| **Refers To** | VoiceVendorInfo 

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **VoiceVendorLineOwnerSharingRule**
  - Sharing rules are available for the object.

- **VoiceVendorLineShare**
  - Sharing is available for the object.

### Vote

Represents a vote that a user has made on an Idea or a Reply.

**Note:** In API version 16.0 and earlier, SOQL queries on the Vote object only return votes for the Idea object. Starting in API version 17.0, SOQL queries return votes for both Idea and Reply.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

As of Summer ’20 and later, only authenticated internal and external users can access this object.

</tr>
<tr>
<td>Refers To</td>
<td>Idea, IdeaComment, Solution</td>
</tr>
</tbody>
</table>

**Type**
- Type: picklist
- Properties: Group, Sort, Create, Filter, Restricted picklist, Update

**Description**
Picklist that indicates the type of vote. The value `Up` indicates that the vote is a user’s positive endorsement of the associated idea or reply. The value `Down` indicates that the vote is a user’s negative endorsement of the associated idea or reply.

**Note:** If you are importing Vote data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

**Usage**
In version 12.0 and later, use this object to track the votes that users made on ideas. For more information on ideas, see “Understand and Work with Ideas” in the Salesforce online help.

In version 17.0 and later, you must filter using the following syntax when querying this object in a SOQL query: `ParentId = single ID, Parent.Type = single Type, Id = single ID` or `Id IN (list of IDs)`. See Comparison Operators in the Salesforce SOQL and SOSL Reference Guide for a sample query.

A SOQL query must filter using one of the following Parent or Id clauses:
- ParentId = `[single ID]`
- Parent.Type = `[single type]`
- Id = `[single ID]`
- Id IN = `[list of IDs]`

**SEE ALSO:**
- Idea
- IdeaComment

**WarrantyTerm**
Represents warranty terms defining the labor, parts, and expenses covered, along with any exchange options, provided to rectify issues with products. This object is available in API version 50.0 and later.
## Supported Calls

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

**WarrantyTermChangeEvent**

Change events are available for the object.

**WaveAutoInstallRequest**

Provides access the concrete object that represents a Tableau CRM auto install request. The auto install request tracks the progress of Tableau CRM applications created from Tableau CRM templates by the automated process user. This object is available in API version 38.0 and later.

**Supported Calls**

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Special Access Rules**

Tableau CRM must be enabled in your org. A user must have the Auto Install permission enabled.

</table>
Usage

Use this object to query and create auto install requests for Tableau CRM applications in your org. This object is useful to troubleshoot issues with templated applications that are created by the automated process user.

WebCart

Represents an online shopping cart in a store built with B2B Commerce on Lightning, with total amounts for products, shipping and handling, and taxes. This object is available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

The WebCart object is available only if the B2B Commerce on Lightning Experience license is enabled.

### WebCart Standard Objects

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Properties</strong></td>
<td>FILTER, NILLABLE, SORT</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The total tax adjustment for all item discounts related to product promotions. This field is available in API version 52.0 and later.</td>
</tr>
</tbody>
</table>

#### TotalTaxAmount
- **Type**: currency
- **Properties**: FILTER, NILLABLE, SORT
- **Description**: The sum of all cart items' `TotalTaxAmount`, or `TotalProductTaxAmount` plus `TotalDeliveryTaxAmount`.

#### Type
- **Type**: picklist
- **Properties**: CREATE, DEFAULTED ON CREATE, FILTER, GROUP, NILLABLE, RESTRICTED PICKLIST, SORT, UPDATE
- **Description**: The `WebCart` type. Default value is `Cart`. Possible values are:
  - Cart

#### UniqueProductCount
- **Type**: int
- **Properties**: DEFAULTED ON CREATE, FILTER, GROUP, NILLABLE, SORT
- **Description**: The count of unique product SKUs in the `WebCart`.

#### WebStoreId
- **Type**: reference
- **Properties**: CREATE, FILTER, GROUP, SORT, UPDATE
- **Description**: The store ID related to this `WebCart`.

### Usage Notes
- In a B2B Commerce for Lightning store, customers who created custom components for adding items to carts noticed that, after adding items, the cart badge didn't refresh. A hard refresh causes the value to properly update.
Associated Objects
This object has the following associated objects. Unless it’s noted, associated objects are available in the same API version as this object.

**WebCartHistory**
- History is available for tracked fields of the object.

**WebCartOwnerSharingRule**
- Sharing rules are available for the object.

**WebCartShare**
- Sharing is available for the object.

SEE ALSO:
- Commerce Webstore Cart Promotions
- Commerce Webstore Promotions, Associate Action
- Commerce Webstore Promotions, Execute Action

WebCartAdjustmentGroup
Group of price adjustments for a cart. This object is available in API version 52.0 and later.

Supported Calls
- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules
The WebCartAdjustmentGroup object is available only if the B2B Commerce license is enabled.

|                     | Create, Filter, Group, Sort                                             |
|                     | **Description**
|                     | ID of the cart to which the price adjustment belongs.                   |
|                     | This is a relationship field.                                           |
|                     | **Relationship Name**
|                     | Cart                                                                     |
|                     | **Relationship Type**
|                     | Lookup                                                                  |
## Field: CurrencyIsoCode

**Details**

- **Refers To**: WebCart

**Type**: picklist

**Properties**: Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

**Description**: The ISO code for the currency that’s specified on the buyer’s account. Default value is USD.

Possible values are:
- **EUR**—Euro
- **USD**—U.S. Dollar

## Field: Description

**Details**

**Type**: textarea

**Properties**: Create, Nillable, Update

**Description**: Description of the adjustment group.

## Field: Name

**Details**

**Type**: string

**Properties**: Create, Filter, Group, idLookup, Sort, Update

**Description**: Name of the adjustment group.

## Field: PriceAdjustmentCauseId

**Details**

**Type**: reference

**Properties**: Create, Filter, Group, Sort, Update

**Description**: ID of entity that caused this adjustment (for example, a promotion ID).

This is a relationship field.

**Relationship Name**: PriceAdjustmentCause

**Relationship Type**: Lookup

**Refers To**: Promotion

## WebCartHistory

WebCartHistory represents the history of changes to the values in the fields of the WebCart object.

For specific version information, see the documentation for WebCart.

### Supported Calls

- `describeSObjects()`, `query`, `replicate`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).
Special Access Rules

For specific special access rules, if any, see the documentation for WebCart.

WebLink

Represents a custom link to a URL or Scontrol.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Special Access Rules

- To create a custom link, the client application must be logged in with the "Customize Application" permission.
- Customer Portal users can't access this object.

</tbody>
</table>
| IsResizable     | **Type** boolean  
**Properties** Create, Defaulted on create, Filter, Group, Sort, Update  
**Description** Indicates whether users are allowed to resize the popup window (true) or not (false).                                             |
| LinkType        | **Type** picklist  
**Properties** Create, Filter, Group, Restricted picklist, Sort, Update  
**Description** Required. Type of link (S-control or URL).                                                                                                                                 |
| MasterLabel     | **Type** string  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** Master label for the link. Limit is 240 characters. This display value is the internal label that is not translated.                              |
| Name            | **Type** string  
**Properties** Create, Filter, Group, idLookup, Sort, Update  
**Description** Required. Name to display on page.                                                                                                                                             |
| NamespacePrefix | **Type** string  
**Properties** Filter, Group, Nillable, Sort  
**Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 |

3535
characters. You can refer to a component in a managed package by using the 
```namespacePrefix __ componentName``` notation.

The namespace prefix can have one of the following values.

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

This field can’t be accessed unless the logged-in user has the Customize Application permission.

Usage

Use this object to programmatically manage custom links, which allow client applications to integrate data with external URLs, an organization's intranet, or other back-end office systems. A custom link can point to:

- An external URL, such as www.google.com or your company's intranet.
- A custom s-control, such as a Java applet or Active-X control.

Custom links can include fields as tokens within the URL or custom s-control.

SEE ALSO:
  - Scontrol

WebLinkLocalization

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

**Description**

This field is available in API version 17.0 and later. The combined language and locale ISO code, which controls the language for labels displayed in an application.

This picklist contains the following fully-supported languages:

- Chinese (Simplified): zh_CN
- Chinese (Traditional): zh_TW
- Danish: da
- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX Spanish (Mexico) defaults to Spanish for customer-defined translations.
- Swedish: sv
- Thai: th The Salesforce user interface is fully translated to Thai, but Help is in English.

The following end-user only languages are available:

- Arabic: ar
- Bulgarian: bg
- Croatian: hr
- Czech: cs
- English (UK): en_GB
- Greek: el
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Polish: pl
- Portuguese (European): pt_PT
- Romanian: ro
- Slovak: sk

<tbody>
<tr>
<td>Properties</td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td>Description</td>
<td></td>
</tr>
</tbody>
</table>
| The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation.  

The namespace prefix can have one of the following values.  

- In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field’s value is the namespace prefix of the Developer Edition org of the package developer.  
- In orgs that are not Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix. |

**Value**

<td></td>
</tr>
</tbody>
</table>
**Usage**

Use this object to translate your custom links to URLs or s-controls into the different languages supported by Salesforce. Users with the Translation Workbench enabled can view custom link translations, but either the “Customize Application” or “Manage Translation” permission is required to create or update custom link translations.

**Description**

Type

textarea

**Properties**

Create, Nillable, Update

**Description**

Description of the store.

---

**GuestBuyerProfileId**

Type

reference

**Properties**

Filter, Group, Nillable, Sort

**Description**

The ID of the GuestBuyerProfile associated with the store. GuestBuyerProfile determines what buyer groups are part of the profile. The guest buyer groups then determine the entitlements and pricing of products for the guest buyer.

---

**GuestCartTimeToLive**

Type

int

**Properties**

Create, Defaulted on create, Filter, Group, Nillable, Sort, Update

**Description**

The time that a guest cart is to remain valid. This field is available in API version 52.0 and later.

---

**LastReferencedDate**

Type

dateTime

**Properties**

Filter, Nillable, Sort

**Description**

The timestamp for when the current user last viewed a record related to this record.

---

**LastViewedDate**

Type

dateTime
<table>

### Field Details

**SupportedCurrencies**

- **Type**: textarea
- **Properties**: Create, Defaulted on create, Nillable, Update
- **Description**: Currencies supported in the store.

**SupportedLanguages**

- **Type**: textarea
- **Properties**: Create, Defaulted on create, Nillable, Update
- **Description**: Languages supported in the store.

**Type**

- **Type**: picklist
- **Properties**: Defaulted on create, Filter, Group, Restricted picklist, Sort
- **Description**: Type of store that can be created.
  
  Possible values are:
  
  - B2B
  - B2C
  - B2CE
  - OMS
  
  The default value is B2B.

---

### WebStoreCatalog

Represents the collection of products associated with a store. This object is available in API version 49.0 and later.

#### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

#### Special Access Rules

You must have the B2B Commerce license and a CMS workspace to access product media.
## Fields

<table>

 |  - **USD**— U.S. Dollar  
 |  The default value is **USD**. |
| **LastReferencedDate** | **Type**: dateTime  
 | **Properties**: Filter, Nillable, Sort  
 | **Description**: The timestamp for when the current user last viewed a record related to this record. |
| **LastViewedDate**     | **Type**: dateTime  
 | **Properties**: Filter, Nillable, Sort  
 | **Description**: The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed. |
| **Name**               | **Type**: string  
 | **Properties**: Autonumber, Defaulted on create, Filter, idLookup, Sort  
 | **Description**: Name of the catalog. |
| **ProductCatalogId**   | **Type**: reference  
 | **Properties**: Create, Filter, Group, Sort  
 | **Description**: The ID of the catalog, containing products. |
Details

**SalesStoreId**

- **Type**: reference
- **Properties**: Create, Filter, Group, Sort
- **Description**: The ID of the store that the catalog is associated with. This field is unique within your org.

Associated Objects

- **WebStoreCatalogHistory**
  - History is available for tracked fields of the object.

WebStorePricebook

Represents a store price book used in Lightning B2B Commerce. This object is available in API version 48.0 and later.

Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IsActive</strong></td>
<td></td>
</tr>
<tr>
<td>- <strong>Type</strong>: boolean</td>
<td></td>
</tr>
<tr>
<td>- <strong>Properties</strong>: Create, Defaulted on create, Filter, Group, Sort, Update</td>
<td></td>
</tr>
<tr>
<td>- <strong>Description</strong>: Determines whether the WebStorePricebook is active (true) or not (false). Default value is false.</td>
<td></td>
</tr>
</tbody>
</table>

| LastReferencedDate     |         |
| - **Type**: dateTime   |         |
| - **Properties**: Filter, Nillable, Sort |         |
### Field Details

**Description**
The timestamp for when the current user last viewed a record related to this record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Name**    | Type: string  
  Properties: Autonumber, Defaulted on create, Filter, idLookup, Sort  
  Description: The name of the store price book record. |
| **Pricebook2Id** | Type: reference  
  Properties: Create, Filter, Group, Sort, Update  
  Description: The ID of the price book assigned to the store. |
| **WebStoreId** | Type: reference  
  Properties: Create, Filter, Group, Sort  
  Description: The ID of the store assigned to the price book. |

**Usage**

Use the **WebStorePricebook** object to assign price books to a store. When you assign a price book to a web store, any buyer who has access to the store can price products from the assigned price books. When a store or buyer has multiple price book assignments, including prices to the same product, the price is determined by the pricing strategy of the store.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
Wishlist

Represents a buyer-created list of WishlistItems in a store that’s built with B2B Commerce on Lightning. Available in API version 49.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The Wishlist object is available only if the B2B Commerce on Lightning Experience license is enabled.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccountId</td>
<td>Type reference</td>

</tr>
</tbody>
</table>
Field | Details
--- | ---
OwnerId | **Type** reference
  **Properties** Create, Defaulted on create, Filter, Group, Sort, Update
  **Description** The ID of the user or group that owns the Wishlist.

WebStoreId | **Type** reference
  **Properties** Create, Filter, Group, Sort, Update
  **Description** The ID of the WebStore related to this Wishlist.

WishlistProductCount | **Type** int
  **Properties** Filter, Group, Nillable, Sort
  **Description** The count of WishlistItems on this Wishlist. WishlistProductCount is a calculated field.

Associated Objects
This object has the following associated objects. Unless it’s noted, associated objects are available in the same API version as this object.

- **WishlistOwnerSharingRule on page 3714**
  Sharing rules are available for the object.

- **WishlistShare on page 3719**
  Sharing is available for the object.

Usage Notes
- Wishlists aren’t included in any searches.

SEE ALSO:
  - WishlistItem

WishlistItem
Represents an item on a Wishlist in a store built with B2B Commerce for Lightning. Available in API version 49.0 and later.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules
The WishListItem object is available only if the B2B Commerce for Lightning license is enabled.

3555
Details

Description
The ID of the parent Wishlist of this WishlistItem.

SEE ALSO:
Wishlist

WorkAccess

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

Supported Calls
create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Additional Considerations and Related Objects
WorkAccess is not available through Schema Builder and is not customizable. A WorkAccess record is required for users to Give BadgeDefinitions. If a WorkAccess record is not created, BadgeDefinitions will not be available to users.

The sharing of WorkAccess records is through WorkAccessShare. For each WorkBadgeDefinition record, you must create both a WorkAccess record (per WorkBadgeDefinition) and WorkAccessShare records for sharing to users or groups.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessType</td>
<td>Type: picklist&lt;br&gt;Properties: Create, Filter, Group, Restricted picklist, Sort, Update&lt;br&gt;Description: Define the type of Access given to user (&quot;Give&quot;).</td>
</tr>
<tr>
<td>OwnerId</td>
<td>Type: reference&lt;br&gt;Properties: Create, Defaulted on create, Filter, Group, Sort, Update&lt;br&gt;Description: Salesforce unique ID for owner of Access record. This is a polymorphic relationship field.</td>
</tr>
</tbody>
</table>
### Field Name

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ParentId</td>
<td>Salesforce unique ID for BadgeDefinition record associated with this Access record. This is a relationship field.</td>
</tr>
</tbody>
</table>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkAccessOwnerSharingRule**
  - Sharing rules are available for the object.

- **WorkAccessShare**
  - Sharing is available for the object.

### WorkAccessShare

Used to control Givers of WorkBadgeDefinition records.

### Supported Calls

- `create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Additional Considerations and Related Objects

Related to **WorkAccess Object**. WorkAccess is the parent of WorkAccessShare.
## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>

WorkBadge

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Additional Considerations and Related Objects

WorkBadge is a lookup to WorkThanks. Each WorkBadge record must derive a SourceId from WorkThanks. There can be multiple WorkBadge records tied to a single WorkThanks record.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>

WorkBadgeDefinition

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Additional Considerations and Related Objects

WorkBadgeDefinition has a field called ImageUrl that references a DocumentID. This is a required field for creating a Badge. To grant "giver" access to a WorkBadgeDefinition, you must also create the WorkAccess (and the related WorkAccessShare records.

Each WorkBadgeDefinition has an ImageUrl field that must be populated with a DocumentID of the Document record containing the badge image.
### Fields

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkBadgeDefinitionFeed**
  Feed tracking is available for the object.

- **WorkBadgeDefinitionHistory**
  History is available for tracked fields of the object.

- **WorkBadgeDefinitionOwnerSharingRule**
  Sharing rules are available for the object.

- **WorkBadgeDefinitionShare**
  Sharing is available for the object.

### WorkCoaching

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

### Supported Calls

- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Fields

<table>
<thead>
<tr>

|                 | string |
|                 | **Properties**  
|                 | Create, Filter, Group, Sort, Update |
|                 | **Description**  
|                 | [Required] The record's name. Max length is 255 characters. |
| OwnerId         | **Type**  
|                 | reference |
## WorkDemographic

Represents the field values used to specify slices in the workload forecasting and capacity planning. This object is available in API version 49.0 and later.

### Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

### Special Access Rules

The org must have the Workforce Engagement license. To view, create, edit, or delete records, the user must have the Workforce Engagement Analyst permission set.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>

</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### WorkFeedback

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
</table>
| **ServiceTerritoryId** | **Type**
reference

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
The foreign key to the ServiceTerritory object.
This is a relationship field.

**Relationship Name**
ServiceTerritory

**Relationship Type**
Lookup

**Refers To**
ServiceTerritory

| **SkillSet** | **Type**
string

**Properties**
Filter, Group, Nillable, Sort

**Description**
The skill value.
Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Additional Considerations and Related Objects

- Ownership is transferred to the requester on submit for certain types (ad-hoc feedback).
- The record is read-only after the request that it’s linked to is set to Submitted.
- You can’t link a feedback object to a request unless you are the recipient.
- The question that the feedback is linked to must be part of the same question set that the request is linked to.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feedback</td>
<td>Type textarea</td>
</tr>
<tr>
<td></td>
<td>Properties Create, Nillable, Update</td>
</tr>
<tr>
<td></td>
<td>Description Contains either the free-form text of the answer, or the choice selected by the user. Max length is 65536.</td>
</tr>
<tr>
<td>Name</td>
<td>Type string</td>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkFeedbackQuestionHistory**
  - History is available for tracked fields of the object.

- **WorkFeedbackQuestionOwnerSharingRule**
  - Sharing rules are available for the object.

- **WorkFeedbackQuestionShare**
  - Sharing is available for the object.
WorkFeedbackQuestionSet

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

In the WDC performance application, a question set defines the type of summaries and their due dates that will accompany the deployment of a specific performance summary cycle.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| DueDate     | Type:
  date
  Properties:
  Create, Filter, Group, Nillable, Sort, Update
  Description:
  The date that this specific question set is expected to be submitted by the recipient. This field applies only to performance summaries. |
| FeedbackType| Type:
  picklist
  Properties:
  Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort
  Description:
  The description of the collection of questions that are written in context to the type of recipient answering them, relative to the subject of the summary. This field applies only to performance summaries. |
| Name        | Type:
  string
  Properties:
  Create, Filter, Group, idLookup, Sort, Update
  Description:
  The name of the question set. Maximum length is 225 characters. |
| OwnerId     | Type:
  reference |
## Field Name | Details
--- | ---
**Properties** | Create, Defaulted on create, Filter, Group, Sort, Update
**Description** | ID of the owner of the WorkFeedbackQuestionSet.

### PerformanceCycleId

**Type**
reference

**Properties**
Create, Filter, Group, Nillable, Sort

**Description**
If a question set is associated to a performance summary cycle, then that cycle ID is referenced in this field. This field applies only to performance summaries.

## Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkFeedbackQuestionSetHistory**
  History is available for tracked fields of the object.

- **WorkFeedbackQuestionSetOwnerSharingRule**
  Sharing rules are available for the object.

- **WorkFeedbackQuestionSetShare**
  Sharing is available for the object.

## WorkFeedbackRequest

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

### Supported Calls
- create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()
• When a recipient of a request submits their feedback (Draft->Submitted), a notification will be sent to requester (except for offered feedback).
• Requester cannot modify the subject of the question set after a request is created.
• For offered feedback (to user, to manager, or both), the person who is offering feedback is both the creator of WorkFeedbackRequest as well as the recipient.

### Field Name: SharingScope

**Details**

- **Type**: picklist
- **Properties**: Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update
- **Description**: The users that see the feedback. SharingScope can have the following values:
  - Nobody
  - Subject
  - Manager
  - SubjectAndManager

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
WorkFeedbackRequestFeed
Feed tracking is available for the object.

WorkFeedbackRequestHistory
History is available for tracked fields of the object.

WorkFeedbackRequestOwnerSharingRule
Sharing rules are available for the object.

WorkFeedbackRequestShare
Sharing is available for the object.

WorkforceCapacity

Represents the time series for actual or forecasted workforce allocation. This object is available in API version 51.0 and later.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The org must have the Workforce Engagement license. To view, create, edit, and delete records, the user needs to have the Workforce Engagement Analyst permission set.

### Associated Objects
This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **WorkforceCapacityOwnerSharingRule** on page 3714
  Sharing rules are available for the object.
- **WorkforceCapacityShare** on page 3719
  Sharing is available for the object.

### WorkforceCapacityUnit
Represents the number of resources allocated or needed to handle specific set of work items at a timestamp within a specific duration. This object is available in API version 51.0 and later.

#### Supported Calls
- `create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retriev()`, `undelete()`, `update()`, `upsert()`

#### Special Access Rules
The org must have the Workforce Engagement license. To view, create, edit, or delete records, the user must have the Workforce Engagement Analyst permission set.

### WorkGoal

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| **RootId** | **Type**  
reference to a WorkGoal object  
**Properties**  
Create, Filter, Group, Nillable, Sort, Update  
**Description**  
Specifies the structural root of the WorkGoal. For example, a goal that has a metric is represented by a WorkGoal of Type Metric, which has a root of WorkGoal of Type Goal. |
| **State** | **Type**  
picklist  
**Properties**  
Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description**  
The state of the WorkGoal object. Applies only to WorkGoal objects of Type Metric. Possible values:  
• Draft: the draft state for the WorkGoal  
• Published: published state for the WorkGoal  
• Archived: archived state for the WorkGoal (for example, goals that no longer apply) |
| **TargetValue** | **Type**  
double  
**Properties**  
Create, Filter, Nillable, Sort, Update  
**Description**  
The target value of the WorkGoal. Applies only to WorkGoal objects of Type Metric. |
| **Type** | **Type**  
picklist  
**Properties**  
Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description**  
The type of the WorkGoal object, used to differentiate between the components of a goal. (This field is used to represent components of a goal such as its description and associated metrics.) Possible values:  
• Goal: a goal  
• Metric: a metric (typically associated with goals) |
### Field Name

<table>
<thead>
<tr>
<th>Details</th>

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkGoalFeed (API version 35.0)**
  - Feed tracking is available for the object.

- **WorkGoalHistory**
  - History is available for tracked fields of the object.

- **WorkGoalOwnerSharingRule**
  - Sharing rules are available for the object.

- **WorkGoalShare**
  - Sharing is available for the object.

### WorkGoalCollaborator

Represents collaborators on a WorkGoal object. This doesn’t include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the `Goal` object to query information about WDC goals.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

**Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update  
**Description** Indicates the state of the collaborating user. Whether the user has not responded, joined, or declined collaboration. The possible values are:  
- PendingResponse: a user who was invited to collaborate but hasn't joined or declined  
- Joined: a user who is collaborating on a goal (joined/commit)  
- Declined: a user who declined to collaborate on a goal |
| UserId | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** The collaborating user. |
| WorkGoalId | **Type** reference  
**Properties** Create, Filter, Group, Sort  
**Description** The WorkGoal object that this collaborator is a part of. |

## Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

**WorkGoalCollaboratorHistory**  
History is available for tracked fields of the object.
WorkGoalCollaboratorHistory

Represents the history of changes to the values in the fields in a WorkGoalCollaborator object. Access is read-only.

**Note:** This object has been deprecated as of API version 35.0. Use the Goal object to query information about WDC goals in API version 35.0 and later.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

</tbody>
</table>
### WorkGoalHistory

Represents the history of changes to the values in the fields of a WorkGoal. Access is read-only. This object has been deprecated as of API version 35.0. Use the GoalHistory object to query historical information for WDC goals.

#### Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable `delete()` in API version 42.0 and later. See [Enable delete of Field History and Field History Archive](#).

3598
WorkGoalLink

Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the GoalLink object to query information about the relationship between two WDC goals.

**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
</table>
| IsActive   | Type: boolean  
Properties: Create, Defaulted on create, Filter, Group, Sort  
Description: Whether the WorkGoalLink is active (true) or not (false) |
| LinkType   | Type: picklist  
Properties: Create, Filter, Group, Restricted picklist, Sort, Update  
Description: The type of link |
| Name       | Type: string |
WorkGoalShare

Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the GoalShare object to query information about sharing for WDC goals.

Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessLevel</td>
<td>Type: picklist, Properties: Create, Filter, Group, Restricted picklist, Sort, Update, Description: The user’s or group’s level of access to the goal. The possible values are:</td>
</tr>
</tbody>
</table>
### Field Name: ParentId

**Details**

- Read
- Edit
- **All**: This value is not valid when you create, update, or delete records

This field must be set to an access level that is higher than the organization's default access level for goals.

**Type**

reference

**Properties**

Create, Filter, Group, Sort

**Description**

ID of the WorkGoal object that is associated with this sharing entry.

### Field Name: RowCause

**Type**

picklist

**Properties**

Filter, Group, Restricted picklist, Sort

**Description**

Reason that this sharing entry exists. Read-only. You can create a value for this field in API versions 32.0 and later with the correct organization-wide sharing settings.

Valid values include:

- **Owner**—The User is the owner of the WorkGoal or is in a user role above the WorkGoal owner in the role hierarchy.
- **Manual**—The User or Group has access, because a user with "All" access manually shared the WorkGoal with the user or group.
- **Rule**—The User or Group has access via a WorkGoal sharing rule.
- **GuestRule**—The User or Group has access via a WorkGoal guest user sharing rule.

### Field Name: UserOrGroupId

**Type**

reference

**Properties**

Create, Filter, Group, Sort

**Description**

ID of the user or group that was given access to the goal. This field can't be updated.
## Workload

Represents the time series for work item volume and average handling time from aggregation and forecasting processes. This object is available in API version 49.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

### Special Access Rules

The org must have the Workforce Engagement license. To view, create, edit, or delete records, the user needs to have Workforce Engagement Analyst permission set.

### Fields

<table>
<thead>
<tr>

</tbody>
</table>
Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

- **WorkloadOwnerSharingRule on page 3714**
  - Sharing rules are available for the object.
- **WorkloadShare on page 3719**
  - Sharing is available for the object.

WorkloadUnit

Represents the number of work items and average handle time in a specific time interval. This object is available in API version 49.0 and later.

Supported Calls

- create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Special Access Rules

The org must have a Workforce Engagement license. To view, create, edit, and delete records, the user needs to have the Workforce Engagement Analyst permission set.

Details Field

Description
The derived field from Workload.WorkloadType to indicate the type of workload, e.g. history or forecast workload.

Possible values are:

- 'F'—Forecasted
- 'H'—Historical

The default value is 'H'.

WorkOrder

Represents field service work to be performed for a customer. This object is available in API version 36.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Work orders or Field Service must be enabled.

**Associated Objects**

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.
WorkOrderChangeEvent (API version 48.0)
Change events are available for the object.

WorkOrderFeed
Feed tracking is available for the object.

WorkOrderHistory
History is available for tracked fields of the object.

WorkOrderOwnerSharingRule
Sharing rules are available for the object.

WorkOrderShare
Sharing is available for the object.

WorkOrderHistory
Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

Supported Calls
describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()
You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules
Work orders or Field Service must be enabled in your organization, and field tracking for work order fields must be configured.

</tbody>
</table>
| **TotalPrice** | **Type** currency  
**Properties** Filter, Nillable, Sort  
**Description** Read only. The line item's subtotal with discounts applied. |
| **UnitPrice** | **Type** currency  
**Properties** Create, Filter, Nillable, Sort, Update  
**Description** Initially, the unit price for a work order line item is the line item’s list price from the price book, but you can change it. |
| **WorkOrderId** | **Type** reference  
**Properties** Create, Filter, Group, Sort  
**Description** The line item's parent work order. Because work order line items must be associated with a work order, this is a required field.  
This is a relationship field.  
**Relationship Name** WorkOrder  
**Relationship Type** Lookup  
**Refers To** WorkOrder |
| **WorkTypeId** | **Type** reference  
**Properties** Create, Filter, Group, Nillable, Sort, Update  
**Description** The work type associated with the line item. When a work type is selected, the line item automatically inherits the work type’s Duration, Duration Type, and required skills.  
This is a relationship field.  
**Relationship Name** WorkType |
Usage

A work order line item is a child record of a work order. It represents a specific subtask on a work order.

For example, suppose a customer purchased a truck from you. The truck is represented as an asset in your Salesforce org. After some time, the truck needs both headlight bulbs replaced. Here’s one way that you can use work orders and work order line items to track the repair.

1. Create a work order named “Replace Headlight Bulbs” from the asset record detail page.
2. Add three work order line items to the work order: “Replace Left Headlight Bulb,” “Replace Right Headlight Bulb,” and “Test Headlights.”
3. Assign the work order to a technician via a queue.
4. As the technician completes each line item, he or she marks the item Completed.
5. When all the line items are complete, the technician marks the work order Completed.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

- **WorkOrderLineItemChangeEvent (API version 48.0)**
  Change events are available for the object.
- **WorkOrderLineItemFeed**
  Feed tracking is available for the object.
- **WorkOrderLineItemHistory**
  History is available for tracked fields of the object.

**WorkOrderLineItemHistory**

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

Supported Calls

- `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

Work orders or Field Service must be enabled in your organization, and field tracking for work order line item fields must be configured.

<th>Type</th>
<th>picklist</th>
</tr>
</thead>
<tbody>
<tr>
<td>Properties</td>
<td>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>The status category that the value corresponds to. The Status Category field has seven values which are identical to the default Status values.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage

The Status field on work order line items comes with the following values:

- **New**—Line item was created, but there hasn't yet been any activity.
- **In Progress**—Work has begun.
- **On Hold**—Work is paused.
- **Completed**—Work is complete.
- **Cannot Complete**—Work could not be completed.
- **Closed**—All work and associated activity is complete.
- **Canceled**—Work is canceled, typically before any work began.

The WorkOrderLineItemStatus object corresponds to the Status field. Adding a value to the Status field—for example, Canceled By Customer—creates a work order line item status record, and vice versa.

**Note:** Work order line items also come with a StatusCategory field whose values are identical to the default Status values. If you create custom Status values, you must indicate which category it belongs to. For example, if you create a *Customer Absent* value, you may decide that it belongs in the *Cannot Complete* category. To learn which processes reference StatusCategory, see How are Status Categories Used?

### WorkOrderShare

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.
Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

Special Access Rules

Work orders or Field Service must be enabled in your organization. External users can’t access this object.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>AccessLevel</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
</tbody>
</table>
| **Description**  | Level of access that the user or group has to the work order. The possible values are:  
  • Read  
  • Edit  
  • All (This value isn’t valid for create or update calls.)  
  Set to an access level that is at least equal to the organization’s default work order access level. |
| ParentId         |         |
| **Type**         | reference |
| **Properties**   | Create, Filter, Group, Sort |
| **Description**  | The work order associated with the sharing entry.  
  This is a relationship field. |
| **Relationship Name** | Parent |
| **Relationship Type** | Lookup |
| **Refers To**    | WorkOrder |
| RowCause         |         |
| **Type**         | picklist |
| **Properties**   | Create, Filter, Group, Nillable, Restricted picklist, Sort |
**Details**

**Description**
The reason why this sharing entry exists. You can write to this field only when its value is omitted or set to `Manual` (default). Valid values include:

- **Manual**—The User or Group has access because a user with "All" access manually shared the work order.
- **Owner**—The User is the owner of the work order.
- **Rule**—The User or Group has access via a work order sharing rule.
- **GuestRule**—The User or Group has access via a work order guest user sharing rule.
- **LpuImplicit**—The User has access to records owned by high-volume Experience Cloud site users via a share group.

**Type**
`reference`

**Properties**
Create, Filter, Group, Sort

**Description**
(Read Only) ID of the user or group that has access to the work order.

This is a polymorphic relationship field.

**Relationship Name**
UserOrGroup

**Relationship Type**
Lookup

**Refers To**
Group, User

---

**WorkOrderStatus**

Represents a possible status of a work order in field service.

**Supported Calls**
describeSObjects(), query(), retrieve()

**Special Access Rules**
Field Service must be enabled.
### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ApiName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, idLookup, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The API name of the status value.</td>
</tr>
<tr>
<td><strong>IsDefault</strong></td>
<td><strong>Type</strong> boolean</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates that the status value is the default status on work orders. Only one status value can be the default.</td>
</tr>
<tr>
<td><strong>MasterLabel</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The label for the picklist value that appears in the UI.</td>
</tr>
<tr>
<td><strong>SortOrder</strong></td>
<td><strong>Type</strong> int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Nillable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The value’s position in the drop-down list of values in the UI.</td>
</tr>
<tr>
<td><strong>StatusCode</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The status category that the value corresponds to. The Status Category field has seven values which are identical to the default Status values.</td>
</tr>
</tbody>
</table>
Usage

The Status field on work orders comes with the following values:

- **New**—Work order was created, but there hasn’t yet been any activity.
- **In Progress**—Work has begun.
- **On Hold**—Work is paused.
- **Completed**—Work is complete.
- **Cannot Complete**—Work could not be completed.
- **Closed**—All work and associated activity is complete.
- **Canceled**—Work is canceled, typically before any work began.

The WorkOrderStatus object corresponds to the Status field. Adding a value to the Status field—for example, Canceled By Customer—creates a work order status record, and vice versa.

Note: Work orders also come with a StatusCategory field whose values are identical to the default Status values. If you create custom Status values, you must indicate which category it belongs to. For example, if you create a Customer Absent value, you may decide that it belongs in the Cannot Complete category. To learn which processes reference StatusCategory, see How are Status Categories Used?

WorkPerformanceCycle

Represents feedback that is gathered to assess the performance of a specific set of employees.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Fields

<table>
<thead>

<td><strong>Type</strong> string</td>
</tr>
<tr>
<td></td>
<td><strong>Properties</strong> Create, Filter, Group, idLookup, Sort, Update</td>
</tr>
</tbody>
</table>
### Field Name

#### Description

The name of the performance summary cycle that employees will participate in. This name is created by the administrator and is visible on all respective notifications and in the UI.

#### OwnerId

**Type**

reference

**Properties**

Create, Defaulted on create, Filter, Group, Sort, Update

**Description**

ID of the owner of the WorkPerformanceCycle.

#### State

**Type**

picklist

**Properties**

Create, Filter, Group, Restricted picklist, Sort, Update

**Description**

The state that the performance summary cycle is in. Available pick list values:

- Setup: The summary is in draft.
- In Progress: The summary is deployed and people are answering the questions that were created.
- Finished: The summary is no longer in progress.
- Error: The summary encountered an error.

---

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkPerformanceCycleFeed**
  Feed tracking is available for the object.

- **WorkPerformanceCycleHistory**
  History is available for tracked fields of the object.

- **WorkPerformanceCycleOwnerSharingRule**
  Sharing rules are available for the object.

- **WorkPerformanceCycleShare**
  Sharing is available for the object.

### WorkPlan

Represents a work plan for a work order or work order line item. This object is available in API version 52.0 and later.
**Supported Calls**

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

**Special Access Rules**

Field Service must be enabled.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Type textarea</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Nullable, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The description of the work plan.</td>
</tr>
<tr>
<td><strong>ExecutionOrder</strong></td>
<td>Type int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nullable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The order in which plan is executed. Only positive values or null are supported.</td>
</tr>
<tr>
<td><strong>LastReferencedDate</strong></td>
<td>Type dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The timestamp when the current user last accessed this record, a record related to this record, or a list view.</td>
</tr>
<tr>
<td><strong>LastViewedDate</strong></td>
<td>Type dateTime</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Nullable, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.</td>
</tr>
</tbody>
</table>
### Field Details

**Name**
- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: The name of the work plan.

**OwnerId**
- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The ID of the user who created the work plan.

**WorkOrderId**
- **Type**: reference
- **Properties**: Create, Filter, Group, Sort, Update
- **Description**: Required. The ID of the work order.

**WorkOrderLineItemId**
- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The ID of the work order line item.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkPlanFeed**
  - Feed tracking is available for the object.

- **WorkPlanHistory**
  - History is available for tracked fields of the object.

- **WorkPlanOwnerSharingRule**
  - Sharing rules are available for the object.

- **WorkPlanShare**
  - Sharing is available for the object.
WorkPlanSelectionRule

Represents a rule that selects a work plan for a work order or work order line item. This object is available in API version 52.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

### WorkPlanTemplate

**WorkPlanSelectionRuleNumber**
- **Type**: string
- **Properties**: Autonumber, Defaulted on create, Filter, idLookup, Sort
- **Description**: The auto-generated number of the work plan selection rule, for example, WPSR-0001.

**WorkPlanTemplateId**
- **Type**: reference
- **Properties**: Create, Filter, Group, Sort, Update
- **Description**: Required. The ID of the work plan template.

**WorkTypeId**
- **Type**: reference
- **Properties**: Create, Filter, Group, Nillable, Sort, Update
- **Description**: The ID of the work type.

---

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkPlanSelectionRuleFeed**: Feed tracking is available for the object.
- **WorkPlanSelectionRuleHistory**: History is available for tracked fields of the object.
- **WorkPlanSelectionRuleOwnerSharingRule**: Sharing rules are available for the object.
- **WorkPlanSelectionRuleShare**: Sharing is available for the object.

### WorkPlanTemplate

Represents a template for a work plan. This object is available in API version 52.0 and later.

### Supported Calls

- `create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`
Special Access Rules

reference

**Properties**

Create, Filter, Group, Sort, Update

**Description**

Required. The ID of the work step template.

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkPlanTemplateEntryFeed**
  
  Feed tracking is available for the object.

- **WorkPlanTemplateEntryHistory**
  
  History is available for tracked fields of the object.

### WorkReward

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

### Supported Calls

- create()
- delete()
- describeLayout()
- describeSObjects()
- getDeleted()
- getUpdated()
- query()
- retrieve()
- undelete()
- update()
- upsert()

### Special Access Rules

You must have the Reward permission enabled in order to use the Rewards feature, including WorkRewardFund and WorkReward.

### Additional Considerations and Related Objects

WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record to be available for use. Each WorkBadge record with a RewardId indicates a reward badge given to a Recipient.

**Associated Objects**

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkRewardHistory**
  - History is available for tracked fields of the object.

- **WorkRewardOwnerSharingRule**
  - Sharing rules are available for the object.

- **WorkRewardShare**
  - Sharing is available for the object.

**WorkRewardFund**

Represents a Reward Fund and describes the Reward Fund attributes.
Supported Calls
create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules
To use the Rewards feature, including WorkRewardFund and WorkReward, you must have the Reward permission enabled. To create Rewards, the user must have Create on WorkRewardFund, which is not a standard permission.

Additional Considerations and Related Objects
WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record available. Each WorkBadgeDefinition with a RewardFundId is a “Reward Badge.”

Details

Field Name | Details
--- | ---
Value | Type: currency

Properties
Create, Filter, Sort, Update

Description
Value of each of the reward codes in the WorkRewardFund.

Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkRewardFundFeed**
  Feed tracking is available for the object.

- **WorkRewardFundHistory**
  History is available for tracked fields of the object.

- **WorkRewardFundOwnerSharingRule**
  Sharing rules are available for the object.

- **WorkRewardFundShare**
  Sharing is available for the object.

**WorkRewardFundType**

Represents the type of WorkRewardFund object.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Fields**

Field Name | Details
--- | ---
CreditSystem | Type: picklist

Properties
Create, Filter, Group, Restricted picklist, Sort, Update

Description
The credit system that is used by the WorkRewardFundType object (gift codes or points). If points are selected, the reward message will not consider the CurrencyCode field.

### Field Details

**Description**
Controls whether this work step template is active true or not false. Default is false.

**LastReferencedDate**
- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp when the current user last accessed this record, a record related to this record, or a list view.

**LastViewedDate**
- **Type**: dateTime
- **Properties**: Filter, Nillable, Sort
- **Description**: The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view (LastReferencedDate) but not viewed it.

**Name**
- **Type**: string
- **Properties**: Create, Filter, Group, idLookup, Sort, Update
- **Description**: The user-defined name of the work step template.

**OwnerId**
- **Type**: reference
- **Properties**: Create, Defaulted on create, Filter, Group, Sort, Update
- **Description**: The ID of the owner who created the work step template.

### Associated Objects
This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkStepTemplateFeed**
  Feed tracking is available for the object.

- **WorkStepTemplateHistory**
  History is available for tracked fields of the object.
WorkStepTemplateOwnerSharingRule
Sharing rules are available for the object.

WorkStepTemplateShare
Sharing is available for the object.

WorkThanks

Represents the source and message of a thanks post.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete(), update(), upsert()

Additional Considerations and Related Objects

WorkBadge is a lookup to WorkThanks. Each WorkBadge record must derive a SourceId from WorkThanks.

<tr>
<th>NetworkId</th>
</tr>
</thead>
</table>
| **Type**
  - reference |

**Properties**
- Create, Filter, Group, Nillable, Sort, Update

**Description**
The ID of the community that this WorkThanks is associated with. This field is available only if digital experiences is enabled in your org.

<table>
<thead>
<tr>
<th>OwnerId</th>
</tr>
</thead>
</table>
| **Type**
  - reference |

**Properties**
- Create, Defaulted on create, Filter, Group, Sort, Update

**Description**
Salesforce user ID for the owner of the badge record (typically the same user as the giver of the record).

This is a polymorphic relationship field.

**Relationship Name**
- Owner

**Relationship Type**
- Lookup

**Refers To**
- Group, User

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.
WorkType

Represents a type of work to be performed in Field Service and Lightning Scheduler. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

Special Access Rules

Field Service must be enabled.

</tr>
<tr>
<td></td>
<td><strong>Description</strong> Select this option to have a service appointment automatically created on work orders and work order line items that use the work type.</td>
</tr>
</tbody>
</table>
Details

Note:

• By default, the Due Date on auto-created service appointments is seven days after the created date. Admins can adjust this offset from the Field Service Settings page in Setup.

• If a work type with the Auto-Create Service Appointment option selected is added to an existing work order or work order line item, a service appointment is only created for the work order or work order line item if it doesn’t yet have one.

• If someone updates an existing work type by selecting the Auto-Create Service Appointment option, service appointments aren’t created on work orders and work order line items that were already using the work type.

Usage

Adding a work type to a work order or work order line item causes the record to inherit the work type’s duration values and required skills and products.

Note:

• If needed, you can update the duration values and required skills and products on a work order or work order line item after they’re inherited from the work type.

• If a work order or work order line item already has required skills or products, associating it with a work type doesn’t cause it to inherit the work type’s requirements.

• Customizations to required skills or products, such as validation rules or Apex triggers, are not carried over from work types to work orders and work order line items.

Associated Objects

This object has the following associated objects. If the API version isn’t specified, they’re available in the same API versions as this object. Otherwise, they’re available in the specified API version and later.

WorkTypeChangeEvent (API version 48.0)
Change events are available for the object.

WorkTypeFeed
Feed tracking is available for the object.

WorkTypeHistory
History is available for tracked fields of the object.

WorkTypeOwnerSharingRule
Sharing rules are available for the object.

WorkTypeShare
Sharing is available for the object.
WorkTypeGroup

Represents a grouping of work types used to categorize types of appointments available in Lightning Scheduler, or to define scheduling limits in Field Service. This object is available in API version 45.0 and later.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

### Associated Objects

This object has the following associated objects. Unless noted, they are available in the same API version as this object.

- **WorkTypeGroupMemberFeed**
  Feed tracking is available for the object.
WorkTypeGroupMemberHistory

History is available for tracked fields of the object.
CHAPTER 9    Custom Objects

This section provides details on custom objects, entities that support custom objects, and their standard fields.

When you create or enable features for a custom object, Salesforce creates entities to support your custom object. For example, when you enable sharing rules for a custom object, Salesforce creates a MyObjectName__Share object.

To verify the complete list of fields for an object or entity, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

- **Custom Metadata Type__mdt**: Represents a custom metadata record. This object is available in API version 34.0 and later.
- **Custom Object__c**: Represents a custom object.
- **Custom Object__Feed**: Represents the feed, specifically posts and feed-tracked changes, on a custom object.

**Custom Metadata Type__mdt**

Represents a custom metadata record. This object is available in API version 34.0 and later.

- **Custom Metadata Type__mdt**: Represents a custom metadata record. This object is available in API version 34.0 and later.
- **Custom Object__c**: Represents a custom object.
- **Custom Object__Feed**: Represents the feed, specifically posts and feed-tracked changes, on a custom object.

**Supported Calls**

describeSObjects(), describeLayout(), query(), retrieve()

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom Field__c</td>
<td>Details</td>
</tr>
<tr>

<tr>
<td><strong>Description</strong></td>
<td>A custom field on the record.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td>Type: string; Properties: Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>isProtected</strong></td>
<td>Type: boolean; Properties: Defaulted on create, Filter, Group, Sort</td>
</tr>
</tbody>
</table>

**Description**

The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber's organization.

**isProtected**

Type: boolean; Properties: Defaulted on create, Filter, Group, Sort

**Description**

When a custom metadata type’s records are released in a managed package, access to them is limited in specific ways.

- Code that's in the same managed package as custom metadata records can read the records.
- Code that's in the same managed package as custom metadata types can read the records that belong to that type.
- Code that's in a managed package that doesn't contain either the type or the protected record can't read the protected records.
- Code that the subscriber creates and code that's in an unmanaged package can't read the protected records.
- The developer can modify protected records only with a package upgrade. The subscriber can't read or modify protected records. The developer name of a protected record can't be changed after release.

Records that are hidden by these access rules are also unavailable to REST, SOAP, SOQL, and Setup.

**Label**

Type: picklist; Properties: Filter, Group, Nillable, Sort
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The custom metadata record label. This label value is always the same as the MasterLabel value.</td>
</tr>
</tbody>
</table>
| Language       | **Type**
|                | string                                                                  |
|                | **Properties**
|                | Filter, Group, restrictedPicklist, Sort                                 |
|                | **Description**
|                | The language of the custom metadata record. This value is always the default language of the developing organization. |
| MasterLabel    | **Type**
|                | string                                                                  |
|                | **Properties**
|                | Filter, Group, Sort                                                     |
|                | **Description**
|                | The primary label for the custom metadata record.                       |
| NamespacePrefix| **Type**
|                | string                                                                  |
|                | **Properties**
|                | Filter, Group, Nillable, Sort                                           |
|                | **Description**
|                | The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the `namespacePrefix__componentName` notation. |
| QualifiedApiName| **Type**
|                | string                                                                  |
|                | **Properties**
|                | Filter, Group, Nillable, Sort                                           |
|                | **Description**
|                | A concatenation of the namespace prefix and developer name. The format is `NamespacePrefix__DeveloperName`. |

**Custom Object__c**

Represents a custom object.
The custom object name is a variable with the syntax `Custom Object__c`, where `Custom Object` is the object’s Name associated with the record, followed by two underscores and `c`. For example, a custom object labeled “Issue” in the Salesforce user interface is `Issue__c` in that organization’s WSDL.

System fields and properties behave the same on custom objects as they do on standard objects, unless otherwise noted in the following details.

**Supported Calls**

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

| Description    | The ID of the user who currently owns this object. Default value is the user logged in to the API to perform the create() call. |

SEE ALSO:
- System Fields
- Field Types
- API Field Properties

Custom Object__Feed

Represents the feed, specifically posts and feed-tracked changes, on a custom object.

A custom object feed shows posts and changes to the object’s tracked fields. The object name is variable and uses Custom Object__Feed syntax, where Custom Object is the name of the custom object. For example, Textile__Feed represents a feed on the custom object Textile__c.

Supported Calls

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

Special Access Rules

In the internal org, users can delete all feed items they created. This rule varies in Experience Cloud sites where threaded discussions and delete-blocking are enabled. Site members can delete all feed items they created, provided the feed items don’t have content nested under them—like a comment, answer, or reply. Where the feed item has nested content, only feed moderators and users with the Modify All Data permission can delete threads.

To delete feed items they didn’t create, users must have one of these permissions:

- Modify All Data
- Modify All on the parent object, like Textile__c.
- Moderate Chatter
**Note:** Users with the Moderate Chatter permission can delete only the feed items and comments they can see. Only users with this permission can delete items in unlisted groups.

### Field Details

#### ContentData
- **Type**: base64
- **Properties**: Nullable
- **Description**: Available in API version 36.0 and earlier only. Required if Type is ContentPost. Encoded file data in any format, and can’t be 0 bytes. Setting this field automatically sets Type to ContentPost.

#### ContentDescription
- **Type**: textarea
- **Properties**: Nullable, Sort
- **Description**: Available in API version 36.0 and earlier only. The description of the file specified in ContentData.

#### ContentFileName
- **Type**: string
- **Properties**: Group, Nullable, Sort
- **Description**: Available in API version 36.0 and earlier only. This field is required if Type is ContentPost. The name of the file uploaded to the feed. Setting ContentFileName automatically sets Type to ContentPost.

#### ContentSize
- **Type**: int
- **Properties**: Group, Nullable, Sort
- **Description**: Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.
### Field: `ContentType`

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

### Field: `FeedPostId`

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

### Field: `InsertedById`

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>

### Field: `IsRichText`

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td><strong>Properties</strong></td>
</tr>
<tr>
<td><strong>Description</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Tip:** Though the `<br>` tag isn’t supported, you can use `<p>&nbsp;</p>` to create lines.
The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`

Note: In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>LikeCount</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Note the following exceptions for NetworkScope:

- Only feed items with a Group or User parent can set a NetworkId or a null value for NetworkScope.
- For feed items with a record parent, users can set NetworkScope only to AllNetworks.
- You can’t filter a feed item on the NetworkScope field.

### ParentId

**Type**
reference

**Properties**
Filter, Group, Sort

**Description**
ID of the custom object record that is tracked in the feed. The feed is displayed on the detail page for this record.

### RelatedRecordId

**Type**
reference

**Properties**
Group, Nillable, Sort

**Description**
ID of the ContentVersion object associated with a ContentPost. This field is null for all posts except ContentPost.

### Title

**Type**
string

**Properties**
Group, Nillable, Sort

**Description**
The title of the feed item. When the Type is LinkPost, the LinkUrl is the URL and this field is the link name.

### Type

**Type**
picklist

**Properties**
Filter, Group, Nillable, Restricted picklist, Sort

**Description**
The type of feed item:

- ActivityEvent—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging).
<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.</td>
<td></td>
</tr>
<tr>
<td>• AdvancedTextPost</td>
<td>created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.</td>
</tr>
<tr>
<td>• AnnouncementPost</td>
<td>Not used.</td>
</tr>
<tr>
<td>• ApprovalPost</td>
<td>generated when a user submits an approval.</td>
</tr>
<tr>
<td>• BasicTemplateFeedItem</td>
<td>Not used.</td>
</tr>
<tr>
<td>• CanvasPost</td>
<td>a post made by a canvas app posted on a feed.</td>
</tr>
<tr>
<td>• CollaborationGroupCreated</td>
<td>generated when a user creates a public group.</td>
</tr>
<tr>
<td>• CollaborationGroupUnarchived</td>
<td>Not used.</td>
</tr>
<tr>
<td>• ContentPost</td>
<td>a post with an attached file.</td>
</tr>
<tr>
<td>• CreatedRecordEvent</td>
<td>generated when a user creates a record from the publisher.</td>
</tr>
<tr>
<td>• DashboardComponentAlert</td>
<td>generated when a dashboard metric or gauge exceeds a user-defined threshold.</td>
</tr>
<tr>
<td>• DashboardComponentSnapshot</td>
<td>created when a user posts a dashboard snapshot on a feed.</td>
</tr>
<tr>
<td>• LinkPost</td>
<td>a post with an attached URL.</td>
</tr>
<tr>
<td>• PollPost</td>
<td>a poll posted on a feed.</td>
</tr>
<tr>
<td>• ProfileSkillPost</td>
<td>generated when a skill is added to a user’s Chatter profile.</td>
</tr>
<tr>
<td>• QuestionPost</td>
<td>generated when a user posts a question.</td>
</tr>
<tr>
<td>• ReplyPost</td>
<td>generated when Chatter Answers posts a reply.</td>
</tr>
<tr>
<td>• RypplePost</td>
<td>generated when a user creates a Thanks badge in WDC.</td>
</tr>
<tr>
<td>• TextPost</td>
<td>a direct text entry on a feed.</td>
</tr>
<tr>
<td>• TrackedChange</td>
<td>a change or group of changes to a tracked field.</td>
</tr>
<tr>
<td>• UserStatus</td>
<td>automatically generated when a user adds a post. Deprecated.</td>
</tr>
</tbody>
</table>

The following values appear in the Type picklist for all feed objects but apply only to CaseFeed:

• CaseCommentPost — generated event when a user adds a case comment for a case object
• EmailMessageEvent — generated event when an email related to a case object is sent or received
• CallLogPost — generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
• ChangeStatusPost — generated event when a user changes the status of a case
• AttachArticleEvent — generated event when a user attaches an article to a case

**Note:** If you set Type to ContentPost, also specify ContentData and ContentFileName.
Usage

A feed for a custom object is automatically created when a user enables feed tracking for the custom object. Use feeds to track changes to the custom objects they serve. For example, Textile__Feed tracks changes to a Textile__c object. Use feed objects to retrieve the content of feed fields, such as type of feed or feed ID.

Note the following SOQL restrictions. No SOQL limit if logged-in user has View All Data permission. If not, specify a LIMIT clause of 1,000 records or fewer. SOQL ORDER BY on fields using relationships is not available. Use ORDER BY on fields on the root object in the SOQL query.

What About StandardObjectNameFeed Objects?

Similar to custom objects, standard objects can have associated feed objects. For a list of StandardObjectNameFeed objects, see StandardObjectNameFeed.
CHAPTER 10  Associated Objects (Feed, History, OwnerSharingRule, Share, and ChangeEvent Objects)

This section provides a list of objects associated to standard objects and their standard fields.
Some fields may not be listed for some objects. To see the system fields for each object, see System Fields.
To verify the complete list of fields for an object, use a describe call from the API or inspect with an appropriate tool. For example, inspect the WSDL or use a schema viewer.

**StandardObjectNameFeed**
*StandardObjectNameFeed* is the model for all feed objects associated with standard objects. These objects represent the posts and feed-tracked changes of a standard object.

**StandardObjectNameHistory**
*StandardObjectNameHistory* is the model for all history objects associated with standard objects. These objects represent the history of changes to the values in the fields of a standard object.

**StandardObjectNameOwnerSharingRule**
*StandardObjectNameOwnerSharingRule* is the model for all owner sharing rule objects associated with standard objects. These objects represent a rule for sharing a standard object with users other than the owner.

**StandardObjectNameShare**
*StandardObjectNameShare* is the model for all share objects associated with standard objects. These objects represent a sharing entry on the standard object.

**StandardObjectNameChangeEvent**
A ChangeEvent object is available for each object that supports Change Data Capture. You can subscribe to a stream of change events using Change Data Capture to receive data tied to record changes in Salesforce. Changes include record creation, updates to an existing record, deletion of a record, and undeletion of a record. A change event isn’t a Salesforce object—it doesn’t support CRUD operations or queries. It’s included in the object reference so you can discover which Salesforce objects support change events.

**StandardObjectNameFeed**

*StandardObjectNameFeed* is the model for all feed objects associated with standard objects. These objects represent the posts and feed-tracked changes of a standard object.

The object name is variable and uses *StandardObjectNameFeed* syntax. For example, AccountFeed represents the posts and feed-tracked changes on an account record. We list the available associated feed objects at the end of this topic. For specific version information, see the documentation for the standard object.
**Supported Calls**

delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

**Special Access Rules**

In the internal org, users can delete all feed items they created. This rule varies in Experience Cloud sites where threaded discussions and delete-blocking are enabled. Site members can delete all feed items they created, provided the feed items don’t have content nested under them—like a comment, answer, or reply. Where the feed item has nested content, only feed moderators and users with the Modify All Data permission can delete threads.

To delete feed items they didn’t create, users must have one of these permissions:

- Modify All Data
- Modify All on the parent object, like Account for AccountFeed
- Moderate Chatter

**Note:** Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

Only users with this permission can delete items in unlisted groups.

For more special access rules, if any, see the documentation for the standard object. For example, for AccountFeed, see the special access rules for Account.

</tr>
</tbody>
</table>
### Description
The number of comments associated with this feed item.

**Tip:** In a feed that supports pre-moderation, `CommentCount` isn't updated until a comment is published. For example, say that you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, comments aren't counted until approved by an admin or someone with Can Approve Feed Post and Comment or Modify All Data.

Feed moderation has implications on how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through `CommentCount`, go through pagination until the end of comments is returned.

<table>

## Details

### isRichText

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>boolean</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Defaulted on create, Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Indicates whether the feed item Body contains rich text. If you post a rich text feed comment using SOAP API, set IsRichText to true and escape HTML entities from the body. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags:</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;p&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- Tip: Though the <code>&lt;br&gt;</code> tag isn’t supported, you can use <code>&lt;p&gt;&amp;nbsp;&lt;/p&gt;</code> to create lines.</td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;a&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;b&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;code&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;i&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;u&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;s&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;ul&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;ol&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;li&gt;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>&lt;img&gt;</code></td>
</tr>
</tbody>
</table>

The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>`

| Note: | In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation. |

### LikeCount

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>int</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Filter, Group, Sort</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The number of likes associated with this feed item.</td>
</tr>
</tbody>
</table>

### LinkUrl

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>url</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Nillable, Sort</td>
</tr>
<tr>
<td>Field</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td>Description</td>
<td>The URL of a LinkPost.</td>
</tr>
<tr>
<td>Properties</td>
<td>Group, Nillable, Restricted picklist, Sort</td>
</tr>
</tbody>
</table>

**NetworkScope**

- **Type**: picklist
- **Properties**: Group, Nillable, Restricted picklist, Sort

**Description**

Specifies whether this feed item is available in the default Experience Cloud site, a specific Experience Cloud site, or all sites. This field is available in API version 26.0 and later, if digital experiences is enabled for your org.

*NetworkScope* can have the following values:

- **NetworkId**—The ID of the Experience Cloud site in which the FeedItem is available. If left empty, the feed item is only available in the default Experience Cloud site.
- **AllNetworks**—The feed item is available in all Experience Cloud sites.

Note the following exceptions for *NetworkScope*:

- Only feed items with a Group or User parent can set a *NetworkId* or a null value for *NetworkScope*.
- For feed items with a record parent, users can set *NetworkScope* only to *AllNetworks*.
- You can’t filter a feed item on the *NetworkScope* field.

**ParentId**

- **Type**: reference
- **Properties**: Filter, Group, Sort

**Description**

ID of the record that is tracked in the feed. The detail page for the record displays the feed.

**RelatedRecordId**

- **Type**: reference
- **Properties**: Group, Nillable, Sort

**Description**

ID of the ContentVersion record associated with a *ContentPost*. This field is null for all posts except *ContentPost*.

**Title**

- **Type**: string
- **Properties**: Group, Nillable, Sort
### Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>The title of the feed item. When the <strong>Type</strong> is <strong>LinkPost</strong>, the LinkUrl is the URL and this field is the link name.</td>
</tr>
</tbody>
</table>

**Type**

- **picklist**

**Properties**

- Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The type of feed item:

- **ActivityEvent**—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging).

  For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence.

- **AdvancedTextPost**—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post.

- **AnnouncementPost**—Not used.

- **ApprovalPost**—generated when a user submits an approval.

- **BasicTemplateFeedItem**—Not used.

- **CanvasPost**—a post made by a canvas app posted on a feed.

- **CollaborationGroupCreated**—generated when a user creates a public group.

- **CollaborationGroupUnarchived**—Not used.

- **ContentPost**—a post with an attached file.

- **CreatedRecordEvent**—generated when a user creates a record from the publisher.

- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.

- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.

- **LinkPost**—a post with an attached URL.

- **PollPost**—a poll posted on a feed.

- **ProfileSkillPost**—generated when a skill is added to a user’s Chatter profile.

- **QuestionPost**—generated when a user posts a question.

- **ReplyPost**—generated when Chatter Answers posts a reply.

- **RypplePost**—generated when a user creates a Thanks badge in WDC.

- **TextPost**—a direct text entry on a feed.

- **TrackedChange**—a change or group of changes to a tracked field.

- **UserStatus**—automatically generated when a user adds a post. Deprecated.
The following values appear in the Type picklist for all feed objects but apply only to CaseFeed:

- **CaseCommentPost**—generated event when a user adds a case comment for a case object
- **EmailMessageEvent**—generated event when an email related to a case object is sent or received
- **CallLogPost**—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- **ChangeStatusPost**—generated event when a user changes the status of a case
- **AttachArticleEvent**—generated event when a user attaches an article to a case

**Note:** If you set Type to ContentPost, also specify ContentData and ContentFileName.

### Visibility

**Type**

picklist

**Properties**

Filter, Group, Nillable, Restricted picklist, Sort

**Description**

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if digital experiences is enabled for your organization. Visibility can have the following values:

- **AllUsers**—The feed item is available to all users who have permission to see the feed item.
- **InternalUsers**—The feed item is available to internal users only.

Note the following exceptions for Visibility:

- For record posts, Visibility is set to InternalUsers for all internal users by default.
- External users can set Visibility only to AllUsers.
- On user and group posts, only internal users can set Visibility to InternalUsers.

### Usage

A feed for an object is automatically created when a user enables feed tracking for the object. Use feeds to track changes to records. For example, `AccountFeed` tracks changes to an account record. Use feed objects to retrieve the content of feed fields, such as type of feed or feed ID.

- `NewsFeed` and `UserProfileFeed` are available in API version 18.0 through API version 26.0. In API version 27.0 and later, `NewsFeed` and `UserProfileFeed` are no longer available in SOAP API. Use Connect REST API to access `NewsFeed` and `UserProfileFeed`.

Use the `NewsFeed` object to query and retrieve lead feed items associated with a converted lead record.
For NewsFeed and UserProfileFeed, users who do not have the View All Data permission have the following limitations when querying records: Must specify a LIMIT clause and the limit must be less than or equal to 1000. Can include a WHERE clause that references object fields, but can’t include references to fields in related objects. For example, you can filter by CreatedDate or ParentId, but not by Parent.Name. Can include an ORDER BY clause that references object fields, but can’t include references to fields in related objects. For example, ORDER BY CreatedDate or ParentId, but not by Parent.Name. To query for the most recent feed items, ORDER BY CreatedDate DESC, Id DESC.

Note the following SOQL restrictions. No SOQL limit if logged-in user has View All Data permission. If not, specify a LIMIT clause of 1,000 records or fewer. SOQL ORDER BY on fields using relationships is not available. Use ORDER BY on fields on the root object in the SOQL query.

The name Article Type__Feed is variable, where Article Type is the object name for the article type associated with the article. For example, Offer__Feed represents a feed on an article of type Offer.

Field Service must be enabled in your organization for ServiceAppointmentFeed, ServiceCrewFeed, ServiceMemberFeed, ServiceResourceCapacityFeed, ServiceResourceFeed, ServiceResourceSkillFeed, ServiceTerritoryFeed, ServiceTerritoryMemberFeed, and SkillRequirementFeed.

For WorkOrderFeed, Work Orders or Field Service must be enabled in your organization.

On UserFeed, if you use the FeedComment object to comment on a user record, the user can delete the comment. For example, if John Smith adds a comment to the feed on Sasha Jones’ user record, Sasha can delete the comment.

Objects That Follow This Model

These objects follow the standard pattern for associated feed objects.

- AccountFeed
- AccountRelationshipFeed
- ActiveScratchOrgFeed
- AssetFeed
- AssetDowntimePeriodFeed
- AssetRelationshipFeed
- AssignedResourceFeed
- CalcProcStepRelationship
- CampaignFeed
- CaseFeed
- ChannelProgramFeed
- ChannelProgramLevelFeed
- ChannelProgramMemberFeed
- CollaborationGroupFeed
- CommerceEntitlementPolicy
- CommissionScheduleFeed
- CommissionScheduleAssignmentFeed
- CommSubscriptionChannelTypeFeed
- CommSubscriptionConsentFeed
- CommSubscriptionFeed
Associated Objects (Feed, History, OwnerSharingRule, Share, and ChangeEvent Objects)

- CommSubscriptionTimingFeed
- ConsumptionScheduleFeed
- ContactFeed
- ContentDocumentFeed
- ContractFeed
- CredentialStuffingEventStoreFeed
- DashboardComponentFeed
- DashboardFeed
- EngagementChannelTypeFeed
- EnhancedLetterheadFeed
- EntitlementFeed
- EntityMilestoneFeed
- EventFeed
- ExternalAccountHierarchyFeed
- FulfillmentOrderFeed
- GoalFeed
- JobProfileFeed
- LandingPageFeed
- LeadFeed
- LinkedArticleFeed
- LiveChatTranscriptFeed
- LocationFeed
- LocationGroupFeed
- MaintenanceAssetFeed

Objects That Don’t Follow This Model

Custom object feed objects and Article Type__Feed (API 20.0) use a different naming syntax, but they have the same supported calls and fields.

**StandardObjectNameHistory**

*StandardObjectNameHistory* is the model for all history objects associated with standard objects. These objects represent the history of changes to the values in the fields of a standard object.

The object name is variable and uses *StandardObjectNameHistory* syntax. For example, *AccountHistory* represents the history of changes to the values of an account record’s fields. We list the available associated history objects at the end of this topic. For specific version information, see the documentation for the standard object.

**Supported Calls**

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

You can also enable delete() in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

**Special Access Rules**

For specific special access rules, if any, see the documentation for the standard object. For example, for AccountHistory, see the special access rules for Account.

**Fields**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>StandardObjectNameId</em></td>
<td>Type reference</td>
</tr>
<tr>

Objects That Don’t Follow This Model

These objects don’t follow the standard pattern for associated history objects. They are documented separately.

- KnowledgeArticleVersionHistory
- OpportunityHistory
- ProcessInstanceHistory
- RecordActionHistory
- WebCartHistory

*StandardObjectNameOwnerSharingRule*

*StandardObjectNameOwnerSharingRule* is the model for all owner sharing rule objects associated with standard objects. These objects represent a rule for sharing a standard object with users other than the owner.

The object name is variable and uses *StandardObjectNameOwnerSharingRule* syntax. For example, ChannelProgramOwnerSharingRule is a rule for sharing a channel program with users other than the channel program owner. We list the available associated owner sharing rule objects at the end of this topic. For specific version information, see the standard object documentation.

**Note:** To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The *SharingRules* Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieves()`, `update()`, `upsert()`

Special Access Rules

For specific special access rules, if any, see the documentation for the standard object. For example, for ChannelProgramOwnerSharingRule, see the special access rules for ChannelProgram.
## Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AccessLevel</strong></td>
<td><strong>Type</strong> picklist</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Restricted picklist, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Determines the level of access users have to records. Values are:</td>
</tr>
<tr>
<td></td>
<td>• Read (read only)</td>
</tr>
<tr>
<td></td>
<td>• Edit (read/write)</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td><strong>Type</strong> textarea</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Description of the sharing rule. Maximum length is 1000 characters.</td>
</tr>
<tr>
<td><strong>DeveloperName</strong></td>
<td><strong>Type</strong> string</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Nillable, Sort, Update</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance slows down while Salesforce generates one for each record.</td>
</tr>
<tr>
<td><strong>GroupId</strong></td>
<td><strong>Type</strong> reference</td>
</tr>
<tr>
<td><strong>Properties</strong></td>
<td>Create, Filter, Group, Sort</td>

- CaseOwnerSharingRule
- ContactOwnerSharingRule
- LeadOwnerSharingRule
- OpportunityOwnerSharingRule
- OrderOwnerSharingRule

**StandardObjectNameShare**

*StandardObjectNameShare* is the model for all share objects associated with standard objects. These objects represent a sharing entry on the standard object. The object name is variable and uses *StandardObjectNameShare* syntax. For example, *AccountBrandShare* is a sharing entry on an account brand. We list the available associated share objects at the end of this topic. For specific version information, see the standard object documentation.
## Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

## Special Access Rules

For specific special access rules, if any, see the documentation for the standard object. For example, for AccountBrandShare, see the special access rules for AccountBrand.

## Fields

<table>

StandardObjectNameShare

Associated Objects (Feed, History, OwnerSharingRule, Share, and ChangeEvent Objects)
Objects That Don’t Follow This Model

These objects don’t follow the standard pattern for associated history objects. They are documented separately.

- AccountShare
- AssetShare
- CampaignShare
- CaseShare
- ContactShare
- IndividualShare
- LeadShare
- OpportunityShare
- UserShare

**StandardObjectNameChangeEvent**

A ChangeEvent object is available for each object that supports Change Data Capture. You can subscribe to a stream of change events using Change Data Capture to receive data tied to record changes in Salesforce. Changes include record creation, updates to an existing record, deletion of a record, and undeletion of a record. A change event isn’t a Salesforce object—it doesn’t support CRUD operations or queries. It’s included in the object reference so you can discover which Salesforce objects support change events.

**Supported Calls**

describeSObjects()
Standard Object Change Event Name

<Standard_Object_Name>ChangeEvent

Example: AccountChangeEvent

Custom Object Change Event Name

<Custom_Object_Name>__ChangeEvent

Example: MyCustomObject__ChangeEvent

Change Event Fields

The fields that a change event can include correspond to the fields on the associated parent Salesforce object, with a few exceptions. For example, AccountChangeEvent fields correspond to the fields on Account.

The fields that a change event doesn’t include are:

- The IsDeleted system field.
- The SystemModStamp system field.
- Any field whose value isn’t on the record and is derived from another record or from a formula, except roll-up summary fields, which are included. Examples are formula fields. Examples of fields with derived values include LastActivityDate and PhotoUrl.

Each change event also contains header fields. The header fields are included inside the ChangeEventHeader field. They contain information about the event, such as whether the change was an update or delete and the name of the object, like Account.

In addition to the event payload, the event schema ID is included in the schema field. Also included is the event-specific field, replayId, which is used for retrieving past events.

Event Message Example

The following example is an event message in JSON format for a new account record creation.

