the results of duplicate jobs.

Duplicate Rule
Represents a duplicate rule for detecting duplicate records.

Electronic Media Group
Represents the type of media that you can associate with a product or category. This object is available in API version 49.0 and later.

Electronic Media Use
Represents the usage of media. This object is available in API version 49.0 and later.

Email Content
Represents a marketing email asset for use with Pardot. This object is available in API version 50.0 and later.
Standard Objects

EmailDomainFilter
Represents a filter that determines whether an email relay is restricted to a specific list of domains. This object is available in API version 43.0 and later.

EmailDomainKey
Represents a domain key for an organization’s domain, used to authenticate outbound email that Salesforce sends on the organization’s behalf. This object is available in API version 28.0 and later.

EmailMessage
Represents an email in Salesforce.

EmailMessageRelation
Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

EmailRelay
Represents the configuration for sending an email relay. An email relay routes email sent from Salesforce through your company’s email servers. This object is available in API version 43.0 and later.

EmailServicesAddress
An email service address.

EmailServicesFunction
An email service.

EmailStatus
Represents the status of email sent.

EmailTemplate
Represents a template for an email, mass email, list email, or HVS email.

EmbeddedServiceDetail
Represents a metadata catalog object that exposes fields from the underlying Embedded Service setup objects defined in each EmbeddedServiceConfig deployment for guest users. Guest users don’t have direct access to the Embedded Service setup objects. Available in API version 39.0 and later.

EmbeddedServiceLabel
Represents a customized label in Embedded Chat or embedded Appointment Management. This object is available in API version 44.0 and later.

Employee
Represents an employee within a company or organization. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

EmployeeCrisisAssessment
Represents a crisis assessment of an Employee. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

EmpUserProvisioningProcess
Represents an employee-user provisioning process. This object is available in API version 52.0 and later.

EmpUserProvisionProcessErr
Represents an employee-user provisioning process error. This object is available in API version 52.0 and later.
EngagementChannelType
Represents a channel through which a customer can be reached for communication. This object is available in API version 48.0 and later.

EnhancedLetterhead
Represents an enhanced letterhead that can be associated with a Lightning email template that doesn’t use the Salesforce Merge Language (SML). This object is available in API version 46.0 and later.

Entitlement
Represents the customer support an account or contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an asset, product, or service contract.

EntitlementContact
Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

EntitlementTemplate
Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

EntityHistory
Represents historical information about an object’s changed field values. This object is only available to users with the “View All Data” permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead.

EntityMilestone
Represents a required step in a customer support process on a work order. The Salesforce user interface uses the term “object milestone.” This object is available in API version 37.0 and later.

EntitySubscription
Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

EnvironmentHubMember
Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

Event
Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

EventLogFile
Represents event log files for event monitoring. The event monitoring product gathers information about your Salesforce org’s operational events, which you can use to analyze usage trends and user behavior. This object is available in API version 32.0 and later. The Interval and Sequence fields are available only in API version 37.0 and later.

EventRelation
Represents a person (a user, lead, or contact) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees’ responses to invitations. If Shared Activities is enabled, EventRelation can also represent other objects that are related to an event. EventRelation does not support triggers, workflow, or data validation rules.

EventBusSubscriber
Represents a trigger, process, or flow that’s subscribed to a platform event or a change data capture event. Doesn’t include CometD subscribers.

EventTag
 Associates a word or short phrase with an Event.

EventWhoRelation
Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the EventRelation on page 1588 object; that is, IsParent is true and IsWhat is false. It doesn’t represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.
Expenses
Represents an expense linked to a work order. Service resource technicians can log expenses, such as tools or travel costs. This object is available in API version 49.0 and later.

ExpenseReport
Represents a report that summarizes expenses. This object is available in API version 50.0 and later.

ExpenseReportEntry
Represents an entry in an expense report. This object is available in API version 50.0 and later.

ExpressionFilter
Represents a logical expression that’s used to control the execution of macro instructions. This object is available in API version 46.0 and later.

ExpressionFilterCriteria
Represents a condition in an expression that’s used to control the execution of macro instructions. This object is available in API version 46.0 and later.

ExternalAccountHierarchy
Represents the external account hierarchy, which works like a role-based hierarchy. Use ExternalAccountHierarchy to allow partner and customer users to share data with other external accounts in their hierarchy. This object is available in API version 49.0 and later.

ExternalAccountHierarchyHistory
Represents the history of changes to values in the fields of an external account hierarchy. This object is available in API version 50.0 and later.

ExternalDataSource
Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

ExternalDataUserAuth
Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that’s configured to use per-user authentication. This object is available in API version 27.0 and later.

ExternalSocialAccount
Represents a managed social media account on a social network such as Facebook or Twitter. This object is available in API version 29.0 and later.

FeedAttachment
Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

FeedComment
Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

FeedItem
FeedItem represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces FeedPost.

FeedLike
Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

FeedPollChoice
Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.
FeedPollVote
Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

FeedPost
FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

FeedRevision
Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

FeedSignal
Attach feed signals, like UpDownVote, UserVerified, and Verified, to a feed post or comment. This object is available in API version 41.0 and later.

FeedTrackedChange
Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later.

FieldHistoryArchive
Represents field history values for all objects that retain field history. FieldHistoryArchive is a big object, available only to users with the "Retain Field History" permission. This object is available in API version 29.0 and later.

FieldChangeSnapshot
Use this virtual object to learn which opportunities' close dates changed during the specified time period. This object is available in API version 52.0 and later.

FieldPermissions
Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

FieldSecurityClassification
Represents a field's data sensitivity value selected from the SecurityClassification picklist. This object is available in API version 46.0 and later.

FieldServiceMobileSettings
Represents a configuration of settings that control the Field Service iOS and Android mobile app experience. This object is available in API version 38.0 and later.

FieldServiceOrgSettings
Represents the org settings for Field Service, such as Appointment Assistant settings. If Field Service is enabled, the org contains one read-only record of this object. This object is available in API version 51.0 and later.

FiscalYearSettings
Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

FlexQueueItem
Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the AsyncApexJob. This object is available in API version 36.0 and later.

FlowDefinitionView
Represents the description of a flow definition. This object is available in API version 46.0 and later.

FlowInterview
Represents a flow interview. A flow interview is a running instance of a flow.
FlowInterviewOwnerSharingRule
Represents the rules for sharing a FlowInterview with users other than the owner. This object is available in API version 33.0 and later.

FlowInterviewShare
Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

FlowRecordRelation
Represents a relationship between a record and a flow interview. When a flow interview is paused, Salesforce uses the $Flow.CurrentRecord global variable in the flow to associate the interview with a record. Available in API version 42.0 and later.

FlowStageRelation
Represents a relationship between a paused flow interview and its stages. When a flow interview is paused, Salesforce creates a FlowStageRelation record for each stage that’s set to the $Flow.CurrentStage or $Flow.ActiveStages global variable. Available in API version 43.0 and later.

FlowVariableView
Represents a variable within the flow version. This object is available in API version 46.0 and later.

FlowVersionView
Represents the version of a flow definition. This object is available in API version 46.0 and later.

Folder
Represents a repository for a Dashboard, Document, EmailTemplate, Macro, QuickText, or Report. Only one type of item can be contained in a folder.

FolderedContentDocument
Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

ForecastingAdjustment
This object represents an individual forecast manager’s adjustment for a subordinate’s or child territory’s forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users’ adjustments of their own forecasts, including territory forecasts they own.

ForecastingDisplayedFamily
Represents the table in Forecasts Settings where an admin selects the product families that users can forecast on in Lightning Experience. This object is available in API version 40.0 and later.

ForecastingFact
This is a read-only object linking a ForecastingItem with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

ForecastingItem
This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: AmountWithoutAdjustments, AmountWithoutManagerAdjustment, ForecastAmount, OwnerOnlyAmount. The amounts users see include one of the following when forecasting in quantity: QuantityWithoutAdjustments, QuantityWithoutManagerAdjustment, ForecastQuantity, OwnerOnlyQuantity. Available in API versions 26 and greater.

ForecastingOwnerAdjustment
This object represents an individual forecast user’s adjustment of their own forecast, including territory forecasts they own, via a ForecastingItem. Available in API versions 33 and greater. This object is separate from the ForecastingAdjustment object, which represents managers’ adjustments of subordinates’ and child territories’ forecasts.
ForecastingQuota
This object represents an individual user’s or territory’s quota for a specified time period. The “Manage Quotas” user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates’ or child territories’ quotas, not their own.) The “View All Forecasts” permission is required to view any user’s forecast, regardless of the forecast hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates and territories below them in the forecast hierarchy.

ForecastingShare
Represents forecasts shared between a forecast manager and a user. Available in API version 44.0 and later.

ForecastingSourceDefinition
Represents the object, measure, date type, and hierarchy that a forecast uses to project sales. This object is available in API version 52.0 and later.

ForecastingType
This object is used to identify the forecast type associated with ForecastingAdjustment, ForecastingOwnerAdjustment, ForecastingQuota, ForecastingFact, and ForecastingItem objects. Available in API versions 30.0 and greater.

ForecastingTypeSource
Maps a forecasting source definition to a forecast type. This object is available in API version 52.0 and later.

ForecastingUserPreference
Represents the forecasting selections that a user has made, such as display options, date range, forecasting type, and currency.

FormulaFunction
Represents a function used when building a formula, including examples and uses. This object is available in API version 47.0 and later.

FormulaFunctionAllowedType
Represents the functions that are supported in the given formula context. This object is available in API version 48.0 and later.

FormulaFunctionCategory
Represents the category to which a formula belongs when building a formula. This object is available in API version 47.0 and later.

FulfillmentOrder
Represents a group of products and delivery charges on a single order that share the same fulfillment location, delivery method, and recipient. The FulfillmentOrderLineItems belonging to a FulfillmentOrder are associated with OrderItemSummary objects belonging to a single OrderSummary. This object is available in API version 48.0 and later.

FulfillmentOrderItemAdjustment
Represents a price adjustment on a FulfillmentOrderLineItem. Corresponds to an OrderItemAdjustmentLineSummary associated with the corresponding OrderItemSummary. This object is available in API version 48.0 and later.

FulfillmentOrderItemTax
Represents the tax on a FulfillmentOrderLineItem or FulfillmentOrderItemAdjustment. Corresponds to an OrderItemTaxLineItemSummary. This object is available in API version 48.0 and later.

FulfillmentOrderLineItem
Represents a product or delivery charge belonging to a FulfillmentOrder. Corresponds to an OrderItemSummary. This object is available in API version 48.0 and later.

FunctionConnection
Represents a connection between an org and Salesforce Functions. This object is available in API version 52.0 and later.

FunctionInvocationRequest
Represents invocation information for a Salesforce Function. This object is available in API version 51.0 and later.
Standard Objects

**FunctionReference**
Represents a deployed Salesforce Function associated with an org. This object is available in API version 52.0 and later.

**GtwyProvPaymentMethodType**
The gateway provider payment method type allows integrators and payment providers to choose an active payment to receive an order's payment data rather than allowing the Salesforce Order Management platform to select a default payment method. This object is available in API version 50.0 and later.

**Goal**
The Goal object represents the components of a goal such as its name, description, and status.

**GoalLink**
Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

**GoogleDoc**
Represents a link to a Google Document. This object is available in API version 14.0 and later.

**Group**
A set of User records.

**GroupMember**
Represents a User or Group that is a member of a public group.

**GuestBuyerProfile**
Represents a store's guest buyer profile, which allows unauthenticated buyers to browse the store. This object is available in API version 51.0 and later.

**HashtagDefinition**
HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

**HealthCareDiagnosis**
Represents information related to industry-standard healthcare diagnosis codes.

**HealthCareProcedure**
Represents information related to industry-standard healthcare procedure codes.

**Holiday**
Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

**IconDefinition**
Represents the icon-related metadata for a custom tab. This object is available in API version 43.0 and later.

**Idea**
Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

**IdeaComment**
Represents a comment that a user has submitted in response to an idea.

**IdeaReputation**
Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.
IdeaReputationLevel
Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

IdeaTheme
Represents an invitation to zone members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

IdpEventLog
Represents the Identity Provider Event Log. This log records both problems and successes with inbound SAML or OpenID Connect authentication requests from another app provider. It also records outbound SAML responses when Salesforce is acting as an identity provider. This object is available in API version 39.0 and later.

IframeWhiteListUrl
Represents a list of trusted external domains that you allow to frame your Embedded Service, Surveys, and Visualforce pages. This object is available in API version 45.0 and later.

Image
Represents the details of an image. This object is available in API version 47.0 and later.

Incident
An Incident is any unplanned business interruption that has wide-reaching impacts and requires an urgent fix. This object contains the details of the incident, documenting the history of the incident from registration to closure. This object is available in API version 53.0 and later.

Individual
Represents a customer’s data privacy and protection preferences. Data privacy records based on the Individual object store your customers’ preferences. Data privacy records are associated with related leads, contacts, person accounts, and users. This object is available in API version 42.0 and later.

IndividualHistory
Represents the history of changes to values in the fields of a data privacy record, based on the Individual object. This object is available in versions 42.0 and later.

IndividualShare
Represents a list of access levels to a data privacy record along with an explanation of the access level. For example, if you have access to a record because you own it, the IndividualAccessLevel is All and RowCause is Owner. This object is available in API version 42.0 and later.

InternalOrganizationUnit
Represents an organization that an Employee belongs to. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Invoice
Represents a financial document describing the total amount a buyer must pay for goods or services provided. This object is available in API version 48.0 and later.

InvoiceLine
Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 48.0 and later.

JobProfile
Represents a job profile used for shift scheduling. This object is available in API versions 47.0 and later.
Standard Objects

**JobProfileQueueGroup**
JobProfileQueueGroup defines the mapping between Queue and JobProfile, and configurations for Omni-Channel Planning. This object is available in API version 53.0 and later.

**Knowledge__Feed**
Represents the feed for a knowledge article. This object is available in API version 39.0 and later.

**Knowledge__ka**
Provides access to the concrete object that represents a Knowledge article, the parent object for article versions. This object is available in API version 39.0 and later.

**Knowledge__kav**
Provides access to the concrete object that represents a Knowledge article version. This object is available in API version 39.0 and later.

**Knowledge__DataCategorySelection**
Represents a data category that classifies an article. This object is available in API version 39.0 and later.

**KnowledgeableUser**
Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

**KnowledgeArticle**
Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

**KnowledgeArticleVersion**
Provides a global view of standard article fields across all types of articles depending on their version. This object is available in API version 18.0 and later.

**KnowledgeArticleVersionHistory**
Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

**KnowledgeArticleViewStat**
Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20.0 and later.

**KnowledgeArticleVoteStat**
Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20.0 and later.

**LandingPage**
Represents a Pardot landing page. A landing page is a web page that a visitor reaches after clicking a link or advertisement. Landing pages can be created in Pardot Classic and synced to Salesforce or created on the core object in Pardot Lightning App. This object is available in API version 42.0 and later.

**Lead**
Represents a prospect or lead.

**LeadCleanInfo**
Stores the metadata Data.com Clean uses to determine a lead record’s clean status. Helps you automate the cleaning or related processing of lead records.

**LeadOwnerSharingRule**
Represents the rules for sharing a lead with users other than the owner.

**LeadShare**
Represents a sharing entry on a Lead.
**Standard Objects**

- **LeadStatus**
  Represents the status of a Lead, such as Open, Qualified, or Converted.

- **LeadTag**
  Associates a word or short phrase with a Lead.

- **LegalEntity**
  Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 48.0 and later.

- **LightningExperienceTheme**
  Represents information for a theme in Lightning Experience. This object is available in API Version 42.0 and later.

- **LightningOnboardingConfig**
  Represents the feedback provided when users switch from Lightning Experience to Salesforce Classic. Admins can customize the question, how frequently the form appears, and where the feedback is stored in Chatter from the Adoption Assistance page in Lightning Experience Setup. Available in API version 47.0 and later.

- **LightningToggleMetrics**
  Represents users who switched from Lightning Experience back to Salesforce Classic. This object is available in API version 43.0 and later.

- **LightningUsageByAppTypeMetrics**
  Represents number of users on Lightning Experience and Salesforce Mobile. This object is available in API version 43.0 and later.

- **LightningUsageByBrowserMetrics**
  Represents Lightning Experience usage grouped by user's browser. This object is available in API version 43.0 and later.

- **LightningUsageByPageMetrics**
  Represents standard pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

- **LightningUsageByFlexiPageMetrics**
  Represents custom pages users viewed most frequently in Lightning Experience. This object is available in API version 43.0 and later.

- **LightningExitByPageMetrics**
  Represents standard pages users switched from Lightning Experience to Salesforce most frequently. This object is available in API version 44.0 and later.

- **LinkedArticle**
  Represents a knowledge article that is attached to a work order, work order line item, or work type. This object is available in API version 37.0 and later.

- **LinkedArticleFeed**
  Represents the comment feed on a linked article. This object is available in API version 39.0 and later.

- **LinkedArticleHistory**
  Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

- **ListEmail**
  Represents a list email sent from Salesforce, or sent from Pardot and synced to Salesforce. When the list email is sent, the recipients are generated by combining recipients in ListEmailIndividualRecipients and ListEmailRecipientSource. Duplicate and other invalid recipients are removed. The result is the recipients who are sent any given list email. Has a one-to-many relationship with ListEmailRecipientSource and ListEmailIndividualRecipient. This object is available in API version 41.0 and later.
ListEmailIndividualRecipient
For a list email in Salesforce, represents a recipient. Each record represents a link from a list email to exactly one recipient for that list email. Recipients can be contacts, leads, or campaign members. Has a one-to-many relationship with ListEmail. This object is available in API version 44.0 and later.

ListEmailRecipientSource
For a list email in Salesforce, represents the dynamically defined sources of recipient email addresses. Each record represents a link to a single list view or campaign that is examined when the list email is sent. Has a one-to-many relationship with ListEmail. This object is available in API version 41.0 and later.

ListView
Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

ListViewChart
Represents a graphical chart that’s displayed on Salesforce for Android, iOS, and mobile web list views. The chart aggregates data that is filtered based on the list view that’s currently displayed. This object is available in API version 33.0 and later and is accessible by portal users.

ListViewChartInstance
Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

LiveAgentSession
This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

LiveAgentSessionHistory
This object is automatically created for each Chat session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

LiveAgentSessionShare
This object is automatically created for each Chat session and stores information about the session. This object is available in API versions 28.0 and later.

LiveChatBlockingRule
Represents a rule for blocking chat visitors’ IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

LiveChatButton
Represents a button that allows visitors to request chats with Chat users. This object is available in API version 24.0 and later.

LiveChatButtonDeployment
Associates an automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

LiveChatButtonSkill
Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

LiveChatDeployment
Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

LiveChatSensitiveDataRule
Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.
**LiveChatTranscript**
This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

**LiveChatTranscriptEvent**
Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

**LiveChatTranscriptShare**
Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

**LiveChatTranscriptSkill**
Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

**LiveChatUserConfig**
Represents a setting that controls the console settings for Chat users. This object is available in API version 24.0 and later.

**LiveChatUserConfigProfile**
Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

**LiveChatUserConfigUser**
Represents a join between LiveChatUserConfig and User. This object is available in API version 24.0 and later.

**LiveChatVisitor**
Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

**Location**
Represents a warehouse, service vehicle, work site, or other element of the region where your team performs field service work. In API version 49.0 and later, you can associate activities with specific locations. Activities, such as the tasks and events related to a location, appear in the activities timeline when you view the location detail page. Also in API version 49.0 and later, Work.com users can view Employees as a related list on Location records. In API version 51.0 and later, this object is available for Omnichannel Inventory and represents physical locations where inventory is available for fulfilling orders.

**LocationGroup**
Represents a group of Omnichannel Inventory locations, providing an aggregate view of inventory availability across those locations. Omnichannel Inventory can create an inventory reservation for an order at the location group level, then assign the reservation to one or more locations in the group as needed. This object is available in API version 51.0 and later.

**LocationGroupAssignment**
Represents the assignment of a location to a location group. This object is available in API version 51.0 and later.

**LocationTrustMeasure**
Represents the COVID safety protocols that your business follows. For example, enforcement of masks, social distancing, cleanliness, and capacity limits. This object is available in API version 50.0 and later.

**LocWaitlistMsgTemplate**
Represents a junction object connecting LocationWaitlist to MessagingTemplate. This object is available in API version 50.0 and later.

**LocationWaitlist**
Represents a queue created for a specific location. Multiple queues can be created for a single location. For example, you can have a queue for each sales agent or a standard queue and a queue for vulnerable groups. The specific party of people in a queue is represented by LocationWaitlistedParty. This object is available in API version 50.0 and later.

**LocationWaitlistedParty**
Represents a specific party of people waiting in a queue. This object is available in API version 50.0 and later.

**LoginEvent**
The documentation has moved to LoginEvent in the Platform Events Developer Guide.
Standard Objects

LoginGeo
Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

LoginHistory
Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

LoginIp
Represents a validated IP address. This object is available in version 28.0 and later.

LogoutEventStream
The documentation has moved to LogoutEventStream in the Platform Events Developer Guide.

LookedUpFromActivity
This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

Macro
Represents a macro, which is a set of instructions that tells the system to perform one or more tasks. This object is available in API version 32.0 and later.

MacroInstruction
Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro’s actions.

MacroUsage
Represents macro usage on a record, including which macro was used, who used it, and how they used it. This object is available in API version 47.0 and later.

MailmergeTemplate
Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

MaintenanceAsset
Represents an asset covered by a maintenance plan in field service. Assets can be associated with multiple maintenance plans.

MaintenancePlan
Represents a preventive maintenance schedule for one or more assets in field service.

MaintenanceWorkRule
Represents the recurrence pattern for a maintenance record. This object is available in API version 49.0 and later.

ManagedContentInfo
Allows the creation of relationship to Product using ProductMedia. This object is available in API version 49.0 and later.

MarketingForm
Represents a Pardot marketing form that has been synched to Salesforce. Use forms on your website and landing pages to collect information about visitors and turn anonymous visitors into identified prospects. This object is available in API version 42.0 and later.

MarketingLink
Represents a Pardot marketing link record, either a custom redirect or a file, that has been synced to Salesforce. This object is available in API version 42.0 and later.

MatchingRule
Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

MatchingRuleItem
Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.
MessagingChannel
Represents a communication channel that an end user can use to send a message to an agent. A communication channel can be an SMS number, a Facebook page, or another supported messaging channel. This object is available in API version 45.0 and later.

MessagingChannelSkill
Junction object that represents an association between MessagingChannel and Skill. This object is available in API version 45.0 and later.

MessagingConfiguration
Represents the details for a Messaging configuration. This object is available in API version 47.0 and later.

MessagingDeliveryError
Represents a log of triggered outbound failures to verify when a triggered outbound has failed. This object is available in API version 44.0 and later.

MessagingEndUser
Represents a single address—such as a phone number or Facebook page—communicating with a single Messaging channel. This object is available in API version 45.0 and later.

MessagingLink
Represents the link between a Messaging Channel and where it’s shared. This object is available in API version 47.0 and later.

MessagingSession
Represents a session on a Messaging channel. This object is available in API version 47.0 and later.

MessagingTemplate
Represents a Messaging template used to send pre-formatted messages. This object is available in API version 47.0 and later.

MetadataPackage
Represents a package that has been developed in the org you’re logged in to. Applies to unlocked, unmanaged, first-generation, and second-generation managed packages.

MetadataPackageVersion
Represents a package version (managed or unmanaged) that has been uploaded from the org you’re logged in to.

Metric
The Metric object represents the components of a goal metric such as its name, metric type, and current value.

MetricDataLink
The link between the metric and the data source, such as a report.

MetricsDataFile
Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

MilestoneType
Represents a milestone (required step in a customer support process). This object is available in API version 18.0 and later.

MLField
Represents a single field in a data definition. This object is available in API version 50.0 and later.

MLIntentUtteranceSuggestion
Represents a customer input, used for training purposes in the feedback loop process of a conversation. Admins can add these inputs to the intent training model. This object is available in API version 51.0 and later.

MLPredictionDefinition
Represents a prediction definition that specifies details about the prediction. This object is available in API version 50.0 and later.
Standard Objects

MLRecommendationDefinition
For internal use only.

MobileSecurityPolicy
Enables mobile security policies on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 50.0 and later.

MobileSecurityUserMetric
Represents the metrics for users who have Enhanced Mobile Security policies enforced. This object is available in API version 51.0 and later.

MobileSettingsAssignment
Represents the assignment of a particular field service mobile settings configuration to a user profile. This object is available in API version 41.0 and later.

MobSecurityCertPinConfig
Configuration of mobile security certificate pinning on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 53.0 and later.

MobSecurityCertPinEvent
The event of mobile security certificate pinning on the Salesforce mobile app with Enhanced Mobile Security. This object is available in API version 53.0 and later.

MsgChannelLanguageKeyword
Represents the consent configuration for a Messaging channel. This object is available in API version 48.0 and later.

MyDomainDiscoverableLogin
Represents configuration settings when the My Domain login page type is Discovery. Login Discovery provides an identity-first login experience, where the login page contains the identifier field only. Based on the identifier entered, a handler determines how to authenticate the user. This object is available in API version 45.0 and later.

MutingPermissionSet
Represents a set of disabled permissions and is used in conjunction with PermissionSetGroup. This object is available in API version 46.0 and later.

Name
Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

NamedCredential
Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

NamespaceRegistry
Represents a namespace that you can link to scratch orgs that were created from your org's Dev Hub. You use the namespace when developing, packaging, and releasing an app. You can’t create this object with the API. Use the Link Namespace action in the Dev Hub graphical interface to insert a NamespaceRegistry record. This object is available in API version 41.0 and later.

NavigationLinkSet
Represents the navigation menu in an Experience Cloud site. A navigation menu consists of items that users can click to go to other parts of the site. This object is available in API version 35.0 and later.

NavigationMenuItem
Represents a single menu item in a NavigationLinkSet. Use this object to create, delete, or update menu items in your Experience Cloud site’s navigation menu. This object is available in API version 35.0 and later.
Standard Objects

NavigationMenuItemLocalization
Represents the translated value of a navigation menu item in an Experience Cloud site. This object is available in API version 36.0 and later.

Network
Represents an Experience Cloud site. Salesforce Experience Cloud lets you create branded spaces for your employees, customers, and partners. You can customize and create experiences, whether they’re communities, sites, or portals, to meet your business needs, and then transition seamlessly between them. Experience Cloud sites let you share information, records, and files with coworkers and stakeholders all in one place. This object is available in API version 26.0 and later.

NetworkActivityAudit
Represents an audit trail of moderation actions in Experience Cloud sites. This object is available in API version 30.0 and later.

NetworkAffinity
Represents a junction object that associates a user profile with a Network object, that is, with an Experience Cloud site. Use NetworkAffinity to assign a default Experience Cloud site to a user profile. This object is available in API version 41.0 and later.

NetworkDiscoverableLogin
Represents the Login Discoverable page from where customers and partners log in to an Experience Cloud site. Customers and partners are users with an External Identity license or any communities license for Experience Cloud. This object is available in API version 44.0 and later.

NetworkFeedResponseMetric
Represents an object that stores the date and time values of question posts. It captures information for question creation, answer creation, and when an answer is marked as best answer. This object is available in API version 51.0 and later.

NetworkMember
Represents a member of an Experience Cloud site. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

NetworkMemberGroup
Represents a group of members in an Experience Cloud site. Members can be either users in your internal org or external users assigned portal profiles. An administrator adds members to an Experience Cloud site by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the site. This object is available in API version 26.0 and later.

NetworkModeration
Represents a flag on an item in a community. This object is available in API version 30.0 and later.

NetworkPageOverride
Represents information about custom pages used to override the default pages in Experience Cloud sites. You can create Experience Builder or Visualforce pages and override the default pages in a site. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

NetworkSelfRegistration
Represents the account that self-registering Experience Cloud users are associated with by default. Self-registering users in an Experience Cloud site are required to be associated with an account, which the administrator must specify while setting up self-registration for the site. If an account isn’t specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

NetworkUserHistoryRecent
Represents an Experience Cloud site user’s history of accessed records. This object is available in API version 42.0 and later.

Note
Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.
Standard Objects

**NoteAndAttachment**
This read-only object contains all notes and attachments associated with an object.

**NoteTag**
Associates a word or short phrase with a Note.

**OauthCustomScope**
Represents a permission defining the protected data that a connected app can access from an external entity when Salesforce is the OAuth authorization provider.

**OauthCustomScopeApp**
Represents the name of the connected app to which the custom scope is assigned. This object is available in API version 49.0 and later.

**OauthToken**
Represents an OAuth access token for connected app authentication. Use this object to create a user interface for token management. This object is available in API version 32.0 and later.

**ObjectPermissions**
Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

**ObjectTerritory2AssignmentRule**
Represents a territory assignment rule that’s associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is null. Available only if Enterprise Territory Management has been enabled for your organization.

**ObjectTerritory2AssignmentRuleItem**
A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule object is a null value. Available only if Enterprise Territory Management has been enabled for your organization.

**ObjectTerritory2Association**
 Represents an association (by assignment) between a territory and an object record, such as an account. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

**OmniDataPack**
For internal use only.

**OmniDataTransform**
For internal use only.

**OmniDataTransformItem**
For internal use only.

**OmniESignature**
For internal use only.

**OmniInteractionConfig**
For internal use only.

**OmniInteractionAccessConfig**
For internal use only.

**OmniProcess**
For internal use only.

**OmniProcessCompilation**
For internal use only.
Standard Objects

OmniProcessElement
For internal use only.

OmniProcessTransientData
For internal use only.

OmniScriptSavedSession
For internal use only.

OmniUiCard
For internal use only.

OpenActivity
This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. OpenActivity fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

OperatingHours
Represents the hours in which a service territory, service resource, or account is available for field service work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

OperatingHoursHistory
Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

Opportunity
Represents an opportunity, which is a sale or pending deal.

OpportunityCompetitor
Represents a competitor on an Opportunity.

OpportunityContactRole
Represents the role that a Contact plays on an Opportunity.

OpportunityContactRoleSuggestionInsight
Represents a suggestion for a new opportunity contact role. Available in API versions 45.0 and later.

OpportunityFieldHistory
Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

OpportunityHistory
Represents the stage history of an Opportunity.

OpportunityInsight
Represents an individual insight (deal prediction, follow-up reminder, or key moment) related to an opportunity record.

OpportunityLineItem
Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

OpportunityLineItemSchedule
Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

OpportunityOwnerSharingRule
Represents a rule for sharing an opportunity with users other than the owner.

OpportunityPartner
This object represents a partner relationship between an Account and an Opportunity. An OpportunityPartner record is created automatically when a Partner record is created for a partner relationship between an account and an opportunity.
Standard Objects

OpportunityShare
Represents a sharing entry on an Opportunity.

OpportunitySplit
OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

OpportunitySplitType
OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

OpportunityStage
Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

OpportunityTag
Associates a word or short phrase with an Opportunity.

OpportunityTeamMember
Represents a User on the opportunity team of an Opportunity.

Order
Represents an order associated with a contract or an account.

OrderAdjustmentGroup
Group containing a set of adjustments applied to an order. This object is available in API version 48.0 and later.

OrderAdjustmentGroupSummary
Represents the current properties and state of a group of related price adjustments. Associated with a set of OrderItemAdjustmentLineSummaries that apply to OrderItemSummaries belonging to one OrderSummary. Corresponds to one or more order adjustment group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderDeliveryGroup
A group of order items that share a delivery method and address. The delivery method and address are used during the fulfillment process, such as shipping as a gift, downloading, picking up in store, or shipping to a standard address. This object is available in API version 48.0 and later.

OrderDeliveryGroupSummary
Represents the current properties and state of a group of OrderItemSummaries, belonging to one OrderSummary, to be fulfilled using the same delivery method and delivered to the same address. A single shipment can include them all, but that isn’t guaranteed. Corresponds to one or more order delivery group objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderDeliveryMethod
Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

OrderHistory
Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

OrderItem
Represents an order product that your organization sells.

OrderItemAdjustmentLineItem
An adjustment that has been made to an order item. This object is available in API version 48.0 and later.
Standard Objects

OrderItemAdjustmentLineSummary
Represents the current properties and state of price adjustments on an OrderItemSummary. Corresponds to one or more order item adjustment line item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemSummary
Represents the current properties and state of a product or charge on an OrderSummary. Corresponds to one or more order item objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemSummaryChange
Represents a change to an OrderItemSummary, usually a reduction in quantity due to a cancel or return. Corresponds to a change order item. This object is available in API version 48.0 and later.

OrderItemTaxLineItem
The tax amount that has been applied to an order item. This object is available in API version 48.0 and later.

OrderItemTaxLineItemSummary
Represents the current tax on an OrderItemSummary or OrderItemAdjustmentLineSummary. Corresponds to one or more order item tax line items, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderItemType
Shows whether the order product is a product line or charge line. This object is available in API version 48.0 and later.

OrderOwnerSharingRule
Represents a rule which determines order sharing access for the order’s owners.

OrderPaymentSummary
Represents the current properties and state of payments using a single payment method that are applied to one OrderSummary. This object is available in API version 48.0 and later.

OrderShare
Represents a sharing entry on an Order. This object is available in API version 48.0 and later.

OrderStatus
Represents the status of the order entity. This object is available in API version 48.0 and later.

OrderSummary
Represents the current properties and state of an order. Corresponds to one or more order objects, consisting of an original object and any change objects applicable to it. This object is available in API version 48.0 and later.

OrderSummaryRoutingSchedule
Represents an attempt to route an order summary to one or more inventory locations for fulfillment. You can use it to schedule future attempts and to record completed attempts. This object is available in API version 51.0 and later.

Organization
Represents key configuration information for an organization.

OrgDeleteRequest
Represents a request to delete a developer edition (DE) org. This object is available in API version 42.0 and later. It is available only in Developer and Database.com editions.

OrgWideEmailAddress
Represents an organization-wide email address for user profiles.
Standard Objects

OutOfOffice
Represents a user-set value on a profile that shows when the user intends to be out of the office. This object is available in API version 41.0 and later.

OutgoingEmail
For internal use only.

OutgoingEmailRelation
For internal use only.

OwnedContentDocument
Represents a file owned by a user. This object is available in version 30.0 and later.

OwnerChangeOptionInfo
Represents default and optional actions that can be performed when a record’s owner is changed. Available in API version 35.0 and later, but to query for change owner metadata, use the OwnerChangeOptionInfo object in Tooling API instead. For more information, see OwnerChangeOptionInfo in the Tooling API.

PackageLicense
Represents a license for an installed managed package. This object is available in API version 31.0 and later.

PackagePushError
Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

PackagePushJob
Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

PackagePushRequest
Represents the push request for upgrading a package in one or many orgs from one version to another version.

PackageSubscriber
Represents an installation of a package in an org. This object contains installation information for managed or unlocked packages developed in the org you’re logged in to.

Partner
Represents a partner relationship between two Account records or between an Opportunity record and an Account record.

PartnerFundAllocation
Represents allocated funds from a partner marketing budget for channel partners. This object is available in API version 41.0 and later.

PartnerFundClaim
Represents a claim of funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

PartnerFundRequest
Represents a request for funds from the partner marketing budget by a channel partner. This object is available in API version 41.0 and later.

PartnerMarketingBudget
Represents a budget that provides funds to channel partners for selling and marketing products and services. This object is available in API version 41.0 and later.
**Standard Objects**

**PartnerNetworkConnection**
Represents a Salesforce to Salesforce connection between Salesforce organizations.

**PartnerNetworkRecordConnection**
Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

**PartnerNetworkSyncLog**
Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log’s twenty most recent entries, and provides a link to the log.

**PartnerRole**
Represents a role for an account Partner, such as consultant, supplier, and so on.

**PartyConsent**
Represents consent preferences for an individual. This object is available in API version 48.0 and later.

**Payment**
Represents a single event where the customer creates a payment. For credit cards, this is a payment capture or payment sale, which won’t show up in the end user’s credit card statement. This object is available in API version 48.0 and later.

**PaymentAuthAdjustment**
Shows information about an adjustment made to an authorized transaction. This object is available in API version 51.0 and later.

**PaymentAuthorization**
Represents a single payment authorization event where users can capture or reverse a payment against a reserve of funds. This object is available in API version 48.0 and later.

**PaymentGateway**
Platform entity that represents the connection to the external payment gateway. This object is available in API version 48.0 and later.

**PaymentGatewayLog**
Stores information exchanged between the Salesforce payments platform and external payment gateways. Gateway logs can also record payloads from external payment entities. This object is available in API version 48.0 and later.

**PaymentGatewayProvider**
Setup entity for payment gateways. Defines the connection to a payment gateway Apex adapter. This object is available in API version 48.0 and later.

**PaymentGroup**
Top-level object that groups all the payment transactions that have been processed an order or contract. PaymentGroup is a standalone object, so it isn’t required for users to execute payment transactions (authorizations, captures, refunds, and sales). This object is available in API version 48.0 and later.

**PaymentLineInvoice**
Represents a payment allocated to or unallocated from an invoice. This object is available in API version 48.0 and later.

**PaymentMethod**
The method that a buyer uses to compensate the seller of a good or service. Common payment methods include cash, checks, credit or debit cards, money orders, bank transfers, and online payment services. This object is available in API version 48.0 and later.

**PendingServiceRouting**
Represents a work assignment that’s waiting to be routed. This object is available in API version 40.0 and later.
Standard Objects

**PendingServiceRoutingInteractionInfo**
Represents PendingServiceRouting interaction information that’s used when work is routed to an agent. For a screen pop, it specifies which records to open when work is routed to an agent from a specific channel. PendingServiceRoutingInteractionInfo is read-only. This object is available in API version 53.0 and later.

**Period**
Represents a fiscal period defined in FiscalYearSettings.

**PermissionSet**
Represents a set of permissions that’s used to grant more access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

**PermissionSetAssignment**
Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

**PermissionSetGroup**
Represents a group of permission sets and the permissions within them. Use permission set groups to organize permissions based on job functions or tasks. Then, you can package the groups as needed. This object is available in API version 45.0 and later.

**PermissionSetGroupComponent**
A junction object that relates the PermissionSetGroup and PermissionSet objects via their respective IDs; enables permission set group recalculation to determine the aggregated permissions for the group. This object is available in API version 45.0 and later.

**PermissionSetLicense**
Represents a license that’s used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

**PermissionSetLicenseAssign**
Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

**PermissionSetTabSetting**
Represents a permission set tab setting. Requires the View Setup permission. Use this object to query all tab settings of the permission set. This object is available in API version 45.0 and later.

**PersonalizationTargetInfo**
Represents a target for an audience. This object is available in API version 47.0 and later.

**PicklistValueInfo**
Represents the active picklist values for a given picklist field. This object is available in API version 40.0 and later.

**PipelineInspectionListView**
Represents a pipeline view or saved filter. A pipeline view specifies a set of opportunity records, based on specific criteria. This object is available in API version 53.0 and later.

**PlatformAction**
PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

**PlatformEventUsageMetric**
Contains usage data for event publishing and CometD-client delivery. Usage data is available for the last 24 hours, ending at the last hour, and for historical daily usage. PlatformEventUsageMetric contains separate usage metrics for platform events and change data capture events. This object is available in API version 50.0 and later.

**PlatformStatusAlertEvent**
The documentation has moved to PlatformStatusAlertEvent in the Platform Events Developer Guide.
PortalDelegablePermissionSet
PortalDelegablePermissionSet is a base platform object used to store permission sets that can be assigned by a delegated portal/external user admin (DPUA) to portal users. This object is available in API version 47.0 and later.

PresenceConfigDeclineReason
Represents the settings for a decline reason that a presence user provides when declining work. This object is available in API version 37.0 and later.

PresenceDeclineReason
Represents an Omni-Channel decline reason that agents can select when declining work requests. This object is available in API version 37.0 and later.

PresenceUserConfig
Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

PresenceUserConfigProfile
Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

PresenceUserConfigUser
Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

PriceAdjustmentSchedule
Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 47.0 and later.

PriceAdjustmentTier
Represents a discount tier in a price adjustment schedule. This object is available in API version 47.0 and later.

Pricebook2
Represents a price book that contains the list of products that your org sells.

Pricebook2History
Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 53.0 and later.

PricebookEntry
Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

PricebookEntryAdjustment
Read-only junction object created when you associate a price adjustment schedule with a price book entry. This object is available in API version 47.0 and later.

Problem
Problems represent the root cause data of one or more incidents. This object contains all the details of a problem, documenting the history of the problem from detection to closure. This object is available in API version 53.0 and later.

ProcessDefinition
Represents the definition of a single approval process.

ProcessException
Represents a processing failure on an order summary. A separate process is required to resolve the failure that caused the process exception before order summary processing can continue. This object is available in API version 50.0 and later.

ProcessInstanceId
Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.
Standard Objects

**ProcessInstanceHistory**
This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

**ProcessInstanceStep**
Represents one work item in an approval process (ProcessInstance).

**ProcessInstanceNode**
Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

**ProcessInstanceWorkitem**
Represents a user’s pending approval request.

**ProcessNode**
Describes a step in a process definition. Compare to ProcessInstanceNode, which describes the step in a running process.

**ProducerCommission**
Represents a producer’s commission for an insurance policy. The commission can be calculated from the commissionable transactions or can be populated from an external system. This object is available in API version 51.0 and later.

**Product2**
Represents a product that your org sells.

**Product2DataTranslation**
Represents the translated values of the data stored within a Product2 record’s fields. This object is available in API version 45.0 and later.

**ProductAttribute**
Represents the attributes that can be associated with a product. This object is available in API version 50.0 and later.

**ProductAttributeSet**
Represents a group of attributes that can be associated with a product. This object is available in API version 50.0 and later.

**ProductAttributeSetItem**
Represents a set of attributes that can be associated with a product. This object is available in API version 50.0 and later.

**ProductAttributeSetProduct**
Represents the product associated with a set of attributes. This object is available in API version 50.0 and later.

**ProductCategory**
Represents the category that products are organized in. This object is available in API version 49.0 and later.

**ProductCategoryDataTranslation**
Represents the translated values for the data stored within a ProductCategory record’s fields. This object is available in API version 46.0 and later.

**ProductConsumed**
Represents an item from your inventory that was used to complete a work order or work order line item in field service.

**ProductEntitlementTemplate**
Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

**ProductItem**
Represents the stock of a particular product at a particular location in field service, such as all bolts stored in your main warehouse.

**ProductItemTransaction**
Represents an action taken on a product item in field service. Product item transactions are auto-generated records that help you track when a product item is replenished, consumed, or adjusted.
Standard Objects

ProductMedia
Represents the rich media, including images and attachments, that can be added to products. This object is available in API version 49.0 and later.

ProductRequest
Represents an order for a part or parts in field service.

ProductRequestLineItem
Represents a request for a part in field service. Product request line items are components of product requests.

ProductRequired
Represents a product that is needed to complete a work order or work order line item in field service.

ProductServiceCampaign
Represents a set of activities to be performed on a product service campaign asset, such as a product recall for safety issues or product defects. This object is available in API version 51.0 and later.

ProductServiceCampaignItem
Represents a product service campaign's asset. This object is available in API version 51.0 and later.

ProductServiceCampaignItemStatus
Represents a status for a product service campaign item in field service. This object is available in API version 51.0 and later.

ProductServiceCampaignStatus
Represents a status for a product service campaign in field service. This object is available in API version 51.0 and later.

ProductTransfer
Represents the transfer of inventory between locations in field service.

ProductWarrantyTerm
Defines the relationship between a product or product family and warranty term. This object is available in API version 50.0 and later.

Profile
Represents a profile, which defines a set of permissions to perform different operations. Operations can include creating a custom profile or querying, adding, updating, or deleting information.

ProfileSkill
Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

ProfileSkillEndorsement
Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

ProfileSkillShare
Represents a sharing entry on a ProfileSkill.

ProfileSkillUser
Represents a detail relationship of User. The object connects profile skills with users.

Prompt
Represents record details about an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

PromptAction
Represents how the user interacted with the in-app guidance prompt or walkthrough. Available in API version 46.0 and later.
PromptError
Represents the error or warning associated with the PromptAction. Available in API version 52.0 and later.

PromptActionOwnerSharingRule
Represents a rule which determines PromptAction sharing access for the owners. Available in API version 46.0 and later.

PromptActionShare
Represents a sharing entry on a prompt action record. Available in API version 46.0 and later.

PromptLocalization
Represents the translated value of a label for record details about in-app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

PromptVersion
Represents an in-app guidance prompt or walkthrough. Available in API version 46.0 and later.

PromptVersionLocalization
Represents the translated value of a label for app guidance when the Translation Workbench is enabled for your org. Available in API version 48.0 and later.

PushTopic
Represents a query that is the basis for notifying Streaming API clients of changes to records in an org. This object is available in API version 21.0 and later.

QueueRoutingConfig
Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

Question
Represents a question in a zone that users can view and reply to.

QuestionDataCategorySelection
A data category selection represents a data category that classifies a question.

QuestionReportAbuse
Represents a user-reported abuse on a Question in a Chatter Answers zone. This object is available in API version 24.0 and later.

QuestionSubscription
Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

QueueSobject
Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

QuickText
This object stores a snippet of text that allows users to send a quick response to a customer. Use quick text to create greetings, answers to common questions, short notes, and more. This object is available in API version 24.0 and later.

QuickTextUsage
Represents the usage of quick text on a record, including which quick text was used, who used it, and how they used it. This object is available in API version 47.0 and later.

Quote
The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

QuoteDocument
Represents a quote in document format. Available in API version 18.0 and later.
Standard Objects

**QuoteLineItem**
The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

**RecentFieldChange**
Use this virtual object to see how an opportunity has changed in the past seven days. Learn the previous value of a field, who made the change, and when the change was made. This object is available in API version 52.0 and later.

**RecentlyViewed**
 Represents records or list views that the current user has recently viewed or referenced (by viewing a related record). List views are available in API version 29.0 and later.

**Recommendation**
Represents the recommendations surfaced as offers and actions for Einstein Next Best Action. This object is available in API version 45.0 and later.

**RecordAction**
Represents a relationship between a record and an action, such as a flow. Create a RecordAction for every action that you want to associate with a particular record. Available in API version 42.0 and later.

**RecordActionHistory**
Represents the lifecycle of a RecordAction as it goes through different states. Available in API version 44.0 and later.

**RecordsetFilterCriteria**
Represents a set of filters that can be used to match service appointments or assets based on your criteria fields. For example, you can create recordset filter criteria so that only service appointments that satisfy the filter criteria are matched to the filtered shifts, and likewise only maintenance work rules that satisfy your criteria are matched to assets. This object is available in API version 50.0 and later. Assets and maintenance work rules are available in API version 52.0 and later.

**RecordsetFilterCriteriaRule**
Represents a rule using fields from the designated source object to create filters on the filtered, or target, object. RecordsetFilterCriteriaRule is associated with the RecordsetFilterCriteria object. This object is available in API version 50.0 and later.

**RecordType**
Represents a record type.

**RecordTypeLocalization**
Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

**RecordVisibility (Pilot)**
Represents the visibility attributes that determine a record’s read access. This object is read only and is available in API version 46.0 and later.

**RedirectWhitelistUrl**
Represents a trusted URL that users can navigate to without being shown a warning message. This object is available in API version 48.0 and later.

**Refund**
Represents a refund made against a payment. This object is available in API version 48.0 and later.

**RefundLinePayment**
A refund line that has been applied to a payment. This object is available in API version 48.0 and later.

**RegisteredExternalService**
Represents a registered service used for checkout integrations by data integrators. This object is available in API version 49.0 and later.
RemoteKeyCalloutEvent
The documentation has moved to RemoteKeyCalloutEvent in the Platform Events Developer Guide.

Reply
Represents a reply that a user has submitted to a question in an answers zone.

ReplyReportAbuse
Represents a user-reported abuse on a Reply in a Chatter Answers zone. This object is available in API version 24.0 and later.

ReplyText
A text reply generated by Einstein Reply Recommendations that is based on closed chat transcripts. Admins review replies and publish them as quick text, editing them as needed. Einstein recommends relevant published replies to support agents in the Lightning Service Console, and agents can insert replies into chats or messaging sessions. This object is available in API version 49.0 and later.

Report
Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

ReportTag
 Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

ReputationLevel
Represents a reputation level defined for an Experience Cloud site. This object is available in API version 32.0 and later.

ReputationLevelLocalization
Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in Experience Cloud sites. This object is available in API version 35.0 and later.

ReputationPointsRule
Represents the reputation point rules for an Experience Cloud site. Each rule specifies an action that members can earn points from and the points associated with those actions in a particular site. This object is available in API version 32.0 and later.

ResourceAbsence
Represents a time period in which a service resource is unavailable to work in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ResourcePreference
Represents an account’s preference for a specified service resource on field service work.

ReturnOrder
Represents the return or repair of inventory or products in Field Service, or the return of order products in Order Management. This object is available in API version 42.0 and later.

ReturnOrderItemAdjustment
Represents a price adjustment on a return order line item. This object is available in API version 50.0 and later.

ReturnOrderItemTax
Represents the tax on a return order line item or return order item adjustment. This object is available in API version 50.0 and later.

ReturnOrderLineItem
Represents a specific product that is returned or repaired as part of a return order in Field service, or a specific order item that is returned as part of a return order in Order Management. This object is available in API version 42.0 and later.

ReturnOrderOwnerSharingRule
Represents the rules for sharing a return order with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 42.0 and later.
Standard Objects

**RuleTerritory2Association**
Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

**SalesAI ScoreCycle**
Represents the cycle type and ID used to score records. This object is available in API version 47.0 and later.

**SalesAI ScoreModelFactor**
Represents the factors that Sales Cloud Einstein uses to build a scoring model. Scoring models are used by features, such as Opportunity Scoring, to score individual records. This object is available in API version 47.0 and later.

**SalesChannel**
Represents the origin of an order. For example, a web storefront, physical store, marketplace, or mobile app. If you integrate Salesforce Order Management with Salesforce B2C Commerce, set up a SalesChannel corresponding to each Site in your B2C Commerce implementation. This object is available in API version 48.0 and later.

**SalesStoreCatalog**
Represents the catalog associated with a store. This object is available in API version 49.0 and later.

**SalesWorkQueueSettings**
Represents settings used to customize work queue options for third-party scoring. Third-party scoring enables custom number fields on person accounts, contacts, and leads. You must be a High Velocity Sales customer to update this object. Previously, you could only use the Einstein Intelligence Score for third-party scoring. Available starting in Version 47.0.

**SamlSsoConfig**
Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

**SchedulingConstraint**
Represents the scheduling constraints of each service resource. This object is available in API version 50.0 and later.

**SchedulingRule**
Represents scheduling rules that are hard constraints in the scheduling logic engine. This object is available in API version 52.0 and later.

**SchedulingRuleParameter**
Represents scheduling rule parameters associated with a scheduling rule. This object is available in API version 51.0 and later.

**Scontrol**
A custom s-control, which is custom content that is hosted by the system but executed by the client application.

**ScontrolLocalization**
The translated value of the field label for an s-control.

**Scorecard**
Use scorecards to measure partner performance and establish benchmarks for channel programs within Experience Cloud. Display any report summary results that your channel account manager or executive team wants to see. This object is available in API version 40.0 and later.

**ScorecardAssociation**
Represents a connection between a specific scorecard and the associated account, channel program, or channel program level. This object is available in API version 41.0 and later.

**ScorecardMetric**
Stores information about a Salesforce report that is run and summarized to get a single value. The stored value is added as a metric to the related Scorecard object. This object is available in API version 40.0 and later.
ScratchOrgInfo
Represents a scratch org and its audit log. Use this object to create a scratch org and keep a log of its creation and deletion. This object is available in API version 41.0 and later.

SearchPromotionRule
Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user’s search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

SecurityCustomBaseline
Provides the ability to read, create, and delete user-defined custom security baselines, which define an org’s security standards. This object is available in API version 39.0 and later.

SelfServiceUser
Represents a Contact who has been enabled to use your organization’s Self-Service portal, where he or she can obtain online support.

Seller
Represents the seller role of an individual with respect to a particular company or organization. This object is available in API version 53.0 and later.

ServiceAppointment
Represents an appointment to complete work for a customer in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceAppointmentStatus
Represents a possible status of a service appointment in field service.

ServiceChannel
Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

ServiceChannelFieldPriority
Represents a secondary routing priority field-value mapping. This object is available in API version 47.0 and later.

ServiceChannelStatus
Represents the status that’s associated with a specific service channel. This object is available in API version 32.0 and later.

ServiceChannelStatusField
Represents the values that you use to indicate completed and in-progress work item status for the status field in the Status-Based Capacity routing model. This object is available in API version 49.0 and later.

ServiceContract
Represents a customer support contract (business agreement). This object is available in API version 18.0 and later.

ServiceContractOwnerSharingRule
Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

ServiceCrew
Represents a group of service resources who can be assigned to service appointments as a unit.

ServiceCrewMember
Represents a technician service resource that belongs to a service crew.

ServiceCrewOwnerSharingRule
Represents the rules for sharing a service crew with user records other than the owner or anyone above the owner in the role hierarchy.
Standard Objects

ServicePresenceStatus
Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

ServiceReport
Represents a report that summarizes a work order, work order line item, or service appointment.

ServiceReportLayout
Represents a service report template in field service.

ServiceResource
Represents a service technician or service crew in field service in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceResourceCapacity
Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

ServiceResourceCapacityHistory
Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

ServiceResourceOwnerSharingRule
Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

ServiceResourcePreference
Represents the service resource scheduling preferences that are considered as a business objective in the scheduling logic engine. This object is available in API version 52.0 and later.

ServiceResourceSkill
Represents a skill that a service resource possesses in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceSetupProvisioning
Represents a task completed by the Service Setup Assistant. This object is available in API version 52.0 and later.

ServiceTerritory
Represents a geographic or functional region in which field service work can be performed in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceTerritoryLocation
Represents a location associated with a particular service territory in field service.

ServiceTerritoryMember
Represents a service resource who can be assigned to service appointments in a service territory in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later.

ServiceTerritoryWorkType
Represents the relationship between a ServiceTerritory object and a WorkType object for Salesforce Scheduler appointments. This object is available in API version 45.0 and later.

SessionPermSetActivation
The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user’s specific session. This object is available in API versions 37.0 and later.
Standard Objects

**SetupAuditTrail**
Represents changes you or other admins made in your org’s Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

**SetupEntityAccess**
Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

**ShapeRepresentation**
Contains information about the shape of an org. The shape of an org includes features, settings, licenses, and limits information. You can easily create scratch orgs based on a source org’s shape. This object is available in API version 50.0 and later.

**SharingRecordCollection**
Represents a collection of records. This object is available in API version 51.0 and later.

**SharingRecordCollectionItem**
Represents a single record in a collection of records. This object is available in API version 51.0 and later.

**SharingRecordCollectionMember**
Represents a user with access to a collection of records. This object is available in API version 51.0 and later.

**Shift**
Represents a shift for service resource scheduling. Available in API versions 46.0 and later.

**ShiftHistory**
Represents the history of changes made to tracked fields on a time sheet. Available in API versions 46.0 and later.

**ShiftOwnerSharingRule**
Represents the rules for sharing a shift with user records other than the owner or anyone above the owner in the role hierarchy. Available in API versions 46.0 and later.

**ShiftPattern**
Represents a pattern of templates for creating shifts. This object is available in API version 51.0 and later.

**ShiftPatternEntry**
ShiftPatternEntry links a shift template to a shift pattern. This object is available in API version 51.0 and later.

**ShiftShare**
Represents a sharing entry on a field service shift. Available in API versions 46.0 and later.

**ShiftStatus**
Represents a shift, such as Tentative, Published, or Confirmed. Available in API versions 46.0 and later.

**ShiftTemplate**
Represents a template for creating shifts. This object is available in API version 51.0 and later.

**Shipment**
Represents the transport of inventory in field service or a shipment of order items in Order Management.

**ShipmentItem**
Represents an order item included in a shipment. This object is available in API version 51.0 and later.

**SignupRequest**
Represents a request for a new sign-up. This object is available in API version 27.0 and later.

**Site**
Represents a public website that is integrated with an org. This object is available in API version 16.0 and later.
SiteDetail
Represents the details of a Salesforce site or Experience Cloud site. Available in API Version 38.0 and later.

SiteDomain
SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the Domain and DomainSite objects instead.

SiteHistory
Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

SiteIframeWhitelistUrl
Represents a list of external domains that you allow to frame your Salesforce site or Experience Cloud site pages. This object is available in API version 44.0 and later.

Skill
Represents a category or group that Chat users or field service resources can be assigned to. This object is available in API version 24.0 and later.

SkillLevelDefinition
Represents a skill which can be acquired by taking myTrailhead learning modules. This object is available in API version 51.0 and later.

SkillLevelProgress
Represents training progress for a given user. This object is available in API version 51.0 and later.

SkillProfile
Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

SkillRequirement
Represents a skill that is required to complete a particular task in Field Service and Lightning Scheduler. Skill requirements can be added to work types, work orders, and work order line items in Field Service and Lightning Scheduler. This object is available in API version 38.0 and later. You also can add skill requirements to work items in Omni-Channel skills-based routing using API version 42.0 and later.

SkillUser
Represents a join between Skill and User. This object is available in API version 24.0 and later.

SlaProcess
Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

Snippet
Represents a snippet, which is a container for rich text that can be reused across Pardot emails and email templates. This object is available in API version 47.0 and later.

SnippetAssignment
Represents a relationship between a snippet and a campaign. Assignments are required to use snippet content in Pardot emails and email templates. A snippet can be assigned to more than one campaign. This object is available in API version 47.0 and later.

SocialPersona
Represents a snapshot of a contact's profile on a social network such as Facebook or Twitter. This object is available in API version 22.0 and later.

SocialPost
Represents a snapshot of a post on a social network such as a Facebook or Twitter. This object is available in API version 23.0 and later.
Standard Objects

Solution
Represents a detailed description of a customer issue and the resolution of that issue.

SolutionStatus
Represents the status of a Solution, such as Draft, Reviewed, and so on.

SolutionTag
Associates a word or short phrase with a Solution.

SOSDeployment
Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

SOSSession
This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

SOSSessionActivity
Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

Stamp
Represents a User Specialty. This object is available in API version 39.0 and later.

StampAssignment
Represents assignment of a User Specialty to a user. This object is available in API version 39.0 and later.

StaticResource
Represents a static resource that can be used in Visualforce markup.

StoreIntegratedService
Represents an association between an integration and a store. This object is available in API version 49.0 and later.

StreamingChannel
Represents a channel that is the basis for notifying listeners of generic Streaming API events. This object is available in API version 29.0 and later.

Salesforce Surveys Object Model
Learn about how Salesforce Surveys objects relate to one another in Salesforce.

Survey
Represents a survey.

SurveyEmailBranding
Represents the configuration settings for invitation emails sent to survey participants for a particular survey.

SurveyEngagementContext
Represents the context based on which a survey invitation was sent or a survey response was received. This object is available in API version 49.0 and later.

SurveyInvitation
Represents the invitation sent to a participant to complete the survey.

SurveyPage
Represents a page, such as the title page or a question page, in a survey.

SurveyQuestion
Represents a question in a survey.
SurveyQuestionChoice
Represents an answer choice that a participant can select for a survey question.

SurveyQuestionResponse
Represents a participant’s answer to a specific question.

SurveyQuestionScore
Represents the aggregate of responses for the following question types: date, multiple choice, picklist, radio, ranking, rating, scoring, slider, and Net Promoter Score® (NPS®).

SurveyResponse
Represents information about a participant’s response to a survey, such as the status of the response, the participant’s location, and when the survey was completed.

SurveySubject
Represents a relationship between a survey and another object, such as an account or a case.

SurveyVersion
Represents a version of a survey.

SurveyVersionAddlInfo
Represents additional information about a survey version. This information defines the default settings of a survey version. This object is available in API version 49.0 and later.

TabDefinition
Represents a custom tab. Returns only the tabs that the current user has access to. This object is available in API version 43.0 and later.

TagDefinition
Defines the attributes of child Tag objects.

Task
Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

TaskPriority
Represents the importance or urgency of a Task, such as High, Normal, or Low.

TaskRelation
Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn’t support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

TaskStatus
Represents the status of a Task, such as Not Started, Completed, or Closed.

TaskTag
Associates a word or short phrase with a Task.

TaskWhoRelation
Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

TenantSecret
This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

TenantSecurityApiAnomaly
Tracks anomalies in how users make API calls. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.
TenantSecurityConnectedApp
Stores the details for a connected app that was added to or removed from a Security Center tenant. This object is available in API version 53.0 and later.

TenantSecurityCredentialStuffing
Tracks when a user successfully logs into Salesforce during an identified credential stuffing attack. Credential stuffing refers to large-scale automated login requests using stolen user credentials. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.

TenantSecurityHealthCheckDetail
Stores the details of Security Health Check scores for a connected tenant within Security Center. This object is available in API version 53.0 and later.

TenantSecurityHealthCheckTrend
Represents the history of Security Health Check scores for a connected tenant within Security Center. This object is available in API version 53.0 and later.

TenantSecurityLogin
Stores the login details of a single user to a tenant in Security Center. This object is available in API version 53.0 and later.

TenantSecurityMonitorMetric
Represents the count and count change details for a metric that is monitored by Security Health Check within a Security Center tenant. This object is available in API version 53.0 and later.

TenantSecurityNotificationRule
Represents an alert configured in Security Center to notify recipients of changes made to security settings. This object is available in API version 53.0 and later.

TenantSecurityPackage
Stores details about managed and unmanaged packages that are added to or removed from a tenant in Security Center. This object is available in API version 53.0 and later.

TenantSecurityReportAnomaly
Tracks anomalies in how users run or export reports, including unsaved reports. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.

TenantSecuritySessionHijacking
Tracks when unauthorized users gain ownership of a Salesforce user’s session with a stolen session identifier. To detect such an event, Salesforce evaluates how significantly a user’s current browser fingerprint diverges from the previously known fingerprint using a probabilistically inferred significance of change. This object stores information about Threat Detection events within connected tenants in Security Center. This object is available in API version 53.0 and later.

TenantSecurityUserActivity
Stores details about a user’s activity in Security Center tenants. The activity that’s monitored is whether the user has never logged in, hasn’t been active for 90 days, has a frozen account, or isn’t using multi-factor authentication (MFA). This object is available in API version 53.0 and later.

TenantSecurityUserPerm
Stores information on permissions assigned to a particular user. This object is available in API version 53.0 and later.

Territory
Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

Territory2
Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.
Standard Objects

**Territory2Model**
Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

**Territory2ModelHistory**
Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

**Territory2Type**
Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

**TestSuiteMembership**
Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

**ThirdPartyAccountLink**
Represents the list of external users who authenticated using an authentication provider. This object is available in API version 32.0 and later.

**ThreatDetectionFeedback**
Represents feedback provided by a user about a Threat Detection event that occurred in your org. The feedback specifies whether the event was malicious, suspicious, not a threat, or unknown. Each ThreatDetectionFeedback object is associated with one of these Threat Detection storage events: CredentialStuffingEventStore, ReportAnomalyEventStore, or SessionHijackingEventStore. This object is available in API version 49.0 and later.

**TimeSheet**
Represents a schedule of a service resource’s time in field service. This object is available in API v47.0 and later.

**TimeSheetEntry**
Represents a span of time that a service resource spends on a field service task. This object is available in API version 47.0 and later.

**TimeSlot**
Represents a period of time on a specified day of the week during which field service work can be performed in Field Service and Lightning Scheduler. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

**TimeSlotHistory**
Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

**Topic**
Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

**TopicAssignment**
Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

**TopicLocalization**
Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in Experience Cloud sites. This object is available in API version 33.0 and later.

**TopicUserEvent**
Represents an action (such as comment, post, like, or share) made by a user on a topic. This object is available in API version 42.0 and later.

**TransactionSecurityPolicy**
Represents a transaction security policy definition.

**Translation**
The Translation object represents the languages enabled for translation in your Salesforce org. This object is available in API version 47.0 and later.
Standard Objects

TwoFactorInfo
Stores a user's secret for multi-factor operations. Use this object when customizing multi-factor authentication in your organization. (Note that multi-factor authentication was formerly called two-factor authentication.) This object is available in API version 32.0 and later.

TwoFactorMethodsInfo
Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

TwoFactorTempCode
Stores information about a user's temporary verification code for confirming their identity when logging in. This object is available in API version 37.0 and later.

UiFormulaCriterion
Represents a filter that helps define component visibility on a Lightning page. This object is available in API version 47.0 and later.

UiFormulaRule
Represents a set of one or more filters that define the conditions under which a component displays on a Lightning page. This object is available in API version 47.0 and later.

UndecidedEventRelation
Represents event participants (invitees or attendees) with the status Not Responded for a given event. This object is available in API versions 29.0 and later.

User
Represents a user in your organization.

UserAccountTeamMember
Represents a User on the default account team of another User.

UserAppInfo
Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

UserAppMenuCustomization
Represents an individual user’s settings for items in the app menu or App Launcher. This object is available in API version 35.0 and later.

UserAppMenuItem
Represents the organization-wide settings for items in the app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

UserAuthCertificate
Represents a user authentication certificate in your org. A user certificate is a unique PEM-encoded X.509 digital certificate to authenticate individual users to your org. This object is available in API version 45.0 and later.

UserConfigTransferButton
Represents the association between a Chat configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

UserConfigTransferSkill
Represents the association between a Chat configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

UserCustomBadge
Represents a custom badge for a user. This object is available in API version 38.0 and later.
Standard Objects

UserCustomBadgeLocalization
Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

UserDevice
Represents information unique to a device. Available in API version 43.0 and later.

UserDeviceApplication
Represents information on applications installed on a device that is accessing Salesforce. Available in API version 43.0 and later.

UserDeviceHistory
Represents tracking information on the UserDevice sObject. This object is available in API version 50.0 and later.

UserEmailCalendarSync
Represents the user assignments of an Einstein Activity Capture configuration. This object is available in API version 49.0 and later.

UserEmailPreferredPerson
Represents a mapping for a user’s preferred record for an email address when multiple records match an email field. This object is available in API version 44.0 and later.

UserEmailPreferredPersonShare
Represents a sharing entry on a UserEmailPreferredPerson object. Sharing is not customizable for UserEmailPreferredPerson records. This object is available in API version 44.0 and later.

UserLicense
Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

UserListView
Represents the customizations a user made to a list view. This object is available in API version 32.0 and later.

UserListViewCriterion
Represents the criterion for a user’s customized list view. The criterion consists of the filters or sort order a user added to a list view for the Salesforce Mobile app. This object is available in API version 32.0 and later.

UserLogin
Represents the settings that affect a user’s ability to log into an organization. To access this object, you need the UserPermissions.ManageUsers permission. This object is available in API version 29.0 and later.

UserMembershipSharingRule
Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

UserPackageLicense
Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

UserPermissionAccess
Represents the permissions accessibility for a current user. Available in API version 41.0 and later.

UserPrioritizedRecord
Represents records that Pipeline Inspection users flag as important for tracking in pipeline views and filters. This object is available in API version 53.0 and later.

UserPreference
Represents a functional preference for a specific user in your organization.
Standard Objects

UserProfile
Represents a Chatter user profile.

UserProvAccount
Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

UserProvAccountStaging
Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

UserProvMockTarget
Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

UserProvisioningConfig
Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

UserProvisioningLog
Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

UserProvisioningRequest
Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

UserRecordAccess
Represents a user’s access to a set of records. This object is read only and is available in API version 24.0 and later.

UserRole
Represents a user role in your organization.

UserServicePresence
Represents a presence user’s real-time presence status. This object is available in API version 32.0 and later.

UserShare
Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

UserTeamMember
Represents a single User on the default opportunity team of another User.

UserTerritory
Represents a User who has been assigned to a Territory.

UserTerritory2Association
Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

UserWorkList
Represents a list of work items in the My Feed tab for High Velocity Sales users.

UserWorkListItem
Represents an individual work item in the My Feed tab for High Velocity Sales users.

VerificationHistory
Represents the past six months of your org users’ attempts to verify their identity. This object is available in API version 36.0 and later.
Standard Objects

**VisualforceAccessMetrics**
Represents summary statistics for Visualforce pages.

**VideoCall**
Represents a video call.

**VideoCallParticipant**
Represents a participant in a video call.

**VideoCallRecording**
Represents a recording from a video call, such as a video recording, a voice recording, or a transcript.

**VoiceCall**
Represents a call in Service Cloud Voice and Sales Dialer.

**VoiceCallList**
Represents a prioritized list of numbers to call.

**VoiceCallListItem**
Represents a single phone number in a prioritized call list.

**VoiceCallQualityFeedback**
Represents feedback given by a Sales Dialer user about the quality of a VoiceCall.

**VoiceCallRecording**
Represents a call recording in Service Cloud Voice and Sales Dialer. Call recordings for Service Cloud Voice with Amazon Connect and for Service Cloud Voice with Partner Telephony from Amazon Connect are stored in S3 buckets on your Amazon Web Services (AWS) account and can be accessed via AWS. Call recordings for Sales Dialer are saved as files in Salesforce.

**VoiceCoaching**
Represents a call that is using call monitoring.

**VoiceLocalPresenceNumber**
Represents a phone number with the same area code as the person who’s being called.

**VoiceMailContent**
Represents a voicemail message left by a caller to the context user.

**VoiceMailGreeting**
Represents a custom greeting message that plays upon reaching a user’s voicemail. This object is available in API version 41.0 and later.

**VoiceMailMessage**
Represents a prerecorded voicemail message.

**VoiceUserLine**
Represents a user’s forwarding phone number.

**VoiceUserPreferences**
Represents the number the user displays when making outbound calls. This object is available in API version 41.0 and later.

**VoiceVendorInfo**
Represents information about the Service Cloud Voice or Sales Dialer provider’s vendor.

**VoiceVendorLine**
Represents a user’s phone number reserved with the vendor.

**Vote**
Represents a vote that a user has made on an Idea or a Reply.
**Standard Objects**

**WarrantyTerm**
Represents warranty terms defining the labor, parts, and expenses covered, along with any exchange options, provided to rectify issues with products. This object is available in API version 50.0 and later.

**WaveAutoInstallRequest**
Provides access to the concrete object that represents a Tableau CRM auto install request. The auto install request tracks the progress of Tableau CRM applications created from Tableau CRM templates by the automated process user. This object is available in API version 38.0 and later.

**WebCart**
Represents an online shopping cart in a store built with B2B Commerce on Lightning, with total amounts for products, shipping and handling, and taxes. This object is available in API version 49.0 and later.

**WebCartAdjustmentGroup**
Group of price adjustments for a cart. This object is available in API version 52.0 and later.

**WebCartHistory**
WebCartHistory represents the history of changes to the values in the fields of the WebCart object.

**WebLink**
Represents a custom link to a URL or Scontrol.

**WebLinkLocalization**
Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

**WebStore**
Represents a B2B Commerce store. This object is available in API version 49.0 and later.

**WebStoreCatalog**
Represents the collection of products associated with a store. This object is available in API version 49.0 and later.

**WebStorePricebook**
Represents a store price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

**Wishlist**
Represents a buyer-created list of WishlistItems in a store that's built with B2B Commerce on Lightning. Available in API version 49.0 and later.

**WishlistItem**
Represents an item on a Wishlist in a store built with B2B Commerce for Lightning. Available in API version 49.0 and later.

**WorkAccess**
Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

**WorkAccessShare**
Used to control Givers of WorkBadgeDefinition records.

**WorkBadge**
Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

**WorkBadgeDefinition**
Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.
Standard Objects

WorkCoaching
Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

WorkDemographic
Represents the field values used to specify slices in the workload forecasting and capacity planning. This object is available in API version 49.0 and later.

WorkFeedback
Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

WorkFeedbackQuestion
Represents a free-form text type or multiple choice question within a set of questions.

WorkFeedbackQuestionSet
Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

WorkFeedbackRequest
Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

WorkforceCapacity
Represents the time series for actual or forecasted workforce allocation. This object is available in API version 51.0 and later.

WorkforceCapacityUnit
Represents the number of resources allocated or needed to handle specific set of work items at a timestamp within a specific duration. This object is available in API version 51.0 and later.

WorkGoal
Represents the components of a goal, such as its description and associated metrics. This object has been deprecated as of API version 35.0. Use the Goal object to query information about WDC goals.

WorkGoalCollaborator
Represents collaborators on a WorkGoal object. This doesn’t include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the Goal object to query information about WDC goals.

WorkGoalCollaboratorHistory
Represents the history of changes to the values in the fields in a WorkGoalCollaborator object. Access is read-only.

WorkGoalHistory
Represents the history of changes to the values in the fields of a WorkGoal. Access is read-only. This object has been deprecated as of API version 35.0. Use the GoalHistory object to query historical information for WDC goals.

WorkGoalLink
Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the GoalLink object to query information about the relationship between two WDC goals.

WorkGoalShare
Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the GoalShare object to query information about sharing for WDC goals.
Standard Objects

**Workload**
Represents the time series for work item volume and average handling time from aggregation and forecasting processes. This object is available in API version 49.0 and later.

**WorkloadUnit**
Represents the number of work items and average handle time in a specific time interval. This object is available in API version 49.0 and later.

**WorkOrder**
Represents field service work to be performed for a customer. This object is available in API version 36.0 and later.

**WorkOrderHistory**
Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

**WorkOrderLineItem**
Represents a subtask on a work order in field service. This object is available in API version 36.0 and later.

**WorkOrderLineItemHistory**
Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

**WorkOrderLineItemStatus**
Represents a possible status of a work order line item in field service.

**WorkOrderShare**
Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

**WorkOrderStatus**
Represents a possible status of a work order in field service.

**WorkPerformanceCycle**
Represents feedback that is gathered to assess the performance of a specific set of employees.

**WorkPlan**
Represents a work plan for a work order or work order line item. This object is available in API version 52.0 and later.

**WorkPlanSelectionRule**
Represents a rule that selects a work plan for a work order or work order line item. This object is available in API version 52.0 and later.

**WorkPlanTemplate**
Represents a template for a work plan. This object is available in API version 52.0 and later.

**WorkPlanTemplateEntry**
Represents an object that associates a work step template with a work plan template. This object is available in API version 52.0 and later.

**WorkReward**
Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

**WorkRewardFund**
Represents a Reward Fund and describes the Reward Fund attributes.

**WorkRewardFundType**
Represents the type of WorkRewardFund object.

**WorkStep**
Represents a work step in a work plan. This object is available in API version 52.0 and later.
**AcceptedEventRelation**

Represents event participants (invitees or attendees) with the status *Accepted* for a given event.

This object is available in API versions 29.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()

Usage

Query invitees who have accepted an invitation to an event

```
SELECT eventId, type, response FROM AcceptedEventRelation WHERE eventid='00UTD000000ZH5LA'
```

SEE ALSO:
- DeclinedEventRelation
- UndecidedEventRelation

Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Customer Portal users can access their own accounts and any account shared with them.

### IsPersonAccount Fields

These fields are the subset of person account fields that are contained in the child person contact record of each person account. If the IsPersonAccount field has the value false, the following fields have a null value and can’t be modified. If true, the fields can be modified.

Person accounts are not enabled by default.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**AccountBrandOwnerSharingRule**

Sharing rules are available for the object.

**AccountBrandShare**

Sharing is available for the object.

**AccountContactRelation**

Represents a relationship between a contact and one or more accounts.

This object is available in API version 37.0. The AccountContactRelation object supports person accounts. That means that a person account can be either a related contact on a business account or a related account on a contact. A person account can also be related to another person account as either a related contact or related account.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

</tr>
</tbody>
</table>

**Usage**

Use this object to associate a single contact record to multiple account records so you can easily track the relationships between the people and businesses they work with.

When you insert a non-private contact in your org that associates a contact to multiple accounts, an AccountContactRelation is created and its validation rules, database insertion, and triggers are executed immediately after the contact is saved to the database. When you change a contact’s primary account, an AccountContactRelation may be created or edited, and the AccountContactRelation validation rules, database changes, and triggers are executed immediately after the contact is saved to the database. See Order of Execution.
AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record’s clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field IsDifferent has an IsDifferentState field. If the IsDifferentState field’s value is False, that means the State field value is the same on the Salesforce account record and its matched Data.com record.

AccountCleanInfo bit vector fields include:

- **CleanedBy** indicates who (a user) or what (a Clean job) cleaned the account record.
- **IsDifferent** indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- **IsFlaggedWrong** indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.
- **IsReviewed** indicates whether or not a field on the account record is in a Reviewed state, which means that the value was reviewed but not accepted.

Their individual bits are defined here.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update()

### Field Name: IsReviewedYearStarted

**Details**

**Description**
Indicates whether the account’s YearStarted field value is in a Reviewed state (true) or not (false).

**Type**
boolean

**Properties**
Filter, Update

---

### Field Name: LastMatchedDate

**Details**

**Description**
The date the account record was last matched and linked to a Data.com record.

**Type**
dateTime

**Properties**
Filter, Sort

---

### Field Name: LastStatusChangedById

**Details**

**Description**
The ID of who or what last changed the record’s Clean Status field value: a Salesforce user or a Clean job.

**Type**
reference

**Properties**
Filter, Group, Nillable, Sort

---

### Field Name: LastStatusChangedDate

**Details**

**Description**
The date on which the record’s Clean Status field value was last changed.

**Type**
dateTime

**Properties**
Filter, Nillable, Sort

---

### Field Name: Latitude

**Details**

**Description**
Used with Longitude to specify the precise geolocation of a billing address. Data not currently provided.

**Type**
double

**Properties**
Filter, Nillable, Sort

The website of the account. |
| YearStarted      | **Type**
string | **Properties**
Filter, Group, Nillable, Sort | **Description**
The year the company was established or the year when current ownership or management assumed control of the company. |

**Usage**

Administrators can modify a limited set of AccountCleanInfo fields from the Account Clean Info page.
Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the Clean Status field on the Account object. If an account record’s Clean Status field value is Different, but the record has no Billing Street value, the trigger could update the record’s status to Not Compared.

Create triggers that read AccountCleanInfo fields to help automate the cleaning or related processing of account records. For example:

- Keep account records’ status InSync if the only difference from matched records is the Phone format (for example, (415) 353-8000 on the account record versus 415 353 8000 on the matched Data.com record).

```
trigger AccountPhoneTrigger on Account (before update) {
    for (Account account: Trigger.new) {
        Account oldAccount = Trigger.oldMap.get(account.ID);
        if (account.CleanStatus == 'Different') {
            List <AccountCleanInfo> cleanInfo = [Select Id, IsDifferentPhone, IsReviewedPhone, Phone from AccountCleanInfo where AccountId = :account.Id];
            if (cleanInfo.size() > 0 && cleanInfo[0].IsDifferentPhone && cleanInfo[0].Phone.StartsWith('+')) {
                // if Data.com phone number is marked Different but starts with '+',
                // and set the status to “Reviewed”
                AccountCleanInfo cleanInfoToUpdate = new AccountCleanInfo();
                cleanInfoToUpdate.Id = cleanInfo[0].Id;
                cleanInfoToUpdate.IsReviewedPhone = true;
                update cleanInfoToUpdate;
                account.CleanStatus = 'Reviewed';
            }
        }
    }
}
```

- Create a customized set of Industry field values for accounts. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

- Read the CleanStatus field value on the Account object. If that value is Different, but a Salesforce record has no street address value, update the record’s status to Not Compared.

**AccountContactRole**

Represents the role that a Contact plays on an Account.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Customer Portal users can’t access this object.

</table>
**Field**

Properties
Create, Defaulted on create, Filter, Group, Sort, Update

Description
Specifies whether the Contact plays the primary role on the Account (true) or not (false). Note that each account has only one primary contact role. Label is Primary. Default value is false.

**Role**

Type
picklist

Properties
Create, Filter, Group, Nillable, Sort, Update

Description
Name of the role played by the Contact on this Account, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can’t be multiple records in which the AccountId, ContactId, and Role values are identical. Different contacts can play the same role on the same account. A contact can play different roles on the same account.

**Usage**

Use this object to define the role that a Contact plays on a given Account within the context of a specific Opportunity.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**AccountContactRoleChangeEvent (API version 44.0)**
Change events are available for the object.

SEE ALSO:
Account
Contact

**AccountInsight**

Represents an individual insight (a key business development) related to an account record.

**Supported Calls**
describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
Special Access Rules

To see an insight related to a specific account, users need a Sales Cloud Einstein license and access to the account record. As of the Spring ’20 release, Pardot and High Velocity Sales users no longer have access to this object.

Usage

This object is read-only and isn’t supported with workflows, triggers, or process builder.

AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

Note: To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can’t access this object.

Usage

Use this object to manage the sharing rules for accounts. General sharing and territory management-related sharing use this object. For example, the following code creates an account owner sharing rule between two public groups, which can also contain portal users.

```java
AccountOwnerSharingRule rule = new AccountOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx00000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx00000000001"); // Set the group of users to share records to
rule.setAccountAccessLevel("Edit");
rule.setOpportunityAccessLevel("Read");
rule.setCaseAccessLevel("None");
connection.create(rule);
```

Note: The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

AccountPartner

This object represents a partner relationship between two Account records. An AccountPartner record is created automatically when a Partner record is created for a partner relationship between two accounts.