```json
{
   "schema": "IeRuaY6cbI_HsV8Rv1Mc5g",
   "payload": {
      "ChangeEventHeader": {
         "entityName": "Account",
         "recordIds": ["<record_ID>"],
         "changeType": "CREATE",
         "changeOrigin": "com/salesforce/api/soap/51.0;client=SfdcInternalAPI/",
         "transactionKey": "0002343d-9d90-e395-ed20-cf416ba652ad",
         "sequenceNumber": 1,
         "commitTimestamp": 1612912679000,
         "commitNumber": 1071628339728,
         "commitUser": "<User_ID>"
      },
      "Name": "Acme",
      "Description": "Everyone is talking about the cloud. But what does it mean?",
      "OwnerId": "<Owner_ID>",
      "CreatedDate": "2021-02-09T23:17:59Z",
      "CreatedBy": "<User_ID>"
   }
}
```
API Version and Schema

When you subscribe to change events, the subscription uses the latest API version and the event messages received reflect the latest field definitions. For more information, see API Version and Event Schema in the Change Data Capture Developer Guide.

Usage

For more information about Change Data Capture, see Change Data Capture Developer Guide.

Objects That Follow This Model

The following objects have associated ChangeEvent objects that follow this model.

- Account (including Person Account)
- AccountContactRole
- ActionCadence

CHAPTER 11  Apex-Related Calls

In this chapter ...

- `compileAndTest()`
- `compileClasses()`
- `compileTriggers()`
- `executeAnonymous()`
- `runTests()`

The following table lists supported calls in the API in alphabetical order, and provides a brief description for each. Click a call name to see syntax, usage, and more information for that call.

Note: For a list of core calls, see Core Calls, for a list of describe calls, see Describe Calls, and for a list of utility calls, see Utility Calls.

<table>
<thead>
<tr>
<th>Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compileAndTest()</code></td>
<td>Compile and test your Apex in a single call.</td>
</tr>
<tr>
<td><code>compileClasses()</code></td>
<td>Compile your Apex in Developer Edition or sandbox organizations.</td>
</tr>
<tr>
<td><code>compileTriggers()</code></td>
<td>Compile your Apex triggers in Developer Edition or sandbox organizations.</td>
</tr>
<tr>
<td><code>executeAnonymous()</code></td>
<td>Execute a block of Apex.</td>
</tr>
<tr>
<td><code>runTests()</code></td>
<td>Run your Apex unit tests.</td>
</tr>
</tbody>
</table>
**compileAndTest()**

Compile and test your Apex in a single call.

**Syntax**

```java
CompileAndTestResult[] = compileAndTest(CompileAndTestRequest request);
```

**Usage**

Use this call to both compile and test the Apex you specify with a single call. Production organizations (not a Developer Edition or Sandbox Edition) must use this call instead of `compileClasses()` or `compileTriggers()`.

This call supports the [DebuggingHeader](#) on page 3981 and the [SessionHeader](#) on page 3995.

All specified tests must pass, otherwise data is not saved to the database. If this call is invoked in a production organization, the `RunTestsRequest` property of the `CompileAndTestRequest` is ignored, and all unit tests defined in the organization are run and must pass.

**Sample Code—Java**

Note that the following example sets `checkOnly` to `true` so that this class is compiled and tested, but the classes are not saved to the database.

```java
{
    CompileAndTestRequest request;
    CompileAndTestResult result = null;

    String triggerBody = "trigger t1 on Account (before insert){ " +
        " for(Account a:Trigger.new){ " +
        " a.description = 't1_UPDATE';}" +
        "}";

    String testClassBody = "@isTest private class TestT1{" +
        " // Test for the trigger" +
        " public static testmethod void test1(){" +
        " Account a = new Account(name='TEST');" +
        " insert(a);" +
        " a = [select id,description from Account where id=:a.id];" +
        " System.assert(a.description.contains('t1_UPDATE'));" +
        "}" +
        " // Test for the class" +
        " public static testmethod void test2(){" +
        " String s = C1.method1();" +
        " System.assert(s=='HELLO');" +
        "}" +
        "};"

    String classBody = "public class C1{" +
        " public static String s ='HELLO';" +
        " public static String method1(){" +
```
try {
    result = apexBinding.compileAndTest(request);
} catch (RemoteException e) {
    System.out.println("An unexpected error occurred: " + e.getMessage());
} 
assert (result.isSuccess());

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>CompileAndTestRequest</td>
<td>A request that includes the Apex and the values for any fields that need to be set for this request.</td>
</tr>
</tbody>
</table>

Response

CompileAndTestRequest

The compileAndTest() call contains this object, a request with information about the Apex to be compiled.

A CompileAndTestRequest object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkOnly</td>
<td>boolean</td>
<td>If set to true, the Apex classes and triggers submitted are not saved to your organization, whether or not the code successfully compiles and unit tests pass.</td>
</tr>
<tr>
<td>classes</td>
<td>string</td>
<td>Content of the class or classes to be compiled.</td>
</tr>
<tr>
<td>deleteClasses</td>
<td>string</td>
<td>Name of the class or classes to be deleted.</td>
</tr>
<tr>
<td>deleteTriggers</td>
<td>string</td>
<td>Name of the trigger or triggers to be deleted.</td>
</tr>
<tr>
<td>runTestsRequest</td>
<td>RunTestsRequest</td>
<td>Specifies information about the Apex to be tested. If this request is sent in a production organization, this property is ignored and all unit tests are run for your entire organization.</td>
</tr>
<tr>
<td>triggers</td>
<td>string</td>
<td>Content of the trigger or triggers to be compiled.</td>
</tr>
</tbody>
</table>
Note the following about this object:

- This object contains the `RunTestsRequest` property. If the request is run in a production organization, the property is ignored and all tests are run.
- If any errors occur during compile, delete, testing, or if the goal of 75% code coverage is missed, no classes or triggers are saved to your organization. This is the same requirement as Salesforce AppExchange package testing.
- All triggers must have code coverage. If a trigger has no code coverage, no classes or triggers are saved to your organization.

**CompileAndTestResult**

The `compileAndTest()` call returns information about the compile and unit test run of the specified Apex, including whether it succeeded or failed.

A CompileAndTestResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>CompileClassResult</td>
<td>Information about the success or failure of the <code>compileAndTest()</code> call if classes were being compiled.</td>
</tr>
<tr>
<td>deleteClasses</td>
<td>DeleteApexResult</td>
<td>Information about the success or failure of the <code>compileAndTest()</code> call if classes were being deleted.</td>
</tr>
<tr>
<td>deleteTriggers</td>
<td>DeleteApexResult</td>
<td>Information about the success or failure of the <code>compileAndTest()</code> call if triggers were being deleted.</td>
</tr>
<tr>
<td>runTestsResult</td>
<td>RunTestsResult</td>
<td>Information about the success or failure of the Apex unit tests, if any were specified.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>If <code>true</code>, all of the classes, triggers, and unit tests specified ran successfully. If any class, trigger, or unit test failed, the value is <code>false</code>, and details are reported in the corresponding result object:</td>
</tr>
<tr>
<td>triggers</td>
<td>CompileTriggerResult</td>
<td>Information about the success or failure of the <code>compileAndTest()</code> call if triggers were being compiled.</td>
</tr>
</tbody>
</table>

**CompileClassResult**

This object is returned as part of a `compileAndTest()` or `compileClasses()` call. It contains information about whether or not the compile and run of the specified Apex was successful.

A CompileClassResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodyCrc</td>
<td>int</td>
<td>The CRC (cyclic redundancy check) of the class or trigger file.</td>
</tr>
</tbody>
</table>
### CompileTriggerResult

This object is returned as part of a `compileAndTest()` or `compileTriggers()` call. It contains information about whether or not the compile and run of the specified Apex was successful.

A CompileTriggerResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodyCrc</td>
<td>int</td>
<td>The CRC (cyclic redundancy check) of the trigger file.</td>
</tr>
<tr>
<td>column</td>
<td>int</td>
<td>The column where an error occurred, if one did.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>An ID is created for each compiled trigger. The ID is unique within an organization.</td>
</tr>
<tr>
<td>line</td>
<td>int</td>
<td>The line number where an error occurred, if one did.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the trigger.</td>
</tr>
<tr>
<td>problem</td>
<td>string</td>
<td>The description of the problem if an error occurred.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>If true, all the specified triggers compiled and ran successfully. If the compilation or execution of any trigger fails, the value is false.</td>
</tr>
</tbody>
</table>

### DeleteApexResult

This object is returned when the `compileAndTest()` call returns information about the deletion of a class or trigger.

A DeleteApexResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of the deleted trigger or class. The ID is unique within an organization.</td>
</tr>
<tr>
<td>problem</td>
<td>string</td>
<td>The description of the problem if an error occurred.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>If true, all the specified classes or triggers were deleted successfully. If any class or trigger is not deleted, the value is false.</td>
</tr>
</tbody>
</table>
compileClasses()

Compile your Apex in Developer Edition or sandbox organizations.

Syntax

```
CompileClassResult[] = compileClasses(string[] classList);
```

Usage

Use this call to compile Apex classes in Developer Edition or sandbox organizations. Production organizations must use `compileAndTest()`.

This call supports the `DebuggingHeader` on page 3981 and the `SessionHeader` on page 3995.

Sample Code—Java

```java
public void compileClassesSample() {
    String p1 = "public class p1 {
        " + "public static Integer var1 = 0;\n" + "public static void methodA() {\n" + "    var1 = 1;\n" + "}\n" + "public static void methodB() {\n" + "    p2.MethodA();\n" + "}\n" + "};
    String p2 = "public class p2 {
        " + "public static Integer var1 = 0;\n" + "public static void methodA() {\n" + "    var1 = 1;\n" + "}\n" + "public static void methodB() {\n" + "    p1.MethodA();\n" + "}\n" + "};
    CompileClassResult[] r = new CompileClassResult[0];
    try {
        r = apexBinding.compileClasses(new String[]{p1, p2});
    } catch (RemoteException e) {
        System.out.println("An unexpected error occurred: ", e.getMessage());
    }
    if (!r[0].isSuccess()) {
        System.out.println("Couldn't compile class p1 because: ", r[0].getProblem());
    }
    if (!r[1].isSuccess()) {
        System.out.println("Couldn't compile class p2 because: ", r[1].getProblem());
    }
}
```
**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scripts</td>
<td>string</td>
<td>A request that includes the Apex classes and the values for any fields that need to be set for this request.</td>
</tr>
</tbody>
</table>

**Response**

CompileClassResult

**compileTriggers()**

Compile your Apex triggers in Developer Edition or sandbox organizations.

**Syntax**

```java
CompileTriggerResult[] = compileTriggers(string[] triggerList);
```

**Usage**

Use this call to compile the specified Apex triggers in your Developer Edition or sandbox organization. Production organizations must use `compileAndTest()`.

This call supports the DebuggingHeader on page 3981 and the SessionHeader on page 3995.

**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scripts</td>
<td>string</td>
<td>A request that includes the Apex trigger or triggers and the values for any fields that need to be set for this request.</td>
</tr>
</tbody>
</table>

**Response**

CompileTriggerResult

**executeanonymous()**

Executes a block of Apex.

**Syntax**

```java
ExecuteAnonymousResult[] = binding.executeanonymous(string apexcode);
```
Usage

Use this call to execute an anonymous block of Apex. This call can be executed from AJAX.

This call supports the API DebuggingHeader on page 3981 and SessionHeader on page 3995.

If a component in a package with restricted API access issues this call, the request is blocked.

Apex classes and triggers saved (compiled) using API version 15.0 and higher produce a runtime error if you assign a String value that is too long for the field.

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apexcode</td>
<td>string</td>
<td>A block of Apex.</td>
</tr>
</tbody>
</table>

Response

ExecuteAnonymousResult

The executeanonymous() call returns information about whether or not the compile and run of the code was successful.

An ExecuteAnonymousResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td>int</td>
<td>If compiled is False, this field contains the column number of the point where the compile failed.</td>
</tr>
<tr>
<td>compileProblem</td>
<td>string</td>
<td>If compiled is False, this field contains a description of the problem that caused the compile to fail.</td>
</tr>
<tr>
<td>compiled</td>
<td>boolean</td>
<td>If True, the code was successfully compiled. If False, the column, line, and compileProblem fields are not null.</td>
</tr>
<tr>
<td>exceptionMessage</td>
<td>string</td>
<td>If success is False, this field contains the exception message for the failure.</td>
</tr>
<tr>
<td>exceptionStackTrace</td>
<td>string</td>
<td>If success is False, this field contains the stack trace for the failure.</td>
</tr>
<tr>
<td>line</td>
<td>int</td>
<td>If compiled is False, this field contains the line number of the point where the compile failed.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>If True, the code was successfully executed. If False, the exceptionMessage and exceptionStackTrace values are not null.</td>
</tr>
</tbody>
</table>

runTests()

Run your Apex unit tests.
Syntax

```java
RunTestsResult[] = binding.runTests(RunTestsRequest request);
```

Usage

To facilitate the development of robust, error-free code, Apex supports the creation and execution of unit tests. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, and send no emails. Such methods are flagged with the `@isTest` annotation in the method definition. Unit test methods must be defined in test classes, that is, classes annotated with `@isTest`. Use this call to run your Apex unit tests.

This call supports the `DebuggingHeader` on page 3981 and the `SessionHeader` on page 3995.

Sample Code—Java

```java
public void runTestsSample() {
    String sessionId = "sessionId goes here";
    String url = "url goes here";
    // Set the Apex stub with session ID received from logging in with the partner API
    _SessionHeader sh = new _SessionHeader();
    apexBinding.setHeader(
        new ApexServiceLocator().getServiceName().getNamespaceURI(),
        "SessionHeader", sh);
    // Set the URL received from logging in with the partner API to the Apex stub
    apexBinding._setProperty(ApexBindingStub.ENDPOINT_ADDRESS_PROPERTY, url);

    // Set the debugging header
    _DebuggingHeader dh = new _DebuggingHeader();
    dh.setDebugLevel(LogType.Profiling);
    apexBinding.setHeader(
        new ApexServiceLocator().getServiceName().getNamespaceURI(),
        "DebuggingHeader", dh);

    long start = System.currentTimeMillis();
    RunTestsRequest rtr = new RunTestsRequest();
    rtr.setAllTests(true);
    RunTestsResult res = null;
    try {
        res = apexBinding.runTests(rtr);
    } catch (RemoteException e) {
        System.out.println("An unexpected error occurred: " + e.getMessage());
    }

    System.out.println("Number of tests: " + res.getNumTestsRun());
    System.out.println("Number of failures: " + res.getNumFailures());
    if (res.getNumFailures() > 0) {
        for (RunTestFailure rtf : res.getFailures()) {
            System.out.println("Failure: "+ (rtf.getNamespace() == null ? "" : rtf.getNamespace() + ".")
                            + rtf.getName() + ": " + rtf.getMethodName() + "\n" + rtf.getMessage() + rtf.getStackTrace());
        }
    }
}
```
if (res.getCodeCoverage() != null) {
    for (CodeCoverageResult ccr : res.getCodeCoverage()) {
        System.out.println("Code coverage for " + ccr.getType() + 
            (ccr.getNamespace() == null ? "" : ccr.getNamespace() + ".")
            + ccr.getName() + ": 
            " + ccr.getNumLocationsNotCovered()
            + " locations not covered out of 
            + ccr.getNumLocations());

        if (ccr.getNumLocationsNotCovered() > 0) {
            for (CodeLocation cl : ccr.getLocationsNotCovered())
                System.out.println("\tLine " + cl.getLine());
        }
    }
}
System.out.println("Finished in " + 
    (System.currentTimeMillis() - start) + " ms");

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>RunTestsRequest</td>
<td>A request that includes the Apex unit tests and the values for any fields that need to be set for this request.</td>
</tr>
</tbody>
</table>

Response

RunTestsResult

RunTestsRequest

Specifies information about the Apex code to be tested. RunTestsRequest is part of CompileAndTestRequest, which is the request passed to the compileAndTest() call. This object is also passed to the Tooling SOAP API call runTests(). You can specify the same or different classes to be tested and compiled. Since triggers cannot be tested directly, they are not included in this object. Instead, you must specify a class that calls the trigger.

If the request is sent to a production organization, this request is ignored and all unit tests defined for your organization are run.

The RunTestsRequest object has the following organization:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allTests</td>
<td>boolean</td>
<td>If allTests is true, all unit tests defined for your organization are run.</td>
</tr>
<tr>
<td>classes</td>
<td>string[]</td>
<td>An array of one or more objects.</td>
</tr>
</tbody>
</table>
| namespace| string | If specified, the namespace that contains the unit tests to be run. Do not use this property if you specify allTests as true. Also, if you execute compileAndTest()
### RunTestsRequest Apex-Related Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxFailedTests</td>
<td>int</td>
<td>A mandatory parameter for the Tooling SOAP API call <code>runTests()</code>. To allow all tests in a run to execute, set <code>maxFailedTests</code> to <code>-1</code>. To stop the test run from executing new tests after a given number of tests fail, set <code>maxFailedTests</code> to an integer value from <code>0</code> to <code>1,000,000</code>. This integer value sets the maximum allowable test failures. A value of <code>0</code> causes the test run to stop if any failure occurs. A value of <code>1</code> causes the test run to stop on the second failure, and so on.</td>
</tr>
<tr>
<td>packages</td>
<td>string[]</td>
<td>Do not use after version 10.0. For earlier, unsupported releases, the content of the package to be tested.</td>
</tr>
<tr>
<td>skipCodeCoverage</td>
<td>boolean</td>
<td>Indicates whether to opt out of collecting code coverage information during Apex test runs. Available in API version 43.0 and later.</td>
</tr>
<tr>
<td>tests</td>
<td>TestsNode[]</td>
<td>A mandatory parameter for the Tooling SOAP API call <code>runTests()</code>. Specifies individual test methods in an Apex test class. To specify classes or suites instead of a <code>TestsNode[]</code>, set <code>tests</code> to <code>null</code>. Although this property accepts an array, the array can contain only one entry.</td>
</tr>
</tbody>
</table>

### TestsNode

Specifies individual test methods in an Apex test class.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classId</td>
<td>string</td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The ID of the Apex class that contains the test methods you want to run. <code>classId</code> or <code>className</code> is required.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Supported Methods</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>getClassId()</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>setClassId(new String &quot;&lt;your class ID&gt;&quot;)</code></td>
</tr>
<tr>
<td>className</td>
<td>string</td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The name of the Apex class that contains the test methods you want to run. To run tests from a managed package, include the package's namespace using dot notation. <code>classId</code> or <code>className</code> is required.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Supported Methods</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>getClassName()</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>setClassName(new String &quot;YourClassName&quot;)</code></td>
</tr>
</tbody>
</table>
### Description

The test methods you want to run.

Required.

### Supported Methods

- `getTestMethods()`
- `setTestMethods(new String[] {"testMethod1", "testMethod2"})`

---

## RunTestsResult

Contains information about the execution of unit tests, including whether unit tests were completed successfully, code coverage results, and failures.

A `RunTestsResult` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apexLogId</code></td>
<td><code>string</code></td>
<td>The ID of an ApexLog object that is created at the end of a test run. The ApexLog object is created if there is an active trace flag on the user running an Apex test, or on a class or trigger being executed. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td><code>codeCoverage</code></td>
<td><code>CodeCoverageResult[]</code></td>
<td>An array of one or more CodeCoverageResult objects that contains the details of the code coverage for the specified unit tests.</td>
</tr>
<tr>
<td><code>codeCoverageWarnings</code></td>
<td><code>CodeCoverageWarning[]</code></td>
<td>An array of one or more code coverage warnings for the test run. The results include both the total number of lines that could have been executed, as well as the number, line, and column positions of code that was not executed.</td>
</tr>
<tr>
<td><code>failures</code></td>
<td><code>RunTestFailure[]</code></td>
<td>An array of one or more RunTestFailure objects that contain information about the unit test failures, if there are any.</td>
</tr>
<tr>
<td><code>flowCoverage</code></td>
<td><code>FlowCoverageResult[]</code></td>
<td>An array of results from test runs that executed flows. This field is available in API version 44.0 and later.</td>
</tr>
<tr>
<td><code>flowCoverageWarnings</code></td>
<td><code>FlowCoverageWarning[]</code></td>
<td>An array of warnings generated by test runs that executed flows. This field is available in API version 44.0 and later.</td>
</tr>
<tr>
<td><code>numFailures</code></td>
<td><code>int</code></td>
<td>The number of failures for the unit tests.</td>
</tr>
<tr>
<td><code>numTestsRun</code></td>
<td><code>int</code></td>
<td>The number of unit tests that were run.</td>
</tr>
</tbody>
</table>
### RunTestsResult

The `RunTestsResult` object contains information about the success or failure of the compile and run of the specified Apex and unit tests. It contains the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>successes</td>
<td><code>RunTestSuccess[]</code></td>
<td>An array of one or more <code>RunTestSuccess</code> objects that contain information about successes, if there are any.</td>
</tr>
<tr>
<td>totalTime</td>
<td><code>double</code></td>
<td>The total cumulative time spent running tests, in milliseconds. This can be helpful for performance monitoring.</td>
</tr>
</tbody>
</table>

### CodeCoverageResult

The `RunTestsResult` object contains this object. It contains information about whether or not the compile of the specified Apex and run of the unit tests was successful. A `CodeCoverageResult` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dmlInfo</td>
<td><code>CodeLocation[]</code></td>
<td>For each class or trigger tested, for each portion of code tested, this property contains the DML statement locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.</td>
</tr>
<tr>
<td>id</td>
<td><code>ID</code></td>
<td>The ID of the <code>CodeLocation</code>. The ID is unique within an organization.</td>
</tr>
<tr>
<td>locationsNotCovered</td>
<td><code>CodeLocation[]</code></td>
<td>For each class or trigger tested, if any code is not covered, the line and column of the code not tested, and the number of times the code was executed.</td>
</tr>
<tr>
<td>methodInfo</td>
<td><code>CodeLocation[]</code></td>
<td>For each class or trigger tested, the method invocation locations, the number of times the code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.</td>
</tr>
<tr>
<td>name</td>
<td><code>string</code></td>
<td>The name of the class or trigger covered.</td>
</tr>
<tr>
<td>namespace</td>
<td><code>string</code></td>
<td>The namespace that contained the unit tests, if one is specified.</td>
</tr>
<tr>
<td>numLocations</td>
<td><code>int</code></td>
<td>The total number of code locations.</td>
</tr>
<tr>
<td>soqlInfo</td>
<td><code>CodeLocation[]</code></td>
<td>For each class or trigger tested, the location of SOQL statements in the code, the number of times this code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.</td>
</tr>
<tr>
<td>soslInfo</td>
<td><code>CodeLocation[]</code></td>
<td>For each class tested, the location of SOSL statements in the code, the number of times this code was executed, and the total cumulative time spent in these calls. This can be helpful for performance monitoring.</td>
</tr>
<tr>
<td>type</td>
<td><code>string</code></td>
<td>Do not use. In early, unsupported releases, used to specify class or package.</td>
</tr>
</tbody>
</table>
**CodeCoverageWarning**

The `RunTestsResult` object contains this object. It contains information about the Apex class which generated warnings.

This object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>The ID of the class which generated warnings.</td>
</tr>
<tr>
<td>message</td>
<td>string</td>
<td>The message of the warning generated.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the class that generated a warning. If the warning applies to the overall code coverage, this value is null.</td>
</tr>
<tr>
<td>namespace</td>
<td>string</td>
<td>The namespace that contains the class, if one was specified.</td>
</tr>
</tbody>
</table>

**RunTestFailure**

The `RunTestsResult` object returns information about failures during the unit test run.

This object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>The ID of the class which generated failures.</td>
</tr>
<tr>
<td>message</td>
<td>string</td>
<td>The failure message.</td>
</tr>
<tr>
<td>methodName</td>
<td>string</td>
<td>The name of the method that failed.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the class that failed.</td>
</tr>
<tr>
<td>namespace</td>
<td>string</td>
<td>The namespace that contained the class, if one was specified.</td>
</tr>
<tr>
<td>seeAllData</td>
<td>boolean</td>
<td>Indicates whether the test method has access to organization data (true) or not (false).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This field is available in API version 33.0 and later.</td>
</tr>
<tr>
<td>stackTrace</td>
<td>string</td>
<td>The stack trace for the failure.</td>
</tr>
<tr>
<td>time</td>
<td>double</td>
<td>The time spent running tests for this failed operation, in milliseconds. This can be helpful for performance monitoring.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>Do not use. In early, unsupported releases, used to specify class or package.</td>
</tr>
</tbody>
</table>
**FlowCoverageResult**

This object contains information about the flow version and the number of elements executed by the test run. This object is available in API version 44.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elementsNotCovered</td>
<td>string</td>
<td>List of elements in the flow version that weren't executed by the test run.</td>
</tr>
<tr>
<td>flowId</td>
<td>string</td>
<td>The ID of the flow version. The ID is unique within an org.</td>
</tr>
<tr>
<td>flowName</td>
<td>string</td>
<td>The name of the flow that was executed by the test run.</td>
</tr>
<tr>
<td>flowNamespace</td>
<td>string</td>
<td>The namespace that contains the flow, if one is specified.</td>
</tr>
<tr>
<td>numElements</td>
<td>int</td>
<td>The total number of elements in the flow version.</td>
</tr>
<tr>
<td>numElementsNotCovered</td>
<td>int</td>
<td>The number of elements in the flow version that weren't executed by the test run</td>
</tr>
<tr>
<td>processType</td>
<td>FlowProcessType (enumeration of type string)</td>
<td>The process type of the flow version.</td>
</tr>
</tbody>
</table>

**FlowCoverageWarning**

This object contains information about the flow version that generated warnings. This object is available in API version 44.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flowId</td>
<td>string</td>
<td>The ID of the flow version that generated the warning.</td>
</tr>
<tr>
<td>flowName</td>
<td>string</td>
<td>The name of the flow that generated the warning. If the warning applies to the overall test coverage of flows within your org, this value is null.</td>
</tr>
<tr>
<td>flowNamespace</td>
<td>string</td>
<td>The namespace that contains the flow, if one was specified.</td>
</tr>
<tr>
<td>message</td>
<td>string</td>
<td>The message of the warning that was generated.</td>
</tr>
</tbody>
</table>

**RunTestSuccess**

The `RunTestsResult` object returns information about successes during the unit test run.

This object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>The ID of the class which generated the success.</td>
</tr>
<tr>
<td>methodName</td>
<td>string</td>
<td>The name of the method that succeeded.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the class that succeeded.</td>
</tr>
</tbody>
</table>
### namespace
- **Type**: string
- **Description**: The namespace that contained the class, if one was specified.

### seeAllData
- **Type**: boolean
- **Description**: Indicates whether the test method has access to organization data (true) or not (false).
  - This field is available in API version 33.0 and later.

### time
- **Type**: double
- **Description**: The time spent running tests for this operation. This can be helpful for performance monitoring.

### CodeLocation

The RunTestsResult object contains this object in a number of fields.

This object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td>int</td>
<td>The column location of the Apex tested.</td>
</tr>
<tr>
<td>line</td>
<td>int</td>
<td>The line location of the Apex tested.</td>
</tr>
<tr>
<td>numExecutions</td>
<td>int</td>
<td>The number of times the Apex was executed in the test run.</td>
</tr>
<tr>
<td>time</td>
<td>double</td>
<td>The total cumulative time spent at this location. This can be helpful for performance monitoring.</td>
</tr>
</tbody>
</table>
### CHAPTER 12  Core Calls

The following table lists supported calls in the API in alphabetical order, and provides a brief description for each. Click a call name to see syntax, usage, and more information for that call.

**Note:** For a list of Apex-related calls, see Apex-Related Calls, for a list of describe calls, see Describe Calls, and for a list of utility calls, see Utility Calls.

<table>
<thead>
<tr>
<th>Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>convertLead()</td>
<td>Converts a Lead into an Account, Contact, or (optionally) an Opportunity.</td>
</tr>
<tr>
<td>create()</td>
<td>Adds one or more new individual objects to your organization’s data.</td>
</tr>
<tr>
<td>delete()</td>
<td>Deletes one or more individual objects from your organization’s data.</td>
</tr>
<tr>
<td>deleteByExample()</td>
<td>Deletes objects from your organization’s data using an sObject as a template for what to delete. All data in a big object matching the values in the sObject templates are deleted.</td>
</tr>
<tr>
<td>emptyRecycleBin()</td>
<td>Delete records from the recycle bin immediately.</td>
</tr>
<tr>
<td>executeListView()</td>
<td>Executes a list view’s SOQL query to retrieve data, labels, and actions from a list view.</td>
</tr>
<tr>
<td>findDuplicates()</td>
<td>Performs rule-based searches for duplicate records. The input is an array of sObject, each of which specifies the values to search for and the type of object that supplies the duplicate rules. The output identifies the detected duplicates for each object that supplies the duplicate rules. $findDuplicates$() applies the rules to the values to do the search. The output identifies the detected duplicates for each sObject.</td>
</tr>
<tr>
<td>findDuplicatesByIds()</td>
<td>Performs rule-based searches for duplicate records. The input is an array of IDs, each of which specifies the records for which to search for duplicates. The output identifies the detected duplicates for each object that supplies the duplicate rules. $findDuplicatesByIds$() applies the rules to the record IDs to do the search. The output identifies the detected duplicates for each ID.</td>
</tr>
<tr>
<td>getDeleted()</td>
<td>Retrieves the IDs of individual objects of the specified object that have been deleted since the specified time. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>getUpdated()</td>
<td>Retrieves the IDs of individual objects of the specified object that have been updated since the specified time. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>invalidateSessions()</td>
<td>Ends one or more sessions specified by sessionId.</td>
</tr>
<tr>
<td>login()</td>
<td>Logs in to the login server and starts a client session.</td>
</tr>
</tbody>
</table>
### Core Calls

<table>
<thead>
<tr>
<th>Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logout()</td>
<td>Ends the session of the logged-in user.</td>
</tr>
<tr>
<td>merge()</td>
<td>Merges records of the same object type.</td>
</tr>
<tr>
<td>performQuickActions()</td>
<td>Executes quick actions of type create or update.</td>
</tr>
<tr>
<td>process()</td>
<td>Submits an array of approval process instances for approval, or processes an array of approval process instances to be approved, rejected, or removed.</td>
</tr>
<tr>
<td>query()</td>
<td>Executes a query against the specified object and returns data that matches the specified criteria.</td>
</tr>
<tr>
<td>queryAll()</td>
<td>Same as query(), but includes deleted and archived items.</td>
</tr>
<tr>
<td>queryMore()</td>
<td>Retrieves the next batch of objects from a query.</td>
</tr>
<tr>
<td>retrieve()</td>
<td>Retrieves one or more objects based on the specified object IDs.</td>
</tr>
<tr>
<td>search()</td>
<td>Executes a text search in your organization’s data.</td>
</tr>
<tr>
<td>undelete()</td>
<td>Undelete records identified with queryAll().</td>
</tr>
<tr>
<td>update()</td>
<td>Updates one or more existing objects in your organization’s data.</td>
</tr>
<tr>
<td>upsert()</td>
<td>Creates new objects and updates existing objects; matches on a custom field to determine the presence of existing objects.</td>
</tr>
</tbody>
</table>

### Samples

The samples in this section are based on the enterprise WSDL file. They assume that you have already imported the WSDL file and created a connection. To learn how to do so, see the Quick Start tutorial.

#### convertLead()

Converts a Lead into an Account, Contact, or (optionally) an Opportunity.

**Syntax**

```java
LeadConvertResult[] = connection.convertLead(leadConverts LeadConvert[]);
```

**Usage**

Use `convertLead()` to convert a Lead into an Account and Contact, and (optionally) an Opportunity. If appropriate for your business, you can also use `convertLead()` to convert a lead to an account and a person account instead of a contact. To convert a Lead, your client application must be logged in with the “Convert Leads” permission and the “Edit” permission on leads, as well as “Create” and “Edit” on the Account, Contact, and Opportunity objects.
This call provides an easy way to convert the information in a qualified lead to a new or updated account, contact, and opportunity. Your organization can set its own guidelines for determining when a lead is qualified. Typically, a lead can be converted when it becomes a real opportunity that you want to forecast.

If data is merged into existing account, contact, and opportunity objects, then only empty fields in the target object are overwritten—existing data (including IDs) aren’t overwritten. The only exception is if your client application sets `overwriteLeadSource` to `true`. In this case, the `LeadSource` field in the target `Contact` object will be overwritten with the contents of the `LeadSource` field in the source `Lead` object.

When converting leads, consider the following rules and guidelines:

Field Mappings
The system automatically maps standard lead fields to standard account, contact, and opportunity fields. For custom lead fields, your Salesforce administrator can specify how they map to custom account, contact, and opportunity fields.

Record Types
If the organization uses record types, the default record type of the new owner is assigned to records created during lead conversion. For more information about record types, see Salesforce Help.

Picklist Values
The system assigns the default picklist values for the account, contact, and opportunity when mapping any standard lead picklist fields that are blank. If your organization uses record types, blank values are replaced with the default picklist values of the new record owner.

String Values
Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the `AllowFieldTruncationHeader` SOAP header.

Errors
If any of the leads fail to convert as part of a bulk operation, the lead conversion is retried for each lead individually.

Automatic Subscriptions for Chatter Feeds
When you convert a lead into a new account, contact, and opportunity, the lead owner is unsubscribed from the lead record’s Chatter feed. The lead owner, the owner of the generated records, and users that were subscribed to the lead aren’t automatically subscribed to the generated records, unless they have automatic subscriptions enabled in their Chatter feed settings. They must have automatic subscriptions enabled to see changes to the account, contact, and opportunity records in their news feed.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user’s home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.
Basic Steps for Converting Leads

Converting leads involves the following basic steps:

1. The client application determines the IDs of any lead(s) to be converted.
2. Optionally, the client application determines the IDs of any account(s) to merge the lead into. The client application can use SOSL or SOQL to search for accounts that match the lead name, as in the following example:
   
   ```sql
   select id, name from account where name='CompanyNameOfLeadBeingMerged'
   ```

3. Optionally, the client application determines the IDs of contact(s) to merge the lead into. The client application can use SOSL or SOQL to search for contacts that match the lead contact name, as in the following example:
   
   ```sql
   select id, name from contact where firstName='FirstName' and lastName='LastName' and accountId='001...'
   ```

4. Optionally, the client application determines whether opportunities should be created from the lead, or the ID of an opportunity to merge the lead into. The client application can use SOSL or SOQL to search for contacts that match the lead contact name, as in the following example:
   
   ```sql
   select id, name from opportunity where name='OpportunityNameOfOpportunityBeingMerged'
   ```

5. The client application queries the LeadStatus table to obtain the possible converted status options:
   
   ```sql
   SELECT Id, MasterLabel FROM LeadStatus WHERE IsConverted=true
   ```

6. The client application calls `convertLead()`.

7. The client application iterates through the returned result and examines each `LeadConvertResult` object to determine whether conversion succeeded for each lead.

8. As an optional best practice, the client application creates tasks in which the `WhoId` is the `ContactId` and, if an opportunity is created, the `WhatId` is the `OpportunityId`.

9. Optionally, when converting leads owned by a queue, the owner must be specified. This is because accounts and contacts cannot be owned by a queue. Even if you are specifying an existing account or contact, you must still specify an owner.

Sample Code—Java

This sample shows how to convert leads. It creates two leads and converts them. Next, it iterates through the lead conversion results and writes the IDs of the account, contact, and opportunity created for each lead.

```java
public String[] convertLeadRecords() {
    String[] result = new String[4];
    try {
        // Create two leads to convert
        Lead[] leads = new Lead[2];
        Lead lead = new Lead();
        lead.setLastName("Mallard");
        lead.setFirstName("Jay");
        lead.setCompany("Wingo Ducks");
        lead.setPhone("(707) 555-0328");
        leads[0] = lead;
```
lead = new Lead();
lead.setLastName("Platypus");
lead.setFirstName("Ogden");
lead.setCompany("Denio Water Co.");
lead.setPhone("(775) 555-1245");
leads[1] = lead;
SaveResult[] saveResults = connection.create(leads);

// Create a LeadConvert array to be used
// in the convertLead() call
LeadConvert[] leadsToConvert = new LeadConvert[saveResults.length];

for (int i = 0; i < saveResults.length; ++i) {
    if (saveResults[i].isSuccess()) {
        System.out.println("Created new Lead: " + saveResults[i].getId());
        leadsToConvert[i] = new LeadConvert();
        leadsToConvert[i].setConvertedStatus("Closed - Converted");
        leadsToConvert[i].setLeadId(saveResults[i].getId());
        result[0] = saveResults[i].getId();
    } else {
        System.out.println("\nError creating new Lead: " + saveResults[i].getErrors()[0].getMessage());
    }
}

// Convert the leads and iterate through the results
LeadConvertResult[] lcResults = connection.convertLead(leadsToConvert);
for (int j = 0; j < lcResults.length; ++j) {
    if (lcResults[j].isSuccess()) {
        System.out.println("Lead converted successfully!");
        System.out.println("Account ID: " + lcResults[j].getAccountId());
        System.out.println("Contact ID: " + lcResults[j].getContactId());
        System.out.println("Opportunity ID: " + lcResults[j].getOpportunityId());
    } else {
        System.out.println("\nError converting new Lead: " + lcResults[j].getErrors()[0].getMessage());
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
return result;

---

Sample Code—C#

This sample shows how to convert leads. It creates two leads and converts them. Next, it iterates through the lead conversion results and writes the IDs of the account, contact, and opportunity created for each lead.

```csharp
public String[] convertLeadRecords()
{
    String[] result = new String[4];
```
try
{
    // Create two leads to convert
    Lead[] leads = new Lead[2];
    Lead lead = new Lead();
    lead.LastName = "Mallard";
    lead.FirstName = "Jay";
    lead.Company = "Wingo Ducks";
    lead.Phone = "(707) 555-0328";
    leads[0] = lead;
    lead = new Lead();
    lead.LastName = "Platypus";
    lead.FirstName = "Ogden";
    lead.Company = "Denio Water Co.";
    lead.Phone = "(775) 555-1245";
    leads[1] = lead;
    SaveResult[] saveResults = binding.create(leads);

    // Create a LeadConvert array to be used
    // in the convertLead() call
    LeadConvert[] leadsToConvert =
        new LeadConvert[saveResults.Length];
    for (int i = 0; i < saveResults.Length; ++i)
    {
        if (saveResults[i].success)
        {
            Console.WriteLine("Created new Lead: " +
                saveResults[i].id);
            leadsToConvert[i] = new LeadConvert();
            leadsToConvert[i].convertedStatus = "Closed - Converted";
            leadsToConvert[i].leadId = saveResults[i].id;
            result[0] = saveResults[i].id;
        }
        else
        {
            Console.WriteLine("\nError creating new Lead: " +
                saveResults[i].errors[0].message);
        }
    }
    // Convert the leads and iterate through the results
    LeadConvertResult[] lcResults =
        binding.convertLead(leadsToConvert);
    for (int j = 0; j < lcResults.Length; ++j)
    {
        if (lcResults[j].success)
        {
            Console.WriteLine("Lead converted successfully!");
            Console.WriteLine("Account ID: " +
                lcResults[j].accountId);
            Console.WriteLine("Contact ID: " +
                lcResults[j].contactId);
            Console.WriteLine("Opportunity ID: " +
                lcResults[j].opportunityId);
        }
    }
}
else
{
    Console.WriteLine("\nError converting new Lead: " +
    lcResults[j].errors[0].message);
}
}

} catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
    e.Message + "\n" + e.StackTrace);
    return result;
}

---

**LeadConvert Arguments**

This call accepts an array of LeadConvert objects (100 maximum). A LeadConvert object contains the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accountId</td>
<td>ID</td>
<td>ID of the Account into which the lead will be merged. Required only when updating an existing account, including person accounts. If no accountId is specified, then the API creates a new account. To create a new account, the client application must be logged in with sufficient access rights. To merge a lead into an existing account, the client application must be logged in with read/write access to the specified account. The account name and other existing data are not overwritten. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>contactId</td>
<td>ID</td>
<td>ID of the Contact into which the lead will be merged (this contact must be associated with the specified accountId, and an accountId must be specified). Required only when updating an existing contact. <strong>Important:</strong> If you’re converting a lead into a person account, do not specify the contactId or an error will result. Specify only the accountId of the person account. If no contactId is specified, then the API creates a contact that is implicitly associated with the Account. To create a new contact, the client application must be logged in with sufficient access rights. To merge a lead into an existing contact, the client application must be logged in with read/write access to the specified contact. The contact name and other existing data aren’t overwritten (unless overwriteLeadSource is set to true, in which case only the LeadSource field is overwritten).</td>
</tr>
<tr>
<td>convertedStatus</td>
<td>string</td>
<td>Valid LeadStatus value for a converted lead. Required. To obtain the list of possible values, the client application queries the LeadStatus object. For example:</td>
</tr>
</tbody>
</table>

```sql
SELECT Id, MasterLabel
FROM LeadStatus WHERE IsConverted=true
```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doNotCreateOpportunity</td>
<td>boolean</td>
<td>Specifies whether to create an Opportunity during lead conversion (false, the default) or not (true). Set this flag to true only if you don’t want to create an opportunity from the lead. An opportunity is created by default.</td>
</tr>
<tr>
<td>leadId</td>
<td>ID</td>
<td>ID of the Lead to convert. Required. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>opportunityId</td>
<td>ID</td>
<td>The ID of an existing opportunity to relate to the lead. The opportunityId and opportunityName arguments are mutually exclusive. Specifying a value for both results in an error. If doNotCreateOpportunity argument is true, then no Opportunity is created and this field must be left blank; otherwise, an error is returned.</td>
</tr>
<tr>
<td>opportunityName</td>
<td>string</td>
<td>Name of the opportunity to create. If no name is specified, then this value defaults to the company name of the lead. The maximum length of this field is 80 characters. The opportunityId and opportunityName arguments are mutually exclusive. Specifying a value for both results in an error. If doNotCreateOpportunity argument is true, then no Opportunity is created and this field must be left blank; otherwise, an error is returned.</td>
</tr>
<tr>
<td>overwriteLeadSource</td>
<td>boolean</td>
<td>Specifies whether to overwrite the LeadSource field on the target Contact object with the contents of the LeadSource field in the source Lead object (true), or not (false, the default). To set this field to true, the client application must specify a contactId for the target contact.</td>
</tr>
<tr>
<td>ownerId</td>
<td>ID</td>
<td>Specifies the ID of the person to own any newly created account, contact, and opportunity. If the client application doesn’t specify this value, then the owner of the new object will be the owner of the lead. Not applicable when merging with existing objects—if an ownerId is specified, the API doesn’t overwrite the ownerId field in an existing account or contact. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>relatedPersonAccountId</td>
<td>ID</td>
<td>When converting a lead to a business account and a person account instead of a contact, specifies the ID of the existing person account to convert the lead to.</td>
</tr>
<tr>
<td>relatedPersonAccountRecord</td>
<td>Entity</td>
<td>When converting a lead to a business account and a person account instead of a contact, specifies the entity record of the new person account to convert the lead to.</td>
</tr>
<tr>
<td>sendNotificationEmail</td>
<td>boolean</td>
<td>Specifies whether to send a notification email to the owner specified in the ownerId (true) or not (false, the default).</td>
</tr>
</tbody>
</table>

**Response**

LeadConvertResult[]
Fault

*UnexpectedErrorFault*

SEE ALSO:

API Call Basics

**LeadConvertResult**

This call returns an array of *LeadConvertResult* objects. Each element in the *LeadConvertResult* array corresponds to the LeadConvert[] array passed as the *leadConverts* parameter in the *convertLead()* call. For example, the object returned in the first index in the *LeadConvertResult* array matches the object specified in the first index of the LeadConvert[] array. A *LeadConvertResult* object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>accountId</strong></td>
<td>ID</td>
<td>ID of the new <em>Account</em> (if a new account was specified) or the ID of the account specified when <em>convertLead()</em> was invoked.</td>
</tr>
<tr>
<td><strong>contactId</strong></td>
<td>ID</td>
<td>ID of the new <em>Contact</em> (if a new contact was specified) or the ID of the contact specified when <em>convertLead()</em> was invoked. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td><strong>leadId</strong></td>
<td>ID</td>
<td>ID of the converted <em>Lead</em>. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td><strong>opportunityId</strong></td>
<td>ID</td>
<td>ID of the new or existing <em>Opportunity</em>, if one was created or related to the lead when <em>convertLead()</em> was invoked. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td><strong>relatedPersonAccountId</strong></td>
<td>ID</td>
<td>ID of the new or existing related <em>Person Account</em>, if one was created or related to the lead when <em>convertLead()</em> was invoked. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td><strong>success</strong></td>
<td>boolean</td>
<td>Indicates whether the <em>convertLead()</em> call succeeded (true) or not (false) for this object.</td>
</tr>
<tr>
<td><strong>errors</strong></td>
<td>Error[]</td>
<td>If an error occurred during the <em>create()</em> call, an array of one or more <em>Error</em> objects providing the error code and description.</td>
</tr>
</tbody>
</table>

**create()**

⚠️ |other|: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Adds one or more new records to your organization’s data.

**Syntax**

```python
SaveResult[] = connection.create(sObject[] sObjects);
```
Usage

Use `create()` to add one or more records, such as an Account or Contact record, to your organization’s information. The `create()` call is analogous to the INSERT statement in SQL.

When creating objects, consider the following rules and guidelines.

Permissions

Your client application must be logged in with sufficient access rights to create records within the specified object. For more information, see Factors that Affect Data Access.

Special Handling

Certain objects—and certain fields within those objects—require special handling or permissions. For example, you might also need permissions to access the object’s parent object. Before you attempt to `create()` a record for a particular object, be sure to read its description in the Standard Objects.

Createable Fields

Only objects where `createable` is true can be created via the `create()` call. To determine whether a given object can be created, your client application can invoke the `describeSObjects()` call on the object and inspect its `createable` property.

Automatically Maintained Fields

The API generates unique values for ID fields automatically. For `create()`, you cannot explicitly specify an ID value in the `sObject`. The `saveResult[]` object contains the ID of each record that was successfully created. For information on IDs, see ID Field Type.

The API populates certain fields automatically, such as `CreatedDate`, `CreatedBy`, `LastModified`, `LastModifiedBy`, and `SystemModstamp`. You cannot explicitly specify these values.

Required Fields

For required fields that do not have a preconfigured default value, you must supply a value. For more information, see Required Fields.

Default Values

For some objects, some fields have a default value, such as `OwnerID`. If you do not specify a value for such fields, the API populates the fields with the default value. For example, if you do not override `OwnerID`, then the API populates this field with the user ID associated with the user as whom your client application is logged in.

- For required fields that do not have a preconfigured default value, you must supply a value.
- For all other fields in the object, if you do not explicitly specify a value, then its value is `null` (VT_EMPTY).
Referential Integrity

Your client application must conform to the rules of referential integrity. For example, if you are creating a record for an object that is the child of a parent object, you must supply the foreign key information that links the child to the parent. For example, when creating a CaseComment, you must supply the valid case ID for the parent Case, and that parent Case must exist in the database.

Valid Data Values

You must supply values that are valid for the field's data type, such as integers (not alphabetic characters) for integer fields. In your client application, follow the data formatting rules specified for your programming language and development tool (your development tool will handle the appropriate mapping of data types in SOAP messages).

String Values

When storing values in string fields, the API trims any leading and trailing whitespace. For example, if the value of a name field is entered as " ABC Company ", then the value is stored in the database as "ABC Company".

Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the AllowFieldTruncationHeader SOAP header.

Assignment Rules

When creating new Account (accounts fire Territory Management assignment rules), Case, or Lead records, your client application can set options in the AssignmentRuleHeader to have the case or lead automatically assigned to one or more users based on assignment rules configured in the Salesforce user interface.

Maximum Number of Records Created

Your client application can add up to 200 records in a single create() call. If a create request exceeds 200 records, then the entire operation fails.

Rollback on Error

The AllOrNoneHeader header allows you to roll back all changes unless all records are processed successfully. This header is available in API version 20.0 and later. Allows a call to roll back all changes unless all records are processed successfully.

Automatic Subscriptions for Chatter Feeds

To subscribe to records they create, users must enable the Automatically follow records that I create option in their personal settings. If users have automatic subscriptions enabled, they automatically follow the records they create and see changes to those records in their Chatter feed on the Home tab.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later. The EntitySubscription object represents a subscription of a user following a record or another user.
Disabling Feed Notifications

If you’re processing a large number of records and don’t want to track the changes in various feeds related to the records, use DisableFeedTrackingHeader. This is especially useful for bulk changes.

Creating Records for Different Object Types

You can create records for multiple object types, including custom objects, in one call with API version 20.0 and later. For example, you could create a contact and an account in one call. You can create records for up to 10 object types in one call.

Records are saved in the same order that they are entered in the sObjects input array. If you are entering new records that have a parent-child relationship, the parent record must precede the child record in the sObjects array. For example, if you are creating a contact that references an account that is also being created in the same call, the account must have a smaller index in the sObjects array than the contact does. The contact references the account by using an External ID field.

You can’t add a record that references another record of the same object type in the same call. For example, the Contact object has a Reports To field that is a reference to another contact. You can’t create two contacts in one call if one contact uses the Reports To field to reference a second contact in the sObjects array. You can create a contact that references another contact that has been previously created.

Records for different object types are broken into multiple chunks by Salesforce. A chunk is a subset of the sObjects input array and each chunk contains records of one object type. Data is committed on a chunk-by-chunk basis. Any Apex triggers related to the records in a chunk are invoked once per chunk. Consider an sObjects input array containing the following set of records:

account1, account2, contact1, contact2, contact3, casel, account3, account4, contact4

Salesforce splits the records into five chunks:

1. account1, account2
2. contact1, contact2, contact3
3. casel
4. account3, account4
5. contact4

Each call can process up to 10 chunks. If the sObjects array contains more than 10 chunks, you must process the records in more than one call.

Warning: You can’t create records for multiple object types in one call if one of those types is related to a feature in the Setup area in Salesforce. The only exceptions are the following objects:

- Custom settings objects, which are similar to custom objects. For more information, see “Create Custom Settings” in the Salesforce online help.
- GroupMember
- Group
- User if the UserRole field is not being set.

create() and Foreign Keys

You can use external ID fields as a foreign key, which allows you to create a record and relate it to another existing record in a single step instead of querying the parent record ID first. To do this, set the foreign key field to an instance of the parent sObject that only has the external ID field specified. This external ID should match the external ID value on the parent record.
The following Java and C# examples show you how to create an opportunity and relate it to an existing account using a custom external ID field named `MyExtId__c`. Each example creates an opportunity, sets the required fields, and then sets the opportunity external ID field to the account object that has only the external ID field specified. The code then creates the opportunity. Once the opportunity is created, the account will be its parent.

**Java Example**

```java
public void createForeignKeySample() {
    try {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.setName("OpportunityWithFK");
        newOpportunity.setStageName("Prospecting");
        Calendar dt = connection.getServerTimestamp().getTimestamp();
        dt.add(Calendar.DAY_OF_MONTH, 7);
        newOpportunity.setCloseDate(dt);
        Account parentAccountRef = new Account();
        parentAccountRef.setMyExtId__c("SAP1111111");
        newOpportunity.setAccount(parentAccountRef);
        SaveResult[] results = connection.create(new SObject[] { newOpportunity });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**C# Example**

```csharp
public void createForeignKeySample()
{
    try
    {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.Name = "OpportunityWithFK";
        newOpportunity.StageName = "Prospecting";
        DateTime dt = (DateTime)binding.getServerTimestamp().timestamp;
        newOpportunity.CloseDate = dt.AddDays(7);
        newOpportunity.CloseDateSpecified = true;
        // Create the parent reference.
        // Used only for foreign key reference
        // and doesn't contain any other fields
        Account accountReference = new Account();
        accountReference.MyExtId__c = "SAP1111111";
        newOpportunity.Account = accountReference;
        // Create the account and the opportunity
        SaveResult[] results = binding.create(new SObject[] { newOpportunity });
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " +
        e.Message + "\n" + e.StackTrace);
    }
}
```
Creating Parent and Child Records in a Single Call Using Foreign Keys

You can use external ID fields as foreign keys to create parent and child records of different sObject types in a single call instead of creating the parent record first, querying its ID, and then creating the child record. To do this:

- Create the child sObject and populate its required fields, and optionally other fields.
- Create the parent reference sObject used only for setting the parent foreign key reference on the child sObject. This sObject has only the external ID field defined and no other fields set.
- Set the foreign key field of the child sObject to the parent reference sObject you just created.
- Create another parent sObject to be passed to the `create()` call. This sObject must have the required fields (and optionally other fields) set in addition to the external ID field.
- Call `create()` by passing it an array of sObjects to create. The parent sObject must precede the child sObject in the array, that is, the array index of the parent must be lower than the child’s index.

The parent and child records are records related through a predefined relationship, such as a master-detail or lookup relationship. You can create related records that are up to 10 levels deep. Also, the related records created in a single call must have different sObject types. For more information, see Creating Records for Different Object Types.

The following Java and C# examples show you how to create an opportunity with a parent account in the same `create()` call. Each example creates an Opportunity sObject and populates some of its fields, then creates two Account objects. The first account is only for the foreign key relationship, and the second is for the account creation and has the account fields set. Both accounts have the external ID field, `MyExtID__c`, set. Next, the sample calls `create()` by passing it an array of sObjects. The first element in the array is the parent sObject and the second is the opportunity sObject. The `create()` call creates the opportunity with its parent account in a single call. Finally, the sample checks the results of the call and writes the IDs of the created records to the console, or the first error if record creation fails.

**Java Example**

```java
public void createForeignKeySample() {
    try {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.setName("OpportunityWithAccountInsert");
        newOpportunity.setStageName("Prospecting");
        Calendar dt = connection.getServerTimestamp().getTimestamp();
        dt.add(Calendar.DAY_OF_MONTH, 7);
        newOpportunity.setCloseDate(dt);

        // Create the parent reference.
        // Used only for foreign key reference
        // and doesn't contain any other fields.
        Account accountReference = new Account();
        accountReference.setMyExtID__c("SAP111111");
        newOpportunity.setAccount(accountReference);

        // Create the Account object to insert.
        // Same as above but has Name field.
        // Used for the create call.
        Account parentAccount = new Account();
        parentAccount.setName("Hallie");
        parentAccount.setMyExtID__c("SAP111111");
    }
    catch (Exception e) {
        System.out.println(e.getMessage());
    }
}
```
// Create the account and the opportunity.
SaveResult[] results = connection.create(new SObject[] {
    parentAccount, newOpportunity });

// Check results.
for (int i = 0; i < results.length; i++) {
    if (results[i].isSuccess()) {
        System.out.println("Successfully created ID: "
            + results[i].getId());
    } else {
        System.out.println("Error: could not create sobject "
            + "for array element " + i + ").");
        System.out.println("The error reported was: "
            + results[i].getErrors()[0].getMessage() + 
        \n");
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

C# Example

public void createForeignKeySample()
{
    try
    {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.Name = "OpportunityWithAccountInsert";
        newOpportunity.StageName = "Prospecting";
        DateTime dt = (DateTime)binding.getServerTimestamp().timestamp;
        newOpportunity.CloseDate = dt.AddDays(7);
        newOpportunity.CloseDateSpecified = true;

        // Create the parent reference.
        // Used only for foreign key reference
        // and doesn't contain any other fields.
        Account accountReference = new Account();
        accountReference.MyExtID__c = "SAP111111";
        newOpportunity.Account = accountReference;

        // Create the Account object to insert.
        // Same as above but has Name field.
        // Used for the create call.
        Account parentAccount = new Account();
        parentAccount.Name = "Hallie";
        parentAccount.MyExtID__c = "SAP111111";

        // Create the account and the opportunity.
        SaveResult[] results = binding.create(new SObject[] {
            parentAccount, newOpportunity });

        // Check results.
        for (int i = 0; i < results.Length; i++)
        {
Basic Steps for Creating Records

Creating records involves the following basic steps:

1. Create an sObject for one or more objects. For each record, populate its fields with the data that you want to add.
2. Construct an sObject[] array and populate that array with the objects that you want to create.
3. Call create(), passing in the sObject[] array.
4. Process the results in the saveResult[] object to verify whether the records have been successfully created.

Sample Code—Java

This sample shows how to create records. It creates two Account objects and sets their fields. The Name of the second account isn’t set so that an error occurs on creation, since Name is a required field. After making the create() call by passing the array containing the two accounts, the sample iterates over the results and writes the ID of the new account or an error message if the account creation fails. Finally, the sample returns an array of the new account IDs, which in this case contains only one ID.

```java
public String[] createRecords() {
    // Create two accounts
    String[] result = new String[2];
    Account account1 = new Account();
    Account account2 = new Account();

    // Set some fields on the account object
    account1.setName("The Brick Hut");
    account1.setBillingStreet("403 McAdoo St");
    account1.setBillingCity("Truth or Consequences");
    account1.setBillingState("NM");
    account1.setBillingPostalCode("87901");
    account1.setBillingCountry("US");
    account2.setName("Example Account 2");
    account2.setBillingStreet("Example Address");
    account2.setBillingCity("Example City");
    account2.setBillingState("Example State");
    account2.setBillingPostalCode("Example Postal Code");
    account2.setBillingCountry("Example Country");

    // Create the accounts
    List<DatabaseApiException> exceptions = new List<DatabaseApiException>;
    try {
        Map<String, Id> resultMap = new Map<String, Id>;
        resultMap = create(account1, account2, exceptions);
        result[0] = resultMap.get(account1.Id);
        result[1] = resultMap.get(account2.Id);
    }
    catch (DatabaseApiException e) {
        result[0] = "Error creating account 1: " + e.getMessage();
        result[1] = "Error creating account 2: " + e.getMessage();
    }
    return result;
}
```
// Required Name field is not being set on account2, so this record should fail during create.
// account2.setName("Camp One Creations");
account2.setBillingStreet("25800 Arnold Dr");
account2.setBillingCity("Sonoma");
account2.setBillingState("CA");
account2.setBillingPostalCode("95476");
account2.setBillingCountry("US");
Account[] accounts = { account1, account2 };  

try {
    // Call create() to add the accounts
    SaveResult[] saveResults = connection.create(accounts);
    // Iterate through the results.
    // There should be one successful creation
    // and one failed creation.
    for (int i = 0; i < saveResults.length; i++) {
        if (saveResults[i].isSuccess()) {
            System.out.println("Successfully created Account ID: " + saveResults[i].getId());
            result[i] = saveResults[i].getId();
        } else {
            System.out.println("Error: could not create Account " + "for array element " + i + ":");
            System.out.println(" The error reported was: " + saveResults[i].getErrors()[0].getMessage() + \n");
            result[i] = saveResults[i].getId();
        }
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}  
return result;

Sample Code—C#  
This sample shows how to create records. It creates two Account objects and sets their fields. The Name of the second account isn’t set so that an error occurs on creation, since Name is a required field. After making the create() call by passing the array containing the two accounts, the sample iterates over the results and writes the ID of the new account or an error message if the account creation fails. Finally, the sample returns an array of the new account IDs, which in this case contains only one ID.

public String[] createRecords()
{
    // Create two accounts
    String[] result = new String[2];
    Account account1 = new Account();
    Account account2 = new Account();

    // Set some fields on the account object
    account1.Name = "The Brick Hut";
    account1.BillingStreet = "403 McAdoo St";
    account1.BillingCity = "Truth or Consequences";
account1.BillingState = "NM";
account1.BillingPostalCode = "87901";
account1.BillingCountry = "US";
// Required Name field is not being set on account2,
// so this record should fail during create.
// account2.Name = "Camp One Creations";
account2.BillingStreet = "25800 Arnold Dr";
account2.BillingCity = "Sonoma";
account2.BillingState = "CA";
account2.BillingPostalCode = "95476";
account2.BillingCountry = "US";
Account[] accounts = { account1, account2 };

try {
    // Call create() to add the accounts
    SaveResult[] saveResults = binding.create(accounts);
    // Iterate through the results.
    // There should be one successful creation
    // and one failed creation.
    for (int i = 0; i < saveResults.Length; i++)
    {
        if (saveResults[i].success)
        {
            Console.WriteLine("Successfully created Account ID: " +
                           saveResults[i].id);
            result[i] = saveResults[i].id;
        }
        else
        {
            Console.WriteLine("Error: could not create Account " +
                               "for array element " + i + ",";
            )
            Console.WriteLine(" The error reported was: " +
             saveResults[i].errors[0].message + "\n");
            result[i] = saveResults[i].id;
        }
    }
}
catch (SoapException e)
{    
    Console.WriteLine("An unexpected error has occurred: " +
                     e.Message + "\n" + e.StackTrace);
}
return result;
}
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjects</td>
<td>sObject[]</td>
<td>Array of one or more sObject objects to create(). Limit: 200 sObject values.</td>
</tr>
</tbody>
</table>

Response

saveResult[]

Faults

- InvalidSObjectFault
- UnexpectedErrorFault

SEE ALSO:
- upsert()
- API Call Basics

SaveResult

The create() call returns an array of SaveResult objects. Each element in the SaveResult array corresponds to the sObject[] array passed as the sObjects parameter in the create() call. For example, the object returned in the first index in the SaveResult array matches the object specified in the first index of the sObject[] array. A SaveResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of the sObject that you attempted to create(). If this field contains a value, then the object was created successfully. If this field is empty, then the object was not created and the API returned error information instead.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the create() call succeeded (true) or not (false) for this object.</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the create() call, an array of one or more Error objects providing the error code and description. If your organization has active duplicate rules and a duplicate is detected, the SaveResult includes an Error with a data type of DuplicateError.</td>
</tr>
</tbody>
</table>

delete()

Deletes one or more records from your organization’s data.
**Syntax**

```java
DeleteResult[] = connection.delete(ID[] ids);
```

**Usage**

Use `delete()` to delete one or more existing records, such as individual accounts or contacts, in your organization’s data. The `delete()` call is analogous to the `DELETE` statement in SQL.

**Rules and Guidelines**

When deleting objects, consider the following rules and guidelines:

- Your client application must be logged in with sufficient access rights to delete individual objects within the specified object. For more information, see [Factors that Affect Data Access](#).
- In addition, you might also need permission to access this object’s parent object. For special access requirements, see the object’s description in [Standard Objects](#).
- To ensure referential integrity, the `delete()` call supports cascading deletions. If you delete a parent object, you delete its children automatically, as long as each child object can be deleted. For example, if you delete a Case, the API automatically deletes any CaseComment, CaseHistory, and CaseSolution objects associated with that case. However, if a CaseComment is not deletable or is currently being used, then the `delete()` call on the parent Case will fail.
- Certain objects cannot be deleted via the API. To delete an object via the `delete()` call, its object must be configured as deletable (`deletable` is true). To determine whether a given object can be deleted, your client application can invoke the `describeSObjects()` call on the object and inspect its `deletable` property.
- You can’t delete records for multiple object types in one call if one of those types is related to a feature in the Setup area in Salesforce. The only exceptions are the following objects:
  - Custom settings objects, which are similar to custom objects. For more information, see "Create Custom Settings" in the Salesforce online help.
  - GroupMember
  - Group
  - User

**Rollback on Error**

The `AllOrNoneHeader` header allows you to roll back all changes unless all records are processed successfully. This header is available in API version 20.0 and later. Allows a call to roll back all changes unless all records are processed successfully.

**Basic Steps for Deleting Records**

Deleting records involves the following basic steps:

1. Determine the ID of each record that you want to delete. For example, you might call `query()` to retrieve a set of records that you want to delete based on specific criteria.
2. Construct an `ID[]` array and populate it with the IDs of each record that you want to delete. You can specify the IDs of different types of objects in the same call. For example, you could specify the ID for an individual Account and an individual Contact in the same array. For information on IDs, see [ID Field Type](#).
3. Call `delete()`, passing in the ID[] array.

4. Process the results in the `DeleteResult[]` to verify whether the records have been successfully deleted.

**Sample Code—Java**

This sample shows how to delete records based on record IDs. The method in this sample accepts an array of IDs, which it passes to the `delete()` call and makes the call. It then parses the results and writes the IDs of the deleted records to the console or the first returned error if the deletion failed.

```java
public void deleteRecords(String[] ids) {
    try {
        DeleteResult[] deleteResults = connection.delete(ids);
        for (int i = 0; i < deleteResults.length; i++) {
            DeleteResult deleteResult = deleteResults[i];
            if (deleteResult.isSuccess()) {
                System.out.println("Deleted Record ID: " + deleteResult.getId());
            } else {
                // Handle the errors.
                // We just print the first error out for sample purposes.
                Error[] errors = deleteResult.getErrors();
                if (errors.length > 0) {
                    System.out.println("Error: could not delete " + "Record ID " + deleteResult.getId() + ".");
                    System.out.println("The error reported was: (" + errors[0].getStatusCode() + ") " + errors[0].getMessage() + 
"\n");
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**Sample Code—C#**

This sample shows how to delete records based on record IDs. The method in this sample accepts an array of IDs, which it passes to the `delete()` call and makes the call. It then parses the results and writes the IDs of the deleted records to the console or the first returned error if the deletion failed.

```csharp
public void deleteRecords(String[] ids) {
    try {
        DeleteResult[] deleteResults = binding.delete(ids);
        for (int i = 0; i < deleteResults.Length; i++) {
            DeleteResult deleteResult = deleteResults[i];
            if (deleteResult.success) {
                Console.WriteLine("Deleted Record ID: " + deleteResult.id);
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
else
{
    // Handle the errors.
    // We just print the first error out for sample purposes.
    Error[] errors = deleteResult.errors;
    if (errors.Length > 0)
    {
        Console.WriteLine("Error: could not delete " + "Record ID "
            + deleteResult.id + ":");
        Console.WriteLine("The error reported was: (" + errors[0].statusCode + ") "
            + errors[0].message + 
            
        
    }
}

try
{
    delete();
}

catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
        e.Message + 
        e.Message + 
        e.StackTrace);

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ids</td>
<td>ID[]</td>
<td>Array of one or more IDs associated with the objects to delete. In version 7.0 and later, you can pass a maximum of 200 object IDs to the delete() call. In version 6.0 and earlier, the limit is 2,000.</td>
</tr>
</tbody>
</table>

Response

DeleteResult[]

Faults

InvalidSObjectFault
UnexpectedErrorFault

SEE ALSO:
API Call Basics
DeleteResult

The `delete()` call returns an array of `DeleteResult` objects. Each element in the `DeleteResult` array corresponds to the ID[] array passed as the `ids` parameter in the `delete()` call. For example, the object returned in the first index in the `DeleteResult` array matches the object specified in the first index of the ID[] array.

A `DeleteResult` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of an <code>sObject</code> that you attempted to delete. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the <code>delete()</code> call succeeded (<code>true</code>) or not (<code>false</code>) for this object.</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the <code>delete()</code> call, an array of one or more <code>Error</code> objects providing the error information.</td>
</tr>
</tbody>
</table>

`deleteByExample()`

Use `deleteByExample()` to delete big object data from your org using an `sObject` as a template for what to delete. All data in a big object matching the values in the `sObject` templates are deleted.

**Syntax**

```java
DeleteByExampleResult[] = connection.deleteByExample(sObject[] sObjects);
```

**Rules and Guidelines**

When deleting data, consider the following rules and guidelines:

- Your client application must be logged in with sufficient access rights to delete individual objects within the specified object. For more information, see Factors that Affect Data Access.
- You can’t delete records for multiple object types in one call if one of those types is related to a feature in the Setup area in Salesforce. The only exceptions are the following objects:
  - Custom settings objects, which are similar to custom objects. For more information, see “Create Custom Settings” in the Salesforce Help.
  - `GroupMember`
  - `Group`
  - `User`

**Basic Steps for Deleting Data**

Deleting data involves the following basic steps:

1. Define an `sObject` using all the fields that make up the index of the big object.
2. Specify the values for each field.
3. Call `deleteByExample()`, passing in the `sObject` you created.
4. Process the results in the `DeleteByExampleResult[]` to verify whether the records have been successfully deleted.

**Note:** Repeating a successful `deleteByExample()` operation results in success, even if the data has already been deleted.

**Sample Code—Custom Big Objects**

This sample shows how to delete records in a custom big object. In this example, `Account__c`, `Game_Platform__c`, and `Play_Date__c` are part of the custom big object's index. All rows where `Account__c` is "001d000000Ky3xIAB", `Game_Platform__c` is "iOS", and `Play_Date__c` is '2017-11-28T19:13:36.000z" are deleted.

```java
public static void main(String[] args) {
    try{
        //Declare an sObject that has the values to delete
        sObject[] sObjectsToDelete = new sObject[1];
        sObject[] customerBO = new sObject();
        customerBO.setType("Customer_Interaction__b");
        customerBO.setField("Account__c","001d000000Ky3xIAB");
        customerBO.setField("Game_Platform__c","iOS");
        customerBO.setField("Play_Date__c","2017-11-28T19:13:36.000z");
        sObjectsToDelete[0] = customerBO;
        DeleteByExampleResult[] result = connection.deleteByExample(sObjectsToDelete);
    }
}
```

**Sample Code—Field Audit Trail**

This sample shows how to delete records in `FieldHistoryArchive`. All rows with the specified criteria are deleted.

```java
public static void main(String[] args) {
    try{
        //Declare an sObject that has the values to delete
        sObject[] sObjectsToDelete = new sObject[2];
        sObject[] fieldHistoryArchive_1 = new sObject();
        fieldHistoryArchive_1.setFieldName("FieldHistoryArchive");
        fieldHistoryArchive_1.setField("FieldHistoryType","Account");
        fieldHistoryArchive_1.setField("ParentId","001d000000Ky3xIAB");
        fieldHistoryArchive_1.setField("CreatedDate","2017-11-28T19:13:36.000z");
        fieldHistoryArchive_1.setField("HistoryId","017D000000ESURXIA5");
        sObjectsToDelete[0] = fieldHistoryArchive_1;
        sObject[] fieldHistoryArchive_2 = new sObject();
        fieldHistoryArchive_2.setFieldName("FieldHistoryArchive");
        fieldHistoryArchive_2.setField("FieldHistoryType","Account");
        fieldHistoryArchive_2.setField("ParentId","001d000000Ky3xIAB");
        fieldHistoryArchive_2.setField("CreatedDate","2017-11-29T19:13:36.000z");
        fieldHistoryArchive_2.setField("HistoryId","017D000000ESURXIA5");
        sObjectsToDelete[1] = fieldHistoryArchive_2;
        DeleteByExampleResult[] result = connection.deleteByExample(sObjectsToDelete);
    }
}
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObject</td>
<td>sObject[]</td>
<td>Array of one or more sObjects to use as templates for deletion.</td>
</tr>
</tbody>
</table>

Response

DeleteByExampleResult[]

Faults

InvalidSObjectFault
UnexpectedErrorFault

DeleteByExampleResult

The deleteByExample() call returns an array of DeleteByExampleResult objects. Each element in the DeleteByExampleResult array corresponds to the sObject[] array passed in the deleteByExample() call. For example, the object returned in the first index in the DeleteByExampleResult array matches the sObject specified in the first index of the sObject[] array.

A DeleteByExampleResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>
<td>sObject</td>
<td>Details for the sObject that you attempted to delete.</td>
</tr>
<tr>
<td>rowCount</td>
<td>long</td>
<td>Indicates the number of rows that were deleted.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the deleteByExample() call succeeded (true) or not (false)</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the deleteByExample() call, an array of one or more Error objects providing the error information.</td>
</tr>
</tbody>
</table>

emptyRecycleBin()

Delete records from the recycle bin immediately.

Syntax

```bash
EmptyRecycleBinResult[] = connection.emptyRecycleBin(ID[] ids);
```
Usage

The Recycle Bin lets you view and restore recently deleted records for 15 days before they are permanently deleted. Your org can have up to 5,000 records per license in the Recycle Bin at any one time. For example, if your org has five user licenses, 25,000 records can be stored in the Recycle Bin. If your org reaches its Recycle Bin limit, Salesforce automatically removes the oldest records, as long as they have been in the recycle bin for at least two hours.

If you know you will be adding a great number of records to the Recycle Bin and you know you won’t need to undelete() them, you may wish to remove them before the Salesforce process deletes records. For example, you can use this call if you are loading a large number of records for testing, or if you are doing a large number of create() calls followed by delete() calls.

Rules and Guidelines

When emptying recycle bins, consider the following rules and guidelines:

- The logged in user can delete any record that he or she can query in their Recycle Bin, or the recycle bins of any subordinates. If the logged in user has Modify All Data permission, he or she can query and delete records from any Recycle Bin in the organization.
- Available in version 10.0 and later.
- Maximum number of records is 200.
- Do not include the IDs of any records that will be cascade deleted, or an error will occur.
- Once records are deleted using this call, they cannot be undelete().
- After records are deleted from the Recycle Bin using this call, they can be queried using queryAll() for some time. Typically this time is 24 hours, but may be shorter or longer.

Sample Code—Java

This sample shows how to empty the Recycle Bin. It accepts an array containing the IDs of the records to remove from the Recycle Bin. It calls emptyRecycleBin() and passes it the array of IDs. Next, it iterates over the results and writes the IDs of the removed records or the first error of the failed records to the console.

```java
public void emptyRecycleBin(String[] ids) {
  try {
    EmptyRecycleBinResult[] emptyRecycleBinResults = connection
     .emptyRecycleBin(ids);
    for (int i = 0; i < emptyRecycleBinResults.length; i++) {
      EmptyRecycleBinResult emptyRecycleBinResult = emptyRecycleBinResults[i];
      if (emptyRecycleBinResult.isSuccess()) {
        System.out.println("Recycled ID: 
                   + emptyRecycleBinResult.getId());
      } else {
        Error[] errors = emptyRecycleBinResult.getErrors();
        if (errors.length > 0) {
          System.out
                   .println("Error code: " + errors[0].getStatusCode());
          System.out
                   .println("Error message: " + errors[0].getMessage());
        }
      }
    }
  } catch (ConnectionException ce) {
    ce.printStackTrace();
  }
}
```
Sample Code—C#

This sample shows how to empty the Recycle Bin. It accepts an array containing the IDs of the records to remove from the Recycle Bin. It calls `emptyRecycleBin()` and passes it the array of IDs. Next, it iterates over the results and writes the IDs of the removed records or the first error of the failed records to the console.

```csharp
public void emptyRecycleBin(String[] ids)
{
    try
    {
        EmptyRecycleBinResult[] emptyRecycleBinResults =
            binding.emptyRecycleBin(ids);
        for (int i = 0; i < emptyRecycleBinResults.Length; i++)
        {
            EmptyRecycleBinResult emptyRecycleBinResult = emptyRecycleBinResults[i];
            if (emptyRecycleBinResult.success)
            {
                Console.WriteLine("Recycled ID: "+ emptyRecycleBinResult.id);
            }
            else
            {
                Error[] errors = emptyRecycleBinResult.errors;
                if (errors.Length > 0)
                {
                    Console.WriteLine("Error code: "+ errors[0].statusCode);
                    Console.WriteLine("Error message: "+ errors[0].message);
                }
            }
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: "+
                         e.Message + "\n" + e.StackTrace);
    }
}
```

### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

InvalidSObjectFault
UnexpectedErrorFault

SEE ALSO:

delete()
undelete()

EmptyRecycleBinResult

The emptyRecycleBin() call returns an array of EmptyRecycleBinResult objects. Each element in the array corresponds to an element in the ID[] array passed as the parameter in the emptyRecycleBin() call. For example, the object returned in the first index in the EmptyRecycleBinResult array matches the object specified in the first index of the ID[] array.

A EmptyRecycleBinResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of an sObject that you attempted to delete from the Recycle Bin. For information about IDs, see ID Field Type.</td>
</tr>
<tr>
<td>isSuccess</td>
<td>boolean</td>
<td>Indicates whether the call succeeded (true) or not (false) for this record.</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the call, an array of one or more Error objects providing the error information.</td>
</tr>
</tbody>
</table>

executeListView()

Executes a list view's SOQL query to retrieve data, labels, and actions from a list view.

Syntax

```java
ExecuteListViewResult result = connection.executeListView(ExecuteListViewResult request);
```

Usage

The executeListView() call takes an ExecuteListViewRequest object, executes the SOQL query for the list view, and returns the resulting data and presentation information in an ExecuteListViewResult object. This call is available in API version 32.0 and later.
Sample Code—Java

```java
private void example(ApiProtocol protocol, AppVersion version) throws Exception {

    // Get the list results via the list view API
    EnterpriseConnection connection = makeClient(getUserUtil().getUserWithModifyAllData(), AppVersion.VERSION_190,
                                                getName());
    ExecuteListViewRequest request = new ExecuteListViewRequest();
    request.setSobjectType("Account");
    request.setDeveloperNameOrId(listViews[0].getId());
    request.setLimit(50000);

    com.sforce.soap.enterprise.ExecuteListViewResult result =
    connection.executeListView(request);
}
```

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>ExecuteListViewRequest</td>
<td>An object that specifies the list view and the limit, offset, and ordering of the results.</td>
</tr>
</tbody>
</table>

Response

An `ExecuteListViewResult` object.

`ExecuteListViewRequest`

Use the `ExecuteListViewRequest` object with `executeListView()` to retrieve data, labels, and actions from a list view. The `ExecuteListViewRequest` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>developerNameOrId</td>
<td>string</td>
<td>The list view's ID or fully qualified developer name.</td>
</tr>
<tr>
<td>limit</td>
<td>int</td>
<td>The maximum number of records to return. Default: 25</td>
</tr>
<tr>
<td>offset</td>
<td>int</td>
<td>The number of records to skip. Default: 0</td>
</tr>
<tr>
<td>orderBy</td>
<td>ListViewOrderBy[]</td>
<td>The order in which to return the records.</td>
</tr>
<tr>
<td>sobjectType</td>
<td>string</td>
<td>The API name of the sObject for the list view.</td>
</tr>
</tbody>
</table>

`ExecuteListViewResult`

Contains list view data that you retrieve programmatically.
To retrieve an `executeListViewResult` object, use the `executeListView()` call. The `executeListViewResult` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td><code>ListViewColumn[]</code></td>
<td>An array of the columns in the list view.</td>
</tr>
<tr>
<td>developerName</td>
<td>string</td>
<td>The list view’s fully qualified developer name.</td>
</tr>
<tr>
<td>done</td>
<td>boolean</td>
<td>If <code>true</code>, indicates that all records have been returned.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>The list view’s ID.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The display label of the list view.</td>
</tr>
<tr>
<td>records</td>
<td><code>ListViewRecord[]</code></td>
<td>An array of records that match the list view query.</td>
</tr>
<tr>
<td>size</td>
<td>int</td>
<td>The number of records that are returned by the list view query.</td>
</tr>
</tbody>
</table>

**ListViewColumn**

Contains metadata about a single list view column.

The `ListViewColumn` object is returned by the `describeSoqlListViews()` and `executeListView()` calls. It has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ascendingLabel</td>
<td>string</td>
<td>The localized type-specific label for sorting the column in ascending order. For example: “A-Z” for a text field, or “Low to High” for a numeric field. Set to null if the column isn’t sortable.</td>
</tr>
<tr>
<td>descendingLabel</td>
<td>string</td>
<td>The localized type-specific label for sorting the column in ascending order. For example: “Z-A” for a text field, or “High to Low” for a numeric field. Set to null if the column is not sortable.</td>
</tr>
<tr>
<td>fieldNameOrPath</td>
<td>string</td>
<td>The field name or SOQL field path for the column.</td>
</tr>
<tr>
<td>hidden</td>
<td>boolean</td>
<td>If true, specifies that the column is not displayed, and is present only to support the display of other columns or other client-side logic.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The localized display label for the column.</td>
</tr>
<tr>
<td>searchable</td>
<td>boolean</td>
<td>Whether the column is searchable.</td>
</tr>
<tr>
<td>selectListItem</td>
<td>string</td>
<td>The SOQL SELECT item for the column. The item might differ from the field name or path, due to display formatting (for example, toLabel for picklists).</td>
</tr>
<tr>
<td>sortDirection</td>
<td><code>orderByDirection</code></td>
<td>An enumerated value, one of the following if the column is sortable:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ascending</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• descending</td>
</tr>
<tr>
<td>sortIndex</td>
<td>int</td>
<td>The zero-based index that indicates the column’s position within a multilevel sort, or null if the records are not sorted by the column.</td>
</tr>
</tbody>
</table>
### ListViewRecord

Represents a single row in a list view.

The `ListViewRecord` object is a member of the `ExecuteListViewResult` object and has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td><code>ListViewRecordColumn[]</code></td>
<td>The columns and their values for the record. The record data columns are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>returned in the same order as metadata and describe columns. For any data</td>
</tr>
<tr>
<td></td>
<td></td>
<td>column that's obtained by using</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>ExecuteListViewResult.getRecords()[0].getColumns[index]</code>,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the corresponding describe column can be obtained with</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>ExecuteListViewResult.getColumns[index]</code>.</td>
</tr>
</tbody>
</table>

### ListViewRecordColumn

Represents a single cell in a row from a list view.

The `ListViewRecordColumn` object is one cell (column) of a row (`ListViewRecord`) and has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldNameOrPath</td>
<td>string</td>
<td>The field name or SOQL field path for the column.</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>The contents of the record for a certain column, localized if appropriate, or null if there's no value.</td>
</tr>
</tbody>
</table>

### findDuplicates() function

Performs rule-based searches for duplicate records. The input is an array of `sObject`, each of which specifies the values to search for and the type of object that supplies the duplicate rules. The output identifies the detected duplicates for each object that supplies the duplicate rules. `findDuplicates()` applies the rules to the values to do the search. The output identifies the detected duplicates for each `sObject`.

**Syntax**

```java
FindDuplicatesResult[] duplicateResults =
    connection.findDuplicates(SObject[] inputSObjectArray);
```
Usage

Use `findDuplicates()` to apply duplicate rules associated with an object to values specified by each sObject. Each sObject also has a type that corresponds to an object.

`findDuplicates()` uses the duplicate rules for the object that has the same type as the sObject. For example, if the sObject type is Account, `findDuplicates()` uses the duplicate rules associated with the Account object.

⚠️ Note: ⚠️
- All the sObject elements in the input array must have the same type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, the SOAP call returns an API Fault Element containing the following fields:
  - ExceptionCode: LIMIT_EXCEEDED
  - exceptionMessage: Configuration error: The number of records to check is greater than the permitted batch size.

For each input sObject, `findDuplicates()` adds a FindDuplicatesResult object to the output array. Matching is controlled by the values specified in the sObject. The values can include a record ID, a field map, or both. The specified values determine the behavior of `findDuplicates()`:

**Record ID only**

`findDuplicates()` searches the object defined by the duplicate rule for an existing record that has the same ID. Then it loads the values from that record, and searches for duplicates based on those values.

**Field Map only**

`findDuplicates()` loads the values from the map and searches for duplicates based on those values.

**Record ID and Field Map**

`findDuplicates()` searches the object defined by the duplicate rule for an existing record that has the same ID. It loads any values from that record that aren't specified in the map, and then loads values from the map. Based on the resulting union of values, `findDuplicates()` searches for duplicates.

The output of `findDuplicates()` is an array of FindDuplicatesResult objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records, if any. Optionally, the output objects also contain values from the duplicate records.

Each FindDuplicatesResult element contains a DuplicateResult object. If `findDuplicates()` doesn't find any duplicates for an sObject, the duplicateRule field in DuplicateResult contains the name of the duplicate rule that `findDuplicates()` applied, but the matchResults array is empty.

If the `includeRecordDetails` flag in DuplicateRuleHeader is set to false, `findDuplicates()` only returns the record IDs of the matching records. Otherwise, `findDuplicates()` returns all the fields specified in the primary CompactLayout associated with the target object.

Basic Steps for Using

1. Create one or more sObject objects with a type that corresponds to the object that has the duplicate rules you want to use.
2. In each sObject, specify record IDs or field maps (or both) to compare to records in the object.
3. Set DuplicateRuleHeader to control the output you want.
The following Java sample demonstrates how to search for duplicates of a Lead, using the standard Leads duplicate rule.

```java
package wsc;

import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.sobject.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class Main {
    private static final String USERNAME = "YOUR-USERNAME";
    private static final String PASSWORD = "YOUR-PASSWORD&SECURITY-TOKEN";
    private static PartnerConnection connection = null;

    public static void main(String[] args) throws ConnectionException {
        // Create the configuration for the partner connection
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(USERNAME);
        config.setPassword(PASSWORD);

        // Initialize the connection
        connection = new PartnerConnection(config);

        SObject[] inputSObjectArray = new SObject[1];
        // Instantiate an empty Java SObject
        SObject searchCriteria = new SObject();
        // Set its type to Lead. This tells findDuplicates() to use the duplicate rules
        // for Lead
        searchCriteria.setType("Lead");
        /*
         * Set the necessary fields for matching, based on the standard matching rules for
         * Lead (Search
         * help.salesforce.com for "Standard Contact and Lead Matching Rule" to see the rules).
         */
        searchCriteria.setField("FirstName", "Marc");
        searchCriteria.setField("LastName", "Benioff");
        searchCriteria.setField("Company", "Salesforce.com Inc");
        searchCriteria.setField("Title", "CEO");
        searchCriteria.setField("Email", "ceo@salesforce.com");

        // Add the sObject to the input array
        inputSObjectArray[0] = searchCriteria;
        /*
         * By default, findDuplicates() returns only record IDs. To return additional values,
         * set the second parameter
         * to true.
         */
        connection.setDuplicateRuleHeader(
                /*
                 * @param allowSave - Not Applicable for this API call
                 */
        }
    }
}
```
false,
/* @param includeRecordDetails */
false,
/*
 * @param runAsCurrentUser - Not Applicable for this API call
 */
false);

// Invoke findDuplicates() to find duplicates based on the information in the
// SObject array
FindDuplicatesResult[] callResults = connection.findDuplicates(inputSObjectArray);

// Iterate through the results
// For each SObject in the input array, get the duplicate results
for (FindDuplicatesResult findDupeResult : callResults) {
    // If errors were found for this SObject, print them out
    if (!findDupeResult.isSuccess()) {
        for (Error findDupError : findDupeResult.getErrors()) {
            System.out.println("FindDuplicatesRule errors detected: " + findDupError.getMessage());
        }
    } else {
        /* Get the DuplicateResult object array for the result. Each element in the array
         * of testing one duplicate rule for the SObject. Process each DuplicateResult.
         */
        for (DuplicateResult dupeResult : findDupeResult.getDuplicateResults()) {
            System.out.println("Duplicate rule: " + dupeResult.getDuplicateRule());
            // Print out the name of the object associated with the duplicate
            // rule
            System.out.println("Source of this duplicate rule is: " + dupeResult.getDuplicateRuleEntityType());
            for (MatchResult matchResult : dupeResult.getMatchResults()) {
                if (!matchResult.isSuccess()) {
                    for (Error e : matchResult.getErrors()) {
                        System.out.println("Errors detected: " + e.getMessage());
                    }
                } else {
                    System.out.println("Matching rule is: " + matchResult.getRule());
                    System.out.println("Object type for this matching rule is: " + matchResult.getEntityType());
                    for (MatchRecord matchRecord : matchResult.getMatchRecords()) {
                        System.out.println("Duplicate record ID: " + matchRecord.getRecord().getId());
                    }
                }
            }
        }
    }
}

3778
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjects</td>
<td>Array of sObject</td>
<td>Required. A list of sObject objects that contain values you want to search for.</td>
</tr>
</tbody>
</table>

Response

An array of FindDuplicatesResult objects.

FindDuplicatesResult

Represents the result of a duplicate search for a single sObject in the input array. Because the object associated with the sObject can have more than one duplicate rule, FindDuplicatesResult contains an array of DuplicateResult objects.

Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>duplicateResults</td>
<td>Array of DuplicateResult objects</td>
<td>The result of each duplicate rule applied by findDuplicates() to a single sObject.</td>
</tr>
<tr>
<td>errors</td>
<td>Array of Error objects</td>
<td>Contains an array of errors encountered by findDuplicates().</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>This field is set to true if the findDuplicates() doesn't encounter any errors.</td>
</tr>
</tbody>
</table>

Faults

- InvalidSObjectFault
- UnexpectedErrorFault
- InvalidFieldFault

findDuplicatesByIds()

Performs rule-based searches for duplicate records. The input is an array of IDs, each of which specifies the records for which to search for duplicates. The output identifies the detected duplicates for each object that supplies the duplicate rules. findDuplicatesByIds() applies the rules to the record IDs to do the search. The output identifies the detected duplicates for each ID.
Syntax

```java
FindDuplicatesResult[] duplicateResults =
    connection.findDuplicatesByIds(Id[] inputIdArray);
```

Usage

Use `findDuplicatesByIds()` to apply duplicate rules associated with an object to records represented by the record IDs. `findDuplicatesByIds()` uses the duplicate rules for the object that has the same type as the input record IDs. For example, if the record ID represents an Account, `findDuplicatesByIds()` uses the duplicate rules associated with the Account object.

**Note:**
- All record IDs in the input array must have the same object type, and that type must correspond to an object type that supports duplicate rules.
- The input array is limited to 50 elements. If you exceed this limit, the SOAP call returns an API Fault Element containing the following fields:
  - `ExceptionCode`: LIMIT_EXCEEDED
  - `exceptionMessage`: Configuration error: The number of records to check is greater than the permitted batch size.

For each input ID, `findDuplicatesByIds()` adds an object to the output array. Matching is controlled by the values specified by the input record ID. The values can include a record ID only. `findDuplicatesByIds()` searches the object defined by the duplicate rule for an existing record that has the same ID. Then it loads the values from that record, and searches for duplicates based on those values.

The output of `findDuplicatesByIds()` is an array of objects with the same number of elements as the input array, and in the same order. The output objects encapsulate record IDs for duplicate records. Optionally, the output objects also contain values from the duplicate records.

Each element contains a `DuplicateResult` object. If `findDuplicatesByIds()` doesn’t find any duplicates for an sObject, the `duplicateRule` field in `DuplicateResult` contains the name of the duplicate rule that `findDuplicatesByIds()` applied, but the `matchResults` array is empty.

If the `includeRecordDetails` flag in `DuplicateRuleHeader` is set to `false`, `findDuplicatesByIds()` returns only the record IDs of the matching records. Otherwise, `findDuplicatesByIds()` returns all the fields specified in the primary CompactLayout associated with the target object.

**Basic Steps for Using**

1. Create one or more ID objects that correspond to the object that has the duplicate rules you want to use.
2. Specify record IDs to compare to records in the object.
3. Set `DuplicateRuleHeader` to control the output you want.
The following Java sample demonstrates how to search for duplicates of a Lead, using the standard Leads duplicate rule.

```java
package wsc;

import com.sforce.soap.partner.*;
import com.sforce.soap.partner.Error;
import com.sforce.soap.partner.SObject;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;

public class Main {

    private static final String USERNAME = "YOUR-USERNAME";
    private static final String PASSWORD = "YOUR-PASSWORD&SECURITY-TOKEN";
    private static PartnerConnection connection = null;

    public static void main(String[] args) throws ConnectionException {

        // Create the configuration for the partner connection
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(USERNAME);
        config.setPassword(PASSWORD);

        // Initialize the connection
        connection = new PartnerConnection(config);

        SObject[] objectsToSearch = new SObject[2];
        String[] inputIds = new String[2];
        // Instantiate an empty Java SObject
        SObject searchCriteria = new SObject();
        // Set its type to Lead. This tells findDuplicatesByIds() to use the duplicate rules
        // for Lead
        searchCriteria.setType("Lead");
        /*
         * Set the necessary fields for matching, based on the standard matching rules for
         * Lead
         * (Search help.salesforce.com for "Standard Contact and Lead Matching Rule" to see
         * the
         * rules).
         */
        searchCriteria.setField("FirstName", "Marc");
        searchCriteria.setField("LastName", "Benioff");
        searchCriteria.setField("Company", "Salesforce.com Inc");
        searchCriteria.setField("Title", "CEO");
        searchCriteria.setField("Email", "ceo@salesforce.com");

        // Add the SObjects to the input array
        objectsToSearch[0] = searchCriteria;
        objectsToSearch[1] = searchCriteria;

        SaveResult[] saveResults = connection.create(objectsToSearch);

        for (int i = 0; i < saveResults.length; ++i) {
            if (saveResults[i].isSuccess()) {
```

```
```
System.out.println("Successfully created ID: " + saveResults[i].getId());

        }
    } else {
        System.out.println("Matching rule is: " + matchResult.getRule());
        System.out.println("Object type for this matching rule is: " + matchResult.getEntityType());
        for (MatchRecord matchRecord : matchResult.getMatchRecords()) {
            System.out.println("Duplicate record ID: " + matchRecord.getRecord().getId());
        }
    }
}

### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDs</td>
<td>Array of ID</td>
<td>Required. A list of IDs that contain values you want to search for.</td>
</tr>
</tbody>
</table>

### Response

An array of `FindDuplicatesResult` objects.

### FindDuplicatesResult

Represents the result of a duplicate search for a single ID in the input array. Because the object associated with the sObject can have more than one duplicate rule, `FindDuplicatesResult` contains an array of `DuplicateResult` objects.

### Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>duplicateResults</td>
<td>Array of <code>DuplicateResult</code> objects</td>
<td>The result of each duplicate rule applied by <code>findDuplicatesByIds()</code> to a single sObject.</td>
</tr>
<tr>
<td>errors</td>
<td>Array of <code>Error</code> objects</td>
<td>Contains an array of errors encountered by <code>findDuplicatesByIds()</code>.)</td>
</tr>
</tbody>
</table>
### Field Name
- **success**

### Field Type
- boolean

### Description
This field is set to true if findDuplicatesByIds() doesn’t encounter any errors.

## Faults
- **InvalidSObjectFault**
- **UnexpectedErrorFault**
- **InvalidFieldFault**

## getDeleted()

Retrieves the list of individual records that have been deleted within the given timespan for the specified object.

### Syntax

```
GetDeletedResult = connection.getDeleted(string sObjectType, dateTime startDate, dateTime endDate);
```

### Usage

Use **getDeleted()** for data replication applications to retrieve a list of records that have been deleted from your organization’s data within the specified timespan. The **getDeleted()** call retrieves a GetDeletedResult object that contains an array of DeletedRecord objects containing the ID of each deleted record and the date/time (Coordinated Universal Time (UTC) time zone) on which it was deleted, using information from the SystemModstamp system field if available. Be sure to read Data Replication before using **getDeleted()** in your client applications. (For information on IDs, see ID Field Type.)

As of release 8.0, the **getDeleted()** call respects the user’s sharing model.

### Rules and Guidelines

When replicating deleted records, consider the following rules and guidelines:

- The specified **startDate** must chronologically precede the specified **endDate** value by more than one minute. The specified **startDate** cannot be the same value as, or later than, the specified **endDate** value. Otherwise, the API returns an INVALID_REPLICATION_DATE error.
- Records are returned only if the user has access to them.
- Results are returned for no more than 15 days previous to the day the call is executed (or earlier if an administrator has purged the Recycle Bin). If the purge has been performed before your **getDeleted()** call is executed, an INVALID_REPLICATION_DATE error is returned.
- If **latestDateCovered** is less than **endDate**, the call will fail, returning an INVALID_REPLICATION_DATE error with the value of **latestDateCovered**.
- Deleted records are written to a delete log, which **getDeleted()** accesses. A background process that runs every two hours purges records that have been in an organization’s delete log for more than two hours if the number of records is above a certain
limit. Starting with the oldest records, the process purges delete log entries until the delete log is back below the limit. This is done to protect Salesforce from performance issues related to massive delete logs. The limit is calculated using this formula:

\[
5000 \times \text{number of licenses in the organization}
\]

For example, an organization with 1,000 licenses could have up to 5,000,000 (five million) records in the delete log before any purging took place. If purging has been performed before your `getDeleted()` call is executed, an `INVALID_REPLICATION_DATE` error is returned. If you get this exception, you should do a full pull of the table.

- If you delete a large numbers of records, your data replication should run more frequently than every two hours to ensure all records are returned by `getDeleted()`.
- Client applications typically poll for changed data periodically. For important polling considerations, see Polling for Changes.
- Records for certain objects cannot be replicated via the API. To replicate a record via the `getDeleted()` call, its object must be configured as replicatable (`replicateable` is true). To determine whether a given object can be replicated, your client application can invoke the `describeSObjects()` call on the object and inspect its `replicateable` property.
- Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time. To determine how your development tool handles time values, refer to its documentation.
- If you call `getDeleted()` for a history object, the call returns the records deleted during the given date range for all history objects, not only the history object you specified. For example, if you call `getDeleted()` for AccountHistory, you'll get records deleted during the given date range for AccountHistory, ContactHistory, and so on. However, `getDeleted()` calls on OpportunityHistory return only deleted OpportunityHistory records, not other associated deleted history objects.

Basic Steps for Replicating Deleted Records

You can replicate deleted records using the following basic steps for each object:

1. Optionally, determine whether the structure of the object has changed since the last replication request, as described in Checking for Structural Changes in the Object.
2. Call `getDeleted()`, passing in the object and the relevant time span for deleted records.
3. In the `DeleteResult` object, iterate through the returned array of `DeletedRecord` objects containing the ID of each deleted record and the date on which it was deleted (Coordinated Universal Time (UTC) time zone).
4. Take the appropriate action on the local data to remove the deleted records or flag as deleted.
5. Optionally, save the request time span for future reference. You should save the value of `latestDateCovered`.

A client application likely performs other tasks associated with data replication operations. For example, if an opportunity is closed, a client application might run a new revenue report. Similarly, if a task is completed, the process might log this in another system.

Sample Code—Java

This sample calls `getDeleted()` to get all accounts that were deleted in the last 60 minutes. It then writes the ID and the deleted date of each returned account to the console.

```java
public void getDeletedRecords() {
    try {
        GregorianCalendar endTime = (GregorianCalendar) connection.getServerTimestamp().getTimestamp();
        GregorianCalendar startTime = (GregorianCalendar) endTime.clone();
        // Subtract 60 minutes from the server time so that we have
        // a valid time frame.
```
Sample Code—C#

This sample calls getDeleted() to get all accounts that were deleted in the last 60 minutes. It then writes the ID and the deleted date of each returned account to the console.

```csharp
public void getDeletedRecords()
{
    try
    {
        DateTime endTime = binding.getServerTimestamp().timestamp;
        // Subtract 60 minutes from the server time so that we have
        // a valid time frame.
        DateTime startTime = endTime.AddMinutes(-60);
        Console.WriteLine("Checking deletes at or after: "+ startTime.ToString());
        // Get records deleted during the specified time frame.
        GetDeletedResult gdResult = binding.getDeleted("Account",
            startTime, endTime);
        // Check the number of records contained in the results,
        // to check if something was deleted in the 60 minute span.
        DeletedRecord[] deletedRecords = gdResult.deletedRecords;
        if (deletedRecords != null && deletedRecords.Length > 0) {
            for (int i = 0; i < deletedRecords.Length; i++) {
                DeletedRecord dr = deletedRecords[i];
                System.out.println(dr.getId() + " was deleted on "+
                    dr.getDeletedDate().getTime().toString());
            }
        } else {
            System.out.println("No deletions of Account records in "
                + "the last 60 minutes.");
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
DeletedRecord dr = deletedRecords[i];
Console.WriteLine(dr.id + " was deleted on "
+ dr.deletedDate.ToLocalTime().ToString());
}
else
{
    Console.WriteLine("No deletions of Account records in "
    + "the last 60 minutes.");
}
}

try
{
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " +
        e.Message + "\n" + e.StackTrace);
    }

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectEntityType</td>
<td>string</td>
<td>Object type. The specified value must be a valid object for your organization. See sObject.</td>
</tr>
<tr>
<td>startDate</td>
<td>dateTime</td>
<td>Starting date/time (Coordinated Universal Time (UTC)—not local—timezone) of the timespan for which to retrieve the data. The API ignores the seconds portion of the specified dateTime value (for example, 12:30:15 is interpreted as 12:30:00 UTC).</td>
</tr>
<tr>
<td>endDate</td>
<td>dateTime</td>
<td>Ending date/time (Coordinated Universal Time (UTC)—not local—timezone) of the timespan for which to retrieve the data. The API ignores the seconds portion of the specified dateTime value (for example, 12:35:15 is interpreted as 12:35:00 UTC).</td>
</tr>
</tbody>
</table>

Limits

There are record limits on the result GetDeletedResult:

- If your getDeleted() call returns more than 600,000 records and the user is a system administrator, an exception EXCEEDED_ID_LIMIT is returned.
- If your getDeleted() call returns more than 20,000 records and the user is not a system administrator, an exception OPERATION_TOO_LARGE is returned. Note that this error is returned when more than 20,000 records across the organization have been deleted, not just the records viewable by the user.

You can correct the error by choosing start and end dates that are closer together.

Response

GetDeletedResult
Faults

InvalidSObjectFault
UnexpectedErrorFault

SEE ALSO:
  Data Replication
  API Call Basics

GetDeletedResult

The `getDeleted()` call returns a `GetDeletedResult` object that contains an array of `DeletedRecord` records and two properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>earliestDateAvailable</td>
<td>dateTime</td>
<td>For the object type of the <code>getDeleted()</code> call, the timestamp (Coordinated Universal Time (UTC)—not local—timezone) of the last physically deleted object. If this value is less than <code>endDate</code>, the call will fail, and you should resynch your data before performing another replication.</td>
</tr>
<tr>
<td>deletedRecords[]</td>
<td>deletedRecords=</td>
<td>Array of the deleted records which satisfy the start and end dates specified in the <code>getDeleted()</code> call.</td>
</tr>
<tr>
<td>latestDateCovered</td>
<td>dateTime</td>
<td>The timestamp (Coordinated Universal Time (UTC)—not local—timezone) of the last date covered in the <code>getDeleted()</code> call. If there is a value, it is less than or equal to <code>endDate</code>. A value here indicates that, for safety, you should use this value for the <code>startDate</code> of your next call to capture the changes that started after this date but did not complete before <code>endDate</code> and were, therefore, not returned in the previous call.</td>
</tr>
</tbody>
</table>

`deletedRecords[]`

The `GetDeletedResult` contains an array of `deletedRecords`, which contain the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deletedDate</td>
<td>dateTime</td>
<td>Date and time (Coordinated Universal Time (UTC)—not local—timezone) when this record was deleted. This information is obtained using the <code>SystemModstamp</code> system field if available.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of an <code>sObject</code> that has been deleted.</td>
</tr>
</tbody>
</table>

`getUpdated()`

Retrieves the list of individual records that have been updated (added or changed) within the given timespan for the specified object.
Syntax

```java
GetUpdatedResult[] = connection.getUpdated(string sObjectType, dateTime startDate, dateTime endDate);
```

Usage

Use `getUpdated()` for data replication applications to retrieve a set of IDs for objects of the specified object that have been created or updated within the specified timespan. The `getUpdated()` call retrieves an array of `GetUpdatedResult` objects containing the ID of each created or updated object and the date/time (Coordinated Universal Time (UTC) time zone) on which it was created or updated, respectively. Be sure to read Data Replication before using `getUpdated()` in your client application.

**Note:** The `getUpdated()` call retrieves the IDs only for objects to which the logged-in user has access.

Rules and Guidelines

When replicating created and updated objects, consider the following rules and guidelines:

- The specified `startDate` must chronologically precede the specified `endDate` value. The specified `startDate` cannot be the same value as, or later than, the specified `endDate` value. Otherwise, the API returns an `INVALID_REPLICATION_DATE` error.
- Results are returned for no more than 30 days previous to the day the call is executed.
- Client applications typically poll for changed data periodically. For important polling considerations, see Polling for Changes.
- Your client application can replicate any objects to which it has sufficient permissions. For example, to replicate all data for your organization, your client application must be logged in with "View All Data" access rights to the specified object. Similarly, the objects must be within your sharing rules. For more information, see Factors that Affect Data Access.
- Certain objects cannot be replicated via the API. To replicate an object via the `getUpdated()` call, its object must be configured as `replicateable` (i.e., `replicateable` is `true`). To determine whether a given object can be replicated, your client application can invoke the `describeSObjects()` call on the object and inspect its `replicateable` property.
- Certain objects cannot be deleted, such as Group, User, Contract, or Product2 objects. However, if instances of these objects are no longer visible in the Salesforce user interface, they may have been rendered inactive so that only users with administrative access can see them. To determine whether a missing object instance has been made inactive, your client application can call `getUpdated()` and check the object's `active` flag.
- Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time. To determine how your development tool handles time values, refer to its documentation.

Basic Steps for Replicating Updated Objects

Replicating objects involves the following basic steps for each object that you want to replicate:

1. Optionally, the client application determines whether the structure of the object has changed since the last replication request, as described in Checking for Structural Changes in the Object.
2. Call `getUpdated()`, passing in the object and timespan for which to retrieve data.
3. Iterate through the returned array of IDs. For each ID element in the array, call `retrieve()` to obtain the latest information you want from the associated object. Your client application must then take the appropriate action on the local data, such as inserting new rows or updating existing ones with the latest information.
4. Optionally, the client application saves the request timestamp for future reference.

A client application likely performs other tasks associated with data replication operations. For example, if an opportunity were to become closed, a client application might run a new revenue report. Similarly, if a task were completed, the process might log this somehow in another system.

Sample Code—Java

This sample gets the accounts that were updated in the last 60 minutes and writes their IDs to the console.

```java
public void getUpdatedRecords() {
    try {
        GregorianCalendar endTime = (GregorianCalendar) connection.getServerTimestamp().getTimestamp();
        GregorianCalendar startTime = (GregorianCalendar) endTime.clone();
        // Subtract 60 minutes from the server time so that we have
        // a valid time frame.
        startTime.add(GregorianCalendar.MINUTE, -60);
        System.out.println("Checking updates as of: " + startTime.getTime().toString());
        // Get the updated accounts within the specified time frame
        GetUpdatedResult ur = connection.getUpdated("Account", startTime, endTime);
        System.out.println("GetUpdateResult: "+ ur.getIds().length);
        // Write the results
        if (ur.getIds() != null && ur.getIds().length > 0) {
            for (int i = 0; i < ur.getIds().length; i++) {
                System.out.println(ur.getIds()[i] + " was updated between " + startTime.getTime().toString() + " and " + endTime.getTime().toString());
            }
        } else {
            System.out.println("No updates to accounts in " + "the last 60 minutes.");
        }
    } catch (ConnectionException ce) { ce.printStackTrace(); }
}
```

Sample Code—C#

This sample gets the accounts that were updated in the last 60 minutes and writes their IDs to the console.

```csharp
public void getUpdatedRecords() {
    try {
        DateTime endTime = binding.getServerTimestamp().timestamp;
        // Subtract 60 minutes from the server time so that we have
        // a valid time frame.
```
DateTime startTime = endTime.AddMinutes(-60);
Console.WriteLine("Checking updates as of: "+ startTime.ToLocalTime().ToString());

// Get the updated accounts within the specified time frame
GetUpdatedResult ur = binding.getUpdated("Account", startTime, endTime);
Console.WriteLine("GetUpdateResult: "+ ur.ids.Length);

// Write the results
if (ur.ids != null && ur.ids.Length > 0)
{
    for (int i = 0; i < ur.ids.Length; i++)
    {
        Console.WriteLine(ur.ids[i] + " was updated between "
            + startTime.ToLocalTime().ToString() + " and "
            + endTime.ToLocalTime().ToString());
    }
}
else
{
    Console.WriteLine("No updates to accounts in "
            + "the last 60 minutes.");
}

} catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: "+
            e.Message + "\n" + e.StackTrace);
}

### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectTypeEntityTypestring</td>
<td>Object type. The specified value must be a valid object for your organization. For a list of standard objects, see <a href="#">Standard Objects</a>.</td>
<td></td>
</tr>
<tr>
<td>startDate</td>
<td>dateTime</td>
<td>Starting date/time (Coordinated Universal Time (UTC) time zone—not local—timezone) of the timespan for which to retrieve the data. The API ignores the seconds portion of the specified dateTime value (for example, 12:30:15 is interpreted as 12:30:00 UTC).</td>
</tr>
<tr>
<td>endDate</td>
<td>dateTime</td>
<td>Ending date/time (Coordinated Universal Time (UTC) time zone—not local—timezone) of the timespan for which to retrieve the data. The API ignores the seconds portion of the specified dateTime value (for example, 12:35:15 is interpreted as 12:35:00 UTC).</td>
</tr>
</tbody>
</table>

**Important:** There is a limit of 600,000 IDs in the result `GetUpdatedResult[]`. If your `getUpdated()` call returns more than 600,000 IDs, an exception `EXCEEDED_ID_LIMIT` is returned. You can correct the error by choosing start and end dates that are closer together.
Response

GetUpdatedResult[]

Faults

InvalidSObjectFault
UnexpectedErrorFault

SEE ALSO:
  Data Replication
  API Call Basics

GetUpdatedResult

The `getUpdated()` call returns a `GetUpdatedResult` object that contains information about each record that was inserted or updated within the given timespan. An `GetUpdatedResult` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id[]</td>
<td>ID</td>
<td>Array of IDs of each object that has been updated.</td>
</tr>
</tbody>
</table>
| latestDateCovered   | dateTime | The timestamp (Coordinated Universal Time (UTC)—not local—time zone) of the last date covered in the `getUpdated()` call. If there is a value, it is less than or equal to `endDate`. A value here indicates that, for safety, you should use this value for the `startDate` of your next call to capture the changes that started after this date but did not complete before the `endDate` and were, therefore, not returned in the previous call.

Note: If Salesforce executes a long-running transaction on your instance, the value in this field is the start time of that long-running transaction until it completes. This is because a long-running transaction might affect your user data (for example, batch processing).

invalidateSessions()

Ends one or more sessions specified by a `sessionId`.

Syntax

```
InvalidateSessionsResult = connection.invalidateSessions(string[] sessionIds);
```

Usage

Use this call to end one or more sessions.
You can also use `logout()` to end just one session, the session of the logged-in user.

### Sample Code—Java

This sample invalidates a set of sessions. The method in this sample takes an array of session IDs passed in as String values. The method then calls `invalidateSessions()` with this array and then checks the results for any errors.

```java
public void invalidateSessionsSample(String[] sessionIds) {
    try {
        InvalidateSessionsResult[] results;
        results = connection.invalidateSessions(sessionIds);
        for (InvalidateSessionsResult result : results) {
            // Check results for errors
            if (!result.isSuccess()) {
                if (result.getErrors().length > 0) {
                    System.out.println("Status code: " + result.getErrors()[0].getStatusCode());
                    System.out.println("Error message: " + result.getErrors()[0].getMessage());
                }
            } else {
                System.out.println("Success.");
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

### Sample Code—C#

This sample invalidates a set of sessions. The method in this sample takes an array of session IDs passed in as String values. The method then calls `invalidateSessions()` with this array and then checks the results for any errors.

```csharp
public void invalidateSessionsSample(string[] sessionIds) {
    try {
        InvalidateSessionsResult[] results;
        results = binding.invalidateSessions(sessionIds);
        foreach (InvalidateSessionsResult result in results) {
            // Check results for errors
            if (!result.success)
            {
                if (result.errors.Length > 0)
                {
                    Console.WriteLine("Status code: " + result.errors[0].statusCode);
                    Console.WriteLine("Error message: " + result.errors[0].message);
                }
            }
        }
    }
```
```csharp
else
{
    Console.WriteLine("Success.");
}
}
}
}
}
}
}
}
}

```C#``` else {    Console.WriteLine("Success."); } } }
}
}

```C#```

**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>

**Faults**

UnexpectedErrorFault

**InvalidateSessionsResult**

The invalidateSessions() call returns an array of LogoutResult objects. Each object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the session was successfully terminated (true) or not (false).</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the call, an array of one or more Error objects. Each object contains an error code and description.</td>
</tr>
</tbody>
</table>

**login()**

Logs in to the login server and starts a client session.

> Note: login() calls count toward your login rate limit.
Syntax

```
LoginResult = connection.login(string username, string password);
```

Usage

Use the `login()` call to log in to the login server and start a client session. The client app logs in and obtains a `sessionId` and server URL before making other API calls.

When a client app invokes the `login()` call, it passes in a username and password as credentials. Upon invocation, the API authenticates the credentials. It then returns the `sessionId`, the user ID associated with the logged-in username, and a URL that points to the Lightning Platform API to use in all subsequent API calls.

Salesforce checks the IP address from which the client app is logging in and blocks logins from unknown IP addresses. If the API blocks the login, Salesforce returns a login fault. To log in, the user must add the security token at the end of the user’s password. For example, if a user’s password is `mypassword` and the security token is `XXXXXXXXXX`, the user enters `mypasswordXXXXXXXXXX`. Users get their security token by changing their password or resetting their security token from the Salesforce user interface. When users change their password or reset their security token, Salesforce sends a new security token to the email address on the user’s Salesforce record. The security token is valid until the user resets the security token, or changes the password, or you reset the user’s password.

When the security token is invalid, the user must repeat the login process. To avoid another log in, add the client’s IP address to the org’s list of trusted IP addresses. For more information, see Security Token.

After logging in, make sure that your client app performs these tasks.

- Sets the session ID in the SOAP header so that the API can validate subsequent requests for this session.
- Specifies the server URL as the target for subsequent service requests. The login server supports only login calls.

Development tools differ in the way you specify session headers and server URLs. For more information, see the documentation for your particular development tool.

**Note:** Multiple client apps can log in using the same `username` argument. However, this approach increases your risk of getting errors due to query limits. A user can have up to 10 query cursors open at a time. If 10 `QueryLocator` cursors are open when a client application, logged in as the same user, attempts to open a new one, then the oldest of the 10 cursors is released. If the client application attempts to open the released query cursor, an error results.

The limit is 3,600 calls to `login()` per user per hour. Exceeding this limit results in a “Login Rate Exceeded” error. After reaching the hourly limit, Salesforce blocks the user from logging in. Users can try to log in again an hour after the block occurred.

Enterprise and Partner Endpoints

In API version 11.1 and earlier, client apps built with the partner WSDL can send requests to the enterprise endpoint, and enterprise WSDL apps can send requests to the partner endpoint. Beginning with version 12.0, this functionality is not supported.

Sandbox Endpoints

If you’re logging in to a sandbox org, use an endpoint based on `test.salesforce.com` instead of `login.salesforce.com`. 

3795
Login When Using a Proxy

If you log in to Salesforce via a proxy, set the proxy host and port number on the instance of the `ConnectorConfig` class that you use to log in. If you must authenticate on the proxy, set the username and password.

```java
ConnectorConfig config = new ConnectorConfig();
config.setUsername(userId);
config.setPassword(passwd);
config.setAuthEndpoint(authEndPoint);
config.setProxy(proxyHost, proxyPort);
// Set the username and password if your proxy must be authenticated
config.setProxyUsername(proxyUsername);
config.setProxyPassword(proxyPassword);
try {
    EnterpriseConnection connection = new EnterpriseConnection(config);
    // etc.
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
```

Session Expiration

Client apps aren’t required to explicitly log out to end a session. Sessions expire automatically after a predetermined length of inactivity. The default is two hours. If you make an API call, the inactivity timer is reset to zero. To change the session expiration (timeout) value, from Setup, enter Session Settings in the Quick Find box, and select Session Settings.

Active Self-Service Users Authentication

⚠️ Note: Starting with Spring ‘12, the Self-Service portal isn’t available for new Salesforce orgs. Existing orgs continue to have access to the Self-Service portal.

To authenticate active self-service users, use `LoginScopeHeader` to specify the Organization ID against which self-service users are authenticated. A self-service user must exist and be active before being authenticated (see `SelfServiceUser`).

Customer Community User Authentication

To authenticate an active Experience Cloud site user who has the API Enabled permission, use `LoginScopeHeader` to specify the Organization ID of the org with Experience Cloud sites. Site users must exist, be active, and belong to the Experience Cloud site before being authenticated.

Client apps can send login requests to these endpoints (using valid values for the authentication endpoint).

Enterprise WSDL:

- String authEndPoint = "https://login.salesforce.com/services/Soap/c/version/"
- String authEndPoint = "https://site-domain/path-prefix/Soap/c/version/"

Partner WSDL:

- String authEndPoint = "https://login.salesforce.com/services/Soap/u/version/"
- String authEndPoint = "https://site-domain/path-prefix/Soap/u/version/"
Logout

Salesforce recommends that you always call `logout()` to end a session when it’s no longer needed. This call ends any child sessions. To provide the most protection, log out the user instead of waiting for the session to expire.

Sample Code—Java

This sample logs a user in with the specified username, password, and authentication endpoint URL. The sample writes user and session information to the console after a successful login. Before running this sample, replace the values for username, password, and authentication endpoint with valid values.

To learn how to generate and import the web service WSDL needed to make API calls, see Step 2: Generate or Obtain the Web Service WSDL in the Quick Start.

```java
public boolean loginSample() {
    boolean success = false;
    String username = "username";
    String password = "password";
    String authEndPoint = "https://login.salesforce.com/services/Soap/c/24.0/";

    try {
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(username);
        config.setPassword(password);

        System.out.println("AuthEndPoint: " + authEndPoint);
        config.setAuthEndpoint(authEndPoint);

        connection = new EnterpriseConnection(config);

        // Print user and session info
        GetUserInfoResult userInfo = connection.getUserInfo();
        System.out.println("UserID: " + userInfo.getUserId());
        System.out.println("User Full Name: " + userInfo.getUserFullName());
        System.out.println("User Email: " + userInfo.getUserEmail());
        System.out.println();
        System.out.println("SessionID: " + config.getSessionId());
        System.out.println("Auth End Point: " + config.getAuthEndpoint());
        System.out.println("Service End Point: " + config.getServiceEndpoint());
        System.out.println();
        success = true;
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }

    return success;
}
```
Sample Code—C#

This sample logs a user in using the specified username and password. The result of the login call contains the service endpoint URL, which is the virtual server instance that is servicing your org, and a unique session ID. The sample sets these returned values on the binding. It sets the binding URL to the returned service endpoint. It also sets the session ID on the session header that is used on all API calls. Next, the sample writes user and session information to the console after a successful login. Before running this sample, replace the values for username and password with valid values.

To learn how to generate and import the web service WSDL needed to make API calls, see Step 2: Generate or Obtain the Web Service WSDL in the Quick Start.

```csharp
public bool loginSample()
{
    Boolean success = false;
    string username = "username";
    string password = "password";

    // Create a service object
    binding = new SforceService();

    LoginResult lr;
    try
    {
        Console.WriteLine("\nLogging in...\n");
        lr = binding.login(username, password);

        /**
         * The login results contain the endpoint of the virtual server instance
         * that is servicing your org. Set the URL of the binding
         * to this endpoint.
         */
        // Save old authentication end point URL
        String authEndPoint = binding.Url;
        // Set returned service endpoint URL
        binding.Url = lr.serverUrl;

        /** Get the session ID from the login result and set it for the
        * session header that will be used for all subsequent calls.
        */
        binding.SessionHeaderValue = new SessionHeader();
        binding.SessionHeaderValue.sessionId = lr.sessionId;

        // Print user and session info
        GetUserInfoResult userInfo;
        userInfo = lr.userInfo;
        Console.WriteLine("UserID: " + userInfo.userId);
        Console.WriteLine("User Full Name: " + userInfo.userFullName);
        Console.WriteLine("User Email: " + userInfo.userEmail);
        Console.WriteLine("SessionID: " + lr.sessionId);
        Console.WriteLine("Auth End Point: " + authEndPoint);
        Console.WriteLine("Service End Point: " +
```
lr.serverUrl;
Console.WriteLine();

// Return true to indicate that we are logged in, pointed
// at the right URL and have our security token in place.
success = true;
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
    e.Message + "\n" + e.StackTrace);
}
return success;

API Call Basics

LoginResult

The login() call returns a LoginResult object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadataServerUrl</td>
<td>string</td>
<td>URL of the endpoint that will process subsequent metadata API calls. Your client application needs to set the endpoint.</td>
</tr>
<tr>
<td>passwordExpired</td>
<td>boolean</td>
<td>Indicates whether the password used during the login attempt is expired (true) or not (false). If the password has expired, then the API returns a</td>
</tr>
</tbody>
</table>
logout()

Ends the session of the logged-in user.

Syntax

```java
connection.logout();
```

Usage

This call ends the session for the logged-in user issuing the call. No arguments are needed.

To end one or more sessions started by someone other than the logged-in user, see `invalidateSessions()`.

Sample Code—Java

This sample calls `logout()` to log the current user out and writes a message to the console.

```java
public void logoutSample() {
    try {
        connection.logout();
        System.out.println("Logged out.");
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample calls `logout()` to log the current user out and writes a message to the console.

```csharp
public void logoutSample()
{
    try
    {
```
Arguments
This call uses no arguments. It ends the session for the logged-in user issuing the call, so no arguments are needed. The logged-in user is identified by the `sessionId` specified in the `SessionHeader` for this call.

Response
Void is returned. Because failure of the call means that the session has already been logged out, no results are needed. Any unexpected error, such as system unavailability, throws an error that should be handled by your client application.

Faults
`UnexpectedErrorFault`

merge()

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

Combines up to 3 records of the same type into 1 record. The input is an array of `MergeRequest` elements, each of which specifies the records to combine. The output is a `MergeResult` object that contains information about the result of the merge.

Syntax

```
MergeResult[] = connection.merge(MergeRequest[] mergeRequests);
```

Usage
Use `merge()` to combine records of the same object type into one of the records, known as the `main record`. `merge()` deletes the other records, known as the `victim records`. If a victim record has related records, `merge()` makes the main record the new parent of the related records.

Rules and Guidelines

Values from non-main records
Before you call `merge()`, decide if you want field values in the non-main records to supersede the main record values. If you do, set the field names and values in the record identified by the `masterRecord` of the `MergeRequest`. 
Contacts, Leads, and Data Privacy Records

When you merge contacts or leads that have corresponding data privacy records based on the Individual object, \texttt{merge()} determines the correct data privacy record to associate with the main record.

- If you selected the option to retain the most recently updated data privacy record for merging leads and contacts, \texttt{merge()} selects the most recently updated data privacy record.
- Otherwise, \texttt{merge()} selects the data privacy record already associated with the main record.

Successive merges

Because \texttt{merge()} handles each \texttt{MergeResult} element in the input argument as a separate transaction, you can successively merge several records into the same main record.

To perform successive merges, call \texttt{merge()} with an array of \texttt{MergeResult} elements. For each \texttt{MergeResult} element, set:

- \texttt{masterRecord} to the main record ID.
- Each element in the \texttt{recordToMergeIds} array to the ID of a record you want to combine into the main record.

Deleted records

Use \texttt{queryAll()} to view records that have been deleted during a merge.

List merged records

To find all records that have been merged since a given point in time, call \texttt{queryAll()} with a SELECT statement. For example:

```sql
SELECT Id FROM Contact WHERE isDeleted=true and masterRecordId != null AND SystemModstamp > 2006-01-01T23:01:01+01:00
```

Supported Object Types

The supported object types are \texttt{Lead}, \texttt{Contact}, \texttt{Account}, \texttt{Person Account}, and \texttt{Individual}. You can only merge objects of the same type. For example, leads can be merged only with leads.

Account Hierarchies

When you merge accounts that are part of an account hierarchy, \texttt{merge()} tries to set the victims’ child records as children of the main record. If this action causes a cyclical relationship, \texttt{merge()} returns an error.

Contacts Reports To relationships

When you merge contacts that have a value for the \texttt{ReportsToId} field, \texttt{merge()} tries to add the victims’ \texttt{ReportsToId} value to the main record. If this action causes a cyclical relationship, \texttt{merge()} reports an error.

Contacts and portal users

When you want to merge a contact victim record that has an associated portal user, set \texttt{AdditionalInformationMap} for victim record’s \texttt{MergeRequest} element. You can only merge 1 victim with a portal user into the main record. In Salesforce Classic, you can’t merge person accounts that are enabled to use a Customer Portal.

Considerations

The following limits apply to any merge request:

- Up to 200 merge requests can be made in a single SOAP call.
- Up to three records can be merged in a single request, including the main record. This limit is the same as the limit enforced by the Salesforce user interface. To merge more than 3 records, do a successive merge.
- External ID fields cannot be used with \texttt{merge()}.
- If you selected the option to retain the most recently updated data privacy record for merging leads and contacts, but the caller does not have CRUD permission for the selected data privacy record, the merge process selects the data privacy record already associated with the main record.
Redundant relationships

You can’t merge accounts or person accounts that are related to the same contact. Remove redundant account-contact relationships before you try to merge accounts.

⚠️ Note: Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the AllowFieldTruncationHeader SOAP header.

Sample Code—Java

This sample merges a victim account with a main account. It creates 2 accounts and attaches a note to the victim. After the merge, the code prints the ID of the victim account and the number of child records updated. In this example, the number of updated records is one, because the note of the merged account is moved to the main account.

```java
public Boolean mergeRecords() {
    Boolean success = false;
    // Array to hold the results
    String[] accountIds = new String[2];
    try {
        // Create two accounts to merge
        Account[] accounts = new Account[2];
        Account masterAccount = new Account();
        masterAccount.setName("MasterAccount");
        masterAccount.setDescription("The Account record to merge with.");
        accounts[0] = masterAccount;
        Account accountToMerge = new Account();
        accountToMerge.setName("AccountToMerge");
        accountToMerge.setDescription("The Account record that will be merged.");
        accounts[1] = accountToMerge;
        SaveResult[] saveResults = connection.create(accounts);
        if (saveResults.length > 0) {
            for (int i = 0; i < saveResults.length; i++) {
                if (saveResults[i].isSuccess()) {
                    accountIds[i] = saveResults[i].getId();
                    System.out.println("Created Account ID: " + accountIds[i]);
                } else {
                    // If any account is not created,
                    // print the error returned and exit
                    System.out.println("An error occurred while creating account."
                        + " Error message: " + saveResults[i].getErrors()[0].getMessage());
                }
            }
        }
        // Set the Ids of the accounts
        masterAccount.setId(accountIds[0]);
        accountToMerge.setId(accountIds[1]);
    }
    return success;
}
```
// Attach a note to the account to be merged with the master,
// which will get re-parented after the merge
Note note = new Note();
System.out.println("Attaching note to record " +
        accountIds[1]);
note.setParentId(accountIds[1]);
note.setTitle("Merged Notes");
note.setBody("This note will be moved to the "
        + "MasterAccount during merge");
SaveResult[] sRes = connection.create(new SObject[] { note });
if (sRes[0].isSuccess()) {
    System.out.println("Created Note record.");
} else {
    Error[] errors = sRes[0].getErrors();
    System.out.println("Could not create Note record: "
            + errors[0].getMessage());
}

// Perform the merge
MergeRequest mReq = new MergeRequest();
masterAccount.setDescription("Was merged");
mReq.setMasterRecord(masterAccount);
mReq.setRecordToMergeIds(new String[] { saveResults[1].getId() });
MergeResult mRes = connection.merge(new MergeRequest[] { mReq })[0];
if (mRes.isSuccess())
{
    System.out.println("Merge successful.");
    // Write the IDs of merged records
    for(String mergedId : mRes.getMergedRecordIds()) {
        System.out.println("Merged Record ID: " + mergedId);
    }
    // Write the updated child records. (In this case the note.)
    System.out.println("Child records updated: " + mRes.getUpdatedRelatedIds().length);
    success = true;
} else {
    System.out.println("Failed to merge records. Error message: " +
            mRes.getErrors()[0].getMessage());
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
return success;
Sample Code—C#

This sample merges a victim account with a main account. It creates 2 accounts and attaches a note to the victim. After the merge, the code prints the ID of the victim account and the number of child records updated. In this example, the number of updated records is one, because the note of the merged account is moved to the main account.

```csharp
public Boolean mergeRecords()
{
    Boolean success = false;
    // Array to hold the results
    String[] accountIds = new String[2];
    try
    {
        // Create two accounts to merge
        Account[] accounts = new Account[2];
        Account masterAccount = new Account();
        masterAccount.Name = "MasterAccount";
        masterAccount.Description = "The Account record to merge with.";
        accounts[0] = masterAccount;
        Account accountToMerge = new Account();
        accountToMerge.Name = "AccountToMerge";
        accountToMerge.Description = "The Account record that will be merged.";
        accounts[1] = accountToMerge;
        SaveResult[] saveResults = binding.create(accounts);

        if (saveResults.Length > 0)
        {
            for (int i = 0; i < saveResults.Length; i++)
            {
                if (saveResults[i].success)
                {
                    accountIds[i] = saveResults[i].id;
                    Console.WriteLine("Created Account ID: "+ accountIds[i]);
                }
                else
                {
                    // If any account is not created,

}
} catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
        e.Message + "\n" + e.StackTrace);
}
return success;
Arguments

This call accepts an array of MergeRequest objects. A MergeRequest object contains the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>masterRecord</td>
<td>sObject</td>
<td>Required. Must provide the ID of the object that other records will be merged into. Optionally, provide the fields to be updated and their values.</td>
</tr>
<tr>
<td>recordToMergeIds</td>
<td>ID[]</td>
<td>Required. Minimum of one, maximum of two. The other record or records to be merged into the main record.</td>
</tr>
<tr>
<td>AdditionalInformationMap</td>
<td>map</td>
<td>A field-value map.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Merge a portal user ID:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- name: PortalUserId</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- value: ID of the portal user</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In all other merge cases, set to null.</td>
</tr>
</tbody>
</table>

API Call Basics

MergeResult

The merge() call returns a MergeResult object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the merge() call, an array of one or more Error objects providing the error code and description.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of the primary record, the record into which the other records were merged.</td>
</tr>
<tr>
<td>mergedRecordIds</td>
<td>ID[]</td>
<td>ID of the records that were merged into the primary record. If successful, the values match mergeRequest.recordToMergeIds.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the merge was successful (true) or not (false).</td>
</tr>
</tbody>
</table>
**performQuickActions()**

Executes quick actions of type create or update.

**Syntax**

```java
PerformQuickActionResult[] = connection.performQuickActions(PerformQuickActionRequest
PerformQuickActionRequest[]);
```

**Usage**

Use the `performQuickActions()` call to perform a specific quick action. Returns an array of `PerformQuickActionResult` objects.

**Note:** In API version 46.0 and later, the `apiName` for a global quick action can include the prefix `Global`, in a `performQuickActions()` request body. The request body also accepts global quick action API names without the prefix.

**Note:** If you’re accessing the API using a custom community URL and you use the `performQuickActions()` call to create a group, the group is only available within that community.

**Note:** The OutgoingEmail entity can be created only via calls from the `performQuickAction` API.

**Sample—Java**

This sample uses a quick action to create a new contact.

```java
public void example() throws Exception {
    PerformQuickActionRequest req = new PerformQuickActionRequest();
    Contact con = new Contact();
    con.setLastName("Smith");

    req.setQuickActionName("Account.QuickCreateContact");
    req.setParentId("001D000000JSaHa");
    //For version 29.0 and greater, use setContextId */
    req.setRecords(new SObject[] { con }); //you can only save one record here
    PerformQuickActionResult[] pResult =
    conn.performQuickActions(new PerformQuickActionRequest[] { req });
    for(PerformQuickActionResult pr : pResult) {
        assert pr.getSuccess();
        assert pr.getCreated();
        assert pr.getErrors().length == 0;
        System.out.println("Id of the record created: " + pr.getIds()[0]);
        System.out.println("Id of the feeditem for action performed: " +
```
Arguments

<table>

<td>An array of IDs.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>If <code>true</code>, the action executed successfully and if <code>false</code>, the action failed.</td>
</tr>
</tbody>
</table>
process()

Submits an array of approval process instances for approval, or processes an array of approval process instances to be approved, rejected, or removed. For more information, see “Set Up an Approval Process” in the Salesforce Help.

Syntax

```java
ProcessResult = connection.process( processType processRequest[])
```

processType can be either `ProcessSubmitRequest` or `ProcessWorkItemRequest`.

Usage

Use the `process()` call to perform either of the following two tasks:

- Submit an array of objects to the approval process. Objects cannot already be in an approval process when submitted. Use the `ProcessSubmitRequest` signature.
- Process an object that has been submitted to the approval process by performing an approval action (Approve or Reject). Use the `ProcessWorkItemRequest` signature.

Requests are processed and a `ProcessResult` is returned with the same process instances as sent in the request. The failure of a particular record will not cause failure of the entire request.

Note: Because you can fire Apex triggers with this call, you may be updating fields that contain strings.

Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the `AllowFieldTruncationHeader` SOAP header.

Sample Code—Java

This sample accepts the ID of the sObject to process the approval for and an array containing the IDs of the next approvers. It creates a process approval request and submits it for approval. Finally, it parses the results of the `process()` call.

```java
public void processRecords(String id, String[] approverIds) {
    ProcessSubmitRequest request = new ProcessSubmitRequest();
    request.setComments("A comment about this approval.");
    request.setObjectId(id);
    request.setNextApproverIds(approverIds);
    try {
        ProcessResult[] processResults = connection.process(new ProcessSubmitRequest[] { request });
        for (ProcessResult processResult : processResults) {
            if (processResult.isSuccess()) {
                System.out.println("Approval submitted for: " + id + ":");
                for (int i = 0; i < approverIds.length; i++) {
```
System.out.println("By: " + approverIds[i] + " successful.");
}
System.out.println("Process Instance Status: "+ processResult.getInstanceStatus());
} else {
    System.out.println("Approval submitted for: " + id
    + ", approverIds: " + approverIds.toString() + " FAILED.");
    System.out.println("Error: " + processResult.getErrors().toString());
}
}
}
}
}
}
}
}

Sample Code—C#

This sample accepts the ID of the sObject to process the approval for and an array containing the IDs of the next approvers. It creates a process approval request and submits it for approval. Finally, it parses the results of the `process()` call.

```csharp
public void processRecords(String id, String[] approverIds)
{
    ProcessSubmitRequest request = new ProcessSubmitRequest();
    request.comments = "A comment about this approval.";
    request.objectId = id;
    request.nextApproverIds = approverIds;
    try
    {
        ProcessResult[] processResults = binding.process(new ProcessSubmitRequest[] { request });
        foreach (ProcessResult processResult in processResults)
        {
            if (processResult.success)
            {
                Console.WriteLine("Approval submitted for: " + id + ":");
                for (int i = 0; i < approverIds.Length; i++)
                {
                    Console.WriteLine("\tBy: " + approverIds[i] + " successful.");
                }
                Console.WriteLine("Process Instance Status: "+ processResult.instanceStatus);
            }
            else
            {
                Console.WriteLine("Approval submitted for: " + id
                    + ", approverIds: " + approverIds.ToString() + " FAILED.");
                Console.WriteLine("Error: " + processResult.errors.ToString());
            }
        }
    }
    catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
```csharp
try
{
    // Your code here
}
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
                      e.Message + "\n" + e.StackTrace);
}
```

### ProcessSubmitRequest Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>string</td>
<td>Text that you want to accompany the submission. Don’t reference merge fields or formula expressions. Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the <code>{!ApprovalRequest.Comments}</code> merge field.</td>
</tr>
<tr>
<td>nextApproverIds</td>
<td>ID</td>
<td>If the process requires specification of the next approval, the ID of the user to be assigned the next request.</td>
</tr>
<tr>
<td>objectId</td>
<td>ID</td>
<td>The record to submit for approval.</td>
</tr>
<tr>
<td>processDefinitionNameOrId</td>
<td>string</td>
<td>The unique name or ID of the specific approval process to which you want the record to be submitted. The process must have the same object type as the record you specified in objectId. Required if skipEntryCriteria is true.</td>
</tr>
<tr>
<td>skipEntryCriteria</td>
<td>boolean</td>
<td>If true, the record isn’t evaluated against the entry criteria set on the process that is defined in processDefinitionNameOrId.</td>
</tr>
<tr>
<td>submitterId</td>
<td>ID</td>
<td>The ID for the user who submitted the record for approval. The user receives notifications about responses to the approval request. The user must be one of the allowed submitters for the process.</td>
</tr>
</tbody>
</table>

### ProcessWorkitemRequest Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>string</td>
<td>For processing an item after being submitted for approval, a string representing the kind of action to take: Approve, Reject, or Remove. Only system administrators can specify Remove. If the Allow submitters to recall approval requests option is selected for the approval process, the submitter can also specify Remove.</td>
</tr>
<tr>
<td>comments</td>
<td>string</td>
<td>Text that you want to accompany the submission. Don’t reference merge fields or formula expressions. Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the <code>{!ApprovalRequest.Comments}</code> merge field.</td>
</tr>

API Call Basics

**ProcessResult**

The `process()` call returns a ProcessResult object, which has the following properties, depending on the type of call (submit for approval or process object already submitted to for approval):

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actorIds</td>
<td>ID</td>
<td>IDs of the users who are currently assigned to this approval step.</td>
</tr>
<tr>
<td>entityId</td>
<td>ID</td>
<td>The object being processed.</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>The set of errors returned if the request failed.</td>
</tr>
<tr>
<td>instanceId</td>
<td>ID</td>
<td>The ID of the ProcessInstance associated with the object submitted for processing.</td>
</tr>
<tr>
<td>instanceStatus</td>
<td>string</td>
<td>The status of the current process instance (not an individual object but the entire process instance). The valid values are “Approved,” “Rejected,” “Removed,” or “Pending.”</td>
</tr>
<tr>
<td>newWorkItemIds</td>
<td>ID[]</td>
<td>Case-insensitive IDs that point to ProcessInstanceWorkitem items (the set of pending approval requests).</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td><code>true</code> if processing or approval completed successfully.</td>
</tr>
</tbody>
</table>

**query()**

Executes a query against the specified object and returns data that matches the specified criteria.
Syntax

```java
QueryResult = connection.query(string queryString);
```

Usage

Use the `query()` call to retrieve data from an object. When a client application invokes the `query()` call, it passes in a query expression that specifies the object to query, the fields to retrieve, and any conditions that determine whether a given object qualifies. For an extensive discussion about the syntax and rules used for queries, see the Salesforce SOQL and SOSL Reference Guide.

Upon invocation, the API executes the query against the specified object, caches the results of the query on the API, and returns a query response object to the client application. The client application can then use methods on the query response object to iterate through rows in the query response and retrieve information.

Your client application must be logged in with sufficient access rights to query individual objects within the specified object and to query the fields in the specified field list. For more information, see Factors that Affect Data Access.

Certain objects cannot be queried via the API. To query an object via the `query()` call, its object must be configured as queryable. To determine whether an object can be queried, your client application can invoke the `describeSObjects()` call on the object and inspect its `queryable` property.

Tip: If you use the enterprise WSDL, you should not use `describe` to populate a select list. For example, if a system administrator adds a field to the sObject after you consume it, the `describe` call will pull down the field but your toolkit won’t know how to serialize it, and your integration may fail.

You can use `queryAll()` to query on all Task and Event records, archived or not. You can also filter on the `isArchived` field to find only the archived objects. You cannot use `query()`, it automatically filters out all records where `isArchived` is set to `true`. You can insert, update, or delete archived records.

The query result object contains up to 500 rows of data by default. If the query results exceed 500 rows, then the client application uses the `queryMore()` call and a server-side cursor to retrieve additional rows in 500-row chunks. You can increase the default size up to 2,000 in the QueryOptions header. For more details see Change the Batch Size in Queries in the SOQL and SOSL Reference.

Queries that take longer than two minutes to process will be timed out. For timed out queries, the API returns an API fault element of `InvalidQueryLocatorFault`. If a timeout occurs, refactor your query to return or scan a smaller amount of data.

When querying for fields of type Base64 (see `base64`), the query response object returns only one record at a time. You cannot alter this by changing the batch size of the `query()` call.

Note: For multicurrency organizations, special handling is required when querying currency fields containing values in different currencies. For example, if a client application is querying PricebookEntry objects based on values in the `UnitPrice` field, and if the `UnitPrice` amounts are expressed in different currencies, then the query logic must handle this case correctly. For example, if the query is trying to retrieve the product codes of all products with a unit price greater than or equal to $10 USD, the query expression might look something like this:

```sql
SELECT Product2Id, ProductCode, UnitPrice FROM PricebookEntry
WHERE (UnitPrice >= 10 and CurrencyIsoCode='USD')
OR (UnitPrice >= 5.47 and CurrencyIsoCode='GBP')
OR (UnitPrice >= 8.19 and CurrencyIsoCode='EUR')
```
Sample Code—Java

This sample executes a query that fetches the first names and last names of all contacts. It calls `query()` with the query string to get the first batch of records. It then calls `queryMore()` in a loop to get subsequent batches of records until no records are returned. It writes the first and last names of the contacts queried to the console.

```java
public void queryRecords() {
    QueryResult qResult = null;
    try {
        String soqlQuery = "SELECT FirstName, LastName FROM Contact";
        qResult = connection.query(soqlQuery);
        boolean done = false;
        if (qResult.getSize() > 0) {
            System.out.println("Logged-in user can see a total of "+ qResult.getSize() + " contact records.");
            while (!done) {
                SObject[] records = qResult.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName(); String lName = con.getLastName();
                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName);
                    } else {
                        System.out.println("Contact " + (i + 1) + ": " + fName + " " + lName);
                    }
                }
                if (qResult.isDone()) {
                    done = true;
                } else {
                    qResult = connection.queryMore(qResult.getQueryLocator());
                }
            }
            System.out.println("No records found.");
        }
        catch (ConnectionException ce) {
            ce.printStackTrace();
        }
    }
}
```

Sample Code—C#

This sample executes a query that fetches the first names and last names of all contacts. It calls `query()` with the query string to get the first batch of records. It then calls `queryMore()` in a loop to get subsequent batches of records until no records are returned. It writes the first and last names of the contacts queried to the console.