Note: This object is completely distinct from and independent of Account records that have been enabled for the partner portal.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve()

Special Access Rules

Customer Portal users can’t access this object.

- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: ID of the account in a partner relationship.

#### Role

- **Type**: picklist
- **Properties**: Create, Filter, Group, Nillable, Sort
- **Description**: The UserRole that the partner Account has on the main Account. For example, Consultant or Distributor.

---

## Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner record and specify the `AccountFromId`), the API automatically creates two AccountPartner records, one for the forward relationship and one for the reverse. For example, if you create a Partner relationship with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`, the API automatically creates two AccountPartner records:

- The forward relationship AccountPartner with “Acme, Inc.” as the `AccountFromId` and “Acme Consulting” as the `AccountToId`.
- The reverse relationship AccountPartner with “Acme Consulting” as the `AccountFromId` and “Acme, Inc.” as the `AccountToId`.
- The value of the `Role` field in the reverse relationship AccountPartner is set to the PartnerRole record `ReverseRole` value associated with the value of the `Role` field in the forward relationship AccountPartner.

This mapping allows the API to manage the records and their relationships efficiently.

## AccountRelationship

Represents a relationship of a given type between two accounts. This object is available in API version 45.0 and later.
## Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

## Special Access Rules

In Digital Experience Settings, turn on the Enable Account Relationships org preference, which is off by default.

* **Description**  
  The relationship type. All account relationship sharing rules of that type will be applied to this account relationship.  
  Standard values are:  
  • System Integrator  
  • Agency  
  • Advertiser  
  • Reseller  
  • Distributor  
  • Developer  
  • Broker  
  • Lender  
  • Institution  
  • Contractor  
  • Dealer  
  • Consultant  
  • Client  
  • Vendor  
  • Agent  
  • Retailer  
  • Subcontractor  
  • Supplier |
Picklist items can be updated with your own values.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **AccountRelationshipFeed**
  - Feed tracking is available for the object.

- **AccountRelationshipHistory**
  - History is available for tracked fields of the object.

- **AccountRelationshipOwnerSharingRule**
  - Sharing rules are available for the object.

- **AccountRelationshipShare**
  - Sharing is available for the object.

AccountRelationshipShareRule

Represents the rule that determines which object records are shared, how they are shared, the account relationship type that shares the records, and the level of access granted to the records. This object is available in API version 45.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AccessLevel</strong></td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Create, Filter, Group, Restricted picklist, Sort, Update</td>

</tbody>
</table>
### Description
Criteria that must be met for the data to be shared.

Possible values are:

- `Account.OwnerId`
- `Account.ParentId`
- `Campaign.OwnerId`
- `Case.AccountId`
- `Case.OwnerId`
- `Contact.AccountId`
- `Contact.OwnerId`
- `Lead ConvertedAccountId`
- `Lead.OwnerId`
- `Lead.PartnerAccountId`
- `Opportunity.AccountId`
- `Opportunity.OwnerId`
- `Opportunity.PartnerAccountId`
- `Order.AccountId`
- `Order.ActivatedById`
- `Order.CompanyAuthorizedById`
- `Order.OwnerId`
- `PartnerFundAllocation.CreatedById`
- `PartnerFundAllocation.ChannelPartnerId`
- `PartnerFundAllocation.OwnerId`
- `PartnerFundClaim.CreatedById`
- `PartnerFundClaim.OwnerId`
- `PartnerFundRequest.ChannelPartnerId`
- `PartnerFundRequest.CreatedById`
- `PartnerFundRequest.OwnerId`
- `PartnerMarketingBudget.CreatedById`
- `PartnerMarketingBudget.ChannelPartnerId`
- `PartnerMarketingBudget.OwnerId`

### Type
`textarea`

### Properties
Create, Filter, Nillable, Sort, Update

### Description
A meaningful explanation of the sharing rule.
<table>

</table>
| MasterLabel           | **Type**
                          string                                    |
|                       | **Properties** Create, Filter, Group, Sort, Update |
|                       | **Description** The label assigned to the sharing rule to identify it. |
| NamespacePrefix       | **Type**
                          string                                    |
|                       | **Properties** Filter, Group, Nullable, Sort |
|                       | **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

| StaticFormulaCriteria | **Type**
                          string                                    |
|                       | **Properties** Create, Filter, Nullable, Sort |
|                       | **Description** A way to further filter what data gets shared. This must be a deterministic formula and spanning is not allowed. |

| Type                  | **Type**
                          picklist                                |
|                       | **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update |
|                       | **Description** Must match the type of an account relationship for data to be shared according to the `AccountToCriteriaField` and the `StaticFormulaCriteria`. |
AccountShare

Represents a sharing entry on an Account.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules
As of Summer ’20 and later, only users with access to the Account object can access this object.

Special Access Rules
Customer Portal users can’t access this object.

Fields
The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| AccountAccessLevel | **Type**
|                 | picklist                                                                |
|                 | **Properties**
|                 | Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update |
|                 | **Description**
|                 | Level of access that the User or Group has to the Account. The possible values are:
|                 | - Read
|                 | - Edit
|                 | - All (This value isn't valid for create or update calls.)
|                 | This field must be set to an access level that is at least equal to the organization's default Account access level. In addition, either this field, the OpportunityAccessLevel field, or the CaseAccessLevel field must be set higher than the organization's default access level. |
| AccountId       | **Type**
|                 | reference                                                                |
|                 | **Properties**
|                 | Create, Filter, Group, Sort                                               |
|                 | **Description**
|                 | ID of the Account associated with this sharing entry. This field can’t be updated. This is a relationship field. |
## CaseAccessLevel

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Relationship Name</strong></td>
<td>Account</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
<td>Account</td>
</tr>
</tbody>
</table>

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Level of access that the User or Group has to cases associated with the account. The possible values are:

- None
- Read
- Edit

This field must be set to an access level that is at least equal to the organization’s default CaseAccessLevel. This field can’t be updated via the API if the AccountAccessLevel field is set to All. You can’t update this field for the associated account owner via the API. You must update the account owner’s CaseAccessLevel via the Salesforce user interface.

## ContactAccessLevel

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>

**Type**
- picklist

**Properties**
- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Level of access that the User or Group has to contacts associated with the account. The possible values are:

- None
- Read
- Edit

This field must be set to an access level that is at least equal to the organization’s default ContactAccessLevel. This field can’t be updated via the API if the ContactAccessLevel field is set to “Controlled by Parent.” You can’t update this field for the associated account owner using the API. You must update the account owner’s ContactAccessLevel via the Salesforce user interface.

## OpportunityAccessLevel

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>

**Type**
- picklist
## Field: AccountShare

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
</tr>
</tbody>
</table>
| **Description** | Level of access that the User or Group has to opportunities associated with the Account. The possible values are:  
  - None  
  - Read  
  - Edit  
  
This field must be set to an access level that is at least equal to the organization’s default opportunity access level. This field can't be updated via the API if the `AccountAccessLevel` field is set to `All`. You can't use the API to update this field for the associated Account owner. You must update the Account owner's opportunityAccessLevel via the Salesforce user interface. |

## Field: RowCause

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
</tbody>
</table>
| **Description** | Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to `Manual` (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.  
Valid values include:  
  - **Manual**—The User or Group has access because a User with "All" access manually shared the Account with the user or group.  
  - **Owner**—The User is the owner of the Account  
  - **Team**—The User or Group has team access (is an AccountTeamMember).  
  - **Rule**—The User or Group has access via an Account sharing rule.  
  - **GuestRule**—The user or group has access via an Account guest user sharing rule.  
  - **ImplicitParent**—The User or Group has access because they’re the owner of or have sharing access to records related to the account, such as opportunities, cases, contacts, contracts, or orders.  
  - **GuestParentImplicit**—The guest user has access because they have access to records related to the Account, such as opportunities, cases, contacts, contracts, or orders.  
  - **LpuParentImplicit**—The User has access because they have access to records owned by high-volume Experience Cloud site users and shared via a share group.  
  - **LpuImplicit**—The User has access to records owned by high-volume Experience Cloud site users via a share group.  
  - **PortalImplicit**—The Account is associated with the portal user. |
• **ARImplicit**—The User, who belongs to a partner or customer account, has access to the Account via an account relationship data sharing rule.

• **Territory2AssociationManual**—With Enterprise Territory Management in API version 44.0 and earlier, the TerritoryManual reason code was written to AccountShare records when you manually assigned an account to a territory. In API version 45.0 and later, Territory2AssociationManual replaces all instances of TerritoryManual, and the Territory2AssociationManual reason code is written to AccountShare records when you manually assign an account to a territory.

• **Territory**—The territory has access via a territory assignment rule.

• **TerritoryManual**—Deprecated starting in API version 45.0 and replaced by the Territory2AssociationManual value.

---

### Usage

This object allows you to determine which users and groups can view or edit Account records owned by other users.

If you attempt to create an AccountShare record that matches an existing record, the request updates any modified fields and returns the existing record.

For example, the following code finds all accounts owned by a user and manually shares them to a portal user.

```java
QueryResult result = conn.query("SELECT Id FROM Account WHERE OwnerId = '005D0000001LPFB'");
// Create a new AccountShare object
List<AccountShare> shares = new ArrayList<AccountShare>();
for (SObject rec : result.getRecords()) {
    AccountShare share = new AccountShare();
    share.setAccountId(rec.getId());
    //Set the portal user Id to share the accounts with
    share.setUserOrGroupId("003D000000QA8T1");
    share.setAccountAccessLevel("Edit");
    shares.add(share);
}
```
This code shares the accounts that the user owns at the time, but not those accounts that are owned later. For these types of shares, use an owner-based sharing rule, such as AccountOwnerSharingRule.

If an account is shared in multiple ways with a user, you don’t always see multiple sharing records. If a user has access to an account for one or more of the following RowCause values, the records in the AccountShare object are compressed into one record with the highest level of access.

- ImplicitParent
- Manual
- Owner

SEE ALSO:
- Account
- CaseShare
- LeadShare
- OpportunityShare

**AccountTag**

Associates a word or short phrase with an Account.

**Supported Calls**

`create(), delete(), describeSObjects(), query(), retrieve()`

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter</td>
</tr>
<tr>
<td></td>
<td>Description ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Filter</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</td>
</tr>
<tr>
<td><strong>TagDefinitionId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the parent TagDefinition object that owns the tag.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Restricted picklist</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Defines the visibility of a tag.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• Public—The tag can be viewed and manipulated by all users in an organization.</td>
</tr>
<tr>
<td></td>
<td>• Personal—The tag can be viewed or manipulated only by a user with a matching OwnerId.</td>
</tr>
</tbody>
</table>

**Usage**

AccountTag stores the relationship between its parent TagDefinition and the Account being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**AccountTeamMember**

Represents a User who is a member of an Account team.

See also UserAccountTeamMember, which represents a User who is on the default account team of another user.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
Special Access Rules

- This object is available only for Enterprise, Unlimited, and Performance Edition users who have enabled the account team functionality.
- Customer Portal users can't access this object.

A deleted AccountTeamMember record can’t be undeleted unless the record was cascade-deleted when deleting a related Account. For directly deleted AccountTeamMember records, don’t use the isDeleted field to detect deleted records in SOQL queries or queryAll() calls. The getDeleted() call also doesn’t show deleted account team members unless the record was deleted from an account related list or the Developer Console.</td>
</tr>
</tbody>
</table>
### OpportunityAccessLevel

**Type**
- picklist

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
Level of access that the User has to opportunities associated with the account. The possible values are:
- None
- Read
- Edit

This field must be set to an access level that is at least equal to the organization’s default opportunity access level. In addition, the user’s AccountAccessLevel, ContactAccessLevel, OpportunityAccessLevel, or CaseAccessLevel field must be set higher than the organization’s default access level. This field is available in API version 37.0 and later.

### PhotoURL

**Type**
- URL

**Properties**
- Filter, Nillable, Sort, Group

**Description**
Read only. Retrieves the users Chatter photo URL. This field is available in API version 37.0 and later.

### TeamMemberRole

**Type**
- picklist

**Properties**
- Create, Filter, Nillable, Update

**Description**
Role associated with this team member. One of the valid team member roles defined for your organization. Label is **Team Role**.

### Title

**Type**
- string

**Properties**
- Filter, Nillable, Sort, Group

**Description**
Read only. Retrieves the user’s title. This field is available in API version 37.0 and later.

### UserId

**Type**
- reference
Usage

Use this object to manage the team members of a particular Account and to specify team member roles for those users on that account. Behavior differs when an account owner adds a team member whose access is based on group sharing. If the account owner is changed, the team member with group-based access is removed from the team, even if the Keep account team option is selected.

If you use SOQL statements to query all records in an organization, the ALL ROWS keywords don't query deleted account team member records.

- Account

AccountTerritoryAssignmentRule

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

Note: The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Spring '20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

Usage
A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

SEE ALSO:
- AccountTerritoryAssignmentRuleItem
- Territory
- UserTerritory

AccountTerritoryAssignmentRuleItem
A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

Note: The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer ’21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

AccountTerritoryAssignmentRuleItem can be created or deleted if the BooleanFilter field on its corresponding AccountTerritoryAssignmentRule object is a null value.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules
As of Spring ’20 and later, only users with the View Setup and Configuration permission can access this object, and only users with the Manage Territories permission can edit this object.

### Usage

- Both standard and custom account fields can be used as criteria for account assignment rules.
- A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

**SEE ALSO:**
- AccountTerritoryAssignmentRule
- Territory
- UserTerritory
AccountTerritorySharingRule

Represents the rules for sharing an Account within a Territory.

**Note:** The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Customer Portal users can’t access this object.

<tr>
<td><strong>Description</strong></td>
<td>Unique identifier for each user in the Users in Assigned Territories related list.</td>
</tr>
</tbody>
</table>
Usage

Use this object to show the users who are assigned to the territories assigned to an account.

A filter criterion with one AccountId is required when you execute a SOQL query on this object.

ActionCadence

Represents the definition of a sales cadence. This object is available in API version 45.0 and later.

Use ActionCadence and its related objects to learn about a sales cadence, including:

- The current state of the sales cadence.
- The steps that the sales cadence contains.
- Which leads, contacts, or person accounts are assigned to the sales cadence.

By learning when the sales cadence objects are created and deleted, you can make the most of the sales cadence API.

- An ActionCadence record is created when you use the High Velocity Sales app to create a sales cadence.
- An ActionCadenceStep record is created to represent a step. If the step is a branch step, then corresponding ActionCadenceRule and ActionCadenceRuleCondition records are also created.
- An ActionCadenceTracker record is created when you assign a prospect to a sales cadence.
- An ActionCadenceStepTracker record is created each time the prospect moves to a new step.

All of these sales cadence records exist until you use the High Velocity Sales app to delete a sales cadence. If many prospects have been assigned to the sales cadence, there can be many associated ActionCadenceTracker and ActionCadenceStepTracker records. In this case, deleting the sales cadence can take some time. While the sales cadence is being deleted, the ActionCadence record is in the Deleting state.

Supported Calls

dele te(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(),

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>

<td>Type: dateTime&lt;br&gt;Properties: Filter, Nillable, Sort&lt;br&gt;Description: The date this sales cadence was last viewed in the High Velocity Sales app.</td>
</tr>
<tr>
<td>Name</td>
<td>Type: string&lt;br&gt;Properties: Filter, Group, idLookup, Sort, Update&lt;br&gt;Description: The name of this sales cadence. Every sales cadence in an org must have a unique name.</td>
</tr>
</tbody>
</table>
### OwnerId

**Type**
reference

**Properties**
Filter, Group, Sort, Update

**Description**
The ID of the owner of the sales cadence (typically the user who created it).

> **Note:** To change the owner of a sales cadence, the new owner must have read access to sales cadences enabled in their user profile.

### State

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
This entity’s state.

Possible values are:

- **Active**
The user finished modifying the sales cadence and has activated it. At this point, you can’t make any more changes to the steps in the sales cadence.

- **Deleting**
All records associated with this sales cadence, including the ActionCadence record and all its related records, are being deleted. While in this state, the ActionCadence can’t be attached to a prospect.

- **Draft**
ActionCadence objects are in the draft state when they’re created. In this state, the ActionCadence can’t be assigned to any prospect.

- **Error**
An error occurred while trying to activate the sales cadence.

- **Inactive**
The user deactivated the sales cadence. New targets can’t be added to the sales cadence. Existing targets continue in the sales cadence until completion.

### Usage

Use ActionCadence to learn how many sales cadences are currently active:

```sql
select COUNT() from ActionCadence where State="Active"
```
Retrieve all ActionCadence records that have "West Coast" in their name:

```sql
SELECT ActionCadenceId FROM ActionCadence WHERE NAME LIKE '[West Coast Cadence]%'
```

Retrieve all ActionCadence records owned by a specific user:

```sql
SELECT ActionCadenceId FROM ActionCadence WHERE OwnerId = '<owner id>'
```

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**ActionCadenceChangeEvent** *(API version 48.0)*

Change events are available for the object.

SEE ALSO:

- ActionCadenceRule
- ActionCadenceRuleCondition
- ActionCadenceStep
- ActionCadenceStepTracker

### ActionCadenceRule

Represents the logic that a branch step uses to make decisions in your sales cadence. Use ActionCadenceRule to learn about a branch step, including its logic and what the next step is. This object is available in API version 48.0 and later.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

| OutcomeNextStepName    | **Type** string                                                         |
|                       | Properties Filter, Group, Nillable, Sort                                 |
|                       | **Description** The next step in the sales cadence if this rule evaluates as true. If this rule evaluates as false, the next step is ActionCadenceStep.BranchDefaultStepName. |

| ParentRuleName         | **Type** string                                                         |
|                       | Properties Filter, Group, Nillable, Sort                                 |
|                       | **Description** The value of the RuleName field of the previous rule in the sales cadence. Must contain a valid rule name value unless this rule is the root rule. null if this rule is a root rule. |
Field | Details
---|---
RuleName | This field is available in API version 49.0 and later.

**RuleName**

**Type**
string

**Properties**
Filter, Group, Sort

**Description**
The name given to the rule. Every rule in a sales cadence must have a unique name.

**RuleType**

**Type**
picklist

**Properties**
Filter, Group, Nullable, Restricted picklist, Sort

**Description**
The type of step that this rule applies to. Possible values are:
- **BranchStep** — The rule evaluates the condition of a branch step. A branch step is an ActionCadenceStep record with the field `type` equal to `Branch`.
- **RootStep** — The rule evaluates a global exit condition.

This field is available in API version 49.0 and later.

**Usage**

Use ActionCadenceRule to see all the rules associated with a branch step:

```sql
select RuleName from ActionCadenceRule where ActionCadenceStep.ActionCadence.Name = "High Priority CFO"
```

**SEE ALSO:**
- ActionCadence
- ActionCadenceRuleCondition
- ActionCadenceStep
- ActionCadenceStepTracker

**ActionCadenceRuleCondition**

Represents the logic for a branch step. This object is available in API version 48.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

</table>
### Field Details

<table>
<thead>
<tr>
<th>Description</th>
<th>The event that your sales cadence rule condition listens for to decide when the event is complete.</th>
</tr>
</thead>
</table>

Possible values for emails are:
- EmailOpen
- EmailLinkClick

Possible values for calls are:
- CallMeaningfulConnect
- CallUnqualified
- CallLeftVoicemail
- CallNotInterested
- CallCallBackLater

### Usage

Use `ActionCadenceRuleCondition` to see all the rule conditions associated with a branch step:

```sql
SELECT RuleConditionName FROM ActionCadenceRuleCondition WHERE ActionCadenceStepId = <ID of a branch step>
```

SEE ALSO:
- `ActionCadence`
- `ActionCadenceRule`
- `ActionCadenceStep`
- `ActionCadenceStepTracker`

### ActionCadenceStep

Represents a step in a sales cadence. Use `ActionCadenceStep` to learn which steps belong to a sales cadence, and how the steps are connected to each other. This object is available in API version 48.0 and later.

An `ActionCadenceStep` record is created to represent a step. If the step is a branch step, then corresponding `ActionCadenceRule` and `ActionCadenceRuleCondition` records are also created.

**Note:** An `ActionCadenceStep` with `IsOrphan` equal to `true` can be part of a sales cadence but is never executed. To retrieve the steps that can be executed by the sales cadence, query for `ActionCadenceStep` records with `IsOrphan` equal to `false`. `ActionCadenceStep` records with `IsOrphan` equal to `true` are deleted.

### Supported Calls

- `describeSObjects()`,
- `getDeleted()`,
- `getUpdated()`,
- `query()`,
- `retrieve()`

<tr>
<td><strong>Description</strong></td>
<td>The type of step. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• AutoSendAnEmail — Salesforce automatically sends the specified email.</td>
</tr>
<tr>
<td></td>
<td>• Branch — A branch step in the sales cadence.</td>
</tr>
<tr>
<td></td>
<td>• CreateTask — Used for custom steps.</td>
</tr>
<tr>
<td></td>
<td>• DaisyChain — A daisy chain step. A daisy chain step connects this sales cadence to another sales cadence. It must be the last step in the path.</td>
</tr>
<tr>
<td></td>
<td>• ListenerBranch — A branch step for emails.</td>
</tr>
<tr>
<td></td>
<td>• MakeACall — The sales rep must call the prospect at this step.</td>
</tr>
<tr>
<td></td>
<td>• Root — This step is the root step for the sales cadence.</td>
</tr>
<tr>
<td></td>
<td>• SendAnEmail — The sales rep must send the prospect an email at this step.</td>
</tr>
<tr>
<td></td>
<td>• Wait — A wait step tells the sales rep not to do anything at this point in the sales cadence.</td>
</tr>
</tbody>
</table>
### Field: UniqueEmailsLinkClickedCount

**Type** reference

**Properties** Filter, Group, Nillable, Sort

**Description** The number of links inside an email that the sales rep clicks during this step. Multiple clicks on the same link are not counted. This field is available in API version 50.0 and later.

### Field: UniqueEmailsOpenedCount

**Type** reference

**Properties** Filter, Group, Nillable, Sort

**Description** The number of emails that the sales rep opens as part of this step. Multiple openings of the same email are not counted. This field is available in API version 50.0 and later.

### Field: UniqueEmailsRepliedCount

**Type** reference

**Properties** Filter, Group, Nillable, Sort

**Description** The number of emails that the sales rep replies to as part of this step. Multiple replies to the same email are not counted. This field is available in API version 50.0 and later.

### Field: WaitTimeInSeconds

**Type** int

**Properties** Filter, Group, Nillable, Sort

**Description** Required if the step type is Wait. The time in seconds for this step to wait.

### Usage

Use ActionCadenceStep to see what steps your sales cadence has:

```sql
select StepTitle from ActionCadenceStep where ActionCadence.ID= <the id of an action cadence> and IsOrphan=false
```

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.
ActionCadenceStepChangeEvent (API version 48.0)

Change events are available for the object.

SEE ALSO:
- ActionCadence
- ActionCadenceRule
- ActionCadenceRuleCondition
- ActionCadenceStepTracker

ActionCadenceStepTracker

Represents a step in an active sales cadence for a specific sales cadence target. This object is available in API version 48.0 and later.

An ActionCadenceStepTracker record is created when a target moves to a new step in a sales cadence. Use ActionCadenceStepTracker to find information such as the step’s current state, the reason it completed, and its type.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Active — the current step that the sales rep is performing. There can only be one active step for a given target.</td>
</tr>
<tr>
<td></td>
<td>• Cancelled — the sales rep canceled the step. Salesforce doesn’t run any canceled steps.</td>
</tr>
<tr>
<td></td>
<td>• Completed — this step is finished. Either the work in the step completed, or the step was skipped.</td>
</tr>
</tbody>
</table>
Details

- **Error** — an error occurred while executing this step.
- **InProgress** — the sales rep has started the step, but it isn’t yet completed.
- **Paused** — the sales rep paused the step.
- **Scheduled** — used for email steps. An email can be scheduled to be sent later.
- **Queued** — used for automated email steps. The email step has started but the email is waiting in the queue to be sent.

### Field Details

**Properties**
- Defaulted on create, Filter, Group, Sort

**Description**
- Indicates whether the sales rep had ever paused this step (`true`), or not (`false`). This field is available in API version 50.0 and later.

### Usage

List all the steps that this prospect has completed in a given sales cadence:

```sql
select StepTitle from ActionCadenceStepTracker where TargetID = <target ID> and ActionCadenceId=.<action cadence id> and StepType="Completed"
```

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**ActionCadenceStepTrackerChangeEvent (API version 48.0)**
- Change events are available for the object.

SEE ALSO:
- ActionCadence
- ActionCadenceRule
- ActionCadenceStep
- ActionCadenceRuleCondition

### ActionCadenceStepVariant

Represents an email template or call script variant associated with an action cadence step. Email and call steps can have up to 3 variants associated so sales teams can compare the engagement results. This object is available in API version 53.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

High Velocity Sales and Allow Email Template and Call Script Variant Testing must be enabled.

<td></td>
<td>• SendAnEmail</td>
</tr>
<tr>
<td></td>
<td>• Wait</td>
</tr>
<tr>
<td></td>
<td>Only email and call steps can have an associated action cadence step variant.</td>
</tr>
</tbody>
</table>

**Usage**

Use `ActionCadenceStepVariant` to retrieve the email template or call script for an action cadence step:

```sql
SELECT SplitPercentage, TemplateId FROM ActionCadenceStepVariant WHERE ActionCadenceStepId=:[idValue]
```

Use `ActionCadenceStepVariant` to retrieve the call scripts from all call steps:

```sql
SELECT SplitPercentage, TemplateId, ActionCadenceStepId FROM ActionCadenceStepVariant WHERE Type='MakeACall'
```

**ActionCadenceTracker**

Represents an active sales cadence target. This object is available in API version 45.0 and later.

An `ActionCadenceTracker` record is created when you add a target to a sales cadence. Use `ActionCadenceTracker` to learn about a running sales cadence target, including its state, current step, assigned prospect, and reason for completion.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionCadenceId</td>
<td>Type: reference</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The ID of the related ActionCadence.</td>
</tr>
<tr>
<td>CompletionDisposition</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The target’s disposition when it exited the sales cadence. This field contains a value if the target’s state is Completed. Sales reps can set this value when removing a target from a sales cadence. This field is available in API version 51.0 and later. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Bad Data — some of the target’s data is incorrect or invalid.</td>
</tr>
<tr>
<td></td>
<td>• Contact Later — the target asked to be contacted at a later date.</td>
</tr>
<tr>
<td></td>
<td>• Customer Connected — the sales rep contacted the target.</td>
</tr>
<tr>
<td></td>
<td>• Customer Engaged — the target engaged with an email.</td>
</tr>
<tr>
<td></td>
<td>• Disqualified — a sales rep determined that the target is not qualified.</td>
</tr>
<tr>
<td></td>
<td>• Duplicate — the target has a duplicate lead, contact, or person account record.</td>
</tr>
<tr>
<td></td>
<td>• No Response — the target did not reply to any outreach.</td>
</tr>
<tr>
<td></td>
<td>• Not Interested — the target stated a lack of interest.</td>
</tr>
<tr>
<td></td>
<td>• Success — the sales cadence outreach was successful.</td>
</tr>
<tr>
<td>CompletionReason</td>
<td>Type: picklist</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td></td>
<td>Description: The reason that the target completed the sales cadence. This field contains a value if the target’s state is Completed. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• AutomaticallyExited — the target completed because a global exit condition occurred. This value is available in API version 49.0 and later.</td>
</tr>
<tr>
<td></td>
<td>• DaisyChained — the target completed because it’s connected to another sales cadence.</td>
</tr>
<tr>
<td></td>
<td>• LeadConverted — the target completed because the lead converted.</td>
</tr>
<tr>
<td></td>
<td>• ManuallyRemoved — the target completed because the sales rep removed it from the sales cadence.</td>
</tr>
<tr>

<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID of the last completed ActionCadenceStepTracker.</td>
</tr>
<tr>
<td><strong>OwnerId</strong></td>
<td>Type reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID of the user who is assigned to complete the sales cadence steps for the target.</td>
</tr>
<tr>
<td><strong>State</strong></td>
<td>Type picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Restricted picklist, Sort</td>
</tr>
</tbody>
</table>
| **Description** | The state of the current step. Possible values are:  
  - Complete  
  - Error  
  - Initializing  
  - Paused  
  - Processing—Salesforce is working on changing the state of this step. We recommend that you filter out steps that have this state from your dashboards.  
  - Running |
| **TargetId** | Type reference |
| **Properties** | Filter, Group, Nillable, Sort |
| **Description** | The ID of the target that is assigned to this sales cadence. |

**Usage**

Use ActionCadenceTracker to see what targets are currently assigned to an active sales cadence.

```
select TargetId from ActionCadenceTracker where ActionCadenceId=<Id of the sales cadence> and State= "Running"
```
Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**ActionCadenceTrackerChangeEvent** *(API version 48.0)*

Change events are available for the object.

---

**ActionLinkGroupTemplate**

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

Only users with the "Customize Application" permission can modify or delete this object.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The location of the action link group within the feed element. Values are:</td>
</tr>
<tr>
<td></td>
<td>• Primary—The action link group is displayed in the body of the feed element.</td>
</tr>
<tr>
<td></td>
<td>• Overflow—The action link group is displayed in the overflow menu of the feed element.</td>
</tr>
<tr>
<td>DeveloperName</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The name of the action link group template to use in code.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field." /></td>
</tr>
<tr>
<td>ExecutionsAllowed</td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
</tbody>
</table>
|                           | **Description** | The number of times an action link can be executed. Values are:  
- **Once**—An action link can be executed only once across all users.  
- **OncePerUser**—An action link can be executed only once for each user.  
- **Unlimited**—An action link can be executed an unlimited number of times by each user. If the action link’s `actionType` is `Api` or `ApiAsync`, you can’t use this value. |
| HoursUntilExpiration       | **Type**  | int |
|                           | **Properties** | Create, Filter, Group, Nillable, Sort, Update |
|                           | **Description** | The number of hours from when the action link group is created until it’s removed from associated feed elements and can no longer be executed. The maximum value is 8,760. |
| IsPublished                | **Type**  | boolean |
|                           | **Properties** | Create, Defaulted on create, Filter, Group, Sort, Update |
|                           | **Description** | If `true`, the action link group template is published. Action link group templates shouldn’t be published until at least one `ActionLinkTemplate` is associated with it. Once set to `true`, this can’t be set back to `false`. |
| Language                   | **Type**  | picklist |
|                           | **Properties** | Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update |
|                           | **Description** | The language of the `MasterLabel`. |
| MasterLabel                | **Type**  | string |
### Field Name

**Properties**
Create, Filter, Group, Sort, Update

**Description**
The name of the action link group template.

<table>
<thead>
<tr>
<th>NamespacePrefix</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td></td>
<td>The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <code>namespacePrefix__componentName</code> notation. The namespace prefix can have one of the following values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Developer Edition orgs, <code>NamespacePrefix</code> is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In orgs that are not Developer Edition orgs, <code>NamespacePrefix</code> is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.</td>
</tr>
</tbody>
</table>

### Usage

Define action link templates in Setup and use `ConnectApi` in Apex or Connect REST API to instantiate action links from the templates and to post feed elements with the action links.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

### ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`
## Special Access Rules

Only users with the "Customize Application" permission can modify or delete this object.

## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ActionLinkGroupTemplateId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the ActionLinkGroupTemplate with which this action link template is associated. This is a relationship field.</td>
</tr>
<tr>

<td>ActionLinkGroupTemplate</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
<td>ActionLinkGroupTemplate</td>
</tr>
</tbody>
</table>

| **ActionUrl**                  | **Type** textarea |
| **Properties**                 | Create, Update |
| **Description**                | The action link URL. For example, a Uİ action link URL is a Web page. A Download action link URL is a link to the file to download. Uİ and Download action link URLs are provided to clients. An Api or ApiAsync action link URL is a REST resource. Api and ApiAsync action link URLs aren’t provided to clients. Links to Salesforce can be relative. All other links must be absolute and start with https:///. Links to resources hosted on Salesforce servers can be relative, starting with a /. All other links must be absolute and start with https:///. This field can contain context variables and binding variables in the form {!Bindings.key}, for example, https://www.example.com/{!Bindings.itemId}. Set the binding variable’s value when you instantiate the action link group from the template. |

| **Headers**                    | **Type** textarea |
### Field Name: IsConfirmationRequired

**Type:** boolean

**Properties:** Create, Defaulted on create, Filter, Group, Sort, Update

**Description:** If true, a confirmation dialog appears before the action is executed.

### Field Name: IsGroupDefault

**Type:** boolean

**Properties:** Create, Defaulted on create, Filter, Group, Sort, Update

**Description:** If true, action links derived from this template are the default or primary action in their action groups. There can be only one default action per action group.

### Field Name: Label

**Type:** string

**Properties:** Create, Filter, Group, Nillable, Sort, Update

**Description:** A custom label to display on the action link button. If none of the LabelKey values make sense for an action link, use a custom label. Set the LabelKey field to None and enter a label name in the Label field.

Action links have four states: new, pending, success, and failed. These strings are appended to the label for each state:

- **Label**
- **Label Pending**
- **Label Success**
- **Label Failed**

For example, if the value of Label is “Call Home,” the values of the four action link states are: Call Home, Call Home Pending, Call Home Success, and Call Home Failed.

If LabelKey has any value other than None, the Label field is empty.
### Field Name: LabelKey

**Type:** string

**Properties:** Create, Filter, Group, Sort, Update

**Description:**
Key for the set of labels to display for these action link states: new, pending, success, failed. For example, the Approve set contains these labels: Approve, Pending, Approved, Failed. For a complete list of keys and labels, see Action Link Labels in the Connect REST API Developer Guide.

If none of the label key values make sense for an action link, set this field to **None** and enter a custom label name in the **Label** field.

### Field Name: LinkType

**Type:** picklist

**Properties:** Create, Filter, Group, Restricted picklist, Sort, Update

**Description:**
The type of action link. One of these values:
- **Api**—The action link calls a synchronous API at the action URL. Salesforce sets the status to **SuccessfulStatus** or **FailedStatus** based on the HTTP status code returned by your server.
- **ApiAsync**—The action link calls an asynchronous API at the action URL. The action remains in a **PendingStatus** state until a third party makes a request to `/connect/action-links/` to set the status to **SuccessfulStatus** or **FailedStatus** when the asynchronous operation is complete.
- **Download**—The action link downloads a file from the action URL.
- **Ui**—The action link takes the user to a web page at the action URL.

### Field Name: Method

**Type:** picklist

**Properties:** Create, Filter, Group, Restricted picklist, Sort, Update

**Description:**
HTTP method for the action URL. One of these values:
- **HttpDelete**—Returns HTTP 204 on success. Response body or output class is empty.
- **HttpGet**—Returns HTTP 200 on success.
- **HttpHead**—Returns HTTP 200 on success. Response body or output class is empty.
- **HttpPatch**—Returns HTTP 200 on success or HTTP 204 if the response body or output class is empty.
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
|                     | • **HttpPost**—Returns HTTP 201 on success or HTTP 204 if the response body or output class is empty. Exceptions are the batch posting resources and methods, which return HTTP 200 on success.  
|                     | • **HttpPut**—Return HTTP 200 on success or HTTP 204 if the response body or output class is empty.  
|                     | **Ui and Download** action links must use **HttpGet**.                                            |

### Position

<table>
<thead>
<tr>
<th>Type</th>
<th>int</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>An integer specifying the position of the action link template relative to other action links in the group. 0 is the first position.</td>
</tr>
</tbody>
</table>

### RequestBody

<table>
<thead>
<tr>
<th>Type</th>
<th>textarea</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Create, Nillable, Update</td>
</tr>
<tr>
<td>Description</td>
<td>Template for the HTTP request body sent when corresponding action links are invoked. This field can be used only for <strong>Api</strong> and <strong>ApiAsync</strong> action links. This field can contain context variables and binding variables in the form <code>{!Bindings.key}</code>.</td>
</tr>
</tbody>
</table>

### UserAlias

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>

<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>If you selected <strong>CustomUser</strong> or <strong>CustomExcludedUser</strong> for <strong>UserVisibility</strong>, this field is the alias for the custom user. Use the alias in a template binding to specify the custom user when an action link group is created using the template.</td>
</tr>
</tbody>
</table>

### UserVisibility

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td>Description</td>
<td>Who can see the action link. This value is set per action link, not per action link group. One of these values:</td>
</tr>
</tbody>
</table>

318
Usage

Create action link templates in Setup. Use Apex classes in the ConnectApi namespace or Connect REST API to instantiate action links from templates and to post feed elements with the action links.

For information about action links, see Working with Action Links in the Apex Developer Guide or the Connect REST API Developer Guide.

ActionPlan

Represents the instance of an action plan, a set of tasks created from an action plan template. This object is used by more than one cloud in Industries.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

</table>

For API version 47 and later, supported parent objects are Account, BusinessMilestone, Campaign, Case, Claim, Contact, Contract, InsurancePolicy, InsurancePolicyCoverage, Lead, Opportunity, PersonLifeEvent, and Visit as well as custom objects with activities enabled.

For API version 46 and later, supported parent objects are Account, Campaign, Case, Contact, Contract, Lead, and Opportunity as well as custom objects with activities enabled.

For API version 45 and earlier: the only supported parent object is Account.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**ActionPlanTemplateOwnerSharingRule**

Sharing rules are available for the object.

**ActionPlanTemplateShare**

Sharing is available for the object.

**ActionPlanTemplateItem**

Represents the instance of an item on an action plan template version. This object is used by more than one cloud in Industries.

**Supported Calls**

create (), delete (), describeLayout (), describeSObjects (), getDeleted (), getUpdated (), query (), retrieve (), search (), undelete (), update (), upsert ()

</tr>
</tbody>
</table>
### Field Name | Details
---|---
**Edition** | **Type**
picklist
**Properties**
Filter, Group, Nillable, Restricted picklist, Sort
**Description**
The org edition of this scratch org. Possible values are Group, Developer, Enterprise, and Professional. This field is read-only.

**ExpirationDate** | **Type**
date
**Properties**
Filter, Group, Nillable, Sort
**Description**
Date when the scratch org expires. This field is read-only.

**Features** | **Type**
textarea
**Properties**
Nillable
**Description**
The features enabled in this scratch org, such as MultiCurrency. See the Salesforce DX Developer Guide for the full list of valid features. This field is read-only.

**HasSampleData** | **Type**
boolean
**Properties**
Create, Defaulted on create, Filter, Group, Sort
**Description**
Specifies whether the scratch org contains sample data. If set to true, the sample data is similar to the data in a Salesforce free trial org.

**LastLoginDate** | **Type**
date
**Properties**
Filter, Group, Nillable, Sort
**Description**
The date of the last user login to the scratch org. This field is read-only.

**LastReferencedDate** | **Type**
dateTime
**Properties**
Filter, Nillable, Sort
<table>

<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Filter, Group, Nillable, Sort&lt;br&gt;<strong>Description</strong> The username of the Administration user of the scratch org. This field is read-only.</td>
</tr>
</tbody>
</table>
Usage

Salesforce automatically creates an instance of this object after a ScratchOrgInfo record moves to the Active state. The new ActiveScratchOrg gets many of its field values from the ScratchOrgInfo object with which it is associated.

When you delete an ActiveScratchOrg record, its associated scratch org is deleted and its associated ScratchOrgInfo record is moved to the Deleted state.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ActiveScratchOrgFeed**
  Feed tracking is available for the object.

- **ActiveScratchOrgHistory**
  History is available for tracked fields of the object.

- **ActiveScratchOrgOwnerSharingRule**
  Sharing rules are available for the object.

- **ActiveScratchOrgShare**
  Sharing is available for the object.

SEE ALSO:
- ScratchOrgInfo
- NamespaceRegistry
- Salesforce DX Developer Guide

ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

Supported Calls

describeSObjects()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong></td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
</tbody>
</table>
### Description
Indicates the ID of the related account, which is determined as follows:

- The account associated with the `WhatId`, if it exists; or
- The account associated with the `WhoId`, if it exists; otherwise
- `null`

For information on IDs, see [ID Field Type](#).

This is a relationship field.

#### Relationship Name
**Account**

#### Relationship Type
**Lookup**

#### Refers To
**Account**

### ActivityDate

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>date</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
</tbody>
</table>

#### Description
Indicates one of the following:

- The due date of a task
- The due date of an event if `IsAllDayEvent` is set to `true`

This field has a time stamp that is always set to midnight in the Universal Time Coordinated (UTC) time zone. The time stamp doesn’t represent the time of the activity; don’t attempt to alter it to accommodate time zone differences. Label is [Date](#).

### ActivityDateTime

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Aggregate, Filter, Nillable, Sort</td>
</tr>
</tbody>
</table>

#### Description
Contains the event’s due date if the `IsAllDayEvent` flag is set to `false`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is [Due Date Time](#).

The value for this field and the [StartDateTime](#) must match, or one of them must be `null`.

### ActivitySubtype

<table>

</table>

### StartDateTime

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates the start date and time of the event. Available in versions 29.0 and later. If the event's <code>IsAllDayEvent</code> flag is set to true (indicating an all-day event), then the time stamp in <code>StartDateTime</code> is always set to midnight in the Coordinated Universal Time (UTC) time zone. <strong>Note:</strong> Don't attempt to alter the time stamp to account for any time zone differences. If the event's <code>IsAllDayEvent</code> flag is set to false, then you must translate the time portion of the time stamp in <code>StartDateTime</code> to or from a local time zone for the user or the application, as appropriate. The translation must be in the Coordinated Universal Time (UTC) time zone. If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> either must be null or must match the value of this field. If the activity is a task, <code>StartDateTime</code> is null.</td>

### Field | Details
--- | ---

| Type |
| reference |

| Properties |
| Filter, Group, Nillable, Sort |

| Description |
| The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact’s ID or a lead’s ID. The label is Name ID. If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID. If your organization uses Shared Activities, when you query activities in API version 30.0 or later, the returned value of the WhoId field matches the value in the queried object, not necessarily in the activity record itself. If Shared Activities is enabled, the value of this field is not populated and the field PrimaryWhoId should be queried instead. This is a polymorphic relationship field. |

| Relationship Name |
| Who |

| Relationship Type |
| Lookup |

| Refers To |
| Contact, Lead |

### Usage

**Query activities that are related to an object**

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity history; for example:

```sql
SELECT
    (SELECT ActivityDate, Description
     FROM ActivityHistories)
FROM Account
WHERE Name Like 'XYZ%
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn’t have permission to see.

The following constraints on users who don’t have the “View All Data” permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can’t filter on all records where the account name starts with “A.” Instead, you must reference a single account record.

```sql
SELECT
    (SELECT ActivityDate, Description
     FROM ActivityHistories
     ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC
     LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can’t use WHERE.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- In the inner clause of the query, you must sort on ActivityDate in descending order and LastModifiedDate in descending order. You can optionally display nulls last. For example: ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC.

SEE ALSO:
Task

**ActivityMetric**

Represents activities that were added to Salesforce automatically by Einstein Activity Capture and manually by users.

This object is available in API version 45.0.

**Supported Calls**

create(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Unless otherwise noted, Einstein Activity Capture and Activity Metrics must be enabled.

</tbody>
</table>
**Usage**

Use this object to see data about sales activities that were added to Salesforce manually and by Einstein Activity Capture. Activity Metric fields are derived from your activity data. For example, the Inactive Days field indicates the number of days since the most recent activity was completed. Create a trigger that notifies a user when there isn’t any activity on an account for a certain amount of time.

**AdditionalNumber**

Represents an optional additional number for a call center. This additional number is visible in the call center’s phone directory.

**Supported Calls**

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

Customer Portal users can’t access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CallCenterId</strong></td>
<td></td>
</tr>
<tr>

</tbody>
</table>
Usage

Create an additional number for a call center directory. Use this object if the number is not easily categorized as a User, Contact, Lead, Account, or the other object. Examples include phone queues or conference rooms.

Address

Represents a mailing, billing, or home address.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

|            | **Description**  
|            | Picklist of available time zones. |
**Usage**

⚠️ **Important:** “Address” in Salesforce can also refer to the Address compound field found on many standard objects. When referencing the Address object in your Apex code, always use `Schema.Address` instead of `Address` to prevent confusion with the standard Address compound field. If referencing both the address object and the Address field in the same snippet, you can differentiate between the two by using `System.Address` for the field and `Schema.Address` for the object.

**AgentWork**

Represents a work assignment that’s been routed to an agent. This object is available in API version 32.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

To access this object, **Omni-Channel** must be enabled.

**Fields**

<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates when the work item was accepted.</td>
</tr>
<tr>
<td>ActiveTime</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The amount of time an agent actively worked on the work item. Tracks when the item is open and in focus in the agent's console. If After Conversation Work (beta) is in use, ActiveTime ends when the AfterConversationActualTime period ends or the agent closes the work item, whichever occurs first.</td>
</tr>
<tr>
<td></td>
<td>Note: ActiveTime is tracked only for work that is routed using the tab-based capacity model.</td>
</tr>
</tbody>
</table>
### Field: AfterConversationActualTime

**Type:** int  
**Properties:** Filter, Group, Nillable, Sort  
**Description:** (Beta) The number of seconds an agent spent on After Conversation Work (ACW) after customer contact ended. This field is available in API version 52.0 and later.

### Field: AgentCapacityWhenDeclined

**Type:** double  
**Properties:** Filter, Nillable, Sort  
**Description:** The agent’s capacity when declining work, either explicitly or through push timeout.

### Field: AssignedDateTime

**Type:** dateTime  
**Properties:** Filter, Nillable, Sort  
**Description:** Indicates when the work item was assigned to an agent.

### Field: CancelDateTime

**Type:** dateTime  
**Properties:** Filter, Nillable, Sort  
**Description:** Indicates when the work item was canceled.

### Field: CapacityModel

**Type:** picklist  
**Properties:** Filter, Group, Nillable, Restricted picklist, Sort  
**Description:** Indicates the capacity model used to determine agent capacity. Valid values are StatusBased and TabBased. This field is available in API version 50.0 and later.

**Note:** A work item consumes agent capacity only if it was first assigned to the agent by Omni-Channel using queues or skills.

### Field: CapacityPercentage

**Type:** percent

| **Description** | The working status of the work item. Valid values are:  
  - Assigned – The item is assigned to the agent but hasn’t been opened.  
  - Opened – The agent opened the item.  
  - Unavailable – The item was assigned to the agent but the agent became unavailable (went offline or lost connection).  
  - Declined – The item was assigned to the agent but the agent explicitly declined it.  
  - DeclinedOnPushTimeout – The item was declined because push time-out is enabled and the item request timed out with the agent.  
  - Closed – The item is closed.  
  - Canceled – The item no longer needs to be routed. For example: a chat visitor cancels their Omni-Channel routed chat request before it reaches an agent.  
  - Transferred–The item was transferred from an agent to another agent, queue, or skill. |

<td></td>
</tr>
</tbody>
</table>
Usage

AgentWork records can only be deleted if they have the status Closed, Declined, or Unavailable. They can’t be deleted if their status is Assigned or Opened because they’re active in Omni-Channel.

AgentWork records have the status Assigned when they’re created. Once created, the record is automatically pushed to the assigned agent.

While the metadata for AgentWork indicates support for upsert() and update(), these calls aren’t used with AgentWork because none of its fields can be updated.

Apex triggers are supported with AgentWork.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

AgentWorkOwnerSharingRule
  Sharing rules are available for the object.

AgentWorkShare
  Sharing is available for the object.

AgentWorkSkill

Represents a skill used to route a work assignment to an agent. AgentWorkSkill is used for reporting and represents the result of a routing decision. This object is available in API version 42.0 and later.

Supported Calls

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

### Field Details

**Properties**
Filter, Group, Nillable, Sort

**Description**
Specifies the namespace of the application, if installed with a managed package.

### Status

**Type**
picklist

**Properties**
Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**
Status of the AI application. Possible values are:

- Disabled
- Enabled
- Migrated

### Type

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The type of application. Possible values are:

- PredictionBuilder

---

### AIApplicationConfig

Additional prediction information related to an AI application. This object is available in API version 50.0 and later.

### Supported Calls

delete(), describeSObjects(), query(), retrieve()

### AllInsightAction

Represents an Einstein prediction insight action. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Reply Recommendations, makes a prediction. An insight is represented by a root AlRecordInsight and the following child objects: AllInsightAction, AllInsightFeedback, AllInsightReason, and AllInsightValue.

AllInsightAction is a one-to-many child of AlRecordInsight. AllInsightAction contains information about predicted actions for this particular insight. AllInsightAction has one or more AllInsightValue children which contain predicted values for the action. For example, an AllInsightAction could represent a quick action, and have a child AllInsightValue with the recommended value used by the quick action.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

### Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
### Field Details

**Description**

The name of the AIInsightAction.

**Type**

picklist

**Properties**

Filter, Group, Restricted picklist, Sort

**Description**

The type of action. Possible values are:

- InvocableAction—Invocable Action
- Macro—Macro
- QuickAction—Quick action.
- StandardAction—Standard Action. An example standard action would be to update a record.

### Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren’t run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can’t be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

### AllInsightFeedback

Represents an Einstein prediction insight feedback. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Reply Recommendations, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AllInsightFeedback is a one-to-many child of AIRecordInsight. AllInsightFeedback contains information about explicit and implicit feedback collected from users for a particular insight.
**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

**Fields**

</tbody>
</table>
Usage
Salesforce creates AIInsightFeedback records based on user responses to predictions after the prediction has been created. User feedback, such as a thumbs up/down response or accepting a recommended value, results in the creation of a feedback record in which the feedback type is explicit. An implicit feedback record is created when Einstein makes a recommendation but the field is updated in another way, for example, by a process. Once the AIInsightFeedback record has been created, it’s immutable.

Custom fields can’t be added to Einstein insight objects.

AllInsightReason

Represents an Einstein prediction insight reason. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Reply Recommendations, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AllInsightAction, AllInsightFeedback, AllInsightReason, and AllInsightValue.

AllInsightReason is a one-to-many child of AllInsightValue. AllInsightReason contains details about how Einstein predicted an insight value.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

### Field Details

**Properties**
- Filter, Group, Nillable, Sort

**Description**
A number value used to organize the phrases in the model’s insights message in the Einstein Key Accounts Identification (Beta) feature.

### Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AIInsightAction, AIInsightReason, and AIInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren’t run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can’t be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

### AllInsightValue

Represents an Einstein prediction insight value. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Reply Recommendations, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AllInsightValue is a one-to-many child of AIRecordInsight. AllInsightValue represents a predicted value of a predicted insight.

### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
Special Access Rules
Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

**Usage**

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AllInsightAction, AllInsightReason, and AllInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren’t run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can’t be added to Einstein insight objects.
Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

**AIRecordInsight**

Represents an Einstein prediction insight. This object is available in API version 47.0 and later.

An Einstein insight is created every time an Einstein feature, such as Prediction Builder or Reply Recommendations, makes a prediction. An insight is represented by a root AIRecordInsight and the following child objects: AIInsightAction, AIInsightFeedback, AIInsightReason, and AIInsightValue.

AIRecordInsight contains information on the Einstein prediction, the AI prediction field where results were written to, and other details such as the type of prediction.

**Supported Calls**

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

**Special Access Rules**

Prediction insight objects are only available in orgs that have Einstein features, such as Prediction Builder or Case Classification, enabled.

### Field Details

**Properties**
- Filter, Group, Nillable, Restricted picklist, Sort

**Description**
The status of this insight. Possible values are:
- Defunct — The insight has been consumed by the Einstein feature that owns the prediction. For example, Case Classification marks an insight as defunct if a predicted recommendation was presented to a user and the user either accepted or ignored the recommendation. This behavior ensures that the same recommendation isn't presented multiple times to the user.
- New — The insight hasn't been consumed by the Einstein feature.

### Field Details

**Description**

The type of insight. Possible values are:

- **Action**—An insight that indicates a suggested action, such as sending an email.
- **Lookup**—An insight that indicates a related value not directly related to the target object and field.
- **MultiValue**—An insight with multiple values, such as a multi-class classification.
- **SimilarRecord**—An insight that indicates similar or duplicate records.
- **SingleValue**—A single value insight, such as a regression number or a score.

**ValidUntil**

- **Type** dateTime
- **Properties** Filter, Nillable, Sort

**Description**

The day and time this insight is valid until. After this day and time, the insight might no longer be valid due to new prediction results from new or changed data. If this field is null, this insight never expires.

### Usage

When an Einstein feature makes a prediction and saves the results, the following events happen in a single atomic operation:

- An AIRecordInsight record is created and populated with information about the prediction insight. AllInsightAction, AllInsightReason, and AllInsightValue records are also created and made children of the AIRecordInsight record.
- If the Einstein feature uses AI prediction fields, prediction result values are written to the target AI prediction field.
- An AIPredictionEvent platform event is created, and any subscriber to AIPredictionEvent is notified.

When Einstein writes prediction results back to AI prediction fields, record save custom logic, such as Apex triggers, workflow rules, and assignment rules, aren’t run. To add custom logic based on Einstein prediction results, use a platform event subscriber, such as Process Builder, to get notifications for AIPredictionEvents that contain references to Einstein insight objects.

Custom fields can’t be added to Einstein insight objects.

Einstein insights contain information about target fields and predicted value. Be aware that your org may have created Einstein predictions that are associated with target fields with field-level security restrictions. Use data access features of Salesforce, such as user profiles and permission sets, if you need to control how users access Einstein insights records.

### Considerations for Case Classification

To generate reports about how well Einstein Case Classification predictions are working, use the root AIRecordInsight object and its child objects, AllInsightFeedback and AllInsightValue. For example, you can determine how many cases received predictions or how often agents accepted or rejected them.

- To determine how many cases received recommendations, the AIRecordInsight table identifies the case and contains a row for each field and each recommendation. In AIRecordInsight, the TargetId field contains the case ID. The PredictionField indicates which case field is being predicted. Each field value recommendation is contained in a separate AllInsightValue object with AIRecordInsight as
the parent. For a picklist field, Einstein creates AIInsightValue objects with up to 10 field value recommendations. However, just the top three predictions appear to agents in the Einstein Field Recommendations component.

- To learn whether agents acted on any of the top three predictions, use the AIInsightFeedback object. When an agent updates fields after viewing Einstein’s recommendations, or when Einstein applies a recommendation automatically, the object’s AIInsightFeedbackType field contains Explicit. If the agent updates fields without viewing the predictions, such as on the case details tab, AIInsightFeedbackType is set to Implicit. When the agent applies the recommended value, the object’s AiFeedback field is set to Positive; if the agent applies a different value, AiFeedback is Negative.

### AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define an allowlist to restrict the email domains allowed in a user’s Email field. This object is available in API version 29.0 and later.

#### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

#### Special Access Rules

You must have the “Manage Internal Users” user permission to use this object.

⚠️ **Note:** If you don’t see this object, contact your Salesforce representative to enable it.

#### Fields

<table>

### AlternativePaymentMethod

Represents a payment method that doesn’t have a defined Commerce Orders entity such as CardPaymentMethod on page 673 or DigitalWallet on page 1168. Common examples of alternative payment methods for Commerce Orders include CashOnDeliver, Klarna, and Direct Debit. AlternativePaymentMethod functions the same as any other type of payment method for processing transactions in the payment gateway. This object is available in API version 51.0 and later.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
To access Commerce Payments entities, your org must have a Salesforce Order Management license. Commerce Payments entities are available only in Lightning Experience.

**ProcessingMode**

- **Description**
  Shows whether the payment method was created in Salesforce or externally. Required.
  Possible values are:
  - **External**: Select this value if you create the alternative payment method record through any method other than Commerce Payments Connect API.
  - **Salesforce**: Select this value if you use Commerce Payments Connect API to create the alternative payment method record.
The state of the payment method. Required.
Possible values are:
- **Active**: The Payments Platform can use the alternative payment method to make payments. Active alternative payment methods can't be deleted.
- **Canceled**: The Payments Platform can no longer use the payment method to make payments. A value of Canceled can't be changed back to Active or Inactive.
- **InActive**: The Payment Platform currently can't use the payment method to make payments. Admins can change this value to Active or Canceled when needed.

**AnalyticsLicensedAsset**

Represents a licensed Analytics asset. In this context, Analytics is Tableau CRM or Sonic. Available in API version 52.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **ConsumerNamespace** | **Type**
|                | picklist |
| **Properties**  | Create, Filter, Group, Nillable, Restricted picklist, Sort, Update |
| **Description** | The consumer namespace for the asset. The possible values are: |
|                | • **Industries** |
| **LicenseType** | **Type**
|                | picklist |
| **Properties**  | Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update |
| **Description** | The license type for the asset. The possible values are: |
|                | • **EinsteinAnalytics** |
|                | • **Sonic** |
|                | The default value is EinsteinAnalytics.
Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExpirationDate</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>dateTime</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**SendEmails**

| Type | boolean |
| Properties | Defaulted on create, Filter, Group, Sort |
| Description | Set to `true` to email all group members when an announcement is posted to the group. The default is `false`. This requires the user to have the “Send announcement on email” permission. This field is available in API version 36.0 and later. |

**Note:** This field is currently available to select customers through a pilot program. To be nominated to join this pilot program, contact Salesforce. Additional terms and conditions may apply to participate in the pilot program. Please note that pilot programs are subject to change, and as such, we cannot guarantee acceptance into this pilot program or a particular time frame in which this feature can be enabled. Any unreleased services or features referenced in this document, press releases, or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

---

**Usage**

Group owners, managers, and users with the “Modify All Data” permission can use the Announcement object to create, edit, and delete group announcements. Creating a group announcement is a three-step process.

1. Use the FeedItem object to create a text post with the announcement’s content. Use the CollaborationGroup record you want to post the announcement to as the parent of this feed item.
2. Next, use the feed item ID and an expiration date to create the announcement record.
3. Finally, update the `AnnouncementId` field in the CollaborationGroup record with the ID of the announcement you created.
To delete the group announcement, simply delete the \texttt{AnnouncementId} value in the CollaborationGroup record. To restore a group announcement, update the \texttt{AnnouncementId} field for a group with the announcement’s ID. The expiration date for the announcement should be in the future and the feed item used to create the announcement should be parented by the same group.

**ApexClass**

Represents an Apex class.

Note: Although Apex classes and triggers have the \texttt{Create} and \texttt{Update} field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

**Supported Calls**

\texttt{create()}, \texttt{delete()}, \texttt{describeSObjects()}, \texttt{getDeleted()}, \texttt{getUpdated()}, \texttt{query()}, \texttt{retrieve()}, \texttt{search()}, \texttt{update()}, \texttt{upsert}()

</tbody>
</table>
|                     | **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values.  
  - In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.  
  - In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |
## Status

**Type**  
picklist

**Properties**  
Create, Filter, Group, Restricted picklist, Sort, Update

**Description**  
The current status of the Apex class. The following string values are valid:

- **Active**—The class is active.
- **Deleted**—The class is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated.
- **Inactive**—This option is unused and is only supported for ApexTrigger. For more information, see the Metadata API Developer Guide.

SEE ALSO:
- ApexTrigger
  - Developer Guide: Apex Developer Guide

## ApexComponent

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`. For information, see the Visualforce Developers Guide.

### Supported Calls

`create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()`

### Fields

<table>
<thead>
<tr>

<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <strong>namespacePrefix__componentName</strong> notation.</td>
</tr>
</tbody>
</table>

The namespace prefix can have one of the following values:

- In Developer Edition orgs, **NamespacePrefix** is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, **NamespacePrefix** is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
Usage

Use custom components to encapsulate a common design pattern and then reuse that pattern several times in one or more Visualforce pages. All users who can view Visualforce pages can view custom components, but the “Customize Application” permission is required to create or update custom components.

ApexLog

Represents a debug log containing information about a transaction, including information about Apex, Visualforce, and workflow and validation rules. This object is available in API version 19.0 and later.

Supported Calls

delete(), describeSObjects(), query(), retrieve()

ApexPageInfo

Represents metadata about a single Visualforce page. This object is available in API version 48.0 and later.

Supported Calls

describeSObjects(), query()

Special Access Rules

As of Summer '20 and later, this object can only be accessed by users who can view a particular Visualforce page, and users with the View Setup and Configuration permission.

Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Developer name of the Visualforce page.</td>
</tr>
<tr>
<td>NameSpacePrefix</td>
<td>Type: string</td>
</tr>
<tr>
<td></td>
<td>Properties: Filter, Nillable, Sort</td>
</tr>
</tbody>
</table>

**Description**

The namespace prefix associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values:

- In Developer Edition orgs, the namespace prefix is set to the namespace prefix of the org for all objects that support it.

  **Note:** If an object is in an installed managed package, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

- In non-Developer Edition orgs, `NamespacePrefix` is only set for objects that are part of an installed managed package. Objects outside of an installed managed package do not have a namespace prefix.

**Usage**

Use `ApexPageInfo` to query limited metadata about Visualforce pages. Some of this metadata corresponds to settings for a Visualforce page available in Visualforce Pages. To access Visualforce Pages, from `Setup`, in the `Quick Find` box, enter `Custom Code`. Then, select Visualforce Pages. Other values are only available via API. Use `ApexPageInfo` in Visualforce pages to add custom content that extends the base Salesforce application functionality.

Users can only query `ApexPageInfo` records if they can display the associated Visualforce page, or if they have the View Setup & Configuration permission. Allow users to view Visualforce pages by modifying their user profile or assigning permission sets.

**ApexTestQueueItem**

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

This object is available in API version 23.0 and later.

**Supported Calls**

- `create()`,
- `describeSObjects()`,
- `query()`,
- `retrieve()`,
- `update()`,
- `upsert()`
Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

Fields

<table>
<thead>
<tr>

<td></td>
<td></td>
<td>• Failed</td>
</tr>
<tr>
<td>TestRunResultId</td>
<td></td>
<td>reference</td>
<td>Filter, Group, Nillable, Sort</td>
<td></td>
</tr>
</tbody>
</table>

### Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the `ApexTestQueueItem` object and set its `Status` field to `Aborted`. 
If you insert multiple Apex test queue items in a single bulk operation, the queue items share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

**ApexTestResult**

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

| **Refers To**   | ApexTestQueueItem              |
| **RunTime**     | **Type** int                    |
Details

Field Name | Details
--- | ---
Properties | Create, Filter, Group, Nillable, Sort, Update
Description | The time it took the test method to run, in milliseconds.

StackTrace

Type | string
Properties | Create, Filter, Nillable, Sort, Update
Description | The Apex stack trace if the test failed; otherwise, null.

TestTimestamp

Type | dateTime
Properties | Create, Filter, Sort, Update
Description | The start time of the test method.

Usage

You can query the fields of the ApexTestResult record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single ApexTestResult record. For example, if an Apex test class contains six test methods, six ApexTestResult records are created. These records are in addition to the ApexTestQueueItem record that represents the Apex class.

Each ApexTestResult record has an associated ApexTestResultLimits on page 421 record, which captures the Apex limits used during execution of the test method.

ApexTestResultLimits

Captures the Apex limits used for a particular test method execution. An instance of this object is associated with each ApexTestResult record. This object is available in API version 37.0 and later.

Supported Calls

create(), delete(), describesSObjects(), query(), retrieve(), update(), upsert()
Special Access Rules

The enableApexTestReqViewSetup field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to true, users must have the View Setup and Configuration permission to access this object.

<td><strong>Type</strong> int</td>
</tr>
</tbody>
</table>
### Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren’t called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

### ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

The `enableApexTestReqViewSetup` field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

The enableApexTestReqViewSetup field on the ApexSettings metadata type controls the activation of the critical update “Require View Setup permission to access Apex test data”. In API version 49.0 and later, when the field is set to true, users must have the View Setup and Configuration permission to access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TestSuiteName</td>
<td>The name of the Apex test suite. This label appears in the user interface.</td>
</tr>
<tr>
<td></td>
<td>This value is case-sensitive and must be unique.</td>
</tr>
</tbody>
</table>
Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren’t editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

SEE ALSO:

TestSuiteMembership

ApexTrigger

Represents an Apex trigger.

Note: Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Ant Migration Tool, the Salesforce user interface, or the Salesforce Extensions for Visual Studio Code to create or update Apex classes or triggers.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

</tr>
</tbody>
</table>
### ApexTrigger

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **NamespacePrefix**          | • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.  
  • In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |

</tbody>
</table>
| **Description**              | The current status of the Apex trigger. The following string values are valid:  
  • Active—The trigger is active.  
  • Inactive—The trigger is inactive, but not deleted.  
  • Deleted—The trigger is marked for deletion. This is useful for managed packages, because it allows a class to be deleted when a managed package is updated.  
  **Note:** Inactive is not valid for ApexClass. For more information, see the Metadata API Developer Guide. |

**AppAnalyticsQueryRequest**

Represents a request for AppExchange App Analytics data.

AppExchange App Analytics is available for packages that passed security review and are registered to a License Management App (LMA). Usage data is provided as package usage logs, as month-based package usage summaries, or as point-in-time subscriber snapshots. Usage logs, monthly usage summaries, and subscriber snapshots are downloadable comma-separated value (.csv) files. For information on how to optimize your use of App Analytics, see AppExchange App Analytics Best Practices.

⚠️ **Note:** Usage data from Government Cloud and Government Cloud Plus orgs isn’t available in App Analytics.

### Supported Calls

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

### Special Access Rules

See Request AppExchange App Analytics in the ISVforce Guide.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AvailableSince</td>
<td><strong>Type</strong> dateTime&lt;br&gt;<strong>Properties</strong> Create, Filter, Nillable, Sort&lt;br&gt;<strong>Description</strong> An optional value used to limit the requested results file to data newly arrived in the data lake after the specified date and time. This field is always transferred in the Coordinated Universal Time (UTC) time zone. Use the AvailableSince field as part of your catch-up query strategy.</td>
</tr>
</tbody>
</table>
AvailableSince must be later than StartTime and EndTime, if specified. AvailableSince must be earlier than now. A query must include StartTime, AvailableSince, or both.

For example, to schedule a catch-up query on 2021-04-03T18:00:00Z for this date range:

- StartTime=2021-03-29T00:00:00Z
- EndTime=2021-03-30T00:00:00Z

Valid AvailableSince values range from 2021-03-30T00:00:00Z to 2021-04-03T18:00:00Z.

For more information on AvailableSince and catch-up queries, see AppExchange App Analytics Best Practices.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AvailableSince</td>
<td>AvailableSince must be later than StartTime and EndTime, if specified. AvailableSince must be earlier than now. A query must include StartTime, AvailableSince, or both.</td>
</tr>
</tbody>
</table>

**DataType**

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Group, Restricted picklist, Sort

**Description**

The type of usage data being requested. Valid values include:

- PackageUsageLog
- PackageUsageSummary
- SubscriberSnapshot

**Note:** In Summer ’20, we changed the enum names from CustomObjectUsageSummary and CustomObjectUsageLog to PackageUsageSummary and PackageUsageLog.

If you have integrations that use CustomObjectUsageSummary or CustomObjectUsageLog, they work only with v47 and earlier. After you upgrade to v48, you must update the DataType to PackageUsageSummary and PackageUsageLog.

**DownloadExpirationTime**

<table>
<thead>
<tr>
<th>Type</th>
<th>dateTime</th>
</tr>
</thead>
</table>

**Properties**

Filter, Nillable, Sort

**Description**

The time when the download URL is no longer valid. The expiration time is 60 minutes after the query is completed.

**DownloadSize**

<table>
<thead>
<tr>
<th>Type</th>
<th>long</th>
</tr>
</thead>
</table>
### Field Name: FileCompression

- **Type:** picklist
- **Properties:** Create, Filter, Group, Nillable, Restricted picklist, Sort
- **Description:**
  
  The file compression format of your requested results file. `FileCompression` and `FileType` must align. If `FileType` is `csv`, `FileCompression` defaults to `none` and can be `none` or `gzip`. If `FileType` is `parquet`, `FileCompression` is `snappy` by default and can be `snappy`, `gzip`, or `none`.
  
  Valid values include:

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>snappy</td>
</tr>
<tr>
<td>gzip</td>
</tr>
<tr>
<td>none</td>
</tr>
</tbody>
</table>

### Field Name: ErrorMessage

- **Type:** string
- **Properties:** Filter, Group, Nillable, Sort
- **Description:**
  
  Stores error message text that results from this query.

### Field Name: EndTime

- **Type:** dateTime
- **Properties:** Create, Filter, Nillable, Sort
- **Description:**
  
  Enter the end time in format `yyyy-MM-ddTHH:mm:ss`.
  
  **Example:**
  
  2019-04-15T12:00:00

### Field Name: DownloadUrl

- **Type:** textarea
- **Properties:** Nillable
- **Description:**
  
  URL that the user can download data from. Populated after the request is completed. This URL expires and is removed when the expiration time is reached.

### Field Name: Properties

- **Filter, Group, Nillable, Sort**

### Field Name: Description

- **Properties:**
  
  The size of the AppExchange App Analytics results file available for download, in bytes.
<table>

</tr>
<tr>
<td></td>
<td>• Pending</td>
</tr>
</tbody>
</table>
Usage

To request usage data, log in to the License Management Org (LMO) that your package is registered to, and initiate the API request from the LMO. In a 24-hour period, you can download a maximum 20 GB of AppExchange App Analytics data.

See Download Package Usage Logs, Package Usage Summaries, and Subscriber Snapshots in the ISVforce Guide.

If requests to view package usage log or subscriber snapshot data are inactive for 90 days, we reserve the right to stop collecting this data. To resume data collection, log a support case in the Salesforce Partner Community. For product, specify Partner Programs & Benefits. For topic, specify ISV Technology Request.

AppDefinition

Represents the metadata of an app and its navigation items. Metadata is returned only for apps that the current user can access. This object is available in API version 43.0 and later.

Supported Calls

describeSObjects(), query()

Fields

<table>

The ID of the utility bar associated with this application.

---

**AppExtension**

Repsents a connection between the Field Service mobile app and another app, typically for passing record data to the Salesforce mobile app or other apps. This object is available in API version 41.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Field Service must be enabled.

</tbody>
</table>
|             | Description: The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values:  
  - In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.  
  - In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |
| **SortOrder** | Type: int |
|             | Properties: Filter, Group, Sort |
|             | Description: The index value that controls where this item appears in the menu. For example, a menu item with a sort order of 5 appears between items with sort order values of 3 and 9. |

### AppMenuItem

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>For a connected app, the location users are directed to after they’ve authenticated. Otherwise, the application’s default start page.</td>
</tr>
</tbody>
</table>

**Type**

- **Type**
  - picklist

**Properties**

- Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The type of application represented by this item. The types are:

- ConnectedApplication
- Network
- ServiceProvider
- TabSet

**UserSortOrder**

- **Type**
  - int

**Properties**

- Filter, Group, Nillable, Sort

**Description**

The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 appears between items with sort order values of 3 and 9.

This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:

```sql
SELECT ApplicationId, SortOrder, UserSortOrder FROM AppMenuItem
order by userSortOrder NULLS LAST, sortOrder NULLS LAST
```

### Usage

Use this read-only object to view an entry in the Lightning Platform app menu or the App Launcher. You can create a SOQL query to retrieve all items, even items the user does not see from the user interface.

There are many ways you can use AppMenuItem. Here are some examples:

- Build your own App Launcher or app menu in Salesforce. Create a custom page showing all the apps you have access to and that lets you run them using single sign-on.
- Build your own App Launcher or app menu on a tablet or mobile app. You can have your own app for launching applications on various mobile devices.
• Build an app launcher into your company's intranet. There’s no need to have it run on Salesforce because Salesforce APIs let you integrate with Salesforce programmatically and build an app launcher.

Tip: To get metadata information about apps and their tabs, use the Apex Schema.describeTabs() method, REST API /vXX.X/tabs/ resource, or SOAP API describeTabs() call.

AppointmentAssignmentPolicy

Stores information about resource assignment rules. This object is available in API version 52.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

**Properties**  
Create, Defaulted on create, Filter, Group, Sort, Update

**Description**  
Indicates whether this appointment scheduling policy allows only required service resources who have certain skills and skill levels to be assigned to appointments.

Indicates whether this appointment scheduling policy prevents users from scheduling appointments outside of an account's visiting hours.

Indicates whether this appointment scheduling policy allows only service resources who are primary members of a service territory to be assigned to appointments.

Indicates whether this appointment scheduling policy allows service resources who are secondary members of a service territory to be assigned to appointments.

**AppointmentTopicTimeSlot**

Junction object that is a lookup to a work type or a work type group for a time slot. This object is available in API version 52.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

  - Change events are available for the object.
Approval

Represents an approval request for a Contract.

Note: This object is read-only and is specific to approvals on the Contract object. It isn't equal to or involved in the approval processes represented by the ProcessInstance, which is more powerful.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

Customer Portal users can't access this object.

</tbody>
</table>
### Field: OwnerId

**Type**: reference  
**Properties**: Filter, Group, Sort  
**Description**: Required. ID of the User being asked to approve or reject the approval request. Must be a valid User ID. Required.

### Field: ParentId

**Type**: reference  
**Properties**: Filter, Group, Sort  
**Description**: Required. ID of the Contract associated with this approval request. Must be a valid contract ID.

### Field: RequestComment

**Type**: string  
**Properties**: Filter, Nullable, Sort  
**Description**: Text entered by the User who created the approval request. Optional. This field can't be updated after the Approval has been created. Limit: 4,000 characters.

### Field: Status

**Type**: picklist  
**Properties**: Filter, Group, Restricted picklist, Sort  
**Description**: Required. Status of this approval request. One of the following picklist values:  
- Pending—Specified only when the Approval request is created (create() call)  
- Approved—Specified only when the Approval request is approved (update() call)  
- Rejected—Specified when the Approval request is rejected (update() call) or when it is created (create() call) and immediately rejected for archival/historical purposes.

### Usage

This object allows client applications to programmatically handle approval requests for a Contract. Initially, to request a Contract approval, a client application might create a new Approval request record, specifying the ParentId, OwnerId (user approving or rejecting the request), Status (Pending), and (optionally) RequestComment fields. Note that when a client application creates the first
approval request, if the value of the Contract Status field is Draft, then the Approval Status for this record is automatically changed to In Approval Process (see ContractStatus for more information).

A client application might subsequently update an existing Approval request, specifying the Status (Approved or Rejected) and an ApproveComment (required); the RequestComment field can’t be updated. Updating an Approval record (either to approve or reject) requires the client application to be logged in with “Approve Contract” permission. To update an Approval request, its Status must be Pending—a client application can’t update an Approval that has already been Approved or Rejected. To re-submit an approval request for a given Contract, a client application must create a new, separate Approval record and repeat the approval process.

Once a Contract has been approved (not rejected), the Contract LastApprovedDate field is automatically updated, however the Contract Status field isn’t updated, it keeps the value InApproval.

An approved Contract must be activated explicitly. Client applications can activate a Contract by setting the value in its Status field to Activated, or a User can activate a Contract via the Salesforce user interface.

A Contract can have multiple approval requests in various states (Pending, Approved, and Rejected). In addition, one User can have multiple approval requests associated with the same Contract.

Client applications can’t explicitly delete Approval records. Approval records are deleted automatically if the parent Contract is deleted.

**Article Type__DataCategorySelection**

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later. This object can be used to associate an article with data categories from a data category group or to query the category selections for an article.

The object name is variable and has a syntax of **Article Type__DataCategorySelection**, where **Article Type** is the Object Name for the article type associated with the article. For example, **Offer__DataCategorySelection** represents the association between the **Offer** article type and its data categories. Every article is associated with an article type.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `getDeleted()`, `retrieve()`

**Special Access Rules**

Knowledge must be enabled in your org. Not available in Lightning Knowledge. Users can only access, create or delete data category selection visible to their role, permission set, or profile. If a user has partial visibility on an article’s categorization, only the visible categories are returned.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataCategoryGroupName</td>
<td><strong>Type</strong> DataCategoryGroupReference</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create</td>

<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> ID of the article associated with the data category selection.</td>
</tr>
</tbody>
</table>
Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use the `Article Type__DataCategorySelection` object to query and manage article categorization in your org. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

⚠️ **Note:** When using `Article Type__DataCategorySelection` to classify an article, you can’t select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

Answers zones use `QuestionDataCategorySelection` to classify questions.

SOQL Sample

The following SOQL query returns the data category selections used to classify the article whose ID is ka0D000000005ApIAI.

```sql
SELECT Id, DataCategoryName, ParentId
FROM Offer__DataCategorySelection
WHERE ParentId = 'ka0D000000005ApIAI'
```

This clause only returns category unique names. To retrieve category labels use the following clause:

```sql
SELECT Id, toLabel(DataCategoryName), ParentId
FROM Offer__DataCategorySelection
WHERE ParentId = 'ka0D000000005ApIAI'
```

⚠️ **Tip:** You can also use relationship queries to retrieve categorizations from an article type.

**AssetLevel**

- **Type**: int
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: The asset’s position in an asset hierarchy. If the asset has no parent or child assets, its level is 1. Assets that belong to a hierarchy have a level of 1 for the root asset, 2 for the child assets of the root asset, 3 for their children, and so forth.

**Note**: On assets created before the introduction of this field, the asset level defaults to –1. After the asset record is updated, the asset level is calculated and automatically updated.

**AssetProvidedBy**

- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The account that provided the asset, typically a manufacturer. This is a relationship field.

**Relationship Name**

- AssetProvidedBy

**Relationship Type**

- Lookup

**Refers To**

- Account

**AssetServicedById**

- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update

</table>
Usage

Use this object to track products sold to customers. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of up to 10,000 assets.

For example, your organization might want to renew and up-sell opportunities on products sold in the past. Similarly, your organization might want to track competitive products that exist in a customer environment that could potentially be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the PurchaseDate or SerialNumber could indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the UsageEndDate might indicate when the asset was removed from service or when a license or warranty expires.

If an application creates an Asset record, it must specify a Name and either an AccountId, ContactId, or both.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.
**AssetChangeEvent (API version 44.0)**  
Change events are available for the object.

**AssetFeed**  
Feed tracking is available for the object.

**AssetHistory**  
History is available for tracked fields of the object.

**AssetOwnerSharingRule**  
Sharing rules are available for the object.

**AssetShare**  
Sharing is available for the object.

Object Basics

## AssetAction

Represents a change made to a lifecycle-managed asset. The fields can’t be edited. This object is available in API version 50.0 and later.

### Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()

### Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ActionDate</strong></td>
<td><strong>Type</strong> dateTime</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The date when an asset action change is recorded. This date can differ from the start date of the related asset state period. For example, suppose that a customer cancels a subscription in June, and the subscription expires in October. The date the customer cancels the subscription (June) is the action date of the asset action. The cancellation's effective date (October) is the start date of the asset state period.</td>

### Standard Objects

#### AssetAction

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
|                        | - Transfers  
|                        | - Upsells   |

#### EstimatedTaxChange

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
The rollup of estimated tax from all asset action sources. This field is populated by the system.
Label is **Change in Estimated Tax**.
This field is a calculated field.

#### MrrChange

**Type**
currency

**Properties**
Filter, Sort

**Description**
The delta in the asset’s monthly recurring revenue resulting from an asset action. For example, suppose that the MRR during an asset state period is $200 and the next asset action adds $100. Then this field’s value is $100. Label is **Change in Monthly Recurring Revenue**.

#### ProductAmountChange

**Type**
currency

**Properties**
Filter, Nillable, Sort

**Description**
The rollup of product amount from all asset action sources. This field is populated by the system. Label is **Change in Product Amount**.
This field is a calculated field.

#### QuantityChange

**Type**
double

**Properties**
Filter, Sort

**Description**
The delta in the asset quantity resulting from an asset action. For example, suppose that the asset quantity during an asset state period is 20 and the next asset action adds 10. Then this field’s value is 10. Label is **Change in Quantity**.

#### SubtotalChange

**Type**
currency

</tr>
</tbody>
</table>

---

### AssetActionSource

Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can’t be edited. This object is available in API version 50.0 and later.

#### Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()
**Special Access Rules**

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

</tbody>
</table>
AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>

</tbody>
</table>

**AssetOwnerSharingRule**

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.
Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

**AssetAccessLevel**

<table>
<thead>
<tr>

<tr>
<td><strong>Description</strong></td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name</td>
</tr>
</tbody>
</table>
in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the user interface.