```csharp
public void queryRecords()
{
    QueryResult qResult = null;
    try
```
String soqlQuery = "SELECT FirstName, LastName FROM Contact";
qResult = binding.query(soqlQuery);
Boolean done = false;
if (qResult.size > 0)
{
    Console.WriteLine("Logged-in user can see a total of "+ qResult.size + " contact records.");
    while (!done)
    {
        sObject[] records = qResult.records;
        for (int i = 0; i < records.Length; ++i)
        {
            Contact con = (Contact)records[i];
            String fName = con.FirstName;
            String lName = con.LastName;
            if (fName == null)
            {
                Console.WriteLine("Contact " + (i + 1) + ": " + lName);
            }
            else
            {
                Console.WriteLine("Contact " + (i + 1) + ": " + fName+
                " " + lName);
            }
        }
        if (qResult.done)
        {
            done = true;
        }
        else
        {
            qResult = binding.queryMore(qResult.queryLocator);
        }
    }
}
else
{
    Console.WriteLine("No records found.");
}
Console.WriteLine("\nQuery succesfully executed.");
catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: "+
e.Message + "\n" + e.StackTrace);
}

QueryResult

The query() call returns a QueryResult object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryLocator</td>
<td>QueryLocator</td>
<td>A specialized string, similar to ID. Used in queryMore() for retrieving subsequent sets of objects from the query results, if applicable. Represents a server-side cursor. Each user can have up to ten query cursors open at a time.</td>
</tr>
<tr>
<td>done</td>
<td>boolean</td>
<td>Indicates whether additional rows need to be retrieved from the query results (false) using queryMore(), or not (true). Your client application can use this value as a loop condition while iterating through the query results.</td>
</tr>
<tr>
<td>records</td>
<td>sObject[]</td>
<td>Array of sObjects representing individual objects of the specified object and containing data defined in the field list specified in the queryString. For information on queries that use a GROUP BY clause, see AggregateResult.</td>
</tr>
<tr>
<td>size</td>
<td>int</td>
<td>Your client application can use this value to determine whether the query retrieved any rows (size &gt; 0) or not (size = 0). Total number of rows retrieved in the query.</td>
</tr>
</tbody>
</table>
AggregateResult

This object contains the results returned by a `query()` if the query contains an aggregate function, such as `MAX()`.

AggregateResult is an `sObject`, but unlike other `sObject` objects such as `Contact`, it is read-only and it is only used for query results.

The `QueryResult` object has a `records` field that is an array of `sObject` records matching your query. For example, the following query

```
SELECT Id, LastName
FROM Contact
WHERE FirstName = 'Bob'
```

When a SOQL query contains an aggregate function, the results are a set of aggregated data instead of an array of records for a standard object, such as `Contact`. Therefore, the `records` field returns an array of `AggregateResult` records.

For more information on aggregate functions, see "Aggregate Functions" in the Salesforce SOQL and SOSL Reference Guide.

Fields

Each `AggregateResult` object contains a separate field for each of the items in the `SELECT` list. For the enterprise WSDL, retrieve the result for each item by calling `getField()` on an `AggregateResult` object when using WSC client framework. For the partner WSDL, retrieve the result for each item by calling `getField()` on an `sObject` object.

See Sample Code—Java and Sample Code—C# for examples that work with the enterprise WSDL.

Sample Code—Java

```java
public void queryAggregateResult() {
    try {
        String groupByQuery = "SELECT Account.Name n, " +
                                "MAX(Amount) max, MIN(Amount) min " +
                                "FROM Opportunity GROUP BY Account.Name";
        QueryResult qr = connection.query(groupByQuery);
        if (qr.getSize() > 0) {
            System.out.println("Query returned " +
                                qr.getRecords().length + " results."
            );
            for (SObject sObj : qr.getRecords()) {
                AggregateResult result = (AggregateResult) sObj;
                System.out.println("aggResult.Account.Name: " +
                                    result.getField("n")
                );
                System.out.println("aggResult.max: " +
                                    result.getField("max")
                );
                System.out.println("aggResult.min: " +
                                    result.getField("min")
                );
                System.out.println();
            }
        } else {
            System.out.println("No results found.");
        }
        System.out.println("\nQuery successfully executed.");
    } catch (ConnectionException ce) {
```

                                        e.LocalName,
                                        e.InnerText
                                    );
                }
            }
        } else
        {
            Console.WriteLine("No records found");
        }
        Console.WriteLine("Query successfully executed.");
    }
    catch (Exception ex)
    {
        Console.WriteLine("\nFailed to execute query successfully." +
                          "error message was: \n" +
                          ex.Message
                        );
    }
QueryLocator

In the QueryResult object returned by the query() call, queryLocator contains a value that you use in the subsequent queryMore() call. Note the following guidelines:

- Use a given queryLocator value only one time. When you pass it in a queryMore() call, the API returns a new queryLocator in the QueryResult.
- QueryLocator objects expire automatically after 15 minutes of inactivity.
- A user can have up to 10 query cursors open at a time. If 10 QueryLocator cursors are open when a client application, logged in as the same user, attempts to open a new one, then the oldest of the 10 cursors is released. If the client application attempts to open the released query cursor, an error results.

Note: Cursor limits for different Lightning Platform features are tracked separately. For example, you can have 10 SOAP API query cursors, 10 Metadata API cursors, and 50 Apex query cursors open at the same time.

A QueryLocator represents a server-side cursor.

queryAll()

Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Retrieves data from specified objects, whether or not they have been deleted.

Syntax

```
QueryResult = connection.queryAll(string queryString);
```

Usage

Use queryAll to identify the records that have been deleted because of a merge or delete. queryAll has read-only access to the field isDeleted; otherwise it is the same as query().

To find records that have been deleted (in preparation for undeleting them with the undelete() call), specify isDeleted = true in the query string, and for merged records, request the masterRecord. For example:

```
SELECT id, isDeleted, masterRecordId FROM Account WHERE masterRecordId='100000000000Abc'
```

You can use queryAll() to query on all Task and Event records, archived or not. You can also filter on the isArchived field to find only the archived objects. You cannot use query() as it automatically filters out all records where isArchived is set to true. You can update or delete archived records, though you cannot update the isArchived field. If you use the API to insert activities that meet the criteria listed below, the activities will be archived during the next run of the archival background process.

Because Salesforce doesn’t track changes to external data, queryAll() behaves the same as query() for external objects.

For additional information about using queryAll, see query().
Sample Code—Java

This sample performs a query to get all the accounts, whether they're deleted or not. It sets a custom batch size of 250 records. It fetches all batches of records by calling `queryAll()` the first time and then `queryMore()`. The names and the value of the `isDeleted` fields of all returned accounts are written to the console.

```java
public void queryAllRecords() {
    // Setting custom batch size
    connection.setQueryOptions(250);

    try {
        String soqlQuery = "SELECT Name, IsDeleted FROM Account";
        QueryResult qr = connection.queryAll(soqlQuery);
        boolean done = false;
        if (qr.getSize() > 0) {
            System.out.println("Logged-in user can see a total of "
                + qr.getSize()
                + " contact records (including deleted records).");
            while (!done) {
                SObject[] records = qr.getRecords();
                for (int i = 0; i < records.length; i++) {
                    Account account = (Account) records[i];
                    boolean isDel = account.getIsDeleted();
                    System.out.println("Account " + (i + 1) + ": "
                        + account.getName() + " isDeleted = "
                        + account.getIsDeleted());
                }
                if (qr.isDone()) {
                    done = true;
                } else {
                    qr = connection.queryMore(qr.getQueryLocator());
                }
            }
            System.out.println("No records found.");
        } else {
            System.out.println("No records found.");
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample performs a query to get all the accounts, whether they're deleted or not. It sets a custom batch size of 250 records. It fetches all batches of records by calling `queryAll()` the first time and then `queryMore()`. The names and the value of the `isDeleted` fields of all returned accounts are written to the console.

```csharp
public void queryAllRecords()
{
    // Setting custom batch size
    QueryOptions qo = new QueryOptions();
    qo.batchSize = 250;
    qo.batchSizeSpecified = true;
```
binding.QueryOptionsValue = qo;

try {
    String soqlQuery = "SELECT Name, IsDeleted FROM Account";
    QueryResult qr = binding.queryAll(soqlQuery);
    Boolean done = false;
    if (qr.size > 0) {
        Console.WriteLine("Logged-in user can see a total of " + qr.size + " contact records (including deleted records)."辐);
        while (!done) {
            sObject[] records = qr.records;
            for (int i = 0; i < records.Length; i++) {
                Account account = (Account)records[i];
                Boolean isDel = (Boolean)account.IsDeleted;
                Console.WriteLine("Account " + (i + 1) + ": " + account.Name + " isDeleted = " + account.IsDeleted);
            }
            if (qr.done) {
                done = true;
            } else {
                qr = binding.queryMore(qr.queryLocator);
            }
        }
    } else {
        Console.WriteLine("No records found.");
    }
} catch (SoapException e) {
    Console.WriteLine("An unexpected error has occurred: " + e.Message + 
        e.Message + "
        e.StackTrace);"
}

SEE ALSO:

API Call Basics
queryMore()

queryMore()

Retrieves the next batch of objects from a query().

Syntax

```
QueryResult = connection.queryMore( QueryLocator QueryLocator);
```

Usage

Use this call to process query() calls that retrieve a large number of records (by default, more than 500) in the result set. The query() call retrieves the first 500 records and creates a server-side cursor that is represented in the queryLocator object. The queryMore() call processes subsequent records in up to 500-record chunks, resets the server-side cursor, and returns a newly generated QueryLocator. To iterate through records in the result set, you generally call queryMore() repeatedly until all records in the result set have been processed (the Done flag is true). You can change the maximum number of records returned to up to 2,000. See Change the Batch Size in Queries in the Salesforce SOQL and SOSL Reference Guide for more information.

You can't use queryMore() if a query includes a GROUP BY clause. See GROUP BY and queryMore() in the Salesforce SOQL and SOSL Reference Guide for more information.

Note: A queryMore() call on a parent object invalidates all child cursors in the previous result set. If you need the results from the child, you must use queryMore() on those results before using queryMore() on the parent results.

When querying external objects, Salesforce Connect accesses the external data in real time via Web service callouts. Each queryMore() call results in a Web service callout. The batch boundaries and page sizes depend on your adapter and how you set up the external data source.

We recommend the following:

- When possible, avoid paging by filtering your queries of external objects to return fewer rows than the batch size, which by default is 500 rows. Remember, obtaining each batch requires a queryMore() call, which results in a Web service callout.
- If the external data frequently changes, avoid using queryMore() calls. If the external data is modified between queryMore() calls, you can get an unexpected QueryResult.
If the primary or “driving” object for a SELECT statement is an external object, queryMore() supports only that primary object and doesn’t support subqueries.

By default, the OData 2.0 and 4.0 adapters for Salesforce Connect use client-driven paging. With client-driven paging, OData adapters convert each queryMore() call into an OData query that uses the $skip and $top system query options to specify the batch boundary and page size. These options are similar to using LIMIT and OFFSET clauses to page through a result set. If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default queryMore() batch size of 500 rows. The pages returned by the external system determine the batches, but each page can’t exceed 2,000 rows.

**Sample Code—Java**

This sample executes a query that fetches the first names and last names of all contacts. It calls query() with the query string to get the first batch of records. It then calls queryMore() in a loop to get subsequent batches of records until no records are returned. It writes the first and last names of the contacts queried to the console.

```java
public void queryRecords() {
    QueryResult qResult = null;
    try {
        String soqlQuery = "SELECT FirstName, LastName FROM Contact";
        qResult = connection.query(soqlQuery);
        boolean done = false;
        if (qResult.getSize() > 0) {
            System.out.println("Logged-in user can see a total of " + qResult.getSize() + " contact records.");
            while (!done) {
                SObject[] records = qResult.getRecords();
                for (int i = 0; i < records.length; ++i) {
                    Contact con = (Contact) records[i];
                    String fName = con.getFirstName();
                    String lName = con.getLastName();
                    if (fName == null) {
                        System.out.println("Contact " + (i + 1) + ": " + lName);
                    } else {
                        System.out.println("Contact " + (i + 1) + ": " + fName + " " + lName);
                    }
                }
                if (qResult.isDone()) {
                    done = true;
                } else {
                    qResult = connection.queryMore(qResult.getQueryLocator());
                }
            }
        } else {
            System.out.println("No records found.");
        }
        System.out.println("\nQuery succesfully executed.");
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
This sample executes a query that fetches the first names and last names of all contacts. It calls `query()` with the query string to get the first batch of records. It then calls `queryMore()` in a loop to get subsequent batches of records until no records are returned. It writes the first and last names of the contacts queried to the console.

```csharp
public void queryRecords()
{
    QueryResult qResult = null;
    try
    {
        String soqlQuery = "SELECT FirstName, LastName FROM Contact";
        qResult = binding.query(soqlQuery);
        Boolean done = false;
        if (qResult.size > 0)
        {
            Console.WriteLine("Logged-in user can see a total of " + qResult.size + " contact records.");
            while (!done)
            {
                sObject[] records = qResult.records;
                for (int i = 0; i < records.Length; ++i)
                {
                    Contact con = (Contact)records[i];
                    String fName = con.FirstName;
                    String lName = con.LastName;
                    if (fName == null)
                    {
                        Console.WriteLine("Contact " + (i + 1) + ": " + lName);
                    }
                    else
                    {
                        Console.WriteLine("Contact " + (i + 1) + ": " + fName + " " + lName);
                    }
                }
                if (qResult.done)
                {
                    done = true;
                }
                else
                {
                    qResult = binding.queryMore(qResult.queryLocator);
                }
            }
        }
        else
        {
            Console.WriteLine("No records found.");
        }
        Console.WriteLine("\nQuery succesfully executed.");
    }
    catch (SoapException e)
    {
    }
}```

- Change the Batch Size in Queries

QueryResult

The `queryMore()` call returns a QueryResult object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryLocator</td>
<td>QueryLocator</td>
<td>A specialized string, similar to ID. Used in the subsequent <code>queryMore()</code> call for retrieving sets of objects from the query results, if applicable.</td>
</tr>
<tr>
<td>done</td>
<td>boolean</td>
<td>Indicates whether additional rows need to be retrieved from the query results (false) using another <code>queryMore()</code> call, or not (true). Your client application can use this value as a loop condition while iterating through the query results.</td>
</tr>
<tr>
<td>records</td>
<td>sObject[]</td>
<td>Array of sObjects representing individual objects of the specified object and containing data defined in the field list specified in the <code>queryString</code>.</td>
</tr>
<tr>
<td>size</td>
<td>int</td>
<td>Total number of rows retrieved in the query. Your client application can use this value to determine whether the query retrieved any rows (size != 0) or not (size = 0). When querying external objects, the system may not know the number of rows that are retrieved from the external data source. If this situation occurs, size = -1.</td>
</tr>
</tbody>
</table>
Note: A queryMore() call on a parent object invalidates all child cursors in the previous result set. If you need the results from the child, you must use queryMore() on those results before using queryMore() on the parent results.

QueryLocator

In the QueryResult object returned by the queryMore() call, queryLocator contains a value that you will use in the subsequent queryMore() call. Note the following guidelines for using this value:

- Use a queryLocator only once. When you pass it in a queryMore() call, the API returns a new queryLocator in the QueryResult.
- The queryLocator value expires automatically after 15 minutes of inactivity.
- A user can have up to ten query cursors open at a time. If ten QueryLocator cursors are opened when a client application with the same logged-in user attempts to open a new cursor, then the oldest of the ten cursors is released.
- You can’t use a custom metadata query as a queryLocator.

A QueryLocator represents a server-side cursor.

Note: A queryMore() call on a parent object invalidates all child cursors in the previous result set. If you need the results from the child, you must use queryMore() on those results before using queryMore() on the parent results.

retrieve()

Retrieves one or more records based on the specified IDs.

Syntax

```java
sObject[] result = connection.retrieve(string fieldList, string sObjectType, ID ids[]);
```

Usage

Use the retrieve() call to retrieve individual records from an object. The client application passes the list of fields to retrieve, the object, and an array of record IDs to retrieve. The retrieve() call does not return records that have been deleted.

In general, you use retrieve() when you know in advance the IDs of the records to retrieve. Use query() instead to obtain records when you do not know the IDs or when you want to specify other selection criteria.

Client applications can use retrieve() to perform a client-side join. For example, a client application can run a query() to obtain a set of Opportunity records, iterate through the returned opportunity records, obtain the accountId for each opportunity, and then call retrieve() to obtain Account information for those accountIds.

Records for certain objects cannot be retrieved via the API. To retrieve a record via the retrieve() call, its object must be configured as retrievable (retrievable is true). To determine whether an object can be retrieved, your client application can invoke the describeSObjects() call on the object and inspect its retrievable property.

Your client application must be logged in with sufficient access rights to retrieve records within the specified object and to retrieve the fields in the specified field list. For more information, see Factors that Affect Data Access.
Sample Code—Java

This sample retrieves the Id, Name, and Website of the specified Account records. It writes the fields of the retrieved records to the console.

```java
public void retrieveRecords(String[] ids) {
    try {
        SObject[] sObjects = connection.retrieve("ID, Name, Website",
            "Account", ids);
        // Verify that some objects were returned.
        // Even though we began with valid object IDs,
        // someone else might have deleted them in the meantime.
        if (sObjects != null) {
            for (int i = 0; i < sObjects.length; i++) {
                // Cast the SObject into an Account object
                Account retrievedAccount = (Account) sObjects[i];
                if (retrievedAccount != null) {
                    System.out.println("Account ID: " + retrievedAccount.getId());
                    System.out.println("Account Name: " + retrievedAccount.getName());
                    System.out.println("Account Website: " + retrievedAccount.getWebsite());
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample retrieves the Id, Name, and Website of the specified Account records. It writes the fields of the retrieved records to the console.

```csharp
public void retrieveRecords(String[] ids)
{
    try
    {
        sObject[] sObjects = binding.retrieve("ID, Name, Website",
            "Account", ids);
        // Verify that some objects were returned.
        // Even though we began with valid object IDs,
        // someone else might have deleted them in the meantime.
        if (sObjects != null)
        {
            for (int i = 0; i < sObjects.Length; i++)
            {
                // Cast the SObject into an Account object
                Account retrievedAccount = (Account)sObjects[i];
                if (retrievedAccount != null)
                {
                    Console.WriteLine("Account ID: " + retrievedAccount.Id);
                    Console.WriteLine("Account Name: " + retrievedAccount.Name);
                    Console.WriteLine("Account Website: " + retrievedAccount.Website);
                }
            }
        }
    }
```

API Call Basics
search()

Executes a text search in your organization’s data.

**Syntax**

```java
SearchResult = connection.search(String searchString);
```

**Usage**

Use `search()` to search for records based on a search string. The search call supports searching custom objects. For an extensive discussion about the syntax and rules used for text searches, see the *Salesforce SOQL and SOSL Reference Guide*.

Certain objects cannot be searched via the API, such as Attachment objects. To search an object via the `search()` call, the object must be configured as searchable (`isSearchable` is true). To determine whether an object can be searched, your client application can invoke the `describeSObjects()` call on the object and inspect its `searchable` property.

**Sample Code—Java**

This sample makes the `search()` call by passing it a SOSL query, which returns contacts, leads, and accounts whose phone fields contain a specified value. Next, it gets the SObject records from the results and stores the records in arrays depending on the record type. Finally, it writes the fields of the returned contacts, leads, and accounts to the console.

```java
public void searchSample() {
    try {
        // Perform the search using the SOSL query.
        SearchResult sr = connection.search("FIND \{4159017000\} IN Phone FIELDS RETURNING "+ "Contact(Id, Phone, FirstName, LastName), " + "Lead(Id, Phone, FirstName, LastName), " + "Account(Id, Phone, Name)\);

        // Get the records from the search results.
        SearchRecord[] records = sr.getSearchRecords();
        ArrayList<Contact> contacts = new ArrayList<Contact>();
        ArrayList<Lead> leads = new ArrayList<Lead>();
        ArrayList<Account> accounts = new ArrayList<Account>();

        // For each record returned, find out if it's a
        // contact, lead, or account and add it to the
        // appropriate array, then write the records
        // to the console.
        if (records.length > 0) {
            for (int i = 0; i < records.length; i++) {
                SObject record = records[i].getRecord();
                if (record instanceof Contact) {
                    contacts.add((Contact) record);
                } else if (record instanceof Lead) {
                    leads.add((Lead) record);
                } else if (record instanceof Account) {
```
accounts.add((Account) record);
}
}

System.out.println("Found " + contacts.size() + " contacts.");
for (Contact c : contacts) {
    System.out.println(c.getId() + ", " + c.getFirstName() + ", " + c.getLastName() + ", " + c.getPhone());
}
System.out.println("Found " + leads.size() + " leads.");
for (Lead d : leads) {
    System.out.println(d.getId() + ", " + d.getFirstName() + ", " + d.getLastName() + ", " + d.getPhone());
}
System.out.println("Found " + accounts.size() + " accounts.");
for (Account a : accounts) {
    System.out.println(a.getId() + ", " + a.getName() + ", " + a.getPhone());
} else {
    System.out.println("No records were found for the search.");
}
} catch (Exception ce) {
    ce.printStackTrace();
}

Sample Code—C#

This sample makes the `search()` call by passing it a SOSL query, which returns contacts, leads, and accounts whose phone fields contain a specified value. Next, it gets the SObject records from the results and stores the records in arrays depending on the record type. Finally, it writes the fields of the returned contacts, leads, and accounts to the console.

```csharp
public void searchSample()
{
    try
    {
        // Perform the search using the SOSL query.
        SearchResult sr = binding.search("FIND [4159017000] IN Phone FIELDS RETURNING "+ "Contact(Id, Phone, FirstName, LastName), "
            + "Lead(Id, Phone, FirstName, LastName), " + "Account(Id, Phone, Name)";"

        // Get the records from the search results.
        SearchRecord[] records = sr.searchRecords;

        List<Contact> contacts = new List<Contact>();
        List<Lead> leads = new List<Lead>();
        List<Account> accounts = new List<Account>();

        // For each record returned, find out if it's a contact, lead, or account and add it to the
```
if (records.Length > 0)
{
  for (int i = 0; i < records.Length; i++)
  {
    sObject record = records[i].record;
    if (record is Contact)
    {
      contacts.Add((Contact)record);
    }
    else if (record is Lead)
    {
      leads.Add((Lead)record);
    }
    else if (record is Account)
    {
      accounts.Add((Account)record);
    }
  }

  Console.WriteLine("Found " + contacts.Count + " contacts.");
  foreach (Contact c in contacts)
  {
    Console.WriteLine(c.Id +", " + c.FirstName +", " + c.LastName +", " + c.Phone);
  }
  Console.WriteLine("Found " + leads.Count + " leads.");
  foreach (Lead d in leads)
  {
    Console.WriteLine(d.Id +", " + d.FirstName +", " + d.LastName +", " + d.Phone);
  }
  Console.WriteLine("Found " + accounts.Count + " accounts.");
  foreach (Account a in accounts)
  {
    Console.WriteLine(a.Id +", " + a.Name +", " + a.Phone);
  }
  else
  {
    Console.WriteLine("No records were found for the search.");
  }
}
}
catch (SoapException e)
{
  Console.WriteLine("An unexpected error has occurred: " + e.Message + "\n" + e.StackTrace);

SearchResult

The `search()` call returns a SearchResult object, which has the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryId</td>
<td>string</td>
<td>Unique identifier for the SOSL search.</td>
</tr>
<tr>
<td>searchRecords</td>
<td>SearchRecord[]</td>
<td>Array of SearchRecord objects, each of which contains an sObject.</td>
</tr>
<tr>
<td>searchResultsMetadata</td>
<td>SearchResultsMetadata</td>
<td>Metadata for SearchRecords.</td>
</tr>
</tbody>
</table>

SearchRecord

Represents an individual record returned from a search.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>sObject</td>
<td>The individual record returned by the search.</td>
</tr>
<tr>
<td>searchRecordMetadata</td>
<td>SearchRecordMetadata</td>
<td>Metadata for searchRecords.</td>
</tr>
</tbody>
</table>
### Core Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snippet</td>
<td>SearchSnippet</td>
<td>On the search results page, shows terms that match the search string, highlighted within the surrounding text.</td>
</tr>
</tbody>
</table>

### SearchRecordMetadata

Metadata for search results at the record level.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchPromoted</td>
<td>boolean</td>
<td>Indicates that an article has been promoted in search results. Admins define promoted search terms by adding promoted terms to knowledge articles. Users who search for these keywords see the article first in search results. Available in API version 42.0 and later.</td>
</tr>
<tr>
<td>spellCorrected</td>
<td>boolean</td>
<td>Indicates that a record matches a spell-corrected search term. Appears in the response only when true.</td>
</tr>
</tbody>
</table>

### SearchSnippet

Excerpts shown on search results pages for article, case, feed, and idea searches.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>string</td>
<td>The excerpt that contains the match for the search term.</td>
</tr>
<tr>
<td>wholeFields</td>
<td>WholeFields</td>
<td>The list of highlighted fields.</td>
</tr>
</tbody>
</table>

### WholeFields

Contains the complete text of each field that contains highlighting for terms that match the search query. The highlighted terms are surrounded by `<mark>` tags.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the highlighted field.</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>The highlighted text.</td>
</tr>
</tbody>
</table>

### SearchResultsMetadata

Global metadata for the search result.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityMetadata</td>
<td>EntitySearchMetadata</td>
<td>Search results metadata at the object level.</td>
</tr>
</tbody>
</table>
**EntitySearchMetadata**

Metadata for search results at the object level.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldMetadata</td>
<td>FieldLevelSearchMetadata</td>
<td>Metadata for search results at the field level.</td>

<td>Metadata for search term promotion at the object level. Available in API version 42.0 and later.</td>
</tr>
<tr>
<td>spellCorrectionMetadata</td>
<td>EntitySpellCorrectionMetadata</td>
<td>Metadata for spelling correction at the object level.</td>
</tr>
<tr>
<td>entityName</td>
<td>string</td>
<td>Identifies the object.</td>
</tr>
</tbody>
</table>

**FieldLevelSearchMetadata**

Metadata for search results at the field level.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>The field name.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The field label.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>The field type.</td>
</tr>
</tbody>
</table>

**EntitySearchPromotionMetadata**

Metadata for search term promotion at the object level. Appears in the response only when at least one article for an object is a promoted result. Available in API version 42.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>promotedResultCount</td>
<td>int</td>
<td>Count of promoted article results at the object level.</td>
</tr>
</tbody>
</table>

**EntitySpellCorrectionMetadata**

Metadata for spelling correction at the object level. Appears in the response only when at least one record for an object matches a spell-corrected search term.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>correctedQuery</td>
<td>string</td>
<td>The spell-corrected search term.</td>
</tr>
</tbody>
</table>
### undelete()

Undeletes records from the Recycle Bin.

#### Syntax

```java
UndeleteResult[] = connection.undelete(ID[] ids);
```

#### Usage

Use this call to restore any deleted record that is undeletable. Undeletable records include those in the Recycle Bin. Records can be put in the Recycle Bin as the result of a `merge()` or `delete()` call. You can identify deleted records, including records deleted as the result of a merge, using the `queryAll()` call.

You should verify that a record can be undeleted before attempting to delete it. Some records cannot be undeleted, for example, `Account` records can be undeleted, but not `AccountTeamMember` records. To verify that a record can be undeleted, check that the value of the `undeletable` flag in the `DescribeSObjectResult` for that object is set to `true`.

Since a delete call cascade-deletes child records, an undelete call will undelete the cascade-deleted records. For example, deleting an account will delete all the contacts associated with that account.

You can undelete records that were deleted as the result of a merge, but the child objects will have been re-parented, which cannot be undone.

**Note:** Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the `AllowFieldTruncationHeader` SOAP header.

This call supports the `AllOrNoneHeader`, `AllowFieldTruncationHeader`, and `CallOptions` headers.

#### Rollback on Error

The `AllOrNoneHeader` header allows you to roll back all changes unless all records are processed successfully. This header is available in API version 20.0 and later. Allows a call to roll back all changes unless all records are processed successfully.
Sample Code—Java

This sample calls `queryAll()` to get the last five deleted accounts. It then passes the IDs of these accounts to `undelete()`, which restores these accounts. Finally, it checks the results of the call and writes the IDs of the restored accounts or any errors to the console.

```java
public void undeleteRecords() {
    try {
        // Get the accounts that were last deleted
        // (up to 5 accounts)
        QueryResult qResult = connection
            .queryAll("SELECT Id, SystemModstamp FROM "
                + "Account WHERE IsDeleted=true "
                + "ORDER BY SystemModstamp DESC LIMIT 5");

        String[] Ids = new String[qResult.getSize()];
        // Get the IDs of the deleted records
        for (int i = 0; i < qResult.getSize(); i++) {
            Ids[i] = qResult.getRecords()[i].getId();
        }

        // Restore the records
        UndeleteResult[] undelResults = connection.undelete(Ids);

        // Check the results
        for (UndeleteResult result : undelResults) {
            if (result.isSuccess()) {
                System.out.println("Undeleted Account ID: " + result.getId());
            } else {
                if (result.getErrors().length > 0) {
                    System.out.println("Error message: "
                        + result.getErrors()[0].getMessage());
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample calls `queryAll()` to get the last five deleted accounts. It then passes the IDs of these accounts to `undelete()`, which restores these accounts. Finally, it checks the results of the call and writes the IDs of the restored accounts or any errors to the console.

```csharp
public void undeleteRecords()
{
    try
    {
    // Get the accounts that were last deleted
    // (up to 5 accounts)
    QueryResult qResult = binding.queryAll(
        "SELECT Id, SystemModstamp FROM "
        + "Account WHERE IsDeleted=true "
        + "ORDER BY SystemModstamp DESC LIMIT 5");
```
String[] Ids = new String[qResult.size];
// Get the IDs of the deleted records
for (int i = 0; i < qResult.size; i++)
{
    Ids[i] = qResult.records[i].Id;
}

// Restore the records
UndeleteResult[] undelResults = binding.undelete(Ids);

// Check the results
foreach (UndeleteResult result in undelResults)
{
    if (result.success)
    {
        Console.WriteLine("Undeleted Account ID: " + result.id);
    }
    else
    {
        if (result.errors.Length > 0)
        {
            Console.WriteLine("Error message: " + result.errors[0].message);
        }
    }
}
}

catch (SoapException e)
{
    Console.WriteLine("An unexpected error has occurred: " +
                      e.Message + "\n" + e.StackTrace);
}

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ids</td>
<td>ID[]</td>
<td>IDs of the records to be restored.</td>
</tr>
</tbody>
</table>

Response

UndeleteResult
Faults

UnexpectedErrorFault

SEE ALSO:

delete()

UndeleteResult

The undelete() call returns an undeleteResult object with the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id</td>
<td>ID</td>
<td>ID of the record being undeleted.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the undelete was successful (true) or not (false).</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the undelete() call, an array of one or more Error objects providing the error code and description.</td>
</tr>
</tbody>
</table>

update()

Updates one or more existing records in your organization’s data.

Syntax

```java
SaveResult[] = connection.update(sObject[] sObjects);
```

Usage

Use this call to update one or more existing records, such as accounts or contacts, in your organization’s data. The update() call is analogous to the UPDATE statement in SQL.

Permissions

Your client application must be logged in with sufficient access rights to update() records objects for the specified object, as well as individual fields inside that object. For more information, see Factors that Affect Data Access.

Special Handling

Certain objects—and certain fields within those objects—require special handling or permissions. For example, you might also need permissions to access an object’s parent object. Before you attempt to update a record for a particular object, be sure to read its description in the Standard Objects and in the Salesforce online help.
Updateable Objects

Certain records cannot be updated via the API. To update a record via the update() call, its object must be configured as updateable (updateable is true). To determine whether an object can be updated, your client application can invoke the describeSObjects() call on the object and inspect its updateable property.

Required Fields

When updating required fields, you must supply a value—you cannot set the value to null. For more information, see Required Fields.

ID Fields

Fields whose names contain “Id” are either that object’s primary key (see ID Field Type) or a foreign key (see Reference Field Type). Client applications cannot update primary keys, but they can update foreign keys. For example, a client application can update the OwnerId of an Account, because OwnerId is a foreign key that refers to the user who owns the account record. Use describeSObjects() to confirm whether the field can be updated.

This call checks a batch for duplicate Id values, and if there are duplicates, the first 12 are processed. For additional duplicate Id values, the SaveResult for those entries is marked with an error similar to the following:

Maximum number of duplicate updates in one batch (12 allowed).

Automatically Updated Fields

The API updates certain fields automatically, such as LastModifiedDate, LastModifiedById, and SystemModstamp. You cannot explicitly specify these values in your update() call.

Resetting Values to null

To reset a field value to null, you add the field name to the fieldsToNull array in the sObject. You cannot set required fields (nullable is false) to null.

Valid Field Values

You must supply values that are valid for the field’s data type, such as integers (not alphabetic characters) for integer fields. In your client application, follow the data formatting rules specified for your programming language and development tool (your development tool will handle the appropriate mapping of data types in SOAP messages).

String Values

When storing values in string fields, the API trims any leading and trailing white space. For example, if the value of a name field is entered as " ABC Company ", then the value is stored in the database as "ABC Company".

Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the AllowFieldTruncationHeader SOAP header.
Assignment Rules

When updating Case or Lead objects, your client application can set AssignmentRuleHeader options to have the case or lead automatically assigned to one or more users based on assignment rules configured in the Salesforce user interface. For more information, see Case or Lead.

Maximum Number of Objects Updated

Your client application can change up to 200 records in a single update() call. If an update request exceeds 200 records, the entire operation fails.

Rollback on Error

The AllOrNoneHeader header allows you to roll back all changes unless all records are processed successfully. This header is available in API version 20.0 and later. Allows a call to roll back all changes unless all records are processed successfully.

Automatic Subscriptions for Chatter Feeds

To subscribe to records they create, users must enable the Automatically follow records that I create option in their personal settings. If users have automatic subscriptions enabled, they automatically follow the records they create and see changes to those records in their Chatter feed on the Home tab.

When you update the owner of a record, the new owner is not automatically subscribed to the record, unless the new owner has automatic subscriptions for records enabled in his or her Chatter feed settings. The previous owner is not automatically unsubscribed. If the new owner has automatic subscriptions for records enabled, the new and previous owners both see any changes to the record in their news feed.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user’s home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

Updating Records for Different Object Types

You can update records for multiple object types, including custom objects, in one call with API version 20.0 and later. For example, you could update a contact and an account in one call. You can update records for up to 10 objects types in one call.

Records are saved in the same order that they are entered in the sObjects input array.

Records for different object types are broken into multiple chunks by Salesforce. A chunk is a subset of the sObjects input array and each chunk contains records of one object type. Data is committed on a chunk-by-chunk basis. Any Apex triggers related to the records in a chunk are invoked once per chunk. Consider an sObjects input array containing the following set of records:

account1, account2, contact1, contact2, contact3, casel, account3, account4, contact4

Salesforce splits the records into five chunks:

1. account1, account2
2. contact1, contact2, contact3
3. casel
4. account3, account4
5. contact4
Each call can process up to 10 chunks. If the sObject array contains more than 10 chunks, you must process the records in more than one call.

⚠️ **Warning:** you can’t update records for multiple object types in one call if one of those types is related to a feature in the Setup area in Salesforce. The only exceptions are the following objects:

- Custom settings objects, which are similar to custom objects. For more information, see “Create Custom Settings” in the Salesforce online help.
- GroupMember
- Group
- User if the following fields are not being updated:
  - UserRoleIds
  - IsActive
  - ForecastEnabled
  - IsPortalEnabled
  - Username
  - ProfileId

**update()** and Foreign Keys

You can use external ID fields as a foreign key, which allows you to update a record and relate it to another existing record in a single step instead of querying the parent record ID first. To do this, set the foreign key to an instance of the parent sObject that has only the external ID field specified. This external ID should match the external ID value on the parent record.

The following Java and C# examples show you how to update an opportunity and relate it to an existing account using a custom external ID field named MyExtId__c. Each example has a method that accepts the ID of the opportunity to update. It creates an opportunity sObject and sets its ID field so that the object points to an existing opportunity to be updated, sets a new value for the stage name field, and then sets the external ID field to the account object. It then updates the opportunity. Once the opportunity is updated, the account becomes its parent and the state name is updated.

**Java Example**

```java
public void updateForeignKeySample(String oppId) {
    try {
        Opportunity updateOpportunity = new Opportunity();
        // Point to an existing opportunity to update
        updateOpportunity.setId(oppId);
        updateOpportunity.setStageName("Qualification");

        Account parentAccountRef = new Account();
        parentAccountRef.setMyExtId__c("SAP1111111");
        updateOpportunity.setAccount(parentAccountRef);

        SaveResult[] results = connection.update(new SObject[] { updateOpportunity });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
C# Example

```csharp
public void updateForeignKeySample(String oppId)
{
    try
    {
        Opportunity updateOpportunity = new Opportunity();
        // Point to an existing opportunity to update
        updateOpportunity.Id = oppId;
        updateOpportunity.StageName = "Prospecting";

        Account parentAccountRef = new Account();
        parentAccountRef.MyExtId__c = "SAP1111111";
        updateOpportunity.Account = parentAccountRef;

        SaveResult[] results = binding.update(  
            new sObject[] { updateOpportunity });
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: "+
            e.Message + "\n" + e.StackTrace);
    }
}
```

Basic Steps for Updating Records

Use this process to update records:

1. Determine the ID of each record that you want to update(). For example, you might call query() to retrieve a set of records (with their IDs), based on specific criteria, that you would want to update. If you know the ID of the record that you want to update, you can call retrieve() instead. For information on IDs, see ID Field Type.
2. Create an sObject for each record, and populate its fields with the data that you want to update.
3. Construct an sObject[] array and populate that array with the records that you want to update.
4. Call update(), passing in the sObject[] array.
5. Process the results in the SaveResult[] object to verify whether the records have been successfully updated.

Sample Code—Java

This sample accepts the IDs of the accounts to update. It creates two account sObjects, sets each with one of the passed IDs so that the sObject points to an existing account, and sets other fields. It then makes the update() call and verifies the results.

```java
public void updateRecords(String[] ids) {  
    Account[] updates = new Account[2];

    Account account1 = new Account();
    account1.setId(ids[0]);
    account1.setShippingPostalCode("89044");
    updates[0] = account1;

    Account account2 = new Account();
    ```
account2.setId(ids[1]);
account2.setNumberOfEmployees(1000);
updates[1] = account2;

// Invoke the update call and save the results
try {
    SaveResult[] saveResults = connection.update(updates);
    for (SaveResult saveResult : saveResults) {
        if (saveResult.isSuccess()) {
            System.out.println("Successfully updated Account ID: "
                + saveResult.getId());
        } else {
            // Handle the errors.
            // We just print the first error out for sample purposes.
            Error[] errors = saveResult.getErrors();
            if (errors.length > 0) {
                System.out.println("Error: could not update "
                    + "Account ID "
                    + saveResult.getId() + ".");
                System.out.println("The error reported was: (" + "
                    + errors[0].getStatusCode() + ") "
                    + errors[0].getMessage() + ".");
            }
        }
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

Sample Code—C#

This sample accepts the IDs of the accounts to update. It creates two sObjects, sets each with one of the passed IDs so that the
sObject points to an existing account, and sets other fields. It then makes the update() call and verifies the results.

```csharp
public void updateRecords(String[] ids)
{
    Account[] updates = new Account[2];

    Account account1 = new Account();
    account1.Id = ids[0];
    account1.ShippingPostalCode = "89044";
    updates[0] = account1;

    Account account2 = new Account();
    account2.Id = ids[1];
    account2.NumberOfEmployees = 1000;
    updates[1] = account2;

    // Invoke the update call and save the results
    try
    {
        SaveResult[] saveResults = binding.update(updates);
        foreach (SaveResult saveResult in saveResults) {
            System.out.println("Successfully updated Account ID: "
                + saveResult.getId());
        }
    }
    catch (ConnectionException ce) {
        ce.printStackTrace();
    }
```
```csharp
if (saveResult.success)
{
    Console.WriteLine("Successfully updated Account ID: " +
                      saveResult.id);
}
else
{
    // Handle the errors.
    // We just print the first error out for sample purposes.
    Error[] errors = saveResult.errors;
    if (errors.Length > 0)
    {
        Console.WriteLine("Error: could not update " +
                          "Account ID " + saveResult.id + ".";
        Console.WriteLine("The error reported was: (" +
                          errors[0].statusCode + ") " +
                          errors[0].message + ");
    }
}
}

Arguments

UnexpectedErrorFault

SEE ALSO:
   API Call Basics

3845
SaveResult

The `update()` call returns an array of SaveResult objects. Each element in the SaveResult array corresponds to the `sObject[]` array passed as the `sObjects` parameter in the `update()` call. For example, the object returned in the first index in the SaveResult array matches the object specified in the first index of the `sObject[]` array.

A SaveResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>ID of an sObject that you successfully updated. If this field contains a value, then the object was updated successfully. If this field is empty, then the object was not updated and the API returned error information instead.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the <code>update()</code> call succeeded (true) or not (false) for this object.</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If an error occurred during the <code>update()</code> call, an array of one or more Error objects providing the error code and description. If your organization has active duplicate rules and a duplicate is detected, the SaveResult includes an Error with a data type of DuplicateError.</td>
</tr>
</tbody>
</table>

upsert()

Creates new records and updates existing records; uses a custom field to determine the presence of existing records. In most cases, we recommend that you use `upsert()` instead of `create()` to avoid creating unwanted duplicate records (idempotent). Available in the API version 7.0 and later.

Note: Starting with API version 15.0, if you specify a value for a field that contains a string, and the value is too big for the field, the call fails and an error is returned. In previous versions of the API the value was truncated and the call succeeded. If you wish to keep the old behavior with versions 15.0 and later, use the `AllowFieldTruncationHeader` SOAP header.

Syntax

```java
UpsertResult[] = connection.upsert(String externalIdFieldName, sObject[] sObjects);
```

Usage

Upsert is a merging of the words insert and update. This call is available for objects if the object has an external ID field or a field with the `idLookup` field property.

On custom objects, this call uses an indexed custom field called an external ID to determine whether to create a new record or update an existing record. On standard objects, this call can use the name of any field with the `idLookup` instead of the external ID.

Note: External ID fields cannot be used with `merge()`.

For more information about adding custom fields, including external ID fields, to objects, see the "Adding Fields" topic in the Salesforce online help.

Using this call can dramatically reduce how many calls you need to make, particularly when:
• You are integrating your organization’s Salesforce data with ERP (enterprise resource planning) systems such as accounting and manufacturing.
• You are importing data and want to prevent the creation of duplicate objects.

If you are upserting a record for an object that has a custom field with both the **External ID** and **Unique** attributes selected (a unique index), you do not need any special permissions, because the **Unique** attribute prevents the creation of duplicates. If you are upserting a record for an object that has the **External ID** attribute selected but not the **Unique** attribute selected, (a non-unique index) your client application must have the permission “View All Data” to execute this call.

**Note:** Matching by external ID is case-insensitive only if the external ID field has the **Unique** attribute and the **Treat "ABC" and "abc" as duplicate values (case insensitive)** option selected. These options are selected in the Salesforce user interface during field creation. If this is the case, “ABC123” is matched with “abc123.” Before performing an operation, if you have external ID fields without the case-insensitive option selected, review your external IDs for any values that would be matched if case was not considered. If such values exist, you may want to modify them to make them unique, or select the case-sensitive option for your external ID fields. For more information about field attributes, see “Custom Field Attributes” in the Salesforce online help.

### How Upsert Chooses to **update()** or **create()**

Upsert uses the external ID to determine whether it should create a new record or update an existing one:

- If the external ID is not matched, then a new record is created.
- If the external ID is matched once, then the existing record is updated.
- If the external ID is matched multiple times, then an error is reported.
- When batch updating multiple records where the external ID is the same for two or more records in your batch call, those records will be marked as errors in the **UpsertResult** file. The records will be neither created or updated.

### Rollback on Error

The **AllOrNoneHeader** header allows you to roll back all changes unless all records are processed successfully. This header is available in API version 20.0 and later. Allows a call to roll back all changes unless all records are processed successfully.

### Automatic Subscriptions for Chatter Feeds

To subscribe to records they create, users must enable the **Automatically follow records that I create** option in their personal settings. If users have automatic subscriptions enabled, they automatically follow the records they create and see changes to those records in their Chatter feed on the Home tab.

When you update the owner of a record, the new owner is not automatically subscribed to the record, unless the new owner has automatic subscriptions for records enabled in his or her Chatter feed settings. The previous owner is not automatically unsubscribed. If the new owner has automatic subscriptions for records enabled, the new and previous owners both see any changes to the record in their news feed.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user’s home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.
**upsert() and Foreign Keys**

You can use external ID fields as a foreign key, which allows you to create or update a record and relate it to another existing record in a single step instead of querying the parent record ID first. To do this, set the foreign key to an instance of the parent sObject that has only the external ID field specified. This external ID should match the external ID value on the parent record. Unlike `create()`, the parent record must already exist when using `upsert()` to create or update a child record related by a foreign key.

The following Java and C# examples `upsert` an opportunity. In this case, the opportunity doesn’t exist in the database, so the `upsert()` call will create it. The opportunity references an existing account. Rather than specify the account ID, which would require a separate query to obtain, we specify an external ID for the account, in this example the `MyExtId__c` custom field.

**Java Example**

```java
public void upsertForeignKeySample() {
    try {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.setName("UpsertOpportunity");
        newOpportunity.setStageName("Prospecting");
        Calendar dt = connection.getServerTimestamp().getTimestamp();
        dt.add(Calendar.DAY_OF_MONTH, 7);
        newOpportunity.setCloseDate(dt);
        newOpportunity.setMyExtId__c("UPSERTID001");

        // Parent Account record must already exist
        Account parentAccountRef = new Account();
        parentAccountRef.setMyExtId__c("SAP111111");
        newOpportunity.setAccount(parentAccountRef);

        SaveResult[] results = connection
            .upsert("MyExtId__c", new SObject[] { newOpportunity });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**C# Example**

```csharp
public void upsertForeignKeySample()
{
    try
    {
        Opportunity newOpportunity = new Opportunity();
        newOpportunity.Name = "UpsertOpportunity";
        newOpportunity.StageName = "Prospecting";
        DateTime dt = (DateTime)binding.getServerTimestamp().timestamp;
        newOpportunity.CloseDate = dt.AddDays(7);
        newOpportunity.CloseDateSpecified = true;
        newOpportunity.MyExtId__c = "UPSERTID001";

        // Parent Account record must already exist
        Account parentAccountRef = new Account();
        parentAccountRef.MyExtId__c = "SAP111111";
        newOpportunity.Account = parentAccountRef;

        SaveResult[] results = binding
            .upsert("MyExtId", new sObject[] { newOpportunity });
    }
```
Sample Code—Java

This sample upserts two accounts using a custom external ID field called MyExtId__c. The upsert() call matches the accounts based on the MyExtId__c field in order to determine whether to create or update the accounts. Before running this sample, change the MyExtId__c field name to an existing custom ID field name in your org.

```java
public void upsertRecords() {
    SObject[] upserts = new Account[2];

    Account upsertAccount1 = new Account();
    upsertAccount1.setName("Begonia");
    upsertAccount1.setIndustry("Education");
    upsertAccount1.setMyExtId__c("1111111111");
    upserts[0] = upsertAccount1;

    Account upsertAccount2 = new Account();
    upsertAccount2 = new Account();
    upsertAccount2.setName("Bluebell");
    upsertAccount2.setIndustry("Technology");
    upsertAccount2.setMyExtId__c("2222222222");
    upserts[1] = upsertAccount2;

    try {
        // Invoke the upsert call and save the results.
        // Use External_Id custom field for matching records.
        UpsertResult[] upsertResults = connection.upsert("MyExtId__c", upserts);
        for (UpsertResult result : upsertResults) {
            if (result.isSuccess()) {
                System.out.println("Upsert succeeded.");
                System.out.println((result.isCreated() ? "Insert" : "Update")
                        + " was performed.");
                System.out.println("Account ID: " + result.getId());
            } else {
                System.out.println("The Upsert failed because: "
                        + result.getErrors()[0].getMessage());
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Sample Code—C#  

This sample upserts two accounts using a custom external ID field called MyExtId__c. The upsert() call matches the accounts based on the MyExtId__c field in order to determine whether to create or update the accounts. Before running this sample, change the MyExtId__c field name to an existing custom ID field name in your org.

```csharp
public void upsertRecords()
{
    sObject[] upserts = new Account[2];
    Account upsertAccount1 = new Account();
    upsertAccount1.Name = "Begonia";
    upsertAccount1.Industry = "Education";
    upsertAccount1.MyExtId__c = "1111111111";
    upserts[0] = upsertAccount1;
    Account upsertAccount2 = new Account();
    upsertAccount2.Name = "Bluebell";
    upsertAccount2.Industry = "Technology";
    upsertAccount2.MyExtId__c = "2222222222";
    upserts[1] = upsertAccount2;

    try
    {
        // Invoke the upsert call and save the results.
        // Use External_Id custom field for matching records.
        UpsertResult[] upsertResults =
            binding.upsert("MyExtId__c", upserts);
        foreach (UpsertResult result in upsertResults)
        {
            if (result.success)
            {
                Console.WriteLine("\nUpsert succeeded.");
                Console.WriteLine((result.created ? "Insert" : "Update") + " was performed."
                );
                Console.WriteLine("Account ID: " + result.id);
            }
            else
            {
                Console.WriteLine("The Upsert failed because: " +
                    result.errors[0].message);
            }
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " +
            e.Message + "\n" + e.StackTrace);
    }
}
```
Arguments

<table>
<thead>
<tr>

update()
API Call Basics

UpsertResult

The upsert call returns an array of UpsertResult objects. Each element in the array corresponds to the sObject[] array passed as the sObjects parameter in the upsert() call. For example, the object returned in the first index in the UpsertResult array matches the object specified in the first index of the sObject[] array.

An UpsertResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>boolean</td>
<td>Indicates whether the record was created (true) or updated (false).</td>
</tr>
<tr>
<td>errors</td>
<td>Error[]</td>
<td>If errors occurred during the call, an array Error objects, providing the error code and description, is returned.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>If the call succeeded, the field contains the ID of the record that was either updated or created. If there was an error, the field is null. For more information, see ID Field Type.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether the call succeeded (true) or not (false) for this object. If your organization has active duplicate rules and a duplicate is detected, the UpsertResult includes an Error with a data type of DuplicateError.</td>
</tr>
</tbody>
</table>
## CHAPTER 13 Describe Calls

The following table lists supported describe calls in the API in alphabetical order, and provides a brief description for each. Click a call name to see syntax, usage, and more information for that call.

**Note:** For a list of Apex-related calls, see Apex-Related Calls, for a list of core calls, see Core Calls, and for a list of utility calls, see Utility Calls.

<table>
<thead>
<tr>
<th>Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>describeAllTabs()</td>
<td>Returns information about all the tabs—including Lightning page tabs—available to the logged-in user, regardless of whether the user has chosen to hide tabs in his own user interface via the All Tabs (+) tab customization feature.</td>
</tr>
<tr>
<td>describeAppMenu()</td>
<td>Retrieves metadata about items either in the Salesforce mobile app navigation menu or the Salesforce drop-down app menu.</td>
</tr>
<tr>
<td>describeApprovalLayout()</td>
<td>Retrieves metadata about approval layouts for the specified object type.</td>
</tr>
<tr>
<td>describeAvailableQuickActions()</td>
<td>In API version 28.0, describes details about actions available for a specified parent. In API version 29.0 and greater, describes details about actions available for a specified context.</td>
</tr>
<tr>
<td>describeCompactLayouts()</td>
<td>Retrieves metadata about compact layouts for the specified object type.</td>
</tr>
<tr>
<td>describeDataCategoryGroups()</td>
<td>Retrieves available category groups for entities specified in the request.</td>
</tr>
<tr>
<td>describeDataCategoryGroupStructures()</td>
<td>Retrieves available category groups along with their data category structure for entities specified in the request.</td>
</tr>
<tr>
<td>describeGlobal()</td>
<td>Retrieves a list of available objects for your organization’s data.</td>
</tr>
<tr>
<td>describeGlobalTheme()</td>
<td>Returns information about both objects and themes available to the current logged-in user.</td>
</tr>
<tr>
<td>describeKnowledge()</td>
<td>Retrieves the Knowledge language settings in the organization.</td>
</tr>
<tr>
<td>describeLayout()</td>
<td>Retrieves metadata about page layouts for the specified object type.</td>
</tr>
<tr>
<td>describePrimaryCompactLayouts()</td>
<td>Retrieves metadata about the primary compact layout for each of the specified object types.</td>
</tr>
<tr>
<td>describeQuickActions()</td>
<td>Retrieves details about specified actions.</td>
</tr>
<tr>
<td>describeSearchScopeOrder()</td>
<td>Retrieves an ordered list of objects in the logged-in user’s default global search scope, including any pinned objects in the user’s search results page.</td>
</tr>
<tr>
<td>describeSObject()</td>
<td>Retrieves metadata (field list and object properties) for the specified object type. Superseded by describeSObjects().</td>
</tr>
<tr>
<td>describeSObjects()</td>
<td>An array-based version of describeSObject.</td>
</tr>
<tr>
<td>describeSoftphoneLayout()</td>
<td>Describes the softPhone layout(s) created for an organization.</td>
</tr>
</tbody>
</table>
Describe Calls

<table>
<thead>
<tr>
<th>Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>describeSoqlListViews()</td>
<td>Retrieves the SOQL query and other information about a list view.</td>
</tr>
<tr>
<td>describeTabs()</td>
<td>Returns information about the standard and custom apps available to the logged-in user, as listed in the Lightning Platform app menu at the top of the page.</td>
</tr>
<tr>
<td>describeTheme()</td>
<td>Returns information about themes available to the current logged-in user.</td>
</tr>
</tbody>
</table>

Samples

The samples in this section are based on the enterprise WSDL file. They assume that you have already imported the WSDL file and created a connection. To learn how to do so, see the Quick Start tutorial.

**describeAllTabs()**

Returns information about all the tabs—including Lightning page tabs—available to the logged-in user, regardless of whether the user has chosen to hide tabs in his own user interface via the All Tabs (+) tab customization feature.

**Syntax**

```java
DescribeTab[] = connection.describeAllTabs();
```

**Usage**

Use the `describeAllTabs()` call to obtain information about all the tabs that are available to the logged-in user.

Alternately, use `describeTabs()` if you want information only about the tabs that display in the Salesforce user interface for the logged-in user.

**Sample Code—Java**

This sample calls `describeAllTabs()`, which returns an array of `DescribeTab` results.

```java
public void describeAllTabsSample() {
    try {
        // Describe tabs
        DescribeTab[] tabs = connection.describeAllTabs();
        System.out.println("There are " + tabs.length + " tabs available to you.");

        // Iterate through the returned tabs
        for (int j = 0; j < tabs.length; j++) {
            DescribeTab tab = tabs[j];
            System.out.println("\tTab " + (j + 1) + ":");
            System.out.println("\t\tName: " + tab.getName());
            System.out.println("\t\tAssociated SObject" + tab.getSobjectName());
            System.out.println("\t\tLabel: " + tab.getLabel());
        }
    }
}
```
Arguments

None.

Response

DescribeTab
describeAppMenu()

Retrieves metadata about items either in the Salesforce mobile app navigation menu or the Salesforce drop-down app menu. This call is available in API version 29.0 and later.

If you’re accessing the API using a custom community URL, the `describeAppMenu()` call retrieves the tab set associated with the community ID you specify.

Syntax

```
DescribeAppMenuResult describeResult = connection.describeAppMenu(String appMenuType, String networkId);
```

Code Sample—Java

This code sample shows how to get the menu items from the Salesforce mobile app navigation menu.

```
public void describeAppMenu() {
    try {
        //The following two lines are equivalent
        DescribeAppMenuResult describe = connection.describeAppMenu("Salesforce1", "");
        DescribeAppMenuResult appMenu = getClient().describeAppMenu(AppMenuType.Salesforce1);

        for (DescribeAppMenuItem menuItem : appMenu.getAppMenuItems()) {
            if (menuItem.getType() == "Tab.apexPage") {
                String visualforceUrl = menuItem.getContent();
            }
        }
    }
}
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>appMenuType</td>
<td>string</td>
<td>Restricts the menu data returned to the specified menu type. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AppSwitcher—to retrieve the data from the Salesforce drop-down app menu</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Salesforce1—to retrieve the data from the Salesforce mobile app navigation menu</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NetworkTabs—to retrieve the data from a community tab set</td>
</tr>
<tr>
<td>networkId</td>
<td>ID</td>
<td>If the appMenuType is set to NetworkTabs, enter the ID of the community to retrieve the tab set from. If appMenuType is not NetworkTabs, this field must be null or empty.</td>
</tr>
</tbody>
</table>

Response

DescribeAppMenuResult

Faults

InvalidOrNullForRestrictedPicklist

DescribeAppMenuResult

The describeAppMenu() call returns a list of menu items contained in the specified menu type. The following types are available in API version 29.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>appMenuItems</td>
<td>DescribeAppMenuItem[]</td>
<td>Array of one or more menu items in the selected menu type.</td>
</tr>
</tbody>
</table>

DescribeAppMenuItem

Each DescribeAppMenuItem object has these fields:
### describeApprovalLayout()

Retrieves metadata about approval layouts for the specified object type.

#### Syntax

```java
DescribeApprovalLayoutResult approvalLayoutResult = connection.describeApprovalLayout(string sObjectType, string[] approvalProcessNames);
```

#### Usage

Use this call to retrieve information about the approval layout for a given object type. Each approval process has one approval layout.
If you supply a null value for approvalProcessNames, all the approval layouts for the object are returned, instead of the approval layout of each specified approval process.

Sample Code—Java

This sample shows how to get the approval layouts of an Account sObject. It calls describeApprovalLayout() with the name of the sObject type to describe. After getting the approval layouts, the sample prints the name and fields found for each approval layout.

```java
public void describeApprovalLayoutSample() {
    try {
        String objectToDescribe = "Account";
        DescribeApprovalLayoutResult approvalLayoutResult =
            connection.describeApprovalLayout(objectToDescribe, null);
        System.out.print("There are " + approvalLayoutResult.getApprovalLayouts().length);
        System.out.println(" approval layouts for the " + objectToDescribe + " object.");

        // Get all the approval layouts for the sObject
        for (int i = 0; i < approvalLayoutResult.getApprovalLayouts().length; i++) {
            DescribeApprovalLayout aLayout = approvalLayoutResult.getApprovalLayouts()[i];
            System.out.println(" There is an approval layout with name: " + aLayout.getName());
            DescribeLayoutItem[] layoutItems = aLayout.getLayoutItems();
            System.out.print(" There are " + layoutItems.length);
            System.out.println(" fields in this approval layout.");
            for (int j = 0; j < layoutItems.length; j++) {
                System.out.print("This approval layout has a field with name: ");
                System.out.println(layoutItems[j].getLabel());
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectType</td>
<td>string</td>
<td>The specified value must be a valid object for your organization. If the object is a person account, specify Account, or if it is a person contact, specify Contact.</td>
</tr>
<tr>
<td>approvalProcessNames</td>
<td>string[]</td>
<td>Optional array of the approval process API names to return approval layout metadata for.</td>
</tr>
</tbody>
</table>

Response

DescribeApprovalLayoutResult

Faults

InvalidSObjectFault
DescribeApprovalLayoutResult

The `describeApprovalLayout()` call returns a DescribeApprovalLayoutResult object containing top-level record type information about the passed-in sObjectType. Your client application can traverse this object to retrieve detailed metadata about the approval layout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>approvalLayouts</td>
<td>DescribeApprovalLayout[]</td>
<td>List of all the approval layouts in use by the object.</td>
</tr>
</tbody>
</table>

DescribeApprovalLayout

Represents an individual item in the DescribeApprovalLayout list.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>ID</td>
<td>Unique ID of this ApprovalLayout. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label of the approval layout.</td>
</tr>
<tr>
<td>layoutItems</td>
<td>DescribeLayoutItem[]</td>
<td>Array of one or more fields assigned to the approval layout.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>API name of the approval layout.</td>
</tr>
</tbody>
</table>

describeAvailableQuickActions()

In API version 28.0, describes details about actions available for a specified parent. In API version 29.0 and greater, describes details about actions available for a specified context.

Syntax

```java
DescribeAvailableQuickActionResult [] = connection.describeAvailableQuickActions(string parentOrContextType );
```

Usage

Use `describeAvailableQuickActions()` to get the list of actions whose parent (API version 28.0) or context (API version 29.0 and greater) entity name is supplied as well as standard and global actions. The `describeAvailableQuickActions()` call uses the parent entity name, such as “Account”, or “null” for global actions, or in API version 29.0 and greater, the context, to return an array of DescribeAvailableQuickActionResult.
Sample—Java

This sample retrieves and displays the available action information for the Account object.

```java
public void example() throws Exception {
    DescribeAvailableQuickActionResult[] aResult =
        conn.describeAvailableQuickActions("Account");
    for(DescribeAvailableQuickActionResult ar : aResult) {
        System.out.println("Action label: " + ar.getLabel());
        System.out.println("Action name: " + ar.getName());
        System.out.println("Action type: " + ar.getType());
    }
}
```

Response

An array of `DescribeAvailableQuickActionResult` objects.

Faults

cannection.exception errors

DescribeAvailableQuickActionResult

The `describeAvailableQuickActions()` call returns an array of `DescribeAvailableQuickActionResult` objects. In API version 28.0, each `DescribeAvailableQuickActionResult` object represents details about actions available for a specified parent. In API version 29.0 and greater, each `DescribeAvailableQuickActionResult` object represents details about actions available for a specified context.

<table>

</tr>
</tbody>
</table>
describeCompactLayouts()

Retrieves metadata about compact layouts for the specified object type.

**Syntax**

```java
DescribeCompactLayoutsResult compactLayoutResult = connection.describeCompactLayouts(string sObjectType, ID[] recordTypeId);
```

**Usage**

Use this call to retrieve information about the compact layout for a given object type. This call returns metadata about a given compact layout, including the record type mappings. For more information about compact layouts, see the Salesforce online help.

**Sample Code—Java**

This sample shows how to get the compact layouts of an Account sObject. It calls `describeCompactLayouts()` with the name of the sObject type to describe. After getting the compact layouts, the sample prints the images, fields, and action buttons found for each compact layout. Next, it prints the system default compact layout for the object, then the mapping information of record types to compact layouts.

```java
public void testDescribeCompactLayoutsSample() {
    try {
        String objectToDescribe = "Account";
        DescribeCompactLayoutsResult compactLayoutResult = connection.describeCompactLayouts(objectToDescribe, null);
        System.out.println("There are " + compactLayoutResult.getCompactLayouts().length + " compact layouts for the " + objectToDescribe + " object.");

        // Get all the compact layouts for the sObject
        for (int i = 0; i < compactLayoutResult.getCompactLayouts().length; i++) {
            DescribeCompactLayout cLayout = compactLayoutResult.getCompactLayouts()[i];
            System.out.println("There is a compact layout with name: " + cLayout.getName());

            DescribeLayoutItem[] fieldItems = cLayout.getFieldItems();
            System.out.println("There are " + fieldItems.length + " fields in this compact layout.");

            // Write field items
        }
    } catch (Exception e) {
        e.printStackTrace();
    }
}
```
for (int j = 0; j < fieldItems.length; j++) {
    System.out.println(j + " This compact layout has a field with name: " + fieldItems[j].getLabel());
}

DescribeLayoutItem[] imageItems = cLayout.getImageItems();
System.out.println(" There are "+ imageItems.length + " image fields in this compact layout.");

// Write the image items
for (int j = 0; j < imageItems.length; j++) {
    System.out.println(j + " This compact layout has an image field with name: " + imageItems[j].getLabel());
}

DescribeLayoutButton[] actions = cLayout.getActions();
System.out.println(" There are " + actions.length + " buttons in this compact layout.");

// Write the action buttons
for (int j = 0; j < actions.length; j++) {
    System.out.println(j + " This compact layout has a button with name: " + actions[j].getLabel());
}

System.out.println("This object's default compact layout is: "
        + compactLayoutResult.getDefaultCompactLayoutId());

RecordTypeCompactLayoutMapping[] mappings =
compactLayoutResult.getRecordTypeCompactLayoutMappings();
System.out.println("There are " + mappings.length + " record type to compact layout mapping for the "
                    + objectToDescribe + " object.");
for (int j = 0; j < mappings.length; j++) {
    System.out.println(j + " Record type " + mappings[j].getRecordTypeId()
                                  + " is mapped to compact layout " + mappings[j].getCompactLayoutId());
}

} catch (ConnectionException ce) {
    ce.printStackTrace();
}

DescribeCompactLayoutsResult

The `describeCompactLayouts()` call returns a `DescribeCompactLayoutsResult` object containing top-level record type information about the passed-in `sObjectType`, as well as a mapping of record types to compact layouts. Your client application can traverse this object to retrieve detailed metadata about the compact layout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compactLayouts</td>
<td><code>DescribeCompactLayout[]</code></td>
<td>List of all the compact layouts in use by the object.</td>
</tr>
<tr>
<td>defaultCompactLayoutId</td>
<td>ID</td>
<td>ID of the primary compact layout assigned to the object. The system default compact layout ID has a value of null.</td>
</tr>
<tr>
<td>recordTypeCompactLayoutMappings</td>
<td><code>RecordTypeCompactLayoutMapping[]</code></td>
<td>Record type mapping(s) for the object. The compact layouts associated with the object may be mapped to more than one record type.</td>
</tr>
</tbody>
</table>

DescribeCompactLayout

Represents an individual item in the `DescribeCompactLayout` list.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actions</td>
<td><code>DescribeLayoutButtonSection[]</code></td>
<td>Array of one or more <code>DescribeLayoutButtonSection</code> items assigned to the compact layout. This list is set by Salesforce and is read-only.</td>
</tr>
<tr>
<td>fieldItems</td>
<td><code>DescribeLayoutItem[]</code></td>
<td>Array of one or more fields assigned to the compact layout.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>Unique ID of this CompactLayout. For information on IDs, see ID Field Type.</td>
</tr>
</tbody>
</table>
RecordTypeCompactLayoutMapping

Represents a single record type mapping in the `recordTypeCompactLayoutMappings` field in a `DescribeCompactLayoutsResult` object. This object is a map of valid `recordTypeId` to `compactLayoutId`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>available</td>
<td>boolean</td>
<td>Indicates whether this record type is available (<code>true</code>) or not (<code>false</code>). Availability is used to display a list of available record types to the user when they are creating a new record.</td>
</tr>
<tr>
<td>compactLayoutId</td>
<td>ID</td>
<td>ID of the compact layout associated with this record type. This field has a value of <code>null</code> if the record type is associated with the system default compact layout.</td>
</tr>
<tr>
<td>compactLayoutName</td>
<td>string</td>
<td>API name of the compact layout.</td>
</tr>
<tr>
<td>recordTypeName</td>
<td>string</td>
<td>API name of the record type.</td>
</tr>
<tr>
<td>recordTypeId</td>
<td>ID</td>
<td>ID of the record type.</td>
</tr>
</tbody>
</table>

describeDataCategoryGroups()

Retrieves available category groups for objects specified in the request.

**Syntax**

```java
DescribeDataCategoryGroupResult[] = connection.describeDataCategoryGroups() (string[] sObjectTypes);
```

**Usage**

Use this call to describe the available category groups for the objects specified in the request. This call can be used with the `describeDataCategoryGroupStructures()` call to describe all the categories available for a specific object. For additional information about data categories, see “Work with Data Categories” in the Salesforce online help.
Sample Code—Java

This sample shows how to retrieve the data category groups associated with:

- Salesforce Knowledge articles
- Questions from the Answers feature

It returns the name, label and description of a category group and the name of the associated sobject (article or question). It also returns the number of data categories in the data category group.

```java
public void describeDataCategoryGroupsSample() {
    try {
        // Make the describe call for data category groups
        DescribeDataCategoryGroupResult[] results =
            connection.describeDataCategoryGroups(new String[] {
                "KnowledgeArticleVersion", "Question"});

        // Get the properties of each data category group
        for (int i = 0; i < results.length; i++) {
            System.out.println("sObject: " +
                results[i].getSobject());
            System.out.println("Group name: " +
                results[i].getName());
            System.out.println("Group label: " +
                results[i].getLabel());
            System.out.println("Group description: " +
                (results[i].getDescription()==null? "" :
                results[i].getDescription()));
            System.out.println("Number of categories: " +
                results[i].getCategoryCount());
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample shows how to retrieve the data category groups associated with:

- Salesforce Knowledge articles
- Questions from the Answers feature

It returns the name, label and description of a category group and the name of the associated sobject (article or question). It also returns the number of data categories in the data category group.

```csharp
public void describeDataCategoryGroups() {
    try {
        // Make the describe call for data category groups
        DescribeDataCategoryGroupResult[] results =
            binding.describeDataCategoryGroups(new String[] {
                "KnowledgeArticleVersion", "Question"});

        // Get the properties of each data category group
        for (int i = 0; i < results.Length; i++) {
            System.out.println("sObject: " +
                results[i].getSobject());
            System.out.println("Group name: " +
                results[i].getName());
            System.out.println("Group label: " +
                results[i].getLabel());
            System.out.println("Group description: " +
                (results[i].getDescription()==null? "" :
                results[i].getDescription()));
            System.out.println("Number of categories: " +
                results[i].getCategoryCount());
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Console.WriteLine("sObject: "+results[i].sobject);
Console.WriteLine("Group name: "+results[i].name);
Console.WriteLine("Group label: "+results[i].label);
Console.WriteLine("Group description: "+
{results[i].description==null?"":results[i].description});
Console.WriteLine("Number of categories: "+results[i].categoryCount);
}
}
} catch (SoapException e) {
Console.WriteLine("An unexpected error has occurred: "+
e.Message +"\n"+ e.StackTrace);
}
}

## Arguments

## DescribeDataCategoryGroupResult

The describeDataCategoryGroups() call returns a DescribeDataCategoryGroupResult object containing the list of the category groups associated with the specified objects.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>categoryCount</td>
<td>int</td>
<td>The number of visible data categories in the data category group.</td>
</tr>
</tbody>
</table>
describeDataCategoryGroupStructures()

Retrieves available category groups along with their data category structure for objects specified in the request.

Syntax

```java
describeDataCategoryGroupStructures()[] = connection.
    describeDataCategoryGroupStructures() (DataCategoryGroupSObjectTypePair[]
pairs, boolean topCategoriesOnly)
```

Usage

Use this call to return the visible data category structure for the given object category group pairs. First use describeDataCategoryGroups() to find the available category groups for the objects specified. From the returned list, choose the object category group pairs to pass as the input in describeDataCategoryGroupStructures(). This call returns all the visible categories and data category structure as output. For additional information about data categories and data category visibility, see "Work with Data Categories" and "Data Category Visibility" in the Salesforce online help.

Sample Code—Java

This sample shows how to use sObject and data category group pairs to retrieve data categories for each pair. It calls describeDataCategoryGroupStructures() with two pairs, KnowledgeArticleVersion/Regions and Question/Regions, and iterates through the results of this call. It gets the top categories for each result, which is "All", and then gets the first-level child categories. The sample requires that you set up a data category group called Regions with some child categories and associate it with a knowledge article and questions. Alternatively, you can replace the data category group name in the sample if you want to use an existing data category group in your org that has a different name.

```java
public void describeDataCategoryGroupStructuresSample() {
    try {
        // Create the data category pairs
        DataCategoryGroupSObjectTypePair pair1 =
            new DataCategoryGroupSObjectTypePair();
        DataCategoryGroupSObjectTypePair pair2 =
            new DataCategoryGroupSObjectTypePair();
        pair1.setSobject("KnowledgeArticleVersion");
        pair1.setDataCategoryGroupName("Regions");
        pair2.setSobject("Question");
        pair2.setDataCategoryGroupName("Regions");
```
pair2.setDataCategoryGroupName("Regions");

DataCategoryGroupSobjectTypePair[] pairs =
    new DataCategoryGroupSobjectTypePair[] {
        pair1,
        pair2
    };

    // Get the list of top level categories using the describe call
DescribeDataCategoryGroupStructureResult[] results =
    connection.describeDataCategoryGroupStructures(
        pairs,
        false
    );

    // Iterate through each result and get some properties
    // including top categories and child categories
for (int i = 0; i < results.length; i++) {
    DescribeDataCategoryGroupStructureResult result = results[i];
    String sObject = result.getSobject();
    System.out.println("sObject: " + sObject);
    System.out.println("Group name: " + result.getName());
    System.out.println("Group label: " + result.getLabel());
    System.out.println("Group description: " +
        result.getDescription());

    // Get the top-level categories
    DataCategory[] topCategories = result.getTopCategories();

    // Iterate through the top level categories and retrieve
    // some information
    for (int j = 0; j < topCategories.length; j++) {
        DataCategory topCategory = topCategories[j];
        System.out.println("Category name: " +
            topCategory.getName());
        System.out.println("Category label: " +
            topCategory.getLabel());
        DataCategory [] childCategories =
            topCategory.getChildCategories();
        System.out.println("Child categories: ");
        for (int k = 0; k < childCategories.length; k++) {
            System.out.println("\t" + k + ". Category name: " +
                childCategories[k].getName());
            System.out.println("\t" + k + ". Category label: " +
                childCategories[k].getLabel());
        }
    }
}
}
}
}

} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
Sample Code—C#

This sample shows how to use sObject and data category group pairs to retrieve data categories for each pair. It calls describeDataCategoryGroupStructures() with two pairs, KnowledgeArticleVersion/Regions and Question/Regions, and iterates through the results of this call. describeGlobal()

Retrieves a list of available objects for your organization’s data.

Syntax

```java
DescribeGlobalResult = connection.describeGlobal();
```

Usage

Use describeGlobal() to obtain a list of available objects for your organization. You can then iterate through this list and use describeSObjects() to obtain metadata about individual objects.

Your client application must be logged in with sufficient access rights to retrieve metadata about your organization’s data. For more information, see Factors that Affect Data Access.
Sample Code—Java

This sample shows how to perform a global describe. It then retrieves the sObjects from the global describe result and writes their names to the console.

```java
public void describeGlobalSample() {
    try {
        // Make the describeGlobal() call
        DescribeGlobalResult describeGlobalResult =
            connection.describeGlobal();

        // Get the sObjects from the describe global result
        DescribeGlobalSObjectResult[] sobjectResults =
            describeGlobalResult.getSobjects();

        // Write the name of each sObject to the console
        for (int i = 0; i < sobjectResults.length; i++) {
            System.out.println(sobjectResults[i].getName());
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample shows how to perform a global describe. It then retrieves the sObjects from the global describe result and writes their names to the console.

```csharp
public void describeGlobalSample()
{
    try {
        // Make the describeGlobal() call
        DescribeGlobalResult dgr = binding.describeGlobal();

        // Get the sObjects from the describe global result
        DescribeGlobalSObjectResult[] sObjResults = dgr.sobjects;

        // Write the name of each sObject to the console
        for (int i = 0; i < sObjResults.Length; i++)
        {
            Console.WriteLine(sObjResults[i].name);
        }
    } catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " +
            e.Message + "\n" + e.StackTrace);
    }
}
```

DescribeGlobalResult
The describeGlobal() call returns a DescribeGlobalResult object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encoding</td>
<td>string</td>
<td>Specifies how an org’s data is encoded, such as UTF-8 or ISO-8859-1.</td>
</tr>
<tr>
<td>maxBatchSize</td>
<td>int</td>
<td>Maximum number of records allowed in a create(), update(), or delete() call.</td>
</tr>
<tr>
<td>objects</td>
<td>DescribeGlobalSOBJobjectResult[]</td>
<td>List of result objects that returns information about the available objects for your org. Available in API version 17.0 and later. This property enhances the information that was previously available in the types property.</td>
</tr>
<tr>
<td>types</td>
<td>string[]</td>
<td>List of available objects for your org. You iterate through this list to retrieve the object string that you pass to describeSObjects(). Beginning with API version 17.0, this property is no longer supported. Use the name property in DescribeGlobalSOBJobjectResult instead.</td>
</tr>
</tbody>
</table>

DescribeGlobalSOBJobjectResult
Represents the properties for one of the objects available for your org. Each object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>activateable</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>createable</td>
<td>boolean</td>
<td>Indicates whether the object can be created via the <code>create()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>custom</td>
<td>boolean</td>
<td>Indicates whether the object is a custom object (true) or not (false).</td>
</tr>
<tr>
<td>customSetting</td>
<td>boolean</td>
<td>Indicates whether the object is a custom setting object (true) or not (false).</td>
</tr>
<tr>
<td>dataTranslationEnabled</td>
<td>boolean</td>
<td>Indicates whether data translation is enabled for the object (true) or not (false). Available in API version 49.0 and later.</td>
</tr>
<tr>
<td>deepCloneable</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>deletable</td>
<td>boolean</td>
<td>Indicates whether the object can be deleted via the <code>delete()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>deprecatedAndHidden</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>feedEnabled</td>
<td>boolean</td>
<td>Indicates whether Chatter feeds are enabled for the object (true) or not (false). This property is available in API version 19.0 and later.</td>
</tr>
<tr>
<td>isInterface</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>keyPrefix</td>
<td>string</td>
<td>Three-character prefix code in the object ID. Object IDs are prefixed with three-character codes that specify the type of the object. For example, Account objects have a prefix of 001 and Opportunity objects have a prefix of 006. Note that a key prefix can sometimes be shared by multiple objects so it does not always uniquely identify an object. Use the value of this field to determine the object type of a parent in those cases where the child may have more than one object type as parent (polymorphic). For example, you may need to obtain the <code>keyPrefix</code> value for the parent of a Task or Event.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label text for a tab or field renamed in the user interface, if applicable, or the object name, if not. For example, an organization representing a medical vertical might rename Account to Patient. Tabs and fields can be renamed in the Salesforce user interface. See the Salesforce online help for more information.</td>
</tr>
<tr>
<td>labelPlural</td>
<td>string</td>
<td>Label text for an object that represents the plural version of an object name, for example, “Accounts.”</td>
</tr>
<tr>
<td>layoutable</td>
<td>boolean</td>
<td>Indicates whether the object supports the <code>describeLayout()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>mergeable</td>
<td>boolean</td>
<td>Indicates whether the object can be merged with other objects of its type (true) or not (false). true for leads, contacts, and accounts.</td>
</tr>
<tr>
<td>mruEnabled</td>
<td>boolean</td>
<td>Indicates whether Most Recently Used (MRU) list functionality is enabled for the object (true) or not (false).</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the object. This name is equivalent to an entry in the <code>types</code> list that is no longer supported, beginning with API version 17.0.</td>
</tr>
</tbody>
</table>
## Describe Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryable</td>
<td>boolean</td>
<td>Indicates whether the object can be queried via the <code>query()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>replicateable</td>
<td>boolean</td>
<td>Indicates whether the object can be replicated via the <code>getUpdated()</code> and <code>getDeleted()</code> calls (true) or not (false).</td>
</tr>
<tr>
<td>retrieveable</td>
<td>boolean</td>
<td>Indicates whether the object can be retrieved via the <code>retrieve()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>searchable</td>

</tr>
</tbody>
</table>

### describeGlobalTheme()

Returns information about both objects and themes available to the current logged-in user.

#### Syntax

```
DescribeGlobalTheme = connection.describeGlobalTheme();
```

#### Usage

Use `describeGlobalTheme()` to get both a list of available objects and theme information about those objects for your organization. `describeGlobalTheme()` is a combination of `describeGlobal()` and `describeTheme()` combined into a single call.

Your client application must be logged in with sufficient access rights to retrieve theme and object information about your organization’s data. For more information, see [Factors that Affect Data Access](#).

`describeGlobalTheme()` is available in API version 29.0 and later.

#### Sample

This Java sample calls `describeGlobalTheme()` and then iterates over the retrieved object and theme information.

```
public static void describeGlobalThemeExample() {
    try {
        // Get current theme and object information
        DescribeGlobalTheme globalThemeResult = connection.describeGlobalTheme();
        DescribeGlobalResult globalResult = globalThemeResult.getGlobal();
        DescribeThemeResult globalTheme = globalThemeResult.getTheme();
    }
}
```
// For the themes, get the array of theme items, one per object
DescribeThemeItem[] themeItems = globalTheme.getThemeItems();
for (int i = 0; i < themeItems.length; i++) {
    DescribeThemeItem themeItem = themeItems[i];
    System.out.println("Theme information for object " + themeItem.getName());
    // Get color and icon info for each themeItem
    DescribeColor colors[] = themeItem.getColors();
    System.out.println(" Number of colors: " + colors.length);
    int k;
    for (k = 0; k < colors.length; k++) {
        DescribeColor color = colors[k];
        System.out.println(" For Color #" + k + ":");
        System.out.println(" Web RGB Color: " + color.getColor());
        System.out.println(" Context: " + color.getContext());
        System.out.println(" Theme: " + color.getTheme());
    }
    DescribeIcon icons[] = themeItem.getIcons();
    System.out.println(" Number of icons: " + icons.length);
    for (k = 0; k < icons.length; k++) {
        DescribeIcon icon = icons[k];
        System.out.println(" For Icon #" + k + ":");
        System.out.println(" ContentType: " + icon.getContentType());
        System.out.println(" Height: " + icon.getHeight());
        System.out.println(" Theme: " + icon.getTheme());
        System.out.println(" URL: " + icon.getUrl());
        System.out.println(" Width: " + icon.getWidth());
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

describeKnowledge()

Retrieves the Knowledge language settings in the organization.

Syntax

```java
KnowledgeSettings result = _connection.describeKnowledgeSettings();
```

Usage

Use this call to describe the existing Knowledge language settings, including the default Knowledge language, supported languages, and a list of Knowledge language information. You can also use `KnowledgeSettings` in the Metadata API to obtain similar information.

Sample Code—Java

This sample shows how to retrieve the Knowledge language settings. It returns the default Knowledge language, a list of Knowledge supported language, including the language code and whether it's an active Knowledge language.

```java
public void describeKnowledgeSettingsSample() {
  try {
    // Make the describe call for KnowledgeSettings
    KnowledgeSettings result = connection.describeKnowledgeSettings();

    // Get the properties of KnowledgeSettings
    System.out.println("Knowledge default language: "+result.getDefaultLanguage());
    for (KnowledgeLanguageItem lang : result.getLanguages()) {
      System.out.println("Language: "+lang.getName());
      System.out.println("Active: "+lang.isActive());
    }
  } catch (ConnectionException ex) {
    ex.printStackTrace();
  }
}
```
Sample Code—C#

This sample shows how to retrieve the Knowledge language settings. It returns the default Knowledge language, a list of Knowledge supported language, including the language code and whether it’s an active Knowledge language.

```csharp
public void describeKnowledgeSettingsSample() {
    try {
        // Make the describe call for KnowledgeSettings
        KnowledgeSettings result = connection.describeKnowledgeSettings();

        // Get the properties of KnowledgeSettings
        Console.WriteLine("Knowledge default language: " + result.getDefaultLanguage());
        for (KnowledgeLanguageItem lang : result.getLanguages()) {
            Console.WriteLine("Language: " + lang.getName());
            Console.WriteLine("Active: " + lang.isActive());
        }
    } catch (SoapException ex) {
        ex.printStackTrace();
    }
}
```

Response

KnowledgeSettings

describeLayout()

Retrieves metadata about page layouts for the specified object type.

Syntax

```csharp
DescribeLayoutResult = connection.describeLayout(string sObjectType, string layoutName, ID recordTypeID[]);
```

Usage

Use this call to retrieve information about the layout (presentation of data to users) for a given object type. This call returns metadata about a given page layout, such as the detail page layout, the edit page layout, and the record type mappings. For additional information, see “Page Layouts” in the Salesforce online help.

Generally, user profiles have one layout associated with each object. In Enterprise, Unlimited, and Performance Editions, user profiles can have multiple layouts per object, where each layout is specific to a given record type. This call returns metadata for multiple layouts, if applicable.

Layouts can be further customized in standard objects that have defined named layouts, which are separate from the primary layout for both the profile and the record type. One example of named layouts is the UserAlt layout defined on the User object, which is consumed in the Salesforce mobile app instead of the primary User layout. New layout names can only be defined by Salesforce, but customization of named layouts is controlled by administrators in the same way as primary layouts.
If you supply a null value for recordTypeIds, all the layouts for that user are returned, instead of just the layouts for each specified record type. The same layout can be associated with multiple record types for the user's profile, in which case there would only be one layout returned.

**Note:** This call is an advanced API call that is typically used only by partners who have written custom page rendering code for generating output on a specialized device (for example, on PDAs) and need to examine the layout details of an object before rendering the page output.

Use the following procedure to describe layouts:

1. To display a detail page or edit page for a record that exists, a client application first gets the recordTypeIds from the record, then it finds the layoutId associated with that recordTypeIds (through recordTypeMapping), and finally it uses that layout information to render the page.

2. To display the create version of an edit page, a client application first determines whether more than one record type is available and, if so, presents the user with a choice. Once a record type has been chosen, then the client application uses the layout information to render the page. It uses the picklist values from the RecordTypeMapping to display valid picklist values for picklist fields.

3. A client application can access the labels for the layout, using the DescribeLayoutResult.

The following restrictions apply to person account record types:

- **describeLayout()** for version 7.0 and below returns the default business account record type as the default record type even if the tab default is a person account record type. In version 8.0 and after, it will always be the tab default.
- **describeLayout()** for version 7.0 and below doesn't return any person account record types.

For more information about person account record types, see Person Account Record Types.

### Sample Code—Java

This sample shows how to get the layouts of an Account sObject. It calls describeLayout() with the name of the sObject type to describe. It doesn’t specify record type IDs as a third argument, which means that layouts for all record types will be returned if record types are defined in your org for the specified sObject. After getting the layout, the sample writes the number of detail and edit sections found and their headings. Next, it iterates through each edit layout section and retrieves its components.

```java
public void describeLayoutSample(){
    try {
        String objectToDescribe = "Account";
        DescribeLayoutResult dlr = connection.describeLayout(objectToDescribe, null, null);
        System.out.println("There are " + dlr.getLayouts().length + " layouts for the " + objectToDescribe + " object.");

        // Get all the layouts for the sObject
        for(int i = 0; i < dlr.getLayouts().length; i++) {
            DescribeLayout layout = dlr.getLayouts()[i];
            DescribeLayoutSection[] detailLayoutSectionList = layout.getDetailLayoutSections();
            System.out.println("There are " + detailLayoutSectionList.length + " detail layout sections");
            DescribeLayoutSection[] editLayoutSectionList = layout.getEditLayoutSections();
            System.out.println("There are " + editLayoutSectionList.length +
```
// Write the headings of the detail layout sections
for (int j = 0; j < detailLayoutSectionList.length; j++) {
    System.out.println(j + " This detail layout section has a heading of " +
                       detailLayoutSectionList[j].getHeading());
}

// Write the headings of the edit layout sections
for (int x = 0; x < editLayoutSectionList.length; x++) {
    System.out.println(x + " This edit layout section has a heading of " +
                        editLayoutSectionList[x].getHeading());
}

// For each edit layout section, get its details.
for (int k = 0; k < editLayoutSectionList.length; k++) {
    DescribeLayoutSection els =
        editLayoutSectionList[k];
    System.out.println("Edit layout section heading: " +
                       els.getHeading());
    DescribeLayoutRow[] dlrList = els.getLayoutRows();
    System.out.println("This edit layout section has " +
                       dlrList.length + " layout rows.");
    for (int m = 0; m < dlrList.length; m++) {
        DescribeLayoutRow lr = dlrList[m];
        System.out.println(" This row has "+
                           lr.getNumItems() + " layout items.");
        DescribeLayoutItem[] dliList = lr.getLayoutItems();
        for (int n = 0; n < dliList.length; n++) {
            DescribeLayoutItem li = dliList[n];
            if ((li.getLayoutComponents() != null) &&
                (li.getLayoutComponents().length > 0)) {
                System.out.println("\tLayout item " + n +
                                   ", layout component: " +
                                   li.getLayoutComponents()[0].getValue());
            }
            else {
                System.out.println("\tLayout item " + n +
                                   ", no layout component");
            }
        }
    }

    // Get record type mappings
    if (dlr.getRecordTypeMappings() != null) {
        System.out.println("There are " +
                           dlr.getRecordTypeMappings().length +
                           " record type mappings for the " +
                           objectToDescribe + " object");
    }
Sample Code—C#

This sample shows how to get the layouts of an Account sObject. It calls `describeLayout()` with the name of the sObject type to describe. It doesn’t specify record type IDs as a third argument, which means that layouts for all record types will be returned if record types are defined in your org for the specified sObject. After getting the layout, the sample writes the number of detail and edit sections found and their headings. Next, it iterates through each edit layout section and retrieves its components.

```csharp
public void describeLayoutSample()

**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectType</td>
<td>string</td>
<td>The specified value must be a valid object for your organization. If the object is a person account, specify Account, or if it is a person contact, specify Contact.</td>
</tr>
<tr>
<td>layoutName</td>
<td>string</td>
<td>The specified value must be a valid named layout for this object. Layout names are obtained from namedLayoutInfos in DescribeSObjectResult. The entity name is not valid because the primary layout is not considered &quot;named.&quot;</td>
</tr>
<tr>
<td>recordTypeIds</td>
<td>ID[]</td>
<td>Optional parameter restricts the layout data returned to the specified record types. To retrieve the layout for the primary record type, specify the value 012000000000000AAA for the recordTypeIds regardless of the object. This value is returned in the recordTypeInfos for the primary record type in the DescribeSObjectResult. A SOQL query returns a null value, not 012000000000000AAA. For information on IDs, see ID Field Type.</td>
</tr>
</tbody>
</table>

DescribeLayoutResult

The `describeLayout()` call returns a `DescribeLayoutResult` object containing top-level record type information about the passed-in `sObjectType`, as well as a mapping of record types to layouts. Your client application can traverse this object to retrieve detailed metadata about the layout.

**Tip:** If you have actions in the publisher enabled in your organization, you can retrieve the layout definition for a global publisher layout by using `Global` as the `sObjectType` and `null` as the `recordTypeId`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedView</td>
<td>DescribeLayoutFeedView[]</td>
<td>Feed view related layout data for a feed-based layout. This field is null for page layouts that are not feed-based.</td>
</tr>
<tr>
<td>layouts</td>
<td>DescribeLayout[]</td>
<td>Layout(s) associated with the specified <code>sObjectType</code>. In general, there is a one-to-one correspondence between layouts and objects. However, in some cases, an object will have multiple layouts in the context of a given user profile.</td>
</tr>
<tr>
<td>recordTypeMappings</td>
<td>RecordTypeMapping[]</td>
<td>Record type mapping(s) available for the user. The objects on a user profile can have multiple record types. All record types are returned, not just those available to the calling user. This allows the client application to display a layout appropriate for a given user profile. For example, suppose User A owns a record, and this record has record type X set. If User B tries to view this record, then the client application can display the record using the layout associated with this record type for User B's profile (even if the record type is not available for the user).</td>
</tr>
<tr>
<td>recordTypeSelectorRequired</td>
<td>boolean</td>
<td>If <code>true</code>, a record type selector page is required; if <code>false</code>, use the default record type.</td>
</tr>
</tbody>
</table>

DescribeLayout

Represents a specific layout for the specified `sObjectType`. Each `DescribeLayout` is referenced by its unique layout ID and consists of two types of views (represented in this object as arrays of `DescribeLayoutSection`):

- **Detail view**—Read-only display of the object. In a detail layout, certain pieces of information (such as address details) might be aggregated into a single `DescribeLayoutItem`.
- **Edit view**—Editable display of the object. In an edit layout, individual pieces of information (such as an address) will be broken up into separate fields.

An individual `DescribeLayout` consists of these fields:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buttonLayoutSection</td>
<td>DescribeLayoutButtonSection</td>
<td>Standard and custom button sections associated with the specified layout.</td>
</tr>
<tr>
<td>detailLayoutSections</td>
<td>DescribeLayoutSection[]</td>
<td>Layout section(s) for the detail view.</td>
</tr>
<tr>
<td>editLayoutSections</td>
<td>DescribeLayoutSection[]</td>
<td>Layout section(s) for the edit view.</td>
</tr>
</tbody>
</table>
### DescribeCalls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>highlightsPanelLayoutSection</td>
<td>DescribeLayoutSection[]</td>
<td>Layout section(s) for the highlights panel view.</td>
</tr>
<tr>
<td>multirowEditLayoutSections</td>
<td>DescribeLayoutSection[]</td>
<td>Layout section(s) for the multiline layout view. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>Unique ID of this layout. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>quickActionList</td>
<td>DescribeQuickActionListResult</td>
<td>List of actions associated with the specified layout. This field is available in API version 28.0 and later.</td>
</tr>
<tr>
<td>relatedContent</td>
<td>RelatedContent</td>
<td>Mobile Cards section associated with the specified layout. This field is available in API version 29.0 and later.</td>
</tr>
<tr>
<td>relatedLists</td>
<td>RelatedList[]</td>
<td>Related list(s) associated with the specified layout.</td>
</tr>
<tr>
<td>saveOptions</td>
<td>DescribeLayoutSaveOption[]</td>
<td>List of save options for the layout.</td>
</tr>
</tbody>
</table>

### DescribeLayoutButtonSection

Represents one of two sections of the layout containing either standard or custom buttons.

<table>
<thead>
<tr>

<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detailButtons</td>
<td>DescribeLayoutButton[]</td>
<td>Standard or custom button(s) associated with the specified button section.</td>
</tr>
</tbody>
</table>

### DescribeLayoutButton

Represents a single standard button, custom button, or custom link in a DescribeLayout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>behavior</td>
<td>WebLinkWindowType</td>
<td>What the button or link does when clicked, such as execute JavaScript or open its content source in a new window, for example. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>colors</td>
<td>DescribeColor[]</td>
<td>Array of color information for icons associated with this button or link. Each color is associated with a theme. This field is available in API version 32.0 and later.</td>
</tr>
<tr>
<td>content</td>
<td>string</td>
<td>The API name of the Visualforce page or s-control being delivered. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>contentSource</td>
<td>WebLinkType</td>
<td>The content source of the custom button or link. The contentSource for a standard button which hasn’t been overridden is null. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>custom</td>
<td>boolean</td>
<td>Required. Indicates whether this is a custom button or link (true) or not (false).</td>
</tr>
</tbody>
</table>
| encoding   | string  | Type of encoding assigned to the URL called by the button or link. Valid values are:  
  - UTF-8—Unicode (UTF-8)  
  - ISO-8859-1—General US & Western Europe (ISO-8859–1, ISO-LATIN-1)  
  - Shift_JIS—Japanese (Shift-JIS)  
  - x-SJIS_0213—Japanese (Shift-JIS_2004)  
  - ks_c_5601-1987—Korean (ks_c_5601-1987)  
  - Big5—Traditional Chinese (Big5)  
  - GB2312—Simplified Chinese (GB2312)  
  - Big5–HKSCS—Traditional Chinese Hong Kong (Big5–HKSCS)  
  This field is available in API version 31.0 and later. |
| height     | int     | The height (in pixels) when a button or link’s behavior field value is set to newWindow, sidebar, or noSidebar.  
  This field is available in API version 31.0 and later. |
| icons      | DescribeIcon[] | Array of icons for this button or link. Each icon is associated with a theme. This field is available in API version 29.0 and later. |
| label      | string  | Label for the button or link displayed in the Salesforce user interface.                                                                    |
| menubar    | boolean | Indicates whether the menu bar displays (true) or not (false) when a button or link’s behavior field value is set to newWindow.  
  This field is available in API version 31.0 and later. |
| name       | string  | API name of the button or link.                                                                                                             |
| overridden | boolean | Required. Indicates whether a standard button has been overridden (true) or not (false).                                                      
  This field is available in API version 31.0 and later. |
| resizeable | boolean | Indicates whether the new window is resizeable (true) or not (false) when a button or link’s behavior field value is set to newWindow.  
  This field is available in API version 31.0 and later. |
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scrollbars</td>
<td>boolean</td>
<td>Indicates whether scrollbars display (true) or not (false) when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>showsLocation</td>
<td>boolean</td>
<td>Indicates whether the address bar displays (true) or not (false) when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>showsStatus</td>
<td>boolean</td>
<td>Indicates whether the status bar displays (true) or not (false) when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>toolbar</td>
<td>boolean</td>
<td>Indicates whether the toolbars display (true) or not (false) when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>url</td>
<td>string</td>
<td>The URL called by the button or link. This field is null for standard buttons in a related list. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>width</td>
<td>int</td>
<td>The width (in pixels) when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>windowPosition</td>
<td>WebLinkPosition</td>
<td>Indicates the window position when a button or link's behavior field value is set to newWindow. This field is available in API version 31.0 and later.</td>
</tr>
</tbody>
</table>

**DescribeLayoutComponent**

Represents the smallest unit in a layout—a field or a separator. To reference a field for display, a client application uses the following notation to reference a field in the `describeSObjects()` call: `LayoutComponentfieldName`.

In API version 31.0 and later, DescribeLayoutComponent is extended with FieldLayoutComponent if both the LayoutComponentType value is Field, and the field being described is either the compound field Address or the compound field Person Name.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayLines</td>
<td>int</td>
<td>The number of vertical lines displayed for a field in the edit view. Applies to textarea and multi-select picklist fields.</td>
</tr>
<tr>
<td>tabOrder</td>
<td>int</td>
<td>Indicates the tab order for the item in the row.</td>
</tr>
</tbody>
</table>
### DescribeCalls

#### DescribeLayoutResult

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>LayoutComponentType</td>
<td>The <code>LayoutComponentType</code> for this <code>LayoutComponent</code>.</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>Value of this <code>LayoutComponent</code>. The name of the field if the <code>LayoutComponentType</code> value is <code>Field</code>. The API name of the canvas app if the <code>LayoutComponentType</code> value is <code>Canvas</code>.</td>
</tr>
</tbody>
</table>

### DescribeLayoutFeedFilter

Represents an individual feed filter option that you can use to filter the feed.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>string</td>
<td>The label of the filter.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The API name of the filter.</td>
</tr>
<tr>
<td>type</td>
<td>FeedLayoutFilterType enum</td>
<td>Standard feed filter types:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AllUpdates</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FeedItemType</td>
</tr>
</tbody>
</table>

### DescribeLayoutFeedView

Represents the layout of the feed view for a feed-based page layout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feedFilters</td>
<td>DescribeLayoutFeedFilter[]</td>
<td>Lists the feed filter options that are displayed with the feed.</td>
</tr>
</tbody>
</table>

### DescribeLayoutItem

Represents an individual item in a `DescribeLayoutRow`. A `DescribeLayoutItem` consists of a set of components (`DescribeLayoutComponent`), each of which is either a field or a separator. For most fields on a layout, there is only one component per layout item. However, in a display-only view, the `DescribeLayoutItem` might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate `DescribeLayoutItems`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>editable</td>
<td>boolean</td>
<td>Indicates whether this <code>DescribeLayoutItem</code> can be edited (<code>true</code>) or not (<code>false</code>). This field is available in API version 30.0 and below. It was replaced by the <code>editableForNew</code> and <code>editableForUpdate</code> fields in API version 31.0.</td>
</tr>
<tr>
<td>editableForNew</td>
<td>boolean</td>
<td>Indicates whether a new <code>DescribeLayoutItem</code> can be edited when creating a new record (<code>true</code>) or not (<code>false</code>). This field is available in API version 31.0 and later.</td>
</tr>
</tbody>
</table>
Describe Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>editableForUpdate</td>
<td>boolean</td>
<td>Indicates whether an existing DescribeLayoutItem can be edited when editing a record (true) or not (false). This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label text for this DescribeLayoutItem.</td>
</tr>
<tr>
<td>layoutComponents</td>
<td>DescribeLayoutComponent[]</td>
<td>DescribeLayoutComponent for this DescribeLayoutItem.</td>
</tr>
<tr>
<td>placeholder</td>
<td>boolean</td>
<td>Indicates whether this DescribeLayoutItem is a placeholder (true) or not (false). If true, then this DescribeLayoutItem is blank.</td>
</tr>
<tr>
<td>required</td>
<td>boolean</td>
<td>Indicates whether this DescribeLayoutItem is required (true) or not (false). This is useful to know if, for example, you wanted to render required fields in a contrasting color (such as red).</td>
</tr>
</tbody>
</table>

DescribeLayoutRow

Represents a row in a DescribeLayoutSection. A DescribeLayoutRow consists of one or more DescribeLayoutItem objects. For each DescribeLayoutRow, a DescribeLayoutItem refers either to a specific field or to an “empty” DescribeLayoutItem (a DescribeLayoutItem that contains no DescribeLayoutComponent objects). An empty DescribeLayoutItem can be returned when a given DescribeLayoutRow is sparse (for example, containing more fields on the right column than on the left column). Where there are gaps in the layout, an empty DescribeLayoutItem is returned as a placeholder.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutItems</td>
<td>DescribeLayoutItem[]</td>
<td>Refers to either a specific field or to an empty LayoutItem (a LayoutItem that contains no DescribeLayoutComponent objects).</td>
</tr>
<tr>
<td>numItems</td>
<td>int</td>
<td>Number of layoutItems. This information is redundant but, due to a bug in a popular SOAP toolkit, was required to avoid serialization problems.</td>
</tr>
</tbody>
</table>

DescribeLayoutSection

Represents a section of a DescribeLayout and consists of one or more columns and one or more rows (an array of DescribeLayoutRow).

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td>int</td>
<td>Number of columns in this DescribeLayoutSection.</td>
</tr>
<tr>
<td>heading</td>
<td>string</td>
<td>Heading text (label) for this DescribeLayoutSection.</td>
</tr>
<tr>
<td>layoutRows</td>
<td>DescribeLayoutRow[]</td>
<td>Array of one or more DescribeLayoutRow objects.</td>
</tr>
<tr>
<td>parentLayoutId</td>
<td>ID</td>
<td>The ID of the layout upon which this DescribeLayoutSection resides. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td>rows</td>
<td>int</td>
<td>Number of rows in this DescribeLayoutSection.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| tabOrder                 | string        | Indicates the tab order for the fields in the section in the edit view. Valid values are:  
|                          |               | • LeftToRight                                                              |
|                          |               | • TopToBottom                                                              |
|                          |               | This field is available in API version 31.0 and later.                     |
| useCollapsibleSection    | boolean       | Indicates whether this DescribeLayoutSection is a collapsible section, also known as a “twistie” (true), or not (false). |
| useHeading               | boolean       | Indicates whether to display the heading (true) or not (false).             |

**DescribeQuickActionListResult**

Represents a list of actions assigned to the page layout. Available in API version 28.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quickActionListItems</td>
<td>DescribeQuickActionListResult[]</td>
<td>Array of zero or more QuickActionListItemResult objects.</td>
</tr>
</tbody>
</table>

**DescribeQuickActionListItemResult**

Represents a QuickAction assigned to the actions list for a page layout. Available in API version 28.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colors</td>
<td>DescribeColor[]</td>
<td>Array of color information. Each color is associated with a theme. This field is available in API version 29.0 and later.</td>
</tr>
<tr>
<td>iconUrl</td>
<td>string</td>
<td>The URL of the icon associated with the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring '10.</td>
</tr>
<tr>
<td>icons</td>
<td>DescribeIcon[]</td>
<td>Array of icons for this action. Each icon is associated with a theme. This field is available in API version 29.0 and later.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The label of the action.</td>
</tr>
<tr>
<td>miniIconUrl</td>
<td>string</td>
<td>The URL of the mini icon associated with the action. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring '10.</td>
</tr>
<tr>
<td>quickActionName</td>
<td>string</td>
<td>The API name of the action.</td>
</tr>
<tr>
<td>targetSobjectType</td>
<td>string</td>
<td>The API name of the action’s target object.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>The QuickActionType of the action. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• VisualforcePage</td>
</tr>
</tbody>
</table>
CustomLinkComponent

When the LayoutComponentType value is CustomLink, this type contains information about a single custom link on the page layout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>customLink</td>
<td>DescribeLayoutButton</td>
<td>A single LayoutComponent object of type CustomLink.</td>
</tr>
</tbody>
</table>

FieldLayoutComponent

Extends the information returned by describeLayoutComponent. When the LayoutComponentType value is Field, and the field being described is an Address or Person Name field, FieldLayoutComponent includes information about the field’s components. When the LayoutComponentType value is Field, and the field being described is a compound field, such as Address or Person Name, FieldLayoutComponent includes information about its components.

Available in API version 31.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>components</td>
<td>describeLayoutComponent[]</td>
<td>Array of zero or more LayoutComponent objects of type Field.</td>
</tr>
<tr>
<td>fieldType</td>
<td>FieldType</td>
<td>The field type.</td>
</tr>
</tbody>
</table>

Sample Code for Usage of FieldLayoutComponent

```java
DescribeLayoutComponent layoutComponent = layoutComponents[n];
// Look for a component representing the BillingAddress field
if (layoutComponent.getType() == LayoutComponentType.Field.toString() &&
layoutComponent.getValue().equals("BillingAddress") {  
// Cast this component as a FieldLayoutComponent
DescribeLayoutComponent.FieldLayoutComponent addressFieldComponent =
(FieldLayoutComponent)layoutComponent;
// At this point you can access addressFieldComponent
FieldLayoutComponent-specific methods such as getComponents() or
getFieldType()
}
```

LayoutComponentType

Represents the type for a DescribeLayoutComponent. Contains one of these values:

- AnalyticsCloud—An Tableau CRM dashboard on the page layout. Available in API version 34.0 and later.
- Canvas—A canvas component on the page layout. This layout component type is available in API version 31.0 and later.
- CustomLink—A custom link on the page layout.
- EmptySpace—A blank space on the page layout.
- ExpandedLookup—An Expanded Lookup component in the Mobile Cards section of the page layout.
- Field—Field name. A mapping to the RecordTypeInfo field on the describeSObjectResult.
- ReportChart—A report chart on the page layout.
• **SControl**—Reserved for future use.
• **Separator**—Separator character, such as a semicolon (:) or slash (/).
• **VisualforcePage**—A Visualforce component on the page layout.

## PicklistForRecordType

Represents a single record type picklist in a **RecordTypeMapping**. The `picklistName` matches up with the `name` attribute of each field in the `fields` array in `describeSObjectResult`. The `picklistValues` are the set of acceptable values for the `recordType`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>picklistName</td>
<td>string</td>
<td>Name of the picklist.</td>
</tr>
<tr>
<td>picklistValues</td>
<td>PicklistEntry[]</td>
<td>Set of picklist values associated with the <code>recordTypeIds</code> in the <code>RecordTypeMapping</code>.</td>
</tr>
</tbody>
</table>

**Note:** If you retrieve `picklistValues`, the `PicklistEntry` value is null. If you need the `PicklistEntry` value, get it from the `PicklistEntry` object obtained from the `Field` object associated with the `DescribeSObjectResult`.

## RecordTypeMapping

Represents a single record type mapping in the `recordTypeMappings` field in a `DescribeLayoutResult` object. This object is a map of valid `recordTypeIds` to `layoutId`. For displaying a detail view, a client application uses this mapping to determine which layout is associated with the record type on the record. For displaying an edit view, a client application uses this mapping to determine which layout to use (and possibly to allow the user to choose between multiple record types); it will also determine the set of available picklist values.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>available</td>
<td>boolean</td>
<td>Indicates whether this record type is available (<code>true</code>) or not (<code>false</code>). Availability is used to display a list of available record types to the user when they are creating a new record.</td>
</tr>
<tr>
<td>defaultRecordTypeMapping</td>
<td>boolean</td>
<td>Indicates whether this is the default record type mapping (<code>true</code>) or not (<code>false</code>).</td>
</tr>
<tr>
<td>layoutId</td>
<td>ID</td>
<td>ID of the layout associated with this record type.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of this record type.</td>
</tr>
<tr>
<td>picklistsForRecordType</td>
<td>PicklistForRecordType[]</td>
<td>Record type picklist(s) mapped to the <code>recordTypeIds</code>.</td>
</tr>
<tr>
<td>recordTypeId</td>
<td>ID</td>
<td>ID of this record type.</td>
</tr>
</tbody>
</table>

**Note:** Some fields previously in this result have moved to `RecordTypeInfo` on page 3926.

## RelatedContent

Represents the Mobile Cards section in a `DescribeLayout`. Available in API version 29.0 and later.
### DescribeCalls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relatedContentItems</td>
<td>DescribeRelatedContentItem[]</td>
<td>An array of items in the Mobile Cards section of the page layout.</td>
</tr>
</tbody>
</table>

#### DescribeRelatedContentItem

Represents an individual item in the DescribeRelatedContentItem list. Available in API version 29.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>describeLayoutItem</td>
<td>DescribeLayoutItem</td>
<td>An individual layout item in the Mobile Cards section. Must be wrapped in a DescribeRelatedContentItem to be added to the Mobile Cards section.</td>
</tr>
</tbody>
</table>

#### RelatedList

Represents a single related list in a DescribeLayoutResult.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buttons</td>
<td>DescribeLayoutButton[]</td>
<td>Buttons associated with this related list. This field is available in API version 32.0 and later.</td>
</tr>
</tbody>
</table>
| columns | RelatedListColumn[] | Columns associated with this related list. You can pair this value with Field to achieve a number of useful tasks, including determining whether the field is:  
• A name field, in order to present a link to the detail  
• Sortable, (to allow the user to include it in an ORDER BY clause to sort the rows by the given column  
• A currency field, to include the currency symbol or code  
| custom | boolean | If true, this related list is custom.                                                                                                      |
| field | string | Name of the field on the related (associated) object that establishes the relationship with the associating object. For example, for the Contact related list on Account, the value is Account.Id. |
| label | string | Label for the related list, displayed in the Salesforce user interface.                                                                    |
| limitRows | int | Number of rows to display.                                                                                                               |
| name | string | Name of the ChildRelationship in the DescribeSObjectResult for the sObjectType which was provided as the argument to DescribeLayout. |
| sobject | string | Name of the sObjectType that is the row type for rows within this related list.                                                          |
RelatedListColumn

Represents a single field in a related list returned by DescribeLayoutResult.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>string</td>
<td>API name of the field. This value is always of the form <code>object_type.field_name</code>. For example, if <code>name</code> is <code>Contact.Account.Owner.Alias</code>, then this value is <code>User.Alias</code>.</td>
</tr>
<tr>
<td>fieldApiName</td>
<td>string</td>
<td>SOQL field syntax for the field in relation to the main sObject for the related list. This value is always of the form <code>object_type.field_name</code>. Unlike <code>name</code>, it doesn't return a value in the Translate Returned SOQL Results format.</td>
</tr>
<tr>
<td>format</td>
<td>string</td>
<td>Display in date or dateTime format.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label of the field.</td>
</tr>
<tr>
<td>lookupId</td>
<td>string</td>
<td>Optional SOQL field syntax to retrieve the lookup ID value for the main related list sObject. This value may be an expression that uses SOQL relationship query dot notation. For example, if the related list sObjectType is <code>Case</code> and the column display value is <code>Owner.Alias</code>, then the lookup ID value would be <code>Owner.Id</code>.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>SOQL field syntax for the field in relation to the main sObject for the related list. This value may be an expression that uses SOQL relationship query dot notation, or it may use the Translate Returned SOQL Results or convertCurrency() format. For example, if the related list sObjectType is <code>Case</code>, then the value might be <code>Owner.Alias</code> or it might be <code>toLabel(Case.Status)</code>.</td>
</tr>
</tbody>
</table>

RelatedListSort

Represents the sorting preference for objects in the related list.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td>string</td>
<td>Name of the field that is used to order the related objects.</td>
</tr>
<tr>
<td>ascending</td>
<td>boolean</td>
<td>If true, sort order is ascending. If false, descending.</td>
</tr>
</tbody>
</table>

Although in most cases there is only one RelatedListSort in the array, for some special standard related lists, there is more than one. If there is more than one, the RelatedListSorts are ordered according to how they should be included in a corresponding SOQL query, for example:

```
ORDER BY relatedListSort[0].getColumn() DIRECTION, relatedListSort[1].getColumn() DIRECTION
```
DescribeLayoutSaveOption

Represents the save options for the layout. Save options define behavior that occurs when objects are created or modified using the given layout. For example, for Cases and Leads, a "UseDefaultAssignmentRule" save option is exposed to control whether assignment rules are applied when Cases or Leads are created or edited.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultValue</td>
<td>boolean</td>
<td>Default value for the save option. Controls whether the save option defaults to enabled or not in the Salesforce user interface. For example, for the &quot;UseDefaultAssignmentRule&quot; save option, if defaultValue is true, then by default the system triggers the default assignment rules when an Account, Case, or Lead is created or edited. If false, then the default assignment rules aren't applied when an Account, Case, or Lead is created or edited, unless the user enables the save option in the Salesforce user interface.</td>
</tr>
<tr>
<td>isDisplayed</td>
<td>boolean</td>
<td>If true, then the save option is displayed in the layout. If false, then the save option isn't displayed in the layout.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label for the save option that is displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>API name for the save option.</td>
</tr>
<tr>
<td>restHeaderName</td>
<td>string</td>
<td>The corresponding REST API header for the save option.</td>
</tr>
<tr>
<td>soapHeaderName</td>
<td>string</td>
<td>The corresponding SOAP API header for the save option.</td>
</tr>
</tbody>
</table>

WebLinkPosition

Represents the window position for a new window opened upon clicking a DescribeLayoutButton. Applies only to custom buttons. Available in API version 31.0 and later. Contains one of these values:

- **fullScreen**—The new window opens in a full screen. If this option is selected, any width or height parameters set for the new window are ignored.
- **none**—No window position preference is set.
- **topLeft**—The new window opens, positioned at the top left of the screen.

WebLinkType

Represents the content being delivered by the custom button. Contains one of these values:
• javascript
• page—Visualforce page
• sControl
• url

WebLinkWindowType

Represents the behavior for a DescribeLayoutButton. Applies only to custom buttons. Available in API version 31.0 and later. Contains one of these values:

• newWindow—The custom button’s content opens in a new browser window.
• noSidebar—The custom button’s content displays in the existing browser window without a sidebar.
• onClickJavaScript—Valid only when the DescribeLayoutButton’s contentSource field value is javascript. Clicking the button or link executes JavaScript.
• replace—The custom button’s content displays in the existing browser window without a sidebar or header.
• sidebar—The custom button’s content displays in the existing browser window with a sidebar.

describePrimaryCompactLayouts()  

Retrieves metadata about the primary compact layout for each of the specified object types. Information returned is limited to 100 objects.

Syntax

DescribeCompactLayout[] primaryCompactLayouts =  
connection.describePrimaryCompactLayouts(string[] sObjectType)

Usage

Use this call to retrieve information about the primary compact layout for the given object types. This call returns metadata about a given primary compact layout. For more information about compact layouts, see the Salesforce Help.

Sample Code—Java

```java
public void testDescribePrimaryCompactLayoutsSample() {
    try {
        String[] objectsToDescribe = new String[] {"Account","Lead"};
        DescribeCompactLayout[] primaryCompactLayouts =
            connection.describePrimaryCompactLayouts(objectsToDescribe);

        for (int i = 0; i < primaryCompactLayouts.length; i++) {
            DescribeCompactLayout cLayout = primaryCompactLayouts[i];
            System.out.println(" There is a compact layout with name: " + cLayout.getName());

            // Write the objectType
            System.out.println(" This compact layout is the primary compact layout for: " +
```
cLayout.getObjectType();

DescribeLayoutItem[] fieldItems = cLayout.getFieldItems();
System.out.println("There are " + fieldItems.length + " fields in this compact layout.");

// Write field items
for (int j = 0; j < fieldItems.length; j++) {
    System.out.println(j + " This compact layout has a field with name: " + fieldItems[j].getLabel());
}

DescribeLayoutItem[] imageItems = cLayout.getImageItems();
System.out.println("There are " + imageItems.length + " image fields in this compact layout.");

// Write the image items
for (int j = 0; j < imageItems.length; j++) {
    System.out.println(j + " This compact layout has an image field with name: " + imageItems[j].getLabel());
}

DescribeLayoutButton[] actions = cLayout.getActions();
System.out.println("There are " + actions.length + " buttons in this compact layout.");

// Write the action buttons
for (int j = 0; j < actions.length; j++) {
    System.out.println(j + " This compact layout has a button with name: " + actions[j].getLabel());
}
}

} catch (ConnectionException ce) {
    ce.printStackTrace();
}

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectTypes</td>
<td>string[]</td>
<td>An array of one or more objects. The specified values must be valid objects for your organization.</td>
</tr>
</tbody>
</table>

Response

DescribeCompactLayout

Faults

InvalidSObjectFault
describeQuickActions()

Retrieves details about specified actions.

Syntax

```java
DescribeQuickActionResult[] = connection.describeQuickActions(string[] quickActionNames);
```

Usage

Use the `describeQuickActions()` call to retrieve details for specified actions. In API version 28.0, the `describeQuickActions()` call takes the action name in the form of `ParentEntity.ActionName`. In API version 29.0 and greater, it takes the action name in the form of `ContextEntity.ActionName`. Returns an array of DescribeQuickActionResult. You might first call `describeAvailableQuickActions()` for a list of actions available for a specified context and then use `describeQuickActions()` to obtain details about specific actions.

Note: In API version 46.0 and later, the `apiName` for a global quick action can include the prefix `Global`. In a `describeQuickActions()` request body, the request body also accepts global quick action API names without the prefix.

Sample—Java

This sample retrieves and displays publisher action details for a create action on the Account object.

```java
public void example() throws Exception {
    DescribeQuickActionResult[] result =
        conn.describeQuickActions(new String[] { "Account.QuickCreateContact", "Account.QuickCreateTask" });
    for(DescribeQuickActionResult r : result) {
        System.out.println("Target Object Field: " + r.getTargetField() );
        System.out.println("Target Object Field's default Value: " + r.getDefaultValue() );
        System.out.println("Action name: " + r.getName());
        System.out.println("Action label: " + r.getLabel());
        System.out.println("ParentOrContext object: " + r.getSourceSobjectType());
        System.out.println("Target object: " + r.getTargetSobjectType());
        System.out.println("Target object record type: " + r.getTargetRecordTypeId());
        System.out.println("Relationship field: " + r.getTargetParentField());
        System.out.println("Quick action type: " + r.getType());
        System.out.println("VF page name for custom actions: " + r.getVisualforcePageName());
        System.out.println("Icon name: " + r.getIconName());
        System.out.println("Icon URL: " + r.getIconUrl());
    }
}
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quickActions</td>
<td>string[]</td>
<td>An array of quick actions to be retrieved.</td>
</tr>
</tbody>
</table>

Response

DescribeQuickActionResult

The describeQuickActions() call returns an array of DescribeQuickActionResult objects. Each DescribeQuickActionResult object represents a quick action for a specified object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionEnumOrId</td>
<td>string</td>
<td>The unique ID for the action. If the action doesn’t have an ID, its API name is used. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td>canvasApplicationName</td>
<td>string</td>
<td>The name of your Canvas application, if you use it.</td>
</tr>
<tr>
<td>colors</td>
<td>DescribeColor[]</td>
<td>Array of color information. Each color is associated with a theme. This field is available in API version 29.0 and later.</td>
</tr>
<tr>
<td>defaultValues</td>
<td>DescribeQuickActionDefaultValue[]</td>
<td>The action’s default values.</td>
</tr>
<tr>
<td>height</td>
<td>int</td>
<td>The height in pixels of the action pane.</td>
</tr>
<tr>
<td>iconName</td>
<td>string</td>
<td>Name of icon used for the action. If a custom icon is not used, this value will not be set.</td>
</tr>
<tr>
<td>iconUrl</td>
<td>string</td>
<td>URL of icon used for the action. This icon URL corresponds to the 32x32 icon used for the current Salesforce theme, introduced in Spring ‘10, or the custom icon, if there is one.</td>
</tr>
<tr>
<td>icons</td>
<td>DescribeIcon[]</td>
<td>Array of icons. Each icon is associated with a theme. If no custom icon was associated with the quick action and the quick action creates a specific object, the icons will correspond to the icons used for the created object.</td>
</tr>
</tbody>
</table>
### DescribeQuickActionResult

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>string</td>
<td>Label of the action.</td>
</tr>
<tr>
<td>layout</td>
<td>DescribeLayoutSection</td>
<td>The section of the layout where the action resides.</td>
</tr>
<tr>
<td>lightningComponentBundleId</td>
<td>ID</td>
<td>If type is LightningComponent, the ID of the Lightning component bundle called by the action. This field is available in API version 38.0 and later.</td>
</tr>
<tr>
<td>lightningComponentBundleName</td>
<td>string</td>
<td>If type is LightningComponent, the name of the Lightning component bundle called by the action. This field is available in API version 38.0 and later.</td>
</tr>
<tr>
<td>miniIconUrl</td>
<td>string</td>
<td>The icon’s URL. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring ’10, or the custom icon, if there is one.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the action.</td>
</tr>
<tr>
<td>contextSobjectType</td>
<td>string</td>
<td>The object used for the action. Named sourceSobjectType in version 29.0 and earlier.</td>
</tr>
<tr>
<td>showQuickActionVfHeader</td>
<td>boolean</td>
<td>Whether or not the Visualforce quick action header and footer should be shown. If set to false, then both the header containing the quick action title and the footer containing the Save and Cancel buttons aren’t displayed.</td>
</tr>
<tr>
<td>targetParentField</td>
<td>string</td>
<td>The parent object type of the action. Links the target object to the parent object. For example, use Account if the target object is Contact and the parent object is Account.</td>
</tr>
<tr>
<td>targetRecordTypeId</td>
<td>ID</td>
<td>The record type of the target record.</td>
</tr>
<tr>
<td>targetSobjectType</td>
<td>string</td>
<td>The action’s target object type.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>The action’s type. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Canvas</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Create</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Flow (This value is available as a Beta in API version 41.0 and later)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LightningComponent. (This value is available in API version 38.0 and later.)</td>
</tr>
</tbody>
</table>
Describe Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visualforcePageName</td>
<td>string</td>
<td>If <code>type</code> is Visualforce, the page name of the associated page for the action.</td>
</tr>
<tr>
<td>visualforcePageUrl</td>
<td>string</td>
<td>If <code>type</code> is Visualforce, the URL of the associated page for the action.</td>
</tr>
<tr>
<td>width</td>
<td>int</td>
<td>If a custom action is created, this is the width in pixels of the action pane.</td>
</tr>
</tbody>
</table>

DescribeQuickActionDefaultValue

Represents the default values of fields to use in default layouts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultValue</td>
<td>string</td>
<td>The value of the auto-populated default action.</td>
</tr>
<tr>
<td>field</td>
<td>string</td>
<td>The field name of the action.</td>
</tr>
</tbody>
</table>

DescribeLayoutSection

Represents a section of a DescribeLayout and consists of one or more columns and one or more rows (an array of DescribeLayoutRow).

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td>int</td>
<td>Number of columns in this DescribeLayoutSection.</td>
</tr>
<tr>
<td>heading</td>
<td>string</td>
<td>Heading text (label) for this DescribeLayoutSection.</td>
</tr>
<tr>
<td>layoutRows</td>
<td>DescribeLayoutRow[]</td>
<td>Array of one or more DescribeLayoutRow objects.</td>
</tr>
<tr>
<td>parentLayoutId</td>
<td>ID</td>
<td>The ID of the layout upon which this DescribeLayoutSection resides. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td>rows</td>
<td>int</td>
<td>Number of rows in this DescribeLayoutSection.</td>
</tr>
<tr>
<td>tabOrder</td>
<td>string</td>
<td>Indicates the tab order for the fields in the section in the edit view. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- LeftToRight</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- TopToBottom</td>
</tr>
</tbody>
</table>
### useCollapsibleSection

**Type:** boolean

Indicates whether this DescribeLayoutSection is a collapsible section, also known as a “twistie” (true), or not (false).

This field is available in API version 31.0 and later.

### useHeading

**Type:** boolean

Indicates whether to display the heading (true) or not (false).

### DescribeLayoutRow

Represents a row in a DescribeLayoutSection. A DescribeLayoutRow consists of one or more DescribeLayoutItem objects. For each DescribeLayoutRow, a DescribeLayoutItem refers either to a specific field or to an “empty” DescribeLayoutItem (a DescribeLayoutItem that contains no DescribeLayoutComponent objects). An empty DescribeLayoutItem can be returned when a given DescribeLayoutRow is sparse (for example, containing more fields on the right column than on the left column). Where there are gaps in the layout, an empty DescribeLayoutItem is returned as a placeholder.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutItems</td>
<td>DescribeLayoutItem[]</td>
<td>Refers to either a specific field or to an empty LayoutItem (a LayoutItem that contains no DescribeLayoutComponent objects).</td>
</tr>
<tr>
<td>numItems</td>
<td>int</td>
<td>Number of layoutItems. This information is redundant but, due to a bug in a popular SOAP toolkit, was required to avoid serialization problems.</td>
</tr>
</tbody>
</table>

### DescribeLayoutItem

Represents an individual item in a DescribeLayoutRow. A DescribeLayoutItem consists of a set of components (DescribeLayoutComponent), each of which is either a field or a separator. For most fields on a layout, there is only one component per layout item. However, in a display-only view, the DescribeLayoutItem might be a composite of the individual fields (for example, an address can consist of street, city, state, country, and postal code data). On the corresponding edit view, each component of the address field would be split up into separate DescribeLayoutItems.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>editable</td>
<td>boolean</td>
<td>Indicates whether this DescribeLayoutItem can be edited (true) or not (false). This field is available in API version 30.0 and below. It was replaced by the editableForNew and editableForUpdate fields in API version 31.0.</td>
</tr>
<tr>
<td>editableForNew</td>
<td>boolean</td>
<td>Indicates whether a new DescribeLayoutItem can be edited when creating a new record (true) or not (false). This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>editableForUpdate</td>
<td>boolean</td>
<td>Indicates whether an existing DescribeLayoutItem can be edited when editing a record (true) or not (false). This field is available in API version 31.0 and later.</td>
</tr>
</tbody>
</table>
**DescribeCalls**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>string</td>
<td>Label text for this DescribeLayoutItem.</td>
</tr>
<tr>
<td>layoutComponents</td>
<td>DescribeLayoutComponent[]</td>
<td>DescribeLayoutComponent for this DescribeLayoutItem.</td>
</tr>
<tr>
<td>placeholder</td>
<td>boolean</td>
<td>Indicates whether this DescribeLayoutItem is a placeholder (true) or not (false). If true, then this DescribeLayoutItem is blank.</td>
</tr>
<tr>
<td>required</td>
<td>boolean</td>
<td>Indicates whether this DescribeLayoutItem is required (true) or not (false). This is useful to know if, for example, you wanted to render required fields in a contrasting color (such as red).</td>
</tr>
</tbody>
</table>

**DescribeLayoutComponent**

Represents the smallest unit in a layout—a field or a separator. To reference a field for display, a client application uses the following notation to reference a field in the `describeSObjects()` call: `LayoutComponent.fieldName`.

In API version 31.0 and later, DescribeLayoutComponent is extended with FieldLayoutComponent if both the DescribeLayoutComponent value is `Field`, and the field being described is either the compound field `Address` or the compound field `Person Name`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayLines</td>
<td>int</td>
<td>The number of vertical lines displayed for a field in the edit view. Applies to textarea and multi-select picklist fields.</td>
</tr>
<tr>
<td>tabOrder</td>
<td>int</td>
<td>Indicates the tab order for the item in the row.</td>
</tr>
<tr>
<td>type</td>
<td>LayoutComponentType</td>
<td>The LayoutComponentType for this LayoutComponent.</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>Value of this LayoutComponent. The name of the field if the LayoutComponentType value is <code>Field</code>. The API name of the canvas app if the LayoutComponentType value is <code>Canvas</code>.</td>
</tr>
</tbody>
</table>

**LayoutComponentType**

Represents the type for a DescribeLayoutComponent. Contains one of these values:

- AnalyticsCloud—An Tableau CRM dashboard on the page layout. Available in API version 34.0 and later.
- Canvas—A canvas component on the page layout. This layout component type is available in API version 31.0 and later.
- CustomLink—A custom link on the page layout.
- EmptySpace—A blank space on the page layout.
- ExpandedLookup—An Expanded Lookup component in the Mobile Cards section of the page layout.
- Field—Field name. A mapping to the name field on the describeObjectResult.
- ReportChart—A report chart on the page layout.
- SControl—Reserved for future use.
- Separator—Separator character, such as a semicolon (:) or slash (/).
- VisualforcePage—A Visualforce component on the page layout.
describeSearchScopeOrder()

Retrieves an ordered list of the objects in a user’s default global search scope.

Syntax

```java
DescribeSearchScopeOrderResult[] describeSearchScopeOrderResults = connection.describeSearchScopeOrder();
```

Usage

Use `describeSearchScopeOrder()` to retrieve an ordered list of objects in the default global search scope of a logged-in user. Global search keeps track of which objects the user interacts with and how often and arranges the search results accordingly. Objects used most frequently appear at the top of the list. The returned list reflects the object order in the user’s default search scope, including any pinned objects on the user’s search results page. This call is useful if you want to implement a custom search results page using the optimized global search scope.

ℹ️ **Note:** You must enable Chatter to enable global search.

Sample Code—Java

This sample shows how to retrieve the global search scope for a user and then iteratively display the name of each object in the scope.

```java
public void describeSearchScopeOrderSample() {
    try {
        //Get the order of objects in search smart scope for the logged-in user
        DescribeSearchScopeOrderResult[] describeSearchScopeOrderResults = connection.describeSearchScopeOrder();
        //Iterate through the results and display the name of each object
        for (int i = 0; i < describeSearchScopeOrderResults.length; i++) {
            System.out.println(describeSearchScopeOrderResults[i].getName());
        }
    }
    catch(Exception ce) {
        ce.printStackTrace();
    }
}
```

Arguments

None.

Response

An array of `DescribeSearchScopeOrderResult` objects
Fault

UnexpectedErrorFault

SEE ALSO:

API Call Basics

DescribeSearchScopeOrderResult

The `describeSearchScopeOrder()` call returns an array of `DescribeSearchScopeOrderResult` objects. Each `DescribeSearchScopeOrderResult` object represents an object in the user’s global search scope. The list reflects the order of the objects in the user’s scope, including any pinned objects. The `DescribeSearchScopeOrderResult` object has the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyPrefix</td>
<td>string</td>
<td>Three-character prefix code in the object ID. Object IDs are prefixed with three-character codes that specify the type of the object. For example, Account objects have a prefix of 001 and Opportunity objects have a prefix of 006. Note that a key prefix can sometimes be shared by multiple objects so it does not always uniquely identify an object.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the object. English only.</td>
</tr>
</tbody>
</table>

`describeSearchLayouts()`

Retrieves the search result layout configuration for one or more objects.

**Syntax**

```java
DescribeSearchLayoutResult[] = binding.describeSearchLayouts(string sObjectType[]);
```

**Usage**

Use `describeSearchLayouts()` to retrieve search layout information for one or more objects. This is handy when you want to create a custom search results page with the same layout settings as in Salesforce.

**Sample**

This sample shows how to retrieve the search result layout information for a list of objects.

```java
public void describeSearchLayoutSample(String[] sObjectTypes) {
    try {
        // Get the search layout of Account and Group
        DescribeSearchLayoutResult[] searchLayoutResults =
            connection.describeSearchLayouts(sObjectTypes);
        // Iterate through the results and display the label of each column
```
for (int i = 0; i < sObjectTypes.length; i += 1) {
    String sObjectType = sObjectTypes[i];
    DescribeSearchLayoutResult result = searchLayoutResults[i];
    System.out.println("Top label for search results for " + sObjectType + " is " + result.getLabel() + " and should display " + result.getLimitRows() + " rows");
    System.out.println("Column labels for search results for " + sObjectType + " are: ");
    for (DescribeColumn column : result.getSearchColumns()) {
        System.out.println(column.getLabel());
    }
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sObjectType</td>
<td>string[]</td>
<td>The list of objects you want to obtain search result layout configuration for. For example, if the object is a person account, specify Account, or if it is a person contact, specify Contact. The specified values must be valid objects in your organization. For a complete list of standard objects, see Standard Objects.</td>
</tr>
</tbody>
</table>

Response

DescribeSearchLayoutResult

Faults

InvalidSObjectFault
UnexpectedErrorFault

DescribeSearchLayoutResult

The describeSearchLayouts() on page 3904 call returns an array of DescribeSearchLayoutResult objects. Each DescribeSearchLayoutResult object represents the search layout configuration for each object queried for. The DescribeSearchLayoutResult object has the following properties.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>string</td>
<td>The browser title used for the search results page.</td>
</tr>
<tr>
<td>limitRows</td>
<td>int</td>
<td>The maximum number of rows to be displayed in the first page of search results. This number can be changed by the administrator.</td>
</tr>
</tbody>
</table>
Describe Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchColumns</td>
<td>DescribeColumn</td>
<td>The columns associated with the search results for this object.</td>
</tr>
</tbody>
</table>

**DescribeColumn**

Represents the columns in the search layout configuration for each DescribeSearchLayoutResult object returned by the `describeSearchLayouts()` call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>string</td>
<td>Field reference in relation to the object it belongs to. For example, &quot;Lead.Phone.&quot;</td>
</tr>
<tr>
<td>format</td>
<td>string</td>
<td>Field data format. For example, &quot;date&quot;. This value can be null.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Display text for this field in the user interface. For example, &quot;Company Phone&quot; or just &quot;Phone.&quot;</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Field name. Use this in your SOQL query or code. For example, &quot;Name.&quot;</td>
</tr>
</tbody>
</table>

describeSObject()

Describes metadata (field list and object properties) for the specified object.

**Note:** describeSObjects() supersedes describeSObject(). Use describeSObjects() instead of describeSObject().

**Syntax**

```
DescribeSObjectResult = connection.describeSObject(string sObjectType);
```

**Usage**

Use `describeSObject()` to obtain metadata for a given object. You can first call `describeGlobal()` to retrieve a list of all objects for your organization, then iterate through the list and use `describeSObject()` to obtain metadata about individual objects.

Your client application must be logged in with sufficient access rights to retrieve metadata about your organization's data. For more information, see Factors that Affect Data Access.

**Sample Code—Java**

This sample calls `describeSObject()` to perform describes on the Account sObject. It retrieves some properties of the sObject describe result, such as the sObject name, label, and fields. It then iterates through the fields and gets the field properties. For picklist
fields, it gets the picklist values and for reference fields, it gets the referenced object names. The sample writes the retrieved sObject and field properties to the console.

```java
public void describeSObjectSample() {
    try {
        // Make the describe call
        DescribeSObjectResult describeSObjectResult =
            connection.describeSObject("Account");

        // Get sObject metadata
        if (describeSObjectResult != null) {
            System.out.println("sObject name: " +
                describeSObjectResult.getName());
            if (describeSObjectResult.isCreateable())
                System.out.println("Createable");

            // Get the fields
            Field[] fields = describeSObjectResult.getFields();
            System.out.println("Has " + fields.length + " fields");

            // Iterate through each field and gets its properties
            for (int i = 0; i < fields.length; i++) {
                Field field = fields[i];
                System.out.println("Field name: " + field.getName());
                System.out.println("Field label: " + field.getLabel());

                // If this is a picklist field, show the picklist values
                if (field.getType().equals(FieldType.picklist)) {
                    PicklistEntry[] picklistValues =
                        field.getPicklistValues();
                    if (picklistValues != null) {
                        System.out.println("Picklist values: ");
                        for (int j = 0; j < picklistValues.length; j++) {
                            if (picklistValues[j].getLabel() != null) {
                                System.out.println("\tItem: " +
                                    picklistValues[j].getLabel());
                            }
                        }
                    }
                }

                // If a reference field, show what it references
                if (field.getType().equals(FieldType.reference)) {
                    System.out.println("Field references the " +
                        "following objects: ");
                    String[] referenceTos = field.getReferenceTo();
                    for (int j = 0; j < referenceTos.length; j++) {
                        System.out.println("\t" + referenceTos[j]);
                    }
                }
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Sample Code—C#

This sample calls `describeSObject()` to perform describes on the Account sObject. It retrieves some properties of the sObject describe result, such as the sObject name, label, and fields. It then iterates through the fields and gets the field properties. For picklist fields, it gets the picklist values and for reference fields, it gets the referenced object names. The sample writes the retrieved sObject and field properties to the console.

```csharp
public void describeSObjectSample() {
    try {
        // Make the describe call
        DescribeSObjectResult describeSObjectResult =
            binding.describeSObject("Account");

        // Get sObject metadata
        if (describeSObjectResult != null) {
            Console.WriteLine("sObject name: " +
                describeSObjectResult.name);
            if (describeSObjectResult.createable) {
                Console.WriteLine("Createable");
            }

        // Get the fields
        Field[] fields = describeSObjectResult.fields;
        Console.WriteLine("Has " + fields.Length + " fields");

        // Iterate through each field and gets its properties
        for (int i = 0; i < fields.Length; i++) {
            Field field = fields[i];
            Console.WriteLine("Field name: " + field.name);
            Console.WriteLine("Field label: " + field.label);

            // If this is a picklist field, show the picklist values
            if (field.type.Equals(fieldType.picklist)) {
                PicklistEntry[] picklistValues =
                    field.picklistValues;
                if (picklistValues != null) {
                    Console.WriteLine("Picklist values: ");
                    for (int j = 0; j < picklistValues.Length; j++) {
                        if (picklistValues[j].label != null) {
                            Console.WriteLine("\tItem: " +
                                picklistValues[j].label);
                        }
                    }
                }
            }

            // If a reference field, show what it references
            if (field.type.Equals(fieldType.reference)) {
                Console.WriteLine("Field references the " +
                    "following objects:");
                String[] referenceTos = field.referenceTo;

        }
    }
}
```
for (int j = 0; j < referenceTos.Length; j++) {
    Console.WriteLine("\t" + referenceTos[j]);
}
}
}
}
}
}
} catch (SoapException e) {
    Console.WriteLine("An unexpected error has occurred: " + 
    e.Message + "\n" + e.StackTrace);
}
}

describeSObjectResult

The describeSObject() call returns a DescribeSObjectResult object.

Note: describeSObjects() supersedes describeSObject(). Use describeSObjects() instead of describeSObject().
describeSObjects()

An array-based version of describeSObject(); describes metadata (field list and object properties) for the specified object or array of objects.

Note: Use this call instead of describeSObject().

Syntax

```
DescribeSObjectResult [] = connection.describeSObjects(string sObjectType[]);
```

Usage

Use describeSObjects() to obtain metadata for a given object or array of objects. You can first call describeGlobal() to retrieve a list of all objects for your organization, then iterate through the list and use describeSObjects() to obtain metadata about individual objects. The describeSObjects() call is limited to a maximum of 100 objects returned.

Your client application must be logged in with sufficient access rights to retrieve metadata about your organization’s data. For more information, see Factors that Affect Data Access.

In organizations where person accounts are enabled, this call shows Accounts as not createable if the profile does not have access to any business account record types.

Sample Code—Java

This sample calls describeSObjects() to perform describes on account, contact, and lead. It iterates through the sObject describe results, gets the properties and fields for each sObject in the result, and writes them to the console. For picklist fields, it writes the picklist values. For reference fields, it writes the referenced object names.

```java
public void describeSObjectsSample()
{
    try {
        // Call describeSObjectResults and pass it an array with
        // the names of the objects to describe.
        DescribeSObjectResult[] describeSObjectResults =
            connection.describeSObjects(
                new String[] { "account", "contact", "lead" });

        // Iterate through the list of describe SObject results
        for (int i=0; i < describeSObjectResults.length; i++)
        {
            DescribeSObjectResult desObj = describeSObjectResults[i];
            // Get the name of the SObject
            String objectName = desObj.getName();
            System.out.println("SObject name: "+objectName);

            // For each described SObject, get the fields
            Field[] fields = desObj.getFields();

            // Get some other properties
            if (desObj.getActivateable()) System.out.println("Activateable");
        }
    } catch (Exception e) {
        e.printStackTrace();
    }
}
```
// Iterate through the fields to get properties for each field
for (int j = 0; j < fields.length; j++)
{
    Field field = fields[j];
    System.out.println("\tField: " + field.getName());
    System.out.println("\t\tLabel: " + field.getLabel());
    if (field.isCustom())
        System.out.println("\t\tThis is a custom field.");
    System.out.println("\t\tType: " + field.getType());
    if (field.getLength() > 0)
        System.out.println("\t\tLength: " + field.getLength());
    if (field.getPrecision() > 0)
        System.out.println("\t\tPrecision: " + field.getPrecision());

    // Determine whether this is a picklist field
    if (field.getType() == FieldType.picklist)
    {
        // Determine whether there are picklist values
        PicklistEntry[] picklistValues = field.getPicklistValues();
        if (picklistValues != null && picklistValues[0] != null)
        {
            System.out.println("\t\tPicklist values = ");
            for (int k = 0; k < picklistValues.length; k++)
            {
                System.out.println("\t\t\tItem: " + picklistValues[k].getLabel());
            }
        }
    }

    // Determine whether this is a reference field
    if (field.getType() == FieldType.reference)
    {
        // Determine whether this field refers to another object
        String[] referenceTos = field.getReferenceTo();
        if (referenceTos != null && referenceTos[0] != null)
        {
            System.out.println("\t\tField references the following objects:");
            for (int k = 0; k < referenceTos.length; k++)
            {
                System.out.println("\t\t\t" + referenceTos[k]);
            }
        }
    }
}

} catch (ConnectionException ce) {
    ce.printStackTrace();
}
Sample Code—C#

This sample calls `describeSObjects()` to perform describes on account, contact, and lead. It iterates through the sObject describe results, gets the properties and fields for each sObject in the result, and writes them to the console. For picklist fields, it writes the picklist values. For reference fields, it writes the referenced object names.