**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| GroupId         | **Type** reference  
**Properties** Create, Filter, Group, Sort  
**Description** The ID representing the source group. Cases owned by users in the source group trigger the rule to give access. |
| Name            | **Type** string  
**Properties** Create, Filter, Group, Sort, Update  
**Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface. |
| UserOrGroupId   | **Type** reference  
**Properties** Create, Filter, Group, Sort  
**Description** The ID representing the target user or group. Target users or groups are given access. |

**Usage**

Use this object to manage the sharing rules for assets. General sharing uses this object.

**SEE ALSO:**

*Metadata API Developer Guide: SharingRules*

**AssetRelationship**

Represents a non-hierarchical relationship between assets due to replacement, upgrade, or other circumstances. Asset relationships appear in the Primary Assets and Related Assets related lists on asset records in the UI.
Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</tbody>
</table>
Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**AssetRelationshipFeed**
Feed tracking is available for the object.

**AssetRelationshipHistory**
History is available for tracked fields of the object.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| AssetAccessLevel | **Type**  
picklist  
**Properties**  
Filter, Group, Restricted picklist, Sort  
**Description**  
Level of access that the User or Group has to the Asset. The possible values are:  
- Read  
- Edit  
- All  This value is not valid for creating or deleting records.  
This field must be set to an access level that is higher than the organization’s default access level for cases. |
| AssetId | **Type**  
reference  
**Properties**  
Filter, Group, Sort |

</tr>
</tbody>
</table>
AssetStatePeriod

Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can’t be edited. This object is available in API version 50.0 and later.

Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>

<tbody>
<tr>
<td>Amount</td>
<td>This is a polymorphic relationship field.</td>
</tr>
</tbody>
</table>

**Relationship Name**
UserOrGroup

**Relationship Type**
Lookup

**Refers To**
Group, User

**Usage**

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.
<table>

DetailsField

Description
The total quantity of an asset during an asset state period.

StartDate

Type
dateTime

Properties
Filter, Sort

Description
The start date and time of an asset state period.

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The total quantity of an asset during an asset state period.</td>
</tr>
</tbody>
</table>
| StartDate        | Type
dateTime

Properties
Filter, Sort

Description
The start date and time of an asset state period.

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| ItemId           | Type
reference

Properties
Create, Filter

Description
ID of the tagged item.

Name

Type
string

Properties
Create, Filter

Description
Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.

TagDefinitionId

Type
reference
### Field Name

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td>Filter</td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>ID of the parent TagDefinition object that owns the tag.</td>
</tr>
</tbody>
</table>

### Type

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td>Create, Filter, Restricted picklist</td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Defines the visibility of a tag.</td>
</tr>
<tr>
<td>Valid values:</td>
</tr>
<tr>
<td>• Public—The tag can be viewed and manipulated by all users in an organization.</td>
</tr>
<tr>
<td>• Personal—The tag can be viewed or manipulated only by a user with a matching OwnerId.</td>
</tr>
</tbody>
</table>

### Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

### AssetTokenEvent

The documentation has moved to AssetTokenEvent in the Platform Events Developer Guide.

### AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

</thead>
</table>
| ServiceAppointmentId | **Type**  
reference  
**Properties**  
Create, Filter, Group, Sort  
**Description**  
The service appointment that the resource is assigned to.  
This is a relationship field.  
**Relationship Name**  
ServiceAppointment  
**Relationship Type**  
Lookup  
**Refers To**  
ServiceAppointment |
| ServiceCrewId    | **Type**  
reference  
**Properties**  
Create, Update, Filter, Group, Sort, Nillable  
**Description**  
The service crew that the resource is assigned to.  
**Note:** Since service resources can represent crews or individuals, appointments are typically assigned to crews in the following way:  
1. Create a service resource of the Crew type that represent the crew.  
2. Create an assigned resource on the service appointment and select the crew resource in the ServiceResourceId field.  
As an alternative, you can assign appointments to crew members separately. This lets you track each member's travel time and see a list of the crew members in the Assigned Resources related list. To take this approach, create an assigned resource for each crew member. List the crew member in the ServiceResourceId field and the crew they belong to in the ServiceCrewId field. |
| ServiceResourceId | **Type**  
reference  
**Properties**  
Create, Update, Filter, Group, Sort  
**Description**  
The resource who is assigned to the service appointment.  
This is a relationship field.  
**Relationship Name**  
ServiceResource |
Usage
You can assign multiple service resources to a service appointment. Service resources who are assigned to service appointments cannot be deactivated until they are removed from the appointments.

Associated Objects
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **AssignedResourceChangeEvent (API version 48.0)**
  - Change events are available for the object.
- **AssignedResourceFeed**
  - Feed tracking is available for the object.

AssignmentRule
Represents an assignment rule associated with a Case or Lead.

Supported Calls
describeSObjects(), query(), retrieve(), search()

Special Access Rules
- This object is read only. Assignment rules are created, configured, and deleted in the user interface.
- Customer Portal users can’t access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>boolean</td>
</tr>
<tr>
<td>Properties</td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Description</th>
<th>Indicates whether this assignment rule is active (true) or not (false).</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Name of this assignment rule.</td>
</tr>
<tr>
<td><strong>SobjectType</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Type of assignment rule—Case or Lead.</td>
</tr>
</tbody>
</table>

### Usage

Before creating or updating a new Case or Lead, a client application can query (by name) the AssignmentRule to obtain the ID of the assignment rule to use, and then assign that ID to the assignmentRuleId field of the AssignmentRuleHeader. The AssignmentRuleHeader can be set using either SOAP API or REST API.

Assignment rules can also be specified when creating or upserting Case or Lead objects via the Bulk API or the Bulk 2.0 API.

SEE ALSO:
- [Object Basics](#)

### AssociatedLocation

Represents a link between an account and a location in Field Service. You can associate multiple accounts with one location. For example, a shopping center location may have multiple customer accounts.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

### Special Access Rules

Field Service must be enabled.

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**AssociatedLocationHistory**

History is available for tracked fields of the object.
AsyncApexJob

AsyncApexJob represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`. Use this object to query Apex batch jobs in your organization.

Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

The `enableAsyncRequiresViewSetup` field on the `ApexSettings` metadata type controls the activation of the critical update “Require View Setup permission to enqueue async Apex Jobs”. In API version 49.0 and later, when the field is set to `true`, users must have the View Setup and Configuration permission to access this object.

• Processing |
### AsyncOperationLog

Represents an async operations log containing progress and status information about external synchronizations to the Omnichannel Inventory service. This object is available in API version 51.0 and later.

#### Supported Calls

del ete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete()

#### Special Access Rules

This object is only available in Omnichannel Inventory orgs.

#### Fields

<table>

### Usage

Use this object to list all ContentDocument objects attached to an object via a feed post.

To retrieve ContentDocument objects, issue a describe call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

### AttachedContentNote

This read-only object contains all ContentNote objects associated with an object. This object is available in API version 35.0 and later.

### Supported Calls

describeSObjects()  

### Special Access Rules

- Notes must be enabled.
- Chatter must be enabled.
### Fields

<table>

</tbody>
</table>
# Usage

Use this object to list all `ContentNote` objects attached to an object.

To retrieve `ContentNote` objects, issue a describe call on an object, which returns a query result for each note created or attached. You can’t directly query this object.

## Attachment

Represents a file that a User has uploaded and attached to a parent object.

### Supported Calls

- `create()`,
- `delete()`,
- `describeSObjects()`,
- `getDeleted()`,
- `getUpdated()`,
- `query()`,
- `retrieves()`,
- `search()`,
- `undelete()`,
- `update()`,
- `upsert()`

---

**Note:** If you are importing Attachment data and want to set the value for an audit field, such as CreatedDate, contact Salesforce. For example, for compliance reasons, you may prefer to set the CreatedDate to the date the record was originally created in your system, rather than the date it was imported into Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

### Usage

The API sends and receives the binary file attachment data encoded as a base64Binary data type. Before creating a record, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

The create call restricts these files to a maximum size of 25 MB. For a file attached to a Solution, the limit is 1.5 MB. The maximum email attachment size is 3 MB.

The API supports attachments on email in create, delete, or update calls. The query call does not return attachments parented by email, unless the user performing the query has the "Modify All Data" permission.

**Note:**
- Attachment records are not searched during text searches.
- When issued by an administrator, the query results include Attachment records from the Recycle Bin.
- When issued by a non-administrator, the queryAll() call results do not include Attachment records from the Recycle Bin.
Access to fields depends on the method being used:

- All of the fields are accessible using the describeSObjects() and query() calls. With the create() call, you can insert the Name, ParentId, Body, IsPrivate, and OwnerId fields.
- To modify existing records, the update() call gives you access to change the Name, Body, IsPrivate, and OwnerId fields.
- You can access all of the fields using a query() call. However, you can’t receive the Body field for multiple records in a single query() call. If your query returns the Body field, your client application must ensure that only one row with one Attachment is returned; otherwise, an error occurs. A more effective approach is to return IDs (but not Attachment records in the Body field) from a query() call and then pass them into retrieve() calls that return the Body field.
- For information about accessing the attachments of archived activities, see Archived Activities.

**Note**

**Audience**

Represents an audience that is defined by criteria and can be assigned and used for targeting in an Experience Cloud site. This object is available in API version 44.0 and later.

**Supported Calls**

delete(), describeSObjects(), query(), retrieve(), update()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AudienceName</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Name of the audience.</td>
</tr>
<tr>
<td>ContainerId</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the site or org that contains the audience. ContainerId is nillable in API versions 47.0 and earlier.</td>
</tr>
</tbody>
</table>
### Field: Description

**Type**
string

**Properties**
Filter, Group, Nillable, Sort, Update

**Description**
Description of the audience.

### Field: DeveloperName

**Type**
string

**Properties**
Filter, Group, Sort, Update

**Description**
The unique name of the audience in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated, but you can supply your own value if you create the record using the API.

**Note:** When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.

**Note:** Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

### Field: FormulaFilterType

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Formula filter for the criteria used to define the audience. Valid values are:

- **AllCriteriaMatch**—Matching all the conditions (AND).
- **AnyCriterionMatches**—Matching at least one condition (OR).
- **CustomLogicMatches**—Matching condition logic (AND and OR) and numbered criteria groups. This value is available in API version 45.0 and later.

### Field: Language

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Language of the audience. Valid values are:

- Chinese (Simplified): zh_CN
### AuraDefinition

Represents an Aura component definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

#### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

#### Special Access Rules

As of Summer ’20 and later, only your Salesforce org’s internal users can access this object.

|                          | - SVG — SVG graphic resource  
|                          | - MODULE — reserved for future use |
## AuraDefinitionBundle

Represents a Lightning Aura component definition bundle, such as a component or application bundle. A bundle contains a Lightning Aura component definition and all its related resources. This object is available in API version 32.0 and later.

### Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApiVersion</td>
<td><strong>Type</strong> double</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Sort, Update</td>
</tr>
</tbody>
</table>

---

**Usage**

For more information, see the [Lightning Aura Components Developer Guide](#).
## Field Name

### Details

#### Description
The API version for this bundle. Every bundle has an API version specified at creation.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>MasterLabel</strong></td>
<td>Master label for the Lightning bundle. This internal label doesn’t get translated.</td>
</tr>
</tbody>
</table>

---

### AuraDefinitionBundle

#### AuraDefinitionBundle

- Standard Objects

---
### NamespacePrefix

**Details**

- **Type**: string
- **Properties**: Filter, Group, Nullable, Sort

**Description**

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

---

**Usage**

For more information, see the [Lightning Aura Components Developer Guide](#).

---

**AuraDefinitionBundleInfo**

For internal use only.

---

**AuraDefinitionInfo**

For internal use only.

---

**AuthConfig**

Represents authentication options for an org with a My Domain configured, an Experience Cloud site, or a custom domain. This object is available in API version 32.0 and later.

The fields for this object control the options that display on the login page of an org configured with a My Domain, an Experience Cloud site, or custom domain.

- Logging in with a username and password
- Using SAML for single sign-on
- Authentication provider logins from a third-party service, such as Facebook or Twitter
Supported Calls

describeSObjects(), query(), retrieve()

Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AuthOptionsAuthProvider</td>

</tr>
</tbody>
</table>

**AuthConfigProviders**

Represents an authentication provider that’s configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

This object links the authentication configuration for an organization to the Auth. Provider through the `AuthOptionsAuthProvider` field of the AuthConfig object. The login page of a Community or My Domain can allow multiple SAML configurations and multiple
authentication providers. These configurations can be set to show up as buttons on the login page. Each configuration has an AuthConfigProvider object.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Special Access Rules**

You must have "View Setup and Configuration" permission to view the settings.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>

</tbody>
</table>
AuthorizationForm

Represents the specific version and effective dates of a form that is associated with consent, such as a privacy policy or terms and conditions. This object is available in API version 46.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Data Protection and Privacy is enabled.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **AuthorizationFormHistory**
  - History is available for tracked fields of the object.

- **AuthorizationFormOwnerSharingRule**
  - Sharing rules are available for the object.

- **AuthorizationFormShare**
  - Sharing is available for the object.

### AuthorizationFormConsent

Represents the date and way in which a user consented to an authorization form. This object is available in API version 46.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Special Access Rules

This object is available if Data Protection and Privacy is enabled.
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| AuthorizationFormTextId | **Type**  
reference  

**Properties**  
Create, Filter, Group, Sort, Update  

**Description**  
Required. The authorization form text that the Individual consented to.  
This is a relationship field.  

**Relationship Name**  
AuthorizationFormText  

**Relationship Type**  
Lookup  

**Refers To**  
AuthorizationFormText  

| ConsentCapturedDateDateTime | **Type**  
dateTime  

**Properties**  
Create, Filter, Nillable, Sort, Update  

**Description**  
Required. The date and time that consent was given.  

| ConsentCapturedSource | **Type**  
string  

**Properties**  
Create, Filter, Group, Nillable Sort, Update  

**Description**  
Required. The source through which consent was captured. For example, user@example.com, www.example.com.  

| ConsentCapturedSourceType | **Type**  
picklist  

**Properties**  
Create, Filter, Group, Nillable Restricted picklist, Sort, Update  

**Description**  
Required. The source type through which consent was captured. For example, phone, email, or website.  

| ConsentGiverId | **Type**  
reference

<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Status     | Type: picklist  
Properties: Create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
Description: The status of the authorization form. Possible values are:  
- Seen  
- Signed |
| PartyId    | Type: reference  
Properties: Create, Filter, Group, Sort  
Description: This field was removed in API version 47.0. Use ConsentGiverId instead. |

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **AuthorizationFormConsentChangeEvent (API version 47.0)**
  Change events are available for the object.
- **AuthorizationFormConsentHistory**
  History is available for tracked fields of the object.
- **AuthorizationFormConsentOwnerSharingRule**
  Sharing rules are available for the object.
- **AuthorizationFormConsentShare**
  Sharing is available for the object.

### AuthorizationFormDataUse

Represents the data use consented to in an authorization form. This object is available in API version 46.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retriever()`, `search()`, `undelete()`, `update()`, `upsert()`
### Special Access Rules

This object is available if Data Protection and Privacy is enabled.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**AuthorizationFormTextHistory**

History is available for tracked fields of the object.

### AuthProvider

Represents an authentication provider (auth provider). An auth provider lets users log in to your Salesforce org from an external service provider, such as Facebook, Google, or GitHub.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

Only users with Customize Application and Manage AuthProviders permissions can access this object.
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **AppleTeam** | **Type** string  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** Required when using Apple as a third-party authentication provider. A 10-character team ID, obtained from an Apple developer account. Available in API version 48.0 and later. |
| **AuthorizeUrl** | **Type** url  
**Properties** Create, Filter, Nillable, Sort, Update  
**Description** Required when creating an OpenID Connect authentication provider. The OAuth authorization endpoint URL. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. |
| **ConsumerKey** | **Type** string  
**Properties** Create, Filter, Nillable, Sort, Update  
**Description** The app's key that is registered at the third-party (external) authentication provider. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. |
| **ConsumerSecret** | **Type** string  
**Properties** Create, Nillable  
**Description** The consumer secret of the authentication provider that is registered at the third-party SSO provider. It's used by the consumer for identification to Salesforce. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. You can create your own consumer secret on create(). However, after you set it, you can't change the value. |
<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| CustomMetadataTypeRecord | Type: string  
  Properties: Create, Filter, Group, Nillable, Sort, Update  
  Description: Required when creating a custom authentication provider plug-in. The API name of the custom authentication provider. Available in API version 36.0 and later. |
| DefaultScopes        | Type: string  
  Properties: Create, Filter, Nillable, Sort, Update  
  Description: For OpenID Connect authentication providers, the scopes to send with the authorization request, if not specified when a flow starts. Available in API version 29.0 and later. In API version 33.0 and later, for Salesforce-managed auth providers, leave the field blank to let Salesforce supply and manage the value. |
| DeveloperName        | Type: string  
  Properties: Create, Filter, Group, Sort, Update  
  Description: Required. Used when referring to the authentication provider from a program. |
| EcKey                 | Type: string  
  Properties: Create, Filter, Group, Nillable, Sort, Update  
  Description: Required when using Apple as a third-party authentication provider. Available in API version 48.0 and later. |
| ErrorUrl              | Type: string  
  Properties: Create, Filter, Nillable, Sort, Update  
  Description: A custom error URL for the authentication provider to use to report errors. |
<table>
<thead>
<tr>
<th>Field Name</th>

AuthSession

The AuthSession object represents an individual user session in your organization. This object is available in versions 29.0 and later.

Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| CreatedDate | **Type**
|  | `dateTime`
|  | **Properties**
|  | Defaulted on `create`, `Filter`, `Sort`
|  | **Description**
|  | The date and time this session was created. This field is a standard system field. |
| Id | **Type**
|  | `id`
|  | **Properties**
|  | Defaulted on `create`, `Filter`, `Group`, `ID Lookup`, `Sort`
|  | **Description**
<p>|  | The current session’s ID. |</p>

Usage

The AuthSession object exposes session data and enables read and delete operations on that data. For example, use this object to create a report showing who is signed in to your organization. Or you can use this object to create a tool to delete a session, ending that user’s session. For a user, only their own sessions are available, while administrators can see all sessions.

You can’t change user sessions with this object. You can only read and delete them.

BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
<table>
<thead>

</tr>
<tr>
<td>RetryBackoff</td>
<td><strong>Type</strong> int</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Applies only if the operation has an error status. The first retry is attempted immediately. Each subsequent retry is increasingly delayed according to an exponential expression that’s multiplied by the RetryBackoff, in milliseconds. Specifically, the delay time is ((2^n - 1) \times R), where (n) is the RetryCount, and (R) is the RetryBackoff. The default value for RetryBackoff depends on the type of operation. For example, the RetryBackoff default for write operations on external objects is 1,000 milliseconds. For write operations, retries are attempted immediately, after 3 seconds, after 7 seconds, after 15 seconds, and so on.</td>

### BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into big objects using Bulk API. This is a big object, available in API version 37.0 and later.

Each instance of `BackgroundOperationResult` represents one error. The `Message` field stores the text of the error message. The `ParentID` field stores the:

- job ID of the query, in case of Async SOQL
- batch ID for the data import, in case of Bulk API

Bulk API validates data at the time of import, and generates an error message for the first occurrence of invalid data in any row of the data file. The validation performed depends on the type of data being imported.

- **Text**—The length of the input string must be less than or equal to the length of the corresponding text field in the target object.
- **Number**—The input data must be a number, whose scale and precision are compatible with the corresponding number field in the target object.
- **ID**—The input data must be a valid 15- or 18-character ID.
- **DateTime**—The input data must be a valid `dateTime` value, in the approved format.
- **Lookup**—The lookup value must be a valid 15- or 18-character ID.

---

**Usage**

The `BackgroundOperation` object lets you:

- Monitor the job status of asynchronous operations.
- View errors that are related to the asynchronous operations.
- Extract statistics for the asynchronous job queue.
## Supported Calls

describeSObjects(), query()

## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreatedById</td>
<td><strong>Type</strong>&lt;br&gt;ID&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Nillable&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;The user ID of the user initiating the Bulk API or Async SOQL request.</td>
</tr>
<tr>
<td>CreatedDate</td>
<td><strong>Type</strong>&lt;br&gt;dateTime&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Defaulted on create&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;The date and time at which the Bulk API or Async SOQL request was made.</td>
</tr>
<tr>
<td>Data</td>
<td><strong>Type</strong>&lt;br&gt;string&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Nillable&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;The data that generated the error message. The total length is limited to 2,000 characters, and each column can occupy a maximum of 50 characters. Any data exceeding those limits is truncated.</td>
</tr>
<tr>
<td>Id</td>
<td><strong>Type</strong>&lt;br&gt;ID&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Defaulted on create, idLookup&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;The ID of the error message.</td>
</tr>
<tr>
<td>Message</td>
<td><strong>Type</strong>&lt;br&gt;string&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Nillable&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;The text of the error message.</td>
</tr>
</tbody>
</table>
Usage

You can check for errors by querying the BackgroundOperationResult object. For example, this query returns details of all errors in a data file imported using Bulk API, whose batch ID is 751xx000000006OAAQ.

```sql
SELECT CreatedbyId, CreatedDate, Id, Message, MessageType, ParentId FROM BackgroundOperationResult WHERE ParentId = "751xx000000006OAAQ"
```

Note: You can only view errors resulting from Async SOQL or Bulk API requests that you initiated, unless you have the global permission to view all data.

BatchApexErrorEvent

The documentation has moved to BatchApexErrorEvent in the Platform Events Developer Guide.

Bookmark

Represents a link between opportunities that share common information.

This object is available to organizations with the Similar Opportunities feature enabled.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

|           | **Description**
           | Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is **Deleted**. |

### Usage

The Bookmark object works with the Opportunity object only.

Use this read-only object to query the bookmarks between opportunities in your organization. In the online application, users can search for opportunities that share attributes with their opportunity. The user can then bookmark the appropriate opportunities for future reference.
BrandTemplate

Letterhead for HTML EmailTemplate.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can't access this object.

Fields

<td><strong>Description</strong> The contents of the letterhead, in HTML, including any logos.</td>
</tr>
</tbody>
</table>
Usage

Use this object to brand EmailTemplate records with your letterhead. You can also set a brand template to active or inactive. For example, if you have five different marketing brands, you can maintain each different brand in one template, and assign to the appropriate EmailTemplate.

SEE ALSO:
   EmailTemplate

BriefcaseAssignment

Represents the assignment of a briefcase definition to selected users and user groups. This object is available in API version 50.0 and later.

Use this object to assign selected records for users and groups to view offline. Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

Supported Calls

create(), delete(), describesSObjects(), getDeleted(), getUpdated(), query(), retrieve()

<td>Required. ID of the user or group requiring access to the briefcase. Label is User or Group ID.</td>
</tr>
</tbody>
</table>

BriefcaseDefinition

Represents a briefcase definition. A briefcase makes selected records available for users to view when they're offline in the Salesforce Field Service mobile app for iOS and Android. This object is available in API version 50.0 and later.
Briefcase objects are available in orgs that have Briefcase Builder and Field Service enabled.

**Supported Calls**

describeSObjects(), query(), retrieve()

**Packaging Considerations**

An org can have up to 5 briefcases. Installed briefcases are counted against this limit. You can’t install a package that includes a briefcase if your org already has 5 briefcases. When a managed package includes a briefcase, the only changes allowed for the briefcase are activating or deactivating and assigning users or groups to the briefcase.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td><strong>Type</strong> textarea&lt;br&gt;<strong>Properties</strong> Filter, Nullable, Sort&lt;br&gt;<strong>Description</strong> Description of the briefcase definition. Limited to 1024 characters.</td>
</tr>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Filter, Group, Sort&lt;br&gt;<strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Limited to 80 characters. Label is <strong>Name</strong>. Note: Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</td>
</tr>
<tr>
<td>IsActive</td>
<td><strong>Type</strong> boolean&lt;br&gt;<strong>Properties</strong> Defaulted on create, Filter, Group, Sort&lt;br&gt;<strong>Description</strong> Indicates whether the briefcase is available for use (true) or not (false). Label is <strong>Active</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>

<td><strong>Type</strong> - picklist</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> - Filter, Group, Restricted picklist, Sort</td>
</tr>
</tbody>
</table>
|               | **Description** - The language for the briefcase. This field defaults to the user's language unless the org is multi-language enabled. Specifies the language of the labels returned. Possible values are:  
|               |   - Chinese (Simplified): zh_CN                                          |
|               |   - Chinese (Traditional): zh_TW                                         |
|               |   - Danish: da                                                           |
|               |   - Dutch: nl_NL                                                        |
|               |   - English: en_US                                                      |
|               |   - Finnish: fi                                                       |
|               |   - French: fr                                                         |
|               |   - German: de                                                         |
|               |   - Italian: it                                                        |
|               |   - Japanese: ja                                                       |
|               |   - Korean: ko                                                          |
|               |   - Norwegian: no                                                       |
|               |   - Portuguese (Brazil): pt_BR                                         |
|               |   - Russian: ru                                                        |
|               |   - Spanish: es                                                        |
|               |   - Spanish (Mexico): es_MX                                             |
|               |   - Spanish (Mexico) defaults to Spanish for customer-defined translations. |
|               |   - Swedish: sv                                                        |
|               |   - Thai: th. The Salesforce user interface is fully translated to Thai, but Help is in English. |
| **MasterLabel** | **Type** - string                                                      |
|               | **Properties** - Filter, Group, Sort                                      |
|               | **Description** - The master label for the briefcase. This internal label doesn't get translated. Limited to 80 characters. |
| **NamespacePrefix** | **Type** - string                                                        |
|               | **Properties** - Filter, Group, Nillable, Sort                           |
Details

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

## Usage

Use this object to query a briefcase or a list of briefcases with selected records and user assignments. For example:

```sql
SELECT Id, Description FROM BriefcaseDefinition
WHERE Id in (SELECT BriefcaseId FROM BriefcaseRule
WHERE TargetEntity='Account')
AND Id in (SELECT BriefcaseId FROM BriefcaseAssignment where
UserOrGroupId='00GR0000000VtwUMAS')
```

## BriefcaseRule

Represents a rule that specifies records for a briefcase definition. This object is available in API version 50.0 and later.

## Supported Calls

describeSObjects(), query(), retrieve()

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BriefcaseId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>

<td>Filter, Group, Sort</td>
</tr>
</tbody>
</table>
### Field | Details
---|---
**Description** | Required. ID of the briefcase definition. Label is **Briefcase Definition ID**.

**FilterLogic** | **Type**
---|---
| string

**Properties**
- Filter, Group, **Nillable**, **Sort**

**Description**
The filter logic for record selection, for example, 1 **AND** 2 where 1 and 2 correspond to filter 1 and filter 2. Filter logic operators include **AND** and **OR**. Limited to 255 characters. Label is **Filter Logic**.

**IsAscendingOrder** | **Type**
---|---
| boolean

**Properties**
- Defaulted on create, Filter, Group, **Sort**

**Description**
Required. Indicates whether the records should be sorted in ascending order. Label is **Ascending**.

**OrderBy** | **Type**
---|---
| picklist

**Properties**
- **Nillable**, **Restricted picklist**

**Description**
The field to order the records by, which determines how the records can be sorted. For example, **AccountName** or **CreatedBy**. Label is **Order By**.

**QueryScope** | **Type**
---|---
| picklist

**Properties**
- Filter, Group, **Restricted picklist**, **Sort**

**Description**
Required. A group of records to restrict the scope of this rule.

Possible values are:
- **assignedToMe**
- **everything**

The default value is **everything** (All Records). The value **assignedToMe** is available only for the **ServiceAppointment** object.

**RecordLimit** | **Type**
---|---
| int
DetailsField

**Properties**
Filter, Group, Nillable, Sort

**Description**
The record limit for the object. The recommended number for record limit is up to 500 records per object for optimal performance. The maximum number is 2000. Label is *Limit*.

**TargetEntity**

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The standard or custom object that the briefcase rule evaluates. Label is *Target Object*.

---

**BriefcaseRuleFilter**

Represents a filter criteria for a briefcase rule. This object is available in API version 50.0 and later.

**Supported Calls**
describeSObjects(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>BriefcaseRuleId</td>
<td>Type reference</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
### Field Details

- **e**—Equals
- **g**—Greater than
- **h**—Greater than or equal
- **i**—Like
- **l**—Less than
- **m**—Less than or equal
- **s**—Starts with

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FilterSeqNumber</td>
<td>int</td>
<td>Filter, Group, Sort</td>
<td>Required. The filter number. When you apply multiple filters, the filters are numbered sequentially, 1, 2, 3, and so on.</td>
</tr>
<tr>
<td>FilterValue</td>
<td>string</td>
<td>Filter, Group, Nullable, Sort</td>
<td>The value for the field and criteria. For example, true or false for a boolean field whose criteria or filter operator is Equals. Capitalization matters with date filter operators. Be sure to specify date literals in uppercase. Some valid date literals include TODAY, YESTERDAY and TOMORROW.</td>
</tr>
<tr>
<td>TargetEntityField</td>
<td>picklist</td>
<td>Restricted picklist</td>
<td>Required. The field to filter by. Compound fields and encrypted fields aren’t supported. Label is Field.</td>
</tr>
</tbody>
</table>

### Budget

Tracks an estimate of future revenue or expenses during a specific time period. This object is available in API version 53.0 and later.
# Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours. If business hours are associated with any Holiday records, then business hours and escalation rules associated with business hours are suspended during the dates and times specified as holidays.

Supported Calls

create(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view business hours via the API.

</tr>
</tbody>
</table>

**Usage**

Use this object to specify the business hours at which your support team operates. Escalation rules only run during the business hours with which they are associated. To set business hours to 24-hours a day, set the times from midnight to midnight (00:00:00 ~ 00:00:00) on each day.

By default, business hours are set from 12:00 AM to 12:00 AM in the default time zone specified in your organization’s profile.

Object Basics

**BusinessProcess**

Represents a business process.

**Supported Calls**

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

Customer Portal users can't access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Description</code></td>
<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Create, Filter, Group, Nillable, Sort, Update&lt;br&gt;<strong>Description</strong> Description of this business process. Limit: 255 characters.</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>IsActive</td>
<td><strong>Type</strong> boolean</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong>(Defaulted on create, Filter, Group, Sort, Update)</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Indicates whether this business process can be presented to users in the Salesforce user interface (true) or not (false) when creating a new record type or changing the business process of an existing record type.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> (Create, Filter, Group, idLookup, Sort, Update)</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Required. Name of this business process. Limit: 80 characters.</td>
</tr>
<tr>
<td>NamespacePrefix</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> (Filter, Group, Nillable, Sort)</td>
</tr>
</tbody>
</table>
|               | **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. The namespace prefix can have one of the following values.  
  - In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.  
  - In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |
| TableEnumOrId  | **Type** picklist                  |
|               | **Properties** (Create, Filter, Group, Restricted picklist, Sort) |
|               | **Description** Required. One of the following values: Case, Opportunity, or Solution. Label is `Entity Enumeration Or ID`. |
Usage

Use the BusinessProcess object to offer different subsets of picklist values to different users for the LeadStatus, CaseStatus, and OpportunityStage fields. Similar to a RecordType, a BusinessProcess identifies the type of a row in a Case, Lead, or Opportunity and implies a subset of picklist values for these three fields. The values for the remaining picklist fields are driven by RecordType.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**BuyerAccountFeed on page 3697**
Feed tracking is available for the object.

**BuyerAccountHistory on page 3709**
History is available for tracked fields of the object.

**BuyerAccountShare on page 3719**
Sharing is available for the object.

BuyerGroupPricebook

Represents a buyer group price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

The BuyerGroupPricebook object is available only if the B2B Commerce on Lightning Experience license is enabled.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| BuyerGroupId| **Type**: reference
              **Properties**: Create, Filter, Group, Sort
              **Description**: The ID of the buyer group that the price book record is assigned to. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsActive      | **Type** boolean  
|               | **Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
|               | **Description** Determines whether the BuyerGroupPricebook is active (true) or not (false). Default value is false. |
| LastReferencedDate | **Type** dateTime  
|               | **Properties** Filter, Nillable, Sort  
|               | **Description** The timestamp for when the current user last viewed a record related to this record. |
| LastViewedDate | **Type** dateTime  
|               | **Properties** Filter, Nillable, Sort  
|               | **Description** The timestamp for when the current user last viewed this record. If this value is null, it’s possible that this record was referenced (LastReferencedDate) and not viewed. |
| Name          | **Type** string  
|               | **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort  
|               | **Description** The name of the Buyer Group Price Book record. |
| Pricebook2Id  | **Type** reference  
|               | **Properties** Create, Filter, Group, Sort, Update  
|               | **Description** The ID of the price book assigned to the buyer group. |
| Priority      | **Type** int  
|               | **Properties** Create, Filter, Group, Nillable, Sort, Update  
|               |
DetailsField

Description

The sequential priority used to determine the price of a product. This field is only available for web stores that use the Priority pricing strategy.

Usage

Use the BuyerGroupPricebook object to assign a price book to a set of buyer users. Assigning a price book to a buyer group allows buyers within that buyer group to retrieve product prices from the price book. When a buyer has multiple price book assignments, including multiple prices for the same product, the store Pricing Strategy determines the price.

Limits

There are organization limits on Buyer Group Price Book records, price books that you can associate to a given buyer group, and buyer groups that you can associate to a given price book.

- Maximum total number of Buyer Group Price Book records: 5,000
- Maximum number of price books associated to a given buyer group: 50
- Maximum number of buyer groups associated to a given price book: 100

CalcProcStepRelationship

Defines a parent-child relationship between two Expression Set Steps in an Expression Set Version. The label for this object is Expression Set Step Relationship. This object is available in API version 53.0 and later.

Parent-child step relationships collectively determine the step order.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

</tr>
</tbody>
</table>

**RelationshipType**

**Type**
picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The type of relationship between the parent and child steps.
Possible values are:
- **Bypass**—The parent is a condition step. If the condition is false, the child is the next step.
- **ParentChild**—The child is the next step after the parent.

**Associated Objects**
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **CalcProcStepRelationshipFeed on page 3697**
  Feed tracking is available for the object.
- **CalcProcStepRelationshipHistory on page 3709**
  History is available for tracked fields of the object.

**CalculationMatrix**
Matches input values to a table row and returns the row’s output values. The label for this object is Decision Matrix. This object is available in API version 53.0 and later.

Decision Matrices are useful for implementing complex rules in a systematic, readable way. There are two types: Standard and Grouped. A Grouped Decision Matrix groups rows in different versions by one or two keys such as geographic region or product code.

**Supported Calls**
```
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()
```

**Special Access Rules**
Access to Decision Matrices requires OmniStudio licenses.

</table>

### CalculationProcedure

Performs a series of calculations using matrix lookups and user-defined variables and constants. The label for this object is Expression Set. This object is available in API version 53.0 and later.

Expression Sets accept input variables and return output variables, both in JSON format. Expression Sets are especially useful for determining prices, rates, and quotes.

#### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

#### Special Access Rules

Access to Expression Sets requires OmniStudio licenses.

### Usage

OmniScripts and Integration Procedures can call Expression Sets. Expression Sets can call Decision Matrices.

#### CalculationProcedureStep

Defines a step in an Expression Set. The label for this object is Expression Set Step. This object is available in API version 53.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

Access to Expression Sets requires OmniStudio licenses.

textarea

**Properties**
Create, Nullable, Update

**Description**
The formula expression converted to JSON format for UI display. Applicable only if the StepType is Calculation. |
| InputVariablesFormatText  | **Type**
textarea

**Properties**
Create, Nullable, Update

**Description**
A list of the input matrix columns or procedure variables applicable to the step. |
| IsConditionalStep         | **Type**
boolean

**Properties**
Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Specifies that this step is conditional.
The default value is false. |
| IsResultIncluded          | **Type**
boolean

**Properties**
Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Specifies that the result of this step is included in the Expression Set output. |

</tbody>
</table>

**Calendar**

Represents a calendar. This can be a default user calendar, public calendar, resource calendar, or holiday calendar. This object is available in API version 45.0 and later.
Newly created users are assigned a default calendar automatically. Similarly, holiday calendars are created automatically for each organization.

**Supported Calls**

describeSObjects(), query(), retrieve(), search()

**Special Access Rules**

Users with "View Setup and Configuration" user permissions can create, edit, and delete public and resource calendars in the user interface. All users, even those without the "View Setup and Configuration" user permission, can view calendars via the API.

**Fields**

All fields are readable only.

<table>
<thead>
<tr>

</table>
CalendarView

These calendars can be created and assigned to users other than the creator. Available calendars include object, shared, public, resource, and user list calendars. Object calendars represent a calendar based on a Salesforce object, either standard or custom. This object is available in API version 51.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

All fields and entities referenced by field values must be accessible by the CalendarView creator even if the creator isn’t the CalendarView owner.

</tr>
<tr>
<td><strong>SobjectType</strong></td>
<td><img src="image" alt="SobjectType" /></td>
</tr>
<tr>
<td><strong>StartField</strong></td>
<td><img src="image" alt="StartField" /></td>
</tr>
</tbody>
</table>

#### PublisherId
- **Type**: Reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: Represents the user, user list, public, or resource calendar from where event data is populated. This is a polymorphic relationship field.

#### SobjectType
- **Type**: Picklist
- **Properties**: Create, Filter, Group, Restricted picklist, Sort
- **Description**: The type of standard or custom Salesforce object that is used to create records for the CalendarView. Use the API name of the desired SobjectType.

#### StartField
- **Type**: String
- **Properties**: Create, Filter, Group, Sort, Update
- **Description**: Represents the SobjectType field used as the start time for records displayed in a user's calendar view within the user interface. Must be a date or dateTime field type.
Usage

To distribute a CalendarView to multiple users, IDs can be pulled from a group, user list, or profile. For this example, a CalendarView based on opportunity close dates is being distributed to a sales team in a public group, Sales Group:

```java
Group userGroup = [SELECT Id FROM Group WHERE Name = 'Sales Group' LIMIT 1];
List<Id> groupId = new List<Id>();
groupId.add(userGroup.id);
List<GroupMember> groupMembers = [SELECT UserOrGroupId FROM GroupMember
    WHERE GroupId IN: groupId];

List<CalendarView> calendarViews = new List<CalendarView>();
for (GroupMember groupMember : groupMembers) {
    CalendarView calendarView = new CalendarView(name = 'Opportunity Close Dates', SobjectType = 'Opportunity', StartField = 'CloseDate', DisplayField = 'Name', OwnerId = groupMember.UserOrGroupId);
    calendarViews.add(calendarView);
}
insert calendarViews;
```

CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

Customer Portal users can't access this object.

</tbody>
</table>
## Usage
Create a call center or query an existing call center.

## CallCenterRoutingMap
Stores a mapping between a user or queue in a Salesforce org to a user or queue in an external system’s call center. This object is available in API version 53.0 and later.

## Supported Calls
`create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()`

</tr>
</tbody>
</table>

**CallDisposition**

Represents a call result value that sales reps select when logging a call. This object is available in API version 47.0 and later.

**Supported Calls**

describeSObjects(), query(), retrieve()
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Disposition**   | **Type**
|                   | string  |
|                   | **Properties**
|                   | Filter, Group, idLookup, Sort |
|                   | **Description**
|                   | The result of a phone call, such as whether a call was connected or the rep left a voicemail. |
| **DispositionCategoryId** | **Type**
|                   | reference |
|                   | **Properties**
|                   | Filter, Group, Sort |
|                   | **Description**
|                   | The related call outcome that is used in reports and branching criteria for sales cadences. |

### CallDispositionCategory

Represents the call outcome of a phone call that is used in reports and branching criteria for sales cadences. This object is available in API version 47.0 and later.

### Supported Calls

describeSObjects(), query(), retrieve()

### Special Access Rules

As of Spring '20 and later, only your Salesforce org's internal users can access this object.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Category** | **Type**
|           | string  |
|           | **Properties**
|           | Filter, Group, idLookup, Sort |
|           | **Description**
|           | The name of the call outcome. |
### DeveloperName

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</td>
</tr>
</tbody>
</table>

**Note:** Only users with ViewDeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.

### Language

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**CallTemplateChangeEvent (API version 48.0)**

Change events are available for the object.

# Campaign

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

## Supported Calls

describeLayout(), describeS Objects(), getDeleted(), getUpdated(), query(), retrieve(), search()

## Special Access Rules

Customer Portal users can’t access this object.

### Field Details

**Description**  
Calculated field for the total number of won opportunities associated with the campaign hierarchy. Label is **Total Won Opportunities in Hierarchy**.

**Type**  
**picklist**

**Properties**  
Defaulted on create, Filter, Group, Nillable, Sort

**Description**  
Type of campaign, for example, Direct Mail or Referral Program. Limit: 40 characters.

### Usage

Client applications can create, update, delete, and query Attachment records associated with a campaign via the API.