```csharp
public void describeSObjectsSample()
{
    try
    {
        // Call describeSObjectResults and pass it an array with
        // the names of the objects to describe.
        DescribeSObjectResult[] describeSObjectResults =
            binding.describeSObjects(
                new string[] { "account", "contact", "lead" });

        // Iterate through the list of describe sObject results
        foreach (DescribeSObjectResult describeSObjectResult in describeSObjectResults)
        {
            // Get the name of the sObject
            String objectName = describeSObjectResult.name;
            Console.WriteLine("sObject name: " + objectName);

            // For each described sObject, get the fields
            Field[] fields = describeSObjectResult.fields;

            // Get some other properties
            if (describeSObjectResult.activateable) Console.WriteLine("Activateable");

            // Iterate through the fields to get properties for each field
            foreach (Field field in fields)
            {
                Console.WriteLine("Field: " + field.name);
                Console.WriteLine("Label: " + field.label);
                if (field.custom)
                    Console.WriteLine("This is a custom field.");
                Console.WriteLine("Type: " + field.type);
                if (field.length > 0)
                    Console.WriteLine("Length: " + field.length);
                if (field.precision > 0)
                    Console.WriteLine("Precision: " + field.precision);

                // Determine whether this is a picklist field
                if (field.type == fieldType.picklist)
                {
                    // Determine whether there are picklist values

**Important:** Where possible, we changed noninclusive terms to align with our company value of Equality. Because changing terms in our code can break current implementations, we maintained this object’s name.

The `describeSObjects()` call returns an array of `DescribeSObjectResult` objects. Each object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionOverrides</td>
<td><code>ActionOverride[]</code></td>
<td>An array of action overrides. Action overrides replace the URLs specified in the urlDetail, urlEdit and urlNew fields. This field is available in API version 32.0 and later.</td>
</tr>
<tr>
<td>activateable</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>actionOverrides</td>
<td><code>ActionOverride[]</code></td>
<td>An array of action overrides. Action overrides replace the URLs specified in the urlDetail, urlEdit and urlNew fields. This field is available in API version 32.0 and later.</td>
</tr>
<tr>
<td>associateEntityTyp</td>
<td>string</td>
<td>If the object is associated with a parent object, the type of association it has to its parent, such as History. Otherwise, its value is null. Available in API version 50.0 and later.</td>
</tr>
<tr>
<td>associateParentEnti</td>
<td>string</td>
<td>If the object is associated with a parent object, the parent object it’s associated with. Otherwise, its value is null. Available in API version 50.0 and later.</td>
</tr>
<tr>
<td>childRelationships</td>
<td><code>ChildRelationship[]</code></td>
<td>An array of child relationships, which is the name of the sObject that has a foreign key to the sObject being described.</td>
</tr>
<tr>
<td>compactLayoutable</td>
<td>boolean</td>
<td>Indicates that the object can be used in <code>describeCompactLayouts()</code></td>
</tr>
<tr>
<td>createable</td>
<td>boolean</td>
<td>Indicates whether the object can be created via the <code>create()</code> call (true) or not (false).</td>
</tr>
<tr>
<td>custom</td>
<td>boolean</td>
<td>Indicates whether the object is a custom object (true) or not (false).</td>

<tr>
<td>keyPrefix</td>
<td>string</td>
<td>Three-character prefix code in the object ID. Object IDs are prefixed with three-character codes that specify the type of the object. For example, Account objects have a prefix of 001 and Opportunity objects have a prefix of 006. Note that a key prefix can sometimes be shared by multiple objects so it does not always uniquely identify an object. Use the value of this field to determine the object type of a parent in those cases where the child may have more than one object type as parent (polymorphic). For example, you may need to obtain the keyPrefix value for the parent of a Task or Event.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Label text for a tab or field renamed in the user interface, if applicable, or the object name, if not. For example, an organization representing a medical vertical might rename Account to Patient. Tabs and fields can be renamed in the Salesforce user interface. See the Salesforce online help for more information.</td>
</tr>
<tr>
<td>labelPlural</td>
<td>string</td>
<td>Label text for an object that represents the plural version of an object name, for example, “Accounts.”</td>
</tr>
<tr>
<td>layoutable</td>
<td>boolean</td>
<td>Indicates whether the object supports the describeLayout() call (true) or not (false).</td>
</tr>
<tr>
<td>mergeable</td>
<td>boolean</td>
<td>Indicates whether the object can be merged with other objects of its type (true) or not (false). true for leads, contacts, and accounts.</td>
</tr>
<tr>
<td>mruEnabled</td>
<td>boolean</td>
<td>Indicates whether Most Recently Used (MRU) list functionality is enabled for the object (true) or not (false).</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the object. This is the same string that was passed in as the sObjectType parameter.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>namedLayoutInfos</td>
<td>NamedLayoutInfo[]</td>
<td>The specific named layouts that are available for the objects other than the default layout.</td>
</tr>
<tr>
<td>networkScopeFieldName</td>
<td>string</td>
<td>The API name of the networkScopeField that scopes the entity to an Experience Cloud site. For most entities, the value of this property is null.</td>
</tr>
<tr>
<td>queryable</td>
<td>boolean</td>
<td>Indicates whether the object can be queried via the query() call (true) or not (false).</td>
</tr>
<tr>
<td>recordTypeInfos</td>
<td>[]</td>
<td>An array of the record types supported by this object. The user need not have access to all the returned record types to see them here.</td>

<tr>
<td>updateable</td>
<td>boolean</td>
<td>Indicates whether the object can be updated via the update() call (true) or not (false).</td>
</tr>
<tr>
<td>urlDetail</td>
<td>string</td>
<td>URL to the read-only detail page for this object. Compare with urlEdit, which is read-write. Client applications can use this URL to redirect to, or access, the Salesforce user interface for standard and custom objects. To provide flexibility and allow for future enhancements, returned urlDetail values are dynamic. To ensure that client applications are forward compatible, it is recommended that they use this capability where possible. Note that, for objects for which a stable URL is not available, this field is returned empty.</td>
</tr>
<tr>
<td>urlEdit</td>
<td>string</td>
<td>URL to the edit page for this object. For example, the urlEdit field for the Account object returns <a href="https://yourInstance.salesforce.com/%7BID%7D/e">https://yourInstance.salesforce.com/{ID}/e</a>. Substituting the {ID} field for the current object ID will return the edit page for that specific account in the Salesforce user interface. Compare with urlDetail, which is read-only. Client applications can use this URL to redirect to, or access, the Salesforce user interface for standard and custom objects. To provide flexibility and allow for future enhancements, returned urlDetail values are dynamic. To ensure that client applications are</td>
</tr>
</tbody>
</table>
forward compatible, it is recommended that they use this capability where possible. Note that, for objects for which a stable URL is not available, this field is returned empty.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>urlNew</td>
<td>string</td>
<td>URL to the new/create page for this object. Client applications can use this URL to redirect to, or access, the Salesforce user interface for standard and custom objects. To provide flexibility and allow for future enhancements, returned <code>urlNew</code> values are dynamic. To ensure that client applications are forward compatible, it is recommended that they use this capability where possible. Note that, for objects for which a stable URL is not available, this field is returned empty.</td>
</tr>
</tbody>
</table>

**Note**: The properties with a Boolean value indicate whether certain API calls can be used for an object. However, other factors, such as permissions, also affect whether such operations can be performed on the object.

### ActionOverride

ActionOverride provides details about an action that replaces the default action pages for an object. For example, an object could be configured to replace the new/create page with a custom page. This type is available in API version 32.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formFactor</td>
<td>string</td>
<td>Represents the environment to which the action override applies. For example, a Large value in this field represents the Lightning Experience desktop environment, and is valid for Lightning pages and Lightning components. A Small value represents the Salesforce mobile app on a phone or tablet. This field is available in API version 37.0 and later.</td>
</tr>
<tr>
<td>isAvailableInTouch</td>
<td>boolean</td>
<td>Indicates whether the action override is available in the Salesforce mobile app (true) or not (false).</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>The name of the action that overrides the default action. For example, if the new/create page was overridden with a custom action, the name might be “New”.</td>
</tr>
<tr>
<td>pageId</td>
<td>reference</td>
<td>The ID of the page for the action override.</td>
</tr>
<tr>
<td>url</td>
<td>string</td>
<td>The URL of the item being used for the action override, such as a Visualforce page. Returns as null for Lightning page overrides.</td>
</tr>
</tbody>
</table>

### ChildRelationship

The name of the sObject that has a foreign key to the sObject being described.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascadeDelete</td>
<td>boolean</td>
<td>Indicates whether the child object is deleted when the parent object is deleted (true) or not (false).</td>
</tr>
<tr>
<td>childSObject</td>
<td>string</td>
<td>The name of the object on which there is a foreign key back to the parent sObject.</td>
</tr>
<tr>
<td>deprecatedAndHidden</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>field</td>
<td>string</td>
<td>The name of the field that has a foreign key back to the parent sObject.</td>
</tr>
<tr>
<td>junctionIdListNames</td>
<td>String[]</td>
<td>The names of the lists of junction IDs associated with an object. Each ID represents an object that has a relationship with the associated object. For more information on JunctionIdList fields, see Field Types on page 32.</td>
</tr>
<tr>
<td>junctionReferenceTo</td>
<td>String[]</td>
<td>A collection of object names that the polymorphic keys in the junctionIdListNames property can reference. You can query these object names.</td>
</tr>
<tr>
<td>relationshipName</td>
<td>string</td>
<td>The name of the relationship, usually the plural of the value in childSObject.</td>
</tr>
<tr>
<td>restrictedDelete</td>
<td>boolean</td>
<td>Indicates whether the parent object can’t be deleted because it is referenced by a child object (true) or not (false).</td>
</tr>
</tbody>
</table>

**Field**

In the DescribeSObjectResult, the fields property contains an array of Field objects. Each field represents a field in an API object. The array contains only the fields that the user can view, as defined by the user’s field-level security settings.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autonumber</td>
<td>boolean</td>
<td>Indicates whether this field is an autonumber field (true) or not (false). Analogous to a SQL IDENTITY type, autonumber fields are read only, non-createable text fields with a maximum length of 30 characters. Autonumber fields are read-only fields used to provide a unique ID that is independent of the internal object ID (such as a purchase order number or invoice number). Autonumber fields are configured entirely in the Salesforce user interface. The API provides access to this attribute so that client applications can determine whether a given field is an autonumber field.</td>
</tr>
<tr>
<td>byteLength</td>
<td>int</td>
<td>For variable-length fields (including binary fields), the maximum size of the field, in bytes.</td>
</tr>
<tr>
<td>calculated</td>
<td>boolean</td>
<td>Indicates whether the field is a custom formula field (true) or not (false). Note that custom formula fields are always read-only.</td>
</tr>
<tr>
<td>caseSensitive</td>
<td>boolean</td>
<td>Indicates whether the field is case sensitive (true) or not (false).</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>controllerName</td>
<td>string</td>
<td>The name of the field that controls the values of this picklist. It only applies if type is picklist or multipicklist and dependentPicklist is true. The mapping of controlling field to dependent field is stored in the validFor attribute of each PicklistEntry for this picklist.</td>
</tr>
<tr>
<td>createable</td>
<td>boolean</td>
<td>Indicates whether the field can be created (true) or not (false). If true, then this field value can be set in a create() call.</td>
</tr>
<tr>
<td>custom</td>
<td>boolean</td>
<td>Indicates whether the field is a custom field (true) or not (false).</td>
</tr>
<tr>
<td>dataTranslationEnabled</td>
<td>boolean</td>
<td>Indicates whether data translation is enabled for the field (true) or not (false). Available in API version 49.0 and later.</td>
</tr>
<tr>
<td>defaultedOnCreate</td>
<td>boolean</td>
<td>Indicates whether this field is defaulted when created (true) or not (false). If true, then Salesforce implicitly assigns a value for this field when the object is created, even if a value for this field is not passed in on the create() call. For example, in the Opportunity object, the Probability field has this attribute because its value is derived from the Stage field. Similarly, the Owner has this attribute on most objects because its value is derived from the current user (if the Owner field is not specified).</td>
</tr>
<tr>
<td>defaultValueFormula</td>
<td>string</td>
<td>The default value specified for this field if the formula is not used. If no value has been specified, this field is not returned.</td>
</tr>
<tr>
<td>dependentPicklist</td>
<td>boolean</td>
<td>Indicates whether a picklist is a dependent picklist (true) where available values depend on the chosen values from a controlling field, or not (false). See About Dependent Picklists.</td>
</tr>
<tr>
<td>deprecatedAndHidden</td>
<td>boolean</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>digits</td>
<td>int</td>
<td>For fields of type integer. Maximum number of digits. The API returns an error if an integer value exceeds the number of digits.</td>
</tr>
<tr>
<td>displayLocationInDecimal</td>
<td>boolean</td>
<td>Indicates how the geolocation values of a Location custom field appears in the user interface. If true, the geolocation values appear in decimal notation. If false, the geolocation values appear as degrees, minutes, and seconds.</td>
</tr>
<tr>
<td>encrypted</td>
<td>boolean</td>
<td>Indicates whether this field is encrypted. This value only appears in the results of a describeSObjects() call when it is true; otherwise, it is omitted from the results. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>extraTypeInfo</td>
<td>string</td>
<td>If the field is a textarea field type, indicates if the text area is plain text (plaintextarea) or rich text (richtextarea).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the field is a url field type, if this value is imageurl, the URL references an image file. Available on standard fields on standard objects only, for example, Account.photoUrl, Contact.photoUrl, and so on.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the field is a reference field type, indicates the type of external object relationship. Available on external objects only.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>filterable</td>
<td>boolean</td>
<td>Indicates whether the field is filterable (true) or not (false). If true, then this field can be specified in the WHERE clause of a query string in a query() call.</td>
</tr>
<tr>
<td>filteredLookupInfo</td>
<td>FilteredLookupInfo</td>
<td>If the field is a reference field type with a lookup filter, filteredLookupInfo contains the lookup filter information for the field. If there is no lookup filter, or the filter is inactive, this field is null. This field is available in API version 31.0 and later.</td>
</tr>
<tr>
<td>formula</td>
<td>string</td>
<td>The formula specified for this field. If no formula is specified for this field, it is not returned.</td>
</tr>
<tr>
<td>groupable</td>
<td>boolean</td>
<td>Indicates whether the field can be included in the GROUP BY clause of a SOQL query (true) or not (false). See GROUP BY in the Salesforce SOQL and SOSL Reference Guide. Available in API version 18.0 and later.</td>
</tr>
<tr>
<td>highScaleNumber</td>
<td>boolean</td>
<td>Indicates whether the field stores numbers to 8 decimal places regardless of what’s specified in the field details (true) or not (false). Used to handle currencies for products that cost fractions of a cent, in large quantities. If high-scale unit pricing isn’t enabled in your organization, this field isn’t returned. Available in API version 33.0 and later.</td>
</tr>
<tr>
<td>htmlFormatted</td>
<td>boolean</td>
<td>Indicates whether a field such as a hyperlink custom formula field has been formatted for HTML and should be encoded for display in HTML (true) or not (false). Also indicates whether a field is a custom formula field that has an IMAGE text function.</td>
</tr>
<tr>
<td>idLookup</td>
<td>boolean</td>
<td>Indicates whether the field can be used to specify a record in an upsert() call (true) or not (false).</td>
</tr>
<tr>
<td>inlineHelpText</td>
<td>string</td>
<td>The text that displays in the field-level help hover text for this field.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Text label that is displayed next to the field in the Salesforce user interface. This label can be localized.</td>
</tr>
<tr>
<td>length</td>
<td>int</td>
<td>Returns the maximum size of the field in Unicode characters (not bytes) or 255, whichever is less. The maximum value returned by the getLength() property is 255. Available in API version 49.0 and later.</td>
</tr>
<tr>
<td>mask</td>
<td>string</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>maskType</td>
<td>string</td>
<td>Reserved for future use.</td>
</tr>
</tbody>
</table>

**Note:** This property is not returned unless at least one field on the object contains a value. When at least one field has field-level help, all fields on the object list the property with either the field-level help value or null for fields that have blank field-level help.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>Field name used in API calls, such as <code>create()</code>, <code>delete()</code>, and <code>query()</code>.</td>
</tr>
<tr>
<td>nameField</td>
<td>boolean</td>
<td>Indicates whether this field is a name field (<code>true</code>) or not (<code>false</code>). Used to identify the name field for standard objects (such as <code>AccountName</code> for an <code>Account</code> object) and custom objects. Limited to one per object, except where <code>FirstName</code> and <code>LastName</code> fields are used (such as in the <code>Contact</code> object). If a compound name is present, for example the <code>Name</code> field on a person account, <code>nameField</code> is set to <code>true</code> for that record. If no compound name is present, <code>FirstName</code> and <code>LastName</code> have this field set to <code>true</code>.</td>
</tr>
<tr>
<td>namePointing</td>
<td>boolean</td>
<td>Indicates whether the field’s value is the <code>Name</code> of the parent of this object (<code>true</code>) or not (<code>false</code>). Used for objects whose parents may be more than one type of object, for example a task may have an account or a contact as a parent.</td>
</tr>
<tr>
<td>nillable</td>
<td>boolean</td>
<td>Indicates whether the field is nillable (<code>true</code>) or not (<code>false</code>). A nillable field can have empty content. A non-nillable field must have a value in order for the object to be created or saved.</td>
</tr>
<tr>
<td>permissionable</td>
<td>boolean</td>
<td>Indicates whether <code>FieldPermissions</code> can be specified for the field (<code>true</code>) or not (<code>false</code>).</td>
</tr>
<tr>
<td>picklistValues</td>
<td><code>PicklistEntry</code>[]</td>
<td>Provides the list of valid values for the picklist. Specified only if <code>restrictedPicklist</code> is true.</td>
</tr>
<tr>
<td>polymorphicForeignKey</td>
<td>boolean</td>
<td>Indicates whether the foreign key includes multiple entity types (<code>true</code>) or not (<code>false</code>).</td>
</tr>
<tr>
<td>precision</td>
<td>int</td>
<td>For fields of type double. Maximum number of digits that can be stored, including all numbers to the left and to the right of the decimal point (but excluding the decimal point character).</td>
</tr>
<tr>
<td>relationshipName</td>
<td>string</td>
<td>The name of the relationship, if this is a master-detail relationship field.</td>
</tr>
<tr>
<td>relationshipOrder</td>
<td>int</td>
<td>The type of relationship for a master-detail relationship field. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0 if the field is the primary relationship</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1 if the field is the secondary relationship</td>
</tr>
<tr>
<td>referenceTargetField</td>
<td>string</td>
<td>Applies only to indirect lookup relationships on external objects. Name of the custom field on the parent standard or custom object whose values are matched against the values of the child external object’s indirect lookup relationship field. This matching is done to determine which records are related to each other. This field is available in API version 32.0 and later.</td>
</tr>
<tr>
<td>referenceTo</td>
<td><code>string</code>[]</td>
<td>For fields that refer to other objects, this array indicates the object types of the referenced objects.</td>
</tr>
<tr>
<td>restrictedPicklist</td>
<td>boolean</td>
<td>Indicates whether the field is a restricted picklist (<code>true</code>) or not (<code>false</code>).</td>
</tr>
<tr>
<td>scale</td>
<td>int</td>
<td>For fields of type double. Number of digits to the right of the decimal point. The API silently truncates any extra digits to the right of the decimal point, but it returns a fault response if the number has too many digits to the left of the decimal point.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>searchPrefilterable</td>
<td>boolean</td>
<td>Indicates whether a foreign key can be included in prefiltering ((true)) or not ((false)) when used in a SOSL WHERE clause. Prefiltering means to filter by a specific field value before executing the full search query. Available in API version 40.0 and later.</td>
</tr>
<tr>
<td>soapType</td>
<td>SOAPType</td>
<td>See SOAPType for a list of allowable values.</td>

<td>Indicates whether a query can sort on this field ((true)) or not ((false)).</td>
</tr>
<tr>
<td>type</td>
<td>FieldType</td>
<td>See FieldType for a list of allowable values.</td>
</tr>
<tr>
<td>unique</td>
<td>boolean</td>
<td>Indicates whether the value must be unique ((true)) or not ((false)).</td>
</tr>
<tr>
<td>updateable</td>
<td>boolean</td>
<td>Indicates one of the following: (\cdot) Whether the field is updateable, ((true)) or not ((false)). If (true), then this field value can be set in an update() call. (\cdot) If the field is in a master-detail relationship on a custom object, indicates whether the child records can be reparented to different parent records ((true)), (false) otherwise.</td>
</tr>
<tr>
<td>writeRequiresMasterRead</td>
<td>boolean</td>
<td>This field only applies to master-detail relationships. Indicates whether a user requires read sharing access ((true)) or write sharing access ((false)) to the parent record to insert, update, and delete a child record. In both cases, a user also needs Create, Edit, and Delete object permissions for the child object.</td>
</tr>
</tbody>
</table>

### FieldType

In the Field object associated with DescribeSObjectResult, the type field can contain one of the following strings. For more information about field types, see Field Types.

<table>
<thead>
<tr>
<th>type Field Value</th>
<th>What the Field Object Contains</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String values.</td>
</tr>
<tr>
<td>boolean</td>
<td>Boolean ((true) / (false)) values.</td>
</tr>
<tr>
<td>int</td>
<td>Integer values.</td>
</tr>
<tr>
<td>double</td>
<td>Double values.</td>
</tr>
<tr>
<td>date</td>
<td>Date values.</td>
</tr>
<tr>
<td>datetime</td>
<td>Date and time values.</td>
</tr>
<tr>
<td>base64</td>
<td>Base64-encoded arbitrary binary data (of type base64Binary). Used for Attachment, Document, and Scontrol objects.</td>
</tr>
<tr>
<td>ID</td>
<td>Primary key field for the object. For information on IDs, see Field Types.</td>
</tr>
<tr>
<td>reference</td>
<td>Cross-references to a different object. Analogous to a foreign key field in SQL.</td>
</tr>
<tr>
<td>currency</td>
<td>Currency values.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>textarea</td>
<td>String that is displayed as a multiline text field.</td>
</tr>
<tr>
<td>percent</td>
<td>Percentage values.</td>
</tr>
<tr>
<td>phone</td>
<td>Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting.</td>
</tr>
<tr>
<td>url</td>
<td>URL values. Client applications should commonly display these as hyperlinks. If Field.extraTypeInfo is imageurl, the URL references an image, and can be displayed as an image instead.</td>
</tr>
<tr>
<td>email</td>
<td>Email addresses.</td>
</tr>
<tr>
<td>combobox</td>
<td>Comboboxes, which provide a set of enumerated values and allow the user to specify a value not in the list.</td>
</tr>
<tr>
<td>picklist</td>
<td>Single-select picklists, which provide a set of enumerated values from which only one value can be selected.</td>
</tr>
<tr>
<td>multipicklist</td>
<td>Multi-select picklists, which provide a set of enumerated values from which multiple values can be selected.</td>
</tr>
<tr>
<td>anyType</td>
<td>Values can be any of these types: string, picklist, boolean, int, double, percent, ID, date, dateTime, url, or email.</td>
</tr>
<tr>
<td>location</td>
<td>Geolocation values, including latitude and longitude, for custom geolocation fields on custom objects.</td>
</tr>
</tbody>
</table>

**FilteredLookupInfo**

In the Field object associated with the DescribeSObjectResult, the filteredLookupInfo field contains information about the lookup filter associated with the field.

This subtype is available in API version 31.0 and later.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>controllingFields</td>
<td>string[]</td>
<td>Array of the field's controlling fields when the lookup filter is dependent on the source object.</td>
</tr>
<tr>
<td>dependent</td>
<td>boolean</td>
<td>Indicates whether the lookup filter is dependent upon the source object (true) or not (false).</td>
</tr>
<tr>
<td>optionalFilter</td>
<td>boolean</td>
<td>Indicates whether the lookup filter is optional (true) or not (false).</td>
</tr>
</tbody>
</table>

**SOAPType**

The DescribeSObjectResult returns the fields property, which contains an array of fields whose value provides information about the object being described. One of those fields, soapType, contains one of the following string values. All of the values preceded by xsd: are XML schema primitive data types. For more information about the XML schema primitive data types, see the World Wide Web Consortium's publication XML Schema Part 2: Data Types at: [http://www.w3.org/TR/xmlschema-2/](http://www.w3.org/TR/xmlschema-2/).
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tns:ID</td>
<td>Unique ID associated with an sObject. For information on IDs, see Field Types.</td>
</tr>
<tr>
<td>xsd:anyType</td>
<td>Can be ID, Boolean, double, integer, string, date, or dateTime.</td>
</tr>
<tr>
<td>xsd:base64Binary</td>
<td>Base 64-encoded binary data.</td>
</tr>
<tr>
<td>xsd:boolean</td>
<td>Boolean (true / false) values.</td>
</tr>
<tr>
<td>xsd:date</td>
<td>Date values.</td>
</tr>
<tr>
<td>xsd:dateTime</td>
<td>Date/time values.</td>
</tr>
<tr>
<td>xsd:double</td>
<td>Double values.</td>
</tr>
<tr>
<td>xsd:int</td>
<td>Integer values.</td>
</tr>
<tr>
<td>xsd:string</td>
<td>Character strings.</td>
</tr>
</tbody>
</table>

**PicklistEntry**

In the Field object associated with the DescribeSObjectResult, the picklistValues field contains an array of PicklistEntry properties. Each PicklistEntry can contain any one of the following string values. For more information, see Field Types.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>boolean</td>
<td>Indicates whether this item must be displayed (true) or not (false) in the drop-down list for the picklist field in the user interface.</td>
</tr>
<tr>
<td>validFor</td>
<td>byte[]</td>
<td>A set of bits where each bit indicates a controlling value for which this PicklistEntry is valid. See About Dependent Picklists.</td>
</tr>
<tr>
<td>defaultValue</td>
<td>boolean</td>
<td>Indicates whether this item is the default item (true) in the picklist or not (false). Only one item in a picklist can be designated as the default.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>Display name of this item in the picklist.</td>
</tr>
<tr>
<td>value</td>
<td>string</td>
<td>Value of this item in the picklist.</td>
</tr>
</tbody>
</table>

**About Dependent Picklists**

A dependent picklist works in conjunction with a controlling field to filter its values. The value chosen in the controlling field affects the values available in the dependent picklist.

A dependent picklist can be any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field. A controlling field can be any standard or custom picklist (with at least one and less than 200 values) or checkbox field whose values control the available values in one or more corresponding dependent fields.

In the following example, the controlling picklist Beverage has two values, which relate to the values of the dependent picklist Beverage Variety:

<table>
<thead>
<tr>
<th>Beverage</th>
<th>Beverage Variety</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coffee</td>
<td>Decaffeinated</td>
</tr>
</tbody>
</table>
### Beverage Variety

<table>
<thead>
<tr>
<th>Beverage</th>
<th>Variety</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular</td>
<td>Chamomile</td>
</tr>
<tr>
<td>Tea</td>
<td>Earl Grey</td>
</tr>
<tr>
<td></td>
<td>English Breakfast</td>
</tr>
</tbody>
</table>

For each `PicklistEntry` that represents a value in a dependent picklist, the `validFor` attribute contains a set of bits. Each bit indicates a controlling field value for which the `PicklistEntry` is valid. Read the bits from left to right.

For more information on dependent picklists, see the “Dependent Picklists” topic in the Salesforce online help.

### Sample Java Code for Dependent Picklists

```java
public void dependentPicklistSample() {
    // inner class to decode a "validFor" bitset
    class Bitset {
        byte[] data;

        public Bitset(byte[] data) {
            this.data = data == null ? new byte[0] : data;
        }

        public boolean testBit(int n) {
            return (data[n >> 3] & (0x80 >> n % 8)) != 0;
        }

        public int size() {
            return data.length * 8;
        }
    }

    try {
        DescribeSObjectResult describeSObjectResult = connection.describeSObject("Case");
        Field[] fields = describeSObjectResult.getFields();
        // create a map of all fields for later lookup
        Map fieldMap = new HashMap();
        for (int i = 0; i < fields.length; i++) {
            fieldMap.put(fields[i].getName(), fields[i]);
        }
        for (int i = 0; i < fields.length; i++) {
            // check whether this is a dependent picklist
            if (fields[i].getDependentPicklist()) {
                // get the controller by name
                Field controller = (Field)fieldMap.get(fields[i].getControllerName());
                System.out.println("Field "+fields[i].getLabel()+" depends on "+controller.getLabel()+"\n");  
                PicklistEntry[] picklistValues = fields[i].getPicklistValues();
                for (int j = 0; j < picklistValues.length; j++) {
                    // for each PicklistEntry: list all controlling values for which it is valid
                }
            }
        }
    }
}
```
System.out.println("Item: "+picklistValues[j].getLabel()+"' is valid for: ");
Bitset validFor = new Bitset(picklistValues[j].getValidFor());
if (FieldType.picklist == controller.getType()) {
    // if the controller is a picklist, list all
    // controlling values for which this entry is valid
    for (int k = 0; k < validFor.size(); k++) {
        if (validFor.testBit(k)) {
            // if bit k is set, this entry is valid for the
            // for the controlling entry at index k
            System.out.println(controller.getPicklistValues()[k].getLabel());
        }
    }
} else if (FieldType._boolean == controller.getType()) {
    // the controller is a checkbox
    // if bit 1 is set this entry is valid if the controller is checked
    if (validFor.testBit(1)) {
        System.out.println(" checked");
    }
    // if bit 0 is set this entry is valid if the controller is not checked
    if (validFor.testBit(0)) {
        System.out.println(" unchecked");
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

RecordTypeInfo
Base class for the old RecordTypeMapping object. This object contains all of the existing fields of RecordTypeMapping except layoutId and picklistForRecordType.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>available</td>
<td>boolean</td>
<td>Indicates whether this record type is available (true) or not (false).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Availability is used to display a list of available record types to the user</td>
</tr>
<tr>
<td></td>
<td></td>
<td>when they are creating a new record.</td>
</tr>
<tr>
<td>defaultRecordTypeMapping</td>
<td>boolean</td>
<td>Indicates whether this is the default record type mapping (true) or not (false).</td>
</tr>
<tr>
<td>developerName</td>
<td>string</td>
<td>Developer name of this record type. Available in API versions 43.0 and later.</td>
</tr>
<tr>
<td>master</td>
<td>boolean</td>
<td>Indicates whether this is the main record type (true) or not (false).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The main record type is the default record type that's used when a record</td>
</tr>
<tr>
<td></td>
<td></td>
<td>has no custom record type associated with it.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of this record type.</td>
</tr>
</tbody>
</table>

3926
### recordTypeId

ID of this record type.

### NamedLayoutInfo

The name of the named layout for the object. Standard objects can have defined named layouts which are separate from the primary layout for both the profile and the record type. For more information on layout names, see `describeLayout()`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>Name of this layout.</td>
</tr>
</tbody>
</table>

### ScopeInfo

A scope for an object that can be used to filter object records. For example, Account may have a supported ScopeInfo of "mine" (with a UI label of "My accounts") which filters only Account records for the current user.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>string</td>
<td>UI label for this scope.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of this scope.</td>
</tr>
</tbody>
</table>

### `describeSoftphoneLayout()`

Retrieves layout information for a Salesforce CRM Call Center Softphone.

**Syntax**

```java
DescribeSoftphoneLayoutResult[] = connection.describeSoftphoneLayout();
```

**Usage**

Use this call to obtain information about the layout of a Softphone. Use only in the context of Salesforce CRM Call Center; do not call directly from client programs.

**Arguments**

This call does not take any objects.

**Response**

The response is a `DescribeSoftphoneLayoutResult` object:
DescribeSoftphoneLayoutCallType

Each DescribeSoftphoneLayoutResult object contains one or more call types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>infoFields</td>
<td>DescribeSoftphoneLayoutInfoField[]</td>
<td>A set of information field in the softphone layout.</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>Name of the layout.</td>
</tr>
<tr>
<td>screenPopOptions</td>
<td>DescribeSoftphoneScreenPopOption[]</td>
<td>Settings in the softphone layout that specify how to display screen pops</td>
</tr>
<tr>
<td></td>
<td></td>
<td>when the details of calls match or don’t match existing records.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This field is available in API version 18.0 and later.</td>
</tr>
<tr>
<td>screenPopsOpenWithin</td>
<td>string</td>
<td>Setting in the softphone layout that specify whether to display</td>
</tr>
<tr>
<td></td>
<td></td>
<td>screen pops in a new browser window or tab when the details of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>calls match or don’t match existing records.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This field is available in API version 18.0 and later.</td>
</tr>
<tr>
<td>sections</td>
<td>DescribeSoftphoneLayoutSection[]</td>
<td>A set of object names and the corresponding item name in the softphone</td>
</tr>
<tr>
<td></td>
<td></td>
<td>layout. There is one section for each object in a call type.</td>
</tr>
</tbody>
</table>

DescribeSoftphoneLayoutInfoField

An information field in the softphone layout.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
<td>The name of an information field in the softphone layout that does not correspond to a Salesforce object. For example, caller ID may be specified in an information field. Information fields hold static information about the call type.</td>
</tr>
</tbody>
</table>

DescribeSoftphoneLayoutSection

Each call type returned in a DescribeSoftphoneLayoutResult object contains one section for each call type. Each section contains object-item pairs:
Describe Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityApiName</td>
<td>string</td>
<td>The name of an object in the Salesforce application that corresponds to an item displayed in the softphone layout, for example, a set of accounts or cases.</td>
</tr>
<tr>
<td>items</td>
<td>DescribeSoftphoneLayoutItem[]</td>
<td>A set of softphone layout items.</td>
</tr>
</tbody>
</table>

DescribeSoftphoneLayoutItem

Each layout item corresponds to a record in Salesforce:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>itemApiName</td>
<td>string</td>
<td>The name of a record in the Salesforce application that corresponds to an item displayed in the softphone layout, for example, the Acme account.</td>
</tr>
</tbody>
</table>

DescribeSoftphoneScreenPopOption

Each call type returned in a DescribeSoftphoneLayoutResult object contains one screenPopOptions field for each call type. Each screenPopOptions field contains details about screen pop settings:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matchType</td>
<td>string</td>
<td>Setting on a softphone layout to pop a screen for call details that match a single record, multiple records, or no records.</td>
</tr>
<tr>
<td>screenPopData</td>
<td>string</td>
<td>Setting on a softphone layout for a specific object or page to pop for a call’s matchType. For example, pop a specified Visualforce page when the details of a call match a record.</td>
</tr>
<tr>
<td>screenPopType</td>
<td>picklist</td>
<td>Setting that specifies how to pop a screen for a call’s matchType. For example, pop a detail page or don’t pop any page when the details of a call match a record.</td>
</tr>
</tbody>
</table>

Sample Code—Java

This sample describes the soft phone layout and writes its properties to the console. It then gets the allowed call types. For each call type, it gets its information fields, layout sections, and the layout items in the layout sections. It writes these values to the console.

```java
public void describeSoftphoneLayout() {
    try {
        DescribeSoftphoneLayoutResult result =
            connection.describeSoftphoneLayout();
        System.out.println("ID of retrieved Softphone layout: " +
            result.getId());
        System.out.println("Name of retrieved Softphone layout: " +
            result.getName());
        System.out.println("\nContains following " +
            "Call Type Layouts\n") ;
        for (DescribeSoftphoneLayoutCallType type :
            result.getCallTypes()) {
```

3929
System.out.println("Layout for " + type.getName() + " calls");
System.out.println("\tCall-related fields:");
for (DescribeSoftphoneLayoutInfoField field : type.getInfoFields()) {
    System.out.println("\t\t" + field.getName());
}
System.out.println("\tDisplayed Objects:");
for (DescribeSoftphoneLayoutSection section : type.getSections()) {
    System.out.println("\t\tFor entity " + section.getEntityApiName() + " following records are displayed:");
    for (DescribeSoftphoneLayoutItem item : section.getItems()) {
        System.out.println("\t\t\t" + item.getItemApiName());
    }
}
}
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

Sample Code—C#
This sample describes the soft phone layout and writes its properties to the console. It then gets the allowed call types. For each call type, it gets its information fields, layout sections, and the layout items in the layout sections. It writes these values to the console.

    /// Demonstrates how to retrieve the layout information
    /// for a Salesforce CRM Call Center Softphone
    public void DescribeSoftphoneLayoutSample()

    Console.WriteLine(e.InnerException);
}

describeSoqlListViews()

Retrieves the SOQL query and other information about a list view.

Syntax

collection.describeSoqlListViews(DescribeSoqlListViewsRequest request);

Usage

Use the describeSoqlListViews() call to retrieve information about a list view, including the ID, the columns, and the SOQL query. This call is useful if you want to use the SOQL that drives an existing list view in your custom application. This call is available in API version 32.0 and later.

Sample Code—Java

class describeSoqlListViews
{
    public void example() throws Exception {
        DescribeSoqlListViewsRequest request =
        createDescribeSoqlListViewsRequest(listViewId, null);
        this.getClient() .describeSoqlListViews(request);
    }
}
Describe Calls

**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>DescribeSoqlListViewsRequest</td>
<td>The fully qualified name or the ID of the list view and the object with which the list view is associated.</td>
</tr>
</tbody>
</table>

**Response**

A `DescribeSoqlListViewsResult` object that contains one or more `DescribeSoqlListView` objects.

**Faults**

- `InvalidSObjectFault`
- `UnexpectedErrorFault`

**DescribeSoqlListView**

Contains information about the specified list view, including the columns, sObject type, and SOQL query.

The `DescribeSoqlListView` object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td>ListViewColumn[]</td>
<td>The columns that are returned by the list view query.</td>
</tr>
<tr>
<td>id</td>
<td>ID</td>
<td>The list view’s fully qualified ID.</td>
</tr>
<tr>
<td>orderBy</td>
<td>ListViewOrderBy[]</td>
<td>A list of fields to sort results by, the sort order, and the position to which null values should be sorted.</td>
</tr>
<tr>
<td>query</td>
<td>string</td>
<td>The fully composed SOQL query for the list view.</td>
</tr>
<tr>
<td>relatedEntityId</td>
<td>ID</td>
<td>The ID of the campaign, if a campaign scope was used.</td>
</tr>
<tr>
<td>scope</td>
<td>string</td>
<td>A filterScope to use for limiting the results.</td>
</tr>
<tr>
<td>scopeEntityId</td>
<td>ID</td>
<td>The ID of the queue or price book, if a queue or price book scope was used.</td>
</tr>
<tr>
<td>sobjectType</td>
<td>string</td>
<td>The object with which the list view is associated.</td>
</tr>
<tr>
<td>whereCondition</td>
<td>SoqlWhereCondition</td>
<td>Filter conditions on the list view. Filter conditions provide an additional level of control over which records get shown in the list view.</td>
</tr>
</tbody>
</table>

**DescribeSoqlListViewsParams**

Use the `DescribeSoqlListViewsParams` object with `describeSoqlListViews()` to retrieve the SOQL from a list view.

The `DescribeSoqlListViewsParams` object has the following properties:
DescribeSoqlListViewResult

Contains one or more DescribeSoqlListView objects, each of which contains information about one or more list views, including the ID, sObject type, columns, and SOQL query of each.

The DescribeSoqlListViewResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>developerNameOrId</td>
<td>string</td>
<td>The list view's ID or fully qualified developer name.</td>
</tr>
<tr>
<td>sobjectType</td>
<td>string</td>
<td>The API name of the sObject for the list view.</td>
</tr>
</tbody>
</table>

DescribeSoqlListViewsRequest

Use the DescribeSoqlListViewsRequest object with describeSoqlListViews() to retrieve information about a list view.

The DescribeSoqlListViewsRequest object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listViewParams</td>
<td>DescribeSoqlListViewParam[]</td>
<td>A list of parameters that specify the list view to describe.</td>
</tr>
</tbody>
</table>

ListViewColumn

Contains metadata about a single list view column.

The ListViewColumn object is returned by the describeSoqlListViews() and executeListView() calls. It has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ascendingLabel</td>
<td>string</td>
<td>The localized type-specific label for sorting the column in ascending order. For example: “A-Z” for a text field, or “Low to High” for a numeric field. Set to null if the column isn’t sortable.</td>
</tr>
<tr>
<td>descendingLabel</td>
<td>string</td>
<td>The localized type-specific label for sorting the column in ascending order. For example: “Z-A” for a text field, or “High to Low” for a numeric field. Set to null if the column is not sortable.</td>
</tr>
<tr>
<td>fieldNameOrPath</td>
<td>string</td>
<td>The field name or SOQL field path for the column.</td>
</tr>
<tr>
<td>hidden</td>
<td>boolean</td>
<td>If true, specifies that the column is not displayed, and is present only to support the display of other columns or other client-side logic.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The localized display label for the column.</td>
</tr>
</tbody>
</table>
### ListViewOrderBy

Use the `ListViewOrderBy` object with `executeListView()` to determine the order in which records are returned from a list view.

The `ListViewOrderBy` object is returned by the `describeSoqlListViews()` call, is an optional input to the `executeListView()` call, and has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldNameOrPath</td>
<td>string</td>
<td>The field name or SOQL path of the field on which to sort the records.</td>
</tr>
<tr>
<td>nullsPosition</td>
<td>orderByNullsPosition</td>
<td>An enumerated value that determines where nulls are sorted in the results:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• first</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• last</td>
</tr>
<tr>
<td>sortDirection</td>
<td>orderByDirection</td>
<td>An enumerated value that determines the sort order of the results:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ascending</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• descending</td>
</tr>
</tbody>
</table>

### SoqlWhereCondition

Contains information about SOQL filter conditions for a list view.

Each condition listed in `SoqlWhereCondition` represents a condition expression in a SQL WHERE clause that compares a field value to a comparison value using a condition operator. Each condition contains the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>string</td>
<td>The object field used by the filter condition.</td>
</tr>
</tbody>
</table>
The filter operation. Operations include:

- **equals**—Condition is true if the field value equals the specified value. String comparisons using the equals operator are case sensitive for unique case-sensitive fields and case insensitive for all other fields.
- **excludes**—Condition is true for multi-select picklist fields if the selected field values are not in the list of condition values.
- **greaterThan**—Condition is true if the field value is greater than the specified value.
- **greaterThanOrEqualTo**—Condition is true if the field value is greater than or equal to the specified value.
- **in**—Condition is true if the field value equals any specified value in the values list.
- **includes**—Condition is true for multi-select picklist fields if the selected field values are in the list of condition values.
- **lessThan**—Condition is true if the field value is less than the specified value.
- **lessThanOrEqualTo**—Condition is true if the field value is less than or equal to the specified value.
- **like**—Condition is true if the field value matches the specified value, using character matching logic described in Comparison Operators in the SOQL and SOSL Reference.
- **notEquals**—Condition is true if the field value doesn’t equal the specified value.
- **notIn**—Condition is true if the field value doesn’t equal any specified value in the values list.
- **notLike**—Condition is true if the field value doesn’t match the specified value using the character matching logic described in Comparison Operators in the SOQL and SOSL Reference. Available in API version 41.0 and later.
- **within**—Condition is true if the field value location is within the value distance using a location-based comparison. For more information, see Location-Based SOQL Queries in the SOQL and SOSL Reference.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<td></td>
<td>distance using a location-based comparison. For more information, see</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Location-Based SOQL Queries in the SOQL and SOSL Reference.</td>
</tr>
</tbody>
</table>

A list of one or more values used to compare with the field value using the operator comparison logic.

**Evaluating SoqlWhereConditions**

In the SOAP API, Salesforce uses subclasses of SoqlWhereCondition to represent different categories of conditions. Use your development language’s type comparison functionality (such as Java’s `instanceof` operator) to determine which subclass is used for a particular instance of SoqlWhereCondition.

The SoqlConditionGroup subclass represents a group of SOQL WHERE clause conditions and uses the following properties.
List of filter conditions. If the list view uses filter logic, each logical filter group is represented with a conditions list.

A conjunction operation that describes the filter logic to use for multiple conditions in a logical filter group. Values include:

- **and** — All conditions must be true for the overall SoqlWhereCondition.
- **or** — One of the conditions must be true for the overall SoqlWhereCondition.

The SoqlNotCondition subclass represents a special use of the `like` operator. In API version 40.0 and earlier, when evaluating a SoqlWhereCondition that was created using a `not like` operator (displayed as `does not contain` in the UI), the operator value in the condition is `like`. Salesforce also uses the SoqlNotCondition subclass of SoqlWhereCondition to represent the complete condition. The following example uses Java's `instanceof` operator to determine whether a `not like` operation is specified.

```java
if (resultSoqlWhereCondition instanceof SoqlNotCondition) {
    // condition is really NOT condition
    // if operator is "like", this condition really means "not like"
    ...
}
```

In API version 41.0 and later, the `notLike` operator is used instead of SoqlNotCondition and a `like` operator. The `notLike` operator is available only for list views. You can’t use it in SOQL queries used in other Salesforce features.

### describeTabs()

Returns information about the standard and custom apps available to the logged-in user, as listed in the Lightning Platform app menu at the top of the page. An app is a set of tabs that works as a unit to provide application functionality. For example, two of the standard Salesforce apps are “Sales” and “Service.”

**Syntax**

```java
describeTabSetResult [] = connection.describeTabs();
```

**Usage**

Use the `describeTabs()` call to obtain information about the standard and custom apps to which the logged-in user has access. The `describeTabs()` call returns the minimum required metadata that can be used to render apps in another user interface. Typically this call is used by partner applications to render Salesforce data in another user interface.

For each app, the call returns the app name, the URL of the logo, whether or not it’s the currently selected application for the user, and details about the tabs included in that app.

**Important:** The `describeTabs()` call returns information only about tabs that display in the Salesforce user interface for the logged-in user. If a user clicks the All Tabs (+) tab and hides some tabs from his Salesforce user interface, those user-hidden tabs aren’t included in the set of tabs returned by `describeTabs()`.

Use the `describeAllTabs()` call to obtain information about all the tabs that are available to the logged-in user.
For each tab, the call returns the tab name, the primary sObject that’s displayed on the tab, whether it’s a custom tab, and the URL for viewing that tab. Note that the “All Tabs” tab and Lightning page tabs aren’t included in the list of tabs.

**Sample Code—Java**

This sample calls `describeTabs()`, which returns an array of tab set results. Next, for each tab set result, which represents an app, it retrieves some of its properties and gets all the tabs for this app. It writes all retrieved properties to the console.

```java
public void describeTabsSample() {
    try {
        // Describe tabs
        DescribeTabSetResult[] dtsrs = connection.describeTabs();
        System.out.println("There are " + dtsrs.length + " tab sets defined.");

        // For each tab set describe result, get some properties
        for (int i = 0; i < dtsrs.length; i++) {
            System.out.println("Tab Set " + (i + 1) + ":");
            DescribeTabSetResult dtsr = dtsrs[i];
            System.out.println("Label: " + dtsr.getLabel());
            System.out.println("Logo URL: " + dtsr.getLogoUrl());
            System.out.println("Tab selected: " + dtsr.isSelected());

            // Describe the tabs for the tab set
            DescribeTab[] tabs = dtsr.getTabs();
            System.out.println("Tabs defined: " + tabs.length);

            // Iterate through the returned tabs
            for (int j = 0; j < tabs.length; j++) {
                DescribeTab tab = tabs[j];
                System.out.println("Tab " + (j + 1) + ":");
                System.out.println("Name: " + tab.getSobjectName());
                System.out.println("Label: " + tab.getLabel());
                System.out.println("URL: " + tab.getUrl());
                DescribeColor[] tabColors = tab.getColors();
                DescribeIcon[] tabIcons = tab.getIcons();
                // Iterate through tab colors as needed
                // Iterate through tab icons as needed
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Sample Code—C#  

This sample calls `describeTabs()`, which returns an array of tab set results. Next, for each tab set result, which represents an app, it retrieves some of its properties and gets all the tabs for this app. It writes all retrieved properties to the console.

```csharp
public void describeTabsSample() {
    try {
        // Describe tabs
        DescribeTabSetResult[] dtsrs = binding.describeTabs();
        Console.WriteLine("There are " + dtsrs.Length + " tab sets defined.");

        // For each tab set describe result, get some properties
        for (int i = 0; i < dtsrs.Length; i++) {
            Console.WriteLine("Tab Set " + (i + 1) + ":");
            DescribeTabSetResult dtsr = dtsrs[i];
            Console.WriteLine("Label: " + dtsr.label);
            Console.WriteLine("Logo URL: " + dtsr.logoUrl);
            Console.WriteLine("Tab selected: " + dtsr.selected);

            // Describe the tabs for the tab set
            DescribeTab[] tabs = dtsr.tabs;
            Console.WriteLine("Tabs defined: " + tabs.Length);

            // Iterate through the returned tabs
            for (int j = 0; j < tabs.Length; j++) {
                DescribeTab tab = tabs[j];
                Console.WriteLine("Tab " + (j + 1) + ":");
                Console.WriteLine("Name: " + tab.sobjectName);
                Console.WriteLine("Label: " + tab.label);
                Console.WriteLine("URL: " + tab.url);
                DescribeColor[] tabColors = tab.colors;
                // Iterate through tab colors as needed
                DescribeIcon[] tabIcons = tab.icons;
                // Iterate through tab icons as needed
            }
        }
    }
    catch (SoapException e) {
        Console.WriteLine("An unexpected error has occurred: " + e.Message + "\n" + e.StackTrace);
    }
}
```

Arguments  

None.
Response

describeTabSetResult, DescribeTab

   API Call Basics
   Using the Partner WSDL
   DescribeTab
describeTabSetResult

describeTabSetResult

The describeTabs() call returns an array of describeTabSetResult objects, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>string</td>
<td>The description for this standard or custom app.</td>
</tr>
<tr>
<td>label</td>
<td>string</td>
<td>The display label for this standard or custom app. This value changes when</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the Salesforce user interface. See the Salesforce online help for more</td>
</tr>
<tr>
<td></td>
<td></td>
<td>information.</td>
</tr>
<tr>
<td>logoUrl</td>
<td>string</td>
<td>A fully qualified URL to the logo image associated with the standard or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>custom app.</td>
</tr>
<tr>
<td>namespace</td>
<td>string</td>
<td>If this is a custom app, and a set of tabs in the custom app was installed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>as part of a managed package, the value of this attribute is the developer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>namespace prefix that the creator of the package chose when the Developer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Edition organization was enabled to allow publishing a managed package.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This attribute identifies elements of a Salesforce AppExchange package.</td>
</tr>
<tr>
<td>selected</td>
<td>boolean</td>
<td>If true, then this standard or custom app is the user’s currently selected</td>
</tr>
<tr>
<td></td>
<td></td>
<td>app.</td>
</tr>
<tr>
<td>tabs</td>
<td>DescribeTab</td>
<td>An array of tabs that are displayed for the specified standard app or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>custom app.</td>
</tr>
</tbody>
</table>

DescribeColor

DescribeColor contains color metadata information for a tab. The describeTabs() call returns an array of DescribeTabSetResult values. Each DescribeTabSetResult contains an array of DescribeTab values, and each DescribeTab contains an array of DescribeColor values.

Each DescribeColor is associated with a Salesforce user interface theme. For more information on themes, see Identifying the Salesforce Style Your Users See in the Visualforce Developer’s Guide.

Color information can also be retrieved via the describeTheme() and describeGlobalTheme() calls. These calls return information on colors used for each object in your organization that can use theme icons and colors.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>string</td>
<td>The color described in web color RGB format—for example, “00FF00”.</td>
</tr>
<tr>
<td>context</td>
<td>string</td>
<td>The color context, which determines whether the color is the main color</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(or primary) for the tab.</td>
</tr>
</tbody>
</table>
DescribeIcon

DescribeIcon contains icon metadata information for a tab. The `describeTabs()` call returns an array of `DescribeTabSetResult` values. Each `DescribeTabSetResult` contains an array of `DescribeTab` values, and each `DescribeTab` contains an array of `DescribeIcon` values.

Icon information can also be retrieved via the `describeTheme()` and `describeGlobalTheme()` calls. These calls return information on icons used for each object in your organization that can use theme icons and colors.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentType</td>
<td>string</td>
<td>The tab icon’s content type, for example, “image/png.”</td>
</tr>
<tr>
<td>height</td>
<td>int</td>
<td>The tab icon’s height in pixels. If the icon content type is an SVG type, height and width values are not used.</td>
</tr>
<tr>
<td>theme</td>
<td>string</td>
<td>The associated theme. Possible values include:</td>
</tr>
<tr>
<td>url</td>

</tr>
<tr>
<td>width</td>
<td>string</td>
<td>The tab icon’s width in pixels. If the icon content type is an SVG type, height and width values are not used.</td>
</tr>
</tbody>
</table>

DescribeTab

The `describeTabs()` call returns a `DescribeTabSetResult` object, of which `DescribeTab` is a property.
### Name | Type | Description
--- | --- | ---
colors | DescribeColor[] | Array of color information used for a tab. This field is available in API version 29.0 and later.
custom | boolean | true if this is a custom tab, false if this is a standard tab.
iconUrl | string | The URL for the main 32x32 pixel icon for a tab. This icon appears next to the heading at the top of most pages. This icon URL corresponds to the 32x32 icon used for the Salesforce Classic 2010 user interface theme.
icons | DescribeIcon[] | Array of icon information used for a tab. This field is available in API version 29.0 and later.
label | string | The display label for this tab.
miniIconUrl | string | The URL for the 16x16 pixel icon that represents a tab. This icon appears in related lists and other locations. This icon URL corresponds to the 16x16 icon used for the current Salesforce theme, introduced in Spring ’10.
name | string | The API name of the tab.
sobjectName | string | The name of the sObject that is primarily displayed on this tab (for tabs that display a particular sObject). For a list of objects, see Standard Objects.
url | string | A fully qualified URL for viewing this tab.

SEE ALSO:
- DescribeColor
- DescribeIcon

**describeTheme()**

Returns information about themes available to the current logged-in user.

**Syntax**

```
DescribeThemeResult = connection.describeTheme(string sObjectType[]);
```

**Usage**

Use `describeTheme()` to get current theme information for a given array of objects. Theme information consists of colors and icons for an object in Salesforce, used for a particular theme. For example, the Merchandise__c object might use the "computer32" icon and a primary tab color of red for the regular Salesforce application theme, and a different set of colors and icons for the mobile touchscreen version of Salesforce.

If you pass null instead of an array of objects, `describeTheme()` returns theme information for all objects in your organization that use theme colors and icons.

Your client application must be logged in with sufficient access rights to retrieve theme information about your organization’s data. For more information, see Factors that Affect Data Access.

`describeTheme()` is available in API version 29.0 and later.
Sample

This Java sample calls `describeTheme()` to retrieve theme information for Account and Contact, and then iterates over the retrieved theme information.

```java
public static void describeThemeExample() {
    try {
        // Get current themes
        DescribeTheme themeResult = connection.describeTheme(
            new String[] { "Account", "Contact" });
        DescribeThemeItem[] themeItems = themeResult.getThemeItems();
        for (int i = 0; i < themeItems.length; i++) {
            DescribeThemeItem themeItem = themeItems[i];
            System.out.println("Theme information for object " + themeItem.getName());
            // Get color and icon info for each themeItem
            DescribeColor colors[] = themeItem.getColors();
            System.out.println(" Number of colors: " + colors.length);
            for (int k = 0; k < colors.length; k++) {
                DescribeColor color = colors[k];
                System.out.println(" For Color #" + k + ":");
                System.out.println(" Web RGB Color: " + color.getColor());
                System.out.println(" Context: " + color.getContext());
                System.out.println(" Theme: " + color.getTheme());
            }  
            DescribeIcon icons[] = themeItem.getIcons();
            System.out.println(" Number of icons: " + icons.length);
            for (int k = 0; k < icons.length; k++) {
                DescribeIcon icon = icons[k];
                System.out.println(" For Icon #" + k + ":");
                System.out.println(" ContentType: " + icon.getContentType());
                System.out.println(" Height: " + icon.getHeight());
                System.out.println(" Theme: " + icon.getTheme());
                System.out.println(" URL: " + icon.getUrl());
                System.out.println(" Width: " + icon.getWidth());
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}

CHAPTER 14  Utility Calls

This topic describes API calls that your client applications can invoke to obtain the system timestamp, user information, and change user passwords.

Note: For a list of Apex-related calls, see Apex-Related Calls, for a list of core calls, see Core Calls, and for a list of describe calls, see Describe Calls.

The following table lists the API utility calls described in this topic:

<table>
<thead>
<tr>
<th>Task / Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getServerTimestamp()</td>
<td>Retrieves the current system timestamp from the API.</td>
</tr>
<tr>
<td>changeOwnPassword()</td>
<td>Allows users to change their own passwords.</td>
</tr>
<tr>
<td>getUserInfo()</td>
<td>Retrieves personal information for the user associated with the current session.</td>
</tr>
<tr>
<td>match()</td>
<td>Evaluates sObjects provided as an input for matches among Leads, using the matching rule specified in the input MatchOptions. This call can be used only with the Standard Matching Rule for Leads on Accounts.</td>
</tr>
<tr>
<td>renderEmailTemplate()</td>
<td>Replaces merge fields in text bodies of email templates with values from Salesforce records, even for polymorphic fields. The email template bodies and their corresponding whoId and whatId values are specified in the argument.</td>
</tr>
<tr>
<td>resetPassword()</td>
<td>Changes a user's password to a system-generated value.</td>
</tr>
<tr>
<td>sendEmail()</td>
<td>Immediately sends an email message.</td>
</tr>
<tr>
<td>sendEmailMessage()</td>
<td>Immediately sends up to 10 draft email messages.</td>
</tr>
<tr>
<td>setPassword()</td>
<td>Sets the specified user's password to the specified value.</td>
</tr>
</tbody>
</table>

Samples

The samples in this section are based on the enterprise WSDL file. They assume that you have already imported the WSDL file and created a connection. To learn how to do so, see the Quick Start tutorial.

changeOwnPassword() 

Allows users to change their passwords from old values to new values that they specify.
Syntax

```java
ChangeOwnPasswordResult changeOwnPasswordResult = connection.changeOwnPassword(string oldPassword, string newPassword);
```

Usage

Use `changeOwnPassword()` to allow users to change their passwords to values that they specify. For example, a client application prompts a user to specify a different password, and then invokes `changeOwnPassword()` to change the user’s password. Use `setPassword()` if you want to set a different user’s password to a value you specify. Use `resetPassword()` if you want to reset a target user’s password with a random value generated by the API.

Sample Code—Java

This sample accepts old password and new password parameters, which it uses in the `changeOwnPassword()` call to set the new password of the user.

```java
public void doChangeOwnPassword(String oldPasswd, String newPasswd) {
    try {
        ChangeOwnPasswordResult result = connection.changeOwnPassword(oldPasswd, newPasswd);
        System.out.println("Your password was changed to "+ newPasswd);
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

Sample Code—C#

This sample accepts old password and new password parameters, which it uses in the `changeOwnPassword()` call to set the new password of the user.

```csharp
public void doChangeOwnPassword(String oldPasswd, String newPasswd)
{
    try {
        ChangeOwnPasswordResult result = binding.changeOwnPassword(oldPasswd, newPasswd);
        Console.WriteLine("Your password was changed to "+ newPasswd);
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: "+ e.Message + "\n" + e.StackTrace);
    }
}
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldPassword</td>
<td>string</td>
<td>The user's previous password that is being replaced.</td>
</tr>
<tr>
<td>newPassword</td>
<td>string</td>
<td>The user's new password.</td>
</tr>
</tbody>
</table>

SEE ALSO:
resetPassword()
Utility Calls
setPassword()

getServerTimestamp()

Retrieves the current system timestamp (Coordinated Universal Time (UTC) time zone) from the API.

Syntax

GetServerTimestampResult timestamp = connection.getServerTimestamp();

Usage

Use `getServerTimestamp()` to obtain the current system timestamp from the API. You might do this if, for example, you need to use the exact timestamp for timing or data synchronization purposes. When you `create()` or `update()` an object, the API uses the system timestamp to update the `CreatedDate` and `LastModifiedDate` fields, respectively, in the object.

The `getServerTimestamp()` call always returns the timestamp in Coordinated Universal Time (UTC) time zone. However, your local system might automatically display the results in your local time based on your time zone settings.

Note: Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.
**Sample Code—Java**

This sample gets the server time and writes it to the console in the user's local time zone.

```java
public void doGetServerTimestamp() {
    try {
        GetServerTimestampResult result = connection.getServerTimestamp();
        Calendar serverTime = result.getTimestamp();
        System.out.println("Server time is: "+ serverTime.getTime().toString());
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**Sample Code—C#**

This sample gets the server time and writes it to the console in the user's local time zone.

```csharp
public void doGetServerTimestamp()
{
    try
    {
        GetServerTimestampResult result =
            binding.getServerTimestamp();
        DateTime serverTime = result.timestamp;
        Console.WriteLine("Server time is: "+
            serverTime.ToLocalTime().ToString());
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: "+
            e.Message + "\n" + e.StackTrace);
    }
}
```

**Arguments**

None.

Utility Calls
getServerTimestampResult

The `getServerTimestamp()` call returns a `GetServerTimestampResult` object, which has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>dateTime</td>
<td>System timestamp of the API when the <code>getServerTimestamp()</code> call was executed.</td>
</tr>
</tbody>
</table>

getUserInfo()

Retrieves personal information for the user associated with the current session.

Syntax

```java
getUserInfoResult result = connection.getUserInfo();
```

Usage

Use `getUserInfo()` to obtain personal information about the currently logged-in user. This convenience API call retrieves and aggregates common profile information that your client application can use for display purposes, performing currency calculations, and so on.

The `getUserInfo()` call applies only to the username under which your client application has logged in. To retrieve additional personal information not found in the `getUserInfoResult` object, you can call `retrieve()` on the `User` object and pass in the `userID` returned by this call. To retrieve personal information about other users, you could call `retrieve()` (if you know their user ID) or `query()` on the `User` object.

Sample Code—Java

This sample calls `getUserInfo()` and writes information about the current user to the console.

```java
public void doGetUserInfo() {
    try {
        UserInfoResult result = connection.getUserInfo();
        System.out.println("\nUser Information");
        System.out.println("\tFull name: " + result.getUserFullName());
        System.out.println("\tEmail: " + result.getUserEmail());
        System.out.println("\tLocale: " + result.getUserLocale());
        System.out.println("\tTimezone: " + result.getUserTimeZone());
        System.out.println("\tCurrency symbol: " + result.getCurrencySymbol());
        System.out.println("\tOrganization is multi-currency: " +
                            result.isOrganizationMultiCurrency());
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Sample Code—C#

This sample calls getUserInfo() and writes information about the current user to the console.

```csharp
public void doGetUserInfo()
{
    try
    {
        GetUserInfoResult result = binding.getUserInfo();
        Console.WriteLine("\nUser Information");
        Console.WriteLine("\tFull name: " + result.userFullName);
        Console.WriteLine("\tEmail: " + result.userEmail);
        Console.WriteLine("\tLocale: " + result.userLocale);
        Console.WriteLine("\tTimezone: " + result.userTimeZone);
        Console.WriteLine("\tCurrency symbol: " + result.currencySymbol);
        Console.WriteLine("\tOrganization is multi-currency: " +
                          result.organizationMultiCurrency);
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " +
                          e.Message + "\n" + e.StackTrace);
    }
}
```

Arguments

None.

### match()

Evaluates sObjects provided as an input for matches among Leads, using the matching rule specified in the input MatchOptions. This call can be used only with the Standard Matching Rule for Leads on Accounts.

This operation is available in API versions 42.0 and later, in Professional, Enterprise, Performance, and Unlimited Editions with Pardot Pro or Pardot Ultimate Edition.

**Syntax**

```java
MatchResult[] callResults = connection.match(SObject[] inputSObjectArray, MatchOptions matchOptions);
```

**Arguments**

<table>
<thead>
<tr>

</table>
renderEmailTemplate()

Replaces merge fields in text bodies of email templates with values from Salesforce records, even for polymorphic fields. The email template bodies and their corresponding whoId and whatId values are specified in the argument.

Syntax

```java
RenderEmailTemplateResult = connection.renderEmailTemplate(RenderEmailTemplateRequest[] renderRequests);
```

Usage

The `renderEmailTemplate()` call is equivalent to rendering merge fields when sending an email with a custom template through the `sendEmail()` call.

The `renderEmailTemplate()` call can take up to 10 `RenderEmailTemplateRequest` elements in its array argument, and each `RenderEmailTemplateRequest` can contain up to 10 template bodies. Each request is independent from the other requests in the array—an error in one request doesn’t affect the other requests. Similarly, an error in one template body doesn’t cause an error in other text bodies within the same request.

The `renderEmailTemplate()` call substitutes a merge field with the value of either the `whatId` or `whoId` in `RenderEmailTemplateRequest`:

- If the merge field references a non-human object, it’s replaced with the corresponding value of `whatId`. For example, if a merge field references an account or opportunity, the `whatId` value is substituted.
- If the merge field references a human object, it’s replaced with the corresponding value of `whoId`. For example, if a merge field references a contact, lead, or user, the `whoId` value is substituted.

The `whatId` and `whoId` field values of `RenderEmailTemplateRequest` are validated for each request. If the `whatId` doesn’t reference a valid what ID (a non-human object), or the `whoId` doesn’t reference a valid who ID (a human object), an error is set for the request.
Sample Code—Java

In this sample, the `renderEmailTemplate()` call substitutes all contact merge fields with the value from the specified `whoId` argument. Similarly, the call substitutes the opportunity merge field `{!Opportunity.Name}` with the specified `whatId` value. The second template body in this sample has an incorrect merge field `{!Contact.SNARF}`, which causes an error on the second template. However, the entire template rendering request is successful.

```java
public void renderTemplates(String whoId, String whatId)
    throws ConnectionException, RemoteException, MalformedURLException {
    // Array of three template bodies.
    // The second template body generates an error.
    final String[] TEMPLATE_BODIES = new String[] {
        "This is a good template body {!Contact.Name}",
        "This is a bad template body {!Opportunity.Name} {!Contact.SNARF} ",
        "This is another good template body {!Contact.Name}"
    };

    // Create request and add template bodies, whatId, and whoId.
    RenderEmailTemplateRequest req = new RenderEmailTemplateRequest();
    req.setTemplateBodies(TEMPLATE_BODIES);
    req.setWhatId(whatId);
    req.setWhoId(whoId);
    // An array of results is returned, one for each request.
    // We only have one request.
    RenderEmailTemplateResult[] results = connection.renderEmailTemplate(
        new RenderEmailTemplateRequest[] { req });
    if (results != null) {
        // Check results for our one and only request.
        // Check request was processed successfully, and if not, print the errors.
        if (!results[0].isSuccess()) {
            System.out.println("The following errors were encountered while rendering email templates:");
            for (Error err : results[0].getErrors()) {
                System.out.println(err.getMessage());
            }
        } else {
            // Check results for each body template and print merged body
            RenderEmailTemplateBodyResult[] bodyResults = results[0].getBodyResults();
            for (Integer i=0;i<bodyResults.length;i++) {
                RenderEmailTemplateBodyResult result = bodyResults[i];
                if (result.isSuccess()) {
                    System.out.println("Merged body: 
" + result.getMergedBody());
                } else {
                    System.out.println("Errors were found for body[" + i + "]: ");
                    for (RenderEmailTemplateError err : result.getErrors()) {
                        System.out.println(err.getMessage() + " - Field name: "
                                + err.getFieldName());
                    }
                }
            }
        }
    }
}
```
Let's say you run this sample by specifying a valid contact ID for the first argument \( \text{whoId} \) and \text{null} for the second argument \( \text{whatId} \). The second template has one error set, for the incorrect merge field. The response looks like the following.

Merged body:
This is a good template body Howard Jones

Errors were found for body[1]:
Field Contact.SNARF does not exist. Check spelling. - Field name: Contact.SNARF

Merged body:
This is another good template body Howard Jones

**RenderEmailTemplateRequest**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| templateBodies | string[] | An array of text bodies that can contain merge fields, such as \
|             |        | \{!Account.Phone\} or \{!Contact.Name\}. |
| whatId     | reference | References a non-human object, such as an account, an opportunity, a campaign, a case, or a custom object. The whatId is polymorphic, which means that it's an ID that can refer to more than one type of object, such as a case or an opportunity. |
| whoId      | reference | References a human object, such as a lead, contact, or user. The whoId is polymorphic, which means that it's an ID that can refer to more than one type of object. |

**Fault**

The `renderEmailTemplate()` can return any of these API status codes.

- EMAIL_TEMPLATE_FORMULA_ERROR
- EMAIL_TEMPLATE_MERGEFIELD_ACCESS_ERROR
- EMAIL_TEMPLATE_MERGEFIELD_ERROR

**RenderEmailTemplateResult**

Contains status and error information for a request processed by the `renderEmailTemplate()` call, including individual results of rendered email templates.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodyResults</td>
<td><code>RenderEmailTemplateBodyResult[]</code></td>
<td>Contains status and error information for each template body that <code>renderEmailTemplate()</code> processed in a request, including merged body text of templates.</td>
</tr>
</tbody>
</table>
### RenderEmailTemplateBodyResult

Contains status and error information for each template body that `renderEmailTemplate()` processed in a request, including merged body text of templates.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td><code>RenderEmailTemplateError[]</code></td>
<td>Contains one or more errors that are associated with a template body that <code>renderEmailTemplate()</code> processed.</td>
</tr>
<tr>
<td>mergedBody</td>
<td>string</td>
<td>The text of the template body with the merge fields replaced with their corresponding values from Salesforce objects. The <code>whatId</code> and <code>whoId</code> fields on the request reference the Salesforce objects to use.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The <code>mergedBody</code> field is populated only when the rendering of the template was successful (<code>success</code> is equal to <code>true</code>). If <code>success</code> is equal to <code>false</code>, <code>mergedBody</code> is null.</td>
</tr>
<tr>
<td>success</td>
<td>boolean</td>
<td>Indicates whether a template body was successfully rendered (<code>true</code>) or not (<code>false</code>).</td>
</tr>
</tbody>
</table>

### RenderEmailTemplateError

An error that occurred when `renderEmailTemplate()` processed a template body.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fieldName</code></td>
<td>string[]</td>
<td>The merge field that affected the error condition.</td>
</tr>
<tr>
<td><code>message</code></td>
<td>string</td>
<td>Error message text.</td>
</tr>
<tr>
<td><code>offset</code></td>
<td>int</td>
<td>The offset in the template body text of the merge field that caused the error. The offset is calculated as the number of characters from the start of the body text. The offset is -1 if it can't be determined because of insufficient contextual information.</td>
</tr>
<tr>
<td><code>statusCode</code></td>
<td><code>StatusCode</code></td>
<td>A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization (see Generating the WSDL File for Your Organization).</td>
</tr>
</tbody>
</table>
**resetPassword()**

Changes a user’s password to a temporary, system-generated value.

**Syntax**

```java
string password = connection.resetPassword(ID userID);
```

**Usage**

Use `resetPassword()` to request that the API change the password of a User or SelfServiceUser, and return a system-generated password string of random letters and numbers. Use `setPassword()` instead if you want to set the password to a specific value.

Your client application must be logged in with sufficient access rights to change the password for the specified user. For more information, see Factors that Affect Data Access.

For information on IDs, see ID Field Type.

**Sample Code—Java**

This sample resets the password for the user specified by the `userId` parameter. It calls `resetPassword()` with this ID and gets the temporary password from the call result. It writes this temporary password to the console and returns it.

```java
public String doResetPassword(String userId) {
    String result = "";
    try {
        ResetPasswordResult rpr = connection.resetPassword(userId);
        result = rpr.getPassword();
        System.out.println("The temporary password for user ID " + userId + " is " + result);
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
    return result;
}
```

**Sample Code—C#**

This sample resets the password for the user specified by the `userId` parameter. It calls `resetPassword()` with this ID and gets the temporary password from the call result. It writes this temporary password to the console and returns it.

```csharp
public String doResetPassword(String userId) {
    String result = "";
    try {
        ResetPasswordResult rpr = binding.resetPassword(userId);
        result = rpr.password;
        Console.WriteLine("The temporary password for user ID " + userId + " is " + result);
    }
```
```csharp
try {
    return result;
} catch (SoapException e) {
    Console.WriteLine("An unexpected error has occurred: " + e.Message + "\n" + e.StackTrace);
}
```

### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>ID</td>
<td>ID of the User or SelfServiceUser whose password you want to reset. For information on IDs, see ID Field Type.</td>
</tr>
</tbody>
</table>

### Response

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>string</td>
<td>New password generated by the API. Once the user logs in with this password, they will be asked to provide a new password. This password is temporary, meaning that it cannot be reused once the user has set his or her new password.</td>
</tr>
</tbody>
</table>

SEE ALSO:

- Utility Calls

### sendEmail()

Immediately sends an email message.

### Syntax

For single email messages:

```csharp
SendEmailResult = connection.sendEmail(SingleEmailMessage emails[]);
```

For mass email messages:

```csharp
SendEmailResult = connection.sendEmail(MassEmailMessage emails[]);
```
Usage

Use this call with Lightning Platform AppExchange applications, custom applications, or other applications outside of Salesforce to send individual and mass email. The email can include all standard email attributes (such as subject line and blind carbon copy address), use Salesforce email templates, and be in plain text or HTML format. You can use Salesforce to track the status of HTML email, including the date the email was sent, first opened, last opened, and the total number of times it was opened. (See “Tracking HTML Email” in Salesforce Help for more information.)

The email address of the logged-in user is inserted in the From Address field of the email header. All return email and out-of-office replies go to the logged-in user. If bounce management is enabled and SingleEmailMessage.targetObjectId or MassEmailMessage.targetObjectIds is set, bounces are processed by Salesforce automatically, and the appropriate records are updated; otherwise, they go to the logged-in user. Bounce management works for contacts and leads only.

Note:

- Single email messages sent with this call count against the sending organization’s daily single email limit. When this limit is reached, sendEmail() calls using SingleEmailMessage are rejected, and the user receives a SINGLE_EMAIL_LIMIT_EXCEEDED error code. However, single emails sent through the application are allowed.
- Mass email messages sent with this call count against the sending organization’s daily mass email limit. When this limit is reached, sendEmail() calls using MassEmailMessage are rejected, and the user receives a MASS_MAIL_LIMIT_EXCEEDED error code.
- Starting in API version 35.0, you can enforce or ignore the Email Opt Out setting for contacts or leads with the optOutPolicy field of SingleEmailMessage. The optOutPolicy field applies to recipients in the To, CC, and BCC lists of the email. By default and in earlier versions, SingleEmailMessage ignores the Email Opt Out setting of recipients and the email is sent to all recipients. When using MassEmailMessage, the Email Opt Out setting of the recipients is always enforced—emails aren’t sent to recipients that have opted out and are sent to all other recipients.

SingleEmailMessage has an optional field called OrgWideEmailAddressId. This is an object ID to an OrgWideEmailAddress object. If OrgWideEmailAddressId is set, the OrgWideEmailAddress DisplayName field is used in the email header, instead of the logged-in user’s DisplayName. The sending email address in the header is also set to the field defined in OrgWideEmailAddress.

Note: If both the DisplayName in an OrgWideEmailAddress and senderDisplayName are defined, the user receives a DUPLICATE_SENDER_DISPLAY_NAME error.

Sample Code—Java

This sample creates an email message and sets its fields, including the To, CC and BCC recipients, subject, and body text. It also sets a recipient to the ID of the logged-in user using the setTargetObjectId method, which causes the email to be sent to the email address of the specified user. The sample creates an attachment and sends the email message with the attachment. Finally, it writes a status message or an error message, if any, to the console.

```java
public void doSendEmail() {
    try {
        EmailFileAttachment efa = new EmailFileAttachment();
        byte[] fileBody = new byte[1000000];
        efa.setBody(fileBody);
        efa.setFileName("attachment");
        SingleEmailMessage message = new SingleEmailMessage();
        message.setBccAddresses(new String[] {
            "someone@salesforce.com"
        });
    }
```
message.setCcAddresses(new String[] {
    "person1@salesforce.com", "person2@salesforce.com", "003xx00000a1b2cAAC"
});
message.setBccSender(true);
message.setEmailPriority(EmailPriority.High);
message.setReplyTo("person1@salesforce.com");
message.setSaveAsActivity(false);
message.setSubject("This is how you use the " + "sendEmail method.");
// We can also just use an id for an implicit to address
GetUserInfoResult guir = connection.getUserInfo();
message.setTargetObjectId(guir.getUserId());
message.setUseSignature(true);
message.setPlainTextBody("This is the humongous body "+ "of the message.");
EmailFileAttachment[] efas = { efa };  
message.setFileAttachments(efas);
message.setToAddresses(new String[] { "person3@salesforce.com" });
SingleEmailMessage[] messages = { message };
SendEmailResult[] results = connection.sendEmail(messages);
if (results[0].isSuccess()) {
    System.out.println("The email was sent successfully.");
} else {
    System.out.println("The email failed to send: " + results[0].getErrors()[0].getMessage());
}
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}

This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The SendEmailOptOutPolicy.FILTER option causes the email to be sent only to recipients that haven't opted out from email.

Sample Code—C#

This sample creates an email message and sets its fields, including the To, CC and BCC recipients, subject, and body text. It also sets a recipient to the ID of the logged-in user using the setTargetObjectId method, which causes the email to be sent to the email
address of the specified user. The sample creates an attachment and sends the email message with the attachment. Finally, it writes a status message or an error message, if any, to the console.

```java
public void doSendEmail()
{
    try
    {
        EmailFileAttachment efa = new EmailFileAttachment();
        byte[] fileBody = new byte[1000000];
        efa.body = fileBody;
        efa.fileName = "attachment";
        SingleEmailMessage message = new SingleEmailMessage();
        message.setBccAddresses(new String[]{
            "someone@salesforce.com"
        });
        message.setCcAddresses(new String[]{
            "person1@salesforce.com", "person2@salesforce.com", "003xx00000a1b2cAAC"
        });
        message.bccSender = true;
        message.emailPriority = EmailPriority.High;
        message.replyTo = "person1@salesforce.com";
        message.saveAsActivity = false;
        message.subject = "This is how you use the " + "sendEmail method.";
        // We can also just use an id for an implicit to address
        GetUserInfoResult guir = binding.getUserInfo();
        message.targetObjectId = guir.userId;
        message.useSignature = true;
        message.plainTextBody = "This is the humongous body " + "of the message.";
        EmailFileAttachment[] efas = { efa ];
        message.fileAttachments = efas;
        message.toAddresses = new String[]{ "person3@salesforce.com" };
        SingleEmailMessage[] messages = { message };
        SendEmailResult[] results = binding.sendEmail(messages);
        if (results[0].success)
        {
            Console.WriteLine("The email was sent successfully.");
        }
        else
        {
            Console.WriteLine("The email failed to send: "+ results[0].errors[0].message);
        }
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " + e.Message + "\n" + e.StackTrace);
    }
}
This example shows how to send an email with the opt-out setting enforced. Recipients are specified by their IDs. The
SendEmailOptOutPolicy.FILTER option causes the email to be sent only to recipients that haven't opted out from email.

```java
SingleEmailMessage message = new SingleEmailMessage();
// Set recipients to two contact IDs.
// Replace IDs with valid record IDs in your org.
message.toAddresses = new String[] { "003D000000QDexS", "003D000000QDfW5" };
message.optOutPolicy = SendEmailOptOutPolicy.FILTER;
message.subject = "Opt Out Test Message";
message.plainTextBody = "This is the message body.";
SingleEmailMessage[] messages = { message };
SendEmailResult[] results = binding.sendEmail(messages);
if (results[0].success)
{
    Console.WriteLine("The email was sent successfully.");
} else {
    Console.WriteLine("The email failed to send: "+ results[0].errors[0].message);
}
```

## BaseEmail

The following table contains the arguments used in both single and mass email.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bccSender</td>
<td>boolean</td>
<td>Indicates whether the email sender receives a copy of the email that is sent. For a mass mail, the sender is only copied on the first email sent.</td>
</tr>
<tr>
<td>saveAsActivity</td>
<td>boolean</td>
<td>Optional. The default value is true, meaning the email is saved as an activity. This argument only applies if the recipient list is based on targetObjectId or targetObjectIds. If HTML email tracking is enabled for the organization, you can track open rates.</td>
</tr>
<tr>
<td>useSignature</td>
<td>boolean</td>
<td>Indicates whether the email includes an email signature if the user has one configured. The default is true, meaning if the user has a signature it is included in the email unless you specify false.</td>
</tr>
<tr>
<td>emailPriority</td>
<td>picklist</td>
<td>Optional. The priority of the email.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Highest</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• High</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Normal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Low</td>
</tr>
</tbody>
</table>

Note: If templates aren't being used, all email content must be in plain text, HTML, or both.
sendEmail() Utility Calls

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replyTo</td>
<td>string</td>
<td>Optional. The email address that receives the message when a recipient replies. This can’t be set if you’re using a Visualforce email template that specifies a replyTo value.</td>
</tr>
<tr>
<td>subject</td>
<td>string</td>
<td>Optional. The email subject line. If you’re using an email template and attempt to override the subject line, an error message is returned.</td>
</tr>
<tr>
<td>templateId</td>
<td>ID</td>
<td>The ID of the template to be merged to create this email.</td>
</tr>
<tr>
<td>senderDisplayName</td>
<td>string</td>
<td>Optional. The name that appears on the From line of the email. This can’t be set if the object associated with OrgWideEmailAddressId for a SingleEmailMessage has defined its DisplayName field.</td>
</tr>
</tbody>
</table>

### SingleEmailMessage

The following table contains the arguments single email uses in addition to the base email arguments.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| bccAddresses | string[]   | Optional. An array of blind carbon copy (BCC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. This argument is allowed only when a template isn’t used. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.
<p>|              |            | You can specify opt-out email options with the optOutPolicy field only for those recipients who were added by their IDs.                                                                                      |
|              |            | Email addresses are verified to ensure that they have the correct format and haven’t been marked as bounced.                                                                                                 |
|              |            | If the BCC COMPLIANCE option is set at the organization level, the user can’t add BCC addresses on standard messages. The following error code is returned: BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED. |
|              |            | All emails must have a recipient value in at least one of the following fields:                                                                                                                              |
|              |            | • toAddresses                                                                                                                                   |
|              |            | • ccAddresses                                                                                                                                   |
|              |            | • bccAddresses                                                                                                                                  |
|              |            | • targetObjectId                                                                                                                                |
| ccAddresses  | string[]   | Optional. An array of carbon copy (CC) addresses or object IDs of the contacts, leads, and users you’re sending the email to. This                                                                           |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>string</td>
<td>Optional. The character set for the email. If this value is null, the user's default value is used. Unavailable if specifying templateId because the template specifies the character set.</td>
</tr>
<tr>
<td>documentAttachments</td>
<td>ID[]</td>
<td>Deprecated. Use entityAttachments instead. Optional. An array listing the ID of each Document you want to attach to the email.</td>
</tr>
<tr>
<td>entityAttachments</td>
<td>ID[]</td>
<td>Optional. Array of IDs of Document, ContentVersion, or Attachment items to attach to the email. This field is available in API version 35.0 and later.</td>
</tr>
<tr>
<td>fileAttachments</td>
<td>EmailFileAttachment[]</td>
<td>Optional. An array listing the file names of the binary and text files you want to attach to the email. You can attach multiple files as long as the total size of all attachments doesn’t exceed 20 MB.</td>
</tr>
<tr>
<td>htmlBody</td>
<td>string</td>
<td>Optional. The HTML version of the email, specified by the sender. The value is encoded according to the specification associated with the organization.</td>
</tr>
<tr>
<td>inReplyTo</td>
<td>string</td>
<td>Optional. The In-Reply-To field of the outgoing email. Identifies the emails to which this one is a reply (parent emails). Contains the parent emails’ Message-IDs. See RFC2822 - Internet Message Format.</td>
</tr>
<tr>
<td>optOutPolicy</td>
<td>SendEmailOptOutPolicy</td>
<td>Optional. If you add contact, lead, or person account recipients by ID instead of email address, this field determines the behavior of the sendEmail() call. By default, the opt-out settings for recipients added by their email addresses aren’t checked and those recipients always receive the email. Possible values of the SendEmailOptOutPolicy enumeration are:</td>
</tr>
</tbody>
</table>

argument is allowed only when a template isn’t used. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.

You can specify opt-out email options with the optOutPolicy field only for those recipients who were added by their IDs.

Email addresses are verified to ensure that they have the correct format and haven’t been marked as bounced.

All emails must have a recipient value in at least one of the following fields:
- toAddresses
- ccAddresses
- bccAddresses
- targetObjectId
### Description

- **SEND (default)**—The email is sent to all recipients. The recipients’ Email Opt Out setting is ignored. The setting Enforce email privacy settings is ignored.
- **FILTER**—No email is sent to recipients that have the Email Opt Out option set. Emails are sent to the other recipients. The setting Enforce email privacy settings is ignored.
- **REJECT**—If any of the recipients have the Email Opt Out option set, sendEmail() throws an error and no email is sent. The setting Enforce email privacy settings is respected, as are the selections in the data privacy record based on the Individual object. If any of the recipients have Don’t Market, Don’t Process, or Forget this Individual selected, sendEmail() throws an error and no email is sent.

*Note:* The Send Non-Commercial Email permission isn’t respected.

This field is available in API version 35.0 and later.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orgWideEmailAddressId</td>
<td>ID</td>
<td>Optional. The object ID of the OrgWideEmailAddress associated with the outgoing email. OrgWideEmailAddress.DisplayName can’t be set if the senderDisplayName field is already set.</td>
</tr>
<tr>
<td>plainTextBody</td>
<td>string</td>
<td>Optional. The text version of the email, specified by the sender.</td>
</tr>
<tr>
<td>references</td>
<td>string</td>
<td>Optional. The References field of the outgoing email. Identifies an email thread. Contains the parent emails' Message-ID and References fields and possibly In-Reply-To fields. See RFC2822 - Internet Message Format.</td>
</tr>
<tr>
<td>targetObjectId</td>
<td>ID</td>
<td>Optional. The object ID of the contact, lead, or user the email will be sent to. The object ID you enter sets the context and ensures that merge fields in the template contain the correct data.</td>
</tr>
<tr>
<td>toAddresses</td>
<td>string[]</td>
<td>Optional. An array of email addresses or object IDs of the contacts, leads, or users you’re sending the email to. This argument is allowed only when a template isn’t used. The maximum size for this field is 4,000 bytes. The maximum total of toAddresses, ccAddresses, and bccAddresses per email is 150. All recipients in these three fields count against the limit for email sent using Apex or the API.</td>
</tr>

</table>
**MassEmailMessage**

The following table contains the arguments mass email uses in addition to the base email arguments.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>string</td>
<td>A value used internally to identify the object in the mass email queue.</td>
</tr>
<tr>
<td>targetObjectIds</td>
<td>ID[]</td>
<td>An array of object IDs of the contacts, leads, or users the email will be sent to. The object IDs you enter set the context and ensure that merge fields in the template contain the correct data. The objects must be of the same type (either all contacts, all leads, or all users). You can list up to 250 IDs per email. If you specify a value for the targetObjectIds field, optionally specify a whatId as well to set the email context to a user, contact, or lead. This ensures that merge fields in the template contain the correct data.</td>
</tr>
</tbody>
</table>
| whatIds           | ID[]     | Optional. If you specify an array of contacts for the targetObjectIds field, you can specify an array of whatIds as well. This helps to further ensure that merge fields in the template contain the correct data. The values must be one of the following types:  
  - Contract  
  - Case  
  - Opportunity  
  - Product  
  If you specify whatIds, specify one for each targetObjectId; otherwise, you receive an INVALID_ID_FIELD error. |

**EmailFileAttachment**

The following table contains properties that the EmailFileAttachment uses in the SingleEmailMessage object to specify attachments passed in as part of the request, as opposed to a Document passed in using the documentAttachments argument.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>base64</td>
<td>The attachment itself.</td>
</tr>
<tr>
<td>contentType</td>
<td>string</td>
<td>Optional. The attachment’s Content-Type.</td>
</tr>
<tr>
<td>fileName</td>
<td>string</td>
<td>The name of the file to attach.</td>
</tr>
<tr>
<td>inline</td>
<td>boolean</td>
<td>Optional. Specifies a Content-Disposition of inline (true) or attachment (false). In most cases, inline content is displayed to the user when the message is opened. Attachment content requires user action to be displayed.</td>
</tr>
</tbody>
</table>

**Response**

SendEmailResult
Fault

The following API status codes can be returned. Also, `sendEmail()` can return other errors when rendering email templates. See `renderEmailTemplate()` Faults.

- `BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED`
- `BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED`
- `DUPLICATE_SENDER_DISPLAY_NAME`
- `EMAIL_ADDRESS_BOUNCED`
- `EMAIL_NOT_PROCESSED_DUE_TO_PRIOR_ERROR`
- `EMAIL_OPTED_OUT`
- `ERROR_IN_MAILER`
- `INSUFFICIENT_ACCESS_ON CROSS_REFERENCE_ENTITY`
- `INVALID_CONTENT_TYPE`
- `INVALID_EMAIL_ADDRESS`
- `INVALID_ID_FIELD`
- `INVALID_MESSAGE_ID_REFERENCE`
- `INVALID_SAVE_AS_ACTIVITY_FLAG`
- `LIMIT_EXCEEDED`
- `MALFORMED_ID`
- `MASS_MAIL_LIMIT_EXCEEDED`
- `NO_MASS_MAIL_PERMISSION`
- `REQUIRED_FIELD_MISSING`
- `SINGLE_EMAIL_LIMIT_EXCEEDED`
- `TEMPLATE_NOT_ACTIVE`
- `UNVERIFIED_SENDER_ADDRESS`

SendEmailResult

The `sendEmail()` call returns a list of SendEmailResult objects. Each SendEmailResult object has the following properties:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `success`          | boolean  | If sending single email: Indicates whether the email was successfully accepted for delivery by the message transfer agent (`true`) or not (`false`). Even if `success = true`, it does not mean the intended recipients received the email, as it could have bounced or been blocked by a spam blocker. Also, even if the email is successfully accepted for delivery by the message transfer agent, there can still be errors in the error array related to individual addresses within the email.  
  If sending mass email: Indicates whether the email was successfully added to the queue for processing (`true`) or not (`false`). Even if the email was added to the... |

3968
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SendEmailError</td>
<td>Error[]</td>
<td>If an error occurred during the sendEmail() call, a list of SendEmailError objects is returned. For single email, errors indicate that Salesforce wasn't able to deliver the email. For mass email, errors indicate that the email wasn't added to the queue for processing.</td>
</tr>
</tbody>
</table>

**SendEmailError**

SendEmailError can have the following attributes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields</td>
<td>Field[]</td>
<td>Reserved for future use. Array of one or more field names. Identifies which fields in the object, if any, affected the error condition.</td>
</tr>
<tr>
<td>Message</td>
<td>string</td>
<td>Error message text.</td>
</tr>
<tr>
<td>StatusCode</td>
<td>statusCode</td>
<td>A code that characterizes the error. The full list of status codes is available in the WSDL file for your organization.</td>
</tr>
<tr>
<td>TargetObjectId</td>
<td>ID</td>
<td>The object ID of the target for which the error occurred.</td>
</tr>
</tbody>
</table>

**Note:** If an error occurs that prevents sendEmail() from sending the email to one or more targets, each TargetObjectId for those targets has an associated error in SendEmailResult. A TargetObjectId that does not have an associated error in SendEmailResult indicates the email was sent to the target. If SendEmailResult has an error that does not have an associated TargetObjectId, no email was sent.

The following is an example of how to parse through a resulting set for errors:

```java
Messaging.SingleEmailMessage email = new Messaging.SingleEmailMessage();
email.setToAddresses(new String[] { 'admin@acme.com' });
eight.setSubject('my subject');
eight.setPlainTextBody('plain text body');
List<Messaging.SendEmailResult> results =
    Messaging.sendEmail(new Messaging.Email[] { email });
if (!results.get(0).isSuccess()) {
    System.StatusCode statusCode = results.get(0).getErrors()[0].getStatusCode();
    String errorMessage = results.get(0).getErrors()[0].getMessage();
}
```

**sendEmailMessage()**

Immediately sends up to 10 draft email messages.
Syntax
For Enterprise SOAP:

```java
SendEmailResult[] = connection.sendEmailMessage(String[] draftEmailIds);
```

For Partner SOAP:

```java
SendEmailResult[] = connection.sendEmailMessage(ID[] draftEmailIds);
```

Usage

Use this call with Lightning Platform AppExchange applications, custom applications, or other applications outside of Salesforce to send up to 10 draft email messages. The messages can include all standard email attributes (such as subject line and blind carbon copy address), use Salesforce email templates, and be in plain text or HTML format. You can use Salesforce to track the status of HTML email, including the date the email was sent, first opened, last opened, and the total number of times it was opened. (See “Tracking HTML Email” in the Salesforce online help for more information.)

The email address of the logged-in user is inserted in the From Address field of the email header. All return email and out-of-office replies go to the logged-in user. If bounce management is enabled and `SingleEmailMessage.targetObjectId` or `MassEmailMessage.targetObjectIds` is set, bounces are processed by Salesforce automatically, and the appropriate records are updated; otherwise, they go to the logged-in user. Bounce management works for contacts and leads only.

Note:

- Email messages sent with this call count against the sending organization’s daily single email limit. When this limit is reached, `sendEmailMessage()` calls using `SingleEmailMessage` are rejected, and the user receives a `SINGLE_EMAIL_LIMIT_EXCEEDED` error code. However, single emails sent through the application are allowed.
- Mass email messages sent with this call count against the sending organization’s daily mass email limit. When this limit is reached, `sendEmail()` calls using `MassEmailMessage` are rejected, and the user receives a `MASS_MAIL_LIMIT_EXCEEDED` error code.
- The AllOrNone header is not honored by this call. `sendEmailMessage()` returns partial success even if the AllOrNone header is set to true.

Sample Code—Java

This sample creates a case and a draft email message, and sets the message fields, including the From, To, CC, and BCC recipients, subject, and body text. It also creates an attachment and sends the email message with the attachment. Finally, it writes a status message or an error message, if any, to the console.

```java
public void doSendEmail() {
    try {
        //Create a case
        Case theCase = new Case();
        theCase.setSubject("Sample Case");
        SaveResult[] saveResult = connection.create(new SObject[] { theCase });
        String caseId = saveResult[0].getId();

        //Create a draft EmailMessage
        EmailMessage message = new EmailMessage();
        message.setParentId(theCase.getId());
        message.setBccAddress("bcc@email.com");
        message.setSubject("Sample Email");
        message.setBody("This is a test email.
It contains an attachment.

---

Sample attachment.

---

This is the end of the email.
");
```

```
message.setCcAddress("cc1@salesforce.com; cc2@email.com");
message.setSubject("This is how you use the sendEmailMessage method.");
message.setFromAddress("from@email.com");
message.setFromName("Sample Code");
message.setTextBody("This is the text body of the message.");
message.setStatus("5"); //"5" means Draft
message.setToAddress("to@email.com");
saveResult = connection.create(new SObject[] { message });
String emailMessageId = saveResult[0].getId();

//Create an attachment for the draft EmailMessage
Attachment att = new Attachment();
byte[] fileBody = new byte[1000000];
att.setBody(fileBody);
att.setName("attachment");
att.setParentId(emailMessageId);
connection.create(new SObject[] { att });

//Send the draft EmailMessage
SendEmailResult[] results = connection.sendEmailMessage(messages);
if (results[0].isSuccess()) {
    System.out.println("The email was sent successfully.");
} else {
    System.out.println("The email failed to send: " + results[0].getErrors()[0].getMessage());
}
}

Arguments
None.

Response
SendEmailResult[]

Fault

BCC_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED
BCC_SELF_NOT_ALLOWED_IF_BCC_COMPLIANCE_ENABLED
EMAIL_NOT_PROCESSED_DUE_TO_PRIOR_ERROR
ERROR_IN_MAILER
INSUFFICIENT_ACCESS_ON CROSSREFERENCE_ENTITY
INVALID_CONTENT_TYPE
INVALID_EMAIL_ADDRESS
INVALID_ID_FIELD
**setPassword()**

Sets the specified user’s password to the specified value.

**Syntax**

```java
SetPasswordResult setPasswordResult = connection.setPassword(ID userID, string password);
```

**Usage**

Use `setPassword()` to change the password of a User or SelfServiceUser to a value that you specify. For example, a client application might prompt a user to specify a different password, and then invokes `setPassword()` for an admin to change the user’s password. Use `resetPassword()` instead if you want to reset the password with a random value generated by the API.

This call can be used to allow users to change their own passwords, as long as their org’s Password Policies setting Allow use of `setPassword()` API for self-resets is enabled. Otherwise, use `changeOwnPassword()`, which is more secure because it verifies the user’s current password before allowing the change.

Your client application must be logged in with sufficient access rights to change the password for the specified user. For more information, see Factors that Affect Data Access.

For information on IDs, see ID Field Type.

This call can use the session ID returned in LoginResult if the password has expired. For more information, see passwordExpired.

**Sample Code—Java**

This sample accepts user ID and password parameters, which it uses in the `setPassword()` call to set the password of the specified user.

```java
public void doSetPassword(String userId, String newPassword) {
    try {
        SetPasswordResult result = connection.setPassword(userId, newPassword);
        System.out.println("The password for user ID " + userId + " changed to " + newPassword);
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
Sample Code—C#

This sample accepts user ID and password parameters, which it uses in the `setPassword()` call to set the password of the specified user.

```csharp
public void doSetPassword(String userId, String newPassword)
{
    try
    {
        SetPasswordResult result = binding.setPassword(userId, newPassword);
        Console.WriteLine("The password for user ID " + userId + " changed to " + newPassword);
    }
    catch (SoapException e)
    {
        Console.WriteLine("An unexpected error has occurred: " + e.Message + "\n" + e.StackTrace);
    }
}
```

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>ID</td>
<td>ID of the User or SelfServiceUser whose password you want to reset. For information on IDs, see ID Field Type.</td>
</tr>
<tr>
<td>password</td>
<td>string</td>
<td>New password to use for the specified user.</td>
</tr>
</tbody>
</table>

Response

`SetPasswordResult (empty)`

## CHAPTER 15   SOAP Headers

The API provides SOAP headers to client applications.

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllOrNoneHeader</td>
<td>Specifies whether a call rolls back all changes unless all records are processed successfully. This header is available in API version 20.0 and later.</td>
</tr>
<tr>
<td>AllowFieldTruncationHeader</td>
<td>Specifies the truncation behavior for some field types in API version 15.0 and later.</td>
</tr>
<tr>
<td>AssignmentRuleHeader</td>
<td>Specifies the assignment rule to use when creating or updating an Account, Case, or Lead.</td>
</tr>
<tr>
<td>CallOptions</td>
<td>Specifies the call options for an API request.</td>
</tr>
<tr>
<td>DebuggingHeader</td>
<td>Returns the debug log in the output header, <code>DebuggingInfo</code>, and specifies the level of detail in the debug log.</td>
</tr>
<tr>
<td>DisableFeedTrackingHeader</td>
<td>Specifies whether the changes made in the current call are tracked in feeds.</td>
</tr>
<tr>
<td>DuplicateRuleHeader</td>
<td>Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.</td>
</tr>
<tr>
<td>EmailHeader</td>
<td>Sends an email notification when a request is processed. Provides equivalent functionality for the Salesforce user interface.</td>
</tr>
<tr>
<td>LimitInfoHeader</td>
<td>A response header returned from calls to SOAP API. This header returns limit information for the organization. Use this header to monitor your API limits as you make calls against the organization.</td>
</tr>
<tr>
<td>LocaleOptions</td>
<td>Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as de_DE or en_GB. For more information on locales, see the <code>Language</code> field on the CategoryNodeLocalization object.</td>
</tr>
<tr>
<td>LoginScopeHeader</td>
<td>Specifies the organization ID so that you can authenticate Self-Service users for your organization using the <code>login()</code> call.</td>
</tr>
<tr>
<td>MruHeader</td>
<td>Indicates whether to update the list of most recently used items (<code>true</code>) or not (<code>false</code>).</td>
</tr>
<tr>
<td>OwnerChangeOptions</td>
<td>Specifies ownership of attachments and notes.</td>
</tr>
<tr>
<td>PackageVersionHeader</td>
<td>Specifies the package version for each installed managed package in API version 16.0 and later.</td>
</tr>
<tr>
<td>QueryOptions</td>
<td>Specifies the batch size for query results.</td>
</tr>
<tr>
<td>SessionHeader</td>
<td>Specifies the session ID returned from the login server after a successful <code>login()</code> call.</td>
</tr>
</tbody>
</table>
UserTerritoryDeleteHeader

Specifies a user to whom open opportunities are assigned when the current owner is removed from a territory.

AllOrNoneHeader

Allows a call to roll back all changes unless all records are processed successfully.
Without the AllOrNoneHeader header, records without errors are committed, while records with errors are marked as failed in the call results. This header is available in API version 20.0 and later.

Even if the header is enabled, it’s still necessary to inspect the success field in the call result for each record to identify records with errors. Each success field contains true or false indicating whether the call was processed successfully.

If there is an error associated with at least one record, the errors field in the call result for the record gives more information on the error. If other records in the same call have no errors, their errors fields indicate that they were rolled back due to other errors.

API Calls

create(), delete(), undelete(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allOrNone</td>
<td>boolean</td>
<td>If true, any failed records in a call cause all changes for the call to be rolled back. Record changes aren’t committed unless all records are processed successfully. The default is false. Some records can be processed successfully while others are marked as failed in the call results.</td>
</tr>
</tbody>
</table>

Sample Code—Java

This sample shows how to use the AllOrNoneHeader. It attempts to create two contacts. The second contact doesn’t have all required fields set and causes a failure on creation. Next, the sample sets the allOrNone field to true, and then attempts to create the contacts. Creating one of the contacts results in an error, so the entire transaction is rolled back and no contacts are created.

```java
public void allOrNoneHeaderSample() {
    try {
        // Create the first contact.
        SObject[] sObjects = new SObject[2];
        Contact contact1 = new Contact();
        contact1.setFirstName("Robin");
        contact1.setLastName("Van Persie");

        // Create the second contact. This contact doesn't
        // have a value for the required
// LastName field so the create will fail.
Contact contact2 = new Contact();
contact2.setFirstName("Ashley");
sObjects[0] = contact1;
sObjects[1] = contact2;

// Set the SOAP header to roll back the create unless
// all contacts are successfully created.
connection.setAllOrNoneHeader(true);
// Attempt to create the two contacts.
SaveResult[] sr = connection.create(sObjects);
for (int i = 0; i < sr.length; i++) {
    if (sr[i].isSuccess()) {
        System.out.println("Successfully created contact with id: " +
        sr[i].getId() + ".");
    } else {
        // Note the error messages as the operation was rolled back
        // due to the all or none header.
        System.out.println("Error creating contact: " +
        sr[i].getErrors()[0].getMessage());
        System.out.println("Error status code: " +
        sr[i].getErrors()[0].getStatusCode());
    }
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
This header has no effect in versions 14.0 and earlier.

API Calls

convertLead(), create(), merge(), process(), undelete(), update(), and upsert()

Apex: `executeanonymous()`

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| allowFieldTruncation| boolean | If true, truncate field values that are too long, which is the behavior in API versions 14.0 and earlier. Default is `false`: no change in behavior. If a string or textarea value is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. The following list shows the field types affected by truncation and this header:
  • anyType, if it represents one of the other datatypes in this list
  • email
  • encryptedstring
  • multipicklist
  • phone
  • picklist
  • string
  • textarea

Sample Code—Java

To create an account with a name that is too long for the `Name` field, use the AllowFieldTruncation header.

This sample:

1. Creates an `Account` object with a name that exceeds the field limit of 255 characters.
2. Sends the create call, which fails because of the name field length.
3. Sets the `AllowFieldTruncationHeader` to `true` and retries the account creation, which succeeds.

```java
public void allowFieldTruncationSample() {
    try {
        Account account = new Account();
        // Construct a string that is 256 characters long.
        // Account.Name's limit is 255 characters.
        String accName = "";
        for (int i = 0; i < 256; i++) {
            accName += "a";
        }
        account.setName(accName);
    // Construct an array of SObjects to hold the accounts.
```
AssignmentRuleHeader

The AssignmentRuleHeader must be specified in the create() or update() call of a Case or Lead for the specified assignment rule to be applied, and it must be specified in the update() call of an Account for the territory assignment rules to be applied.

API Calls

create(), merge(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assignmentRuleId</td>
<td>ID</td>
<td>The ID of a specific assignment rule to run for the Case or Lead. The assignment rule can be active or inactive. The ID can be retrieved by querying the AssignmentRule object. If specified, do not specify useDefaultRule. This element is ignored for accounts, because all territory assignment rules are applied. If the value is not in correct ID format (15-character or 18-character Salesforce ID), the call fails and a MALFORMED_ID exception is returned.</td>
</tr>
<tr>
<td>useDefaultRule</td>
<td>boolean</td>
<td>If true for a Case or Lead, uses the default (active) assignment rule for a Case or Lead. If specified, do not specify an assignmentRuleId. If true for an Account, all territory assignment rules are applied, and if false, no territory assignment rules are applied.</td>
</tr>
</tbody>
</table>
Sample Code

For a code example, see Lead.

SEE ALSO:
   AssignmentRule

CallOptions

Specifies the options needed to work with a specific client. This header is only available for use with the Partner WSDL.

API Calls

The defaultNamespace element supports the following calls: create(), merge(), queryAll(), query(), queryMore(), retrieve(), search(), update(), and upsert().

The client element supports all of the above calls, plus the following: convertLead(), login(), delete(), describeGlobal(), describeLayout(), describeTabs(), describeSObject(), describeSObjects(), getDeleted(), getUpdated(), process(), undelete(), getServerTimestamp(), getUserInfo(), setPassword(), and resetPassword().

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client</td>
<td>string</td>
<td>A string that identifies a client.</td>
</tr>
<tr>
<td>defaultNamespace</td>
<td>string</td>
<td>A string that identifies a developer namespace prefix. Use this field to resolve field names in managed packages without having to fully specify the fieldName everywhere. For example, if the developer namespace prefix is battle, and you have a custom field in your package called botId, you can set this header, and then queries such as the following will succeed:</td>
</tr>
</tbody>
</table>

```xml
query("SELECT id, botId__c from Account");
```

In this case the actual field queried is the battle__botId__c field. Using this field allows you to write client code without having to specify the namespace prefix. Without this field specified, the full name of the field would have to be used for the query to succeed. In the example above, you would have to specify battle__botId__c. Note that if this field is set, and the query specifies the namespace as well, the response will not include the prefix. For example, if you set this header to battle, and issue a query like query("SELECT id, battle__botId__c from Account");, the response would use a botId__c element, not a battle__botId__c element. Describe calls ignore this header, so there will be no ambiguity between fields with namespace prefixes and customer fields of the same name without the prefix.
Sample Code—C#

This sample shows how to use the `CallOptions` header. It sets a client ID and a developer namespace prefix, which is used to resolve field names in managed packages. Next, the sample logs the specified user in.

```csharp
public void CallOptionsSample()
{
    // Web Reference to the imported Partner WSDL.
    APISamples.partner.SforceService partnerBinding;
    
    string username = "USERNAME";
    string password = "PASSWORD";
    
    // The real Client ID will be an API Token provided by salesforce.com
    // to partner applications following a security review.
    // For more details, see the Security Review FAQ in the online help.
    string clientId = "SampleCaseSensitiveToken/100";
    
    partnerBinding = new SforceService();
    partnerBinding.CallOptionsValue = new CallOptions();
    partnerBinding.CallOptionsValue.client = clientId;
    
    // Optionally, if a developer namespace prefix has been registered for
    // your Developer Edition organization, it may also be specified.
    string prefix = "battle";
    partnerBinding.CallOptionsValue.defaultNamespace = prefix;
    
    try
    {
        APISamples.partner.LoginResult lr =
            partnerBinding.login(username, password);
    }
    catch (SoapException e)
    {
        Console.WriteLine(e.Code);
        Console.WriteLine(e.Message);
    }
}
```

DisableFeedTrackingHeader

Specifies that changes made in the current call are tracked in feeds.

Use this header if you want to process many records without tracking the changes in various feeds related to the records. This header is available if the Chatter feature is enabled for your organization.

API Calls

`convertLead()`, `create()`, `delete()`, `merge()`, `process()`, `undelete()`, `update()`, `upsert()`
### Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disableFeedTracking</td>
<td>boolean</td>
<td>If true, the changes made in the current call are not tracked in feeds. The default is false.</td>
</tr>
</tbody>
</table>

### Sample Code—Java

This sample shows how to use the `DisableFeedTrackingHeader`. It sets this header to `true` to disable feed tracking and then creates many account records in bulk.

```java
public void disableFeedTrackingHeaderSample() {
    try {
        // Insert a large number of accounts.
        SObject[] sObjects = new SObject[500];
        for (int i = 0; i < 500; i++) {
            Account a = new Account();
            a.setName("my-account-" + i);
            sObjects[i] = a;
        }
        // Set the SOAP header to disable feed tracking to avoid generating a large number of feed items because of this bulk operation.
        connection.setDisableFeedTrackingHeader(true);
        // Perform the bulk create. This won't result in 500 feed items, which would otherwise be generated without the DisableFeedTrackingHeader.
        SaveResult[] sr = connection.create(sObjects);
        for (int i = 0; i < sr.length; i++) {
            if (sr[i].isSuccess()) {
                System.out.println("Successfully created account with id: " + sr[i].getId() + ".");
            } else {
                System.out.println("Error creating account: " + sr[i].getErrors()[0].getMessage());
            }
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**SEE ALSO:**

- Custom Object__Feed
- EntitySubscription

### DebuggingHeader

Return the debug log in the output header, `DebuggingInfo`, and specify the level of detail in the debug log.
**Note:** Calls that include DebuggingHeader are limited to 1,000 in a 24-hour period. You can continue to make these calls even after reaching the total request limit for an org.

**API Calls**

`compileAndTest(), executeAnonymous(), runTests()`

**Fields**

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>categories</td>
<td>LogInfo[]</td>
<td>Specifies the type and amount of information to be returned in the debug log.</td>
</tr>
</tbody>
</table>
| debugLevel   | DebugLevel         | Deprecated. This field is provided only for backward compatibility. If you provide values for both debugLevel and categories, the categories value is used. The debugLevel field specifies the type of information returned in the debug log. The values are listed from the least amount of information returned to the most information returned. Valid values include:  
  • None  
  • Debugonly  
  • Db  
  • Profiling  
  • Callout  
  • Detail |

**LogInfo**

Specifies the type and amount of information to be returned in the debug log. The `categories` field takes a list of these objects. LogInfo is a mapping of `category` to `level`.

**Fields**

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| category     | LogCategory     | Specify the type of information returned in the debug log. Valid values are:  
  • Db  
  • Workflow  
  • Validation  
  • Callout  
  • Apex_code  
  • Apex_profiling  
  • Visualforce |
### DuplicateRuleHeader

Determines options for using duplicate rules to detect duplicate records. Duplicate rules are part of the Duplicate Management feature.

#### API Calls

`create(), update(), upsert()`

#### Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowSave</td>
<td>boolean</td>
<td>For a duplicate rule, when the Alert option is enabled, bypass alerts and save duplicate records by setting this property to <code>true</code>. Prevent duplicate records from being saved by setting this property to <code>false</code>.</td>
</tr>
<tr>
<td>includeRecordDetails</td>
<td>boolean</td>
<td>Get fields and values for records detected as duplicates by setting this property to <code>true</code>. Get only record IDs for records detected as duplicates by setting this property to <code>false</code>.</td>
</tr>
<tr>
<td>runAsCurrentUser</td>
<td>boolean</td>
<td>Make sure that sharing rules for the current user are enforced when duplicate rules run by setting this property to <code>true</code>. Use the sharing rules specified in the class for the request by setting this property to <code>false</code>. If no sharing rules are specified, Apex code runs in system context and sharing rules for the current user are not enforced.</td>
</tr>
</tbody>
</table>
Java Sample

This sample shows how to use the DuplicateRuleHeader to set options for using duplicate rules. To see the entire sample application, see DuplicateResult.

```java
_DuplicateRuleHeader header = new _DuplicateRuleHeader();
header.setAllowSave(false);
header.setIncludeRecordDetails(true);
header.setRunAsCurrentUser(true);

binding.setHeader(new SforceServiceLocator().getServiceName().getNamespaceURI(),
"DuplicateRuleHeader", header);
```

- DuplicateRule

EmailHeader

The Salesforce user interface allows you to specify whether to send an email when these events occur:

- Create a Case
- Create a CaseComment
- Convert Case email to a Contact
- Send a New User email notification
- Make a resetPassword() call

In API versions 8.0 and later, you can also send an API request that sends email.

A group event is an Event for which IsGroupEvent is true. The EventRelation object tracks the users, leads, or contacts that are invited to a group event. Note the following behaviors for group event email sent through the API:

- Sending a group event invitation to a |User respects the triggerUserEmail option
- Sending a group event invitation to a Lead or Contact respects the triggerOtherEmail option
- Email sent when updating or deleting a group event also respect triggerUserEmail and triggerOtherEmail, as appropriate

API Calls

create(), delete(), resetPassword(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>triggerAutoResponseEmail</td>
<td>boolean</td>
<td>Indicates whether to trigger auto-response rules (true) or not (false), for leads and cases. In the Salesforce user interface, this email can be automatically triggered by a number of events, for example creating a case or resetting a</td>
</tr>
</tbody>
</table>
user password. If this value is set to `true`, when a Case is created, if there is an email address for the contact specified in `ContactId`, the email is sent to that address. If not, the email is sent to the address specified in `SuppliedEmail`.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>triggerOtherEmail</td>
<td>boolean</td>
<td>Indicates whether to trigger email outside the organization (<code>true</code>) or not (<code>false</code>). In the Salesforce user interface, this email can be automatically triggered by creating, editing, or deleting a contact for a case.</td>
</tr>
<tr>
<td>triggerUserEmail</td>
<td>boolean</td>
<td>Indicates whether to trigger email that is sent to users in the organization (<code>true</code>) or not (<code>false</code>). In the Salesforce user interface, this email can be automatically triggered by a number of events; resetting a password, creating a new user, or adding comments to a case.</td>
</tr>
</tbody>
</table>

**Sample Code—Java**

This sample shows how to use the `EmailHeader`. It sets the `triggerAutoResponseEmail` email header field to `true`, which triggers an email to be sent when a case is created. Next, it creates a case. This sample assumes an auto-response rule has been set for cases, and an email address is specified in the contact referenced by `ContactId`.

```java
public void createCaseWithAutoResponse(String contactId) {
    try {
        connection.setEmailHeader(true, false, false);
        Case c = new Case();
        c.setSubject("Sample Subject");
        c.setContactId(contactId);
        SaveResult[] sr = connection.create(new SObject[] { c });
        // Parse sr array to see if case was created successfully.
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

**LimitInfoHeader**

A response header returned from calls to SOAP API. This header returns limit information for the organization. Use this header to monitor your API limits as you make calls against the organization.

**API Calls**

All calls, except for `login()`.
Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>string</td>
<td>The number of calls for the specified limit type that have already been used in the organization.</td>
</tr>
<tr>
<td>limit</td>
<td>string</td>
<td>The organization's limit for the specified limit type.</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>The type of limit information specified in the header.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>API REQUESTS</strong>— the daily API usage for the organization against which the call was made.</td>
</tr>
</tbody>
</table>

Sample Code

This example shows a response to a SOAP request for a Merchandise record. The LimitInfoHeader contains the API usage information for the organization.

```
<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  xmlns="urn:partner.soap.sforce.com" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:sf="urn:sobject.partner.soap.sforce.com">
  <soapenv:Header>
    <LimitInfoHeader>
      <limitInfo>
        <current>5</current>
        <limit>100000</limit>
        <type>API REQUESTS</type>
      </limitInfo>
    </LimitInfoHeader>
  </soapenv:Header>
  <soapenv:Body>
    <queryResponse>
      <result xsi:type="QueryResult">
        <done>true</done>
        <queryLocator xsi:nil="true"/>
        <records xsi:type="sf:sObject">
          <sf:type>dev_ns__Merchandise__c</sf:type>
          <sf:Id>a00D0000008pQSNIA2</sf:Id>
          <sf:dev_ns__Description__c>Phone Case for iPhone 4/4S</sf:dev_ns__Description__c>
          <sf:dev_ns__Price__c>16.99</sf:dev_ns__Price__c>
          <sf:dev_ns__Stock_Price__c>12.99</sf:dev_ns__Stock_Price__c>
          <sf:dev_ns__Total_Inventory__c>108.0</sf:dev_ns__Total_Inventory__c>
        </records>
      </result>
    </queryResponse>
  </soapenv:Body>
</soapenv:Envelope>
```
LocaleOptions

Specifies the language of the labels returned.

API Calls

describeSObject(), describeSObjects(), describeDataCategoryGroups(),
describeDataCategoryGroupStructures()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>string</td>
<td>Specifies the language of the labels returned. The value must be a valid user locale (language and country), such as de_DE or en_GB. For more information on locales, see the Language field on the CategoryNodeLocalization object.</td>
</tr>
</tbody>
</table>

Sample Code—Java

This sample sets the LocaleOptions header to the locale of the logged-in user, and then performs a describe on Account.

```java
public void localeOptionsExample() {
    try {
        connection.setLocaleOptions("en_US");
        connection.describeSObject("Account");
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

LoginScopeHeader

Specifies your organization ID so that you can authenticate Self-Service users for your organization using the existing login().

Note: Starting with Spring `12, the Self-Service portal isn’t available for new Salesforce orgs. Existing orgs continue to have access to the Self-Service portal.

API Calls

login()
Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>organizationId</td>
<td>ID</td>
<td>The ID of the organization against which you authenticate Self-Service users.</td>
</tr>
</tbody>
</table>
| portalId         | ID   | Specify only if user is a Customer Portal user. The ID of the portal for this organization. The ID is available in the Salesforce user interface:  

- From Setup, enter Customer Portal Settings in the Quick Find box, then select Customer Portal Settings
- Select a Customer Portal name, and on the Customer Portal detail page, the URL of the Customer Portal displays. The Portal ID is in the URL. |

Sample Code—C#

This sample shows how to use the LoginScopeHeader. It sets the organization ID and the portal ID for a Customer Portal user. It also sets the CallOptions header. It then logs the specified user in.

```csharp
/// Demonstrates how to set the LoginScopeHeader values.
public void LoginScopeHeaderSample()
{
    // Web Reference to the imported Partner WSDL.
    APIsamples.partner.SforceService partnerBinding;

    string username = "USERNAME";
    string password = "PASSWORD";

    // The real Client ID will be an API Token provided by salesforce.com
    // to partner applications following a security review. For more details,
    // see the Security Review FAQ in the online help.
    string clientId = "SampleCaseSensitiveToken/100";

    partnerBinding = new SforceService();
    partnerBinding.CallOptionsValue = new CallOptions();
    partnerBinding.CallOptionsValue.client = clientId;

    // To authenticate Self-Service users, we need to set the OrganizationId
    // in the LoginScopeHeader.
    string orgId = "00D000000OrgFoo";
    partnerBinding.LoginScopeHeaderValue = new LoginScopeHeader();
    partnerBinding.LoginScopeHeaderValue.organizationId = orgId;

    // Specify the Portal ID if the user is a Customer Portal user.
    string portalId = "00D000000FooPtl";
    partnerBinding.LoginScopeHeaderValue.portalId = portalId;

    try
    {
        APIsamples.partner.LoginResult lr =
            partnerBinding.login(username, password);
    }
}
```
catch (SoapException e)
{
    Console.WriteLine(e.Code);
    Console.WriteLine(e.Message);
}

MruHeader

In API version 7.0 and later, the create(), update(), and upsert() calls do not update the list of most recently used (MRU) items in the Recent Items section of the sidebar in the Salesforce user interface unless this header is used. Be advised that using this header to update the Recent Items list may negatively impact performance.

API Calls
create(), merge(), query(), retrieve(), update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>updateMru</td>
<td>boolean</td>
<td>Indicates whether to update the list of most recently used items (true) or not (false). For retrieve(), if the result has only one row, the MRU is updated to the ID of the retrieve result. For query(), if the result has only one row and the ID field is selected, the MRU is updated to the ID of the query result.</td>
</tr>
</tbody>
</table>

Sample Code—Java

This sample turns on the MRU list update option by setting the MruHeader to true. Next, it creates an account.

```java
public void mruHeaderSample() {
    connection.setMruHeader(true);
    Account account = new Account();
    account.setName("This will be in the MRU");
    try {
        SaveResult[] sr = connection.create(new SObject[]{account});
        System.out.println("ID of account added to MRU: " + sr[0].getId());
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```
OwnerChangeOptions

Represents actions that can be performed when a record’s owner is changed. Available with these options in API version 35.0 and later.

API Calls

update(), upsert()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>OwnerChangeOption[]</td>
<td>Represents a flag for a specific action performed when changing a record owner through an update or upsert call.</td>
</tr>
</tbody>
</table>

OwnerChangeOption Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execute</td>
<td>boolean</td>
<td>If true, the action represented by the type field is performed. If false, the action represented by the type field is skipped.</td>
</tr>
<tr>
<td>type</td>
<td>enum of a string</td>
<td>Represents the action performed or skipped, according to the given value for the execute field, when changing a record owner during an update or upsert call. The following types can be used.</td>
</tr>
</tbody>
</table>

- **EnforceNewOwnerHasReadAccess**
  - If true, the record’s new owner must have at least read access on the record.
  - Available in API version 36.0 and later.

- **KeepAccountTeam**
  - If true, the account team is kept with the account when the account owner is changed. If false, the account team is deleted. Default is false. Available for accounts in API version 45.0 and later.

- **KeepSalesTeam**
  - If true, the opportunity team is kept with the opportunity when the account owner is changed. If false, the opportunity team is deleted. Default is false. Available for opportunities in API version 44.0 and later.

- **KeepSalesTeamGrantCurrentOwnerReadWriteAccess**
  - If true, the opportunity’s previous owner retains read/write access after the owner is changed. Default is false. Can be true only when KeepSalesTeam is true. Available for opportunities in API version 44.0 and later.

- **SendEmail**
  - If true, an email notification is sent to the new owner. Default is false.
<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransferAllOwnedCases</td>
<td></td>
<td>If true, all cases (open and closed) owned by the account owner are transferred to the new owner. Default is false. When TransferAllOwnedCases is true, TransferOwnedOpenCases must also be true. Available for accounts in API version 45.0 and later.</td>
</tr>
<tr>
<td>TransferArticleOwnedPublishedVersion</td>
<td></td>
<td>If true and the record is a Knowledge article, the article owner's published version for the language of the current draft is transferred to the new owner, in addition to the current draft.</td>
</tr>
<tr>
<td>TransferArticleOwnedArchivedVersions</td>
<td></td>
<td>If true and the record is a Knowledge article, the article owner's archived versions for the language of the current draft are transferred to the new owner, in addition to the current draft.</td>
</tr>
<tr>
<td>TransferArticleAllVersions</td>
<td></td>
<td>If true and the record is a Knowledge article, all published and archived versions owned by anyone for the language of the current draft are transferred to the new owner, in addition to the current draft.</td>
</tr>
<tr>
<td>TransferContacts</td>
<td></td>
<td>If true and the record is a business account, contacts associated with the account are transferred to the new owner.</td>
</tr>
<tr>
<td>TransferContracts</td>
<td></td>
<td>If true and the record is an account, contracts associated with the account and owned by the account owner are transferred to the new owner.</td>
</tr>
<tr>
<td>TransferNotesAndAttachments</td>
<td></td>
<td>If true, the record's notes, attachments, and Google Docs are transferred to the new record owner. If false, the original record owner retains ownership.</td>
</tr>
<tr>
<td>TransferOpenActivities</td>
<td></td>
<td>If true, the record's open activities are transferred to the new owner.</td>
</tr>
<tr>
<td>TransferOrders</td>
<td></td>
<td>If true and the record is an account, the draft standalone orders associated with the account and draft orders associated with transferred contracts owned by the account owner are transferred to the new owner.</td>
</tr>
<tr>
<td>TransferOtherOpenOpportunities</td>
<td></td>
<td>If true and the record is an account, open opportunities associated with the account and not owned by the current owner are transferred to the new owner. When this option is executed, TransferOwnedOpenOpportunities must be set to execute. Default is false.</td>
</tr>
<tr>
<td>TransferOwnedClosedOpportunities</td>
<td></td>
<td>If true and the record is an account, closed opportunities owned by the account owner are transferred to the new owner. Default is false. Available for API version 45.0 and later.</td>
</tr>
<tr>
<td>Element Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TransferOwnedOpenCases</td>
<td></td>
<td>If true and the record is an account, open cases owned by the account owner are transferred to the new owner. Default is false. Available for API version 45.0 and later.</td>
</tr>
<tr>
<td>TransferOwnedOpenOpportunities</td>
<td></td>
<td>If true and the record is an account, open opportunities associated with the account and owned by the account owner are transferred to the new owner.</td>
</tr>
</tbody>
</table>

**Sample Code—Java**

This sample creates an account, a note, an opportunity, and task for the account. It sets the owner change options so that the note, opportunity, and task are transferred to the new owner along with the account.

```java
public void ownerChangeOptionsHeaderSample() {
    // Create account. Accounts don't transfer activities, notes, or attachments by default

    Account account = new Account();
    account.setName("Account");
    com.sforce.soap.enterprise.SaveResult[] sr = connection.create(new
    com.sforce.soap.enterprise.sobject.SObject[] { account } );
    String accountId = null;

    if(sr[0].isSuccess()) {
        System.out.println("Successfully saved the account");
        accountId = sr[0].getId();

        // Create a note, a task, and an opportunity for the account

        Note note = new Note();
        note.setTitle("Note Title");
        note.setBody("Note Body");
        note.setParentId(accountId);

        Task task = new Task();
        task.setWhatId(accountId);

        Opportunity opportunity = new Opportunity();
        opportunity.setStageName("Prospecting");
        Calendar dt = connection.getServerTimestamp().getTimestamp();
        dt.add(Calendar.DAY_OF_MONTH, 7);
        opportunity.setCloseDate(dt);
        opportunity.setAccountId(accountId);

        sr = connection.create(new com.sforce.soap.enterprise.sobject.SObject[] { note, task, opportunity } );
```
if(sr[0].isSuccess()) {
    System.out.println("Successfully saved the note, task, and opportunity");

    com.sforce.soap.enterprise.QueryResult qr = connection.query("SELECT Id FROM User WHERE FirstName = 'Jane' AND LastName = 'Doe'");
    String newOwnerId = qr.getRecords()[0].getId();
    account.setId(accountId);
    account.setOwnerId(newOwnerId);

    // Set owner change options so account's child note, task, and opportunity transfer to new owner
    OwnerChangeOption opt1 = new OwnerChangeOption();
    opt1.setExecute(true);
    opt1.setType(OwnerChangeOptionType.TransferOwnedOpenOpportunities); // Transfer Open opportunities owned by the account's owner

    OwnerChangeOption opt2 = new OwnerChangeOption();
    opt2.setExecute(true);
    opt2.setType(OwnerChangeOptionType.TransferOpenActivities);

    OwnerChangeOption opt3 = new OwnerChangeOption();
    opt3.setExecute(true);
    opt3.setType(OwnerChangeOptionType.TransferNotesAndAttachments);

    connection.setOwnerChangeOptions(new OwnerChangeOption[] {opt1, opt2, opt3});
    connection.update(new com.sforce.soap.enterprise.sobject.SObject[] {account});

    // The account's note, task, and opportunity should be transferred to the new owner.
}

else {
    System.out.println("Account save failed: " + sr[0].getErrors().toString());
}

---

PackageVersionHeader

Specifies the package version for each installed managed package.

A managed package can have several versions with different content and behavior. This header allows you to specify the version used for each package referenced by your API client.

If a package version is not specified, the API client uses the version of the package specified in Setup (enter API in the Quick Find box, then select API).

This header is available in API version 16.0 and later.
**Associated API Calls**

convertLead(), create(), delete(), describeGlobal(), describeLayout(), describeSObject(), describeSObjects(), describeSoftphoneLayout(), describeTabs(), merge(), process(), query(), retrieve(), search(), undelete(), update(), upsert()

**Fields**

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>packageVersions</td>
<td>PackageVersion[]</td>
<td>A list of package versions for installed managed packages referenced by your API client.</td>
</tr>
</tbody>
</table>

**PackageVersion**

Specifies a version of an installed managed package. A package version is majorNumber.minorNumber, for example 2.1.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorNumber</td>
<td>int</td>
<td>The major version number of a package version.</td>
</tr>
<tr>
<td>minorNumber</td>
<td>int</td>
<td>The minor version number of a package version.</td>
</tr>
<tr>
<td>namespace</td>
<td>string</td>
<td>The unique namespace of the managed package.</td>
</tr>
</tbody>
</table>

**Sample Code—Java**

This sample sets the package version for one installed package in the PackageVersionHeader. Next, it executes the code passed into this method via the executeAnonymous Apex method.

```java
public void PackageVersionHeaderSample(String code) throws Exception {
  _PackageVersionHeader pvh = new _PackageVersionHeader();
  PackageVersion pv = new PackageVersion();
  pv.setNamespace("installedPackageNamespaceHere");
  pv.setMajorNumber(1);
  pv.setMinorNumber(0);
  // In this case, we are only referencing one installed package.
  PackageVersion[] pvs = new PackageVersion[] {pv};
  pvh.setPackageVersions(pvs);

  apexBinding.setHeader(new SforceServiceLocator().getServiceName().getNamespaceURI(),
      "PackageVersionHeader", pvh);
  // Execute the code passed into the method.
  ExecuteAnonymousResult r = apexBinding.executeAnonymous(code);
  if (r.isSuccess()) {
    System.out.println("Code executed successfully");
  } else {
    System.out.println("Exception message: " + r.getExceptionMessage());
  }
}
```
System.out.println("Exception stack trace: " + r.getExceptionStackTrace());
}

QueryOptions

Specifies the preferred batch size for queries. The system sometimes creates batches that are larger or smaller than the specified size to maximize performance.

Associated API Calls

query(), queryMore(), retrieve()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>batchSize</td>
<td>int</td>
<td>The batch size for the number of records returned in a query() or queryMore() call. Child objects count toward the number of records for the batch size. For example, in relationship queries, multiple child objects are returned per parent row returned. The default is 500; the minimum is 200, and the maximum is 2,000. There is no guarantee that the requested batch size requested is the actual batch size; changes are sometimes made to maximize performance.</td>
</tr>
</tbody>
</table>

Sample Code

For code examples, see Change the Batch Size in Queries in the Salesforce SOQL and SOSL Reference Guide.

SessionHeader

Specifies the session ID returned from the login server after a successful login(). This session ID is used in all subsequent calls. In version 12.0 and later, include the API namespace in the SOAP message associated with this header. The namespace is defined in the enterprise or partner WSDL.

API Calls

All calls, including utility calls.

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sessionId</td>
<td>string</td>
<td>Session ID returned by the login() call to be used for subsequent call authentication.</td>
</tr>
</tbody>
</table>
Sample Code

See the examples provided for login().

UserTerritoryDeleteHeader

![Note:](image)

The original territory management feature is now unavailable. For more information, see The Original Territory Management Module Will Be Retired in the Summer '21 Release. The information in this topic applies to the original territory management feature only, and not to Enterprise Territory Management.

Specify a user to whom open opportunities are assigned when the current owner is removed from a territory. If this header is not used or the value of its element is null, the opportunities are transferred to the forecast manager in the territory above, if one exists. If one does not exist, the user being removed from the territory keeps the opportunities.

API Calls

delete()

Fields

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transferToUserId</td>
<td>ID</td>
<td>The ID of the user to whom open opportunities in that user's territory will be assigned when an opportunity's owner (user) is removed from a territory.</td>
</tr>
</tbody>
</table>

- XML Compliance
- .NET, Non-String Fields, and the Enterprise WSDL

Before you build an integration app or other client app, consider the data management, use limits, and communication issues explained in this section.
Choosing a User for an Integration

When your client app connects to the API, it must first log in. You must specify a user to log in to Salesforce when calling `login()`.

Client apps run with the permissions and sharing of the logged-in user. Use the following sections to help decide how to configure a user for your client app.

**Permissions**

As an org's Salesforce admin, you control which features and views are available to users by configuring profiles and permission sets and assigning users to them. To access the API to issue calls and receive the call results, a user must have the API Enabled permission.

Client apps can query or update only those objects and fields to which they have access via the permissions of the logged-in user.

If the client application logs in as a user who has access to data via a sharing rule, then the API must issue an extra query to check access. To avoid this, log in as a user with the "Modify All Data" permission. This can speed up the call response time. If providing the Modify All Data permission is too permissive for a particular user, consider using the Modify All object-level permission to restrict data access on an object basis. For more information, see Factors that Affect Data Access.

**Limits**

Salesforce limits the number of queries that a user can execute concurrently. A user can have up to 10 query cursors open at a time. If 10 `QueryLocator` cursors are open when a client application, logged in as the same user, attempts to open a new one, then the oldest of the 10 cursors is released. If the client application attempts to open the released query cursor, an error results.

Multiple client apps can log in using the same `username` argument. However, this approach increases your risk of getting errors due to query limits.

If multiple client apps are logged in with the same user, they all share the same session. If one of the client apps calls `logout()`, it invalidates the session for all the client apps. Using a different user for each client app makes it easier to avoid these limits.

**Login Server URL**

SOAP API provides a single login server. You can log in to any org from a single entry point without hard coding the instance. To access an org via the API, first authenticate the session by sending a `login()` request to the login server at one of the following URLs, depending on your choice of WSDL.

- `https://login.salesforce.com/services/Soap/c/53.0` (enterprise WSDL)
- `https://login.salesforce.com/services/Soap/u/53.0` (partner WSDL)

The less secure version of each URL is also supported.

- `http://login.salesforce.com/services/Soap/c/53.0` (enterprise WSDL)
- `http://login.salesforce.com/services/Soap/u/53.0` (partner WSDL)

The less secure version of the URL is supported, but not recommended. It is helpful for debugging through proxy servers.

All subsequent calls to the server during the session should be made to the URL returned in the `login()` response, which points to the server instance for your org.
Log In to the Login Server

Before invoking any other calls, a client app must first invoke the `login()` call to establish a session with the login server. It then sets the returned server URL as the target server for subsequent API requests and sets the returned session ID in the SOAP header to provide server authorization for subsequent API requests. Salesforce checks the IP address from which the client app is logging in and blocks logins from unknown IP addresses. For more information, see `login()` and Step 4: Walk Through the Sample Code.

If the API blocks the login, Salesforce returns a login fault. To log in, the user must add the security token at the end of the user's password. For example, if a user’s password is `mypassword` and the security token is `XXXXXXXXXX`, the user enters `mypasswordXXXXXXXXXX`. Users get their security token by changing their password or resetting their security token from the Salesforce user interface. When users change their password or reset their security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, or changes the password, or you reset the user's password. When the security token is invalid, the user must repeat the login process. To avoid another log in, add the client's IP address to the org's list of trusted IP addresses. For more information, see Security Token.

When you are logged in, you can issue API calls. For each operation, client apps submit a synchronous request to the API, await the response, and then process the results. The API commits changed data automatically.

API calls:
- Core Calls
- Describe Calls
- Utility Calls

Typical API Call Sequence

For each call, your client app typically:
1. Prepares the request by defining request parameters, if applicable.
2.Invokes the call, which passes the request with its parameters to the Lightning Platform Web Service for processing.
3. Receives the response from the API.
4. Handles the response, either by processing the returned data (for a successful invocation) or by handling the error (for a failed invocation).

Salesforce Sandbox

Professional, Enterprise, Unlimited, and Performance Edition customers have access to the Salesforce Sandbox, which is a testing environment that offers a full or partial copy of your Salesforce org's live production data. For more information, visit the Salesforce Community website at www.salesforce.com/community or see Sandbox Types and Templates in the Salesforce Help.

To access your org's sandbox via the API, use the following URLs to make login requests.
- `https://test.salesforce.com/services/Soap/c/53.0` (enterprise WSDL)
- `https://test.salesforce.com/services/Soap/u/53.0` (partner WSDL)

Multiple Instances of Salesforce Database Servers

Although orgs are generally allocated by geographic regions, an org may be on any instance.
Content Type Requirement

In the API version 7.0 and later, all requests must contain a correct content type HTTP header, for example: Content-Type: text/xml; charset=utf-8. Earlier versions of the API do not enforce this requirement.

API Usage Metering

To maintain optimum performance and ensure that the Lightning Platform API is available to all our customers, Salesforce balances transaction loads by imposing two types of limits:

- Concurrent API Request Limits
- Total API Request Allocations

When a call exceeds a request limit, an error is returned.

Concurrent API Request Limits

The following table lists the limits for various types of orgs for concurrent inbound requests (calls) with a duration of 20 seconds or longer.

<table>
<thead>
<tr>
<th>Org Type</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Developer Edition and Trial orgs</td>
<td>5</td>
</tr>
<tr>
<td>Production orgs and Sandboxes</td>
<td>25</td>
</tr>
</tbody>
</table>

Total API Request Allocations

The following table lists the limits for the total inbound API requests (calls) per 24-hour period for an org.

<table>
<thead>
<tr>
<th>Salesforce Edition</th>
<th>API Calls Per License Type Per 24-Hour Period</th>
<th>Total Calls Per 24-Hour Period</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

| Sandbox | N/A | 5,000,000 |

**Note:** Load, performance, and other system issues can prevent you from using your entire allocation of calls in a 24-hour period.

APIs that count toward this allocation include the Lightning Platform REST API, the Lightning Platform SOAP API, Bulk API, and Bulk API 2.0. API calls issued by certain Salesforce connected apps (for example, the Salesforce mobile app) don’t count. To determine which APIs affect the allocation, see Monitoring Your API Usage.

Calls that include Debugging/Header have a separate allocation limit of 1,000 calls per 24-hour period. These calls can continue to be made after the total request limit for an org is reached.

Limits and allocations are enforced against the aggregate of all API calls made to the org in a 24-hour period. Limits and allocations are not on a per-user basis.

### Monitoring Your API Usage

To better monitor your org’s API usage and limits, you can use these resources:
• The API Usage section of the System Overview page in Setup.
• The API Requests, Last 24 Hours item in the Organization Detail section of the System Overview page in Setup.
• The API Request Limit per Month usage-based entitlement, which shows you your org’s API calls aggregated over 30 days. This can be found on the Company Information page in Setup.
• Information returned in the Sforce-Limit-Info response header for REST APIs.
• Information returned in the response body (in <type>API REQUESTS</type>) for SOAP APIs.
• The /limits call in the Lightning Platform REST API.

You can configure your org so that email is sent to a designated user when the number of API requests has exceeded a specified percentage of the amount allotted. Perform this configuration from Setup by entering API Usage Notifications in the Quick Find box and then selecting API Usage Notifications.

See also the Learn About Daily Rate Limits section in the App Development Without Limits Trailhead module.

What Happens If You Reach or Exceed Your API Request Limit

If your org reaches or exceeds its daily API request limit, Salesforce still allows the operations to proceed by a certain amount, if possible. This helps avoid blocking your workflows during unexpected spikes in workloads and occasional peak periods. A hard cap is in place to safeguard platform resources and prevent API requests from exceeding the daily limit unimpeded.

Note: The ability to go over your normal daily limit is always subject to restrictions to protect the overall health of the Salesforce instance that hosts your org. (You can monitor the health of your instance on Salesforce Trust.)

This ability is designed to be used occasionally to help avoid interruptions in your workflow. Don’t rely on it on an ongoing basis.

To increase your allocation, contact your Salesforce account representative.

This ability only applies to paid orgs in active status. It does not apply to trial orgs, Developer Edition, or sandboxes.

API request activity is aggregated into 30 day periods, starting with your contract start date, and includes calls that exceed the org’s entitled limit.

Increasing Total API Request Allocations

The calculation of the API request amounts based on user licenses is designed to allow sufficient capacity for your org based on your number of users. If you need a higher amount and you don’t want to purchase extra user licenses or upgrade to Performance Edition, you can purchase extra API calls. For information, contact your account representative.

Before you purchase more API calls, perform due diligence of your API usage. You can optimize a client application, whether it’s your own enterprise application or partner application, to use fewer API calls and still accomplish the same work. If you use a partner product, consult with the vendor to verify that the product makes optimal use of the API. A product that makes inefficient use of the API incurs unnecessary costs for your company. Use REST API composite resources to improve your application’s performance by minimizing the number of round-trips between the client and server.

Example API Usage Metering Calculations

The following examples illustrate API usage metering calculations for several scenarios.

• For an Enterprise Edition org with 15 Salesforce licenses, the request limit is 115,000 requests (100,000 plus 15 licenses x 1,000 calls).
• For a Developer Edition org that made 14,500 calls at 5:00 AM Wednesday, 499 calls at 11:00 PM Wednesday, only one more call can successfully be made until 5:00 AM Thursday.
Length of Stored Third-Party Refresh and Access Tokens

Salesforce stores third-party access and refresh tokens of up to 10,000 characters in length.

Compression

The API allows the use of compression on the request and the response, using the standards defined by the HTTP 1.1 specification. This is automatically supported by some SOAP/WSDL clients, and can be manually added to others. Visit https://developer.salesforce.com/page/Tools for more information on particular clients.

Compression is not used unless the client specifically indicates that it supports compression. For better performance, we suggest that clients accept and support compression as defined by the HTTP 1.1 specification.

To indicate that the client supports compression, you should include the HTTP header “Accept-Encoding: gzip, deflate” or a similar heading. The API compresses the response if the client properly specifies this header. The response includes the header “Content-Encoding: deflate” or “Content-Encoding: gzip,” as appropriate. You can also compress any request by including a “Content-Encoding: deflate” or “gzip” header.

Most clients are partially constrained by their network connection, even on a corporate LAN. The API allows the use of compression to improve performance. Almost all clients can benefit from response compression, and many clients may benefit from compression of requests as well. The API supports deflate and gzip compression according the HTTP 1.1 specification.

Response Compression

The API can optionally compress responses. Responses are compressed only if the client sends an Accept-Encoding header with either gzip or deflate compression specified. The API is not required to compress the response even if you have specified Accept-Encoding, but it normally does. If the API compresses the response, it also specifies a Content-Encoding header with the name of the compression algorithm used, either gzip or deflate.