The Campaign object is defined only for those organizations that have the marketing feature enabled and valid marketing licenses. In addition, it is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeSObjects()` or `query()` with the Campaign object.

**Note:** The main constituent of a campaign is a CampaignMember. You will commonly need to update campaigns with CampaignMember.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **CampaignChangeEvent** *(API version 44.0)*  
  Change events are available for the object.

- **CampaignFeed** *(API version 18.0)*  
  Feed tracking is available for the object.

- **CampaignHistory** *(API version 40.0)*  
  History is available for tracked fields of the object.

- **CampaignOwnerSharingRule**  
  Sharing rules are available for the object.

- **CampaignShare**  
  Sharing is available for the object.

### SEE ALSO:

- Object Basics
CampaignInfluence

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

Note: This information applies only to Customizable Campaign Influence and not to Campaign Influence 1.0.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| CampaignId | Type
| reference |
| Properties | Create, Filter, Group, Sort |
| Description | The ID of the associated campaign. |
| ContactId | Type
| reference |
| Properties | Create, Filter, Group, Nillable, Sort |
| Description | The ID of the contact on the associated opportunity. |
| Influence | Type
| percent |
| Properties | Create, Defaulted on create, Filter, Nillable, Sort, Update |
| Description | The percentage of the associated opportunity's Amount field attributed to the associated campaign. |
Use this object to create campaign influence records for your custom campaign influence models. Do not create campaign influence records for the Primary Campaign Source model. Records added to the Primary Campaign Source model via the API are deleted when the model is recalculated.

**CampaignInfluenceModel**

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group CampaignInfluence records created by a specific set of triggers and workflows that you define. The Primary Campaign Source influence model is the default model. This object is available in API version 37.0 and later.

**Note:** This information applies only to Customizable Campaign Influence and not to Campaign Influence 1.0.

**Supported Calls**

describeSObjects(), query(), retrieve()
Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can’t access this object.

</table>
### NamespacePrefix

**Type**
string

**Properties**
- Filter
- Group
- Nillable
- Sort

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.
- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### RecordPreference

**Type**
picklist

**Properties**
- Defaulted on create
- Filter
- Group
- Restricted picklist
- Sort

**Description**
The value of this field determines when to create campaign influence records.
- AllRecords: Creates records regardless of the revenue attribution percentage.
- RecordsWithAttribution: Creates records only when the revenue attribution is greater than 0%.

---

**CampaignMember**

Represents the association between a campaign and either a lead or a contact.

**Supported Calls**
- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`
## Special Access Rules

Customer Portal users can't access this object.

<td><strong>Description</strong></td>
<td>Controls the HasResponded flag on this object. You can't directly set the HasResponded flag, as it's read-only. You can set it indirectly by setting this field in a create or update call. Each predefined value implies a HasResponded flag value. Each time you update this field, you implicitly update the HasResponded flag. In the Salesforce user interface, Marketing users can define valid status values for the Status picklist. They can choose one status as the default status. For each Status field value, they can also select which values to count as &quot;Responded,&quot; meaning that the HasResponded flag is set to true for those values. 40 character limit.</td>
</tr>
<tr>
<td>Note:</td>
<td>When creating or updating campaign members, use the text value for Status instead of the ID from the CampaignMemberStatus object.</td>

<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether the campaign member is a lead or a contact.</td>
</tr>
</tbody>
</table>

**Note:** If you’re importing CampaignMember data into Salesforce and want to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

### Usage

Each record has a unique ID, and must contain either a `ContactId` or a `LeadId`, but can’t contain both. Any attempt to create a single record with both results in a successful insert but only the `ContactId` is inserted. However, you can create two separate records on a Campaign—one for the Lead and one for the Contact.

Standard fields from a Contact or Lead are associated with the CampaignMember object but you can’t query them directly. To include a lead’s Phone in your query, for example, query the field from the Lead object.

```sql
SELECT Id, (SELECT Phone FROM Lead)
FROM CampaignMember
```

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. If the organization doesn’t have the marketing feature or valid marketing licenses, this object doesn’t appear in the `describeGlobal()` call, and you can’t use `describeSObjects()` or `query()` with the CampaignMember object.

In API version 16.0 and later, a `create()` call only creates record; in earlier versions, a `create()` call creates and updates records. The API determines whether a record exists with the specified `CampaignId` and either `ContactId` or `LeadId`.

**Note:** Only use a `ContactId` or `LeadId`, but not both, unless you want to track lead-based campaign members you convert to contacts.

When using the API, the `create()` call only requires read access to campaigns.
If the record doesn’t exist for the given ContactId or LeadId, then a new record is created. If the record exists, an error is returned and no update is made. To update an existing record, specify the ID of the CampaignMember record to update.

In API versions 15.0 and earlier, if you submit multiple records using a single create request, and if more than one record matches an existing record, only the first record submitted updates the existing record. If any of the submitted records match each other but don’t match existing records, only the last record submitted is created.

To delete a record, specify the ID of the CampaignMember record to delete.

When creating or updating records, the Status field value specified in the call is verified as a valid status for the given Campaign:

- If the specified Status value is a valid status, the value is updated, and the HasResponded field is updated to either true or false, depending on the Status value association with HasResponded.
- If the specified Status value isn’t a valid status, the API assigns the default status to the Status field and updates the HasResponded field with the associated value. However, if the given Campaign doesn’t have a default status, the API assigns the value specified in the call to the Status field, and the HasResponded field is set to false.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

*CampaignMemberChangeEvent (API version 46.0)*

Change events are available for the object.

**SEE ALSO:**

Campaign
CampaignMemberStatus

**CampaignMemberStatus**

One or more member status values defined for a campaign.

**Supported Calls**

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

Customer Portal users can’t access this object.

You can’t delete a CampaignMemberStatus if that status is designated as the default status or if the status is currently used in a Campaign.

</tbody>
</table>
Usage

Use this object to create picklist items for the member status in a campaign.

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in a describeGlobal() call, and you can’t use describeSObjects() or query() with the CampaignMember object.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

CampaignMemberStatusChangeEvent (API version 46.0)
  Change events are available for the object.

  CampaignMember

CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

</table>
### CampaignShare

Represents a sharing entry on a Campaign.

#### Supported Calls

- create()
- delete()
- describeSObjects()
- query()
- retrieve()
- update()
- upsert()

#### Special Access Rules

As of Summer ’20 and later, only users with access to the Campaign object can access this object.

#### Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CampaignId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>

</tr>
</tbody>
</table>
| **Description**       | Level of access that the User or Group has to the Campaign. The possible values are:  
  • Read  
  • Edit  
  • All (This value is not valid for creating or updating records.)  
  This field must be set to an access level that is higher than the organization's default access level for Campaign. |
| **RowCause**          | **Type** picklist        |
| **Properties**        | Create, Filter, Group, Nillable, Restricted picklist, Sort |
| **Description**       | Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.  
  Valid values:  
  • Rule—The User or Group has access via a Campaign sharing rule.  
  • GuestRule—The User or Group has access via a Campaign guest user sharing rule.  
  • Manual—The User or Group has access because a User with "All" access manually shared the Campaign with them.  
  • Owner—The User is the owner of the Campaign. |
Details

• **LpuImplicit**—The User has access to records owned by high-volume Experience Cloud site users via a share group.
• **ARImplicit**—The User, who belongs to a partner or customer account, has access to the Campaign via an account relationship data sharing rule.

<table>

<td></td>
</tr>
<tr>
<td>Refers To</td>
<td></td>
</tr>
<tr>
<td>Group, User</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

This object allows you to determine which users and groups can view or edit Campaign records owned by other users.

**CampaignTag**

Associates a word or short phrase with a Campaign.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Filter</td>
</tr>
<tr>
<td>Field Name</td>
<td>Details</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong> string \n<strong>Properties</strong> Create, Filter \n<strong>Description</strong> Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</td>
</tr>
<tr>
<td>TagDefinitionId</td>
<td><strong>Type</strong> reference \n<strong>Properties</strong> Filter \n<strong>Description</strong> ID of the parent TagDefinition object that owns the tag.</td>
</tr>
<tr>
<td>Type</td>
<td><strong>Type</strong> picklist \n<strong>Properties</strong> Create, Filter, Restricted picklist \n<strong>Description</strong> Defines the visibility of a tag. Valid values: Public—The tag can be viewed and manipulated by all users in an organization. Personal—The tag can be viewed or manipulated only by a user with a matching OwnerId.</td>
</tr>
</tbody>
</table>

**Usage**

CampaignTag stores the relationship between its parent TagDefinition and the Campaign being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**CardPaymentMethod**

References a credit card or debit card payment method. This entity implements the PaymentMethod entity interface. This object is available in API version 48.0 and later.
**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

To access Commerce Payments entities, your org must have a Salesforce Order Management license with the Payment Platform org permission activated. Commerce Payments entities are available only in Lightning Experience.

</tbody>
</table>
### Usage

The following fields drop zeroes that appear at the beginning of the field value, and introduce commas for values with four or more digits:

- **CardLastFour**
- **CardBin**
- **ExpiryYear**

For example, a `CardLastFour` entered value of `0004122345566` would appear as `4,122,345,566` on the record.

As a workaround, create a String-type custom formula field with the same label as the field that you want to replace, then hide the original field. Here are some examples for replacing `CardLastFour`, `CardBin`, and `ExpiryYear`.

**CardLastFour**

```
IF(ISBLANK(CardLastFour), NULL, RIGHT("0000" & TEXT(CardLastFour) , 4))
```

**CardBin**

```
IF(ISBLANK(CardBin), NULL, RIGHT("000000" & TEXT(CardBin) , 6))
```

**ExpiryYear**

```
IF(ISBLANK(ExpiryYear), NULL, TEXT(ExpiryYear)))
```

CartCheckoutSession

Represents a checkout session used in Lightning B2B Commerce checkout. This object is available in API version 48.0 and later. A checkout session is tied to a single web cart, but there can be multiple checkout sessions for a single cart.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Field | Details
--- | ---
Description | The current state of the checkout session.

WebCartId

Type | reference
--- | ---
Properties | Create, Filter, Group, Sort
Description | The ID of the cart that is used to create the checkout session.

CartDeliveryGroup

Represents shipping information for the delivery of items in an order against a store built with B2B Commerce on Lightning Experience. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The CartDeliveryGroup object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

Field | Details
--- | ---
CartId

Type | reference
--- | ---
Properties | Create, Filter, Group, Sort
Description | The ID of the WebCart on page 3519 that's associated with this delivery group.

CurrencyIsoCode

Type | picklist
--- | ---
Properties | Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update
### Field | Details
--- | ---
**Description** | The ISO code for the currency that's specified on the buyer's account. Default value is **USD**. Possible values are:
- **USD**—U.S. Dollar

**DeliverToAddress** | **Type**
address

**Properties**
Filter, Nillable

**Description**
The address to which a buyer order is delivered.

**DeliverToCity** | **Type**
string

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
The city to which a buyer order is delivered.

**DeliverToCountry** | **Type**
string

**Properties**
Create, Filter, Group, Nillable, Sort, Update

**Description**
The country to which a buyer order is delivered.

**DeliverToGeocodeAccuracy** | **Type**
picklist

**Properties**
Aggregate, Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The geocode location to which a buyer order is delivered. Possible values are:
- Address
- Block
- City
- County
- ExtendedZip
- NearAddress
- Neighborhood
- State

| **Description** | The ID of the WebCart associated with the cart delivery group method. Required field. |
Usage

Use the CartDeliveryGroupMethod object to give commerce buyers the ability to choose a delivery method for a cart delivery group. Shipping integrations populate the delivery options that are available for a cart delivery group.

CartItem

Represents an item in a WebCart that’s active in a store built with B2B Commerce on Lightning Experience. Cart item can be of type Product or Charge. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The CartItem object is available only if the B2B Commerce on Lightning Experience license is enabled.

- EUR—Euro  
- USD—U.S. Dollar |
| DistributedAdjustmentAmount | **Type** currency  
**Properties** Defaulted on create, Filter, Nillable, Sort  
**Description** A calculated field that determines the amount of a cart-wide promotional adjustment when distributed across all items in the cart. This field is available in API version 52.0 and later.  
You receive $10 off, and there are 5 items in the cart. The distributed adjustment is (-$2). |
| DistributedAdjustmentTaxAmount | **Type** currency  
**Properties** Defaulted on create, Filter, Nillable, Sort  
**Description** A calculated field that determines the amount of a cart-wide tax adjustment due to promotions when distributed across all items in the cart. This field is available in API version 52.0 and later.  
EXAMPLE: Your discount causes a cart-wide tax reduction of (-$10), and there are 5 items in the cart. The distributed tax adjustment is (-$2). |
| ItemizedAdjustmentAmount | **Type** currency  
**Properties** Defaulted on create, Filter, Nillable, Sort |
### Field Details

**Description**
A calculated field that determines the total amount of promotional adjustments that are specific to an item. This field is available in API version 52.0 and later.

EXAMPLE: One cart item has one discount code for $10 off. Your itemized adjustment amount is (-$10) for that item.

<td><strong>Description</strong></td>
<td>The email address that was entered when the case was created. Label is Email. If your organization has an active auto-response rule, SuppliedEmail is required when creating a case via the API. Auto-response rules use the email in the contact specified by ContactId. If no email address is in the contact record, the email specified here is used.</td>
</tr>
</tbody>
</table>
| **SuppliedName** | Type: string  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** The name that was entered when the case was created. Label is Name. |
| **SuppliedPhone** | Type: string  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** The phone number that was entered when the case was created. Label is Phone. |
| **Type** | Type: picklist  
**Properties:** Create, Filter, Group, Nillable, Sort, Update  
**Description:** The type of case, such as Feature Request or Question. |

**Note:** If you are importing Case data and need to set the value for an audit field, such as CreatedDate, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

**Usage**

Use the Case object to manage cases for your organization. Client applications can query, update, and delete Attachment records associated with a case via the API.

**Assignment Rules**

When you query or update a case, your client application can have the case automatically assigned to one or more User records based on assignment rules that have been configured in the user interface. To use this feature, your client application must set either of the following options (but not both) in the AssignmentRuleHeader used in the create or update:
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>assignmentRuleId</td>
<td>reference</td>
<td>ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and useDefaultRule is true, then the default assignment rule is used. To find the ID for a given assignment rule, query the AssignmentRule object (specifying RuleType=&quot;caseAssignment&quot;), iterate through the returned AssignmentRule objects, find the one you want to use, retrieve its ID, and then specify its ID in this field in the AssignmentRuleHeader.</td>
</tr>
<tr>
<td>useDefaultRule</td>
<td>boolean</td>
<td>Specifies whether to use the default rule for rule-based assignment (true) or not (false). The default rule is assigned by users in the Salesforce user interface.</td>
</tr>
</tbody>
</table>

For a code example that shows setting the AssignmentRuleHeader for a Lead (which is similar to setting the AssignmentRuleHeader for a Case), see Lead.

### Separating Accounts from Contacts in Cases

In releases before 8.0, the AccountId could not be specified, it was derived from the contact’s account. This behavior will continue to be supported in future releases, but you can also now specify an AccountId. If you do not specify the AccountId during the creation of a case, the value will default to the contact’s AccountId.

⚠️ **Note:** When a record is updated, if the ContactId has not changed, then the AccountId is not regenerated. This prevents the API from overwriting a value previously changed in the Salesforce user interface. However, if an API call changes the ContactId and the AccountId field is empty, then the AccountId is generated using the contact’s account.

### Using _case with Java

Depending on the development tool you use, you might need to write your application using _case instead of Case, because case is a reserved word in Java.

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **CaseChangeEvent** *(API version 44.0)*
  - Change events are available for the object.

- **CaseFeed** *(API version 18.0)*
  - Feed tracking is available for the object.

- **CaseHistory**
  - History is available for tracked fields of the object.

- **CaseOwnerSharingRule**
  - Sharing rules are available for the object.
CaseShare

Sharing is available for the object.

SEE ALSO:

Account
CaseMilestone

CaseArticle

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Special Access Rules

Access to this object is controlled by the parent Case and KnowledgeArticle. However, when querying, access is only controlled by the parent Case.

Customer Portal users can’t access this object.

Fields

</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the KnowledgeArticle associated with the Case.</td>
</tr>
</tbody>
</table>

**Usage**

This object represents the association of a knowledge article with a Case. An article is associated with a case when it’s relevant to a specific issue, when it helps an agent solve the case, or when the agent sends the article to a customer.

You can use this object to include case-article associations in Apex and Visualforce.

You can’t update this object via the API. If you attempt to create a record that matches an existing record, the create request simply returns the existing record.

SEE ALSO:
- Case
- KnowledgeArticle

**CaseComment**

Represents a comment that provides additional information about the associated Case.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()
## CaseComment

### Fields

<table>
<thead>

</tr>
</tbody>
</table>
### Field Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ParentId</td>
<td></td>
</tr>
</tbody>
</table>
  **Type**  
  reference  
  **Properties**  
  Create, Filter, Group, Sort,  
  **Description**  
  Required. ID of the parent Case of the CaseComment.  
  This is a relationship field.  
  **Relationship Name** Parent  
  **Relationship Type** Lookup  
  **Refers To** Case |

**Note:** If you're importing CaseComment data and must set the value for an audit field, such as CreatedDate, contact Salesforce. Record id's can't delete CaseComments entities when calling the Database.delete() Apex method or its analogous SOAP API. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

### Usage

In the Salesforce user interface, comments are entered by a User working on a Case. All users have access to create and view CaseComment in the Salesforce user interface and when using the API. In the API, CaseComment records can’t be modified after insertion unless the user has the “Modify All” object-level permission for Cases or the “Modify All Data” permission. If not, users can only update the IsPublished field, and can't delete CaseComment.

**SEE ALSO:**  
  [Object Basics](#)

### CaseContactRole

**CaseContactRole**

Represents the role that a given Contact plays on a Case.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>

</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Name of the role played by the contact on this case, such as Technical Contact, Business Contact, Decision Maker, and so on. Must be unique—there can't be multiple records in which the CaseId, ContactId, and Role values are identical. Different contacts can play the same role on the same case. A contact can play different roles on the same case.</td>
</tr>
</tbody>
</table>

Usage

Use this object to define the role that a given Case plays on a given Contact. For example, you can use this object to be able to see all contacts who are associated to a case, or, given a contact, be able to query all cases that they are associated with, even if they are not the primary contact on the case.

CaseHistory

Represents historical information about changes that have been made to the associated Case.

Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

This object is always read-only.

Fields

</tbody>
</table>
| **Description**     | Name of the case field that was modified, or a special value to indicate some other modification to the case. The possible values, in addition to the case field names, are:  
  - `ownerAssignment`—The owner of the case was changed.  
  - `ownerAccepted`—A user took ownership of a case from a queue.  
  - `ownerEscalated`—The owner of the case was changed due to case escalation.  
  - `external`—A user made the case visible to customers in the Customer Self-Service Portal. |
| **IsDeleted**       |         |
| **Type**            | boolean |
| **Properties**      | Defaulted on create, Filter |
| **Description**     | Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is `Deleted`. |
| **NewValue**        |         |
| **Type**            | anyType |
| **Properties**      | Nillable, Sort |
| **Description**     | New value of the modified case field. Maximum of 255 characters. |
| **OldValue**        |         |
| **Type**            | anyType |
**Usage**

Case history entries are indirectly created each time a case is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can't access this object.

Fields

<table>
<thead>
<tr>

## CaseOwnerSharingRule

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Defaulted on create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to Rule Name in the user interface. This field is available in API version 24.0 and later.</td>
</tr>
<tr>
<td><strong>GroupId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label on the user interface.</td>
</tr>
</tbody>
</table>

*Note:* When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.
**CaseRelatedIssue**

This object acts as a junction between a customer issue (Case) and the Incident or Problem that represents an associated service failure. This object is available in API version S3.0 and later.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Fields**

<table>

### Field: Refers To
- **Details:**
  - **Case**

### Field: Name
- **Type:** string
- **Properties:** Autonumber, Defaulted on create, Filter, idLookup, Sort
- **Description:** A brief description of the related case.

### Field: RelatedEntityType
- **Type:** picklist
- **Properties:** Filter, Group, Restricted picklist, Sort
- **Description:** Shows what type of object the related entity is.
  - Possible values are:
    - Incident
    - Problem

### Field: RelatedIssueId
- **Type:** reference
- **Properties:** Create, Filter, Group, Sort
- **Description:** A polymorphic relationship field that represents a related Problem or Incident.

#### RelatedIssueId
- **Relationship Name:** RelatedIssue
- **Relationship Type:** Lookup
- **Refers To:** Incident, Problem

### Field: RelationshipType
- **Type:** picklist
- **Properties:** Create, Defaulted on create, Filter, Group, Sort, Update
- **Description:** Shows how two records relate to each other.
  - Possible values are:
**Details**

- **Root Cause**
- **Similar**

The default value is 'Root Cause'.

**UniqueKeyIndex**

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Group, idLookup, Sort, Update

**Description**

This field is unique within your organization.

**Associated Objects**

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

- **CaseRelatedIssueFeed** on page 3697
  
  Feed tracking is available for the object.

- **CaseRelatedIssueHistory** on page 3709
  
  History is available for tracked fields of the object.

**CaseShare**

Represents a sharing entry on a Case.

**Supported Calls**

describeSObjects(), create(), delete(), query(), retrieve(), update(), upsert()

**Special Access Rules**

As of Summer '20 and later, only users with access to the Case object can access this object.

**Fields**

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

|               | **Description** Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to Manual (default). You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings. Valid values include:
**Usage**

This object allows you to determine which users and groups can view and edit Case records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

Details

Field | Details
--- | ---
Relationship Type | Lookup
Refers To | Solution

Usage
You can’t update this object via the API. If you attempt to create a record that matches an existing record, the request simply returns the existing record.

SEE ALSO:
- CaseShare
- SolutionStatus

CaseStatus

Represents the status of a Case, such as New, On Hold, or In Process.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| ApiName | Type: string
Properties: Filter, Group, idLookup, Sort
Description: Uniquely identifies a picklist value so it can be retrieved without using an id or primary label. |
| IsClosed | Type: boolean
Properties: Defaulted on create, Filter, Group, Sort |
### Field Details

**Description**
Indicates whether this case status value represents a closed Case (true) or not (false). Multiple case status values can represent a closed Case.

**IsDefault**
- **Type**: boolean
- **Properties**: Defaulted on create, Filter, Group, Sort
- **Description**: Indicates whether this is the default case status value (true) or not (false) in the picklist.

**MasterLabel**
- **Type**: string
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: Label for this case status value. This display value is the internal label that does not get translated.

**SortOrder**
- **Type**: int
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: Number used to sort this value in the case status picklist. These numbers are not guaranteed to be sequential, as some previous case status values might have been deleted.

### Usage

This object represents a value in the case status picklist. The case status picklist provides additional information about the status of a Case, such as whether a given Status value represents an open or closed case. Query the CaseStatus object to retrieve the set of values in the case status picklist, and then use that information while processing Case records to determine more information about a given case. For example, the application could test whether a given case is open or closed based on its Status value and the value of the IsClosed property in the associated CaseStatus object.

<tr>
<td>---------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td><strong>Type</strong>&lt;br&gt;picklist&lt;br&gt;&lt;br&gt;<strong>Properties</strong>&lt;br&gt;Create, Filter, Group, Restricted picklist, Sort, Update&lt;br&gt;&lt;br&gt;<strong>Description</strong>&lt;br&gt;Required. Specifies the custom <em>Case Subject</em> format from which inbound social content appears in case records.&lt;br&gt;Possible values are:&lt;br&gt;- ColonSeparator&lt;br&gt;- Content—Message&lt;br&gt;- HyphenSeparator&lt;br&gt;- MessageType&lt;br&gt;- PipeSeparator&lt;br&gt;- ProvidedString&lt;br&gt;- RealName&lt;br&gt;- Sentiment&lt;br&gt;- SocialHandle&lt;br&gt;- SocialNetwork&lt;br&gt;- Source</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

In the Salesforce UI, case subjects are brief descriptions of cases. They are what agents see on cases first. Social Business Rules specify the brief descriptions of cases created from social posts. Using CaseSubjectParticle objects you can build your own case subject format, where each object represents a social post’s component. For example, combining CaseSubjectParticle objects with components for types MessageType, RealName, and SocialNetwork results in "Tweet Customer123 Twitter".

**CaseTag**

Associates a word or short phrase with a Case

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve()
Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemId</td>
<td><strong>Type</strong> reference&lt;br&gt;<strong>Properties</strong> Create, Filter&lt;br&gt;<strong>Description</strong> ID of the tagged item.</td>
</tr>
<tr>
<td>Name</td>
<td><strong>Type</strong> string&lt;br&gt;<strong>Properties</strong> Create, Filter&lt;br&gt;<strong>Description</strong> Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</td>
</tr>
<tr>
<td>TagDefinitionId</td>
<td><strong>Type</strong> reference&lt;br&gt;<strong>Properties</strong> Filter&lt;br&gt;<strong>Description</strong> ID of the parent TagDefinition object that owns the tag.</td>
</tr>
<tr>
<td>Type</td>
<td><strong>Type</strong> picklist&lt;br&gt;<strong>Properties</strong> Create, Filter, Restricted picklist&lt;br&gt;<strong>Description</strong> Defines the visibility of a tag.&lt;br&gt;Valid values:&lt;br&gt;• Public—The tag can be viewed and manipulated by all users in an organization.&lt;br&gt;• Personal—The tag can be viewed or manipulated only by a user with a matching OwnerId.</td>
</tr>
</tbody>
</table>

Usage

CaseTag stores the relationship between its parent TagDefinition and the Case being tagged. Tag objects act as metadata, allowing users to describe and organize their data.
When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

**CaseTeamMember**

Represents a case team member, who works with a team of other users to help resolve a case.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

As of Spring ’20 and later, only users with read access to the Case object can access this object.

**Fields**

</tbody>
</table>
CaseTeamRole

Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

Supported Calls

create(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Spring ’20 and later, only users with read access to the Case object can access this object.

Fields

<table>

</tr>
</tbody>
</table>
### CaseTeamTemplate

Represents a predefined case team, which is a group of users that helps resolve a case.

**Supported Calls**

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

**Special Access Rules**

As of Spring '20 and later, only users with read access to the Case object can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>

<td><strong>Properties</strong> Create, Filter, Group, idLookup, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The name of the predefined case team.</td>
</tr>
</tbody>
</table>
**CaseTeamTemplateMember**

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

As of Spring '20 and later, only users with read access to the Case object can access this object.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MemberId</strong></td>
<td></td>
</tr>
<tr>
<td><em>Type</em></td>
<td>reference</td>

<tr>
<td><em>Properties</em></td>
<td>Create, Filter, Group, Sort</td>
</tr>
<tr>
<td><em>Description</em></td>
<td>The ID of the predefined case team’s template.</td>
</tr>
</tbody>
</table>
CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieval()`

Special Access Rules

As of Spring '20 and later, only users with read access to the Case object can access this object.

Fields

</tbody>
</table>
CategoryData

Represents a logical grouping of Solution records.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can't access this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CategoryNodeId</td>
<td>Type reference</td>
</tr>
<tr>
<td>IsDeleted</td>
<td>Type boolean</td>
</tr>
<tr>
<td>RelatedObjectId</td>
<td>Type reference</td>
</tr>
</tbody>
</table>

IsDeleted

Type

boolean

Properties

Defaulted on create, Filter

Description

Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is Deleted.

RelatedObjectId

Type

reference

Properties

Create, Filter, Group, Sort, Update

Description

ID of the solution related to the category.
Usage

This object allows you to assign one or more categories to a Solution. It is an intermediate data table with two foreign keys that defines the relationship between a CategoryNode and a Solution record.

CategoryData has two foreign keys:

- The first foreign key, CategoryNodeId, refers to the ID of a CategoryNode.
- The other foreign key, RelatedObjectId, refers to a Solution ID.

This is a many-to-many relationship, so there can be multiple rows returned with a CategoryNodeId. A Solution can be associated with multiple categories.

SEE ALSO:

Object Basics

CategoryNode

Represents a tree of Solution categories.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

- Customer Portal users can't access this object.
- Attempting to delete a CategoryNode that has children (referred by CategoryNode.Parent), or is referred to elsewhere, causes a failure.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>MasterLabel</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>string</td>

</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
</tbody>
</table>
### Usage

A CategoryNode defines a category of solutions. In the user interface, you can edit category definitions from Setup by entering Solution Categories in the Quick Find box, then selecting Solution Categories.

#### SEE ALSO:
- CategoryData
- Solution

### CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

<table>
<thead>
<tr>
<th>NamespacePrefix</th>
<th>Type</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string</td>
<td>Filter, Nullable</td>
</tr>
</tbody>
</table>
**Description**

The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters.

You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.

- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

**Value**

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>

**Properties**

Create, Filter, Nillable, Update

**Description**

The actual translated label for the solution category. Label is **Translation**.

**Usage**

Use this object to translate the labels of your solution categories into a supported language. Users with the Translation Workbench enabled can view category node translations, but either the “Customize Application,” “Manage Translation,” or “Manage Categories” permission is required to create or update category node translations.

**SEE ALSO:**

- ScontrolLocalization
- WebLinkLocalization

**ChangeRequest**

Represents a decision to implement a formal request for a change (RFC). This object is available in API version 53.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### RelationshipType

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Shows how two records relate to each other.

Possible values are:
- Caused By
- Fixed By

The default value is 'Caused By'.

### UniqueKeyIndex

**Type**
- string

**Properties**
- Create, Filter, Group, idLookup, Sort, Update

**Description**
This field is unique within your organization.

---

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

<tr>
<td><strong>Description</strong></td>
<td>The description for this linking rule.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ChannelProgramFeed**
  Feed tracking is available for the object.

- **ChannelProgramHistory**
  History is available for tracked fields of the object.

- **ChannelProgramOwnerSharingRule**
  Sharing rules are available for the object.

- **ChannelProgramShare**
  Sharing is available for the object.

### ChannelProgramLevel

Represents a level, based on member experience, in a channel program. This object is available in API version 41.0 and later.

### Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Fields

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ChannelProgramLevelFeed**
  Feed tracking is available for the object.

- **ChannelProgramLevelHistory**
  History is available for tracked fields of the object.

- **ChannelProgramLevelOwnerSharingRule**
  Sharing rules are available for the object.

- **ChannelProgramLevelShare (API version 43.0)**
  Sharing is available for the object.

### ChannelProgramMember

Represents a partner who is a member of a channel program. This object is available in API version 41.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ChannelProgramMemberFeed (API version 46.0)**
  
  Feed tracking is available for the object.

- **ChannelProgramMemberHistory (API version 46.0)**
  
  History is available for tracked fields of the object.

- **ChannelProgramMemberOwnerSharingRule**
  
  Sharing rules are available for the object.

- **ChannelProgramMemberShare (API version 43.0)**
  
  Sharing is available for the object.

### ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

### Supported Calls

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Fields

<table>
<thead>
<tr>

### Field Name | Details
--- | ---
| **Description** | the number of abuses reported by other users on the Reply records posted by the User. |
| **UserId** | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** The User ID associated with this reputation. |
| **CommunityId** | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** The ID for the zone associated with this reputation. |

#### Usage
Use this object to view metrics on User activity in Chatter Answers. For example, you can use the ChatterAnswersActivity object to view the number of Question records a user is following in Chatter Answers zones.

SEE ALSO:
- [Question](#)
- [Reply](#)
- [User](#)

**ChatterAnswersReputationLevel**

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

⚠️ **Note:** With the Spring ’18 release, Salesforce no longer supports Chatter Answers. Users of Chatter Answers can post, answer, comment, or view existing Chatter Answers data, but support and updates are scheduled to end. We recommend transitioning to Chatter Questions. For more information, see [End of Support for Chatter Answers in Spring ’18](#).

#### Supported Calls
- `create()`, `delete()`, `query()`, `retrieve()`, `update()`
Fields

<table>

</tbody>
</table>

Usage

Use this object to identify private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:
- ChatterConversationMember
- ChatterMessage

ChatterConversationMember

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConversationId</td>
<td>Type: reference, Properties: Filter, Group, Sort, Description: ID of the associated ChatterConversation.</td>
</tr>
<tr>
<td>MemberId</td>
<td>Type: reference</td>
</tr>
</tbody>
</table>
### Usage

Use this object to view members of private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:
- ChatterConversation
- ChatterMessage

### ChatterExtension

Represents a Rich Publisher App that’s integrated with the Chatter publisher. This object is available in API version 41.0 and later.

### Supported Calls

`create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()`

ChatterExtension Standard Objects
The rendering component of the Rich Publisher App that you provide. It’s comprised of the `lightning:availableForChatterExtensionRenderer` interface. This field requires a value.

### Type

- **Type**: picklist

### Properties

Create, Filter, Group, Restricted picklist, Sort, Update

### Description

Describes the type of the extension. Currently, the only value supported is `Lightning`. Included to allow for other possible types in the future.

---

**ChatterExtensionConfig**

Configuration for the Chatter extension for Experience Cloud sites. This object is available in API version 41.0 and later.

---

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

---

**Fields**

|                   | **Properties** Filter, Sort  
|                   | **Description** Date the message was sent. |
Usage

Use this object to view and delete messages sent or received via private conversations in Chatter. Users can access this object if they have the Manage Chatter Messages and Direct Messages permission. Users with the Moderate Experiences Chatter Messages permission can access this object in Experience Cloud sites they’re a member of, only if the message has been flagged as inappropriate. This object is provided to allow administrators to view and delete users’ Chatter messages, for example, for compliance purposes.

Messages are hard deleted. That is, they’re removed completely without a trip to the Recycle Bin.

Deleting a message that resulted from sharing a file with someone doesn’t also delete the file.

SEE ALSO:

ChatterConversation
ChatterConversationMember

ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

Supported Calls

describeSObjects(), delete(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| FullUserAgent | Type  
string |
|             | Properties Filter, Nillable, Sort |
|             | Description Detailed information about the client (browser). For example, Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.9.0.1) Gecko/2008070208 Firefox/3.0.1 |
| LastUpdate  | Type  
dateTime |
|             | Properties Filter, Nillable, Sort |
|             | Description Represents the last time the cookie was changed. |
| ProxyInfo   | Type  
string |
### Standard Objects

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Filter, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The browser’s current proxy information.</td>
</tr>
<tr>
<td>UsersId</td>
<td>Type reference</td>
</tr>
<tr>
<td>Properties</td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td>Description</td>
<td>The ID of the user associated with this item. This is a relationship field.</td>
</tr>
<tr>
<td>Relationship Name</td>
<td>Users</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>Lookup</td>
</tr>
<tr>
<td>Refers To</td>
<td>User</td>
</tr>
</tbody>
</table>

### Usage

At every login, the device the login request is from is checked against the known devices using ClientBrowser. A match means a cookie was found on the browser that matches an entry in the ClientBrowser table, so the device is known. No match means that no matching cookie was found, so the device is unknown, and the user is asked to confirm their identity.

### CollaborationGroup

Represents a Chatter group. This object is available in API version 19.0 and later.

### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), search(), update(), upsert()

### Special Access Rules

The visibility of information in groups depends on the type of group and the user’s permissions.

- **Members**: Any user with the Create and Own New Chatter Groups permission can create public, private, and unlisted groups, including in any Experience Cloud sites they belong to.
- **Owners and managers**: Users can modify group details for any group they own or manage. Owners can also delete groups they own.
• **Nonmembers:** These user permissions allow group access regardless of group membership.
  – **View All Data**—Allows users to view all public and private groups across their org and its Experience Cloud sites. Users with this permission can’t view unlisted group information, unless they have the Manage Unlisted Groups permission as well.
  – **Modify All Data**—Allows users to view, modify, and delete all public and private groups across their org and its Experience Cloud sites. Users with this permission can’t view or modify unlisted group information, unless they have the Manage Unlisted Groups permission as well.
  – **Create and Set Up Experiences**—Allows users to view, modify, and delete all public and private groups in Experience Cloud sites.
  – **Manage Unlisted Groups**—Allows users to search for, access, and modify any unlisted group in an org and its Experience Cloud sites.
  – **Data Export**—Allows users to export any data from Salesforce, including private and unlisted group data from an org and its Experience Cloud sites.

• **Apex and Visualforce:** Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account.
  – Visualforce pages that display groups might expose unlisted or private group data to users who aren’t members.
  – Because system mode disregards the user’s permissions, all users who are accessing a Visualforce page that’s showing a group can act as an owner of that group.
  – AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren’t members.

To limit and manage access to the unlisted and private groups in your org:

• Explicitly filter out unlisted and private group information from SOQL queries in all Apex code.
• Use permission sets, profile-level permissions, and sharing checks in your code to further limit group access.
• Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of groups. In Setup, enter Group Triggers in the Quick Find box, then select Group Triggers to add triggers.

</tbody>
</table>
## Usage

Use this object to create, edit, or delete groups in an org or Experience Cloud site. Deleting a group permanently deletes all posts and comments to the group. It also deletes all files and links posted to the group and removes the files from other locations where they were shared.

As a Chatter group member, you can post to the group using the CollaborationGroupFeed object. As a Chatter group owner or manager, you can add or remove group members using the CollaborationGroupMember object, post announcements to the group using the
Announcement object, and accept or decline requests to join private groups using the CollaborationGroupMemberRequest object. Additionally, the group owner, manager, or your Salesforce system administrator can invite people to join the group using the CollaborationInvitation object.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **CollaborationGroupFeed**
  Feed tracking is available for the object.

**SEE ALSO:**
- CollaborationGroupMember
- CollaborationGroupMemberRequest

**CollaborationGroupMember**

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), describeLayout(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Description
Required. The frequency at which Salesforce sends Chatter group email digests to this member. Can only be set by the member or users with the “Modify All Data” permission. The valid values are:
- D—Daily
- W—Weekly
- N—Never
- P—On every post
The default value is specified by the member in their Chatter email settings. In communities, the Email on every post option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to Daily digests.

Usage
Use this object to view, create, and delete Chatter group members. You must be a group owner or manager to create members for private Chatter groups.

SEE ALSO:
- CollaborationGroup
- CollaborationGroupMemberRequest

CollaborationGroupMemberRequest

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

<td>• Pending</td>
</tr>
</tbody>
</table>
Usage

This object represents a request to join a private Chatter group, and can be used to accept or decline requests to join private groups you own or manage. On create, an email is sent to the owner and managers of the private group to be accepted or declined. When the Status is Accepted or Declined, an email is sent to notify the requester. When the Status is Declined, a ResponseMessage is optionally included to provide additional details.

Note the following when working with requests:

• Users with the "Modify All Data" or "View All Data" permission can view records for all groups, regardless of membership.
• A user can be a member of 300 groups. Requests to join groups count against this limit.
• Status can’t be specified on create.
• You can only update a request when the Status is Pending.
• You can’t delete or update a request with a Status of Accepted or Declined.

SEE ALSO:

CollaborationGroup
CollaborationGroupMember

CollaborationGroupRecord

Represents the records associated with Chatter groups.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**NetworkId**

- **Type**: reference
- **Properties**: Filter, Group, Nillable, Sort
- **Description**: Optional. The ID of the Experience Cloud site that the group belongs to. Available from API version 34.0.

**RecordId**

- **Type**: reference
- **Properties**: Create, Filter, Group, Sort
- **Description**: Required. The ID of the record associated with the Chatter group.
  - This is a polymorphic relationship field.
- **Relationship Name**: Record
- **Relationship Type**: Lookup
- **Refers To**: Account, Campaign, Case, Contact, Contract, Lead, Opportunity

---

**CollaborationInvitation**

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve()

**Special Access Rules**

Invitations are available if “Allow Invitations” is enabled for your organization.

Invitations are limited to your allowed domain(s) unless the invite is sent from a private group that allows customers. Allowed domains are set by the administrator.