Request Compression

Clients can also compress requests. The API decompresses any requests before processing. The client must send up a Content-Encoding HTTP header with the name of the compression algorithm. For more information, see:

- Content-Encoding at: www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.11
- Accept-Encoding at: www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.3
- Content Codings at: www.w3.org/Protocols/rfc2616/rfc2616-sec3.html#sec3.5

Note: To implement request SOAP compression in a Java client with WSC (Web Service Connector), call setCompression() on the Config you use to instantiate a Connection object with. For an example, see login() sample on page 3797 code.

HTTP Persistent Connections

Most clients achieve better performance if they use HTTP 1.1 persistent connection to reuse the socket connection for multiple requests. Persistent connections are normally handled by your SOAP/WSDL client automatically. For more details, see the HTTP 1.1 specification at:

http://www.w3.org/Protocols/rfc2616/rfc2616-sec8.html#sec8.1
HTTP Chunking

Clients that use HTTP 1.1 may receive chunked responses. Chunking is normally handled by your SOAP/WSDL client automatically.

Internationalization and Character Sets

The API supports either full Unicode characters or ISO-8859-1 characters. The character set depends on the Salesforce instance that your org uses. If your org logs in to ssl.salesforce.com, your encoding is ISO-8859-1. All other instances use UTF-8. To determine the character set, call `describeGlobal()` and inspect the `encoding` value returned in `DescribeGlobalResult`.

If your org uses ISO-8859-1 encoding, all data sent to the API must be encoded in ISO-8859-1. Characters outside the valid ISO-8859-1 range might be truncated or cause an error.

Note: The API response is encoded in the character set used by your org (UTF-8 or ISO-8859-1). Either way, the encoded data is usually handled for you by the SOAP client.

XML Compliance

The API is based on XML, which requires all documents to be well formed. Part of that requirement is that certain Unicode characters are not allowed in an XML document, even in an escaped form, and that others must be encoded according to their location. Normally this is handled for you by any standard SOAP or XML client. Clients must be able to parse any normal XML escape sequence, and must not pass up invalid XML characters.

Some characters, as mentioned, are illegal even if they are escaped. The illegal characters include unpaired Unicode surrogates and a few other Unicode characters. All are seldom-used control characters that are usually not important in any data, and tend to cause problems with many programs. Although they are not allowed in XML documents, they are allowed in HTML documents and may be present in Salesforce data. The illegal characters will be stripped from any API response.

Illegal characters:
- `0xFFFFE`
- `0xFFFFF`
- Control characters `0x0 - 0x19`, except the following characters, which are legal: `0x9`, `0xA`, `0xD`, tab, newline, and carriage return
- `0xD800 - 0x1FFF`, unless they’re used to form a surrogate pair

.NET, Non-String Fields, and the Enterprise WSDL

If you use .NET with the enterprise WSDL, .NET generates a Boolean field for each non-string field. For example, if you have a date value in `MyDateField__c`, .NET generates a Boolean field called `MyDateField__cSpecified`.

The generated field value is `false` by default. If a Specified field value is `false`, then the values in the corresponding original field are not be included in the SOAP message. For example, before the values in the currency field `annualRevenue` can be included in a SOAP message generated by your client app, the value of `annualRevenueSpecified` must be set to `true`.

```csharp
account.annualRevenue = 10000;
account.annualRevenueSpecified = true;
```
Outbound messaging allows you to specify that changes to fields within Salesforce can cause messages with field values to be sent to designated external servers.

Outbound messaging is part of the workflow rule functionality in Salesforce. Workflow rules watch for specific kinds of field changes and trigger automatic Salesforce actions, such as sending email alerts, creating task records, or sending an outbound message.
Outbound messaging uses the `notifications()` call to send SOAP messages over HTTP(S) to a designated endpoint when triggered by a workflow rule.
After you set up outbound messaging, when a triggering event occurs, a message is sent to the specified endpoint URL. The message contains the fields specified when you created the outbound message. After the endpoint URL receives the message, it can take the information from the message and process it. To do that, you must examine the outbound messaging WSDL.

Understanding Notifications

A single SOAP message can include up to 100 notifications. Each notification contains the object ID and a reference to the associated sObject data. If the information in the object changes after the notification is queued but before it’s sent, only the latest data is delivered and not the intermediate changes.

If you issue multiple discrete calls, the calls are sometimes batched together into one or more SOAP messages. Messages are queued locally. A separate background process performs the actual sending, to preserve message reliability:

• If the endpoint is unavailable, messages stay in the queue until sent successfully, or until they’re 24 hours old. After 24 hours, messages are dropped from the queue.
• If a message can’t be delivered, the interval between retries increases exponentially, up to a maximum of two hours between retries.
• Messages are retrieved independent of their order in the queue. As a result, messages can be delivered out of order.
• You can’t build an audit trail using outbound messaging. While each message is usually delivered once, it can sometimes be delivered more than once. If delivery can’t be done within 24 hours, a message isn’t delivered at all. Finally, if the source object changes after a notification is queued but before it’s sent, the endpoint only receives the latest data, not any intermediate changes.
• Because a message can sometimes be delivered more than once, check the notification IDs in the notifications delivered to your listener client before processing.

Note: Instead of polling, which was required in previous releases, you can now use outbound messaging to trigger execution logic when Salesforce raises an event. In previous versions of the API, client applications had to poll Salesforce to find out if relevant changes had occurred. Because most changes eventually trigger a workflow if a rule exists for it, you can use the workflow rule to trigger actions based on Salesforce events.

The metadata needed for outbound messaging, including the definition of the notifications() call, which sends the outbound SOAP message to an external service, is in a separate WSDL. The WSDL is created and available from the Salesforce user interface after a workflow rule has been associated with an outbound message. The WSDL is bound to the outbound message and contains the instructions about how to reach the endpoint service and what data is sent to it. For more information about setting up outbound messaging, see Defining Outbound Messaging.

Setting Up Outbound Messaging

Before you can use outbound messaging, you must set it up via the Salesforce user interface.

• Setting Up User Profiles
• Defining Outbound Messaging
• Downloading the Salesforce Client Certificate
• Viewing Outbound Messages
• Tracking Outbound Message Status
Setting Up User Profiles

It’s possible to create circular changes with outbound messaging. For example, if a user is performing integrations that trigger workflow, and the workflow actions trigger account updates, those account updates trigger new workflow, and so on. To prevent these circular changes, you can disable a user’s ability to send outbound messages.

Here’s another example of a circular change scenario.

1. You configure an outbound message to include a `sessionId` and specify a user in the `User to send as` field. The user doesn’t have outbound messaging disabled.

2. A change in a contact record triggers an outbound message from the specified user, with the `sessionId` to your outbound message listener.

3. Your outbound message listener calls the Lightning Platform API and updates the same contact record which triggered the outbound message.

4. The update triggers an outbound message.

5. Your outbound message listener updates the record.

6. The update triggers an outbound message.

7. Your outbound message listener updates the record.

To disable outbound message notifications for a user, deselect **Send Outbound Messages** in the user’s Profile. We recommend specifying a single user to respond to outbound messages and disabling this user’s ability to send outbound messages.

Defining Outbound Messaging

To define outbound messages, use this procedure in the Salesforce user interface:

1. From Setup, enter **Outbound Messages** in the Quick Find box, then select **Outbound Messages**.

2. Click **New Outbound Message**.

3. Choose the object that has the information you want included in the outbound message, and click **Next**.

4. Configure the outbound message.

   a. Enter a name and description for this outbound message.

   b. Enter an endpoint URL for the recipient of the message. Salesforce sends a SOAP message to this endpoint.

      For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:

      - 80: This port only accepts HTTP connections.
      - 443: This port only accepts HTTPS connections.
      - 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

   c. Select the Salesforce user to use when sending the message by specifying a username in the **User to send as** field. The chosen user controls data visibility for the message that is sent to the endpoint.

   d. Select **Send Session ID** if you want a `sessionId` to be included in the outbound message. Include the `sessionId` in your message if you intend to make API calls back to Salesforce from your listener. The `sessionId` represents the user defined in the previous step and not the user who triggered the workflow.

   e. Select the fields you want included in the outbound message and click **Add**.

5. Click **Save**, and review the outbound message detail page:
The API Version field is automatically generated and set to the current API version when the outbound message was created. This API version is used in API calls back to Salesforce using the enterprise or partner WSDL. The API Version can only be modified by using the Metadata API.

Click Click for WSDL to view the WSDL associated with this message.

The WSDL is bound to the outbound message and contains the instructions about how to reach the endpoint service and what data is sent to it.

Note: If you don’t have these options, your org doesn’t have outbound messaging enabled. Contact Salesforce to enable outbound messaging for your org.

Downloading the Salesforce Client Certificate

Your application (endpoint) server’s SSL/TLS can be configured to require client certificates (two-way SSL/TLS), in order to validate the identity of the Salesforce server when it takes the role of client to your server. You can download the Salesforce client certificate from the Salesforce application user interface. This certificate is the client certificate that Salesforce sends with each outbound message for authentication.

1. From Setup, enter API in the Quick Find box, then select API.
2. On the API WSDL page, click Manage API Client Certificate.
4. On the Certificates page, click Download Certificate. The .crt file is saved in the download location specified in your browser.

Import the downloaded certificate into your application server, and configure your application server to request the client certificate. The application server then checks that the certificate used in the SSL/TLS handshake matches the one you downloaded.

Note: Your application (endpoint) server must send any intermediate certificates in the certificate chain, and the certificate chain must be in the correct order. The correct order is:

1. Server certificate
2. Intermediate certificate that signed the server certificate if the server certificate wasn’t signed directly by a root certificate
3. Intermediate certificate that signed the certificate in step 2
4. Any remaining intermediate certificates

Don’t include the root certificate authority certificate. The root certificate isn’t sent by your server. Salesforce already has its own list of trusted certificates on file, and a certificate in the chain must be signed by one of those root certificate authority certificates.

Viewing Outbound Messages

To view existing outbound messages, from Setup, enter Outbound Messages in the Quick Find box, then select Outbound Messages in the Salesforce user interface.

- Click New Outbound Message to define a new outbound message.
- Click View Message Delivery Status to track the status of an outbound message.
- Select an existing outbound message to view details about it or view workflow rules and approval processes that use it.
- Click Edit to make changes to an existing outbound message.
- Click Del to delete an outbound message.
Tracking Outbound Message Status

To track the status of an outbound message, from Setup, enter Outbound Messages in the Quick Find box, select Outbound Messages, and then click View Message Delivery Status. You can perform several tasks on this page.

- View the status of your outbound messages, including the total number of attempted deliveries.
- View the action that triggered the outbound message by clicking any workflow or approval process action ID.
- Click Retry to change the Next Attempt date to now. This action causes the message delivery to be immediately retried.
- Click Del to permanently remove the outbound message from the queue.

Considerations for Security

To use outbound messaging, ensure that no third party can send messages to the endpoint while pretending to be from Salesforce:

- Lock down the client application’s listener to accept requests only from Salesforce IP ranges. While this action guarantees that the message came from Salesforce, it doesn’t guarantee that another customer isn’t pointing to your endpoint and sending messages. For an up-to-date list of Salesforce IP ranges, see https://help.salesforce.com/articleView?id=000321501&type=1&mode=1
- Use SSL/TLS. Using SSL/TLS provides confidentiality while data is transported across the internet. Without it, a malicious third party can eavesdrop on your data. This issue is especially important if you pass data with privacy requirements and you pass a SessionId with the message. Also, we authenticate the certificate presented on connection, ensure that it is from a valid Certificate Authority, and check that the domain in the certificate matches the one Salesforce is trying to connect. This validation prevents us from communicating with the wrong endpoint.
- When you select Send Session ID, only HTTPS is supported for the endpoint URL to ensure secure transmission of the session ID. For managed and unmanaged packages created before Spring ’19 with this option but without an HTTPS endpoint, subscribers can still install them. Starting in Spring ’19, you can’t create packages with insecure outbound message options.
- The SessionId included in the outbound message is scoped only for API requests and doesn’t apply to UI requests.
- If the configuration of your application (endpoint) server’s SSL/TLS allows, validate the identity of the Salesforce server when it takes the role of a client to your server, using the Salesforce client certificate. For instructions to download the certificate, see Downloading the Salesforce Client Certificate.
- The organization Id is included in each message. For more information about the Id field type, see ID Field Type. In your client application, validate that messages contain your organization Id.

Understanding the Outbound Messaging WSDL

The rest of this topic examines relevant sections of the outbound messaging WSDL. Your WSDL can differ, depending on the choices you made when you set up outbound messaging for a particular event on a particular object.

notifications()

This section defines the notifications() call, which creates an outbound message containing specified fields and values for a particular object or objects, and sends the values to a specified endpoint URL:

```xml
  <import namespace="urn:enterprise.soap.sforce.com" />
  <import namespace="urn:sobject.enterprise.soap.sforce.com" />
</schema>
```
Use this table to understand the elements named in the notifications method definition:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OrganizationId</td>
<td>ID</td>
<td>ID of the organization sending the message.</td>
</tr>
<tr>
<td>ActionId</td>
<td>string</td>
<td>The workflow rule (action) that triggers the message.</td>
</tr>
<tr>
<td>SessionId</td>
<td>string</td>
<td>Optional, a session ID to be used by endpoint URL client that is responding to the outbound message. It's used by the receiving code to make calls back to Salesforce.</td>
</tr>
<tr>
<td>EnterpriseURL</td>
<td>string</td>
<td>URL to use to make API calls back to Salesforce using the enterprise WSDL.</td>
</tr>
<tr>
<td>PartnerURL</td>
<td>string</td>
<td>URL to use to make API calls back to Salesforce using the partner WSDL.</td>
</tr>
<tr>
<td>Notification</td>
<td>Notification</td>
<td>Defined in the next section, contains the object datatype and its Id, for example OpportunityNotification or ContactNotification.</td>
</tr>
</tbody>
</table>

The Notification datatype is defined in the WSDL. In the following example, a Notification for opportunities is defined, based on the Notification entry of the notifications() call definition:

```xml
<complexType name="OpportunityNotification">
  <sequence>
    <element name="Id" type="ent:ID" />
    <element name="sObject" type="ens:Opportunity" />
  </sequence>
</complexType>
```

Each object element (in our example, opportunities) contains the subset of the fields that you selected when you created the outbound message. Each message Notification also has the object ID. Use the object ID to track redelivery attempts of notifications you've already processed.

**notificationsResponse**

This element is the schema for sending an acknowledgment (ack) response to Salesforce.
You acknowledge all notifications in the message if there’s more than one.

## Building a Listener

After you’ve defined an outbound message and configured an outbound messaging endpoint, download the WSDL and create a listener:

1. Right-click **Click for WSDL** and select Save As to save the WSDL to a local directory with an appropriate file name. For example, for an outbound message that deals with leads, you could name the WSDL file `leads.wsdl`.

2. Unlike the enterprise or partner WSDLs, which describe the messages the client sends to Salesforce, this WSDL defines the messages that Salesforce sends to your client application.

3. Most Web services tools generate stub listeners for you, in much the same way as they generate a client stub for the enterprise or partner WSDL. Look for a server-side stub option.

   For example, for .NET 2.0:

   a. Run `wsdl.exe /serverInterface leads.wsdl` with .NET 2.0. This command generates `NotificationServiceInterfaces.cs`, which defines the notification interface.

   b. Create a class that implements `NotificationServiceInterfaces.cs`.

   c. You implement your listener by writing a class that implements this interface. There are a number of ways to do this. One simple way is to compile the interface to a DLL first (DLLs must be in the `bin` directory in ASP.NET).

   ```
   mkdir bin
csc /t:library /out:bin\nsi.dll NotificationServiceInterfaces.cs
   ```

   Now write an ASMX-based Web service that implements this interface. For example, in `MyNotificationListener.asmx`:

   ```csharp
   <%@WebService class="MyNotificationListener" language="C#"%>
class MyNotificationListener : INotificationBinding
{
    public notificationsResponse notifications(notifications n)
    {
        notificationsResponse r = new notificationsResponse();
        r.Ack = true;
        return r;
    }
}
```

   This example is a simple implementation, actual implementations are more complex.

   d. Deploy the service by creating a new virtual directory in IIS for the directory that contains the `MyNotificationListener.asmx`.

   e. You can now test that the service is deployed by viewing the service page with a browser. For example, if you create a virtual directory `salesforce`, you’d go to `http://localhost/salesforce/MyNotificationListener.asmx`.

   The process for other Web service tools is similar. Consult the documentation for your Web service tool.

Your listener must meet these requirements:

- Must be reachable from the public Internet.
- For security reasons, Salesforce restricts the outbound ports you can specify to one of the following:
- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

- To be valid, the common name (CN) of the certificate must match the domain name for your endpoint's server, and the certificate must be issued by a Certificate Authority trusted by Java 2 Platform, Standard Edition (J2SE) 5.0 (JDK 1.5).
- If your certificate expires, message delivery fails.

⚠️ **Warning:** To avoid an infinite loop of outbound messages that trigger changes that trigger more outbound messages, ensure that the user who updates the objects does **not** have the “Send Outbound Messages” permission.
CHAPTER 18  Data Loading and Integration

In this chapter ...

- Client Application Design
- Salesforce Settings
- Best Practices with Any Data Loader
- Integration and Single Sign-On

If you need to load large volumes of data (hundreds of thousands to millions of records), there are a number of factors you must consider. Use the topics in this section to become familiar with issues of client application design, organization configuration, and data loader best practices.
Client Application Design

Although the Bulk API 2.0 is the best choice for loading large numbers of records, you can also use the SOAP-based API. There are many ways you can design your application to improve the speed of data loads:

- **Use persistent connections.** Opening a socket takes time, mostly when opening a socket stems from the SSL/TLS negotiation. Without SSL or TLS, the API request would not be secure. Included in the HTTP 1.1 specification is support for reusing sockets among requests (persistent connections) instead of having to re-open a socket per request as in HTTP 1.0. Whether your client supports persistent connections depends on the SOAP stack you are using. By default, .NET uses persistent connections. If you change the configuration to use the Apache http-commons libraries, your client will be compliant with the HTTP 1.1 specification and use persistent connections.

  For information about HTTP 1.1, see HTTP Persistent Connections and [http://www.w3.org/Protocols/rfc2616/rfc2616-sec8.html#sec8.1](http://www.w3.org/Protocols/rfc2616/rfc2616-sec8.html#sec8.1).

- **Minimize the number of requests.** There is some processing associated with each request, so to save time your client should batch as many records per request as possible. Set `batchSize` to the limit of 2,000. If that is not the most efficient batch size, the API will change it. For more information about setting batch sizes, see `QueryOptions`.

- **Minimize the size of the requests.** Your client application should send as many records per request as possible, but it should also send as small a request as possible to reduce network transmission time. To minimize the request size, use compression on both the request and the response. Gzip is the most popular type of compression, and there are multiple posts on the community boards at the Lightning Platform Developer Boards that describe how to implement compression with different SOAP stacks. The full Gzip analysis and discussion is available at Simon Fell’s blog: [http://www.pocketsoap.com/weblog/2005/12/1583.html](http://www.pocketsoap.com/weblog/2005/12/1583.html).

- **Do Not Design a Multi-Threaded Client Application.** Multi-threading is not allowed for a single client application using the SOAP-based API.

Salesforce Settings

Most processing takes place in the database. Setting these parameters correctly will help the database process as quickly as possible:

- **Enable or Disable the Most Recently Used (MRU) functionality.** Records marked as most recently used (MRU) are listed in the “Recent Items” section of the sidebar in the Salesforce user interface. Check that you are not enabling it for calls where it is not needed.

  In API version 7.0 and above, MRU functionality is disabled by default. To enable the MRU functionality, create this header and set the `updateMru` to `true`. The following sample shows how to use MRU functionality:

  ```java
  public void mruHeaderSample() {
    connection.setMruHeader(true);
    Account account = new Account();
    account.setName("This will be in the MRU");
    try {
      SaveResult[] sr = connection.create(new SObject[] {account});
      System.out.println("ID of account added to MRU: " +
        sr[0].getId());
    } catch (ConnectionException ce) {
      ce.printStackTrace();
    }
  }
  ```

- **Log in as a user with the “Modify All Data” permission to avoid sharing rules.** If the client application logs in as a user who has access to data via a sharing rule, then the API must issue an extra query to check access. To avoid this, log in as a user with the
“Modify All Data” permission. In general, fewer sharing rules quickens load speeds, as there are fewer operations that have to be performed when setting properties such as ownership.

Alternatively, you can set organization-wide defaults for some objects as public read/write for the duration of the load. For more information, see “Set Your Internal Organization-Wide Sharing Defaults” in the Salesforce online help.

- **Avoid workflow or assignment rules.** Anything that causes a post-operation action slows down the load. You can temporarily disable automatic rules if the loaded objects are exempt from them.

- **Avoid triggering cascading updates.** For example, if you update the owner of an account, the contacts and opportunities associated with that account may also require updates. Instead of updating a single object, the client application must access multiple objects, which slows down the load.

The Lightning Platform Data Loader is a good reference for data loading. It disables the MRU, uses HTTP/1.1 persistent connections, and applies GZIP compression on the request and response. If you are performing a data load, or are looking at a place to start when writing your own Java integration, the Lightning Platform Data Loader can serve as a fast and reliable solution. For more information about the Lightning Platform Data Loader, see: Data Loader in the Salesforce online help.

**Best Practices with Any Data Loader**

While this section presents a best practice process using the Lightning Platform Data Loader, the general principles apply to any client data loader:

1. **Identify which data you will migrate.**
   
   You may not want or need to migrate a whole set of data—choose which objects you wish to migrate. For example, you may want to migrate only the contact information from each account, or only migrate account information from a particular division.

2. **Create templates for the data.**
   
   Create one template for each object, for example in an Excel worksheet.
   
   Identify the required fields for each object. In addition to the required fields for each standard object, there may be additional required fields such as those needed to follow business rules, or legacy ID fields. Use this guide or see the page layout definitions in the Salesforce user interface to find out which fields are required on standard objects.
   
   You may wish to highlight the required fields in red for easier review of the data after you populate the templates.
   
   You should also identify any ordering dependencies. Objects may have mandatory relationships, for example all accounts have an owner, and all opportunities are associated with an account. The dependencies in these relationships dictate the order of data migration. For Salesforce data, for example, you should load users first, then accounts, then opportunities.
   
   To identify dependencies, review the related lists and lookup fields in the page layout of the given object, and IDs (foreign keys) in the database.

3. **Populate the templates.**
   
   Clean your data before populating the template, and review the data in the templates.

4. **Migrate the data.**
   
   Create custom fields to store legacy ID information. Optionally, give the custom field the External ID attribute so it will be indexed. This will help maintain relationships, and help you build custom reports for validation.
   
   Load one record, check the results, then load all records.

5. **Validate the data.**
   
   Use all of these techniques to validate your migration:
• Create custom reports that validate record counts and provide an overall snapshot of migration.
• Spot check the data.
• Review exception reports to see what data was not migrated.

6. Re-migrate or update data as needed.

Integration and Single Sign-On

⚠️ **Warning**: To avoid getting into an unrecoverable state, do not enable single sign-on for your system administrator account. If you do, and then perform a single sign-on integration that fails, you may not be able to log in again to recover.
CHAPTER 19  Data Replication

In this chapter ...

• API Calls for Data Replication
• Scope of Data Replication
• Data Replication Steps
• Object-Specific Requirements for Data Replication
• Polling for Changes
• Checking for Structural Changes in the Object

The API supports data replication, which allows you to store and maintain an external, separate copy of your organization's pertinent Salesforce data for specialized uses, such as data warehousing, data mining, custom reporting, analytics, and integration with other applications. Data replication provides you with local control and the ability to run large or ad hoc analytical queries across the entire data set without transmitting all that data across the network.

Note: To get real-time notifications of Salesforce record changes, use Change Data Capture instead. By subscribing to a Change Data Capture channel, you receive a stream of change event messages for record changes, including insertions, updates, deletions, and undeletions. With Change Data Capture, you get broad access to data and can perform updates in your target store using transaction boundaries. Change Data Capture provides a versioned event schema and retains change events temporarily for later retrieval. For more information, see the Change Data Capture Basics Trailhead module, or for a complete reference, see the Change Data Capture Developer Guide.

Use the topics in this section to better understand the best practices for data replication.
API Calls for Data Replication

The API supports data replication with the following API calls:

<table>
<thead>
<tr>
<th>API Call</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getUpdated()</td>
<td>Retrieves the list of objects that have been updated (added or changed) during the specified timespan for the specified object.</td>
</tr>
<tr>
<td>getDeleted()</td>
<td>Retrieves the list of objects that have been deleted during the specified timespan for the specified object.</td>
</tr>
</tbody>
</table>

Client applications can invoke these API calls to determine which objects in your organization’s data have been updated or deleted during a given time period. These API calls return a set of IDs for objects that have been updated (added or changed) or deleted, as well as the timestamp (Coordinated Universal Time (UTC)—not local—timezone) indicating when they were last updated or deleted. It is the responsibility of the client application to process these results and to incorporate the required changes into the local copy of the data.

Scope of Data Replication

This feature provides a mechanism that targets data replication (one-way copying of data). It does not provide data synchronization (two-way copying of data) or data mirroring capabilities.

Data Replication Steps

The following is a typical data replication procedure for an object:

1. Optionally, determine whether the structure of the object has changed since the last replication request, as described in Checking for Structural Changes in the Object.

2. Call getUpdated(), passing in the object and timespan for which to retrieve data.
   
   Note that getUpdated() retrieves the IDs for data to which the logged in user has access. Data that is outside of the user’s sharing model is not returned. The API returns the ID of every changed object that is visible to you, regardless of what change occurred in the object. For information on IDs, see ID Field Type.

3. Pass in all IDs in an array. For each ID element in the array, call retrieve() to obtain the latest information you want from the associated object. You must then take the appropriate action on the local data, such as inserting new rows or updating existing ones with the latest information.

4. Call getDeleted(), passing in the object and timespan for which to retrieve data. Like getUpdated(), getDeleted() retrieves the IDs for data to which the logged-in user has access. Data that is outside of the user’s sharing model is not returned. The API returns the ID of every changed object that is visible to you, regardless of what change occurred in the object, based on SystemModstamp field information if available. For information on IDs, see ID Field Type.

5. Iterate through the returned array of IDs. Your client application must then take the appropriate action on the local data to remove (or flag as deleted) the deleted objects. If your client application cannot match rows in the local data using the retrieved object ID, then the local data rows either were deleted or were never created, in which case there is nothing to do.

6. Optionally, save the request time spans for future reference. You can do this with the getDeleted() latestDateCovered value or the getUpdated() latestDateCovered value.
Object-Specific Requirements for Data Replication

The API objects have the following requirements for data replication:

- The `getUpdated()` and `getDeleted()` calls filter the results so that the client application receives IDs for only those created or updated objects to which the logged-in user has access. For information on IDs, see ID Field Type.
- Your client application can replicate any objects to which it has sufficient permissions. For example, to replicate all data for your organization, your client application must be logged in with the "View All Data" permission. For more information, see Factors that Affect Data Access.
- The logged-in user must have read access to the object. For more information, see “Set Your Internal Organization-Wide Sharing Defaults” in the Salesforce online help.
- The object must be configured to be replicateable (`replicateable` is true). To determine whether a given object can be replicated, your application can invoke the `describeSObject()` call on the object and inspect the `replicateable` property in the `describeSObjectResult`.

Polling for Changes

Client applications typically poll for changed data periodically. Polling involves the following considerations:

- The polling frequency depends on business requirements for how quickly changes in your organization’s Salesforce data need to be reflected in the local copy. Some client applications might poll once a day to retrieve changes, while other client applications might poll every five minutes to achieve closer accuracy.
- Deleted records are written to a delete log, which `getDeleted()` accesses. A background process that runs every two hours purges records that have been in an organization’s delete log for more than two hours if the number of records is above a certain limit. Starting with the oldest records, the process purges delete log entries until the delete log is back below the limit. This is done to protect Salesforce from performance issues related to massive delete logs. The limit is calculated using this formula:

  $5000 \times \text{number of licenses in the organization}$

  For example, an organization with 1,000 licenses could have up to 5,000,000 (five million) records in the delete log before any purging took place. If purging has been performed before your `getDeleted()` call is executed, an `INVALID_REPLICATION_DATE` error is returned. If you get this exception, you should do a full pull of the table.

- The API truncates the seconds portion of `dateTime` values. For example, if a client application submits a timespan between 12:30:15 and 12:35:15 (Coordinated Universal Time (UTC) time), then the API retrieves information about items that have changed between 12:30:00 and 12:35:00 (UTC), inclusive.

  **Note:** Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time. To determine how your development tool handles time values, refer to its documentation.

- We recommend polling no more frequently than every five minutes. There are built-in controls to prevent errant applications from invoking the data replication API calls too frequently.
- Client applications should save the timespan used in previous data replication API calls so that the application knows the last time period for which data replication was successfully completed.
- To ensure data integrity on the local copy of the data, a client application needs to capture all of the relevant changes during polling—even if it requires processing data redundantly to ensure that there are no gaps. Your client application can contain business logic to skip processing objects that have already been integrated into your local data.
• Gaps can also occur if the client application somehow fails to poll the data as expected (for example, due to a hardware crash or network connection failure). Your client application can contain business logic that determines the last successful replication and polls for the next consecutive timespan.

• If for any reason the local data is compromised, your client application might also provide business logic for rebuilding the local data from scratch.

Note: You can now use Outbound Messaging to trigger actions instead of polling for them.

Checking for Structural Changes in the Object

In the API, data replication only reflects changes made to object records. It does not determine whether changes have been made to the structure of objects (for example, fields added to—or removed from—a custom object). It is the responsibility of the client application to check whether the structure of a given object has changed since the last update. Before replicating data, client applications can call describeSObjects() on the object, and then compare the data returned in the DescribeSObjectResult with the data returned and saved from previous describeSObjects() invocations.
Some Salesforce features require special consideration when accessed via the API. Use the topics in this section to learn about the special considerations for activities, person accounts, forecast override business rules, the Call Center, and creating your own apps.
Archived Activities

Salesforce archives activities (tasks and events) that are over a year old.

You can use `queryAll()` to query on all Task and Event records, archived or not. You can also filter on the `isArchived` field to find only the archived objects. You cannot use `query()` as it automatically filters out all records where `isArchived` is set to `true`. You can update or delete archived records, though you cannot update the `isArchived` field. If you use the API to insert activities that meet the criteria listed below, the activities will be archived during the next run of the archival background process.

Older Events and Tasks are archived according to the criteria listed below. In the Salesforce user interface, users can view archived activities in several locations.

- Click **View All** in the Activity History related list to open the Activity History tab. In the Activity History tab, you can sort entries and open, edit, or delete activities.
- Click **View All** in the activity timeline to open the All Activity History list. Up to 2,000 records appear, including archived records. The All Activity History list is ideal for printing.

In the API, archived activities can only be queried via `queryAll()`.

Activity archive criteria:

- Events with an `ActivityDateTime` or `ActivityDate` value greater than or equal to 365 days old
- Tasks with an `IsClosed` value of `true` and an `ActivityDate` value greater than or equal to 365 days old
- Tasks with an `IsClosed` value of `true`, a blank `ActivityDate` field, and a create date greater than or equal to 365 days ago

For more information, see View Archived Activities in Salesforce Help.

Person Account Record Types

Beginning with API version 8.0, a new family of record types on Account objects is available: “person account” record types. The person account record types enable specialized business-to-consumer functionality for users who sell to or do business with individuals. For example, a doctor, hairdresser, or real estate agent whose clients are individuals. For more information about person accounts, see “Person Accounts” and “Considerations for Using Person Accounts” in the Salesforce Help.

Record types are person account record types if the Account field `IsPersonAccount` is set to `true`. Salesforce provides one default person account record type, PersonAccount, but an administrator can create additional person account record types. Conversely, record types with the Account field `IsPersonAccount` set to `false` are “business account” record types, which are traditional business-to-business (B2B) Salesforce accounts.

When a person account is created (or an existing business account is changed to a person account), a corresponding contact record is also created. This contact record is referred to as a “person contact.” The person contact enables the person account to function simultaneously as both an account and a contact. This record is the only contact record that can be associated directly with the person account. Also, the ID of the corresponding person contact record is stored in the PersonContactId field on the person account.

Review this list of facts about person account record types before working with them.

- Contact your account representative to enable the person account feature, if the feature isn’t enable yet.
- You can use a query similar to the following example to find all records with a person account record type:

  ```sql
  SELECT Name, SobjectType, IsPersonType
  FROM RecordType
  WHERE SobjectType='Account' AND IsPersonType=True
  ```
If you issue a `query()` call against an account, the results return the root object type in the `SObjectType` field. The returned value is always `Account`.

A person contact can be modified, but cannot be created or deleted. Since these kinds of contacts do not have their own record detail page, clients must redirect users to the corresponding person account (`Account`) page. SOSL results don’t include any of the contact fields enabled when `IsPersonAccount` is set to `true`. The contact `ReportsToId` field is not visible.

If you delete the account, the contact is also deleted. You cannot directly delete the contact; you must delete the account.

You can change the record type of an account across record type families (typically performed when migrating business accounts to person accounts, but the reverse operation is also supported). When you change the record type from a business account to a person account, the person contact is created. When you change the record type from a person account to a business account, the person fields are set to null, and the person contact becomes a regular contact with the same parent account it had before the change.

**Note:** You cannot change record types across record type families in the Salesforce user interface.

If you change the record type of a business account to a person account using either `update()` or `upsert()`, you cannot make any other changes to fields in that account in the same call; if attempted, the fault `INVALID_FIELD_FOR_INSERT_UPDATE` results. However, you can change record type values from one person account record type to another, or from one business account record type to another, in the same call with other changes.

When converting a business account to a person account, there must be a one-to-one relationship between each business account record and its corresponding contact record. Furthermore, fields common to both records such as `Owner` and `Currency` must have identical values.

Workflow and validation formulas do not fire during a change in record types from or to person accounts.

When you change a business account to a person account, valid records are changed and invalid records show an error in the results array.

When you change a person account to a business account, no validation is performed.

`describeLayout()` for version 7.0 and below returns the default business account record type as the default record type even if the tab default is a person account record type. In version 8.0 and after, it will always be the tab default.

`describeLayout()` for version 7.0 and below doesn’t return any person account record types.

`describeSObject()` for version 7.0 and below shows `Account` objects as not creatable if the profile does not have access to any business record types.

After conversion, the new person accounts will have unique one-to-one relationships with the contact records that formed them. As is true for all person accounts, no other contacts can be associated to a person account.

After conversion, any existing account field history information remains on the person accounts. Any existing contact field history information is retained on the contact, but is not added to the person accounts field history.

For more information about person accounts, see the Salesforce Help.

### External Objects

Special behaviors and limitations apply to `queryAll()` and `queryMore()` calls on external data.

#### queryAll()

Because Salesforce doesn’t track changes to external data, `queryAll()` behaves the same as `query()` for external objects.
queryMore()

It’s common for Salesforce Connect queries of external data to have a large result set that’s broken into smaller batches or pages. When querying external objects, Salesforce Connect accesses the external data in real time via Web service callouts. Each `queryMore()` call results in a Web service callout. The batch boundaries and page sizes depend on your adapter and how you set up the external data source.

We recommend the following:

- When possible, avoid paging by filtering your queries of external objects to return fewer rows than the batch size, which by default is 500 rows. Remember, obtaining each batch requires a `queryMore()` call, which results in a Web service callout.
- If the external data frequently changes, avoid using `queryMore()` calls. If the external data is modified between `queryMore()` calls, you can get an unexpected `QueryResult`.

If the primary or “driving” object for a SELECT statement is an external object, `queryMore()` supports only that primary object and doesn’t support subqueries.

By default, the OData 2.0 and 4.0 adapters for Salesforce Connect use client-driven paging. With client-driven paging, OData adapters convert each `queryMore()` call into an OData query that uses the `$skip` and `$top` system query options to specify the batch boundary and page size. These options are similar to using `LIMIT` and `OFFSET` clauses to page through a result set.

If you enable server-driven paging on an external data source, Salesforce ignores the requested page sizes, including the default `queryMore()` batch size of 500 rows. The pages returned by the external system determine the batches, but each page can’t exceed 2,000 rows.

### Call Centers and the API

The API provides access to information about computer-telephony integration (CTI) call centers with the `describeSoftphoneLayout()` call. You must have the CTI feature enabled for your organization. Contact your account representative for assistance.

The API supports limited access to call center-related objects, including being able to create call centers, and create or modify additional numbers for the call center.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallCenter</td>
<td>Call Center object description, including fields and usage.</td>
</tr>
<tr>
<td>AdditionalNumber</td>
<td>Configuration settings that allow you to add an additional number if it cannot easily be categorized as a user, contact, lead, account, or any other object. Examples include phone queues or conference rooms.</td>
</tr>
</tbody>
</table>

In addition, several fields have been added to existing objects to support call centers. The following fields provide configuration settings for operation of a call center.

<table>
<thead>
<tr>
<th>Object Name</th>
<th>Field Name</th>
<th>Field Type</th>
<th>Field Properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenActivity</td>
<td>CallDisposition</td>
<td>string</td>
<td>Create (Task only) Filter</td>
<td>Represents the result of a given call, for example, “we’ll call back,” or “call unsuccessful.” Limit is 255 characters.</td>
</tr>
<tr>
<td>Object Name</td>
<td>Field Name</td>
<td>Field Type</td>
<td>Field Properties</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------</td>
<td>------------</td>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OpenActivity</td>
<td>CallDurationInSeconds</td>
<td>int</td>
<td>Create (Task only) Filter Nullable Update (Task only)</td>
<td>Duration of the call in seconds. For Task, you can also create and update values for this field.</td>
</tr>
<tr>
<td>ActivityHistory</td>
<td>CallObject</td>
<td>string</td>
<td>Filter Nullable  Update (Task only)</td>
<td>Name of a call center. Limit is 255 characters. For Task, you can also create and update values for this field.</td>
</tr>
<tr>
<td>ActivityHistory</td>
<td>CallType</td>
<td>picklist</td>
<td>Create (Task only) Filter Nullable Restricted picklist Update</td>
<td>The type of call being answered: Inbound, Internal, or Outbound. For Task, you can also create and update values for this field.</td>
</tr>
<tr>
<td>Task</td>
<td>CallCenterId</td>
<td>reference</td>
<td>Create Filter Nullable Update</td>
<td>The unique identifier for the call center associated with this user.</td>
</tr>
<tr>
<td>Task</td>
<td>UserPermissionsCall</td>
<td>boolean</td>
<td>Create Update</td>
<td>Indicates whether a user will be automatically logged in to a call center when logging in to the Salesforce application (true) or not (false).</td>
</tr>
</tbody>
</table>

Implementing Salesforce Integrations on Lightning Platform

You can implement your Salesforce integrations or other client applications, on the Lightning Platform by creating a Salesforce AppExchange app.

1. Create a WebLink that passes the user session ID and the API server URL to an external site:

   ```https://www.your_tool.com/test.jsp?sessionid={!API_Session_ID}&url={!API_Partner_Server_URL_80}```

   Use https to ensure that your session ID cannot be detected.

2. The page pointed to in the preceding step takes the session ID and uses it to call back to the API. Use `getUserInfo()` to return the `userId` associated with the session and related information. If needed, you can also use `retrieve` on the User object to retrieve any additional information you need about the user.

3. Maintain a cross-reference between the `UserId` or username and the corresponding user ID in your system, which you can do using a WebLink that is executed when the user clicks a tab, or a WebLink on the page layout.

4. Package and upload this app using the instructions in Salesforce Help topic “Prepare Your Apps for Distribution.”

Accessing Salesforce Data Using the API and OAuth

Salesforce supports OAuth 1.0.A and 2.0 for SOAP API requests.

Using an already defined connected app and the OAuth protocol, a third party can implement an OAuth authentication flow to integrate with the Salesforce API.

For detailed steps about integrating with the Salesforce API using OAuth, see Authenticating Apps with OAuth in Salesforce Help.

Partners, who wish to get an OAuth consumer Id for authentication, can contact Salesforce

Knowledge

Articles Overview

Articles capture information about your company's products and services that you want to make available in your knowledge base. Articles in the knowledge base can be classified using data categories to make it easy for users to find the articles they need. Administrators can use data categories to control access to articles.

Knowledge Articles vs. Knowledge Article Versions

When working with articles, keep in mind that the `KnowledgeArticle` on page 1888 represents the parent record of all article versions. `KnowledgeArticleVersion` records represent each version of a given article.

Record Types vs. Article Types

The article structure is represented differently between Lightning Experience and Salesforce Classic. In Lightning Knowledge, you use the same record types available in other custom objects (see the `RecordTypeId` field on `Knowledge__kav`) to structure different types of articles. For example, you can use different layouts for different record types. In Salesforce Classic, you get this functionality through article types (see the `ArticleType` field on `KnowledgeArticleVersion`). Each unique type of article has a unique object in Salesforce Classic (for example, FAQ__kav for FAQ article types). Lightning Knowledge does not have a unique object for each type because it is handled using the record type.
Audience Channel
An audience, sometimes called a channel, refers to the types of users who can access an article. Salesforce Knowledge offers four channels where you can make articles available.

- **Internal App**: Salesforce users can access articles depending on their role visibility.
- **Customer**: Customers can access articles in a community, site, or customer portal. Customer users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Customer Community or Customer Community Plus licenses.
- **Partner**: Partners can access articles in a community, site, or partner portal. Partner users inherit the role visibility of the manager on the account. In a community, the article is only available to users with Partner Community licenses.
- **Public Knowledge Base**: Articles can be made available to anonymous users by creating a public knowledge base. With Lightning Knowledge, most Salesforce orgs use Communities to create a knowledge base. Creating a public knowledge base for Salesforce Knowledge in Salesforce Classic requires Sites and Visualforce.

Publishing Cycle
Salesforce Knowledge Articles move through a publishing cycle from their creation to their deletion. The publishing cycle includes three different statuses: **Draft** is the stage when a new article is being created or an existing one is being updated. Articles with the **Online** status are draft articles that have been published and are now available to their different channels. Eventually, when a published article is at the end of its life, it can be moved to the **Archived** status or sent back to **Draft** to be updated in a subsequent version.

Working with Articles in the API
Articles are available through the `KnowledgeArticleVersion` and `KnowledgeArticle` objects in the API. They both represent an article but provide different capabilities.

**KnowledgeArticleVersion**
Every new draft article in Salesforce Knowledge has a version number. When an article is published and you want to update it, you can create a new **Draft** with a distinct version number. Each version has its own ID. Once the updated version is ready to be published, it replaces the former one and updates the version number. You can access the content of an article version using the `KnowledgeArticleVersion` object and filter on its Draft or Online status. For example, the following query returns the title of the Draft version of all the articles across all article types in United States English:

```sql
SELECT Title
FROM KnowledgeArticleVersion
WHERE PublishStatus='Draft'
AND language='en_US'
```

Articles are also auto-assigned an Article Number, which is not a unique identifier to an individual article, but an identifier to a master article and all of its available translations.

**Note**: Both the master version (the knowledge article with IsMasterLanguage = 1) and the translations are `KnowledgeArticleVersion` objects.

**KnowledgeArticle**
Unlike `KnowledgeArticleVersion`, the ID of a `KnowledgeArticle` record is identical irrespective of the article’s version (status). Where the `KnowledgeArticleVersion` object provides API access to an article’s custom field values, the `KnowledgeArticle` object provides API access to an article’s metadata fields.

The article record is the parent container of all versions of an article, whatever the publishing status (draft, published, archived) and the language. While `KnowledgeArticle` and `KnowledgeArticleVersion` represent any article in the knowledge base, use the concrete representation of these objects for the specific articles. In Lightning Knowledge, these concrete representations default to `knowledge__ka`
The following Lightning Knowledge query returns the title for all the published FAQ articles in United States English:

```sql
SELECT Title
FROM Knowledge__kav
WHERE PublishStatus='online'
AND Language = 'en_US'
AND RecordTypeId = '<specify RecordTypeId for FAQ here>'
```

The following Salesforce Classic query returns the title for all the published offers in United States English:

```sql
SELECT Title
FROM FAQ__kav
WHERE PublishStatus='online'
AND language = 'en_US'
```

## Data Categories Overview

Data categories are organized by category group and let:

- Users classify and find records.
- Administrators control access to records.

Salesforce Knowledge uses data categories to classify articles and make them easier to find. For example, to classify articles by sales regions and products, create two category groups: Sales Regions, Products. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level and North America, Europe, and Asia at the second level. The Products group could have All Products as the top level and Phones, Computers, and Printers at the second.

## Working with Data Categories in the API

The following table lists API resources for working with data categories.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Knowledge__DataCategorySelection</code></td>
<td>Object</td>
<td>Gives access to article categorization in Lightning Knowledge.</td>
</tr>
<tr>
<td><code>Article Type__DataCategorySelection</code></td>
<td>Object</td>
<td>Gives access to article categorization in Knowledge for Salesforce Classic.</td>
</tr>
<tr>
<td><code>QuestionDataCategorySelection</code></td>
<td>Object</td>
<td>Gives access to question categorization.</td>
</tr>
<tr>
<td><code>WITH DATA CATEGORY filteringExpression</code></td>
<td>SOQL clause</td>
<td>Filters articles depending on their status in the publishing cycle and their data categories. For more information, see the Salesforce SOQL and SOSL Reference Guide.</td>
</tr>
<tr>
<td><code>WITH DATA CATEGORY DataCategorySpec</code></td>
<td>SOSL clause</td>
<td>Finds articles based on their categorization. For more information, see the Salesforce SOQL and SOSL Reference Guide.</td>
</tr>
<tr>
<td><code>describeDataCategoryGroups()</code></td>
<td>Call</td>
<td>Retrieves available category groups for objects specified in the request.</td>
</tr>
<tr>
<td><code>describeDataCategoryGroupStructures()</code></td>
<td>Call</td>
<td>Retrieves available category groups along with their data category structure for objects specified in the request.</td>
</tr>
</tbody>
</table>
### Feature-Specific Considerations

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>describeDataCategoryGroups</code></td>
<td>Apex method</td>
<td>Returns a list of the category groups associated with the specified objects. See the <em>Apex Developer Guide</em>.</td>
</tr>
<tr>
<td><code>describeDataCategoryGroupStructures</code></td>
<td>Apex method</td>
<td>Returns available category groups along with their data category structure for objects specified in the request. See the <em>Apex Developer Guide</em>.</td>
</tr>
</tbody>
</table>

### Salesforce Knowledge Objects

This entity relationship diagram (ERD) illustrates relationships between the Salesforce Knowledge objects in Lightning Knowledge.

This ERD illustrates the relationship between objects in Salesforce Classic.
Additional Information

To learn more about managing your knowledge base using the API, see the Knowledge Developer Guide.
AJAX Toolkit
A JavaScript wrapper around the API that allows you to execute any API call and access any object you have permission to view from within JavaScript code. For more information, see the AJAX Toolkit Developer's Guide.

Anonymous Block, Apex
Apex code that does not get stored in Salesforce, but that can be compiled and executed by using the ExecuteAnonymousResult() API call, or the equivalent in the AJAX Toolkit.

Anti-Join
An anti-join is a subquery on another object in a NOT IN clause in a SOQL query. You can use anti-joins to create advanced queries. See also Semi-Join.

Apex
Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Lightning platform server in conjunction with calls to the Lightning Platform API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex-Managed Sharing
Enables developers to programmatically manipulate sharing to support their application’s behavior. Apex-managed sharing is only available for custom objects.

App
Short for “application.” A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Service. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

AppExchange
The AppExchange is a sharing interface from Salesforce that allows you to browse and share apps and services for the Lightning Platform.

AppExchange Upgrades
Upgrading an app is the process of installing a newer version.

Application Programming Interface (API)
The interface that a computer system, library, or application provides to allow other computer programs to request services from it and exchange data.
**Boolean Operators**
You can use Boolean operators in report filters to specify the logical relationship between two values. For example, the AND operator between two values yields search results that include both values. Likewise, the OR operator between two values yields search results that include either value.

**Bulk API 2.0**
The REST-based Bulk API 2.0 is optimized for processing large sets of data. It allows you to query, insert, update, upsert, or delete a large number of records asynchronously by submitting a job that is processed in the background by Salesforce. See also SOAP API.

**Callout, Apex**
An Apex callout enables you to tightly integrate your Apex with an external service by making a call to an external Web service or sending a HTTP request from Apex code and then receiving the response.

**Child Relationship**
A relationship that has been defined on an sObject that references another sObject as the "one" side of a one-to-many relationship. For example, contacts, opportunities, and tasks have child relationships with accounts.
See also sObject.

**Class, Apex**
A template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. In most cases, Apex classes are modeled on their counterparts in Java.

**Client App**
An app that runs outside the Salesforce user interface and uses only the Lightning Platform API or Bulk API 2.0. It typically runs on a desktop or mobile device. These apps treat the platform as a data source, using the development model of whatever tool and platform for which they are designed.

**Component, Visualforce**
Something that can be added to a Visualforce page with a set of tags, for example, `<apex:detail>`. Visualforce includes a number of standard components, or you can create your own custom components.

**Component Reference, Visualforce**
A description of the standard and custom Visualforce components that are available in your organization. You can access the component library from the development footer of any Visualforce page or the Visualforce Developer’s Guide.

**Controller, Visualforce**
An Apex class that provides a Visualforce page with the data and business logic it needs to run. Visualforce pages can use the standard controllers that come by default with every standard or custom object, or they can use custom controllers.

**Controlling Field**
Any standard or custom picklist or checkbox field whose values control the available values in one or more corresponding dependent fields.

**Custom App**
See App.

**Custom Field**
A field that can be added in addition to the standard fields to customize Salesforce for your organization's needs.
Custom Help
Custom text administrators create to provide users with on-screen information specific to a standard field, custom field, or custom object.

Custom Links
Custom links are URLs defined by administrators to integrate your Salesforce data with external websites and back-office systems. Formerly known as Web links.

Custom Object
Custom records that allow you to store information unique to your organization.

Custom S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won’t be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Database
An organized collection of information. The underlying architecture of the Lightning Platform includes a database where your data is stored.

Database Table
A list of information, presented with rows and columns, about the person, thing, or concept you want to track. See also Object.

Data Loader
A Lightning Platform tool used to import and export data from your Salesforce organization.

Data Manipulation Language (DML)
An Apex method or operation that inserts, updates, or deletes records.

Date Literal
A keyword in a SOQL or SOSL query that represents a relative range of time such as last month or next year.

Decimal Places
Parameter for number, currency, and percent custom fields that indicates the total number of digits you can enter to the right of a decimal point, for example, 4.98 for an entry of 2. Note that the system rounds the decimal numbers you enter, if necessary. For example, if you enter 4.986 in a field with Decimal Places of 2, the number rounds to 4.99. Salesforce uses the round half-up rounding algorithm. Half-way values are always rounded up. For example, 1.45 is rounded to 1.5. −1.45 is rounded to −1.5.

Delegated Authentication
A security process where an external authority is used to authenticate Lightning Platform users.

Dependent Field
Any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field.

Developer Edition
A free, fully-functional Salesforce organization designed for developers to extend, integrate, and develop with the Lightning Platform. Developer Edition accounts are available on developer.salesforce.com.
Salesforce Developers
The Salesforce Developers website at developer.salesforce.com provides a full range of resources for platform developers, including sample code, toolkits, an online developer community, and the ability to obtain limited Lightning Platform environments.

Document Library
A place to store documents without attaching them to accounts, contacts, opportunities, or other records.

E

Email Alert
Email alerts are actions that send emails, using a specified email template, to specified recipients.

Email Template
A form email that communicates a standard message, such as a welcome letter to new employees or an acknowledgment that a customer service request has been received. Email templates can be personalized with merge fields, and can be written in text, HTML, or custom format.

Note: Lightning email templates aren’t packageable.

Enterprise Edition
A Salesforce edition designed for larger, more complex businesses.

Enterprise WSDL
A strongly-typed WSDL for customers who want to build an integration with their Salesforce organization only, or for partners who are using tools like Tibco or webMethods to build integrations that require strong typecasting. The downside of the Enterprise WSDL is that it only works with the schema of a single Salesforce organization because it is bound to all of the unique objects and fields that exist in that organization’s data model.

Entity Relationship Diagram (ERD)
A data modeling tool that helps you organize your data into entities (or objects, as they are called in the Lightning Platform) and define the relationships between them. ERD diagrams for key Salesforce objects are published in the SOAP API Developer’s Guide.

F

Field
A part of an object that holds a specific piece of information, such as a text or currency value.

Field-Level Security
Settings that determine whether fields are hidden, visible, read only, or editable for users. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

Filter Condition/Criteria
Condition on particular fields that qualifies items to be included in a list view or report, such as “State equals California.”

Foreign Key
A field whose value is the same as the primary key of another table. You can think of a foreign key as a copy of a primary key from another table. A relationship is made between two tables by matching the values of the foreign key in one table with the values of the primary key in another.

Formula Field
A type of custom field. Formula fields automatically calculate their values based on the values of merge fields, expressions, or other values.
Function
Built-in formulas that you can customize with input parameters. For example, the DATE function creates a date field type from a given year, month, and day.

Gregorian Year
A calendar based on a 12-month structure used throughout much of the world.

Group Edition
A product designed for small businesses and workgroups with a limited number of users.

HTTP Debugger
An application that can be used to identify and inspect SOAP requests that are sent from the AJAX Toolkit. They behave as proxy servers running on your local machine and allow you to inspect and author individual requests.

ID
See Salesforce Record ID.

Inline S-Control
An s-control that displays within a record detail page or dashboard, rather than on its own page.

Instance
The cluster of software and hardware represented as a single logical server that hosts an organization’s data and runs their applications. The Lightning Platform runs on multiple instances, but data for any single organization is always stored on a single instance.

Integration User
A Salesforce user defined solely for client apps or integrations. Also referred to as the logged-in user in a SOAP API context.

ISO Code
The International Organization for Standardization country code, which represents each country by two letters.

Junction Object
A custom object with two master-detail relationships. Using a custom junction object, you can model a “many-to-many” relationship between two objects. For example, you create a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.
License Management Application (LMA)
A free AppExchange app that allows you to track sales leads and accounts for every user who downloads your managed package (app) from the AppExchange.

License Management Organization (LMO)
The Salesforce organization that you use to track all the Salesforce users who install your package. A license management organization must have the License Management Application (LMA) installed. It automatically receives notification every time your package is installed or uninstalled so that you can easily notify users of upgrades. You can specify any Enterprise, Unlimited, Performance, or Developer Edition organization as your license management organization. For more information, go to http://www.salesforce.com/docs/en/lma/index.htm.

Lightning Platform
The Salesforce platform for building applications in the cloud. Lightning Platform combines a powerful user interface, operating system, and database to allow you to customize and deploy applications in the cloud for your entire enterprise.

List View
A list display of items (for example, accounts or contacts) based on specific criteria. Salesforce provides some predefined views. In the Agent console, the list view is the top frame that displays a list view of records based on specific criteria. The list views you can select to display in the console are the same list views defined on the tabs of other objects. You cannot create a list view within the console.

Locale
The country or geographic region in which the user is located. The setting affects the format of date and number fields, for example, dates in the English (United States) locale display as 06/30/2000 and as 30/06/2000 in the English (United Kingdom) locale. In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, a user's individual Locale setting overrides the organization's Default Locale setting. In Personal and Group Editions, the organization-level locale field is called Locale, not Default Locale.

Logged-in User
In a SOAP API context, the username used to log into Salesforce. Client applications run with the permissions and sharing of the logged-in user. Also referred to as an integration user.

Managed Package
A collection of application components that is posted as a unit on the AppExchange and associated with a namespace and possibly a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.
Manual Sharing
Record-level access rules that allow record owners to give read and edit permissions to other users who might not have access to the record any other way.

Many-to-Many Relationship
A relationship where each side of the relationship can have many children on the other side. Many-to-many relationships are implemented through the use of junction objects.

Master-Detail Relationship
A relationship between two different types of records that associates the records with each other. For example, accounts have a master-detail relationship with opportunities. This type of relationship affects record deletion, security, and makes the lookup relationship field required on the page layout.

Master Picklist
A complete list of picklist values available for a record type or business process.

Metadata
Information about the structure, appearance, and functionality of an organization and any of its parts. Lightning Platform uses XML to describe metadata.

Metadata WSDL
A WSDL for users who want to use the Lightning Platform Metadata API calls.

Multitenancy
An application model where all users and apps share a single, common infrastructure and code base.

Namespaces
In a packaging context, a one- to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange, similar to a domain name. Salesforce automatically prepends your namespace prefix, followed by two underscores ("__"), to all unique component names in your Salesforce organization.

Native App
An app that is built exclusively with setup (metadata) configuration on Lightning Platform. Native apps do not require any external services or infrastructure.

Object
An object allows you to store information in your Salesforce organization. The object is the overall definition of the type of information you are storing. For example, the case object allow you to store information regarding customer inquiries. For each object, your organization will have multiple records that store the information about specific instances of that type of data. For example, you might have a case record to store the information about Joe Smith's training inquiry and another case record to store the information about Mary Johnson's configuration issue.

Object-Level Help
Custom help text that you can provide for any custom object. It displays on custom object record home (overview), detail, and edit pages, as well as list views and related lists.

Object-Level Security
Settings that allow an administrator to hide whole objects from users so that they don't know that type of data exists. Object-level security is specified with object permissions.
Glossary

onClick JavaScript
JavaScript code that executes when a button or link is clicked.

One-to-Many Relationship
A relationship in which a single object is related to many other objects. For example, an account may have one or more related contacts.

Organization-Wide Defaults
Settings that allow you to specify the baseline level of data access that a user has in your organization. For example, you can set organization-wide defaults so that any user can see any record of a particular object that is enabled via their object permissions, but they need extra permissions to edit one.

Outbound Call
Any call that originates from a user to a number outside of a call center in Salesforce CRM Call Center.

Outbound Message
An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Overlay
An overlay displays additional information when you hover your mouse over certain user interface elements. Depending on the overlay, it will close when you move your mouse away, click outside of the overlay, or click a close button.

Owner
Individual user to which a record (for example, a contact or case) is assigned.

P

PaaS
See Platform as a Service.

Package
A group of Lightning Platform components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Dependency
This is created when one component references another component, permission, or preference that is required for the component to be valid. Components can include but are not limited to:
• Standard or custom fields
• Standard or custom objects
• Visualforce pages
• Apex code
Permissions and preferences can include but are not limited to:
• Divisions
• Multicurrency
• Record types

Package Installation
Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.
Glossary

Package Publication
Publishing your package makes it publicly available on the AppExchange.

Package Version
A package version is a number that identifies the set of components uploaded in a package. The version number has the format majorNumber.minorNumber.patchNumber (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The patchNumber is generated and updated only for a patch release.

Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. See also Patch and Patch Development Organization.

Parent Account
An organization or company that an account is affiliated. By specifying a parent for an account, you can get a global view of all parent/subsidiary relationships using the View Hierarchy link.

Partner WSDL
A loosely-typed WSDL for customers, partners, and ISVs who want to build an integration or an AppExchange app that can work across multiple Salesforce organizations. With this WSDL, the developer is responsible for marshaling data in the correct object representation, which typically involves editing the XML. However, the developer is also freed from being dependent on any particular data model or Salesforce organization. Contrast this with the Enterprise WSDL, which is strongly typed.

Patch
A patch enables a developer to change the functionality of existing components in a managed package, while ensuring subscribing organizations that there are no visible behavior changes to the package. For example, you can add new variables or change the body of an Apex class, but you may not add, deprecate, or remove any of its methods. Patches are tracked by a patchNumber appended to every package version. See also Patch Development Organization and Package Version.

Patch Development Organization
The organization where patch versions are developed, maintained, and uploaded. Patch development organizations are created automatically for a developer organization when they request to create a patch. See also Patch and Package Version.

Personal Edition
Product designed for individual sales representatives and single users.

Personal Information
User information including personal contact information, quotas, personal group information, and default opportunity team.

Picklist
Selection list of options available for specific fields in a Salesforce object, for example, the Industry field for accounts. Users can choose a single value from a list of options rather than make an entry directly in the field. See also Master Picklist.

Picklist (Multi-Select)
Selection list of options available for specific fields in a Salesforce object. Multi-select picklists allow users to choose one or more values. Users can choose a value by double clicking on it, or choose additional values from a scrolling list by holding down the CTRL key while clicking a value and using the arrow icon to move them to the selected box.

Picklist Values
Selections displayed in drop-down lists for particular fields. Some values come predefined, and other values can be changed or defined by an administrator.

Platform as a Service (PaaS)
An environment where developers use programming tools offered by a service provider to create applications and deploy them in a cloud. The application is hosted as a service and provided to customers via the Internet. The PaaS vendor provides an API for creating and extending specialized applications. The PaaS vendor also takes responsibility for the daily maintenance, operation, and support of the deployed application and each customer's data. The service alleviates the need for programmers to install, configure,
and maintain the applications on their own hardware, software, and related IT resources. Services can be delivered using the PaaS environment to any market segment.

Platform Edition
A Salesforce edition based on Enterprise, Unlimited, or Performance Edition that does not include any of the standard Salesforce apps, such as Sales or Service & Support.

Primary Key
A relational database concept. Each table in a relational database has a field in which the data value uniquely identifies the record. This field is called the primary key. The relationship is made between two tables by matching the values of the foreign key in one table with the values of the primary key in another.

Production Organization
A Salesforce organization that has live users accessing data.

Professional Edition
A Salesforce edition designed for businesses who need full-featured CRM functionality.

Queue
A holding area for items before they are processed. Salesforce uses queues in a number of different features and technologies.

Query Locator
A parameter returned from the query() or queryMore() API call that specifies the index of the last result record that was returned.

Query String Parameter
A name-value pair that’s included in a URL, typically after a ‘?’ character. For example:

```
https://yourInstance.salesforce.com/001/e?name=value
```

Record
A single instance of a Salesforce object. For example, “John Jones” might be the name of a contact record.

Record Name
A standard field on all Salesforce objects. Whenever a record name is displayed in a Lightning Platform application, the value is represented as a link to a detail view of the record. A record name can be either free-form text or an autonumber field. Record Name does not have to be a unique value.

Record Type
A record type is a field available for certain records that can include some or all of the standard and custom picklist values for that record. You can associate record types with profiles to make only the included picklist values available to users with that profile.

Record-Level Security
A method of controlling data in which you can allow a particular user to view and edit an object, but then restrict the records that the user is allowed to see.

Recycle Bin
A page that lets you view and restore deleted information. Access the Recycle Bin either by using the link in the sidebar in Salesforce Classic or from the App Launcher in Lightning Experience.
Related Object
Objects chosen by an administrator to display in the Agent console's mini view when records of a particular type are shown in the console's detail view. For example, when a case is in the detail view, an administrator can choose to display an associated account, contact, or asset in the mini view.

Relationship
A connection between two objects, used to create related lists in page layouts and detail levels in reports. Matching values in a specified field in both objects are used to link related data; for example, if one object stores data about companies and another object stores data about people, a relationship allows you to find out which people work at the company.

Relationship Query
In a SOQL context, a query that traverses the relationships between objects to identify and return results. Parent-to-child and child-to-parent syntax differs in SOQL queries.

Report Type
A report type defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Role Hierarchy
A record-level security setting that defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.

Roll-Up Summary Field
A field type that automatically provides aggregate values from child records in a master-detail relationship.

Running User
Each dashboard has a running user, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

S

SaaS
See Software as a Service (SaaS).

S-Control
Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Salesforce Record ID
A unique 15- or 18-character alphanumeric string that identifies a single record in Salesforce.

Salesforce SOA (Service-Oriented Architecture)
A powerful capability of Lightning Platform that allows you to make calls to external Web services from within Apex.

Sandbox
A nearly identical copy of a Salesforce production organization for development, testing, and training. The content and size of a sandbox varies depending on the type of sandbox and the edition of the production organization associated with the sandbox.
Search Layout
The organization of fields included in search results, in lookup dialogs, and in the key lists on tab home pages.

Search Phrase
Search phrases are queries that users enter when searching on www.google.com.

Semi-Join
A semi-join is a subquery on another object in an $IN$ clause in a SOQL query. You can use semi-joins to create advanced queries, such as getting all contacts for accounts that have an opportunity with a particular record type. See also Anti-Join.

Session ID
An authentication token that is returned when a user successfully logs in to Salesforce. The Session ID prevents a user from having to log in again every time they want to perform another action in Salesforce. Different from a record ID or Salesforce ID, which are terms for the unique ID of a Salesforce record.

Session Timeout
The time after login before a user is automatically logged out. Sessions expire automatically after a predetermined length of inactivity, which can be configured in Salesforce from Setup by clicking Security Controls. The default is 120 minutes (two hours). The inactivity timer is reset to zero if a user takes an action in the web interface or makes an API call.

Setup
A menu where administrators can customize and define organization settings and Lightning Platform apps. Depending on your organization’s user interface settings, Setup may be a link in the user interface header or in the dropdown list under your name.

Sharing
Allowing other users to view or edit information you own. There are different ways to share data:

- **Sharing Model**—defines the default organization-wide access levels that users have to each other’s information and whether to use the hierarchies when determining access to data.
- **Role Hierarchy**—defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.
- **Sharing Rules**—allow an administrator to specify that all information created by users within a given group or role is automatically shared to the members of another group or role.
- **Manual Sharing**—allows individual users to share records with other users or groups.
- **Apex-Managed Sharing**—enables developers to programatically manipulate sharing to support their application’s behavior. See Apex-Managed Sharing.

Sharing Model
 Behavior defined by your administrator that determines default access by users to different types of records.

Sharing Rule
Type of default sharing created by administrators. Allows users in a specified group or role to have access to all information created by users within a given group or role.

Sites
Salesforce Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

Snippet
**Note:** S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won’t be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

A type of s-control that is designed to be included in other s-controls. Similar to a helper method that is used by other methods in a piece of code, a snippet allows you to maintain a single copy of HTML or JavaScript that you can reuse in multiple s-controls.
SOAP (Simple Object Access Protocol)
A protocol that defines a uniform way of passing XML-encoded data.

SOAP API
A SOAP-based Web services application programming interface that provides access to your Salesforce organization’s information.

sObject
The abstract or parent object for all objects that can be stored in the Lightning Platform.

Software as a Service (SaaS)
A delivery model where a software application is hosted as a service and provided to customers via the Internet. The SaaS vendor takes responsibility for the daily maintenance, operation, and support of the application and each customer’s data. The service alleviates the need for customers to install, configure, and maintain applications with their own hardware, software, and related IT resources. Services can be delivered using the SaaS model to any market segment.

SOQL (Salesforce Object Query Language)
A query language that allows you to construct simple but powerful query strings and to specify the criteria that selects data from the Lightning Platform database.

SOSL (Salesforce Object Search Language)
A query language that allows you to perform text-based searches using the Lightning Platform API.

Standard Object
A built-in object included with the Lightning Platform. You can also build custom objects to store information that is unique to your app.

Syndication Feeds
Give users the ability to subscribe to changes within Salesforce Sites and receive updates in external news readers.

System Log
Part of the Developer Console, a separate window console that can be used for debugging code snippets. Enter the code you want to test at the bottom of the window and click Execute. The body of the System Log displays system resource information, such as how long a line took to execute or how many database calls were made. If the code did not run to completion, the console also displays debugging information.

Test Method
An Apex class method that verifies whether a particular piece of code is working properly. Test methods take no arguments, commit no data to the database, and can be executed by the runTests() system method either through the command line or in an Apex IDE, such as the Salesforce extensions for Visual Studio Code.

Translation Workbench
The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you’ve made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use Salesforce in their language.

Trigger
A piece of Apex that executes before or after records of a particular type are inserted, updated, or deleted from the database. Every trigger runs with a set of context variables that provide access to the records that caused the trigger to fire, and all triggers run in bulk mode—that is, they process several records at once, rather than just one record at a time.

Trigger Context Variable
Default variables that provide access to information about the trigger and the records that caused it to fire.
Unit Test
A unit is the smallest testable part of an application, usually a method. A unit test operates on that piece of code to make sure it works correctly. See also Test Method.

Unlimited Edition
Unlimited Edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Lightning Platform.

Unmanaged Package
A package that cannot be upgraded or controlled by its developer.

URL (Uniform Resource Locator)
The global address of a website, document, or other resource on the Internet. For example, http://www.salesforce.com.

URL S-Control

Notes: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

An s-control that contains an external URL that hosts the HTML that should be rendered on a page. When saved this way, the HTML is hosted and run by an external website. URL s-controls are also called web controls.

Validation Rule
A rule that prevents a record from being saved if it does not meet the standards that are specified.

Visualforce
A simple, tag-based markup language that allows developers to easily define custom pages and components for apps built on the platform. Each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a controller written in Apex.

Web Control
See URL S-Control.

Web Links
See Custom Links.

Web Service
A mechanism by which two applications can easily exchange data over the Internet, even if they run on different platforms, are written in different languages, or are geographically remote from each other.

Web Services API
A Web services application programming interface that provides access to your Salesforce organization's information. See also SOAP PI and Bulk API 2.0.
WebService Method
An Apex class method or variable that external systems can use, like a mash-up with a third-party application. Web service methods must be defined in a global class.

Web Tab
A custom tab that allows your users to use external websites from within the application.

Automated Actions
Automated actions, such as email alerts, tasks, field updates, and outbound messages, can be triggered by a process, workflow rule, approval process, or milestone.

Workflow Action
A workflow action, such as an email alert, field update, outbound message, or task, fires when the conditions of a workflow rule are met.

Workflow Email Alert
A workflow action that sends an email when a workflow rule is triggered. Unlike workflow tasks, which can only be assigned to application users, workflow alerts can be sent to any user or contact, as long as they have a valid email address.

Workflow Field Update
A workflow action that changes the value of a particular field on a record when a workflow rule is triggered.

Workflow Outbound Message
A workflow action that sends data to an external Web service, such as another cloud computing application. Outbound messages are used primarily with composite apps.

Workflow Queue
A list of workflow actions that are scheduled to fire based on workflow rules that have one or more time-dependent workflow actions.

Workflow Rule
A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day.

Workflow Task
A workflow action that assigns a task to an application user when a workflow rule is triggered.

Wrapper Class
A class that abstracts common functions such as logging in, managing sessions, and querying and batching records. A wrapper class makes an integration more straightforward to develop and maintain, keeps program logic in one place, and affords easy reuse across components. Examples of wrapper classes in Salesforce include the AJAX Toolkit, which is a JavaScript wrapper around the Salesforce SOAP API, wrapper classes such as Critical Section in the CTI Adapter for Salesforce CRM Call Center, or wrapper classes created as part of a client integration application that accesses Salesforce using the SOAP API.

WSC (Web Service Connector)
An XML-based Web service framework that consists of a Java implementation of a SOAP server. With WSC, developers can develop client applications in Java by using Java classes generated from Salesforce Enterprise WSDL or Partner WSDL.

WSDL (Web Services Description Language) File
An XML file that describes the format of messages you send and receive from a Web service. Your development environment’s SOAP client uses the Salesforce Enterprise WSDL or Partner WSDL to communicate with Salesforce using the SOAP API.