Invitations to customers are available if “Allow Customer Invitations” is enabled for your organization. Users must have the “Invite Customers to Chatter” permission to send invitations to people outside their Chatter domain.
## Fields

<table>
<thead>

</thead>
</table>
| InvitedUserEmail          | Type
|                            | string |
|                            | Properties
|                            | Create, Filter, Group, Sort |
| Description               | The email address for the user invited to join Chatter. Label is Invited Email. |
| InvitedUserEmailNormalized| Type
|                            | email |
| Description               | A normalized version of the InvitedUserEmail entered. Label is Invited Email (Normalized). |
| InviterId                 | Type
|                            | reference |
| Description               | The person that initiated the invitation. |
| OptionalMessage           | Type
|                            | string |
| Description               | An optional message from the person sending the invitation to the person receiving it. |
| ParentId                  | Type
|                            | reference |
| Description               | Used when the email address on the invitation is different than the one entered when the invitee accepts the invitation. |
| SharedEntityId            | Type
|                            | reference |
DetailsField

**Properties**
Create, Filter, Group, Sort

**Description**
ID of the user or group associated with this invitation.

- If the invitation is to join Chatter, the `SharedEntityId` is the ID of the User that created the invitation. The invitee will auto-follow the inviter.
- If the invitation is to join a group within Chatter, the `SharedEntityId` is the ID of the Chatter CollaborationGroup.
- To invite a customer, set `SharedEntityId` to the ID of the private CollaborationGroup with Allow Customers turned on.

<table>
<thead>
<tr>
<th><strong>Status</strong></th>
</tr>
</thead>
</table>

**Type**
picklist

**Properties**
Filter, Group, Restricted picklist, Sort

**Description**
The status of the invitation. Possible values are:
- Sent
- Accepted
- Canceled

**Usage**
Use this object to create or delete (cancel) invitations to join Chatter. You can either invite a user to join Chatter directly or as part of a CollaborationGroup.

**Note:** To invite someone to join a CollaborationGroup, you must be either the owner or a manager of the group or a Salesforce system administrator.

The Salesforce system administrator doesn’t need to be a member of the group in order to send invitations using the API.

When the person accepts your CollaborationGroup invitation, they join the CollaborationGroup and Chatter as well.

**Note:** You can’t send invitations to users of the organization the invite was sent from.

Invited users can view profiles, post on their feed, and join groups, but they can’t see your Salesforce data or records.

If your organization allows groups with customers, owners and managers of private groups with the “Allow Customers” setting, as well as system administrators, can use this object to invite customers.

**Java Samples**
The following example shows how to send an invitation to join Chatter:

```java
public void invitePeople(String inviterUserId, String invitedEmail) throws Exception {
    CollaborationInvitation invitation = new CollaborationInvitation();
    // code to populate invitation
    // send invitation
}
```
The following example shows how to send an invitation to a customer user from a group that allows customers:

```java
public void inviteToGroup(String GroupName, String invitedEmail) throws Exception {
    QueryResult qr = query("select id from collaborationgroup where name = "+GroupName); //pass the group name
    String groupId = qr.getRecords()[0].getId();
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(groupId); //pass the groupId
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

**Apex Samples**

```java
String emailAddress = 'bob@external.com';
CollaborationGroup chatterGroup = [SELECT Id 
    FROM CollaborationGroup 
    WHERE Name='All acme.com' 
    LIMIT 1];
CollaborationInvitation inv = New CollaborationInvitation();
inv.SharedEntityId = chatterGroup.id;
inv.InvitedUserEmail = emailAddress;

try {
    insert inv;
} catch(DMLException e){
    System.debug('There was an error with the invite: '+e);
}
```

**CollabDocumentMetric**

Represents the engagement metrics for a Quip thread (document or spreadsheet) that’s linked to a Salesforce record. This object is available in API version 50.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Fields**

### CollabUserEngmtRecordLink

Represents an association between a CollabUserEngagementMetric and a Salesforce record. It tracks which Salesforce record, such as an Account or Contact, is associated with the user engagement metric. This object is available in API version 50.0 and later.

**Note:** The CollabUserEngmtRecordLink object is now deprecated. You can still access user engagement metrics for metric dates before August 12, 2021. To obtain user engagement metric for dates starting from August 12, 2021, follow the instructions in the Quip Engagement Metrics documentation.

#### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

</tbody>
</table>

#### RecordType

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>
| Properties
Filter, Group, Nillable, Sort |

**Description**
The parent object type.

#### SharingOption

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
</table>
| Properties
Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort |

**Description**
Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is Allowed, which means that new shares are allowed. When set to Restricted, new shares are prevented without affecting existing shares. This field is available in API versions 35.0 and later.

#### Title

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
</table>
| Properties
Filter, Group, Nillable, Sort |

**Description**
Title of the attached file.

### Usage

Use this object to list all notes, attachments, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter for a record, such as a related list on a detail page.

To determine if an object supports the CombinedAttachment object, call `describeSObject()` on the object. For example, `describeSObject('Account')` returns all the child relationships of the Account object, including `CombinedAttachment`. You can then query the `CombinedAttachment` child relationship.

```sql
SELECT Name, (SELECT Title FROM CombinedAttachments) FROM Account
```

You can’t directly query CombinedAttachment.
**CommerceEntitlementBuyerGroup**

Represents the entitlement policy for a buyer group. This object is available in API version 49.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

**Special Access Rules**

The CommerceEntitlementBuyerGroup object is available only if the B2B Commerce on Lightning Experience license is enabled.

Details

Properties
Create, Filter, Group, Sort

Description
The unique ID for the entitlement policy.

CommerceEntitlementPolicy

Represents an entitlement policy, which determines what products and prices a user can see. This object is available in API version 49.0 and later.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
The CommerceEntitlementPolicy object is available only if the B2B Commerce on Lightning Experience license is enabled.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **CommerceEntitlementPolicyOwnerFeed** on page 3697
  - Feed tracking is available for the object.

- **CommerceEntitlementPolicyHistory** on page 3709
  - History is available for tracked fields of the object.

- **CommerceEntitlementPolicyOwnerSharingRule**
  - Sharing rules are available for this object.

### CommerceEntitlementPolicyShare

Represents the entitlement rule for sharing products and prices with users other than the owner. This object is available in API version 49.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

**Special Access Rules**

The CommerceEntitlementPolicyShare object is available only if the B2B Commerce on Lightning Experience license is enabled.

## CommissionScheduleAssignment

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **CommissionScheduleFeed**
  Feed tracking is available for the object.

- **CommissionScheduleHistory**
  History is available for tracked fields of the object.

- **CommissionScheduleOwnerSharingRule**
  Sharing rules are available for the object.

- **CommissionScheduleShare**
  Sharing is available for the object.

## CommissionScheduleAssignment

Represents the commission calculation applicable to a specific product or producer for one or multiple commissionable events.

## Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

- Owner

**Relationship Type**
- Lookup

**Refers To**
- Group, User

### Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **CommSubscriptionConsentChangeEvent (API version 49.0)**
  - Change events are available for the object.

- **CommSubscriptionConsentFeed**
  - Feed tracking is available for the object.

- **CommSubscriptionConsentHistory**
  - History is available for tracked fields of the object.

- **CommSubscriptionConsentOwnerSharingRule**
  - Sharing rules are available for the object.

- **CommSubscriptionConsentShare**
  - Sharing is available for the object.

### CommSubscriptionTiming

Represents a customer’s timing preferences for receiving a communication subscription. This object is available in API version 48.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

### Fields

<tr>
<td><strong>Offset</strong></td>
<td><strong>Type</strong> double</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Nullable, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The amount of time before or after an event or the specific day of the week to communicate with the contact point. Set the unit of time in the Unit field.</td>
</tr>
</tbody>
</table>
## Field Details

For example, if you set Unit as Week and Offset as -4, communicate with the contact point four weeks before the event. If you set Offset as 4, communicate with the contact point four weeks after the event.

### PreferredTimeEnd

**Type**

time

**Properties**
Create, Filter, Nillable, Sort, Update

**Description**
End of the preferred time span in which to reach the customer.

### PreferredTimeStart

**Type**

time

**Properties**
Create, Filter, Nillable, Sort, Update

**Description**
Start of the preferred time span in which to reach the customer.

### PreferredTimeZone

**Type**

picklist

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
Time zone of the preferred time span.

### Unit

**Type**

picklist

**Properties**
Create, Filter, Group, Restricted picklist, Sort, Update

**Description**
The unit of time that works with the Offset field to determine the communication timing. Possible values are:

- Day
- DayOfWeek
- Hour
- Month
- Week

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
CommSubscriptionTimingFeed
Feed tracking is available for the object.

CommSubscriptionTimingHistory
History is available for tracked fields of the object.

Community (Zone)
Represents a zone that contains Idea or Question objects.

Note: Starting with the Summer ’13 release, Chatter Answers and Ideas communities were renamed to zones. In API version 28, the API object label has changed to Zone, but the API type is still Community.

Supported Calls
describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>CanCreateCase</td>
<td></td>

</tbody>
</table>
**Details**

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether Chatter Answers is available in the zone.

---

**IsActive**

**Type**
boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether the zone is active or inactive. An idea or question can only be posted to an active zone.

---

**IsPublished**

**Type**
boolean

**Properties**
Defaulted on create, Filter, Group, Sort

**Description**
Indicates whether the zone is available in portals.

---

**Name**

**Type**
string

**Properties**
Filter, Group, idLookup, Sort

**Description**
The name of the zone.

---

**NetworkId**

**Type**
reference

**Properties**
Filter, Group, Nillable, Sort

**Description**
ID of the Experience Cloud site that this zone is associated with. This field is available only if digital experiences is enabled in your org. This field is available in API version 53.0 and later.

---

**Usage**

Use this object to create a zone in Ideas, Chatter Answers, or Answers. Zones help organize ideas and questions into logical groups and are shared by the Ideas, Answers, and Chatter Answers.
ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Connected apps link client applications, third-party services, other Salesforce organizations, apps, and resources to your organization. The connected app configuration specifies authorization and security settings for these resources. This object exposes the settings for a specified connected app.

Supported Calls

describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>MobileSessionTimeout</td>
<td>Type: picklist, Properties: Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Description: Length of time after which the system logs out inactive mobile users.</td>

<tr>
<td><strong>Description</strong></td>
<td>The duration of an authorization token until it expires in hours, months, or days as set in the connected app management page.</td>
</tr>
</tbody>
</table>
Consumption Rate

Consumption rates describe the billing rate for a range of usage within a consumption schedule. All consumption schedules require at least one consumption rate in order to rate usage on a usage product. This object is available in API version 45.0 and later.

The consumption rate sets a quantity-based boundary for usage and defines how much your product costs when its usage falls within that boundary. Consumption rates price usage at a per-unit fee or a flat fee across the entire range of usage.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Fields

<table>

Consumption Schedule

A consumption schedule organizes a set of consumption rates by which usage-based products are quoted and billed. This object is available in API version 45.0 and later.

Salesforce uses consumption schedules to group consumption rates. Your consumption schedule defines the unit of measurement and rating method for the schedule’s rates. It also defines the billing frequency that Salesforce Billing uses to invoice a usage product.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Details

Description
This field is available only with Salesforce Billing.
Salesforce Billing taxes usage summary invoice lines based off the summary’s related tax rule.

Contact

Represents a contact, which is a person associated with an account.

Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), merge(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
Customer Portal users can access only portal-enabled contacts.

### ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record’s clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.
Note: When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see Data.com Prospector and Clean Retirement.

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field IsDifferent has an IsDifferentEmail field. If the IsDifferentEmail field’s value is False, that means the Email field value is the same on the Salesforce contact record and its matched Data.com record.

ContactCleanInfo bit vector fields include:

- **CleanedBy** indicates who (a user) or what (a Clean job) cleaned the contact record.
- **IsDifferent** indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- **IsFlaggedWrong** indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- **IsReviewed** indicates whether or not a field on the contact record is in a Reviewed state, which means that the value was reviewed but not accepted.

### Fields

<table>
<thead>
<tr>

Usage

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.
Create a customized set of Title field values. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

ContactPointAddress

Represents a contact’s billing or shipping address, which is associated with an individual or person account. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **ContactPointConsentChangeEvent**
  - Change events are available for the object.

- **ContactPointPhoneHistory**
  - History is available for tracked fields of the object.

- **ContactPointPhoneOwnerSharingRule**
  - Sharing rules are available for the object.

- **ContactPointPhoneShare**
  - Sharing is available for the object.

**ContactPointTypeConsent**

Represents consent for a contact point type, such as email or phone. This object is available in API version 45.0 and later.

**Supported Calls**

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

This object is available if Data Protection and Privacy is enabled.

</tbody>
</table>

| **Description**        | **Type** | textarea |
| **Properties**         | Create, Filter, Nillable, Sort, Update |
| **Description**        | A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later. |

| **DeveloperName**      | **Type** | string |
| **Properties**         | Create, Defaulted on create, Filter, Group, Sort, Update |
### Field: Details

**Description**
The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to **Rule Name** in the user interface.

This field is available in API version 24.0 and later.

**Note:** When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance slows down while Salesforce generates one for each record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Properties</th>

- Attempted  
- Contacted  
- New |
| WhatId | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** ID of the Salesforce record the contact request is related to, such as an account, case, opportunity, or work order.  
This is a polymorphic relationship field.  
**Relationship Name** What  
**Relationship Type** Lookup  
**Refers To** Account, Case, Opportunity, WorkOrder |
Usage
Contact request records are created when a customer fills out an online form. This form is created using a flow that uses the type ContactRequestFlow. There’s a guided setup experience to create this flow on the Customer Contact Requests page in Setup. You then add the flow to an Experience Cloud site using either the Flows component or the Contact Request Button & Flow component.

Contact Request works in Experience Cloud sites, whether they require authentication or not. Make sure that your users have the Run Flows permission, including your Guest User profile. Without this permission, members won’t see the button or the form to submit contact requests.

By default, all Standard User and System Administrator profiles have access to the object. Make sure that your users profiles, like service agents, have at least read access on the contact request object.

You can create queues for contact requests and route them with Omni-Channel.

Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **ContactRequestOwnerSharingRule**
  Sharing rules are available for the object.

- **ContactRequestShare**
  Sharing is available for the object.

SEE ALSO:

*Salesforce Help: Set Up and Manage Contact Requests*
ContactRequestShare

Represents a list of access levels to a ContactRequest with an explanation of the access level. This object is available in API version 45.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

<table>

|              | **Type** | picklist |
### Field Name: ContactRequestShare

**Details**

**Properties**
Create, Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Reason that this sharing entry exists.
You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Possible values are:
- **Manual**—The User or Group has access because a user with "All" access manually shared the ContactRequest with them.
- **Owner**—The User is the owner of the ContactRequest.
- **Rule**—The User or Group has access via a ContactRequest sharing rule.
- **GuestRule**—The User or Group has access via a ContactRequest guest user sharing rule.

**UserOrGroupId**

**Type**
reference

**Properties**
Create, Filter, Group, Sort

**Description**
ID of the User or Group that has been given access to the ContactRequest.
This is a polymorphic relationship field.

**Relationship Name**
UserOrGroup

**Relationship Type**
Lookup

**Refers To**
Group, User

### Usage

This object lets you determine which users and groups can view and edit ContactRequest records owned by other users.

If you attempt to create a new record that matches an existing record, the create() call updates any modified fields and returns the existing record.

SEE ALSO:

*Salesforce Help: Set Up and Manage Contact Requests*
## ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

As of Summer ’20 and later, only users with access to the Contact object can access this object.

## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ContactId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>ID of the Contact associated with this sharing entry. This field can't be updated. This is a relationship field.</td>
</tr>
<tr>
<td><strong>Relationship Name</strong></td>
<td>Contact</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
<td>Contact</td>
</tr>
<tr>
<td><strong>ContactAccessLevel</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Restricted picklist, Sort</td>
</tr>
</tbody>
</table>
| **Description**        | Level of access that the User or Group has to cases associated with the account Contact. The possible values are:  
  - Read  
  - Edit  
  - All This value is not valid for create or update.  
  This field must be set to an access level that is higher than the organization’s default access level for contacts.  |
### IsDeleted

**Type**
boolean

**Properties**
Defaulted on create, Filter

**Description**
Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.

### RowCause

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Reason that this sharing entry exists. You can only write to this field when its value is either omitted or set to `Manual` (default). There are many possible values, including:

- **Rule**—The User or Group has access via a Contact sharing rule.
- **GuestRule**—The User or Group has access via a Contact guest user sharing rule.
- **ImplicitChild**—The User or Group has access to the Contact via sharing access on the associated Account.
- **ImplicitPerson**—The User or Group has access to the business contact of a person account via a Contact sharing rule.
- **GuestPersonImplicit**—The guest user has access to the business contact of a person account via a Contact sharing rule.
- **PortalImplicit**—The Contact is associated with the portal user.
- **LPuImplicit**—The User has access to records owned by high-volume Experience Cloud site users via a share group.
- **ARImplicit**—The User, who belongs to a partner or customer account, has access to the Contact via an account relationship data sharing rule.
- **Manual**—The User or Group has access because a User with “All” access manually shared the Contact with them.
- **Owner**—The User is the owner of the Contact.

### UserOrGroupId

**Type**
reference

**Properties**
Filter, Group, Sort

**Description**
ID of the User or Group that has been given access to the Contact. This field can’t be updated. This is a polymorphic relationship field.

**Relationship Name**
UserOrGroup
Usage
This object allows you to determine which users and groups can view or edit Contact records owned by other users.

SEE ALSO:
AccountShare

ContactSuggestionInsight

Represents a suggestion for a new contact record. Available in API versions 45.0 and later.

Supported Calls
describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules
To add or decline contact suggestions, users need a Sales Cloud Einstein license and edit access on accounts. As of the Spring ’20 release, Pardot and High Velocity Sales users no longer have access to this object.

</table>

**Usage**

This object is read-only and isn’t supported in workflows, triggers, process builder, or Visualforce pages.
ContactTag

Associates a word or short phrase with a Contact.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| ItemId           | Type: reference  
|                  | Properties: Create, Filter  
|                  | Description: ID of the tagged item. |
| Name             | Type: string  
|                  | Properties: Create, Filter  
|                  | Description: Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically. |
| TagDefinitionId  | Type: reference  
|                  | Properties: Filter  
|                  | Description: ID of the parent TagDefinition object that owns the tag. |
| Type             | Type: picklist  
|                  | Properties: Create, Filter, Restricted picklist  
|                  | Description: Defines the visibility of a tag.  
|                  | Valid values:  
|                  | • Public—The tag can be viewed and manipulated by all users in an organization. |
Details

**Field Name**: Personal
- The tag can be viewed or manipulated only by a user with a matching OwnerId.

Usage

ContactTag stores the relationship between its parent TagDefinition and the Contact being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

ContentAsset

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Use asset files for org setup and configuration. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

**Important**: Where possible, we changed noninclusion terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls

- create()
- delete()
- describeSObjects()
- query()
- retrieve()
- update()
- upsert()

Special Access Rules

- Only admin users can edit or delete ContentAssets.
- Users with file access can create and query ContentAssets.
- It isn’t necessary to create asset files for regular, collaborative use of Salesforce Files. “Assetize” files only when they’re used in setup and configuration situations.
- Neither the file (ContentDocument) nor the asset settings record (ContentAssets) can be deleted if the asset file is referenced by another component.
- ContentAsset doesn’t support search or most recently used (MRU) lists.
- ContentAsset doesn’t support Apex triggers.

Fields

</table>
| Description | ID of the document.  
This is a relationship field. |
| Relationship Name | ContentDocument |
| Relationship Type | Lookup |
| Refers To | ContentDocument |

**DeveloperName**

**Type**
- string

**Properties**
- Create, Filter, Group, Sort, Update

**Description**
The unique name of the asset file in the API. ContentAsset.DeveloperName:
- must be 40 characters or fewer
- must begin with a letter
- can contain only underscores and alphanumeric characters
- can’t include spaces
- can’t end with an underscore
- can’t contain 2 consecutive underscores

In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.

**IsVisibleByExternalUsers**

**Type**
- boolean

**Properties**
- Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Indicates whether unauthenticated users can see the asset file.

**Language**

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**
The language for this document. This field defaults to the user’s language unless the org is multi-language enabled. Specifies the language of the labels returned. The value must be a
valid user locale (language and country), such as de_DE or en_GB. For more information on locales, see the Language field on the CategoryNodeLocalization object.

MasterLabel

Type: string

Properties: Create, Filter, Group, Sort, Update

Description: The label for the asset file. This internal label doesn’t get translated.

NamespacePrefix

Type: string

Properties: Filter, Group, Nillable, Sort

Description: The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.

ContentBody

Represents the body of a file in Salesforce CRM Content or Salesforce Files. This object is available in API version 40.0 and later.

Supported Calls

describeSObjects()

Special Access Rules

Cannot be queried, inserted, updated, or deleted directly.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id</td>
<td></td>
</tr>
</tbody>
</table>

Type: ID

Properties: Filter, Group, idLookup, Sort
**Usage**

ContentBody is intended for internal Salesforce use. If you need to access the file content body, please use ContentVersion.

**ContentDistribution**

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), undelete(), update(), upsert()

**Special Access Rules**

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- Users can query the DistributionPublicUrl and Password fields only if they are the file owner, if the file is shared with them, or if the RelatedRecordId specifies a record that the users can access.
- If the shared document is deleted, the delete cascades to any associated ContentDistribution. The ContentDistribution is still queryable by using the QueryAll verb.
- If the shared document is archived, the only fields that users can edit are ExpiryDate and PreferencesExpires.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The number of times that the shared document has been viewed.</td>
</tr>
</tbody>
</table>

## Usage

Use this object to create, update, delete, or query information about a document shared externally via a link or via Salesforce CRM Content delivery.

The `ContentDistribution` object supports triggers before and after these operations: insert, update, delete. It supports triggers after undelete.

**Example:** The VP of Marketing wants file authors to specify whether their files can be shared with external people using content delivery. He also wants some files to have a password. You can add a custom field `DeliveryPolicy` on the `ContentVersion` object. Make the custom field a picklist with the values, `Allowed`, `Blocked`, and `Password required`. Add the field to the `ContentVersion` layout so that the user can set the delivery policy per file. Then, add an insert trigger for the `ContentDistribution` object to enforce the rules based on the delivery policy set in the file.

**Note:** The `ContentVersionId` for `ContentDistribution` must be unique.

This trigger for the `ContentDistribution` object enforces the delivery policy rules for each file:

```java
trigger deliveryPolicy on ContentDistribution (before insert) {
  for (ContentDistribution cd : trigger.new) {
    String versionId = DeliveryPolicyHelper.getContentVersionId(cd);
    ContentVersion version = [select DeliveryPolicy__c from ContentVersion where Id = :versionId];
    String policy = version.DeliveryPolicy__c;
    if (policy.equals('Blocked')) {
      cd.addError('This file is not allowed to be delivered.');
    } else if (policy.equals('Password required')){
      if (!DeliveryPolicyHelper.requirePassword(cd)) {
        cd.addError('To deliver this file, set a password.');
      }
    }
  }
}
```
The trigger calls this helper class:

```java
public class DeliveryPolicyHelper {
    public static String getContentVersionId(ContentDistribution cd) {
        if (cd.ContentVersionId != null) {
            return cd.ContentVersionId;
        } else {
            String versionId = [select LatestPublishedVersionId from ContentDocument
                where Id = :cd.ContentDocumentId].get(0).LatestPublishedVersionId;
            return versionId;
        }
    }

    public static boolean requirePassword(ContentDistribution cd) {
        return cd.PreferencesPasswordRequired;
    }
}
```

⚠️ Important: Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

### ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

#### Supported Calls

- `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

#### Special Access Rules

- Content deliveries must be enabled to query content deliveries.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- ContentDistributionView can be deleted by an admin.
- If the shared document is deleted, the delete cascades to any associated ContentDistributionView. The ContentDistributionView is still queryable by using the QueryAll verb.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.
# Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **DistributionId** | **Type** reference  
**Properties** Filter, Group, Sort  
**Description** ID of the content delivery that the document is part of. This is a relationship field.  
**Relationship Name** Distribution  
**Relationship Type** Lookup  
**Refers To** ContentDistribution |
| **IsDownload** | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** true if the shared document is downloaded; false if the shared document is viewed. |
| **IsInternal** | **Type** boolean  
**Properties** Defaulted on create, Filter, Group, Sort  
**Description** true if the shared document is viewed by a user in the same organization; false if viewed by an external user. |
| **ParentViewId** | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** ID of this instance of accessing the shared document. |
Usage
Use this read-only object to query information about users who are accessing shared documents.

ContentDocument
Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.
The maximum number of documents that can be published is 30,000,000. Archived files count toward this limit and toward storage usage limits.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24-hour period.
- Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Supported Calls
- delete(), describeLayout(), describeSObjects(), query(), retrieve(), search(), undelete(), update()

Special Access Rules
- By default, users (including users with the View All Data permission) can only query files they have access to, including:
  - Salesforce Files in their personal library and in libraries they’re a member of, regardless of library permissions (API version 17.0 and later).
  - Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).

  Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.
  - Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
  - Users can’t edit, upload new versions, or delete files they don’t have access to.
  - View All Data permission is required to enable Query All Files.

- Customer and Partner Portal users must have the View Content in Portal permission to query content in libraries where they have access.

- A Salesforce CRM Content document can be deleted if any of the following are true:
  - The document is published into a personal library or is in the user's upload queue.
  - The document is published into a public library, the user trying to delete the document is the file owner, and is a member of that library.
  - The document is published into a public library and the user trying to delete the document is not the owner but has the Manage Library or Delete Content library permission enabled.

For API version 25.0 and later, you can change ownership of Salesforce Files and Salesforce CRM Content documents.

- A user can change ownership of a Salesforce CRM Content document or Salesforce file if any of the following are true:
  - The user is the current owner.
  - The user has either the Modify All Data or Manage Salesforce CRM Content permission enabled.
- The user has the Manage Library permission enabled for the library containing the document.

Note: When the owner of a ContentDocument is changed, ContentDocumentLink may be triggered. This action deletes the ContentDocumentLink to the old owner and inserts one to the new owner.

Note:
- The user who is becoming the owner of the document must be a visible user who is active, but the original owner can be inactive.
- A document’s owner can be changed to a user who doesn’t have access to the library that contains the document. Library administrators must give the new owner membership to the library.

</tbody>
</table>
**Usage**

- Use this object to retrieve, query, update, and delete the latest version of a document in a library or a Salesforce file. Use the ContentVersion object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file.
- The `query()` call doesn’t return archived documents. The `queryAll()` call returns archived documents.
- You can’t add new versions of archived documents.
- To query a file that is accessible only through a record share, you must specify the content ID of the file. When SOQL querying the ContentVersion object, either the `ContentVersionId` or the `ContentDocumentId` must be compounded by an AND operator.

For example,

```sql
SELECT FileExtension, Title FROM ContentVersion
WHERE (ContentDocumentId = '<ContentDocumentId>' or Id='<ContentVersionId>') and IsLatest=true
```

```sql
SELECT Id, VersionData, FileExtension, Title FROM ContentVersion
WHERE ContentDocumentId='<ContentDocumentId>' AND FirstPublishLocationId = '<FirstPublishLocationId>'
```

- To create a document, create version via the ContentVersion object without setting the `ContentDocumentId`. This process automatically creates a parent document record. When adding a new version of the document, you must specify an existing `ContentDocumentId` which initiates the revision process for the document. When the latest version is published, the title, owner, and publish status fields are updated in the document.
- When you delete a document, all versions of that document are deleted, including ratings, comments, and tags.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- A document record is a container for multiple version records. You create a version to add a document to the system. The new version contains the actual file data which allows the document to have multiple versions. The version stores the body of the uploaded document.
- Assign topics to ContentDocument using `TopicAssignment` in API version 37.0 or later.

**Associated Objects**

This object has the following associated objects. Unless noted, associated objects are available in the same API version as this object.

- **ContentDocumentFeed (API version 20.0)**
  - Feed tracking is available for the object.

- **ContentDocumentHistory**
  - History is available for tracked fields of the object.

**SEE ALSO:**

- ContentDocumentHistory
- ContentVersion

---

**ContentDocumentHistory**

Represents the history of a document. This object is available in versions 17.0 and later.
Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

### Usage
Use this read-only object to query the history of a document.

SEE ALSO:

ContentDocument
ContentDocumentLink

Represents the link between a Salesforce CRM Content document, Salesforce file, or ContentNote and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

- In API versions 33.0 and later, you can create and delete ContentDocumentLink objects with a LinkedEntityId of any record type that can be tracked in the feed, even if feed tracking is disabled for that record type.
- In API versions 25.0 and later, you can create ContentDocumentLink objects with a LinkEntityId of type User, CollaborationGroup, or Organization.
- In API versions 21.0 and later, users with explicit Viewer access (the file has been directly shared with the user) to a file can delete ContentDocumentLink objects between the file and other users who have Viewer access. In the same API versions, any user with Viewer access to a file can delete ContentDocumentLink objects between the file and organizations or groups of which they are a member.
- For orgs with digital experiences enabled, a document can only be shared with users and groups that are a part of the Experience Cloud site the file was created in.

Inferred permission on shares with standard objects is available in API versions 36.0 and later.</td>
</tr>
</tbody>
</table>

**Visibility**

<table>
<thead>
<tr>
<th>Type</th>
<th>picklist</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Specifies whether this file is available to all users, internal users, or shared users. This field is available in API version 26.0 and later.</td>
</tr>
<tr>
<td>Visibility</td>
<td>can have the following values.</td>
</tr>
<tr>
<td>• All Users—The file is available to all users who have permission to see the file.</td>
<td></td>
</tr>
<tr>
<td>• Internal Users—The file is available only to internal users who have permission to see the file.</td>
<td></td>
</tr>
<tr>
<td>• Shared Users—The file is available to all users who can see the feed to which the file is posted. Shared Users is used only for files shared with users, and is available only when an org has private org-wide sharing on by default. The Shared Users value is available in API version 32.0 and later.</td>
<td></td>
</tr>
</tbody>
</table>

Note the following exceptions for Visibility.
### Field Details

- **AllUsers & InternalUsers** values apply to files posted on standard and custom object records, but not to users, groups, or content libraries.
- For posts to a record feed, **Visibility** is set to **InternalUsers** for all internal users by default.
- External users can set **Visibility** only to **AllUsers**.
- On user and group posts, only internal users can set **Visibility** to **InternalUsers**.
- For posts to a user feed, if the organization-wide default for user sharing is set to private, **Visibility** is set to **SharedUsers**.
- Only internal users can update **Visibility**.
- **Visibility** can be updated on links to files posted on standard and custom object records, but not to users, groups, or content libraries.
- **Visibility** is updatable in API version 43.0 and later.

The visibility setting on ContentDocumentLink determines a file's visibility on a record post. When a file has multiple references posted in a feed, the file's visibility is determined by the most visible setting.

### Usage

Use this object to query the locations where a file is shared or query which files are linked to a particular location. For example, the following query returns a particular document shared with a Chatter group:

```
SELECT ContentDocument.title FROM ContentDocumentLink WHERE ContentDocumentId = '069D00000000so2' AND LinkedEntityId = '0D5000000089123'
```

- You can't run a query without filters against ContentDocumentLink.
- You can't filter on ContentDocument fields if you're filtering by **ContentDocumentId**. You can only filter on ContentDocument fields if you're filtering by **LinkedEntityId**.
- You can't filter on the related object fields. For example, you can't filter on the properties of the account to which a file is linked. You can filter on the properties of the file, such as the title field.

A SOQL query must filter on one of **Id**, **ContentDocumentId**, or **LinkedEntityId**.

The ContentDocumentLink object supports triggers before and after these operations: insert, update, delete.

**Example:** This trigger for the ContentDocumentLink object prevents public XLSX files from being shared.

```
trigger NoShareXLSX on ContentDocumentLink (after insert) {
    for (ContentDocumentLink cdl : trigger.new) {
        if (!CDLHelper.isSharingAllowed(cdl)) {
            cdl.addError('Sorry, you cannot share this file.'kad);
        }
    }
}
```
The trigger calls this helper class.

```java
public class CDLHelper {

    /**
     * Gets FileExtension of the inserted content.
     */
    public static String getFileExtension(ContentDocumentLink cdl) {
        String fileExtension;
        String docId = cdl.ContentDocumentId;
        FileExtension = {select FileExtension from ContentVersion where ContentDocumentId = :docId}.get(0).FileExtension;
        return FileExtension;
    }

    /**
     * Checks the file's PublishStatus and FileExtension to decide whether user can share the file with others.
     * PublishStatus 'P' means the document is in a public library.
     */
    public static boolean isSharingAllowed(ContentDocumentLink cdl) {
        String docId = cdl.ContentDocumentId;
        ContentVersion version = {select PublishStatus,FileExtension from ContentVersion where ContentDocumentId = :docId}.get(0);
            return false;
        }
        return true;
    }

    /**
     * Gets the parent account name if the file is linked to an account.
     */
    public static String getAccountName(ContentDocumentLink cdl) {
        String name;
        String id = cdl.LinkedEntityId;
        if (id.substring(0,3) == '001') {
            name = {select Name from Account where Id = :id}.get(0).Name;
        }
        return name;
    }
}
```

**Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files, like bulk ContentVersion creation, can easily hit the SOQL queries limit.

SEE ALSO:

ContentDocument
ContentDocumentListViewMapping

Represents an association between a ListView and a Quip ContentDocument. Applies to Quip file types only. Maintains the mapping between a list view and Quip document when the list view is exported to a newly created Quip document. This object is available in API version 44.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

To use this object, the Files Connect and Quip permissions must be enabled in the org.
To insert and update this object through the API, the QuipMassAction gater permission must also be enabled.

Fields

<table>

947
### Usage

ContentDocumentListViewMapping is used primarily by the Quip list view integration feature. Only Quip file types (Quip sheets and docs) are supported. The ContentDocumentId field must point to a Quip file.

### ContentDocumentSubscription

Represents a subscription for a user following or commenting on a file in a library. This object is available in API version 42.0 and later.

### Supported Calls

delete(), describeSObjects(), query(), retrieve()

### Special Access Rules

Only users with Modify All Data permission have access to this object.

</table>

**ContentFolder**

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

• Salesforce CRM Content or Chatter must be enabled to access ContentFolder.
• All users with a content feature license can modify folders in their personal library.
• To modify a folder, the user must be a member of the library and have permission to modify folders.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>

</tbody>
</table>

**Usage**

**ContentFolderLink**

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

**Supported Calls**

`describeSObjects()`, `query()`, `retrieve()`

**Special Access Rules**

- Salesforce CRM Content must be enabled to access ContentFolderLink.
- ContentFolderLink is read-only in the context of a library.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentFolderId</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>reference</td>
</tr>
</tbody>
</table>
### Field Name

<table>
<thead>
<tr>
<th><strong>Details</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>ID of the folder.</td>
</tr>
<tr>
<td>This is a relationship field.</td>
</tr>
<tr>
<td><strong>Relationship Name</strong></td>
</tr>
<tr>
<td>ContentFolder</td>
</tr>
<tr>
<td><strong>Relationship Type</strong></td>
</tr>
<tr>
<td>Lookup</td>
</tr>
<tr>
<td><strong>Refers To</strong></td>
</tr>
<tr>
<td>ContentFolder</td>
</tr>
</tbody>
</table>

### EnableFolderStatus

| **Type** |
| picklist |
| **Properties** |
| Filter, Group, Nillable, Restricted picklist, Sort |
| **Description** |
| Indicates the status of enabling folders for the library. Valid values are: |
| - C — Completed folder enablement |
| - S — Started folder enablement |
| - F — Failed folder enablement |
| This field is available in API version 39.0 and later. |

### ParentEntityId

| **Type** |
| reference |
| **Properties** |
| Filter, Group, Sort |
| **Description** |
| Name of the entity the folder hierarchy is linked to. |

---

### ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

#### Supported Calls

- `describeSObjects()`, `delete()`, `query()`, `retrieve()`, `update()`
Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolderMember.
- All users with a content feature license can modify folders in their personal library.
- To modify ContentFolderMember, the user must be a member of the library and have permission to modify folders.

ContentHubItem

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.
### Special Access Rules

Chatter and Files Connect must be enabled for the organization.

### Supported Calls

`describeSObjects(), query(), search()`

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ContentHubRepositoryId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The ID for the related external data source described by the <code>ContentHubRepository</code> object.</td>
</tr>
<tr>
<td><strong>ContentModifiedDate</strong></td>
<td><strong>Type</strong> dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Nillable</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Date the file or folder content last changed.</td>

<td>Details</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>MIME type of the content.</td>
</tr>
</tbody>
</table>

**Name**

| Type | string |
| **Properties** | Filter, Nillable, Sort |
| **Description** | Name of the file or folder in the external data source. |

**Owner**

| Type | string |
| **Properties** | Filter, Group, Nillable |
| **Description** | Username of the content owner in the external data source. |

**ParentId**

| Type | string |
| **Properties** | Filter, Group, Nillable |
| **Description** | The ID of the parent folder for the record. This field isn’t returned in queries or searches of the ContentHubItem object. It supports only WHERE clauses, such as the following: WHERE ContentHubRepositoryId = <ID of external source> and ParentId = <ID of parent folder or record>. Or specify WHERE ParentId = <name of root folder> to return the children of the root folder. |

**Tip:** The ParentId field supports both Salesforce IDs (in the format “0CHxxx”) and external IDs. |

**Title**

| Type | string |
| **Properties** | Group, Nillable |
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>The title that appears in the content, which often differs from the Name of the containing file or folder.</td>
</tr>
<tr>
<td><strong>UpdatedBy</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Group, Nullable</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> Username for the person who last updated the file.</td>
</tr>
</tbody>
</table>

## Usage

The following SOQL query examples show how to retrieve files and folders from a Files Connect external data source. These examples use placeholders for ID values for the repository ID and folder IDs. Before running these queries, replace the placeholders with valid ID values for your external data source and folders.

**Important:** You must filter queries and searches on ContentHubItem with the ContentHubRepositoryId field; for example, SELECT Id FROM ContentHubItem WHERE ContentHubRepositoryId = `<ID of external data source>`.

**Example 1:** Get the ID and name of the root folder in an external file source.

```sql
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = `<repository ID>' AND ParentId = NULL
```

**Example 2:** List all folders and files under the specified root folder.

```sql
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = `<repository ID>' AND ParentId = `<root folder ID>'
```

**Example 3:** List all external file data sources by querying ContentHubRepository.

```sql
SELECT DeveloperName
FROM ContentHubRepository
```

**Example 4:** List all files and folders in a given folder and external file source.

```sql
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = `<repository ID>' AND ParentId = `<parent folder ID>'
```

**Example 5:** To return only folders in the result set, add IsFolder = true in the WHERE clause to a query that returns files and folders. For example, the following query lists all folders under the root folder.

```sql
SELECT Id, Name
FROM ContentHubItem
```
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
AND IsFolder = true

Example 6: Retrieve a link that is used to open the specified document in an external source.

```
SELECT ExternalDocumentUrl
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND Id = '<document ID>'
```

SOSL Example: Retrieve the ID and name of all documents that contain the search string. The result set is limited to the first 10 documents.

```
FIND {<search string>}
RETURNING ContentHubItem(Id, Name
WHERE ContentHubRepositoryId = '<repository ID>'
LIMIT 10
```

### ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

#### Special Access Rules

Chatter and Files Connect must be enabled for the organization.

#### Supported Calls

describeLayout(), describeSObjects(), query(), retrieve()
### ContentNote

Represents a note created with the enhanced note taking tool, released in Winter ’16. This object is available in API version 32.0 and later.

#### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`

#### Special Access Rules

- Notes must be enabled.

#### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>base64</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Nullable, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it must be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the <code>Content</code> field must be escaped. You can escape special characters by calling <code>content.escapeHtml()</code> If the input contains unsafe HTML characters, we automatically strip them out before saving the content.</td>
</tr>

| **LatestPublishedVersionId**              | Type  
|                                            | reference                                   |
| **Properties**                            | Filter, Group, Nillable, Sort                |
| **Description**                           | ID of the ContentVersion for the latest published version of the note. |
| **OwnerId**                               | Type  
|                                            | reference                                   |
| **Properties**                            | Create (for users assigned the Set Audit Fields Upon Creation permission), Defaulted on create, Filter, Group, Sort, Update (for users assigned the Set Audit Fields Upon Creation permission) |
| **Description**                           | ID of the owner of the note.                |
## SharingPrivacy

**Type**
- picklist

**Properties**
- Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

**Description**
Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is Visible to Anyone With Record Access. When set to Private on Records, the file is private on records but can be shared selectively with others.

This field is available in API versions 41.0 and later.

## TextPreview

**Type**
- string

**Properties**
- Filter, Group, Nillable, Sort

**Description**
A preview of the note's content. This field is available in API version 35.0 and later.

## Title

**Type**
- string

**Properties**
- Create, Filter, Group, idLookup, Namefield, Sort, Update

**Description**
Title of the note.

## Usage
- Use ContentNote to create, query, retrieve, search, edit, and update notes.
- ContentNote is built on ContentVersion, and so it has many of the same usages.
- Not all fields can be set for notes. Only the Content and Title fields can be updated.
- The maximum file size you can upload via SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it's converted to base64. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
- You can convert old Note records to Lightning Experience, so users can view and edit notes from the Notes & Attachments related list in Lightning Experience. Users can edit their converted notes, which are accessible from the Notes related list and Notes tab. Copy old Note records to newly created ContentNote records. Users assigned the Set Audit Fields Upon Creation permission can set the owner, created date, and last modified date on ContentNote records.
- SOQL and SOSL queries on the ContentNote return only the most recent version of the note.
- To relate a note to a record, use ContentDocumentLink.

For example, the following Apex code creates a note and escapes any special characters so they're converted to their HTML equivalents.
Note: Apex code doesn’t need to be encoded to base64 before it’s uploaded and downloaded.

ContentNote cn = new ContentNote();
    cn.Title = 'test1';
String body = 'Hello World. Before insert/update, escape special characters such as ", '"',
    '&', and other standard escape characters.';
    cn.Content = Blob.valueOf(body.escapeHTML4());
    insert(cn);

In this example, the following code creates a note using text that is already formatted as HTML, so it doesn’t need to be escaped.

ContentNote cn = new ContentNote();
    cn.Title = 'test2';
String body = '<b>Hello World. Because this text is already formatted as HTML, it does not
    need to be escaped.
    Special characters such as &quot;, etc. must already use their HTML equivalents.</b>'';
    cn.Content = body;
    insert(cn);

ContentNotification

Represents a notification for a file. This object is available in API version 42.0 and later.

Supported Calls
delte(), describeSObjects(), query(), retrieve()

Special Access Rules
Only users with Modify All Data permission have access to this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| EntityIdentifierId | Type reference
|                 | Properties Filter, Group, Nillable, Sort
<p>|                 | Description ID of the object with the notification. |

  - textarea |
| **Properties** | Filter, Nillable, Sort |
| **Description** | Text of the notification. |
| **UsersId** | Type  
  - reference |
| **Properties** | Filter, Group, Sort |
| **Description** | ID of the user who received the notification.  
  This is a relationship field. |
| **Relationship Name** | Users |
| **Relationship Type** | Lookup |
ContentTagSubscription

Represents a subscription for a user following a tag on a file. This object is available in API version 42.0 and later.

Supported Calls

delete(), describeSObjects(), query(), retrieve()

Special Access Rules

Only users with Modify All Data permission have access to this object.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserId</td>
<td></td>

| **Type**        | reference |
| **Properties**  | Filter, Group, Sort |
| **Description** | ID of the user who follows another user. This is a relationship field. |
| **Relationship Name** | SubscriberUser |
| **Relationship Type** | Lookup |
| **Refers To**   | User |
ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

The maximum number of versions that can be published in a 24-hour period is 200,000.

**Note:** Depending on how files are shared, queries on ContentDocument and ContentVersion without specifying an ID won’t return all files a user has access to. For example, if a user only has access to a file because they have access to a record that the file is shared with, the file won’t be returned in a query such as “SELECT Id FROM ContentDocument.”

**Supported Calls**

create(), describeLayout(), describeSObjects(), query(), retrieve(), search(), update(), upsert()

**Special Access Rules**

- All users with a content feature license can create versions in their personal library. Customer and Partner Portal users must also supply the `NetworkId` of the Experience Cloud site in the request.
- By default, users (including users with the View All Data permission) can only query files they have access to, including:
  - Salesforce Files in their personal library and in libraries they’re a member of, regardless of library permissions (API version 17.0 and later).
  - Salesforce Files they own, shared directly with them, posted on their profile, or posted on groups they can see (API version 21.0 and later).
- Enable the Query All Files permission to let your View All Data users bypass the restrictions on querying files.
  - Query All Files returns all files, including files in non-member libraries and files in unlisted groups.
  - Users can’t edit, upload new versions, or delete files they don’t have access to.
  - View All Data permission is required to enable Query All Files.
- All users can update versions in their personal library.
- The owner of a version or document can update the document if they are a member of the library, regardless of library permissions.
- To update a Salesforce CRM Content document, the user must be a member of the library with one of these library privileges enabled:
  - Add Content
  - Add Content On Behalf of Others
  - Manage Library
- Customer and Partner Portal users must have the View Content in Portal permission to query content in libraries where they have access.
- Customer and Partner Portal users can only publish, version, or edit documents if they have a Salesforce CRM Content feature license.
- `FileType` is defined by either `ContentUrl` for links or `PathOnClient` for documents, but not both.
- In API version 34.0 and later, any file can be shared with libraries, whether the file originated in Chatter or in Salesforce CRM Content.
- In API version 39.0 and later, custom Apex download handlers can be created that can control access to documents. See the Apex Developer Guide for more information.

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>FirstPublishLocationId</th>
<th><strong>Type</strong> reference</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Nullable, Sort</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> ID of the location where the version was first published. If the version is first published into a user's personal library or My Files, the field will contain the ID of the user who owns the personal library or My Files. In Lightning Experience, if the first version is published into a public library, the field will contain the ID of that library. Accepts all record IDs supported by ContentDocumentLink (anything a file can be attached to, like records and groups). Setting FirstPublishLocationId allows you to create a file and share it with an initial record/group in a single transaction, and have the option to create more links to share the file with other records or groups later. When a file is created, it's automatically linked to the record, and PublishStatus will change to Public from Pending/Personal. This field is only set the first time a version is published via the API. FirstPublishLocationId can't be set to another ID when a new content version is inserted.</td>
</tr>
</tbody>
</table>

**Note:** Salesforce updates the FirstPublishLocationId updates automatically when a new OwnerId is added to the ContentVersion. For example, when you publish a new version with a different OwnerId than the current OwnerId, the FirstPublishLocationId of all previous versions updates to the previous OwnerId. The new published version sets the FirstPublishLocationId to the new OwnerId. This is a polymorphic relationship field.

### PathOnClient

**Type**  
string

**Properties**  
Create, Filter, Nillable, Sort

**Description**  
The complete path of the document. One of the fields that determines the `FileType`.  

> **Note:** Specify a complete path including the path extension in order for the document to be visible in the Preview tab.

### PositiveRatingCount

**Type**  
int

**Properties**  
Filter, Group, Nillable, Sort

**Description**  
Read only. The number of times different users have given the document a thumbs up.

Rating counts for the latest version are not version-specific. If Version 1 receives 10 thumbs-up votes, and Version 2 receives 2 thumbs-up votes, the `PositiveRatingCount` on Version 2 is 12. However, rating counts are not retroactive for prior versions. The `PositiveRatingCount` on Version 1 is 10.

### PublishStatus

**Type**  
picklist

**Properties**  
Defaulted on create, Filter, Group, Restricted picklist, Sort

**Description**  
Indicates if and how the document is published. Valid values are:

- **P**—The document is published to a public library and is visible to other users. Label is Public.
- **R**—The document is published to a personal library and is not visible to other users. Label is Personal Library.
- **U**—The document is not published because publishing was interrupted. Label is Upload Interrupted.

### RatingCount

**Type**  
int

**Properties**  
Filter, Group, Nillable, Sort

**Description**  
Read only. Total number of positive and negative ratings.
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **ReasonForChange**   | **Type** string  
**Properties** Create, Filter, Nillable, Sort, Update  
**Description** The reason why the document was changed. This field can only be set when inserting a new version (revising) a document. |
| **RecordTypeId**      | **Type** reference  
**Properties** Create, Filter, Nillable, Update  
**Description** ID of the record type of the version. Custom fields are restricted in `RecordTypeId`. When an administrator creates a custom field via the API it must be added to at least one page layout:  
- If the custom field is added to the page layout associated with the General record type, the `RecordTypeId` that corresponds to that record type does not have to be set on the version record.  
- If the custom field is added to the page layout associated with a custom record type, the `RecordTypeId` that corresponds to that record type must be set on the version record. |
| **SharingOption**     | **Type** picklist  
**Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description** Controls whether sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Allowed`, which means that new shares are allowed. When set to `Restricted`, new shares are prevented without affecting existing shares.  
This field is available in API versions 35.0 and later. |
| **SharingPrivacy**    | **Type** picklist  
**Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description** Controls sharing privacy for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is `Visible to Anyone With Record`
### Standard Objects

#### ContentVersion

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Access</strong></td>
<td><em>When set to Private on Records, the file is private on records but can be shared selectively with others.</em>&lt;br&gt;This field is available in API versions 41.0 and later.</td>
</tr>
<tr>
<td><strong>TagCsv</strong></td>
<td><em>Type</em>&lt;br&gt;textarea &lt;br&gt;<em>Properties</em>&lt;br&gt;Create, Nillable, Sort, Update &lt;br&gt;<em>Description</em>&lt;br&gt;Text used to apply tags to a content version via the API.</td>
</tr>
<tr>
<td><strong>TextPreview</strong></td>
<td><em>Type</em>&lt;br&gt;string &lt;br&gt;<em>Properties</em>&lt;br&gt;Nillable, Filter, Group, Sort &lt;br&gt;<em>Description</em>&lt;br&gt;A preview of a document. Available in API version 35.0 and later.</td>
</tr>
<tr>
<td><strong>Title</strong></td>
<td><em>Type</em>&lt;br&gt;string &lt;br&gt;<em>Properties</em>&lt;br&gt;Create, Filter, Group, idLookup, Sort, Update &lt;br&gt;<em>Description</em>&lt;br&gt;The title of a document.</td>
</tr>
<tr>
<td><strong>VersionData</strong></td>
<td><em>Type</em>&lt;br&gt;base64 &lt;br&gt;<em>Properties</em>&lt;br&gt;Create, Nillable, Update &lt;br&gt;<em>Description</em>&lt;br&gt;The content or body of the note, which can include properly formatted HTML or plain text. When a document is uploaded or downloaded via the API, it should be base64 encoded (for upload) or decoded (for download). Any special characters within plain text in the Content field must be escaped. You can escape special characters by calling content.escapeHtml4().&lt;br&gt;This field can't be set for links.&lt;br&gt;The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in VersionData. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.</td>
</tr>
</tbody>
</table>
If a custom Apex download handler is active, this field is accessed from the API, and the download is not allowed, Salesforce will return a `CONTENT_CUSTOMIZED_DOWNLOAD_EXCEPTION` error.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| VersionNumber | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The version number. The number increments with each version of the document, for example, 1, 2, 3.                                                                                                                                                                                                                                                                                                                                                   |

**Usage**

- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file.
- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce file. Use the ContentDocument object to retrieve, query, update, and delete the latest version of a Salesforce file.
- To query a file that is shared only with a record, you must specify the content ID of the file.
- Not all fields can be set for Salesforce Files.
- You can only update a version if it is the latest version and if it is published.
- You can't archive versions.
- Using API version 32.0 and later, you can update record types on versions.
- You can't delete a version via the API.
- The maximum file size you can upload via the SOAP API is 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB after conversion.
- To download a document via the API, you must export the `VersionData` of the document. This does not increase the download count.
- When you upload a document from your local drive using the Data Loader, you must specify the actual path in both `VersionData` and `PathOnClient`. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
- SOQL queries on the ContentVersion object return all versions of the document. SOSL searches on the ContentVersion object return only the most recent version of the document.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- Documents published into a personal library assume the default record type that is set for the user profile of the person publishing the document (General, if no default is set for the user profile).

**Note:** An administrator can rename the default (Content Version Layout) page layout.
• Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 200,000 new versions per 24–hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24–hour period.

• Custom validation rules can prevent an update of documents published into a personal library via the API.

Applying Tags to ContentVersion Records

Tags can be applied to ContentVersion records using either Enterprise or Partner API.

To apply tags to a ContentVersion record, set a value in the TagCsv field. For example, setting this field to one,two,three creates and associates three tags to that version.

• The maximum length of the TagCsv field is 2,000 characters.
• The maximum length of an individual tag is 100 characters.
• When tags are applied to a version, the content is indexed automatically and the tags are searchable.
• You can’t apply tags to a TagCsv that is published into a personal library.
• You can’t apply tags using the ContentDocument object.
• You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.
• Tags are case insensitive. You can’t have two tags with the same name even if they use different uppercase and lowercase letters. The case of the original tag is always used.

To delete tags from a ContentVersion record, perform a standard API update, and remove any values from the TagCsv field that you want to delete. For example, if the original TagCsv is one,two,three, perform an API update specifying one,three in the TagCsv field to delete two. To delete all tags from a ContentVersion you perform a standard API update by setting the field to null.

If you create a ContentVersion record and want to revise it via the API, you insert another ContentVersion record but associate it to the same ContentDocument record as the original. This has an impact on tagging:

• If you insert the revision and do not set any value in the TagCsv field, any tags applied to the previous version are automatically applied to the new version.

• If you insert the revision and specify a new TagCsv field, no tags transfer over and the tags you specify are applied instead.

When you perform a SOQL query for a ContentVersion record and select the TagCsv field, all the tags associated with that record are returned. The tags in the string are always ordered alphabetically even if they were inserted in a different order. You can’t use the TagCsv field as part of a filter in a SOQL query. You can’t query all tags in your organization.

Library tagging rules:

• API tagging respects the tagging restrictions that exist on any library that the document is published into. For example, if the library is in restricted tagging mode and only allows tags one,three, you can’t save a version with a TagCsv of one,two,three.

• If the library is in guided tagging mode, you can apply tags to the ContentVersion. You can’t query the value of guided tags on a library, but you can query the tagging model of a library.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
**ContentVersionHistory**

History is available for tracked fields of the object.

SEE ALSO:
- ContentDocument
- ContentVersionHistory

**ContentVersionComment**

Represents a comment on a version of a file. This object is available in API version 42.0 and later.

**Supported Calls**

delte(), describeSObjects(), query(), retrieve()

**Special Access Rules**

Only users with Modify All Data permission have access to this object.

**Fields**

| Properties      | Filter, Group, Sort |
### ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

#### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

#### Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

**Note:** To record an event in contentVersionViewed, make sure:

- All files are published to a Content Library.
- The details page is viewed in Salesforce Classic.

</tbody>
</table>
ContentWorkspace

Represents a content library. This object is available in versions 17.0 and later.

Note: This object doesn’t apply to personal libraries.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), query(), retrieve(), update(), upsert()

Note: create(), update() and delete() on ContentWorkspace are supported in API version 40.0 and later only.

Special Access Rules

- The Access Libraries user permission allows orgs to make libraries available to users without requiring that they have the legacy Salesforce CRM Content license. This permission is available for profiles and permission sets on most standard user licenses, and isn’t available for High Volume Customer Portal, Customer Community, or Chatter Free licenses. Available in API versions 40.0 and later.
- Users with the Create Libraries user perm or the Manage Salesforce CRM Content administrator permission can create libraries (ContentWorkspaces) from the Libraries tab in Salesforce Classic and from the API.
- Customer and Partner Portal users can only edit the library document object if they have a Salesforce CRM Content feature license.
- Customer and Partner Portal users can query this object if they have the “View Content in Portal” permission. A user can query all public libraries where they’re members, regardless of library permissions.
- Automated process users can’t publish documents to libraries (ContentWorkspaces).

<tr>
<td></td>
<td>• U — Unrestricted. No restrictions on tagging. Users can enter any tag when publishing or editing content.</td>
</tr>
<tr>
<td></td>
<td>• G — Guided. Users can enter any tag when publishing or editing content, but they’re also offered a list of suggested tags.</td>
</tr>
</tbody>
</table>
Usage

Use this object to query libraries to find out where documents can be published.

If the content type isn’t specified when publishing a new version into a library, it is determined by the DefaultRecordTypeId of the primary library.
As of 40.0, you can create, update, or delete a library via the API.

SEE ALSO:
ContentWorkspaceDoc

**ContentWorkspaceDoc**

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

*Note:* This object does not apply to documents and versions in a personal library.

**Supported Calls**
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**
- Customer and Partner Portal users must have the “View Content in Portal” permission in order to query and obtain content in libraries where they have access.
- Customer and Partner Portal users can only edit documents if they have a Salesforce CRM Content feature license.
- To create a ContentWorkspaceDoc, you must be a member of the library with one of these library privileges enabled:
  - “Add Content”
  - “Add Content On Behalf of Others”
  - “Manage Library”
- To query all library documents in a library, a user must be a member of that library, regardless of library permissions.

<td>Read only. Indicates whether the library owns the document and determines permissions for that document (true) or not (false). Documents can belong to more than one library, but only one library owns the document and determines its permissions.</td>
</tr>
</tbody>
</table>

**Usage**

- Use this object to link a document to one or more libraries.
- To share a document with additional libraries, create additional ContentWorkspaceDoc records which join the document to the additional libraries.
- Inserting a ContentWorkspaceDoc triggers the publish process for public libraries.
- A document can be published into many public libraries, but it will always be owned by one library which controls the security of the document.
- A document can only be published into the document owner's personal library. You can't publish into another user's personal library. Personal libraries are not visible via the API.
- To publish a document into a personal library, you must specify your user ID as the first publish location ID. If you leave the first publish location ID blank, it defaults to the current user's ID.
- A document can be published from a personal library into a public library, but once it has been published into the public library, it can't be published into the personal library again.
• You can't publish a document from a personal library into a public library that has restricted content types.
• You can't update or delete a library document via the API.

SEE ALSO:
  ContentWorkspace

ContentWorkspaceMember

 Represents a member of a content library. This object is available in API version 40.0 and later. Manage library membership from the API.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

A user can create/update/delete memberships if they have the Manage Salesforce CRM Content admin perm or the Manage Library permission for the library concerned.

</tr>
</tbody>
</table>

**Usage**

Use this object to create, update, or delete members from a library.

**ContentWorkspacePermission**

Represents a library permission. This object is available in API version 40.0 and later.
A library permission is a group of privileges assigned to each content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

Note: Library permissions do not apply to personal libraries. All library users can save files in their personal libraries.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Special Access Rules**

The ability to create permissions requires either the Manage Salesforce CRM Content admin perm or the Manage Content Permissions user perm.

**Properties** Create, Filter, Update  
**Description** Permission for user to create, rename, and delete folders in libraries. |
| PermissionsTagContent | **Type** boolean  
**Properties** Create, Filter, Update  
**Description** Permission for user to add tags when publishing content or editing content details in the library. |
| PermissionsViewComments | **Type** boolean |
### ContentWorkspaceSubscription

Represents a subscription for a user following a library. This object is available in API version 42.0 and later.

#### Supported Calls

delte(), describeSObjects(), query(), retrieve()

#### Special Access Rules

Only users with Modify All Data permission have access to this object.

#### Fields

</tbody>
</table>
**Usage**

The Contract object represents a business agreement.

The Status field specifies the current state of a contract. Status strings (defined in the ContractStatus object) represent its current state (Draft, InApproval, or Activated).

Client applications must initially create a Contract in a non-Activated state. Client applications can subsequently activate a Contract by updating it and setting the value in its Status field to Activated; however, the Status field is the only field you can update when activating the Contract.

Once a Contract has been activated, your client application can’t change its status; however, prior to activation, your client application can change the status value from Draft to InApproval via the API. Also, your client application can delete contracts whose status is Draft or InApproval but not when a contract status is Activated.

Client applications can use the API to create, update, delete, and query any Attachment associated with a contract.

**Associated Objects**

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**AccountChangeEvent (API version 46.0)**

Change events are available for the object.

**ContractFeed (API version 18.0)**

Feed tracking is available for the object.

**ContractHistory**

History is available for tracked fields of the object.

</table>
DetailsField

This field or TotalPrice is required. You can't specify both.
If you specify Discount and Quantity, this field or TotalPrice is required.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContractLineItemChangeEvent (API version 44.0)
  Change events are available for the object.

ContractLineItemHistory
  History is available for tracked fields of the object.

ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

⚠️ Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Supported Calls

describeSObjects(), query(), retrieve()

### Field Details

**MasterLabel**

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
Label for this contract status value. This display value is the internal label that does not get translated.

**SortOrder**

**Type**
int

**Properties**
Filter, Group, Nillable, Sort

**Description**
Number used to sort this value in the contract status picklist. These numbers are not guaranteed to be sequential, as some previous contract status values might have been deleted.

**StatusCode**

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
Code indicating the status of a contract. One of the following values:

- Draft
- InApproval
- Activated

Two other values (Terminated and Expired) are defined but are not available for use via the API.

### Usage

This object represents a value in the contract status picklist. The contract status picklist provides additional information about the status of a Contract, such as its current state (Draft, InApproval, or Activated). You can query these records to retrieve the set of values in the contract status picklist, and then use that information while processing Contract objects to determine more information about a given contract. For example, the application could test whether a given contract is activated based on its Status value and the value of the StatusCode property in the associated ContractStatus object.

SEE ALSO:

- ContractContactRole
ContractTag

Associates a word or short phrase with a Contract.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve()

Fields

<table>
<thead>

<tr>
<td></td>
<td>● Public—The tag can be viewed and manipulated by all users in an organization.</td>
</tr>
</tbody>
</table>
Details

- **Personal**—The tag can be viewed or manipulated only by a user with a matching OwnerId.

Usage

ContractTag stores the relationship between its parent TagDefinition and the Contract being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

Conversation

Represents a conversation between an end user and an agent. Available in API version 49.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

### ConversationEntry

Represents a message or an event in the chat history between an agent and a messaging user. This object is available in API version 43.0 and later.

**Supported Calls**

- create()
- delete()
- describeSObjects()
- query()
- retrieve()
- update()
- upsert()

**Special Access Rules**

To use the ConversationEntry object, enable the Access Conversation Entries user permission, which is available in API version 50.0 and later. Earlier versions do not require permissions.

### EntryTimeMillisecs

- **Type**: int
- **Properties**: Create, Filter, Group, Nillable, Sort
- **Description**: The milliseconds value for the time when an entry was received by the server. Note that the related EntryTime field does not provide millisecond accuracy. This field is available in API version 51.0 and later.

### EntryType

- **Type**: picklist
- **Properties**: Create, Filter, Group, Restricted picklist, Sort
- **Description**: The type of entry in the chat history. Can be a message (text) or an event. The possible values include:
  - Text
  - AdminOptedIn
  - AdminOptedOut
  - BotEscalated
  - ChatbotClosedIdleSession
  - ChatbotEndedChatByAction—Conversation ended by automated action
  - ChatbotEndedTransferNotConfigured—Conversation ended because transfer fail is not configured
  - ChatbotEstablished
  - ChatbotNotEstablished
  - EndUserOptedIn
  - EndUserOptedOut

### HasAttachments

- **Type**: boolean
- **Properties**: Create, Defaulted on create, Filter, Group, Sort
- **Description**: Indicates whether a message has attachments associated with it (true) or not (false).

MessageStatusCode

Type: string
Properties: Create, Filter, Group, Nillable, Sort, Update
Description: The code associated with a message status. MessageStatusCode is only populated when a message is undeliverable.

Seq

Type: int
Properties: Create, Filter, Group, Sort
Description: The sequence position of this entry in the chat history.

ServerReceivedTimestamp

Type: dateTime
Properties: Create, Filter, Nillable, Sort
Description: The timestamp recorded when the server received the entry. This is a unique value and is used for ordering. This value can also be referred to as the "transcribed timestamp." This field is available in API version 51.0 and later.

ConversationParticipant

Represents an active participant in a conversation. A new ConversationParticipant record is created each time a participant joins a conversation. This object is available in API version 49.0 and later.

Supported Calls

describeSObjects(), query(), retrieve()

</table>

### CorsWhitelistEntry

Represents an entry in the cross-origin resource sharing (CORS) allowlist. Origins included in the allowlist can request REST resources from that Salesforce org.

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.
Supported Calls
create(), delete(), query(), retrieve(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeveloperName</td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong> The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only users with View DeveloperName OR View Setup and Configuration permission can view, group, sort, and filter this field.</td>

</tbody>
</table>
| MasterLabel         | **Type**  
string  
**Properties**  
Create, Filter, Group, Sort, Update  
**Description**  
Primary label for the CORS allowlist entry. |
| NamespacePrefix     | **Type**  
string  
**Properties**  
Filter, Group, Nillable, Sort  
**Description**  
For managed packages, this field is the namespace prefix assigned to the package. For unmanaged packages, this field is blank. |
| UrlPattern          | **Type**  
string  
**Properties**  
Create, Filter, Group, idLookup, Sort, Update  
**Description**  
The origin URL pattern must include the HTTPS protocol (unless you're using your localhost) and a domain name, and can include a port. The wildcard character (*) is supported and must be in front of a second-level domain name. For example, `https://*.*.example.com` adds all subdomains of example.com to the allowlist.  
The origin URL pattern can be an IP address. But an IP address and a domain that resolve to the same address aren't the same origin, and you must add them to the CORS allowlist as separate entries.  
Google Chrome™ and Mozilla® Firefox® browser extensions are also allowed as resources in API version 53 and later. Chrome extensions must use the prefix `chrome-extension://` and 32 characters without digits or capital letters, for example `chrome-extension://abdkkegmcbiomijeckdadaflgehfffed`. Firefox extensions must use the prefix `moz-extension://` and an 8-4-4-4-12 format of small alphanumeric characters, for example `moz-extension://1234ab56-78c9-1df2-3efg-4567891hi1j2`. |
Usage

Cross-Origin Resource Sharing (CORS) allows web browsers to request resources from other origins. For example, using CORS, the JavaScript for a web application at https://www.example.com can request a resource from https://www.salesforce.com. To allow access to supported Salesforce APIs, Apex REST resources, and Lightning Out from JavaScript code in a web browser, add the requesting origin to your Salesforce CORS allowlist.

If a browser that supports CORS makes a request to an origin in the Salesforce CORS allowlist, Salesforce returns the origin in the Access-Control-Allow-Origin HTTP header, along with any additional CORS HTTP headers. If the origin isn’t included in the allowlist, Salesforce returns HTTP status code 403.

⚠️ Important: CORS doesn’t support requests for unauthenticated resources, including OAuth endpoints. You must pass an OAuth token with requests that require it.

CORS is a W3C recommendation to enable browsers to request resources from origins other than their own.

CreditMemo

Represents a document that is used to adjust or rectify errors made in an invoice. The invoice has already been processed and sent to a customer. This object is available in API version 48.0 and later.

A credit memo always decreases the balance of an invoice or invoice lines. Users can apply positive credit memos to positive invoices or invoice lines, and negative credit memos to negative invoices or invoice lines. For example, a $10 credit memo would reduce the balance of a $100 invoice line to $90. A -$10 credit memo would reduce the balance of a -$100 credit memo to -$110.

Supported Calls

describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update()

### Crisis

Represents a major crisis event that affects an Employee in an InternalOrganizationUnit. This object is available in API version 48.0 and later. In API version 49.0 and later, this object supports reports, criteria-based sharing rules, and history tracking, plus you can exclude individual fields from custom page layouts.

Work.com uses this object to track and describe crisis situations.

#### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

#### Special Access Rules

To access this object, you must be assigned a Workplace Command Center permission set license and the Provides access to Workplace Command Center features system permission.

#### Fields

**Properties** Filter, Group, Nillable, Sort  
**Description** The cron expression used to initiate the schedule.  
**Syntax:**  
*Seconds Minutes Hours Day_of_month Month Day_of_week Optional_year*  
See `schedule(jobName, cronExpression, schedulableClass)` in the Apex Reference Guide. |
| **CronJobDetailId** | **Type** reference  
**Properties** Filter, Group, Nillable, Sort  
**Description** The ID of the CronJobDetail record containing more details about this scheduled job. This is a relationship field.  
**Relationship Name** CronJobDetail  
**Relationship Type** Lookup  
**Refers To** CronJobDetail |
| **EndTime** | **Type** dateTime  
**Properties** Filter, Nillable, Sort  
**Description** The date and time when the job either finished or will finish. |
| **NextFireTime** | **Type** dateTime  
**Properties** Filter, Nillable, Sort |
### CronTrigger Standard Objects

<table>
<thead>
<tr>
<th>Field</th>

Usage

Use this object to query scheduled jobs in your organization.

**CspTrustedSite**

Represents a CSP Trusted Site. The Lightning Component framework uses Content Security Policy (CSP) to impose restrictions on content. The main objective is to help prevent cross-site scripting (XSS) and other code injection attacks. To use third-party APIs that make requests to an external (non-Salesforce) server or to use a WebSocket connection, add a CSP Trusted Site. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

<table>
<thead>
<tr>

</tbody>
</table>

**Usage**

CSP is a W3C standard that defines rules to control the source of content that can be loaded on a page. All CSP rules work at the page level, and apply to all components and libraries. By default, the framework’s headers allow content to be loaded only from secure (HTTPS) URLs and forbid XHR requests from JavaScript.

When you define a CSP Trusted Site, you can add the site’s URL to the list of allowed sites for the following directives in the CSP header.

- connect-src
- frame-src
- img-src
- style-src
- font-src
- media-src

This change to the CSP header directives allows Lightning components to load resources, such as images, styles, and fonts, from the site. It also allows client-side code to make requests to the site.
CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

Supported Calls

create(), describeSObjects(), getUpdated(), query(), retrieve(), search(), update()

Special Access Rules

- This object is not available in single-currency organizations.
- You need the “Customize Application” permission to edit this object.
- Your client application can't delete this object.
- Customer Portal users can't access this object.

</tr>
</tbody>
</table>
### Field: IsCorporate

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

### Field: IsoCode

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

### Usage

This object is for multicurrency organizations only. Use this object to define the currencies your organization uses. When updating an existing record, make sure to provide values for all fields to avoid undesired changes to the CurrencyType. For example, if a value for IsActive is not provided, the default (false) is used, which could result in a currently active CurrencyType becoming inactive.

- [DatedConversionRate](#)
- [Object Basics](#)

### CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

### Supported Calls

create(), describeSObjects(), query(), retrieve(), update(), upsert()
Special Access Rules
This object is available only when your org has digital experiences enabled.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>ParentId</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong></td>
</tr>
<tr>

<tr>
<td></td>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td></td>
<td>Create, Filter, Group, Sort, Update</td>
</tr>
<tr>
<td></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td></td>
<td>The ID of the parent entity that this branding applies to. The parent entity can be an Experience Cloud site, organization, topic, or reputation level. The branding applies to the entity that the ParentId references. For example, if the ParentId references a network ID, the branding applies to that Experience Cloud site only, and if the ParentId references an organization ID, the branding applies to the organization that it is accessed through, and so on. Label is Branded Entity ID.</td>
</tr>
</tbody>
</table>

Usage
Use this object along with CustomBrandAsset to apply a custom branding scheme to your Experience Cloud site. The branding scheme for the site shows in both the user interface and in the Salesforce mobile app. You must have Create and Manage Experiences to customize site branding.

You can also use this object to apply a custom branding scheme to your org when it is accessed through the Salesforce mobile app.

SEE ALSO:
Network

CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to an Experience Cloud site or to an org using the Salesforce mobile app. This object is available in API version 28.0 and later.

Supported Calls
create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules
This object is available only when your org has digital experiences enabled.
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AssetCategory</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Type**  
picklist

**Properties**  
Create, Filter, Group, Restricted picklist, Sort, Update

**Description**

Values include:

- **MotifZeronaryColor**—The background color for the header. Label is Zeronary motif color.
  
  If this CustomBrandAsset is for a network, this is the header color for the network. If it is for an org, this is the header color when users access the Salesforce mobile app.

- **MotifPrimaryColor**—The color used for the active tab. Label is Primary motif color.
  
  Not used for the Salesforce mobile app branding.

- **MotifSecondaryColor**—The color used for the top borders of lists and tables. Label is Secondary motif color.
  
  Not used for the Salesforce mobile app branding.

- **MotifTertiaryColor**—The background color for section headers on edit and detail pages. Label is Tertiary motif color.
  
  Not used for the Salesforce mobile app branding.

- **MotifQuaternaryColor**—If this CustomBrandAsset is for a network, this is the background color for network pages. If it is for an org, this is the background color on a splash page. Label is Quaternary motif color.

- **MotifZeronaryComplementColor**—Font color used with zeronaryColor. Label is Zeronary motif colors complement color.

- **MotifPrimaryComplementColor**—Font color used with primaryColor. Label is Primary motif colors complement color.
  
  Not used for the Salesforce mobile app branding.

- **MotifTertiaryComplementColor**—Font color used with tertiaryColor. Label is Tertiary motif colors complement color.
  
  Not used for the Salesforce mobile app branding.

### CustomHelpMenuItem

Represents the items within a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

**Supported Calls**

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

**Packaging Considerations**

Although you can package custom Help Menu section information, the section won’t appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the CustomHelpMenuItem and CustomHelpMenuSection objects and then manually add resources on the Help Menu Setup page. See Define Custom Help for the Lightning Experience Help Menu for more information.

</tr>
</tbody>
</table>
CustomHelpMenuSection

Represents a section of the Lightning Experience help menu that the admin added to display custom, org-specific help resources. This object is available in API version 44.0 and later.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Packaging Considerations

Although you can package custom Help Menu section information, the section won’t appear in the Help Menu Setup page or the Help Menu user interface of orgs where the package is installed. Instead, customers must view the data in the CustomHelpMenuItem and CustomHelpMenuSection objects and then manually add resources on the Help Menu Setup page. See Define Custom Help for the Lightning Experience Help Menu for more information.

Fields

- th (Thai)
- zh_CN (Chinese (Simplified))
- zh_TW (Chinese (Traditional))

### MasterLabel

**Type**
string

**Properties**
Create, Filter, Group, Sort, Update

**Description**
Required. The name of the resource. Specify up to 100 characters.

### NamespacePrefix

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer.
In orgs that are not Developer Edition orgs, NamespacePrefix is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

CustomHttpHeader

Represents a custom HTTP header that provides context information from Salesforce such as region, org details, or the role of the person viewing the external object. This object is available in API version 43.0 and later.

Supported Calls

describeLayout(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Spring ’20 and later, only authenticated internal and external users can access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Type: textarea Properties: Filter, Nillable, Sort Description: A text description of the header field's purpose.</td>
</tr>
<tr>
<td>HeaderFieldName</td>
<td>Type: string Properties: Filter, Group, Sort Description: Name of the header field. The name must contain at least one alphanumeric character or underscore. It can also include: ! # $ % &amp; * + - . ^ _ `</td>
</tr>
<tr>
<td>HeaderFieldValue</td>
<td>Type: string Properties: Filter, Sort</td>
</tr>
</tbody>
</table>
### Field Name: Details

#### Description
A formula that resolves to the value for the header. The values in the formula must evaluate to a string. If the formula resolves to null and an empty string, the header isn’t sent.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsActive</td>
<td>boolean</td>
<td>Defaulted on create, Filter, Group, Sort</td>
<td>Indicates whether the custom HTTP header is available to use.</td>
</tr>
<tr>
<td>ParentId</td>
<td>reference</td>
<td>Filter, Group, Sort</td>
<td>ID of the entity that the custom HTTP header is related to. This is a polymorphic relationship field.</td>
</tr>
</tbody>
</table>

**Usage**

For each OData external data source, define up 10 HTTP headers to request data.

*Note:* HTTP headers aren’t supported on named credentials.

### CustomNotificationType

Stores information about custom notification types. This object is available in API version 47.0 and later.

**Supported Calls**

*create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()*
## CustomNotificationType

| Desktop           | Type  
boolean  
Properties  
Create, Defaulted on create, Filter, Group, Sort, Update  
Description  
Indicates whether the desktop delivery channel is enabled (true) or not (false). The default is false. |
| DeveloperName     | Type  
string  
Properties  
Create, Filter, Group, Sort, Update  
Description  
Specifies the API name of the notification type. |
| Language          | Type  
picklist  
Properties  
Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update  
Description  
Specifies the language of the custom notification type. The value for this field is the language value of the org. |
CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

Supported Calls
describeLayout(), describeSObjects(), query(), retrieve()

Special Access Rules
As of Summer '20 and later, only users who have one of these permissions can access this object:

- View Setup and Configuration
- Manage Session Permission Set Activations
- Assign Permission Sets
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| Description    | **Type**
textarea
**Properties**
Filter, Group, Nillable, Sort
**Description**
A description of the custom permission. Limit: 255 characters. |
| DeveloperName  | **Type**
string
**Properties**
Filter, Group, Sort
**Description**
The unique name of the custom permission in the API. This name can contain only underscores and alphanumeric characters and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The label corresponds to **Name** in the user interface. Limit: 80 characters.

**Note:** When creating large sets of data, always specify a unique **DeveloperName** for each record. If no **DeveloperName** is specified, performance slows down while Salesforce generates one for each record.

**Note:** Only users with View **DeveloperName** OR View Setup and Configuration permission can view, group, sort, and filter this field. |
| IsLicensed      | **Type**
boolean
**Properties**
Defaulted on create, Filter, Group, Sort
**Description**
When enabled (true) indicates that the appropriate Salesforce license is required before accessing the permission. This field is available in API version 50.0 and later. |
| Language        | **Type**
picklist
**Properties**
Filter, Group, Restricted picklist, Sort
**Description**
The language of the custom permission. Valid values are:
- Chinese (Simplified): zh_CN |
### Field Name: Details

- Chinese (Traditional): zh_TW
- Danish: da
- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX  Spanish (Mexico) defaults to Spanish for customer-defined translations.
- Swedish: sv
- Thai: th  The Salesforce user interface is fully translated to Thai, but Help is in English.

### MasterLabel

**Type**
string

**Properties**
Filter, Group, Sort

**Description**
The custom permission label, which corresponds to Label in the user interface. Limit: 80 characters.

### NamespacePrefix

**Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the...
### Field Name Details

- **NamespacePrefix**
  > installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
  > In orgs that are not Developer Edition orgs, NamespacePrefix is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

### Usage

Use the CustomPermission object to determine users’ access to custom permissions.

For example, to query all permission sets where the Button1 permission is enabled:

```sql
SELECT Id, DeveloperName,
(SELECT Id, Parent.Name, Parent.Profile.Name from SetupEntityAccessItems)
FROM CustomPermission
WHERE DeveloperName = 'Button1'
```

To query all permission sets and profiles with custom permissions:

```sql
SELECT Assignee.Name, PermissionSet.Id,
PermissionSet.Profile.Name,
PermissionSet.isOwnedByProfile,
PermissionSet.Label
FROM PermissionSetAssignment
WHERE PermissionSetId IN (SELECT ParentId
FROM SetupEntityAccess
WHERE SetupEntityType = 'CustomPermission')
```

To query for all SetupEntityAccess rows with custom permissions:

```sql
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType = 'CustomPermission'
AND ParentId IN (SELECT Id
FROM PermissionSet
WHERE isOwnedByProfile = false)
```

**SEE ALSO:**
- CustomPermissionDependency
- PermissionSet
- Profile
- SetupEntityAccess
CustomPermissionDependency

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

Supported Calls

describeLayout(), describeSObjects(), query(), retrieve()

Special Access Rules

As of Spring '20 and later, only users with View Setup and Configuration permission can access this object.

The following Apex class contains a method that returns the IDs of all custom permissions that are required for the given custom permission ID. To use this class, save it in your organization.

```apex
public class CustomPermissionUtil {
    public String[] getAllRequiredCustomPermissions(String customPermId) {
        return getAllRequiredHelper(new String[] {customPermId});
    }

    private String[] getAllRequiredHelper(String[] customPermIds) {
        CustomPermissionDependency[] requiredPerms = [SELECT RequiredCustomPermissionId
            FROM CustomPermissionDependency
            WHERE CustomPermissionId IN :customPermIds];

        String[] requiredPermIds = new String[] {};
        for (CustomPermissionDependency cpd : requiredPerms) {
            requiredPermIds.add(cpd.RequiredCustomPermissionId);
        }
        if (requiredPermIds.size() > 0) {
            customPermIds.addAll(getAllRequiredHelper(requiredPermIds));
        } else {
            return customPermIds;
        }
    }
}
```

For more information about using Apex classes, see the Apex Developer Guide.

**DandBCompany**

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

**Note:** When your Data.com Prospector or Data.com Clean contract expires, Data.com features, objects, and fields will be removed from your org.

To support customers’ needs around compliance and to remain a leader in trust and privacy, Salesforce removed all contact data from the Data.com service on February 1, 2021.

For more information, see [Data.com Prospector and Clean Retirement](#).

**Warning:** You can update fields in the DandBCompany object; however, field changes may be overwritten by Data.com Clean jobs or by using the Data.com Clean button.
### Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Special Access Rules

Only organizations with Data.com Premium Prospector or Data.com Premium Clean can access this object.
